

Swarming Prevented!

THE BEEKEEPER'S REVIEW will take another step in advance by publishing in its March issue an illustrated article by B. Taylor, showing how, by a slight modification of hives and a little manipulation, the bees from two queens can be made to work unitedly in one super and swarming be absolutely prevented. Send ten cents and when this number is out it will be sent together with two other copies of late but different issues; or, for \$1, the REVIEW will be sent from January to the end of the year. The 50-cent book, "Advanced Bee Culture," and the REVIEW one year for \$1.25. W. Z. HUTCHISON, Flint, Mich.
