

OIL FROM ALBERTA FIELDS IS PHENOMENAL IN VALUE.

TESTS MADE ON PRODUCT FROM DINGMAN WELL SHOW NINETY
PER CENT GASOLINE CONTENT.

"One of the most remarkable and peculiar oils we have ever come across—in fact, phenomenal. The test that has just been made shows a 90 per cent gasoline content—that means that the crude petroleum, in its refined state, is 90 per cent gasoline. Having ascertained this, it is no surprise that they were able to drive in from the well on the crude product and find that it developed 25 per cent increased efficiency." These remarks were made by J. A. Kelso, Managing Director of the Kelso Testing Laboratories, after an analysis of samples of oil from the Alberta fields.

Speaking further upon the subject of his results with the Black Diamond field oils, Mr. Kelso said: "The distilling was effected under a heat of from 50° to 150° Centigrade. The fact that we were able to obtain some of the gasoline at a temperature of from 50° to 75° Centi-

Dingman Well where high grade oil was found in Benton shales at a depth of 2800 feet. This was the Discovery Well in the Alberta fields.
