FEBRUARY.—A farmer says he once heard a Professor of Agricultural chemistry say "the very worst way to apply manure is to spread it out on the field and have it exposed." He argued that this exposure caused a loss of ammonia by evaporation. But from my own practical experience I believe this statement highly incorrect. No loss arises from spreading manure on the surface of a field; on the contrary if spread and allowed to lie until it is washed with rains, it is more beneficial than to plough it in at once. When spread out in a field, fermentation is stopped, and volatile matter ceases to escape. On clay soils the manure may be spread even six months without material loss.
