

17. Analysis of samples

The samples were analysed immediately on-site; off-site analysis was performed the following day.

18. Types of analyses

The analyses were only for the presence of declared chemicals. Since the samples were found to contain high concentrations of the declared chemicals (confirmed by the off-site analysis), the analysis for the presence of other Schedule [2] chemicals appeared unnecessary.

19. Documentation of the inspection

20. Evaluation by inspectors

The evaluation of inspection activities and information gathered during the inspection included such aspects as:

- the possibility for undeclared conversions between routine inspections;
- the extent and accuracy of data provided by the facility;
- the co-operativeness of the facility;
- difficulties encountered during the inspection.

21. Closing conference

No closing conference was required.

22. Anomalies, disputes and complications

The introduced intentional complication was disclosed by the inspectors. Due to a misunderstanding during the preparation of the advance information for the trial inspection, the handling of a few tonnes of a Schedule [2] chemical was included in the advance notification for 1988 instead of the initial declaration for 1987. This anomaly was disclosed by the inspectors. No other ambiguities were disclosed.

23. Report of the inspection team

The inspection report included:

- an account of actual inspection activities;
- examples of essential inspection activities permitted by the mandate but not performed;
- the material accountability balance;
- results of the analyses;
