Half-tone portraits of the authors will accompany the articles.

This special number is but the beginning of a series which will be given to subscribers from time to time.

## Therapeutic Notes.

LACTO-GLOBULIN IN NEURASTHENIA.—Case Report by Dr.——, Montreal. —W. C. aged 32, unmarried, accountant, 5 feet 9 in height, weight 128 lbs., came to me on Sept. 2nd 1903. He is an individual of a quick, nervous versatile temperament. Complains of always being tired. Unable to sleep at night, suffers from dyspepsia. I am informed by his relatives that he makes them as nervous and irritable as he is himself. He has a sense of pressure on the top of his head. During a conversation I find he is distrustful and intensely suspicious of his employer whom he accuses of persecution. Resigned his position and refused to return although offered an advance in salary of nearly 40%. His friends fear he is becoming insane, and request me to take the most expeditious means to hasten recovery. Urine 1022 s. g., no albumin, no sugar, abundant deposit of phosphates.

Seeing that I had a typical case of neurasthenia to treat, I ordered abstention from mental work and rest. Began treatment with calomel 1 grain every hour until six doses of 1 grain had been given. This was followed by the administration of a seidlitz powder.
