

THE FORE-ARM LEVER WALKING STICK CRUTCH (PATENT)

CONSISTS of an almost horizontal handle, which is grasped in the palm of the hand, and of a slightly sloped spring which supports the forearm from the wrist to the elbow, where the arm hangs naturally. The greater part of the weight of the body bears on the hand and the wrist. Its use compels the active use of hands, arm and shoulder, and is thus an exercise for the upper limb. It brings back the joy of walking to the patient, who can easily and naturally use this crutch after a little practice, and half-a-dozen miles or more may be covered without fatigue. Stairs, 'buses and trams form no obstacles for the patient equipped with this invention.

"Belgravia" Roller Crutch.

"A. & H." Reg. Patterns.
See *Lancet*, April 7th, 1917.

THIS is an improved Crutch, possessing great advantages over existing patterns. The base is made in the form of a roller, which greatly increases the comfort and speed in walking, at the same time decreasing the tendency to slipping. It is covered with indiarubber, which can be easily replaced when worn. The arm piece is of the bridge type, over which is stretched tubular webbing stuffed with horse-hair. This is found very comfortable in use, and the fact that it is ventilated prevents the excessive perspiration in the axillæ of which so many patients complain. The hand piece is adjustable, so that the patient may, if desired, take the weight of the body on the arms instead of the axillæ. The average weight of a pair, Model A, is only 5 lbs.

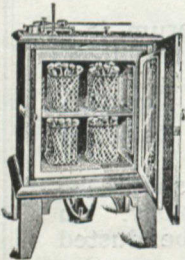

Further, the "Belgravia" Crutch, being constructed in the form of a square, is stronger than the ordinary Crutch. It is made in two models—pattern "A," as described, and pattern "B," which has all the advantages of the "A" Model, and, in addition, is made easily adjustable for height. This is an exceptionally useful Crutch for Hospitals and similar institutions.
