SYNONYMICAL NOTES ON ŒDIONYCHIS

BY F. C. BOWDITCH, BROOKLINE, MASS.

In the rearrangement of my Oedionychis material I note the following:

In the Biologia, p. 418, speaking of *oculata* Fabr., Mr. Jacoby mentioned a figure of a species taken by himself. This figure is now before me, and agrees exactly with a specimen I have from Cayenne (typical locality). I think additional material will prove that the Central American form is distinct.

The name *illigeri* (Jac.) Proc. Zool. Soc., 1905, p. 441, for a Trinidad species was previously used in the Biologia, p. 421, for a Panama insect, so I would suggest for the later form the name *trinidadensis*.

The name *inconspicua* (Jac.) l.c., p. 424, for an Amazon form, was previously used in the Biologia, p. 417, for a Mexican species, so I would suggest for the later form the name *amazona*.

The name *colombiana* (Jac.) l.c., p. 445, was previously used in the same paper, p. 427, evidently some uncorrected error, for the species described on p. 445. I suggest the name *confusa*.

The name *rustica* (Jac.) l.c., p. 433, for an Argentine form, was peviously used by Von Harold, Deut, Ent. Zeit. XXI, p. 434, for a species from Bahia. For the Jacoby species I suggest the name *similis*.

The name *intersignata* (Jac.) l.c., p. 433, for a species from Espirito Santo, Brazil, was previously used (P. Z. S., 1894, p. 617), for a form from Surinam. I suggest the name *santoensis* for the Brazilian form.

Asphaera femorata (Jac.) seems to me the same as chontalensis (Jac.).

In explanation I would add that the late Mr. Jacoby in his working current catalogue (since 1885), for some reason or other, had not entered such of the "Biologia species" as were published after the date of Duvivier's list, so that all the names he used in the Biologia were not before him when he wrote in 1905.

NOTES ON SYNTOMASPIS DRUPARUM BOH. AND ICHNEUMON NIGRICORNIS BERGER

BY C. R. CROSBY, ITHACA, N.Y.

In Bulletin 265 of the Cornell Agricultural Experiment Station, April, 1909, I gave an account of the habits of the Apple-seed Chalcis, (Syntomaspis druparum Boh.), and a resumé of the literature known to me at that time. Since then three more important papers have come to my notice.
