

Heat vs. Cold

IN PNEUMONIA

The application of cold packs to the thoracic wall as a remedial agent in the treatment of pneumonia is rapidly being discarded by practitioners.

The application of heat is again in favor and physicians in every part of the country are now convinced that the logical, safe and sane method of treating pneumonia includes the application of prolonged moist heat over the entire thoracic wall.

Antiphlogistine
TRADE MARK

not only offers the best known method of continuously applying moist heat of equable temperature for a long period, together with the advantages attendant upon its physical properties, hygroscopy, exosmosis and endosmosis, but it offers the pneumonia patient exactly what he absolutely requires—EASE and REST. When Antiphlogistine is once applied it can advantageously remain in place for a long period, usually from twelve to twenty-four hours, all the time performing its soothing and effective service.

THE DENVER CHEMICAL MFG. COMPANY, MONTREAL

YEAST VITAMINE--HARRIS

PATENTS APPLIED FOR

In all cases of yeast feeding, the chief therapeutic and active agent is the **Water-Soluble Yeast Vitamine**.

It is a natural food tonic and aid to normal body-building; stimulating the appetite for common foods and promoting gain in weight.

It is indicated in cases of convalescence, under weight, poor appetite, and lowered resistance to infection.

Yeast Vitamine-Harris is highly concentrated and compressed into tablets containing 200 milligrams of **Standardized Vitamine** each.
