Mr. Tarte Makes Some Interesting Statements as to Tory Boodling

Galt Oct. 22.-When the Liberal leader and his friends arrived at Galt to-day they were given a most cordial reception. The visitors were met at the station by the Musical Society and Citizens' bands, at the head of a large number of citizens and visitors from the surrounding country. The officers of the Reform Association greeted the leader which Mr. Laurier was tendered a welcome in the council chamber by the council. The address from the corporaency: tion was presented by Mr. A. McAusten, the acting mayor. As soon as this proceeding was at an end the introductions to Mr. Laurier took place, and subsequently he and other speakers for the evening were entertained at lunch by Hon. James and Mrs. Young.

sembled at the railroad station to greet | you will do for Mr. Desjardins every- | world. sembled at the failton bassed through the Liberal leader as he passed through the town. The presence of Mr. Laurier important at the same time that your and Mr. Tarte on the platform was division should be represented in the greeted with cheers, and pretty little Miss Graham, daughter of E. C. Graham, stepped forward and presented the tive party. Holiday Garb Witness the Gruesome Spectacle.

Kilgore, Tex., Oct. 30 .- At a point about four miles from Tyler was enacted a horrible tragedy, the very recital DIXI H. ROSS & CO., of which causes the hearer to shudder. A Mrs. Bow, who had been visiting her mother a short distance from home, was on her return met by Henry Hilliard, most noteworthy claims is the Stemwinda negro. What occurred can only be

told by the negro himself and the evi-dence given by the dead body of the by Messrs. Attwood and Schofield. The lady. The ground shows that she had claim has since had an interesting his- gold ores, and allow them to escape struggled hard and the condition of the lowing work Mr. Attraced and July in the foi- This is no doubt often due to the diff. body that told of a cruelty that had lowing year Mr. Attwood sold his inter- culties encountered in saving them, and rarely been equalled by Jack the Ripper. After assaulting the woman, the negro deliberately cut her throat and then taking his knife ripped up her body. When the crime became known a field sold out in the beginning of this sse was quickly organized, led by year to Messrs. Farrell and Midgeon for Deputy Sheriff Smith, of Tyler, who with lanterns in hand and guided by a \$10,000. This sum was later offered b; hound tracked the negro to within four Mr. Smith, agent for the purchasers of miles of this place, where they found him fast asleep in a cotton pen. Try a bottle of RUM and DANTZIC SPRUCE for that cold.

The condition in which the gold occurs in pyrites has been much discussed by chemists and physicists, and is perhaps still a moot point. It was formerly supposed by the highest authorities to be present as a sulphide; then it was contended that, though really metallic. the gold was dissolved in the sulphides of the base metal, so that its state aggregation was one of almost infinite fineness of division. More recently it has been shown by careful researches that gold in pyrites is entirely in metalthat gold in pyrites is entirely in the metallic form, and occurs in extremely thin plates gilding the faces of the crystals of sulphides of iron and other base metal compounds. It has been likened to the mortar in a brick will, the bricks representing the crystals of py rites and the mortar being the gold, but the whole being on so small a scale in nature that the edges of the gold films can with difficulty be observed with the aid of a most powerful microscope. This fact as to the usual condition of gold in pyrites must be borne in mind when the problem of how to get it out is faced in particular cases. Concen trates are of all descriptions and of varying richness. Some concentrates may contain but little gold except that existing in the state just described; in other samples there may be a larger number of little free plates of metallic gold in addition; where amalgamating plates have not been well managed a quantity of finely divided gold-amalgam and mercury may also be present in the heavier parts of the ore. When the amount of free gold and amalgam is appreciable, the method generally to be pted is that of grinding the sulphides with mercury in iron pans and washing down the products-which is probably the best and cheapest that can be adopted, though in this case the percentage

Vegetables, etc.

When the gold is in the main locked up in pyrites this method is not to be recommended. It is true that excessively fine grinding, long continued, may re sult in the mercury being able to stretch out and collect together the little plates of gold released by the crumbling of the pseudo-brick alluded to above; but the fouring and sickening and consequent loss of mercury often greatly increases the cost, and in many cases the yield of gold is even then unsatisfactory, the plates being protected from the attack of the mercury by some coating of a sulphurous nature, or possibly by pieces of the "bricks." To facilitate the amalgamation of the oncentrates have been roasted and the residue ground with mercury and a very little water, so as to make a very thick baste. For some reason however, which has not been fully worked out, the yield is seldom higher than if the concentrates

are amalgamated without being previous ly roasted. Doubtless much of the gold remains in the form of excessively thin films, which are difficult to bring in contact with the mercury; and if, as is isually the case, the stuff is not roasted uite "dead," the coatings of the gold are formed to a greater extent than before, and more harm is done than good At the present time there are but three methods in use which can fairly be held to apply successfully to large classes of concentrates. They are, the treatment y smelting, by roasting and by chlorin ation. and by cyanide solutions. The first method is a little difficult to apply. for a smelting establishment requires the supply of great quantities of several lifferent kinds of ore, of which the con entrates can only form one. If large imounts of galena are present, smelting, preceded by preliminary melting, is ceainly the most satisfactory method; but except in a few localities in the west, one or two isolated cases, lead smelting is impossible, owing to the absence of suitable ores, while pyritic smelting, though more widely applicable, is yet in its infancy. A pyritic smelter would doubtless be a great boon, but no ingle outlying mine could look forward o setting up one unsupported. Roast ng and chlorination is more hopeful, as ven so small a quantity as a few tons er week can be treated in this way a profit, and as with smelting, the pres ence of large quantities of either cop per, zinc, or lead is almost fatal to suc cess, and the process requires some care and skill. Finally, the cyanide process, though not applicable to some varieties of concentrates, promises success in numerous cases. The percentage of ex raction is usually good, but the de composition of cyanide is occasionally onsiderable, but this method has been mable to entirely supplant chlorination with certain classes of material. In conclusion, the maxim may be iterated that in gold mining no part of the values in the ore should be allowed to escape without an effort being made to recover it. The gold in the concer trates may not amount to more that two or three per cent. of the total quant tity: but if it can be obtained easily with little cost by almost automatic nachinery, its loss may make all the difference between success and failure. and in any case, in business, no profi

is o be despised.

had no unpleasant odor when cooking, and lastly Mother's favorite and conservative cooking authority came out and gave it a big recommendation which clinched the matter. So that's why we always fry ours in Cottolene. COMPANY, Wellington and Ann Streets, MONTREAL

Sold in 3 and 5 lb. pails, by all grocers. Made only by THE N. K. FAIRBANK
