

The Kelly Patent Filter Press

is a self-contained, self-discharging tank pressure filter, which can be operated by any convenient means such as, gravity (where sufficient head is available), compressed air, (where montejus are preferred), or pumps of either centrifugal or plunger type.

Filtration can be performed at any required working pressure, up to one hundred and twenty-five pounds.

Its chief points of superiority, which will be appreciated by all cyanide mill operators, are:

Absence of leakage, accessibility of filter diaphragms and individual discharge of filtered solutions therefrom, quick discharge of slime cakes in dry and compact form affording maximum conservation of water where this commodity is scarce, and economy in operating cost as the result of merely nominal amount of manual labor involved.
