est not to turn working oxen to grass till they have done their
spring work."—they will perform labor much better when fed
a good, bright soft hay, with two or three quarts of meal from
adian Corn, barley, or oats and peas, with a few potatoes,
arrots, and other succulent vegetables than when fed on the
young grass. It takes some time for the animal system to accom-
modate itself to the change from dry to green food, or from hay
grass, and the first growth of grass, besides being deficient in
triment, is likely to weaken animals. Sheep may be pastured
rye for a short time, if it is pretty forward, without injury to
the crop, and with very great advantage to the sheep, especially
nursing ewes. In case of a scarcity of other feed they may be
rned on dry meadows. Look out for weeds.
