**EXPORT CONTACT**

Mr. Ray Desjardins            President  
Mr. Colin Smith               Project Engineer

Terray Corporation was established as a bio-engineering research and development firm. The company has been in operation since 1983. Their mission is to assist the orthopaedic community to design and develop, manufacture and through distributors; market orthopaedic implant and instrument products characterized by simplicity - durability and quality standards based on sound bio-engineering methods.

Past success has been through developments in the spinal and pelvic segments. However, the company has developed a new hand surgery system, that may influence surgical techniques in the trauma specialty. Many of the new systems by Terray had to make inroads before the product could succeed, the surgical technique had to be popularized first by demonstrating the system's ability at meeting the challenges presented by the procedure. Although a fairly young company, Terray has in eight years managed to launch a major product line once every two years. These products include Contoured Anterior Spinal Plates, through retroperitoneal or thoracolumbar approaches.
