cumſtances that have been ſtated, this computation is certainly not overcharged. For the ſake of diſtinctneſs, we ſhall proceed by the help of cyphers.

Population previous to the year 1758, - - 54,000,000
Lord Cornwallis, in 1789, ſtates, that
  one-*third* part of this country was, at
  that time, a jungle inhabited by wild
  beaſts. For this jungle, deduct one-
  third of the ancient population - 18,000,000
Suppoſe that the remaining two-third
  parts of theſe provinces have loſt *only*
  one half of the thirty-ſix millions of
  inhabitants, whom they contained,
  before their ſubjection to the Britiſh
  Eaſt-India Company. This one-half
  gives - - - - - - - - 18,000,000

Deduct this from the original population 36,000,000

Preſent number of inhabitants - - - 18,000,000

Thus, in thirty-five years, that is, from 1758, to 1792, incluſive, there has been an uniform waſte of people, under theſe mercantile ſovereigns, at a rate of more than *one million* per annum; in whole, THIRTY-SIX MILLIONS. The premiſes, on which this calculation has been founded, are explicitly placed before the reader. As to their juſtice, he is competent to decide for himſelf.

THE END.
