ILLUSTRATIONS.

Drawings.

- Fig. 1. Chart showing the relation between the evaporation and calorific value per pound of fuel, and the thermal efficiency of the boiler and the grate 437
- " 2. Chart showing the distribution of the heat losses as a fraction of the heat used for steam-raising 438
- " 3. Diagram showing the relation between the loss due to the high temperature of the seeping flue gas and the air supply ratio 439
- " 4. Diagram showing the relation between the average air ratios for the trials and the average carbon dioxide contents of the flue gas 440
- " 5. Chart showing that with the exception of three fuels, the ratio of air supplied for combustion to that used was less when a fuel was burned on a grate with $\frac{1}{2}$ " air space 441
- " 6. Diagram showing the effect of a change in the rate of steaming upon the excess air supply 442
- " 7. Diagram showing the relation between the heat loss due to unburnt solid fuel per pound of fuel fired, and the original ash content of the fuel 443
- " 8. Diagram showing the relation which the sum of the percentage unaccounted for losses, and those due to radiation and unburnt gases bear to the air ratio 444
- " 9. Diagram showing the boiler efficiencies at normal evaporation rates on a base representing the air ratio 445
- " 10. Diagram showing the decrease in thermal efficiency based on ash and moisture free fuel consumed and the increase in the loss due to the high temperature of the flue gas, with an increase in the rate of combustion 446
- " 11. Diagram showing the relation between the difference of draft in the furnace and flue and the mass flow of the gases 447
