

apparently throughout the Province. Arrives May 1; departs early in October.

264. **Hermit Thrush.** *Hylocichla guttata pallasii*. Common summer resident of woodlands in the Canadian region. A migrant in the Alleghanian, passing in late April and early October.
265. **American Robin.** *Planesticus migratorius*. Abundant summer resident throughout the Province. Arrives April 15; departs October 15.
266. **Bluebird.** *Sialia sialis*. Formerly very rare; has become quite a regular summer resident in the country along the Assiniboine, and nearly every grove of oak of any extent is found to have a pair making their home in it along with the Purple Martins.
268. **Mountain Bluebird.** *Sialia currucoides*. E. H. Patterson secured one of a pair that he found at a place two miles west of Brandon, and sent the same to G. E. Atkinson, who recorded it in "Man. Free Press," March 5, 1904. To this, Norman Criddle (the naturalist responsible for records from Aweme) adds ("Ottawa Naturalist," July, 1904, pp 85, 86) that the species is by no means uncommon about the Carberry sandhills, and that he has taken numerous nests there.
