There were twenty-five cases of acute cystitis, which revealed the presence of—

B. coli communis	15 times
Staph, pyogenes albus	5 "
Staph. pyog. aureus	2 "
B. pyocyaneus	1 time
B. typhosus	1 "
B. typhosus Proteus vulg.	1 "

And in 22 cases of chronic cystitis, Dr. Brown found-

B. coli communis
Staphyloc, progenes aureus
Staphyloc. pyogenes aureus 3 " albus 2 "
B. coli communis (with tub, bac.) 1 time
Unidentified (possibly a variety of B. coli) 1 "
Pyuria sterile
A staphyloc, albus (which, decomposed in urea, was
pyogenic, but either did not liquefy gelatine or
did so extremely slowly) 2 "

There were also six cases of tuberculous cystitis.

Compare these findings with those of Melchior, and you will find the similarity is in some respects a striking one. (Kopenhagen, 1893.)

Melchior examined 36 cases of cystitis (17 women) and found—

B. coli communis	25 - 17	pure cultures.
Streptococ. pyogenes	5 3	44
Proteus Hauser	4 1	٤٠
B. tuberculosis	32	**
Diplococ. ure:e liquef	3 2	64
Staphyloc. " " Lundstrom		
Streptobac. anthracoides	3	44
Gonococ, Neisser]	44
B. typhus	1	44

The great importance to be attached to a study of the etiology of cystitis is the discovery of several factors easily within our control, notably the traumata. By recognizing this fact we can do much, in many instances, to prevent a cystitis.

The most important group opened up by bacteriological study of the urine is that of the tubercular cases, which, as a rule, call for the more aggressive plans of treatment.

I will pass over the pathology, simply noting two important facts which bear powerfully on the treatment of cystitis.

First, that the disease is sometimes purely superficial, being seated only in the mucosa, while at other times it extends deep down, even into the muscularis.
