

Airscape of Power Plant at Gres Falls

“Do It By Air”

Aircraft offer the limit owner, engineer or executive a unique opportunity of gaining accurate personal knowledge of timber limits, mining claims or water-powers.

An aerial survey by experienced engineers costs much less than a ground survey of equal accuracy and completeness, and finished work is delivered in as few days as ground surveys require weeks.

With the results of an aerial survey before him the man who has personally flown over the territory is in a position to plan his operation from personal knowledge and accurate information.

Some of our work was recently checked over by a prominent forestry engineer who said:

“There was also a discussion as to the area burned, but the differences were relatively small, and as far as I went I found your map to be correct. I must say that my experience has given me a much better appreciation of aeroplane work than I had before, and I hope that we can co-operate again in the near future.”

Requests for further information will be cheerfully complied with and involve no obligation whatever. Address enquiries to either Company.
