It might be thought that with such a showing, I, as a medical officer of the Immigration Service of Canada, should be satisfied, and thus leave the matter; but the problem of tuberculosis in immigrants has today advanced to a further stage, and become a state and municipal health question which enters into all economic, social, and charitable questions, and demands much further consideration.

At the Congress on Tuberculosis in Washington in 1908, two somewhat remarkable papers were read, one by Dr. Maurice Fishberg, physician to the United Hebrew Charities of New York, on "Tuberculosis among the Jews," and one by Dr. Antonio Stella, of New York, on "Tuberculosis among Italians in the United States." These valuable papers are so well known that I shall refer only to such data in them as are pertinent to my subject.
