MONTREAL

February 4,
1931.

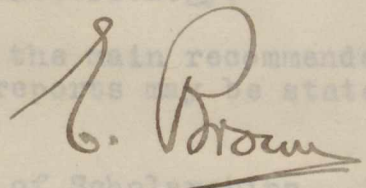

as being a more practical procedure at the moment than the listing of needs impossible of fulfilment in existing buildings, and with our existing financial resources.

My dear Professor Eyo,

I am herewith enclosing a number of reports submitted at our Committee meetings of the Principal's Survey Committee by different Departments, namely,

- Department of Pharmacology,
- Department of Biochemistry,
- Department of Anatomy, and the
- Department of Bacteriology.

I may say that the main recommendations as synopsized through these reports are stated as follows:

1. An increased number of Scholarships,
2. Increased library facilities, particularly of a research nature, particularly Chairman of the Faculty of Applied Science.
3. Increased personnel which varies from department to department, as for instance in Pharmacology appointment of an Organic Chemist to the Department; in Bacteriology, an increased number of teachers; in Surgery, the appointment of a full-time Professor of Experimental Surgery.
4. An increase in the room available in certain departments, while in others they are more inclined to concentrate on an increase in departmental appropriations.

March 25th, 1931.

They were all unanimous in the necessity of improving or raising in some way the scientific standard of the students who enter McGill. This, however, is a subject which the General Committee has already had under serious consideration, but I thought it of value to inform you that this was independently reiterated by the Head of practically every Experimental Department in the Medical Faculty.

Yours sincerely,
