

Get rid of them and help make your home and premises sanitary by the liberal use of **Tanglefoot Fly Paper**. There is fully one-third more compound per sheet on **Tanglefoot** than on any other fly paper; hence it lasts longest, catches the most flies and is the best and cheapest fly paper. If you ask for "fly paper" or "sticky fly paper" you may get a cheap imitation that will soon dry up or glaze over. Ask for **Tanglefoot**.

Sold by Grocers and Druggists.

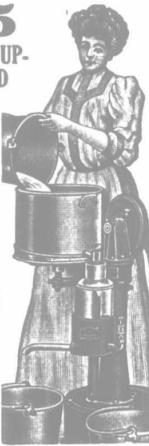

**TREE TANGLEFOOT**, put up in 1, 3, 10 and 20 lb. cans. Will protect your trees from all climbing insects.

**15<sup>95</sup> AND UPWARD**

**GEO. D. FLETCHER, Binkham, Ont.**  
Erie Sta., C. P. R.

MENTION "FARMER'S ADVOCATE."

**QUESTIONS AND ANSWERS.**  
Miscellaneous.

**COW LOSES TEAT.**

Have a cow which had one front teat completely severed. Could you tell me, through your magazine, what would be best to do with it? If that quarter of the udder will go dry, or if it is likely to always leak out the milk?

R. W. S.

Ans.—In all probability the teat will leak for a time, and after it is completely healed, the cow is likely to lose the use of the quarter. This is an unusual case, and one which any of our readers who have had actual experience might discuss through these columns.

**WEED SEEDS IN CLOVER.**

We bought clover seed that had bladder campion in it. Can we claim damages? If so, how should we proceed?

R. J. G.

Ans.—Bladder campion is one of the weeds coming under the Seed Control Act, Sec. 7, and to be No. 1 common red clover or alfalfa, must not contain more than 5 of these or any other noxious seeds, under the Act, per ounce, while alsike may contain 10 seeds per ounce. If you still have a sample of the seed, send it to the Seed Branch, Ottawa, together with a clear statement as to the grade which the seedsmen represented it to be, and get their report on the same. They will inform you as to how to proceed.

**TARRING CORN.**

Please let me know, through your valuable paper, if there is any way of coal-tarring seed corn to keep the crows from pulling it up? Also if there is any other way of keeping the crows off, as the field is down by the bush? E. F.

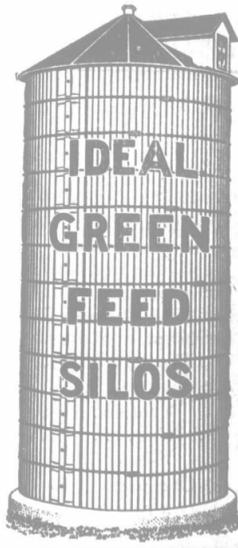

Ans.—Coal-tarring corn has been found to give good success in saving corn from the crows. Some take a small quantity of coal-tar and heat it to almost boiling point, or until it is very thin. The corn is dumped in tubs, or large vessels, and stirred well with a stick frequently dipped in the heated tar. This just darkens the corn a little and gives it a strong odor. The corn is then exposed to the sun for a few hours until dry. The corn must be dried thoroughly, or it may stick together in the planter or seeder. Another method favorably reported upon is to place the corn in a vessel, pour hot water on it (not so hot as to kill the germ), then a little tar is put on and the whole stirred. In place of standing the corn in the sun to dry, a little land plaster is added, which makes cleaner handling. Do not use pine-tar. Some growers use turpentine. As crows are generally very wary, a string stretched on sticks around the field is often beneficial, the crows hesitating to alight inside it. Papers hung from sticks in the field are also beneficial.

**ABOUT DUCKS.**

1. How many ducks would you advise me to start with to make a success of duck-rearing?
2. How many ducks to one drake?
3. What number can I have to an acre of land?
4. What breeds are the best for eggs and table use?
5. Can you give me the address of two or three poultry-packing companies in Canada?
6. How many eggs do ducks lay, as a rule, before sitting?
7. About what time do ducks want to sit, and how many eggs required to one sitting?
8. Can duck eggs be hatched under a hen?
9. At what hour do ducks lay their eggs, as a rule? A SUBSCRIBER.

Ans.—1. Start on a small scale, with from three to six mature birds.  
2. About five or six.  
3. This depends upon equipment. Start as suggested on a small scale, and gradually increase the number.  
4. There are several good breeds. Rouen, Aylesbury, and Pekin are good.  
5. Only through our advertising columns.  
6. This depends upon the breed, care, and conditions.  
7 and 8. Eggs are usually set under hens. Keep the ducks laying as long as possible.  
9. Usually during the night.

**Why Wood Silos are the Best**

Many Government experiment stations, especially in the United States, have made exhaustive experiments as to the most suitable material for silo construction, and the general conclusion seems to be expressed in the following statement from a recent experiment station bulletin: "A round, wooden stave silo, taking all things into consideration, has proved most satisfactory."

The reason for this is simple.

The very best silage is obtained when the whole mass is kept at an even temperature and all air excluded. Cement, stone or brick silos conduct away the heat generated in the silage, and thus prevent proper fermentation; furthermore, both cement and brick are porous, and permit the air to get at the silage, thereby causing it to spoil.

The many experiments and tests made have gone to show that frequently as much as one-third of the silage in a cement or brick silo will be spoiled and unfit for use, while in properly constructed wood silos the only spoilage will be a little on the top.

Due to our colder Canadian climate wood is the only material suitable for silo construction. If you have any doubts on this point write to us, and we will be glad to give you further information on this vital subject, and show you why it is to your interest to erect an Ideal Green Feed Silo in preference to any other kind, not only from the standpoint of first cost, but also from the standpoint of more satisfactory service.

We are the oldest and best known silo manufacturers in Canada. Thousands of our **Ideal Green Feed Silos** are in use on many of the most prosperous farms, and they always give entire satisfaction.

Send for our new Silo Book. It will explain fully why the

**Ideal Green Feed Silo Is the Best Wood Silo**

**DE LAVAL DAIRY SUPPLY CO., LIMITED**
