

undergraduates in medicine is sufficient. More should not be asked for.

Dean Clarke's remarks respecting the supervision that should be given by the older members of the Faculty of Medicine to young students who, in many instances, are removed from parental control and allowed to follow their own devices in a great city, are in excellent taste.

Report of the Milk Commission.

There is very much, indeed, that commends itself to physicians in the carefully-prepared Report of the Milk Commission, and our readers would do well to ask for copies of this report from the Chairman of the Milk Commission, W. K. McNaught, M.P.P., Toronto.

Referring to the question of a general milk supply in Ontario, it is shown that, to be pure and wholesome, milk should be treated in a clean, sanitary way. To accomplish this desideratum, every city and town should have a proper system of inspection, and the work of inspection should be done by a veterinarian. If possible, a man should be employed who could give all his time to the work. In the case of small cities and towns, a veterinarian might be employed to do the work, during a portion of his time. The Report shows that, in Ontario, the inspection of dairies has not been done properly, as regards places where milk is sold and, scarcely at all, as regards farms where milk is produced.

The plan for securing inspection recommended in this Report is to empower each municipality to look after its own milk supply. Each city or town should be given the utmost freedom to make inspection at every stage, from the cow to the consumer, and should have power to exclude any milk believed to be contaminated. The question should be one of buyer and seller—a matter of agreement between producer and consumer—just as is done between dairymen and dairy companies, or between
