

A Real Summer Temperature

YOU know the perfect comfort of a summer day with the thermometer at 65°. Why does 65° in the house in winter feel chilly? Why does 75°, while warm enough, feel stuffy and oppressive?

Because the average furnace, in warming the air, dries out the natural moisture and fails to replace it. Instead of the 70% average humidity of the outside air, your furnace heated air probably contains less than 30% of moisture.

The sudden changes from this hot, dry air to the cold, outdoor air is the commonest cause of the colds, sore throats and lung troubles so common in winter.

The Remedy is The **"CIRCLE WATERPAN"** OF THE **"GOOD CHEER" FURNACE**

This pan encircles the firepot, and holds several times as much water as the make-shift pan in the average furnace. The result is an evaporation sufficient to keep the air in every room in the house at practically the same humidity as the fresh outside air, so that 68° feels perfectly comfortable, like a summer day. Plants and people thrive in such an atmosphere.

The "Good Cheer" Circle Waterpan Furnace saves doctors' bills as well as coal bills.
