FARMERS RAISE **MORE STOCK?** Why Let Texas Supply Our **Ranches** With Stockers? ++ F. S. Stimson, the Great Canadian Northwest Rancher Endorses the Policy of Making Shorthorns the Standard Gattle for New Brunswick, and Says Whv. ++ The enormous demand for stockers

WHY DO NOT OUR

In Alberta and Assiniboia has opened up a great market for the farmers all over the dominion of Canada, the western market market for well bred cattle is almost without a limit. In 1902, 40,000 yearlings and two-year-old steers were bought in Ontario and Manitoba and shipped west to the prairies by the ranchmen, the prices for yearlings delivered at Medicine Hat, Calgary and McLeod being from \$17 to \$21 per head, two years old \$25 to \$30. These prices vary according to weight and breeding. The Canadian Pacific railroad gives exceptionally low rates upon eastern stockers ship-ped west to the range country, as these cattle are fattened by the ranch-ers upon the succulent and nutritious grasses of the prairie and exported to England as finished beef. Owing to the great influx of settlers this year into the Northwest the demand for stockers has so increased that the supply in Manitoba and Ontario was exhausted, and 25,000 have been brought from Texas, New and Old Mexico, and the probabilities are that other 10,000 to 15,000 head will be brought in before the end of the sea-son. Now, why should \$700,000 or \$800,-000 be paid to foreign cattlemen when we have the country and the farmers who should produce these cattle and save to Canada this money and indus-try? Our government is trying to induce England to throw off the em-bargo upon the Canadian stockers, and this at a time when our home demand is far greater than the supply. By fattening and sending the finished animal to England we get \$45 to \$60 per head net, after paying cost of transportation, and utilizing our hay, grass and grain, and getting the increase in price for ourselves. There is no secret in breeding good cattle. The first principle is pure bred

bulls of a beef breed. The Shorthorn stands at the head for producing beef cattle that are not only of the finest quality, but are also good and deep milkers and in great favor for the dairy, and when their usefulness as dairy animals he

highest price from the butcher Use nothing but pure bred bulls, and never keep a half bred calf for a sire, because he looks an exceptionally fine specimen, as he is certain to throw back to the weaker and inferior strain. When animals are put on the market for sale it is quality and finish that establish the price, and the difference between a plain bred yearling and one sired by a pure bred Shorthorn is certainly \$5.00 per head. We do not discuss the value of scrubbs as they are not worth the freight paid upon them

and are always a loss and a disap-pointment to the man who breeds them, it cost no more to feed a good animal than a poor one. Shorthorns stamp their impress upon grade cattle in so marked a manner that with two or three crosses from pure bred sires a herd will have form and character of pure bred animals. The question is how are our farmers to supply themselves with pure bred bulls in the best and cheapest manner, on way is for agricultural societies to combine and appoint a live stock commissioner to buy bulls and have them sold by auction at some central point, the pur-chaser giving the farmers the use of these bulls at a nominal sum. The freight and care of a carload of bulls is but a trifle more than the expenses would amount to on a few. At least 100 Shorthorn and Hereford bulls should be bought and distributed throughout this country so that we can compete with Ontario and Mani toba in furnishing well bred stockers for the ever increasing Western market and at the same time prove the quality of cattle in New Brunswick. Montreal, July 13th, 1903.

THE MODERN BUILDER.

(London Sphere.) The modern builder embarking on big works seeks the aid of new and expensive machinery. Thus a Rugby firm has installed a most remarkable equipment at the Chelsea works, namely, a diamond saw for cutting stones

Cutting stones with steel saws is, or rather was, an expeditious process, but the teeth quickly wear away. The diamond saws work by electricity which quickly sever the great blocks of stone. Each saw is fitted with 170 black diamonds, and these are set in steel wedges (whilst the steel is white hot) round the circumference of a circular disc which is 7 feet 4 1-2 inches in diameter.

The precious stones in the diamond saw are not particularly handsome. They have no sparkling facets; instead they look like irregular pieces of semi-transparent glass. This saw will tear the transparent glass. This saw will tear then through the stone as if it were no ger harder than butter, and will do in minutes the work that formerly took a man days.

The progress from the "man's saw" hours to the present electrically-driven diamond saw is shown by the follow-ing list of the times taken to saw engthways, through a block of stone 5 feet long by 1 foot thick: Hand saw Dattern, 8 hours; steam saw (new pat- | the
