Clearing Sale

of entire herd

Cedar Hedge Stock Farm HOLSTEINS

Tuesday, October, 29, 1918

50 IN NUMBER, OF WHICH 47 ARE FEMALES, all except one are under 6 years of age. There are 9 half-sisters of Queen Butter Baroness, 16 grand-daughters of old Brookbank Butter Baron. All the females that are of breeding age are in calf to Lyons Segis' Champion three-quarter brother to May Echo Sylvia. Some due to freshen soon. All have been bred on the farm from four sires. This is one of the best herds in the county of Oxford and will be sold without reserve to the highest bidder. A splendid opportunity to improve one's herd.

Sale will be held at the farm one mile west and two miles south of Lakeside C.P.R. Morning and noon trains will be met.

Terms: 12 months' credit on approved paper. Parties from a distance must furnish satisfactory references. 5% off for cash.

Sale will commence 1 P.M.

Holstein Bulls

Ready for service and younger. Cows and heifers bred to ORMSBY JANE BURKE, whose two nearest dams average 38.82 lbs. of butter in 7 days. The three nearest sires' dams and his dam's records average 35.69 lbs. for 7 days, and 112 lbs. milk for one day.
R. M. HOLTBY, R. R. 4, Port Perry, Ont.

Please mention this paper

an extra concave filled with teeth. If an extra concave is at hand, it can be put into the machine, the damaged and broken teeth in the cylinder straightened or replaced, and the machine be ready to proceed in a few minutes, while at best a delay of several hours will ensue if the parts must be purchased.

For the same reason a supply of new teeth should be carried, together with the hammer and wrenches necessary for removing the broken ones and placing the new ones.

One should never try to examine the cylinder and concaves or make any repairs to them if the engine is belted to the separator unless he is absolutely sure that there is no danger of the engine being started by accident or carelessness. It would be safest, of course, to throw the main belt off the pulley.

Feeding.

A large majority of the threshing machines of the country are now equipped with self-feeders. It is a mistake, however, to assume that because the feeding is done mechanically the feeder will always deliver the unthreshed grain to the cylinder in the proper manner when the bundles are pitched on promiscuously and at irregular intervals. The governor which controls the feeder should be adjusted so that it will stop feeding as quickly as possible when the speed is reduced below normal. By all means it should be adjusted to act more quickly than the governor on the engine. If a reduction in the speed of the cylinder does not stop the feeder before the engine governor acts, the speed will pick up again and the bundles will continue to move into the machine without giving the separator time to clear itself of the overload which originally reduced the speed. Since it takes some overload and consequent reduction in speed to cause the governor to act, the grain which is in the machine when the speed is reduced will go on through before the speed can pick up again, and there is almost sure to be some waste. The feeders on some machines are provided also with a straw governor designed to stop the bundle conveyor without stopping the remainder of the feeder when too many bundles are moving to the machine in a bunch. When properly adjusted it prevents any more unthreshed grain moving up to the machine until such bunches have been thinned out and fed through the cylinder. Like the speed governor, it must be kept carefully adjusted if it is to operate quickly when it is needed.

The bundles should be pitched on one at a time, with the heads toward the machine, and the distance between bundles should be as nearly uniform as possible. In bundle-threshing, the centre, or dividing board, should nearly always be used to keep the bundles from piling up in the centre of the carrier. If one man on each side of the machine cannot pitch bundles in the proper manner fast enough to keep the machine supplied, it will usually be better to supply extra pitchers than to have two men pitch two or more bundles at a time without any regard to the way they fall on the conveyor. It is hard work to keep the bundles going into the machine in a steady stream, with the heads all pointing in the right direction, but unless this done, it is impossible for the machine to do its best work.

On most self-feeders there is provision for changing the speed of feeding with reference to the speed of the cylinder. This should be kept in mind and the feeder adjusted to feed slowly when the straw is tough or when other conditions will not allow fast threshing. A higher speed may be given to it when conditions are good, so as to keep the machine working to capacity at all times.

There are still many threshing machines not equipped with self-feeders. If hand feeding is to be done most efficiently, the feeder must have had considerable experience and practice. Good feeding is an art. The bundles must be spread out to go into the cylinder evenly and with just the proper frequency if the straw is to be evenly distributed in the separator. The more the straw is divided and spread out on the feeding table, the less is the power required to force it through the cylinder. This should be borne in mind, especially in feeding small machines when the amount of power is limited. Another important thing to remember is not to feed any grain into the machine when it is not running at the proper speed. It is possible to feed so fast as to reduce the speed to a point where good threshing will be impossible, and after the speed is
