

Queen Top Draft Heating Stove

Patented February 1st, 1896.

PRICE OF STOVES CUT INTO HALF.

The Queen will keep you warm until January 1st at 5 cts. per day; why fire up your furnace? Ashes need removing only once or twice in a season; will save 25 to 50 per cent. of fuel; will positively keep a slow burning fire all night.

The Vertical Hot Blast Draft Feeds the fuel with hot air all the time.

When using the QUEEN you do away with leakage of sulphurous and other irrespirable noxious gases, which is caused by continuous contraction and expansion in joinings of cast iron stoves. Three quarters of the heat is never set free with cast iron stoves.

Method of Distribution of Heat by the Queen Stove

Heat is distributed in two ways: 1st, by radiation, or the direct mission of heat in rays, as the sun is distributed; and 2nd, by conduction or immediate contact of the air of the apartment with the heated surfaces of fuel and iron.
