an inferior quality are thrown out.

REMARKS.

CATTLE.—The supply at market this week was light, and with a respectable number of buyers present, there was more activity than we have noticed for some weeks. For cattle of extra quality prices advanced 25c. to 50c. per cwt. We notice three pairs of first rate cattle that sold for ic. per lb. higher than our quotations.

SHEEF.—There were twice the number at market this week than there was last week, mostly of extra quality. There is not so much demand for the lower grades as there has been. The market was quick for good quality, and prices advanced ic. to ic. per lb.

BEET ROOT SUGAR .-- The manufacture of beet-root sugar in the countries of Germany which formed the Zollvereiu, has increased in a marked manner. In Zoliverein, has increased in a marked manner. In 1851-2, it was 1,261,872 cwts; in 1859.60, it was 2,915,196; in 1864-5, 3,413,214; and in 1865-66, 3,688,825. Owing to the employment of improved processes, and to a better cultivation of the root; the quantity of sugar obtained from the beet is gradually increasing. In 1863-6, 8.55. What the production of beet-root sugar in France is, has already been stated in your columns. Other countries are also progressing. Belgium, in 1863-6, 831,087; Sweden, in the former year, 217,517; in the second, 220,000; in the third, 300,000; Holland, 50,000, 50,000, and 70,000. On the other hand, the manufacture in Russia, which was 1,418 285 cwts in 1865-6, and in 1863-5, the in the three years, it was 1,169,057 cwts, 1,691,280 and 1,850,000. But accidental circumstances (such for example, as a bad crop of beet), may have produced the decline last year in Austria. On the whole, therefore, it is clear that the beet-root manufacture has not only assumed formidable proportions, but is fast increasing. These facts must excite grave consideration among the produced therein. Perhaps, also, they may give rise to the conviction that the time is approaching at which Great Britain will have to engage in the beet-root manufacture,—Paris Correspondent London Economist. 1851-2, it was 1,281,372 cwts; in 1859.60, it was

THE BAND SAW FOR IRON.-Among the many sam. ples of War Department ingenuity now ready for shipment in Woolwich Arsenal, for the Industrial Exhinamely, a device in iron cut by the circular or riband saw. The letters, although carved from a slab of solid iron one inch thick, are all correctly formed, and are of perfect uniformity throughout. The saw, it appears, is the invention of M. Ferrin, and was exposed at the Paris Exhibition of 1855, where it was purchased by Colonel Tulloh, then superintendent of the Royal Carriage Department at Woolwich. Until very recently it has been used solely for the purposes for which it was designed—cutting and carving difficult and irregular curves in wood, &c., of which some specimens in mahogany, lignum vitæ, and other hard woods, are preserved in the pattern-room of the department. The tedious and laborious hand process, by means of the punch and chisel, being the only method hitherto used in carving the angle plates necessary in the construction of the wrought-iron gun carriages, led to the attempt by Colonel Clerk to test the application of the circular saw for that purpose, and the result has proved highly successful. The device above-named consists of the words "Royal Carriage Department, 1867," which are surmounted with a crown and the letters "W. D." bition at Paris, is a work hitherto unattempted-
