

KAHN SYSTEM

United Steel Sash

UNITED STEEL SASH are made of specially rolled steel sections, which are combined by powerful presses into sash of maximum strength, and attractive appearance.

The muntins are deep and narrow, offering a minimum obstruction to the light. The joints are not weakened in any way by cutting or punching.

UNITED STEEL SASH are inexpensive and compare favorably in cost with unsatisfactory wooden sash, which are short-lived and inflammable. Ventilators of UNITED STEEL SASH extend the full width of each unit and are made absolutely weather proof around the openings by double circular contact joints. Special spring clips save labor in glazing and hold the glass firmly in place.

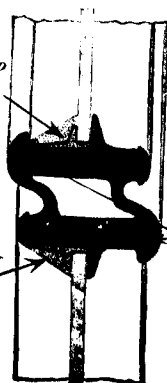

UNITED STEEL SASH are made in many standard types to meet all conditions of window opening. Size of glass, 10 to 14 inches in width and 16 to 24 inches in height.
