

Let us now examine the table of the Adolescentes, searching for these ultimate peculiarities of structure, not simply differences in the proportions of parts among themselves, which furnish the authority for constructing four genera where entomologists have usually found but one.

After observing the sameness in size of head and flatness of front, we meet at once differences which seem to consist in merely varied forms of phraseology. For what else can we make of these? "Front very slightly tumid beneath"; "below considerably tumid," "very slightly fullest below"; "a very little bulbous below." "Scarcely surpassing, barely surpassing, barely protruding beyond the front of the eyes." What may be the relative weight of the four discriminating words "scarcely, considerably, slightly" and "barely," which state how much the antennæ are longer than the abdomen? Does the ascending scale begin with 'barely' and end with 'considerably'? If so, how do we grade the slightly and scarcely? If these words do not express differences, why use them? If they do, is the difference more than a very small difference in the proportion of parts? What shall we say of these phrases which ring the changes upon the devoted fronts of the Equites? They are said to be "scarcely higher than broad," "fully as broad as high," "scarcely broader than high," "of about equal height and breadth," "fully as high as broad." In the Hamadryades we find yet other variations: "Scarcely as broad as," "somewhat narrower than," "not nearly as broad as," "about three-fourths as broad as." Whoever will take the trouble to develop one of these analytical tables will find abundant illustrations of this nature; we believe that Mr. Scudder himself would be surprised at the marvellous facility with which he has escaped saying the same thing twice in the same way.

The numbers of joints in the antennæ scale like a flight of steps. "About 32" must include as possible at least 31 and 33, unless we reckon like that Massachusetts pauper, who being asked how many were there in the poor house, answered "Between eight and nine of us!" Then we have this ladder:

Cyaniris,	33, 34, 35.
Lycaëides and Everes,	31, 32, 33.
Glaucoopsyche,	30, 31, 32.

The whole range has but four usual and six possible terms.

The palpi are "scarcely more than half as long again as the eye," "less than twice as long as the eye," or "nearly or quite twice as long as the
