

I have examined the Alaskan specimens in the Washington Museum, which were referred to *rectilinea* by Dyar. I should call them *indistincta*. Of the five specimens, only one is a male, and that lacks antennae. That is most unfortunate, as I have seen no other male which I could call *indistincta*, and the other three North American Hyppas, which include the No. 177 of my Calgary list, are separable from each other by male antennae. European *rectilinea* is nearest my No. 177 on both antennal and other characters.

605. ***Helotropha reniformis**** Grt.—Taken at High River by Mr. Thomas Baird, in 1912.

606. ***Momaphana comstocki*** Grt.—A fine male, taken, I think, on an electric light pole at Edmonton on May 13th, 1914, by Mr. Valentine Fernekes, to whose generosity I am indebted for the specimen. The type in the British Museum is a much worn male from New York, and there is also a good female there from Orillia, Ont. Hampson gives a wood-cut of the type, but the black markings there shown are too numerous and too intense. Making allowance for that, the Edmonton specimen agrees so well with the wood-cut, Hampson's description, and my notes, as to make me feel confident in the determination. Another type is said to be in the Cornell University at Ithaca, N. Y. The species appears to be very rare everywhere.

A species which has for many years passed under this name in B. C. collections, was described as *Feralia columbiana* by Smith in CAN. ENT., XXXV, p. 9, Jan., 1903, from two males, one from New Westminster, B. C., from Dr. Fletcher, and the other from "North West Territory," from Dr. Ottolengui. A figure of the type is in the British Museum, and is copied by Sir George Hampson. The green of my only two specimens of *columbiana*, which are males, is much darker than that of *comstocki*, and in this and most other characters of colour and pattern, Smith's species has, as he pointed out in the description, more resemblance to *jocosa* than to *comstocki*. The orbicular and reniform of *comstocki* are larger and the wings wider in proportion to their length. As to the generic characters, I do not feel quite sure that the proboscis of my *columbiana* is non-functional, as that of *jocosa*

*Not verified.
