

The DEERING HAY TEDDER

THE Deering hay tedder is a new machine and embodies all that is best in tedder construction. While lightness in weight and lightness of draft are chief characteristics, this tedder is unequalled as a stanch and efficient machine. The outside bar of the main frame is in one piece of square steel tubing, bent at the corners, and at its ends supports the crank shaft. The one-piece frame is a new feature in tedder construction, and gives great rigidity to the machine which the rapidly revolving forks necessarily subject to severe strain.
