THE

DETERMINES

SEED

OF THE

CHARACTER

THE

threshes 2,860 bushels of wheat, the average per acre being about 26 bushels, and 1,600 bushels of oats. After the threshing, and before it freezes up, he cultivates as much of the breaking stubble as possible and then starts hauling out his wheat, receiving an average price of 85c per bushel. Dur-ing the fall he has also buik a henhouse 12 x 20, using 6 foot studding, shiplap, paper, and siding on the outside and half-inch lumber on the inside, which makes the building comfortably warm and dry. Hauling out the wheat, drawing firewood, looking after the stock, and cleaning the seed grain keeps both men fairly busy during the winter. The following is his standing on April 1st, 1913:

foal this year he can push the spring work, and after sowing 100 acres to wheat, 45 to oats, and 5 to corn for fodder, he buys a gang-plow and summer fallows the 75 acres on the east side of the south farm. He continues to do this, i.e., summer-fallowing 75 acres a year, so that he has 150 acres in crop each year, half of it being summer-fallow, and the other half summer-fallow stubble. In later years he breaks up the natural grass land, and sows brome for permanent pasture, while on the cultivated land he practices a crop rotation, using timothy, which is excellent horsefeed as a grass crop, cutting it for hay one year, and raising it as pasture the second year. In this
