These are a few of the native resources of the forest. True they are not to be obtained without toil, neither is the costly product of the silkworm, the gems of the mine, or even the coarsest woollen garment made without labour and care.

A FEW HINTS ON GARDENING.

Owing to the frosts and chilling winds that prevail during the month of April, and often into the early part of May, very little work is done in the garden excepting it be in the matter of planting out trees and bushes; grafting and pruning, and preparing the ground by rough digging or bringing in manure. The second week in May is generally the time for putting in all kinds of garden seeds: any time from the first week in May to the last, sowing may be carried on. Kidney beans are seldom quite secure from frost before the 25th. I have seen both beans, melons, and cucumbers cut off in one night, when they were in six or eight leaves. If the season be warm and showery early sowing may succeed, but unless guarded by glass, or oiled-paper frames, the tender vegetables should hardly be put in the open ground before the 18th or 20th May: corn is never safe before that time. The coldness of the ground and the sharpness of the air. in some seasons, check vegetation, so that the late sowers often succeed better than they who put the seeds in early. Having given some directions in various places about planting corn, potatoes, melons, and some other vegetables, I shall now add a few memoranda that may be useful to the emigrant-gardener. If you wish to have strong and early cabbage-plants, sow in any old boxes or even old sugar-troughs, putting some manure at the bottom, and six or eight inches of good black leaf-mould on the top, and set in a sunny aspect. The plants thus sown will not be touched by the fly. If sown later in May, set your trough on some raised place, and water them from time to time. Or you may sow on the open ground, and sprinkle wood-ashes or soot over the ground : this will protect the plants. The fly also eats off seedling tomatoes, and the same sprinkling will be necessary to preserve them.

In sowing peas, single rows are better in this country than double, ones, as unless there be a good current of air among the plants they are apt to be mildewed.

Lettuces sow themselves in the fall, and you may plant them out early in a bed, when they will have the start of those sown in the middle of May.

Those who have a root-house or cellar usually store their cabbages in the following way: they tie several together by the stem near the root, and then hang them across a line or pole head downwards: others pit them head downwards in a pit in the earth, and cover them
