Drug Reports.

Canadian Market Report.

The year just closed has apparently been a profitable one in all lines of business. Reports from retail druggists indicate it has been an improvement on previous years and the result of 1899 promises to be even better. The prices ruling during 1898 have been fairly steady with little outside the usual fluctuations that marked previous years. The variations that have occurred have all been in favor of the buyer. No important failures have occurred during the year and obligations have been met with more than usual promptness, which indicates a healthy condition from the financial standpoint.

We would suggest to retail druggists the folly of trying to get the large profits that have existed in years gone by, particularly on articles the sale of which is likely to be absorbed in other lines of business, and the successful druggists in the years to come will be those that increase their turn over on smaller profits and bring their business down to a cash basis. No one can afford to sell goods at cut rate

and give credit, it will only end in disaster. During the last month changes in values have been unimportant and it is a little early to forecast changes that may possibly occur as spring trade opens up. Quinine and opium are unchanged at the late advance. Camphor will likely rule higher this spring. Turpentine is very high, it was sold in the city at seventy cents gallon in barrel lots. High prices will likely rule for some time.

English Market Report.

LONDON, DEC. 26th, 1898.

During the month Camphor has advanced and leading chemicals are very firm. Copper sulphate is dearer and Borax and Boric acid slightly advanced. Cinchona bark is also on the up-grade, but has not yet reacted upon Quinine.

The mild weather has had a depressing effect on Cod Liver Oil, Ipecac, Glycerine, and other winter staples. Belladonna root is still dear, but Gentian is easier. Cocaine is talked higher, but manufacturers are uncertain about the future as regards Eucaine, Orthoform, etc. Permanganate of potassium is very low. Sulphonal is firm at recent advance. Arsenic is easier.
