figures. They are worn separately, or over their common cloathing. The most usual head-dress, on these occasions, is a quantity of withe, wrapped about the head, with large feathers, particularly those of eagles stuck in it, or entirely cover'd with small white feathers. At the same time the face is variously painted, the upper and lower parts being of opposite colours, and the strokes having the appearance of large gashes; or it is besmeared with a kind of fat or tallow, mixed with paint, formed into a great variety of figures, somewhat like carved work. The hair, sometimes, is separated into small parcels, and tied, at intervals, with thread: others tie it behind, after the English fashion. Thus equipped, they have a truly savage and ridiculous appearance, which is much heightened when they assume their monstrous decorations. These consist of a great variety of wooden masks, applied to the face, forehead, or upper part of the head. Some of the visors resemble human faces, having hair, beards, and eyebrows; others represent the heads of birds, and various animals, such as deer, porpoises, wolves, &c. Such kind of representations exceed generally the natural size, and they are frequently strewed with pieces of the mica, which makes them glitter, and augments their deformity. In these imaginary decorations, they sometimes run into greater excess, and fix large pieces of carved work upon the head, projecting to a considerable distance, and resembling the prow of a canoe. Whether these extravagant masquerade ornaments are used on any religious occasion, or in any kind of diversion, or whether they are intended to intimidate by their monstrous appearance, or as decoys when hunting animals, is uncertain. One of the dresses seems peculiarly adapted to war: It is a thick tanned leathern mantle, double, and appears to be the skin of an elk, or buffalo. This is fastened on in the ordinary manner, and is so contrived as to cover the breast quite up to the throat; part of it, at the same time, falling down to their heels. This garment is curiously painted, and is strong enough, as we understood from them, to resist even spears; so that it may be considered as their completest defensive armour. Though we cannot view these people without a kind of horror, when they are thus strangely apparelled, yet when divested of these extravagant dresses, and beheld in their common habit, they seem to be of a quiet, phlegmatic disposition, though deficient in vivacity, to render themselves agreeable in society. They are rather reserved than loquacious; but their gravity seems constitutional, and not the result of any particular mode of education: for the orations made by them on public occasions, are little more than short sentences, or only single words, forcibly repeated in one tone of voice, accompanied with a single gesture at every sentence. From their offering human skulls and bones to sale, there is not the least reason to doubt of their treating their enemies with a savage cruelty; but, as this circumstance rather marks a general agreement of character among almost every uncivilized tribe, in every age and country, they are not to be reproached with any charge of peculiar inhumanity. We had not any reason to judge unfavourably of their disposition in this respect: they appear to be docile, courteous, and good-natured; but, notwithstanding their phlegmatic temper, they are quick in resenting injuries; yet, like all passionate people, they forget them quickly. It must be admitted, that they are not wholly unsusceptible of the tender passions, which is evident from their being fond of music, and that too of the pathetic kind.

Their songs are generally slow and solemn. Sonnets were sung by single performers, keeping time by striking the hand against the thigh. A rattle, and a small whistle, are the only instruments of music which we saw among them. The rattle is used when they sing; but upon what occasions the whistle is employed, we know not, unless it be when they assume the figures of particular animals, and endeavour to imitate their howl or cry. We once saw one of these people dressed in the skin of a wolf, with the head covering his own, striving to imitate that animal, by making a squeaking noise with a whistle he had in his mouth. The rattles are ge-

nerally in the shape of a bird, with small pebbles in the belly, and the tail is the handle. We observed another sort, which resembles a child's rattle.

In trafficking with us, some of them displayed a disposition to knavery; taking away our goods without making any return. But the instances of this were rare, and we had abundant reason to approve the integrity of their conduct. However, their eagerness to possess iron, brass, or any kind of metal, was so great, that when an opportunity presented itself, few of them could resist the temptation to steal it. The inhabitants of the South-sea islands in their petty larcenies were actuated by a childish disposition, rather than a thiefish one. The novelty of the object excited their curiosity, and was a sufficient inducement for them to get possession of it by any means: but the natives of Nootka, who made free with our property, are entitled to no such apology. The appellation of thieves is certainly applicable to them; for they well knew that what they pilfered from us would be subservient to the private purposes of utility; and it was fortunate for us, that metals were the only articles upon which they set any value; but thefts are very common among themselves, producing continually quarrels, of which we saw several instances.

The two villages we visited are probably the only inhabited parts of the sound. The number of inhabitants may be computed from the canoes that visited our ships the second day after our arrival. They consisted of about a hundred, which upon an average, contained, at least, five persons each; but as there were very few women, children, or young men among them, we may reasonably suppose, that the number of souls in the two villages, could not be less than four times the number of our visitors, being in the whole two thousand. The village, situated at the entrance of the sound, stands on the side of a pretty steep ascent, extending from the beach to the wood. There are holes, or windows, in the sides of the houses to look out at, having bits of mats hung before them, to prevent the rain getting in. Their houses, in the inside, may, with propriety, be compared to a long English stable with a double range of stalls, and a board passage in the middle; for the different families are separated on by a piece of plank. Close to the sides, in each of the parts, is a bench of boards, raised five or six feet higher than the rest of the floor, and covered with mats, whereon the family sit and sleep. These benches are commonly seven or eight feet long, and four or five broad. In the middle of the floor, between them, is the fire-place, which has neither hearth nor chimney. This part appeared common to them all. The nativeness and stench of their houses are at least equal to the confusion within; for, as they dry their fish within doors, they allegot them there, which, with their bones and fragments, thrown down at meals, and the addition of other sorts of filth, lie every where in heaps, and are, it should seem, never carried away, till they become troublesome, from their size, to walk over them. In a word, their houses are as filthy as hog-sties; every thing in and about them stinking of fish, train oil and smoke. Their furniture consists chiefly of chests and boxes of various sizes, piled upon each other, at the sides or ends of each house, wherein they deposit all their valuables, such as skins, garments, masks, &c. Many of these boxes are painted black, and studded with the teeth of animals, or rudely decorated with figures of birds carved. To complete the scene of confusion, in different parts of their habitations are hung up implements of fishing, and other articles. Among these we may reckon their images, which are nothing more than the trunks of large trees, of the height of about four feet, placed at the upper end of the apartment, with a human face carved on the front, and the hands and arms upon the sides. These figures are variously painted, and make, upon the whole, a ridiculous appearance. They are called generally Klumma. A sort of curtain, made of mat, usually hung before the images, which the natives were sometimes unwilling to remove; and when they did consent to unveil them, they seemed to express themselves in a very mysterious manner; and yet

yet they were held in no very extraordinary degree of
estimation, seeing, with a small quantity of brass or
iron, all the idols in the place might have been pur-
chased. Mr. Webber, when drawing a view of the
inside of a house, wherein those figures were placed,
interrupted in his work by one of the inhabitants.
Mr. Webber, thinking a bribe would have a proper
effect, presented to him a metal-button from his coat,
which immediately operated as was intended: soon
after he was again interrupted by the same man, who
held a mat before the figures: our gentleman therefore
gave him another button, and was again suffered to
proceed. The man then renewed his former tricks, till
Mr. Webber had parted with every single button;
after which he received not any farther molestation.

As to the domestic life of these people, the men seem
to be chiefly employed in fishing and killing animals,
for the sustenance of their families, few of them being
engaged in any household business; but the women were
employed in manufacturing their garments; and in cur-
ing sardines, which they also carry from the canoes to
their houses. They also go in small canoes, to gather
mussels, and other shell-fish. In the labour of the pad-
dle they are as dextrous as the men, who shew them
very little respect or attention on this, or any other oc-
casion. But the young men are remarkably indolent,
sitting generally about in scattered companies, basking
in the sun, or wallowing in the sand upon the beach,
like so many hogs, without any kind of covering.
This disregard of decency was, however, confined solely
to the males; for the females were always clothed, and
behaved with great propriety, meriting justly commen-
dation for a modest bashfulness, so becoming that sex.
In the women of this place, it is the more meritorious,
as the men have not the least sense of shame. Both
sexes pass much of their time in their canoes, especi-
ally in the summer; in which they eat, sleep, and fre-
quently lie to bask themselves in the sun; for these pur-
poses they are sufficiently spacious, and are, in rainy
weather, more comfortable habitations than their filthy
houses.

Though their food, strictly speaking, may be said to
consist of every thing animal or vegetable that they can
procure, yet the quantity of the latter bears an exceed-
ing small proportion to that of the former. Their
greatest reliance for food is upon the sea, as affording
fish, mussels, smaller shell-fish, and sea-animals. Among
the first are herrings, sardines, two species of bream,
and some small cod. The herrings and sardines not
only serve to be eaten fresh in their season, but to be
dried and smoked as stores. The roes of these also,
strewed upon the branches of the Canadian pine, or
prepared upon a long sea grass, afford them another
grand resource for food. They also eat the roe of some
other large fish, that has a very rancid smell and taste.
The large mussels are found in great abundance in the
sound. After having roasted them in their shells, they
are stuck upon long wooden skewers, and taken off as
they are wanted to be eaten. They require no other
preparation, though they are sometimes dipped in oil,
as sauce. The porpoise is a food more common among
them, than that of any other animal in their sea; the
flesh and rind of which they cut into large pieces, dry
them as they do herrings, and eat them without farther
preparation. They also make a sort of broth from the
porpoise, when fresh, in a very singular manner. They
put some pieces of it into a wooden vessel, containing
a sufficient quantity of water, into which they throw
heated stones. This operation is repeated till the con-
tents are supposed to be stewed enough. This is a
common dish among them, and seems to be a strong
nourishing food. They likewise feed probably upon
whales, seals, and sea-otters, the skins of the two latter
being common among them, and they are furnished
with implements of all sorts for their destruction,
though perhaps they may not be able, at all seasons, to
catch them in great plenty. However, from these, and
other sea-animals, they procure oil in great abundance,
which they use, mixed with other food, as sauce; and
often sip it alone with a kind of horn-scoop. Their
No. 66,

fresh skins, at this time, were very scarce; as were the
land animals; for we saw no flesh belonging to the latter;
and, though their skins were to be had in plenty, they
might, perhaps, have been procured from other tribes.
From these and other circumstances, it plainly ap-
peared to us, that these people are furnished with the
principal part of their animal food by the sea; if we
except a few gulls, and some other birds, which they
shoot with their arrows. Their only winter vegetables
seem to be the Canadian pine-branches, and sea-grafs;
but, as the spring advances, they use others as they come
in season. The most common of these were two sorts
of roots, of a mild sweetish taste, which are eaten raw;
as is also a small, sweetish root, about the thickness of
sarsaparilla. As the season advances, they have doubt-
less many others which we did not see: for, though
there is not the least appearance of cultivation among
them, there are plenty of elder, gooseberry, and cur-
rant bushes. One of the conditions, however, which
they seem to require in all their food, is, that it should
be of the less acrid kind: for they would not touch the
leek or garlic, though they sold us great quantities of
it, when they understood it was what we liked. They
seemed not to relish any of our food, and rejected our
spirituous liquors as disgusting and unnatural. It is
their ordinary practice to roast or broil their food; for
they are absolute strangers to our method of boiling, as
appears from their manner of preparing porpoise broth;
besides, as they have only wooden vessels, it is impos-
sible for them to perform such an operation. Their man-
ner of eating corresponds with the narrowness of their
houses and persons; for the platters and troughs, out of
which they eat their victuals, seem never to have been
washed since their original formation; the dirty remains
of a former meal, being only swept away by a succeed-
ing one. Every thing solid and tough, they tear to
pieces with their hands and teeth; for though their
knives are employed in cutting off the larger portions,
they have not yet endeavoured to reduce these to mouth-
fuls by the same means, though more cleanly and con-
venient. But they do not possess even an idea of clean-
liness, and eat constantly the roots which are dug out
of the ground, without attempting to shake off the soil
that adheres to them. Whether they have any set time
for their meals we never could find out, having seen them
eat at all hours in their canoes. But having observed
several messes of porpoise broth preparing about noon,
when we went to the village, they may probably make
a principal meal about that time.

These people have bows, and arrows, spears, slings,
short truncheons made of bone, and a small pick-axe,
somewhat resembling the common American toma-
hawk. Some of the arrows are pointed with iron,
and others with indented bone: the spear has usually a
long point made of bone. The tomahawk is a stone of
the length of seven or eight inches, one end terminat-
ing in a point, and the other fixed in a wooden handle.
This is intended to resemble the head and neck of a hu-
man figure; the stone being fixed in the mouth so as to
represent a tongue of a great magnitude. To heighten
the resemblance, human hair is also fixed to it. This
weapon is called taaweeth; and they have another made
of stone, which they call seaik, about ten or twelve
inches long, having a square point. From the number of
their weapons it may be reasonably concluded, that they
engage frequently in close combat; and we had very
disagreeable proofs of their wars being both frequent
and bloody, from the quantity of human skulls that
were offered to us for sale.

With respect to the design and execution of their
manufactures, and mechanic arts, they are more exten-
sive and ingenious than could possibly be expected from
the natural disposition of the people, and the little
progress they have made in civilization. The flaxen and
woollen garments engage their first care, as being the
most material of those that may be classed under the
head of manufactures. The former are fabricated
from the bark of the pine-tree, beat into a mass resem-
bling hemp. After having been prepared in a proper
manner, it is spread upon a stick, fastened to two
others

others in an erect position. The manufacturer, who sits on her hams at this simple machine, knots it across, at the distance of about half an inch from each other, with small plaited threads. Though it cannot, by this method, be rendered so close and firm as cloth that is woven, it is sufficiently impervious to the air, and is likewise softer and more pliable. Their woollen garments have much the appearance of woven cloth; but the supposition of their being wrought in a loom is destroyed, by the various figures that are ingeniously inserted in them; it being very improbable that these people should be able to produce such a complex work, except immediately by their hands. They are of different qualities: some resembling our coarsest sort of blankets; and others not much inferior to our finest sort, and certainly both softer and warmer. The wool of which they are manufactured, seems to be procured from different animals, particularly the fox and brown lynx. That from the lynx is the finest, and nearly resembles our coarsest wools in colour; but the hair, which also grows upon the animal, being intermixed with it, causes the appearance to be somewhat different when wrought. The ornamental figures in these garments are disposed with great taste, and are generally of a different colour, being usually dyed either of a deep brown, or a yellow; the latter of which, when new, equals in brightness, the most vivid in our best carpets.

Their taste for carving on all their wooden articles, corresponds with that of working figures upon their garments. Nothing is to be seen without a kind of freeze-work, or a representation of some animal upon it; but the most common one is that of the human face. The general design of these figures conveys a sufficient knowledge of the objects they are intended to represent; and in the execution of many of the masks and heads, they prove themselves to be ingenious sculptors. They preserve, with the greatest exactness, the general character of their own faces, and finish the more minute parts with great accuracy and neatness. That these people have a fondness for works of this sort is observable in a variety of particulars. Representations of human figures, birds, beasts, fish, and models of household utensils, were found among them in a very great abundance. To their skill in the imitative arts, we may add their drawing them in colours. The whole process of their whale-fishing has been represented, in this manner, on the caps they wear. The execution was indeed rude, but hereby we were convinced, that, though they have not the knowledge of letters among them, they have a notion of representing actions in a lasting way, exclusive of recording them in their songs and traditions.

The structure of their canoes is simple, yet they are well calculated for every useful purpose. The largest sort, which in each one will contain upwards of twenty people, are formed of a single tree. The length of many of them is 40 feet, the breadth 7, and the depth 3. They become gradually narrower from the middle towards the end, the stern ending, perpendicularly, with a knob at the top. The fore-part stretches forwards, and upwards, and ends in a point, or prow, much higher than the sides of the canoe, which are nearly straight. The greatest part of them are without any ornament; but some have a little carving, and are studded with seals teeth on the surface. They have neither seats, nor any other supporters, on the inside, except some small round sticks, about the size of a walking cane, placed across, about half the depth of a canoe. They are very light, and, on account of their breadth and flatness, swim firmly, without an out-rigger, of which they are all destitute. Their paddles, which are small and light, resemble a small leaf in shape, being pointed at the bottom, broad in the middle, and gradually becoming narrower in the shaft; the whole length being above five feet. By constant practice, they have acquired great dexterity in the management of these paddles; but they never make use of any sails.

In their employment of fishing and hunting, their instruments are ingeniously contrived, and completely made. They consist of nets, hooks, lines, harpoons,

gigs, and an instrument resembling an ear. The last is about 20 feet in length, four or five inches in breadth, and of the thickness of half an inch. The edges for about two thirds of its length, are set with sharp bone-teeth; the other third serving for a handle. With this instrument they strike herrings, sardines, and other fish as come in shoals, which are taken either upon or in the teeth. Their hooks, made of bone and wood, display no great ingenuity; but the harpoon, used in striking whales, and other sea animals, manifests evident contrivance. It consists of a piece of bone, formed into barbs, in which the oval blade of a large muscle shell, and the point of the instrument are fixed. Two or three fathoms of rope is fastened; to one end of which the harpoon is fixed so as to leave the shaft floating, as a buoy upon the water, when the animal is struck.

As to their manner of catching land animals, or killing them, we are strangers; but, it is probable that they shoot the smaller sorts with their arrows, and encounter bears, wolves, and foxes, with their spears. Sometimes they decoy them, by covering themselves with their skins, and running upon all fours, at which sport they are remarkable nimble. For the same purposes the masks, or carved heads, as well as the dried heads of different animals, are used.

Every particular of the rope kind, which they use in making their various articles, is formed either from thongs of skins, and sinews of animals, or from the flaxen substance, of which they manufacture their mantles. The sinews were sometimes so remarkably long, that it was hardly possible they could have belonged to any other animal than the whale. The assistance they receive from iron tools contributes to their dexterity in wooden performances. Their implements are almost wholly made of iron. One chisel indeed we saw made of bone. This consists of a flat long piece, fastened into a wooden handle. A stone is their mallet, and a bit of fish-skin their polisher. Some of these chisels were nine or ten inches in length, and three or four in breadth; but they were, in general, considerably smaller. The chisel and the knife are the principal forms that iron assumes among them. Some of these knives are very large, having crooked blades; the edge being on the back, or convex part. They are sharpened upon a coarse slate whetstone, and kept continually bright. What we saw among them, were about the breadth and thickness of an iron hoop; and their singular form plainly proves, that they are not of European make. Iron is called by the natives seekemaile, a name which they also give to tin, and other white metals. It being so common among these people, we were anxious to discover how it could be conveyed to them. On our arrival in the sound, we perceived that they had a knowledge of traffic, and an inclination to pursue it; and we were afterwards convinced, that they had not acquired this knowledge from a cursory interview with strangers; but with whom they carried on this traffic we could not learn; for though we saw several articles of European manufacture, such as brags and iron, yet it does not follow, that they were received from European nations. We could not obtain the least information of their having seen ships, like ours, before, nor of their having been engaged in commerce with such civilized people. Many circumstances corroborate to prove this beyond doubt. On our arrival, they were earnest in their enquiries, whether we meant to settle among them, and whether we were friendly visitors, informing us, at the same time, that they gave us wood and water from motives of friendship. This proves sufficiently, that they considered themselves as proprietors of the place, and dreaded no superiority: for it would have been an unnatural enquiry, if any ships had been here before, and had supplied themselves with wood and water, and then departed; for they might then reasonably expect that we should do the same. It must be admitted, indeed, that they exhibited no marks of surprise at beholding our ships; but this may, with great propriety, be attributed to their natural indolence of temper, and their wanting a thirst of curiosity. They were

ing an ear. The last is five inches in breadth, inch. The edges for are set with sharp bone or a handle. With this sardines, and other fish taken either upon or in of bone and wood, diffe harpoon, used in strikals, manifests evident piece of bone, formed blade of a large muscle ment are fixed. This proves sufficiently, lves as proprietors of the riority: for it would have if any ships had been here themselves with wood and for they might then reason to the same. It must be adhibited no marks of fur; but this may, with great their natural indolence of a thirst of curiosity. They were

were never startled at the report of a musquet, till they, one day, shewed us that their hide dresses were impene- trable to their spears and arrows, when one of our peo- ple shot a musquet ball through one of them that had been six times folded. Their astonishment at this plainly indicated their ignorance of the effect of fire arms. This was afterwards very frequently confirmed, when we used to shoot birds, at which they appeared greatly confounded. Our explanation of the piece, to- gether with the nature of its operation, with the aid of shot and ball, struck them so forcibly, as to convince us of their having no previous ideas on this matter. Though some account of a voyage to this coast, by the Spaniards, in 1774, or 1775, had arrived in England before we sailed, the circumstances just mentioned, prove, that these ships had never been at Nootka. It is also evident, that iron could not have been in so many hands, nor would the use of it have been so well known, if they had so lately obtained the first knowledge of it. From their general use of this metal, it probably comes from some constant source, in the way of traffic, and they have perhaps been long supplied with it; for they use their tools with as much dexterity as the longest practice can acquire. The most natural conjecture, therefore, is, that they trade for their iron with other Indian tribes, who may have some communication with European settlements upon that continent, or receive it through several intermediate nations. By the same means they probably obtain their brads and copper. Not only the rude materials, but some manufactured articles seem to have found their way hither. The brads ornaments for noses are made in so masterly a manner, that the Indians cannot be supposed capable of fabricating them. We are certain, that the materials are European, as all the American tribes are ignorant of the method of making brads; but copper has been frequently met with, and, from its ductility, might be easily fashioned into any shape, and polished. If such articles are not used by our traders to Hudson's Bay and Canada, in their traffic with the natives, they must have been introduced at Nootka from Mexico; whence, it is probable, the two silver table spoons were originally derived.

With respect to the religious and political institutions established among these people, we cannot be supposed to have acquired much knowledge. However, we discovered, that there were such men as chiefs, distinguished by the title of Acweek, to whom the others are, in some degree, subordinate. But the authority of each of these great men seems to extend no farther than to his own family, who acknowledge him as their head. Nothing that we saw could give us an insight into their notions of religion, except the figures already mentioned, called klumma. These, perhaps, were idols; but as the word acweek was frequently mentioned when they spoke of them, we suppose they may be the images of some of their ancestors, whose memories they venerate. This however is all conjecture; for we could receive no in- formation concerning them, as we knew little more of their language than to enable us to ask the names of things, and being incapable of holding any conversation with the natives relative to their traditions, or their religious institutions. The word wakash was frequently in their mouths. It seemed to express approbation, ap- plause and friendship. Whenever they appeared to be pleased or satisfied, they would call out wakash wakash! It is worthy of remark, that as these people differ from the natives of the islands in the Pacific Ocean, in their persons, customs, and language, we cannot suppose their respective progenitors to have belonged to the same tribe, when they emigrated into those places where we now find their descendants.

Their language is, by no means, harsh or disagree- able, farther than their pronouncing the k and h with a stronger aspiration, or more force than we do. They have one sound, which is very frequent, and not used by us. It is formed in a particular manner by clashing the tongue partly against the roof of the mouth. It is difficult to represent this sound by any composition of our letters, unless from *tszhl*; which is generally used as a termination. The next is composed of *tl*; and

many words end with *z* and *fs*. A specimen or two of each of these is here put down.

With respect to the composition of their language we can say very little, having been scarcely able to distinguish the several parts of speech. We can only infer from their manner of speaking, which is very slow and distinct, that it has very few prepositions or con- junctions; and, as far as we could discover, is destitute of even a single interjection, to express admiration or surprize. From having few conjunctions, it may be conceived, that each single word, with them, will com- prehend a great number of single ideas; which seems to be the case; but, for the same reason, the language will be defective in other respects, not having words to distinguish or express differences which really exist; and hence not sufficiently copious. This was observed to be the case, in many instances, particularly with re- spect to the names of animals. The relation or affinity it may bear to other languages, either on this, or the Asiatic continent, we have not been able sufficiently to trace, for want of proper specimens: to compare it with, except those of the Esquimaux, and Indians about Hudson's Bay; to neither of which it has the least re- semblance. On the other hand, from the few Mexican words we have been able to procure, there is the most obvious agreement in the terminations of words.

In Nootka Sound it is high water, in the days of the new and full moon, at twenty minutes after twelve: the perpendicular rise and fall being eight feet, nine inches; which is to be understood of the day tides, and those which happen two or three days after the full and new moon. The night tides, at this time, rise near two feet higher. Some circumstances that occurred daily, relating to this, deserve particular notice. In the cove where we got wood and water, was a great deal of drift- wood cast ashore, a part of which we had to remove, to come at the water. Now it frequently happened, that large pieces of trees, that we had removed in day, out of the reach of the then high water, were found by us floated again in our way the next morning; and all our spouts for conveying water, thrown out of their places, which were immoveable during the day-tides. We found likewise wood, which we had split up for fuel, and had placed beyond the reach of the day-tide, floated away during the night. Some of these circum- stances occurred every night and morning, for three or four days in the height of the spring tides. To render our account of the transactions in Nootka Sound com- plete we must add, that by a variety of astronomical and nautical observations, we found its latitude to be 49 deg. 36 min. 6 sec. North, and its longitude 233 deg. 17 min. 14 sec. East.

It has been already related, that we put to sea on the 26th of April, in the evening, with manifest indica- tions of an approaching storm; and by these signs we were not deceived, for we had scarce sailed out of the Sound, when the wind shifted from N. E. to S. E. by E. and blew a strong gale, with squalls and rain, the sky being, at the same time, uncommonly black. Ap- prehensive of the wind's veering more to the South, which would expose us to the danger of a lee-shore, we got

got the tacks on board, and made all the sail we could to the S. W. It fortunately happened, that the wind veered no farther towards the S. and S. E. so that early the next morning we were entirely clear of the coast. The Discovery being at some distance astern, we brought to till she came up, and then both vessels steered a north-westerly course. Between one and two o'clock P. M. there was a perfect hurricane, inasmuch that our commodore thought it exceeding dangerous to run any longer before it; we therefore, agreeable to his order, brought the ships to, with their heads to the south. In this situation our ship, the Resolution, sprung a leak in her starboard quarter, which at first alarmed us greatly; but after the water was baled out, which kept us employed till midnight, we kept it under by means of the pump. In the evening, the wind having shifted to the fourthward, its fury in some measure abated; upon which we stretched to the west; but about eleven, the gale again increased, and continued till five the next morning, when the storm seemed to have spent its force, and became moderate. The weather now

clearing up, we were able to see several leagues around us, and steered more to the north. At noon we steered N. W. by N. with a fresh gale and fair weather. But, towards the evening, the wind again blew hard, with squalls and rain. With this weather we continued the same course till the 30th, when we steered N. by W. intending to make the land. Captain Cook regretted that we could not do it sooner, as we were now passing the spot where the pretended strait of Admiral de Fonte has been placed by geographers. Though the captain gave no credit to such vague and improbable stories, he was desirous of keeping the coast of America aboard, that this point might be cleared up beyond dispute: but, at the same time he considered, that it would have been very imprudent to have engaged with the land while the weather was so tempestuous, or to have lost the advantage of a fair wind, by waiting for less stormy weather. This day, at noon, by observation, we found our latitude to be 53 deg. 22 min. north, and our longitude 225 deg. 14 min. east.

ON Friday the 1st of May, not seeing land, we steered to the N. E. having a fresh breeze at S. S. E. attended with squalls, showers of hail and rain. About seven o'clock, P. M. we descried land, distant twelve leagues. At four o'clock the next morning the coast was seen from S. E. to N. by W. the nearest part distant five leagues. At the same time, the northern point of an inlet, or at least what appeared to be one, bore E. by S. from whence to the northward along the coast, there seemed to be many bays and harbours. At six, approaching nearer to the land, we pursued the direction of it, steering N. W. by N. and between eleven and twelve we passed a cluster of small isles, situated near the continent, to the northward of the southern point of an extensive bay. An arm of this bay seemed to reach towards the north, behind a round lofty mountain, that stands between it and the sea. To this eminence Captain Cook gave the name of Mount Edgumbe; and the point of land projecting from it, was called Cape Edgumbe. The Cape lies in latitude 57 deg. 3 min. N. and in long. 224 deg. E. The land, except what is contiguous to the sea, is of considerable height, abounding with hills. Mount Edgumbe, which far out-tops all the rest, was entirely covered with snow, as were also the other elevated hills; but the lower ones, and the spots rising near the sea, were covered with wood. Pursuing our course to the northward, we found the coast to trend to the N. and N. E. for six or seven leagues, and there formed a spacious bay. Some island being in the entrance of it, we gave it the name of the Bay of Islands.

On Sunday the third, at half an hour past four, P. M. Mount Edgumbe bore south 54 deg. E. a large inlet, N. 50 deg. E. and the most advanced point of land towards the N. W. lying under a very lofty mountain, which was called Mount Fair-Weather, bore N. 32 deg. west. The inlet was named Cross Sound, it being first observed on the day so marked in our calendar. An eastern promontory forms the south-eastern point of this Sound; this we distinguished by the name of Cross-Cape. Under the above-mentioned peaked mountain is a point, which was named Cape Fair-Weather. At noon, this cape was distant thirteen leagues. Having

for several days light breezes, we steered S. W. and W. S. W. till the morning of the fourth, when we tacked, and stood towards the shore. At noon Mount Fair-Weather bore north, 63 deg. E. This mountain is the highest of a chain or ridge of mountains, that rise at the north-western entrance of Cross Sound, and extend towards the N. W. parallel with the coast. They are covered with snow, from the highest summit down to the sea coast, except in a few places, where we could discern trees that seemed to rise, as it were from the sea. About five o'clock, P. M. the top of a high mountain appeared above the horizon, bearing N. 26 deg. W. forty leagues distant. This we supposed to be the mount Elias of Commodore Beering. In the course of the day we observed a brownish duck, with a dark indigo head and neck; likewise several whales, porpoises, seals, &c. Having light winds, with occasional calms, we made but little way. On Wednesday the 6th, the nearest land being distant eight leagues, we perceived, in a north-easterly direction, the appearance of a bay, and an island, by its southern point, covered with wood. This is probably the place where Beering anchored: Captain Cook, therefore, in honour of the first discoverer, named it Beering's bay; southward of which the ridge of mountains is interrupted by a plain of several leagues in extent, beyond which the sight was unbounded. On the seventh, at noon, we were five leagues from the shore; from which station we observed a bay under the high land, with low woodland on each side of it. We now perceived, that the coast trended considerably to the west. On the ninth, at noon, Mount Elias bore N. 30 deg. E. distant 19 leagues. This stands twelve leagues inland, lat. 60 deg. 27 min. N. long. 219 deg. E.

Sunday the 10th, we observed in lat. 59 deg. 51 min. and in long. 215 deg. 56 min. being only three leagues distant from the coast of the continent, which extended from E. half N. to N. W. half W. as far as the eye could reach. To the westward of the latter direction we saw an island, distant six leagues. A point, which the Commodore named Cape Suckling, projects towards the north-eastern end of the island: Within this cape stands a hill of considerable height, divided

from the second range of mountains by low land; so that the cape, at a distance, has the appearance of an island. A bay is seated on the north side of Cape Suckling, seemingly extensive, and sheltered from most winds. Before night, we had approached near enough the cape to see some low land projecting from it to the N. W. we also observed some small islands in the bay, and several elevated rocks between the cape and the north-eastern extremity of the island. Early the next morning the wind shifted from N. E. to N. which being against us, the Commodore relinquished his design of going into the bay, and bore up for the west end of the island. Having a calm about ten o'clock, we embarked in a boat, and landed on the island, with a view of seeing what lay on the other side; but finding the hills to be at a greater distance than was expected, we laid aside that intention. On a small eminence near the shore, the captain left, at the foot of a tree, a bottle containing a paper, on which the names of our ships, and the date of our discovery were described: he inclosed also two silver twopenny pieces of English coin, which, with many others, had been furnished him by Dr. Kaye, now dean of Lincoln; and in testimony of his esteem for that gentleman, Captain Cook called the island Kaye's Island. It does not exceed 36 miles in length, and its breadth is not above four miles in any part. The S. W. point is a naked rock, elevated considerably. Its lat. is 59 deg. 49 min. north, long. 216 deg. 58 min. east. Towards the sea, the island terminates in bare sloping cliffs, with a beach consisting of large pebbles, intermixed in some places with a clayey sand. Some parts of the shore are interrupted by small valleys and gullies, in each of which a rivulet or torrent rushes down with a considerable degree of impetuosity; lasting perhaps no longer than the whole of the snow is dissolved. The valleys are filled with pine-trees; and these, indeed, abound in other parts of the island, which is covered as it were with a broad garb of wood. The trees, however, are far from being of an extraordinary growth: on which account, they would be of no great service for shipping, except as materials for making top-gallant-masts, and other small things. Neither Canadian, nor Cyprus pines, are to be seen among them, but we saw some currant, and hawberry bushes, a yellow flowered violet, and the leaves of other plants not yet in flower. A crow was seen flying about the wood; two or three white-headed eagles, like those of Nootka, were also observed; besides another species, equally large, which has a white breast. In our passage from the ship to the shore, we saw a number of fowls sitting on the water, or flying about; the principal of which were gulls, burres, shags, ducks, or large petrels, divers, and quebrantahueses. There was also a single bird flying about, apparently of the gull kind, whose colour was a snowy white, with some black along part of the upper sides of its wings. We saw one fox near a wood; also two or three small seals were seen on the shore; but not any traces of inhabitants could be found.

In the afternoon Captain Cook, with those who accompanied him, returned on board; after which we set sail, and, with a light breeze from the east, we steered for the fourth-west side of the island, which we got round by eight o'clock in the evening; we stood for the westernmost land, now in sight. At the north-east end of Kaye's Island stands another, extending N. W. and S. E. about nine miles, to within the same distance of the north-western boundary, to which the name of Comptroller's Bay was given. The next morning, being Tuesday the 1st, Kaye's Island was still in sight, bearing E. by S. At noon, when in lat. 61 deg. 21 min. the eastern point of a spacious inlet bore west-north-west, three leagues distant. From Comptroller's Bay to this point, which the Commodore named Cape Hinchinbrook, the direction of the coast is nearly E. and W. Beyond this it appeared to incline towards the south; a direction very different from that marked out in the modern charts, founded on the late discoveries of the Russians; inasmuch, that we had some reason to expect, that we should find, through the inlet before us, a passage to the N. and that the land to

No. 67.

the W. and S. W. was a group of islands. We had no sooner reached the inlet, than the weather became exceeding foggy; it was therefore thought necessary that the ships should be secured during the continuance of the fog. With this view we hauled close under Cape Hinchinbrook, and cast anchor in eight fathoms water, at the distance of about two furlongs from the shore. Soon after the boats were hoisted out, some to fish, and others to sound. At intervals, the fog cleared away, and gave us a prospect of the neighbouring land. The cape was one league distant; the western point of the inlet five leagues; and the land on that side extended to W. by N. Between this point and N. W. by W. we could discern no land. The most westerly point we had in view on the north shore, was at the distance of two leagues. Betwixt this point, and the shore under which our ships now lay at anchor, is a bay about three leagues deep, on the south-eastern side of which are several coves; and in the middle are placed some rocky islands. To these Mr. Gore was dispatched in a boat, in order to shoot some birds. He had scarcely reached them, when about twenty natives appeared in two large canoes; upon which he returned to the ship, and they followed him. They were unwilling, however, to venture along-side, but kept at a little distance, shouting aloud, and clapping and extending their arms alternately. They then began a song, much after the manner of King George's, or Nootka Sound. Their heads were strewed with feathers, and one of them held out a white garment, which we supposed was intended as a token of friendship; while another, for near a quarter of an hour, stood up in the canoe, entirely naked, with his arms extended like a cross, and motionless. Their canoes were constructed upon a different plan from those of Nootka. The frame consisted of different laths, and the outside was formed of the skins of seals, or other animals of a similar kind. Though some of our people repeated the most common words of the language of Nootka, they did not appear to understand them. After they had received some presents that were thrown to them, they retired towards the shore, intimating by signs, that they would pay us another visit the next morning. Two of them came off to us in the night, each in a small canoe, hoping, perhaps, they might have an opportunity of pilfering; for they went away as soon as they perceived themselves discovered. The wind, during the night, blew hard in squalls, with rain, and thick hazy weather.

On Wednesday the 13th, at ten o'clock, A. M. the wind becoming more moderate, we got up our anchors, and made sail, in order to search for some convenient place where we might stop the leak, as our present situation was too much exposed for that purpose. We at first intended to have gone up the bay before which our ships had anchored; but, by the clearness of the weather, we were afterwards induced to steer towards the north, further up the great inlet. Having passed the N. W. point of the above-mentioned bay, we found that the coast, on that side, inclined to the eastward: we did not follow it, but proceeded on our course to the northward, for a point of land which we observed in that direction. In the afternoon, before two o'clock, the foul weather returned, with so thick a fog, that we could discern no other land but the point just mentioned, off which we arrived between four and five o'clock, and found it to be a little island, situate at the distance of about two miles from the neighbouring coast, being a point of land on the eastern side of which we discovered an excellent bay, or rather harbour: to this we plied up, while the wind blew in very hard squalls, accompanied with rain. In passing the island, we found a muddy bottom, at the depth of twenty-six fathoms. At length, about eight o'clock, we were obliged, by the violence of the squalls, to cast anchor in thirteen fathoms water, before we had proceeded so far into the bay as the Commodore intended; but we thought ourselves fortunate enough in having the ships already secured, for the night was exceeding tempestuous. But, notwithstanding the weather was so turbulent, the natives were not deterred from paying us a visit. Three of

6 Y

them

them came off in two canoes: two of them in one, and one in the other, being the number that each canoe could carry, for they were constructed nearly in the same manner with those of the Esquimaux, except that in one of them were two holes for two persons to sit in, and in the other but one. The men had each a stick, about three feet long, with the large feathers, or wings of birds, fastened to it, which they probably held up to us as tokens of peace. The treatment these three received, induced many others to visit us, between one and two o'clock the following morning, in both great and small canoes. Some of them ventured on board the Resolution, though not before some of our people had stepped into their boats. Among those who came on board, was a middle-aged man, who, as we afterwards found, was a chief. His dress was made of the skin of the sea-otter, and he had on his head such a cap as is worn by the inhabitants of Nootka, embellished with sky-blue glass beads. Any kind of beads seemed to be in high estimation among these people, who readily gave in exchange for them whatever they had, even their fine sea-otter skins. They coveted particularly iron, but absolutely rejected small bits, and required pieces nine or ten inches long at least, and three or four fingers broad. But they obtained little of this commodity from us, as by this time it was become rather scarce. The points of some of their spears were of this metal; others were of copper, and a few were bone; of which last the points of their arrows, darts, &c. were formed. The chief could not be prevailed upon to venture below the upper deck, nor did he and his companions continue long aboard. While they staid with us, it was necessary to watch them narrowly, as they soon manifested an inclination for thieving. At length, when they had been three or four hours alongside the Resolution, they all quitted her, and repaired to the Discovery, which ship none of them had before been aboard of, except one man, who came from her at this very time, and immediately returned to her, in company with the others. As soon as they had departed from our ship, Captain Cook dispatched a boat to found the head of the bay; for, as the wind was moderate at present, it was intended to lay the ship ashore, if a proper place could be found for the purpose of stopping the leak. Soon afterwards all the Americans quitted the Discovery, and made their way towards our boat that was employed in founding. The officer who was in her, observing their approach, returned to the ship, and all the canoes followed him. The crew of the boat had no sooner repaired on board, leaving in her by way of guard two of their numbers, than several of the natives stepped into her, some of whom presented their spears before the two men, while others loosed the rope by which she was fastened to the ship, and the rest were so daring as to attempt to tow her away; but the moment they saw we were preparing to oppose them, they let her go, stepped into their own boats, and made signs, in order to persuade us to lay down our arms, being to all appearance perfectly unconcerned. This attempt, though a very bold one, was scarce equal to what they had meditated on board Captain Cleve's ship. The man, whom we mentioned before as having conducted his countrymen from the Resolution to the Discovery, had first been aboard of the latter; where, looking down all the hatchways, and observing no one, except the officer of the watch, and two or three more, he doubtless imagined that the might be plundered with ease, particularly as the was stationed at some distance from the Resolution. It was unquestionably with this intent, that the natives went off to her. Several of them repaired aboard without the least ceremony, and drawing their knives, made signs to the officer to keep off, and began to search for plunder. The first thing they laid their hands on was the rudder of one of our boats, which they immediately threw overboard to those of their party, who continued in the canoes. But before they could find another object that struck their fancy, the ship's crew were alarmed, and many of them, armed with cutlasses, came upon deck. The plunderers no sooner saw this, than they all sneaked off into their canoes, with evident

marks of indifference. It was at this time that our boat was employed in founding, as we have already mentioned; and the natives, without delay, proceeded towards her, after the disappointment they had met with at the Discovery. Their visiting us so early in the morning was undoubtedly with a view of plundering, on a supposition that they should find all our people asleep. We were now on the point of weighing anchor, in order to proceed further up the bay, when the wind began to blow as violently as before, and was attended with rain, inasmuch that we were obliged to bear away the cable again, and lie fast. In the evening, perceiving the gale of wind did not abate, and thinking it might be some time before an opportunity of getting higher up presented itself, the Commodore was determined to heel the ship in our present station; and, with that view, caused her to be moored with a kedge anchor and hawser. One of the sailors, in heaving the anchor out of the boat, was carried over-board by the buoy-rope, and accompanied the anchor to the bottom. In this hazardous situation he had presence of mind sufficient to disengage himself, and came up to the surface of the water, where he was immediately taken up, with a dangerous fracture in one of his legs.

On Friday the 15th, at day-break we gave our ship a good heel to port, in order to stop the leak, which, on ripping off the sheathing, was found to be in the seams. While the carpenters were employed in this business, others of our people filled the water-casks at a stream not far from our station. On the 16th, towards the evening, the weather cleared up, and we then found ourselves encompassed with land. Our station was on the eastern side of the sound, in a place distinguished by the appellation of Snug-corner Bay. The Captain, accompanied by some of his officers, went to take a survey of the head of it, and they found it to be sheltered from all winds, having a muddy bottom at the depth of seven to three fathoms. The land near the shore is low, partly wooded, and partly clear: the clear ground was covered with snow, but very little remained in the woods. The summits of the hills, in the neighbourhood, were covered with wood; but those that were at a greater distance inland had the appearance of naked rocks, covered with snow. Our leak being at length stopped, on the 17th, at four o'clock, A. M. we weighed anchor, and steered a N. W. course, with a gentle breeze at E. N. E. Soon after we had made sail, the Americans visited us again. When we had reached the north-western point of the arm wherein we had anchored, we observed that the flood tide came into the inlet, by the same channel through which we had entered. This circumstance did not much contribute to the probability of a passage to the north through the inlet, though it did not make entirely against it. Having passed the point just mentioned, we met with much foul ground, and many sunken rocks: the wind failed us, so that we had some difficulty in extricating ourselves from the danger with which we were threatened; however, about two o'clock P. M. we cast anchor under the eastern shore, in 13 fathoms, and four leagues distant from our last station. The weather soon after cleared up, and we had a distinct view of all the surrounding land, particularly towards the north, where it appeared to close. This gave us but little hope of meeting with a passage that way; but, in order to form a right judgment, Lieutenant Gore was sent out with two armed boats to examine the northern arm; and, at the same time, the master was dispatched with two other boats, to survey another arm that seemed to incline towards the east. Both returned at night. By the Master we were informed, that the arm, to which he had been sent, communicated with that we had last quitted, and that one side of it was formed by a cluster of islands. Mr. Gore reported, "that he had seen the entrance of an arm, which, he was of opinion, extended a long way to the N. E. and that probably by it a passage might be found." On the other hand, Mr. Roberts, one of the mates, who had been sent with Mr. Gore to sketch out the parts they had examined, was of opinion that they saw the head of this arm. "The disagreement of these two opinions (observes Captain Cook) and the

at this time that our boats as we have already mentioned, proceeded to the point they had met with, and we went on to the view of plundering, should find all our people, and weighing anchor, by the bay, when the wind before, and was attended were obliged to bear away.

In the evening, perceived that it was not possible to abate, and thinking it an opportunity of getting the Commodore was determined to station; and, with a kedge anchor, in heaving the anchor over-board by the buoy, and the anchor to the bottom. In the presence of mind sufficient to come up to the surface immediately taken up, with his legs.

At day-break we gave our ship to stop the leak, which was found to be in the deck, and the water-casks in the hold were filled with water-casks. On the 16th, towards the north, and we then found our station was on a small island, in a place distinguished by a bay. The Captain, and officers, went to take a survey, and it was found to be sheltered from the north at the depth of seven fathoms, and near the shore is low, and the clear ground was very little remained in the hills, in the neighbourhood; but those that were left had the appearance of snow. Our leak being at four o'clock, A. M., we ordered a N. W. course, with a view to the north.

Soon after we had made our way again. When we had passed the point of the arm, where we had the flood tide came in, and the channel through which we passed did not much contribute to the north through the channel, and make entirely against it. We mentioned, we met with many funken rocks: the wind made difficulty in extricating, and which we were threatened; and P. M. we cast anchor under the lee of the island, at four fathoms, and four leagues from the shore. The weather soon after cleared, and we had a distinct view of all the mountains towards the north, where we gave up but little hope of any; but, in order to form an opinion, we sent out with the northern arm; and, at the same time, we dispatched with two other arms that seemed to us to be the best. They returned at night. By the return, that the arm, to which we had been directed, that we had lost it was formed by a cluster of rocks, that he had seen the same was of opinion, extended to the north, and that probably by a passage of the other hand, Mr. Roberts, and Mr. Gore, were sent with Mr. Gore to examine, was of opinion that the arm. "The disagreeable observes Captain Cook) and

the circumstances of the flood-tide entering the found from the south, rendered the existence of a passage this way very doubtful. And, as the wind in the morning had become favourable for getting out to sea, the Captain tells us, he resolved to spend no more time in searching for a passage in a place that promised so little success. Besides, if the land on the west should prove to be islands, agreeable to the late Russian Discoveries, we could not fail of getting far enough to the north, and that in good time; provided we did not lose the season in searching places, where a passage was not only doubtful, but improbable. We were now upwards of 520 leagues westward of any part of Baffin's, or of Hudson's Bay, and whatever passage there may be, it must be, or at least part of it must lie to the north of latitude 72 deg. Who could expect to find a passage or strait of such extent?—Notwithstanding the plausibility in the face of this reasoning, our readers will see, it is little more than mere conjecture; and might we hazard our opinion against the judgement of so able a navigator, we must confess, that the latter is not coincident with his usual precision; nor can we think his conduct, in the above search, corresponds in all particulars with his usual assiduity. This is certain, the arm near Cape Hinchinbrook, above alluded to, and the northern part of Hudson's Bay, lie between the same parallels of latitude; and it has been the united opinion of all our most skilful navigators and geographers, that if a N. W. passage does exist, it must be through Hudson's, or Baffin's bay. As to the Russian Discoveries, or those of any other monopolizing, trading companies, they have been of little service hitherto to navigation, and, with respect to their credit, of very small value. It were therefore to be wished, that the report of so able an officer as Mr. Gore had been more particularly attended to; for we think, if the desirable passage can be found, it must be in a lower latitude than 72 deg. and through some arm or strait. This is our own private opinion, and we do not wish to infringe upon the judgement of others, we wish this sacred privilege always to remain inviolate, with every member of civil society.

On Monday, the 18th, about three o'clock A. M. we weighed, and made sail to the southward, down the inlet, with a light northerly breeze. We were enabled to shorten our run out to sea, by discovering another passage into this inlet, to the S. W. of that by which we entered. It is separated from the other, by an island that extends 18 leagues in the direction of S. W. and N. E. to which our Commodore gave the name of Montague Island. In this south-western channel are several islands. Those situated in the entrance next the open sea, are elevated and rocky. Those that lie within are low; and as they were totally free from snow, they were, for this reason, called Green Islands. At two o'clock, P. M. the wind veered to the S. W. by S. which put us under the necessity of plying. We first stretched over to within the distance of two miles of the eastern shore, and tacked in 53 fathoms. When we stood back to Montague Island, we discovered a ledge of rocks, some under water, and others above the surface. We afterwards met with some others towards the middle of the channel. These rocks rendering it dangerous to ply during the night, we spent it in standing off and on, under Montague Island; for the depth of water is so great, that we could not cast anchor. The next morning, at break of day, we steered for the channel between the Green Island and Montague Island, which is between two and three leagues in breadth. About eight in the evening, we had a perfect calm; when we let go our anchors at the depth of twenty-one fathoms, over a muddy bottom, distant about two miles from Montague Island. After the calm had continued till ten o'clock the succeeding morning, a slight breeze sprung up from the north, with which we again weighed and made sail.

Having got out into the open sea, by six in the evening, we discovered that the coast trended W. by S. as far as the eye could reach. To the place we had just left the Commodore gave the name of Prince William's Sound. It seems to occupy, at least, one degree and

a half of latitude, and two degrees of longitude, exclusive of the branches or arms, with whose extent we are unacquainted. The natives, in general, are of a middling stature, though many of them are under it. They are square, or strong chested, with short, thick necks, and large broad visages, which are, for the most part, rather flat. The most disproportioned part of their body appeared to be their heads, which were of great magnitude. Their teeth were of a tolerable whiteness, broad, well set, and equal in size. Their eyes had full, round points, turned up at the tip. Their eyes, though not small, were scarcely proportionate to the largeness of their faces. They have black hair, strong, straight, and thick. Their beards were, in general thin, or deficient; but the hairs growing about the lips of those who have them, were bristly or stiff, and often of a brownish colour. Some of the elderly men had large, thick, straight beards. The variety of their features is considerable. Very few, however, can be said to be handsome, though their countenance usually indicates frankness, vivacity, and good nature; and yet some of them shewed a reserve and fullness in their aspect. The faces of some of the women are agreeable; and many of them, but principally the younger ones, may easily be distinguished from the other sex, by the superior softness of their features. The complexion of some of the females, and of the children, is white, without any mixture of red. Many of the men, whom we saw naked, had rather a swarthy cast, which was scarcely the effect of any stain, it not being a custom among them to paint their bodies. Both sexes, young and old, of this found, are all clothed in the same manner. Their ordinary dress is a sort of close frock, or rather robe, which sometimes reaches only to the knees, but generally down to the ancles. It has, at the upper part, a hole just sufficient to admit the head, with sleeves reaching to the wrist. These frocks are composed of the skins of various animals, and they are commonly worn with the hairy side outwards. Some of the natives have their frocks made of the skins of fowls, with only the down left on them, which they glue upon other substances. The seams, where the different skins are sewed together, are usually adorned with fringes or tassels of narrow thongs, cut out of the same skins. A few have a sort of cape or collar, and some have a hood; but the other is the most customary form, and appears to constitute the whole of their dress in fair weather. When it is rainy, they put over this another frock, made with some degree of ingenuity from the intestines of whales, or some other large animal, prepared with such skill, as to resemble, in great measure, our gold-beater's leaf. It is formed so as to be drawn tight round the neck; and its sleeves extend down to the wrist, round which they are fastened with a string. When in their canoes, they draw the skirts of this frock over the rim of the hole in which they sit, so that the water by this means is prevented from entering; at the same time it keeps the men dry upwards, for no water can penetrate through it. Yet, if not constantly kept moist, it is apt to crack or break. This frock, as well as the common one made of skins, is nearly similar to the dress of the natives of Greenland. Though the inhabitants of this inlet, in general, do not cover their legs or feet, yet some of them wear a kind of skin-stockings, reaching half way up their thighs. Few of them are without mittens for their hands, formed from the skin of a bear's paw. Those who wear any thing on their heads, resembled, in this particular, the people of Nootka Sound, having high truncated conical caps, composed of straw, and sometimes of wood. The hair of the men is commonly cropped round the forehead and neck, but the females suffer it to grow long; and the greatest part of them tie a lock of it on the crown, while a few, after our custom, club it behind. Both men and women perforate their ears with several holes, about the outer and lower part of the edge, wherein they suspend small bunches of beads. They likewise perforate the septum of the nose, through which they often thrust the quill-feathers of birds, or little bending ornaments, made of a tubulous shelly substance, strong

and

on a stiff cord, of the length of three or four inches, which give them a ridiculous and grotesque appearance. But the most extraordinary fashion, adopted by some of the natives of both sexes, is their having the under-lip cut quite through lengthwise, rather below the swelling part. This incision frequently exceeds two inches in length, and, either by its natural retraction while the wound is still fresh, or by the repetition of some artificial management, assumes the appearance and shape of lips, and becomes sufficiently large to admit the tongue through. When a person with his under-lip thus slit, was first seen by one of our sailors, he immediately exclaimed, that the man had two mouths; which, indeed, it greatly resembles. They fix in this artificial mouth, a flat, narrow kind of ornament, made principally out of a solid shell or bone, cut into small narrow pieces, like teeth, almost down to the base, or thick part, which has, at each end, a projecting bit, that serves to support it when put into the divided lip, the cut part then appearing outwards. Some of them only perforate the lower-lip into separate holes; on which occasion the ornament consists of the same number of distinct shelly studs, the points of which are thrust through these holes, and their heads appear within the lip, not unlike another row of teeth under their natural ones. Such are the native ornaments of these people: but we observed among them many beads of European manufacture, chiefly of a pale blue colour, which are hung in their ears, or about their caps, or are joined to their lip ornaments, which have a little hole drilled in each of the points to which they are fastened, and others to them, till they sometimes hang even as low as the point of the chin. In this last case, however, they cannot remove them with such facility; for, with respect to their own lip-ornaments, they can take them out with their tongues at pleasure. They likewise wear bracelets of beads made of a shelly substance resembling amber, and of a cylindrical form. They are, in general, so fond of ornaments of some kind or other, that they fix a variety of things in their perforated lip; one of them appeared with two of our iron nails projecting like prongs from it; and another man attempted to put a large brass button into it. The men often paint their faces of a black colour, and of a bright red, and sometimes of a blueish or leaden hue, but not in any regular figure. The women puncture or stain the chin with black, that comes to a point in each of their cheeks; a custom similar to which is in vogue, as we have been informed, among the Greenland females. Upon the whole, we have not in any country seen savages, who take more pains than these do to disfigure their persons with imaginary ornaments.

They have two sorts of canoes; the one large and open, the other small and covered. They differ no otherwise from the great boats in Greenland, than in the form of the head and stern, particularly of the former, which somewhat resembles a whale's head. The framing consists of slender pieces of wood; and the outside is composed of the skins of seals, or other sea animals, stretched over the wood. Their small canoes are constructed nearly of the same form and materials with those of the Esquimaux. Some of these carry two persons. Their fore part is curved like the head of a violin. Their weapons and implements for hunting and fishing, are the same with those used by the Greenlanders. Many of their spears are headed with iron, and their arrows are generally pointed with bone. Their larger darts are thrown by means of a piece of wood, about a foot long, with a small groove in the middle, which receives the dart; at the bottom is a hole for the reception of one finger, which enables them to grasp the piece of wood much firmer, and to throw with greater force. For defensive armour they have a sort of jacket, or a coat of mail, formed of laths, fastened together with sinews, which render it very flexible, though it is so close as not to admit a dart or arrow. It serves only to cover the trunk of the body, and may, not improperly be compared to the stays worn by our women.

We had not an opportunity of seeing any of the ha-

bitations of the natives, as none of them dwelt in the bay where our ships anchored, or where any of us landed; but with respect to their domestic utensils, they brought, in their canoes, some round and oval wooden dishes, rather shallow, and others of a cylindrical form, considerably deeper. The sides are one piece bent round, after the manner of our chip-boxes, but thick, and neatly fastened with thongs, the bottoms being neatly fixed in with small pegs of wood. Others were somewhat smaller, and of a more elegant figure, not unlike a large oval butter-boat, without any handle, but shallower; these were composed of a piece of wood, or some horny substance, and were sometimes neatly carved. They had in their possession a great number of little square bags, made of the same gut with their exterior frocks, curiously adorned with very small red feathers interwoven with them, in which were contained several very fine sinews, and bundles of small cord, made out of them, plaited with extraordinary ingenuity. They likewise had some models in wood of their canoes; chequered baskets, wrought so closely as to hold water, and a considerable number of little images, four or five inches high, either of wood, or stuffed, which were covered with a piece of fur, and embellished with quill-feathers, with hair fixed on their heads. We could not determine whether these were intended merely as children's toys, or were applied to superstitious purposes. They have many instruments formed of two or three hoops, or concentric pieces of wood, having a cross bar fixed in the middle, by which they are held. To these they fix a number of dried barnacle shells, with threads, which, when shaken, produce a loud noise, and thus serve the purpose of a rattle. This contrivance is probably a substitute for the rattling bird at King George's Sound. It is uncertain with what kind of tools their wooden utensils, frames of canoes, &c. are made; the only one that we observed among them being a sort of stone-adze, somewhat resembling those of Otaheite, and other islands in the Pacific Ocean. They have a great quantity of iron knives, some of which are rather curved; others straight, and some very small ones, fixed in longish handles, with the blades bent upwards. They have also knives, some of which are almost two feet in length, shaped in a great measure like a dagger, with a ridge towards the middle. These they wear in sheaths of skin, hung by a thong round their necks, under their robe or frock. It is probable, that they use them only as weapons, and that their other knives are applied to different purposes. Whatever they have, is as well made as if they were provided with a complete chest of tools; and their plaiting of sinews, sewing, and small-work on their little bags, may be found to vie with the neatest manufactures in any part of the globe. Upon the whole, considering the uncivilized state of the natives of this found, their northerly situation, amidst a country almost continually covered with snow, and the comparative wretched materials they have to work with, it appears, that, with respect to their skill and invention, in all manual operations, they are at least upon a footing with any other people in the islands of the great Pacific Ocean.

The animal food, we saw them eat, was either roasted, or broiled; they feed also on dried fish. Some of the former that was purchased, had the appearance of bear's flesh. They likewise eat a larger sort of tern-root, either baked, or dressed in some other method. Some of our company observed them to eat freely of a substance, which we imagined was the interior part of the pine bark. Their drink, in all probability, is water; for, in their canoes, they brought snow in their wooden vessels, which they swallowed by mouthfuls. Their manner of eating is decent and cleanly, for they constantly took care to remove any dirt that might adhere to their food; and though they would sometimes eat the raw fat of a sea animal, yet, they did not fail to cut it carefully into mouthfuls. To all appearance, their persons were always free from filth; and their utensils, in general, were kept in excellent order, as were also their boats.

The language of these people seemed difficult to be understood;

ole seemed difficult to be
understood;

understood: this, perhaps, was not owing to any cr-
sion, or indistinctness in their words, but to the v-
us significations which their nouns bear: for they frequently
made use of the same word on different occasions;
though, probably, if we could have had a longer inter-
course with them, this might have proved a mistake on
our part. Among the few words and phrases the inge-
nious Mr. Anderson was enabled to procure, we have
selected the following:

Ahleu	- - -	<i>A Spear</i>
Amitloo	- - -	<i>A Piece of white bear's skin</i>
Keelathuk	- - -	<i>Guts of which they make jackets</i>
Natoonehuk	- - -	<i>The Skin of a sea-otter</i>
Lukluk	- - -	<i>A Brown baggy skin</i>
Namuk	- - -	<i>An Ornament for the ear</i>
Aa	- - -	<i>Yes</i>
Chilke	- - -	<i>One</i>
Taiha	- - -	<i>Two</i>
Tokke	- - -	<i>Three</i>
Chukelo	- - -	<i>Four</i>
Koehene	- - -	<i>Five</i>
Takulai	- - -	<i>Six</i>
Keichilloh	- - -	<i>Seven</i>
Klu or Kliew	- - -	<i>Eight</i>

PHRASES.

Yaut	- - -	<i>I'll go; or, shall I go?</i>
Whachai	- - -	<i>Shall I keep it? Do you give it me?</i>
Tawuk	- - -	<i>Keep it</i>
Weona or Veena	- - -	<i>Stranger (calling to one)</i>
Oonaka	- - -	<i>Will you barter for this that belongs to me?</i>
Keeta	- - -	<i>Give me something.</i>
Naema	- - -	<i>Give me something in exchange.</i>
Akashou	- - -	<i>What's the name of that?</i>

With regard to the numerals, Mr. Anderson observes, that the words corresponding to ours, after passing three, are not certain.

Our knowledge of the animals of this part of America is entirely derived from the skins that were brought by the natives for sale. These were principally of bears; common, and pine martins; sea-otters, seals, racoons, small ermines, foxes, and the whitish cat or lynx. Among these various skins, the most common are those of racoons, martins, and sea-otters, which form the ordinary dress of these people: but the skins of the martins which were in general of a far lighter brown than those of Nootka, were greatly superior to them in point of fineness; whereas those of the sea-otters, which, as well as the martins, were much more plentiful here than at Nootka, seemed to be considerably inferior in the thickness and fineness of their fur, though they far exceeded them with respect to size; and were, for the most part, of the glossy black sort. The skins of seals, and bears, were also very common: the former were, in general, white; and many of the bears, here, were of a dark brown hue. Besides these animals, there is the white bear, of whose skins the natives brought several pieces, and some complete skins of cubs. Here is also the wolverene, or quickhatch, whose skin has very bright colours; and a larger species of ermine than the common one, varied with brown, and scarcely any black on its tail. The skin of the head of some very large animal was brought to us, but we could not decide positively what it was; though from the colour, and shagginess of the hair, and its not resembling any land animal, we conjectured, that it may be that of the male ursine-seal, or sea-bear. But one of the most beautiful skins that fell under our consideration, is that of a small animal near a foot in length, of a brown colour on the back, with a number of obscure whitish specks, the sides being of a blueish ash colour, with a few of those specks. The tail is about a third part of the length of the body, and is covered with whitish hair. This animal is doubtless the same with that which is called by Mr. Strahlen, in his account of the New Northern Archipelago, the spotted field-mouse: but whether it is really of the mouse kind, or a squirrel-

No. 67.

rel, we could not learn, nor determine, for want of entire skins; though Mr. Anderson was inclined to believe, that it is the same animal which some of our naturalists have described under the appellation of the cafan-marmor. The great number of skins that we saw at this place, demonstrates the abundance of the various animals we have mentioned; yet, it is somewhat remarkable, that we neither met with the skins of the moose, nor of the common species of deer. As to the birds we found the halcyon, or great king-fisher, having fine bright colours; the shag; the white headed eagle; and the humming bird, which often flew about our ships, while we lay at anchor; though it cannot be supposed to live here, during the winter, which must be extremely severe. The water-fowl seen by us were black sea-pies, with red bills, such as we met with at Van Diemen's Land. Some of our people brought down a snipe, a grouse, and some plovers: but notwithstanding the water-fowl were numerous, particularly the geese and ducks, they were so shy, that it was a difficult matter to get within shot; in consequence of which, we procured a very inconsiderable supply of them as refreshments. The duck is about the size of our common wild one; of a deep black, with red feet, and a short pointed tail. Its bill is white, tinged towards the point with red, and has a large black spot, almost square, near its base, on each side, where it is also somewhat distended. On the forehead is a large triangular white spot; and on the hinder part of the neck is one still larger. The colours of the female are much less vivid than those of the male; and she has none of the ornaments of the bill, excepting those of the two black spots, which are rather obscure. We observed a species of the diver, which seems peculiar to this place. In size, it is equal to a partridge, and has a short, black, compressed bill. Its head, and the upper part of its neck, are of a brownish black; and the remainder of its body is of a deep brown, waved obscurely with black, except the under part, which is totally of a blackish cast, minutely varied with white. We found also a small land bird, of the finch kind, about the bigness of a yellow-hammer; but we imagined it to be one of those which change their colours with the season, and with their different migrations. It was, at this time, of a dusky brown with a reddish tail; and the supposed male had, on the crown of the head, a large yellow spot, with some varied black on the upper part of its neck; but the latter was on the breast of the female.

With respect to the fish, what the natives brought to us for sale, were tork and halibut. We caught some sculpins about the thip, and star-fish of a purplish hue, that had sixteen or eighteen rays. The rocks were almost destitute of shell-fish, and the only one of this tribe that fell under our notice, was a reddish crab, covered with large spines. We observed few vegetables of any kind, and the trees that chiefly grew about this found, were the Canadian, and spruce pine, some of which were of a considerable size. The metals we saw these people possessed of, were iron and copper; both which, but particularly the former, were in such abundance, that their lances and arrows were pointed with them. The ores which they used to paint themselves with, were a brittle, unctuous red ochre or iron ore; a pigment of a bright blue; and black lead: but each of these articles seemed to be very scarce among them. These people must, certainly, have received from some more civilized nation, the beads and iron found among them. We were, doubtless, the first Europeans, with whom they ever had a direct communication; and it remains only to be determined, from what quarter they had procured our manufactures. And it is more than probable, that they had obtained these articles, through the intervention of the more inland tribes, either from the settlements about Hudson's Bay, or those on the lakes of Canada; unless we can admit the supposition, that the Russians, from Kamtschatka, have already extended their traffic to this distance; or that the natives of their most easterly Fox Islands carry on an intercourse along the coast, with the inhabitants of Prince William's Sound. As to copper these people, perhaps, procure it themselves,

themselves, or, at most, it passes to them through very few hands; for when they offered any of it by way of barter, they used to express its being in sufficient plenty among them by pointing to their weapons, as if they would intimate, that, having so much copper of their own, they had no occasion to increase their stock. However, if the natives of this inlet are furnished with European commodities by means of the intermediate traffic to the eastern coast, it is remarkable, that they should never, in return, have supplied the more inland Indians with some of their sea-otter skins, which would undoubtedly have appeared, at one time or other, in the environs of Hudson's Bay. But that does not appear to be the case; and the only method by which we can account for this, must be by considering the very great distance; which, though it might not prevent European articles of commerce from coming so far, as being so uncommon, might hinder the skins, which are common, from passing through more than two or three tribes, who might make use of them for their own clothing, and send others, which they reckoned of inferior value as being of their own animals, to the east; till they reached the traders at the European settlements.

On Wednesday the 20th of May, having took our departure from Prince William's Sound, we directed our course to the S. W. with a gentle breeze. This was succeeded by a calm, at four o'clock, the next morning, which was soon followed by a breeze from the S. W. This veering to the N. W. we continued to stretch to S. W. and passed a lofty promontory, in the latitude of 59 deg. 10 min. long. 207 deg. 45 min. It having been discovered on Princess Elizabeth's birth-day, Captain Cook gave it the name of Cape Elizabeth. As we could see no land beyond it, we flattered ourselves, that it was the western extremity of the continent: but fresh land soon appearing in sight, bearing W. S. W. convinced us of our mistake. The wind had increased to a strong gale, and forced us to a considerable distance from the coast: but, on the 22nd, P. M. the gale abated, and we stood for Cape Elizabeth. On Saturday the 23d, at noon, Cape Elizabeth bore W. distant 10 leagues; at which time new land was seen, bearing S. W. which, it was imagined, connected Cape Elizabeth with the land we had seen towards the west. We stood to the southward till the next day, at noon, when we were three leagues from the coast, which we had seen on the 22nd. More land was discovered, extending to the southward, whereon was seen a ridge of mountains, whose summits were covered with snow. This point of land lies in latitude 58 deg. 15 min. Its longitude is 207 deg. 42 min. And by what the Commodore could gather from Beering's voyage and chart, he supposed it to be, what he called Cape St. Hermogenes. But the account of that voyage, as well as the chart, is so extremely inaccurate, that it is almost impossible to discover any one place, which the navigator either saw or touched at. In the chart a space is pointed out, where Beering is supposed to have seen no land. This favoured Mr. Strehlin's account, who makes Cape St. Hermogenes, and the land discovered by Beering to the S. W. of it, to be a cluster of islands, and that St. Hermogenes is one of those that are destitute of wood. This appeared to be confirmed by what we now saw; and we entertained the pleasing hopes of finding here a passage northward, without being obliged to proceed any farther to the S. W.

We were detained by light airs and calms off the Cape, till two o'clock, A. M. of the 25th, when a breeze springing up, we steered along the coast, and perceived that the land of Cape St. Hermogenes was an island, about six leagues in circumference, separated from the coast by a channel, one league in breadth. Some rocks are to be seen above water to the north of this island; and on the N. E. side of the rocks, we had from 20 to 20 fathoms water. At noon St. Hermogenes bore S. E. distant 8 leagues; the land to the N. W. extending from S. half W. to near W. In this last direction, it ended in a low point, named Point Banks. The ship was, at this time, in latitude 58 deg. 41 min. longitude 207 deg. 44 min. In this station the land was in sight, bearing N. W. which, it was thought, connected Cape

Elizabeth with this S. W. land. When we approached it, we observed it was an unconnected group of high islands and rocks; and from the nakedness of their appearance, the Captain named them the Barren Isles: they are situated in latitude 59 deg. three leagues distant from Cape Elizabeth, and five from Point Banks. It was our intention to have passed through one of the channels by which these islands are divided; but a strong current setting against us, we went to leeward of them all. The weather, which had been thick and hazy, cleared up towards the evening, when we perceived a very lofty promontory, whose elevated summit appeared above the clouds, forming two exceeding high mountains. Captain Cook named this promontory Cape Douglas, in honour of his friend Dr. Douglas, canon of Windsor. It is situated 12 leagues from Point Banks, and 10 to the westward of the Barren Isles; its latitude 58 deg. 56 min. and longitude 206 deg. 10 min. Between this point and Cape Douglas is a large deep Bay, which, from our observing some smoke upon Point Banks, received the name of Smokey Bay. At day break on the 26th, being to the northward of the Barren Isles, we discovered more land, extending from Cape Douglas to the north. It consisted of a chain of very high mountains; one of which, being much more conspicuous than the rest, obtained the name of Mount St. Augustine. Having a fresh gale we stood to the N. W. till eight, when we found, that what we had supposed to be islands were summits of mountains, connected by the lower land. This was covered wholly with snow, from the tops of the mountains down to the sea-beach; and had in every other respect, the appearance of a great continent. Captain Cook was now fully convinced, that no passage could be discovered by this inlet; and his continuing to explore it was more to satisfy others, than to confirm his own opinion. At this time Mount St. Augustine bore N. W. distant three leagues. It is of a conical figure, and rises to a prodigious height; but whether it be an island, or part of the continent, is not yet ascertained. Perceiving that nothing was to be done to the west, we stood over to Cape Elizabeth, under which we fetched at about five in the afternoon. Between Cape Elizabeth and a lofty promontory, which was named Cape Bede, is a bay, wherein we might have anchored; but, the Captain having no such intention, we tacked and stood to the westward, with a very strong gale, accompanied with rain and hazy weather. Next morning the gale abated, and about three o'clock in the afternoon, the weather cleared up; Cape Douglas bearing S. W. by W. and the depth of water being 40 fathoms, over a rocky bottom. From Cape Bede the coast trended N. E. by E. with a chain of mountains in land, in the same direction. We had now the mortification to discover low land in the middle of the inlet, extending from N. N. E. to N. E. by E; but, as it was supposed to be an island, we were not much discouraged.

On Thursday, the 28th, A. M. having but little wind, the ship drove to the southward, and in order to stop her, we dropped a kedge-anchor, with an eight inch hauler. But, in bringing the ship up, we lost both that and the anchor. However, we brought the ship up, with one of the bows, and spent a considerable part of the day in sweeping for them, but without effect. We were now in the latitude of 59 deg. 51 min. the low land extended from N. E. to S. E. the nearest part distant two leagues; and the land on the western shore about seven leagues. A strong tide set to the southward, out of the inlet; it was the ebb, and ran almost four knots in an hour. At ten o'clock it was low water. Though the water had become thick, and refused that in rivers, we were encouraged to proceed, by finding it as salt as in the ocean, even at low water. Three knots was the strength of the flood tide; and the stream continued to run up till four in the afternoon. At eight o'clock in the evening we stood up the inlet, to the north. Soon after the wind veered to this quarter, and blew in squalls, attended with rain; but this did not hinder us from plying up while the flood continued, which was till the next morning at near five o'clock, when we anchored

about two leagues from the eastern shore; and our latitude was 60 deg. 8 min. Some low land, which we supposed to be an island, lay under the western shore, distant between three and four leagues. The weather clearing up, a ridge of mountains appeared; and two columns of smoke were visible on the eastern shore. At one o'clock A. M. we weighed, and plied up under double reefed top-sails, having a strong gale at N. E.

On Saturday the 30th, the gale having much abated, we plied up from two o'clock A. M. till near seven, and then anchored under the shore to the eastward, in 19 fathoms water. At noon two canoes, with a man in each, came off to the ship, nearly from that part where we had seen the smoke the day before. They resembled strongly those we had seen in Prince William's Sound, both in dress and person: their canoes were also constructed in the same manner; and one of them had a large beard, and a countenance like the common sort of people in the Sound. When the flood made, we weighed, stood over to the western shore, and fetched under a bluff point to the N. W. This, with the point on the opposite shore, contracted the breadth of the channel to about four leagues, through which a prodigious tide ran. It had a terrible appearance, and we were ignorant whether the water was thus agitated by the stream, or by the dashing of the waves against sands or rocks. We kept the western shore aboard, that appearing to be the safest. In the evening, about eight o'clock, we anchored under a point of land, bearing N. E. distant about three leagues, and lay there during the ebb. Till we arrived at this station, the water retained an equal degree of saltness, both at high and low water, and was as salt as that which is in the ocean: but now the appearances of a river evidently displayed themselves. The water, taken up at this ebb, was much fresher than any we had tasted; whence we concluded that we were in a large river, and not in a strait, which had a communication with the northern seas: but, having proceeded thus far, Captain Cook was anxious to have stronger proofs; therefore, on the thirty-first, in the morning, we weighed with the flood, and drove up with the tide, having but little wind. Near eight o'clock, many of the natives, in one large canoe, and several small ones, paid us a visit. The latter had only one person on board each; but the larger ones contained men, women, and children. We bartered with them for some of their fur dresses, made of the skins of animals, particularly those of sea-otters, martins, and hares, also salmon, halibut, and a few of their darts; for which, in return, we gave them old clothes, beads, and pieces of iron. These last they call goones; but, in general, their language is nearly the same as that used in Prince William's Sound. At nine o'clock, we anchored in sixteen fathoms water, almost two leagues from the western shore, the ebb being already began. It ran but three knots an hour at its greatest strength, and fell, after we had anchored, twenty-one feet upon a perpendicular. In order to determine the direction, and other particulars respecting the inlet, Captain Cook dispatched two boats, and when the flood tide made, followed them with the two ships; but, after driving about ten miles, we anchored, having a dead calm and strong tide against us. At the lowest of the ebb, the water at and near the surface, was perfectly fresh, though retaining a considerable degree of saltness, if taken above a foot below it. Besides this, we had other convincing proofs of its being a river, such as thick muddy water, low shores, trees, and rubbish of various kinds, floating backward and forward with the tide. In the afternoon we received another visit from the natives, who bartered largely with our people, without so much as attempting one dishonest action.

On Monday the 1st of June, at two o'clock, A. M. the master, who commanded the two boats, returned, informing us that he found the inlet or river contracted to one league in breadth, and that it took a northerly course through low land on each side. He advanced about three leagues through this narrow part, which he found from 20 to 17 fathoms deep. While the stream ran down the water was perfectly fresh, but it became

brackish when it ran up, and more so near high water. Three leagues to the northward of this reach, the master discovered another separation in the eastern chain of mountains, through which he supposed it probable, the river ran in a direction N. E. but this was thought by the captain to be only another branch, and that the main channel continued in a northern direction between the two chains of mountains. The pleasing hopes of finding a passage were no longer entertained; but as the ebb was spent, we took the advantage of the next tide to get a closer view of the eastern branch: in order to determine whether the low land on the shore was an island or not. For this purpose we weighed with the first of the flood, and stood over for the eastern shore. At eight o'clock a breeze sprang up in a direction opposite to our course, so that we despaired of reaching the entrance of the river. By reason of this untoward circumstance, two boats were dispatched, under the command of Lieutenant King, to make such observations as might enable us to form some tolerable idea of the nature and course of the river. About ten o'clock the Resolution and Discovery anchored in nine fathoms water. The Commodore observing the strength of the tide to be so powerful, that the boats could not make head against it, made a signal for them to return, before they had proceeded half way to the entrance of the river. The only knowledge concerning the grand question, obtained by this tide's work, was, that all the low land, which we had imagined to be an island, was one continued tract from the great river to the foot of the mountains, terminating at the fourth entrance of this eastern branch, which the Commodore denominated the river Turnagain.

The low land begins again on the north side of this river, and extends from the foot of the mountains, to the bank of the great river, forming before the river Turnagain a large bay. Having entered this, the flood set very strong into the river, the water falling 20 feet upon a perpendicular, from which circumstances it was evident, that a passage was not to be expected by this side river, any more than by the main branch: but, as the water at ebb, though much fresher, retained a considerable degree of saltness, it is probable that both these branches are navigable by ships much farther; and that a very extensive inland communication lies open, by means of this river and its several branches. We had traced it to the latitude of 61 deg. 30 min. and the longitude of 210 deg. which is upwards of 210 miles from its entrance, and saw no appearance of its source. The time we spent in the discovery—(Here the Commodore having left a blank in his journal, which he had not filled up with any particular name, the earl of Sandwich very properly directed it to be called Cook's river) The time we spent in the discovery of Cook's river ought not to be regretted, if it should hereafter prove useful to the present, or any future age: but the delay thus occasioned was an essential loss to us, who had a greater object in view. The season was far advanced, and it was now evident, that the continent of North America extended much farther to the west than we had reason to expect from the most approved charts.

In the afternoon Lieutenant King was again sent, with orders from the captain to land on the S. E. side of the river, where he was to display the flag; and, in his majesty's name, to take possession of the country and Cook's river. He was ordered also to bury a bottle in the earth, containing some English coin of 1772, and a paper, whereon were written the names of our ships, and the date of our discovery. In the mean time the ships were got under way; but a calm ensued, and the flood tide meeting us, we found it necessary to cast anchor; the point where Mr. King landed bearing S. distant two miles. This point of land was named Point Possession. On Mr. King's return we were informed, that after he had landed he saw several of the natives with their arms extended, an attitude, he supposed, meant to signify their peaceable disposition, and to convince him that they were without weapons. Observing his attendants were armed with muskets, they were alarmed, and requested, by expressive signs, that he would

would lay them down. This was immediately complied with, and then Mr. King and his party were permitted to walk up to them. They now appeared to be very sociable and cheerful. Mr. Iaw, surgeon of the Discovery, being one of the party, purchased a dog, and taking it towards the boat, immediately shot it dead. At this they seemed exceedingly surprized; and, not thinking themselves safe in such company, they walked away; but it presently appeared, that they had concealed their spears and other weapons in the bushes close behind them.

At high-water we weighed anchor, and with a faint breeze stood over to the west shore, where the next morning, being Tuesday the second, we anchored, on account of the return of the flood. Soon after we were visited by several of the natives in canoes, who bartered their skins, and afterwards parted with their garments, many of them returning perfectly naked. Among others, they brought a great quantity of the skins of white rabbits, and red foxes, but only two or three of those of otters. We also purchased some pieces of halibut and salmon. They preferred iron to every thing we offered them in exchange. The lip-ornaments were less in fashion among them than at Prince William's Sound; but those which pass through the nose were more frequent, and in general considerably longer. They had likewise more embroidered work on their garments, quivers, knife-cases, and other articles. At half past ten we weighed, and plied down the river with a gentle breeze at south; when, by the inattention of the man at the lead, our ship struck upon a bank, nearly in the middle of the river. It is pretty certain that this bank occasioned that strong agitation of the stream, with which we were so much surprized when turning up the river. We had twelve feet of water about the ship, at the lowest of the ebb, but the bank was dry in other parts. When our ship came aground Captain Cook made a signal for the Discovery to anchor. We were afterwards informed that she had been almost ashore on the west side of the bank. About five o'clock in the afternoon, as the flood tide came in, the ship floated off without sustaining any damage, or occasioning the least trouble. We then stood over to the west shore, where we anchored, in deep water, to wait for the ebb, the wind being still unfavourable to us. At ten o'clock at night we weighed with the ebb, and about five the next morning, the 3d, the tide being finished, we cast anchor on the west shore, about ten miles below the bluff point. In this station we were visited by many of the natives, who attended us all the morning: their company was highly acceptable to us, as they brought with them a quantity of fine salmon, which they exchanged for some of our trifles. Several hundred weight of it was procured for the two ships. The mountains now, for the first time after our entering the river, were free from clouds, and we saw a volcano in one of those on the western side. Its latitude is 60 deg. 23 min. and it is the first high mountain north of Mount St. Augustin. The volcano is near the summit, and on that part of the mountain next the river. It emits a white smoke, but no fire. The wind continuing southerly, we still tided it down the river.

On Friday the 5th, in the morning, we arrived at the place where we had lost our keedge anchor, which we attempted, though unsuccessfully, to recover. Before our departure from hence, we were again visited by some of the natives in six canoes from the eastern shore. The points of their spears and knives are made of iron; some of the former; indeed, are made of copper. Their spears resemble our spontoons, and their knives, for which they have sheaths, are of considerable length. Except these and a few glass beads, every thing we saw among them was of their own manufacture. A very beneficial fur trade might certainly be carried on with the natives of this vast coast: but without a northern passage, it is too remote for Great Britain to be benefited by such commerce. It should however be noted, that almost the only valuable skins, on this west side of North America, are those of the sea-otter; their other

skins are of an inferior quality. As the skins are used by these people only for cloathing themselves, they, perhaps, are not at the trouble of dressing more of them, than they require for this purpose. This is probably the chief cause of their killing the animals, for they receive principally their supply of food from the sea and rivers: but if these were accustomed to a constant trade with foreigners, such an intercourse would increase their wants, by acquainting them with new luxuries, to be enabled to purchase which, they would become more assiduous in procuring skins; and in this country, without doubt, a plentiful supply might be obtained.

This day, the ebb tide making in our favour, we weighed, and with a gentle breeze at S. W. plied down the river: the flood obliged us to anchor again; but the next morning of Saturday the 6th we got under sail with a fresh breeze, passed the Barren Islands about eight o'clock, A. M. and at noon Cape St. Hermogenes bore S. S. E. eight leagues distant. We intended to go through the passage between the island of that name and the main land, but the wind soon after failed us, on which account we abandoned the design of carrying the ship through that passage: northward of it the land forms a bay, a low rocky island lying off the N. W. point. Some other islands, of a similar appearance, are scattered along the coast between here and Point Banks. At eight in the evening, St. Hermogenes extended from S. half E. to S. S. E. and the rocks bore S. E. distant three miles. About midnight we passed the rocks, and bore up to the southward; and on the 7th at noon St. Hermogenes bore N. distant four leagues. The southernmost point of the main land lay N. half W. five leagues distant. The latitude of this promontory is 58 deg. 15 min. and its longitude 274 deg. 24 min. It was named after the day in our calendar, Cape Whitunday; and a large bay to the west of it was called Whitunday Bay. At midnight we stood in for the land, and at seven in the morning of the eighth we were within four miles of it, and less than two miles from some sunken rocks, bearing W. S. W. Here we anchored in thirty-five fathoms water. To the west of the bay are some small islands. To the southward the sea coast is low, with projecting rocky points, having small inlets between them. We were now in the latitude of 57 deg. 52 min. 30 sec. The land here forming a point, it was named Cape Greville, in lat. 57 deg. 33 min. long. 207 deg. 15 min. distant from St. Hermogenes 15 leagues. On the 9th, 10th and 11th, we continued plying up the coast.

On Friday the 12th, in the evening, the fog clearing up, we descried land twelve leagues distant, bearing W. and we stood in for it early the next morning. At noon an elevated point, which we called Cape Barnabas, in lat. 57 deg. 13 min. bore N. N. E. distant ten miles. The point to the S. W. had an elevated summit, which terminated in two round hills, and was therefore called Two-headed Point. At six in the evening, being about midway between Cape Barnabas and Two-headed Point, a point of land was observed bearing S. 69 deg. W. On the fourteenth, at noon, we observed in lat. 56 deg. 49 min. The land seen the preceding evening, now appeared like two islands. We were up with the southernmost part of it the next morning, and perceived it to be an island, which we named Trinity Island. It lies in lat. 56 deg. 36 min. long. 205 deg. distant from the continent three leagues, between which rocks and islands are interspersed. In the evening, at eight, we were within a league of the small islands. The westernmost point of the continent, now in view, we called Cape Trinity, it being a low point facing Trinity Island. Having reason at this time to expect foggy weather, we stretched out to sea, and passed two or three rocky islets near the east end of Trinity Island. This we weathered, and in the afternoon steered west-southerly, with a gale at S. S. E. No land appearing on Monday the fifteenth at noon, and the gale and fog increasing, we steered W. N. W. under such sail as we could haul the wind with; sensible of the danger of running before a strong gale, in the vicinity of an unknown coast and in a thick fog. It was however become necessary to run some

As the skins are used themselves, they, per dressing more of them, use. This is probably the animals, for they receive food from the sea and are used to constant trade. The trade would increase their new luxuries, to be they would become more in this country, with might be obtained.

ing in our favour, we ze at S. W. plied down anchor again; but the we got under sail with and about eight o'clock, Hermogenes bore S. S. E. and to go through the name and the main land, on which account we the ship through that and forms a bay, a low V. point. Some other are scattered along the banks. At eight in the ded from S. half E. to E. distant three miles. rocks, and bore up to noon St. Hermogenes the fourthernmost point V. five leagues distant. is 58 deg. 15 min. and It was named after the Whitfunday; and a large Whitfundite Bay. At and, and at seven in the within four miles of it, some sunken rocks, beard in thirty-five fathoms are some small islands. is low, with projecting is between them. risk, when the wind was favourable to us; as we were convinced that clear weather was generally accompanied with westerly winds.

On Tuesday, the 16th, at four o'clock, A. M. the fog being now dispersed, we found ourselves, in a manner, surrounded with land. The extreme of the main, at N. E. was a point of land we had seen through the fog, and was therefore named Foggy Cape. It is situated in latitude 56 deg. 31 min. About nine o'clock, we discovered the land to be an island, nine miles in circumference, in lat. 56 deg. 10 min. long. 202 deg. 45 min. we named it Foggy Island; and we supposed, from its situation, that it is the island on which Beering had bestowed the same appellation. Three or four islands bore N. by W. A point, with pinnacle rocks upon it, bore N. W. by W. called Pinnacle Point; and a cluster of illots, S. S. E. about nine leagues from the coast. On the 17th, at noon, the continent extended from S. W. to N. by E; the nearest part distant 7 leagues: at the same distance from the continent, a group of islands was seen to the N. W. On the 18th we had clear, pleasant weather, and it was a calm the greatest part of the day. One of our people, on board a boat dispatched to the Discovery, shot a most beautiful bird. It is smaller than a duck, and the colour is black, except that the fore part of the head is white: behind each eye, an elegant yellowish-white crest arises: the bill and feet are of a reddish colour. The first of these birds were seen to the southward of Cape St. Hermogenes; after which we saw them daily, and frequently in large flocks. We were also visited by molt of the other sea-fowls, that are usually met with in the northern oceans; and seldom a day passed without our seeing whales, seals, and other fish of great magnitude. In the afternoon we steered west, for the channel between the islands and the continent. On Friday, the 19th, at day-break, we were not far from it, and perceived several other islands, within those we had already seen, of various dimensions. Between these islands, and those we had seen before, there appeared to be a clear channel, for which we steered; and, at noon our latitude was 55 deg. 18 min. in the narrowest part of the channel. Of this group of islands, the largest was now upon our left, and is called Kodiak, as we were afterwards informed. Other islands appeared to the southward as far as an island could be seen. They begin in the longitude of 200 deg. 15 min. east, and extend about two degrees to the westward. Most of these islands are tolerably high, but very barren and rugged, exhibiting romantic appearances, and abounding with cliffs and rocks. They have several bays and coves about them; and some fresh-water streams descend from their elevated parts, but the land is not adorned with a single tree or bush. Plenty of snow still remained on many of them, as well as on those parts of the continent which appeared between the innermost islands. By four o'clock, in the afternoon, we had passed all the islands to the south of us; and soon after we had got through the channel, the Discovery, which was two miles astern, fired three guns, and brought to, making a signal to speak with us. A boat being sent off to her, returned immediately with Captain Clerke. He informed the commodore, that some natives in three or four canoes, having followed his ship for some time, at last got under the stern; one of whom made many signs, having his cap off, and bowing in the European manner. A rope was then handed down from the ship, to which he fastened a thin wooden box, and after he had made some more gesticulations, the canoes left the Discovery. Soon after the box was opened, and found to contain a piece of paper, carefully folded up, whereon some writing appeared, which was supposed to be in the Russian language. To this writing was prefixed the date of 1778, and a reference was made therein to the year 1776. Though unable to decipher the alphabet of the writer, we were convinced by his numerals, that others had preceded us in visiting these dreary regions. At first Captain Clerke imagined, that some Russians had been shipwrecked here; and that seeing our ships, these unfortunate persons were induced

No. 67.

thus to inform us of their situation. Deeply impressed with sentiments of humanity on this occasion, he was in hopes the Resolution would have stopped till they had time to join us; but no such idea ever occurred to Captain Cook. If this had really been the case, he supposed, that the first step such persons would have taken, in order to secure relief, would have been, to send some of their people off to the ships in the canoes. He, therefore, rather thought the paper was intended to communicate some information, from a Russian trader, who had lately visited these islands, to be delivered to any of his countrymen who should arrive; and that the natives, supposing us to be Russians, had brought off the note. In consequence of this opinion, the Captain ordered sail to be made, and we steered westward. At midnight, we beheld a vast flame ascend from a burning mountain, and observed several fires within land.

On Saturday, the 20th, at two o'clock A. M. some breakers were seen, distant two miles; others appeared a-head; on our larboard side they were innumerable; and also between us and the land. We cleared them, though with difficulty, by holding a fourth course. These breakers were produced by rocks, many of which were above water: they are very dangerous, and extend seven leagues from land. We got on the outside of them about noon, when we observed in latitude 54 deg. 44 min. longitude 198 deg. The nearest land was an elevated bluff point, which we called Rock Point. It bore N. distant 8 leagues; and a high round hill, called Halibut Head, bore S. W. distant 13 leagues. On the 21st, Halibut Island extended from N. by E. to N. W. This island is seven leagues in circumference, and except the head, is very low and barren. We were kept at such a distance from the continent, by the rocks and breakers, that we had but a very imperfect view of the coast between Halibut Island and Rock Point. We could, however, perceive the main land covered with snow; particularly some hills, whose elevated tops towered above the clouds to a most stupendous height. A volcano was seen on the most south-westerly of these hills, which perpetually threw up immense columns of black smoke: it is at no great distance from the coast, and lies in the latitude of 54 deg. 48 min. and in longitude 195 deg. 45 min. Its figure is a complete cone, and the volcano is at the summit of it: remarkable as it may appear, the wind, at the height to which the smoke of the volcano rose, often moved in an opposite direction to what it did at sea, even in a fresh gale. In the afternoon, having three hours calm, upwards of 100 halibuts were caught by our people, some of which weighed upwards of a hundred pounds, and none of them less than twenty each. They were highly acceptable to us. We fished in 35 fathoms water, about four miles distant from the shore; during which time, we were visited by a man in a small canoe, who came from a large island. When he drew near to the ship, he uncovered his head and bowed, as the other had done the preceding day, when he came off to the Discovery. It appeared very plain to us, that the Russians had some communication with these people, not only from their politeness, but from an additional proof that we now were favoured with: for our new visitor had on a pair of green cloth breeches, and a jacket of black cloth, under the frock of his own country. He had with him a grey fox-skin, and some fishing implements: also a bladder, wherein was some liquid, which we supposed to be oil: he opened it, drank a mouthful, and then closed it up again. His canoe was smaller than any one of those we had seen before, though of the same construction: like others who had visited the Discovery, he used the double-bladed paddle. His features resembled those of the natives of Prince William's Sound, but he was perfectly free from any kind of paint; and his lip had been perforated in an oblique direction, but at this visit he had not any kind of ornament in it. Many of the words frequently used by the natives of the Sound, were repeated to him, but he did not seem to understand any of them, owing either to his ignorance of the dialect, or our erroneous pronunciation.

7 A

Oa

On Monday, the 22d, the wind shifted to the S. E. and, as usual, was attended with thick rainy weather. In the evening, fearing we might fall in with land, we hauled to the southward, till two the next morning, and then bore away west; yet we made but little way. At five o'clock P. M. we had an interval of sunshine, when we saw land bearing N. 59 deg. W. On Wednesday, the 24th, at six o'clock A. M. we saw the continent; and at nine it extended from N. by E. to S. W. by W. the nearest part distant four leagues. The next morning we had clear weather, inasmuch, that we clearly saw the volcano, the other mountains, and all the main land under them. A large opening was likewise seen between several islands and a point of the land. We now steered to the southward; when, having got without all the land in sight, we steered west, the islands lying in that direction. By eight o'clock we had passed three of them, all of a good height; and more were now observed to the westward. In the afternoon, the weather became gloomy, and afterwards turned to a mist, the wind blowing fresh at east, we therefore hauled the wind to the southward till day-break, on Friday the 26th, when we resumed our course to the west. We derived but little advantage from daylight, the weather being so thick that we could not discover objects at the distance of a hundred yards; but as the wind was moderate, we ventured to run. About half an hour after four, the sound of breakers alarmed us on our larboard bow. We brought the ship to, and anchored in twenty-five fathoms water. The Discovery who was not far distant anchored also. Some hours after, the fog being a little dispersed, we discovered the imminent danger we had escaped. We were three quarters of a mile from the N. E. side of an island: two elevated rocks were about half a league from us, and from each other. Several breakers also appeared about them; and yet Providence had safely conducted the ships through in the dark, between those rocks, which we should not have attempted to have done in a clear day; and to so commodious an anchoring-place, which, on account of our miraculous escape, received the name of Providence Bay. During the night, the wind blew fresh at south, but in the morning was more moderate, and the fog, in a great measure dispersed. At seven o'clock, we weighed, and steered between the island near which we had anchored, and a small one not far from it. The breadth of the channel does not exceed a mile, and the wind failed before we could pass through it. We were therefore glad to anchor in 34 fathoms water. Land now presented itself in every direction. That to the south extended, in a ridge of mountains, to the S. W. which we afterwards found to be an island, called Oonalahka. Between this, and the land to the north, which we supposed to be a group of islands, there appeared to be a channel in a N. W. direction. On a point, west from the ship, and at a distance of three quarters of a mile, we perceived several natives and their habitations. To this place we saw two whales towed in, which we supposed had just been killed. A few of the inhabitants came off, at different times, to the ships, and engaged in a little traffic with our people, but never continued with us above a quarter of an hour at a time. They seemed, indeed, remarkably shy; though we could readily discover they were not unacquainted with vessels, similar, in some degree to ours. Their address expressed a degree of politeness which we had never experienced among any of the savage tribes. Being favoured, about one o'clock, P. M. with a light breeze, and the tide of flood, we weighed, and directed our course to the channel last mentioned; expecting when we had passed through, either to find the land trend away to the northward, or that we should discover a passage out to sea, to the west; and we soon found we were right in our conjectures. After we had got under sail, the wind veered to the N. and we were obliged to ply. In the evening, the ebb made it necessary for us to anchor within three leagues of our last station.

On Sunday, the 28th, at day-break, we got again under way, and were wafted up the passage by a light breeze

at south; this was succeeded by variable light airs from all directions. We had, however, a rapid tide in our favour, and the Resolution got through before the ebb made. The Discovery was not equally fortunate, for she was carried back, got into the race, and found a difficulty in getting clear of it. Being now through the channel, we observed the land on one side trending W. and S. W. and that on the other side to N. This encouraged us to hope that the continent had taken a new direction in our favour. Finding our water ran short, and expecting to be driven about in a rapid tide, without wind sufficient to govern the ship, we stood for a harbour on the south side of the passage, but were driven beyond it; and, that we might not be forced back through the passage, anchored near the southern shore, in 28 fathoms, and out of the reach of the strong tide, though even here it ran five knots an hour. In this station we were visited by several of the natives, in separate canoes. They baitered some fishing implements for tobacco. A young man among them overtook his canoe, while he was along-side of one of our boats. He was caught hold of by one of our people, but the canoe was taken up one of his countrymen, and carried ashore. In consequence of this accident, the youth was obliged to come into the ship, where he accepted an invitation into the cabin, without any surmise or embarrassment. He had on an upper garment, resembling a shirt, made of the gut of a whale, or some other large sea-animal. Under this he had another of the same form, made of the skins of birds with the feathers on, curiously sewed together; the feathered side placed next the skin. It was patched with several pieces of silk stuff, and his cap was embellished with gl's beads. His cloaths being wet, we furnished him with some of our own, which he put on with as much readiness as we could have done. From the behaviour of this youth, and that of several others, it evidently appeared that these people were no strangers to Europeans, and to many of their customs. Something in the appearance of our ships, however, greatly excited their curiosity: for, such as had not canoes to bring them off, ascended on the neighbouring hills to have a view of them. At low water we towed the ship into the harbour, where we anchored in nine fathoms water, the Discovery arriving soon after. A boat was now sent off to draw the seine, but we caught only a few trout, and some other small fish. We had scarce anchored, when a native of the island brought another note on board, similar to that which had been given to Captain Clerke. He presented it to our Commodore, but as it was written in the Russian language neither he, nor any of our company, could read it. As it could not be of any use to us, and might be of consequence to others, Captain Cook returned it to the bearer, accompanied with a few presents; for which he expressed his thanks, as he retired, by several low bows. On the 29th we saw along the shore, a group of the natives of both sexes, seated on the grass, partaking of a repast of raw fish, which they seemed to relish exceedingly. We were detained by thick fogs and a contrary wind, till Thursday the 2d of July, in this harbour. It is called by the natives Samganoodha, and is situated on the north side of the island of Oonalahka, in lat. 53 deg. 55 min. long. 193 deg. 30 min. and in the strait which separates this island from those to the north. It is about a mile broad at the entrance, and runs in about four miles S. by W. It narrows towards the head, the breadth there not exceeding a quarter of a mile. Plenty of good water may be procured here, but not a stick of wood of any kind.

On Thursday, the 2d of July we steered from the harbour of Samganoodha, having a gentle breeze at S. S. E. to the northward, and met with nothing to obstruct our course: for on the one side the Isle of Oonalahka trended S. W. and on the other, no land was to be seen in a direction more northerly than N. E. all which land was a continuation of the same group of islands that we had fallen in with, on the 25th of the preceding month. That which is situated before Samganoodha, and constitutes the north-eastern side of the passage,

E.

ed by variable light airs from however, a rapid tide in our got through before the ebb was not equally fortunate, for into the race, and found a fit. Being now through the land on one side tending to the other side to N. This the continent had taken a u. passage, through which we came, is called Ononella and its circumference is 21 miles. Another island, lying to the northward of it, bears the name of Acootan: it is much superior in size to Ononella, and has in it some very lofty mountains, at this time covered with snow. It appeared that we might have passed with great safety between these two islands and the continent, whose south-western point opened off the north-eastern point of Acootan, and proved to be the same point of land that we had discerned when we left the coast of the continent, the 25th of June, in order to go without the islands. It is called by the natives Oonemack; and is situated in lat. 54 deg. 30 min. long. 192 deg. 30 min. E. Over the Cape, which is high land, we perceived a round elevated mountain, at present covered with snow. At six o'clock A. M. this mountain bore E. 2 deg. N. and two hours afterwards not any land was to be seen. Concluding, therefore, that the coast of the continent had now inclined to the north-eastward, we steered the same course till one o'clock the following morning, when the watch stationed on deck gave intimation of their seeing land. Upon this we wore, and for the space of about two hours stood towards the S. W. after which we renewed our course to the E. N. E. At six we discovered land a-head, bearing S. E. distant five leagues. As we advanced we discovered a connected chain of land. At noon we perceived that it extended from S. S. W. to E. the part nearest to us being at the distance of five leagues. We now observed in lat. 55 deg. 21 min. long. 195 deg. 18 min. E. At six o'clock A. M. we found, and found a bottom of black sand, at the depth of 48 fathoms. At this time we were four leagues from the land, and its eastern part in sight was in the direction of E. S. E. to appearance an elevated round hummock.

On Saturday the 4th, at eight o'clock, A. M. we saw the coast from S. S. W. and E. by S. and at intervals we could discern high land behind it, covered with snow. Soon after we had a calm, when all hands were employed in fishing; and as our people were now put on two thirds allowance, what each caught he might eat or sell. Fortunately for them, they caught some tons of fine fish, which proved a most seasonable supply; for the ship provisions, what with salt and maggots eating into the beef and pork, and the rats and the weavils devouring the heart of the bread, the one was little better than putrid flesh, and the other, upon breaking, would crumble into dust. Among the fish we caught with hook and line, were a great number of excellent cod. At noon we had an easterly breeze and clear weather, when we were about six leagues from the land, which extended from S. by W. to E. by S. and the hummock, seen the preceding evening, bore S. W. by S. nine leagues distant. A great hollow swell convinced us, that there was no main land westward near us. At six o'clock, P. M. we steered a northerly course, when the wind veering to the S. E. enabled us to steer E. N. E. The coast lay in this direction, and the next day, at noon, was four leagues distant. On the 6th and 7th we made but little way, the wind being northerly. On Wednesday, the 8th, the coast extended from S. S. W. to E. by N. and was all low land, and it is not improbable that this extends to a considerable distance towards the S. W. and that those places which we sometimes supposed to be inlets or bays, are nothing more than valleys between the mountains. This day we hooked plenty of fine cod.

On Thursday the 9th, in the morning, having a breeze at N. W. we steered E. by N. in order to make a nearer approach to the coast. At noon we observed in latitude 57 deg. 49 min. long. 201 deg. 33 min. E. at the distance of two leagues from land, which was observed to extend from S. by E. to N. E. being all a low coast, with points projecting in several places. In advancing towards the N. E. we had found that the depth of water gradually decreased, and the coast trended more and more northerly; but we observed the ridge of mountains behind it continued to lie in the same direction as those that were more westerly; so that the extent of the low land between the coast and the foot of the mountains insensibly increased. Both the low

and high grounds were totally destitute of wood, but apparently covered with a green turf, the mountains excepted, which were covered with snow. As we proceeded along the coast, with a light westerly breeze, the water shoaled gradually from fifteen to ten fathoms, though we were eight or ten miles distant from the shore. About eight o'clock in the evening a lofty mountain, which had been some time within sight, bore S. E. by E. distant twenty-one leagues. Several other mountains, forming the same chain, and much further distant, bore E. 3 deg. N. The coast was seen to extend as far as N. E. half N. where it seemed to terminate in a point, beyond which it was both our hope and expectation that it would assume a more easterly direction. But not long afterwards we perceived low land, that extended from behind this point, as far as N. W. by W. where it was lost in the horizon; and behind it we discerned high land, appearing in hills detached from each other. Thus the fine prospect we had of getting to the northward, vanished in an instant. We stood on till nine o'clock, and then the point before-mentioned was one league distant, bearing N. E. half E. Behind the point is a river, which, at its entrance, seemed to be a mile in breadth. The water appeared somewhat discoloured, as upon shoals; but a calm would have given it a similar aspect. It seemed to take a winding direction, through the extensive flat which lies between the chain of mountains towards the S. E. and the hills to the north-westward. It abounds, we apprehend, with salmon, as many of those fish were seen leaping before the entrance. The mouth of this river, which we distinguished by the name of Britton River, lies in lat. 58 deg. 27 min. and in long. 201 deg. 55 min. E.

On the 10th at day-break we made sail to the W. S. W. with a light breeze at N. E. At eleven o'clock A. M. thinking that the coast towards the N. W. terminated in a point, bearing N. W. by W. we steered for that point, having ordered the Discovery to keep a-head; but before that vessel had run a mile, the made a signal for shoal water. At that very time we had the depth of seven fathoms, yet before we could get the head of our ship the other way, we had less than five; but the Discovery's soundings were less than four fathoms. We now stood back three miles to the N. E. but observing a strong tide setting to the W. S. W. in a direction to the shoal, we brought the ships to anchor in ten fathoms, over a sandy bottom. Two hours after the water fell upwards of two feet, which proved that it was the tide of ebb that came from Britton River. In the afternoon the wind having shifted to the S. W. we weighed at four o'clock, and made sail towards the S. having several boats a-head employed in sounding. When we had passed over the fourth end of the shoal, in six fathoms water, we afterwards got into fifteen fathoms, in which we let go our anchors again between eight and nine in the evening; some part of the chain of mountains on the south-eastern shore being in sight, and bearing S. E. half S. and the most westerly land on the other shore bearing N. W. In the course of this day we had discerned high land which bore N. 60 deg. W.

On Saturday the 11th, at two o'clock A. M. we weighed anchor, with a gentle breeze at S. W. by W. and plied to windward till nine, when judging the flood tide to be against us, we anchored in twenty-four fathoms. At one o'clock P. M. the fog, that had this morning prevailed, dispersing, and the tide becoming favourable, we weighed and plied to the south-westward. Towards the evening we had some thunder. We had heard none before from the time of our arrival on this coast, and what we now heard was at a great distance. In the morning of the 12th we steered a N. W. course, and at ten o'clock saw the continent. At noon it extended from N. E. by N. to N. N. W. quarter W. and an elevated hill appeared in the direction of N. N. W. distant ten leagues. This we found to be an island, to which, on account of its figure, Captain Cook gave the name of Round Island. It is situated in the latitude of 58 deg. 37 min. and in longitude 200 deg. 6 min. E. distant from the continent seven

seven miles. At nine in the evening, having steered a northerly course to within three leagues of the shore, we tacked in fourteen fathoms; the extremities of the coast bearing S. E. half E. and W. We stretched along shore till two the next morning, when we suddenly got into six fathoms water, being at the same time two leagues from shore. After we had edged off a little, our depth of water gradually increased, and at noon we sounded in twenty fathoms. Round Island at this time bore N. 5 deg. E. and the western extreme of the coast N. 16 deg. W. It is an elevated point, and having calm weather while we were off it, for this reason it was named Calm Point. On the 14th and 15th, having little wind, we advanced but slowly. At times a very thick fog came on. Our soundings were from twenty-six to fourteen fathoms. We had pretty good success in fishing, for we caught plenty of cod and some flat fish.

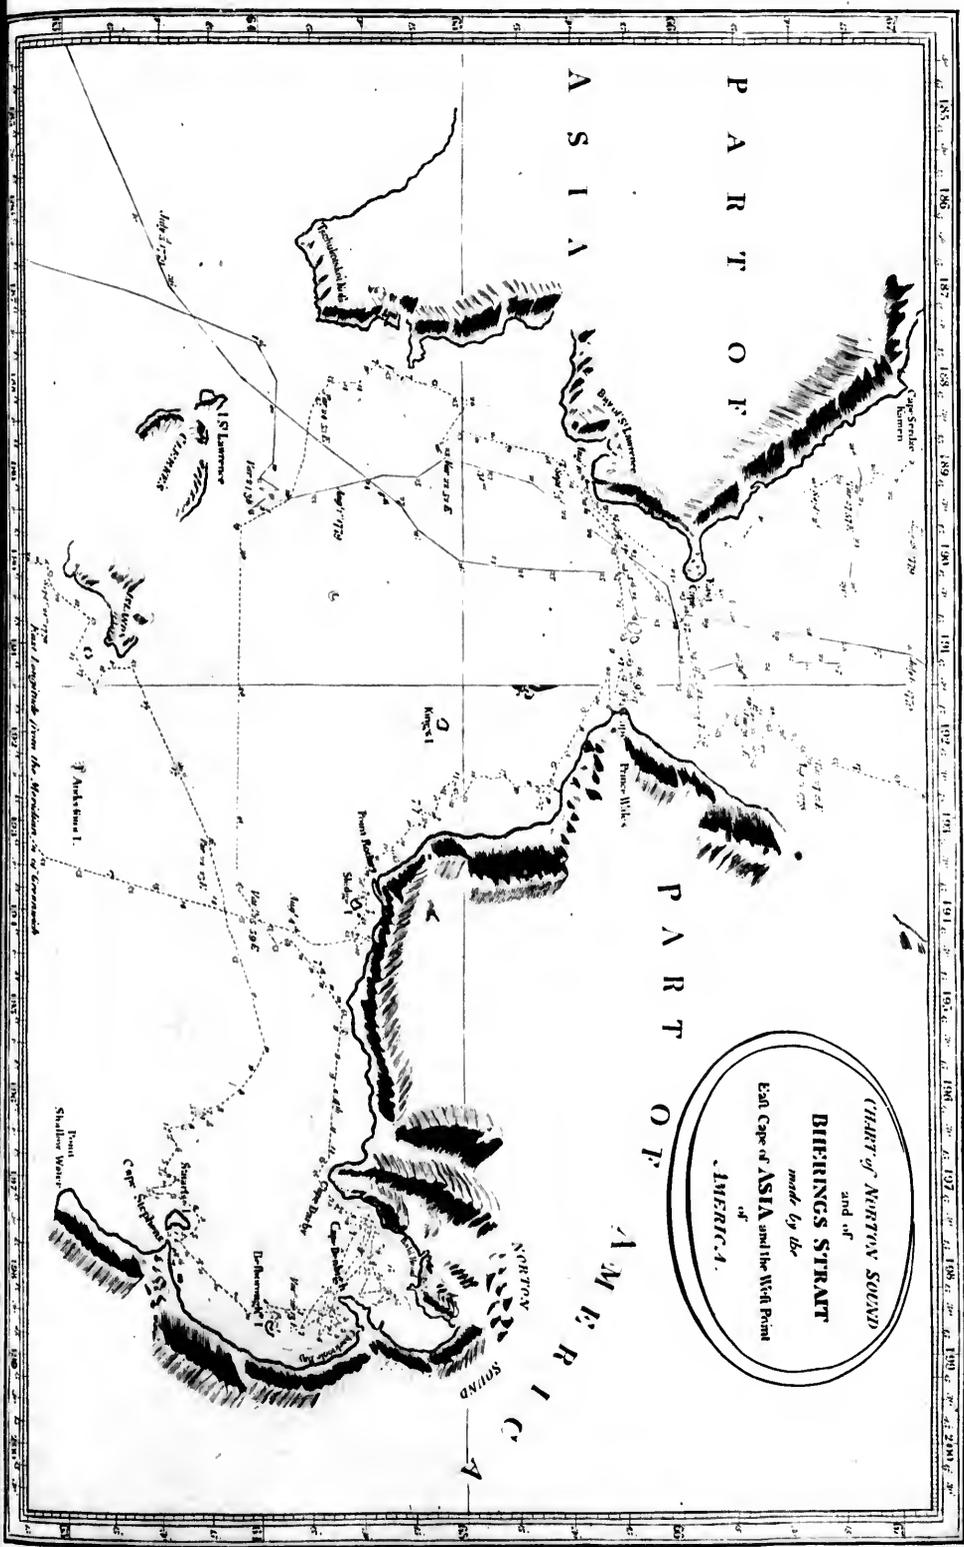

On Thursday the 16th, at five o'clock A. M. the fog clearing up, we found ourselves nearer the shore than we expected. Calm Point bore N. 72 deg. E. and a point about eight leagues from it, in a westerly direction, bore N. 3 deg. E. only three miles distant. Between these two points the coast forms a bay, in several parts of which the land could scarcely be seen from the mast-head. Another bay is on the north-western side of the last-mentioned point, between it and a high promontory, which now bore N. 36 deg. W. at the distance of sixteen miles. About nine o'clock the Commodore dispatched Lieutenant Williamson to this promontory, with orders to go ashore and observe what direction the coast took beyond it, and what might be the produce of the country; which, when viewed from the ships, had but a sterile appearance. We here found the flood-tide setting strongly towards the N. W. along the coast. At noon it was high water, and we cast anchor at the distance of twelve miles from the shore, in twenty-four fathoms. About five in the afternoon, the tide beginning to make in our favour, we weighed, and drove with it, there being no wind. When Mr. Williamson returned, he reported that he had landed on the point, and having ascended the most elevated hill, found that the most distant part of the coast in sight was nearly in a northerly direction. He took possession of the country in the name of his Britannic Majesty, and left on the hill a bottle containing a paper, on which the names of our ships and of their commanders, and the date of the discovery, were inscribed. The promontory, which he named Cape Newenham, is a rocky point, of considerable height, and is seated in latitude 58 deg. 42 min. and in longitude 197 deg. 36 min. E. Over, or within it, two lofty hills arise one behind another, of which the innermost, or easternmost, is the highest. The country, as far as Mr. Williamson could discern, produces not a single tree or shrub. The hills were naked, but on the lower grounds there grew grass and plants of various kinds, very few of which were at this time in flower. The Lieutenant met with no other animals than a doe with her fawn, and a dead sea-horse or cow that lay on the beach: of the latter animals we had seen a considerable number from the ships. Cape Newenham is the northern boundary of the extensive gulph or bay situated before the river Bristol, which, in honour of the Admiral, Earl of Bristol, received from the Commodore the distinction of Bristol Bay. Cape Ooncemak forms the southern limit of this bay, and is eighty-two leagues distant, in the direction of S. S. W. from Cape Newenham. At eight o'clock in the evening we steered to the N. W. and N. N. W. round the cape, which at noon the next day was four leagues distant, bearing S. by E. The most advanced land towards the north, bore N. 30 deg. E. and the nearest part of the coast was three leagues and a half distant. During the afternoon there was but little wind, so that by ten o'clock in the evening we had only proceeded three leagues on a northerly course.

Saturday the 18th, at eight o'clock A. M. we were steering N. by W. when the depth of water suddenly decreased to seven and five fathoms; on which account

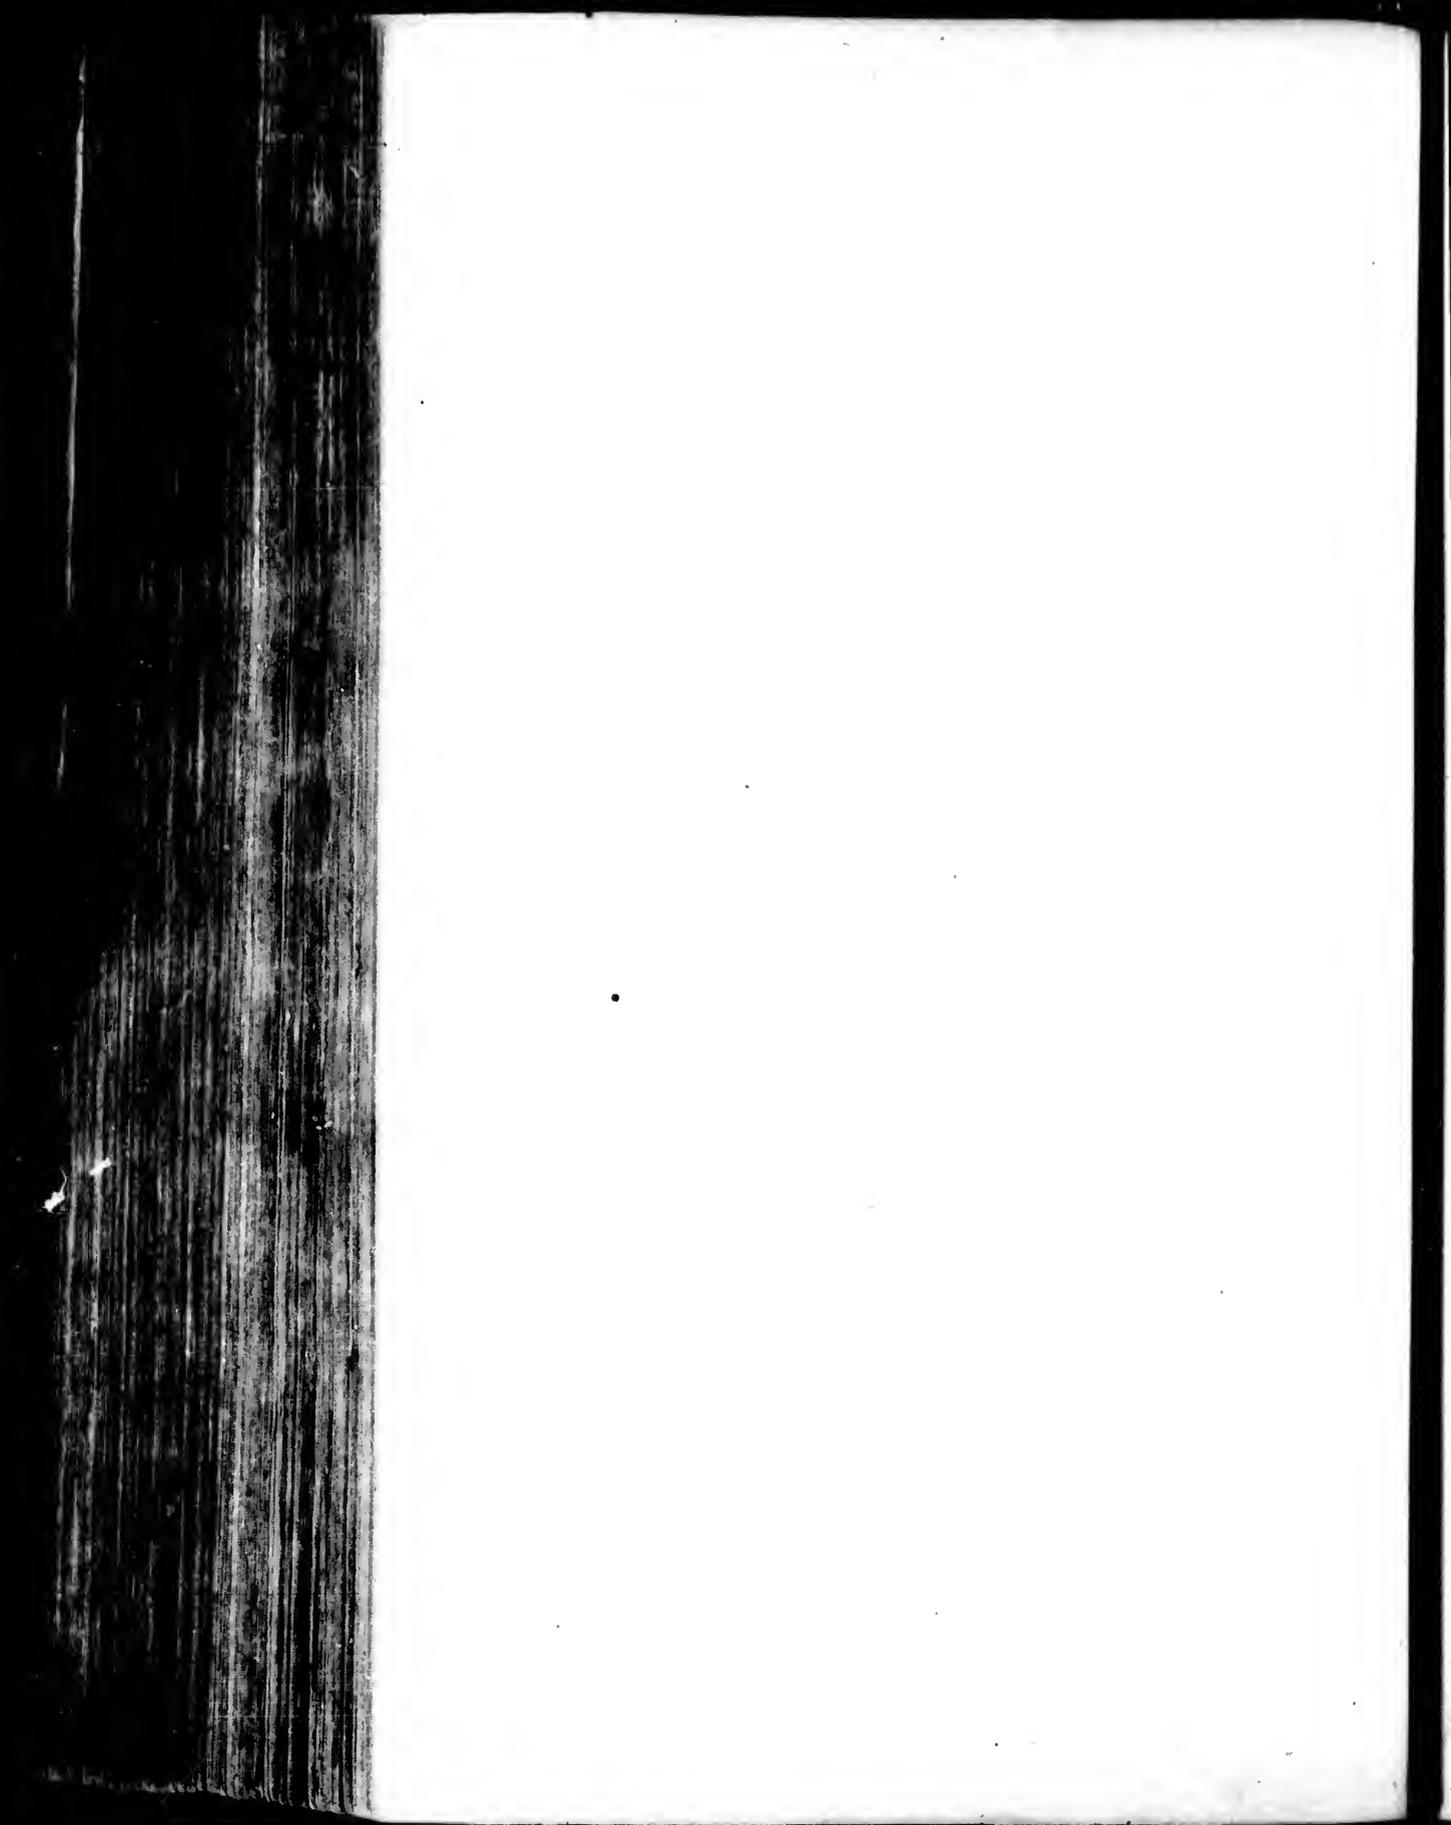

we brought to, till a boat from each of the ships was sent a-head to sound, and then we steered to the N. E. At noon, when the water deepened to seventeen fathoms, Cape Newenham was twelve leagues distant, bearing S. 9 deg. E. the north-eastern extremity of the land in sight bore N. 66 deg. E. and the distance of the nearest shore was four leagues. Our latitude was 59 deg. 16 min. N. Before one o'clock the boats a-head displayed the signal for shoal-water. They had only two fathoms; but at the same time the ships were in six. By hauling more to the north, we continued nearly in the same depth till between five and six o'clock, when our boats finding less and less water, Captain Cook made the signal to the Discovery, which was then a-head, to cast anchor, and both ships soon came to. In bringing up the Resolution, her cable parted at the clinch, so that we were obliged to make use of the other anchor. We rode in 6 fathoms water, over a bottom of sand, at the distance of about five leagues from the continent. Cape Newenham now bore S. distant 16 leagues. The highest hills we could perceive towards the north, bore N. E. by E. and low land stretched out from the more elevated parts as far as N. by E. Without this there was a shoal of stones and sand, dry at half ebb. The two masters having been sent, each in a boat, to sound between this shoal and the coast, reported, on their return, that there was a channel, in which the soundings were 6 and 7 fathoms, but that it was rather narrow and intricate. At low water, we attempted to get a hawser round the lost anchor, but did not then succeed; however being resolved not to leave it behind us, while there remained the prospect of recovering it, we persevered in our endeavours; and at length, in the evening of the 20th, we had the desired success. While thus employed, the Commodore ordered Captain Clerke to send his master in a boat to search for a passage in a S. W. direction. He accordingly did so, but could find no channel in that quarter; nor did it appear, that there was any other way to get clear of the shoals, than by returning by the same track in which we had entered: for though, by following the channel we were now in, we might, perhaps, have got farther down the coast; and though this channel might have probably carried us at last to the northward, clear of the shoals, yet the attempt would have been attended with extreme hazard, and, in case of ill-success, there would have been a great loss of time, that we could not conveniently spare. These reasons induced the Commodore to return by the way which had brought us in, and thus avoid the shoals. The latitude of our present station, by lunar observations, was 59 deg. 37 min. 20 sec. N. and our longitude 197 deg. 45 min. 48 sec. E. The most northern part of the coast that we could discern from this station, was supposed to be situate in lat. 60 deg. It formed, to appearance, a low point, to which was given the name of Shoal Neck. The tide of flood sets to the northward, and the ebb to the southward: it rises and falls five or six feet upon a perpendicular, and we reckon that it is high water at eight o'clock on the full and change days.

On Tuesday the 21st, at three o'clock A. M. having a gentle breeze at N. N. W. we set sail, with three boats a-head employed in sounding. Notwithstanding this precaution, we met with greater difficulty in returning than we had in advancing; and were at length under the necessity of anchoring, to avoid the danger of running upon a shoal that had only a depth of five feet. While we lay at anchor, twenty-seven Americans, each in a separate canoe, came off to the ships, which they approached with some degree of caution. As they advanced they hallooed, and extended their arms; thereby intimating, as we understood, their peaceable intentions, and how cordially they were ready to receive us. Some of them at last came near enough to receive a few trifling articles, which we threw to them. This gave encouragement to the others to venture along-side; and a traffic quickly commenced between them and our people, who obtained wooden vessels, bows, darts, arrows, dresses of skins, &c. in exchange for which the natives accepted whatever we offered.

offered them. They appeared to be the same sort of people with those we had met with all along this coast; and they wore in their lips and noses the same sorts of ornaments; but they were not so well clothed, and were much more dirty. We thought them to be perfectly unacquainted with any civilized nation; they were ignorant of the use of tobacco; nor did we observe in their possession any foreign article, unless a knife may be considered as such. This indeed was nothing more than a piece of common iron fitted in a handle made of wood, so as to serve the purpose of a knife. However, these people understood so well the value and use of this instrument, that it seemed to be almost the only article they thought worth purchasing. The hair of most of them was shaved, or cut short off, a few locks being left on one side and behind. They wore for a covering on their heads, a hood of skins, and a bonnet seemingly made of wood. One part of their dress, which we procured, was a kind of girdle of skin, made in a very neat manner, with trappings depending from it, and passing between the thighs, so as to conceal the adjacent parts. From the use of this girdle, it is probable, that they sometimes go in other respects naked, even in this high northern latitude; for it can scarcely be supposed that they wear it under their other cloathing. Their canoes were covered with skins, like those we had lately seen; but they were broader, and the hole wherein the person sits was wider than in any of those we had before met with. Our boats returning from founding gave them some alarm, so that they all departed sooner than perhaps they otherwise would have done.

On Wednesday the 22d, we got clear of the shoals, yet we could not venture to steer towards the west during the night, but spent it off Cape Newenham. On the 23d, at day-break, we stood to the northward, the Discovery being ordered to go a-head. When we had proceeded two leagues, our soundings decreased to six fathoms. Being apprehensive, that, if we continued this course, we should meet with less water, we hauled to the south. This course brought us gradually into 18 fathoms water; upon which we ventured to steer a little westerly, and afterwards due west, when we at length found 26 fathoms. At noon, by observation, we were in lat. 58 deg. 7 min. long. 194 deg. 22 min. east. We now steered W. N. W. the depth of water increasing gradually to 34 fathoms. On Saturday the 25th, in the evening, having little wind, and an exceeding thick fog, we let go our anchors in 30 fathoms. At six o'clock the next morning, the weather clearing up, we set sail, and stood to the northward. After we had proceeded on this course for the space of nine leagues, the wind veered to the N. so that we were obliged to steer more westerly. On Tuesday the 28th, at noon, we had clear sunshine for a few hours, during which several observa-

tions were made, which determined our lat. to be 59 deg. 55 min. and our long. 190 deg. 6 min. but the time-keeper gave 189 deg. 59 min. difference only 7 min. On the 29th, in the morning, we discovered land, bearing N. W. by W. distant 6 leagues. We stood towards it till between ten and eleven, when we tacked in 24 fathoms, being then a league from the land, which bore N. N. W. It was the south-eastern extreme, and formed a perpendicular cliff of great height; upon which it received from the Captain the name of Point Upright. Its lat. is 60 deg. 17 min. long. 187 deg. 30 min. east. More land was perceived to the westward of this point; and, at a clear interval, we discerned another portion of high land, bearing W. by S. and this seemed to be perfectly separated from the other. On Thursday, the 30th, at four o'clock P. M. Point Upright bore N. W. by N. distant 6 leagues. A light breeze now springing up at N. N. W. we steered to the north-eastward till four the next morning, when the wind veered to the east; we then tacked, and stood to the N. W. The wind, not long after, shifting to S. E. we steered N. E. by N. and continued this course with soundings, from 35 to 20 fathoms, till noon the following day.

Saturday, August the 1st, we observed in lat. 60 deg. 58 min. long. 191 deg. east. The wind now becoming north-easterly, we first made a stretch of about ten leagues towards the N. W. and then, as we observed no land in that direction, we stood back to the E. for the space of 14 or 15 leagues, and met with a considerable quantity of drift-wood. On the 2d, we had variable light winds, with showers of rain the whole day. In the morning of Monday, the 3d, we resumed our northward course. At noon, by observation, our lat. was 62 deg. 34 min. long. 192 deg. E. Between three and four o'clock this afternoon, Mr. Anderson, Captain Cook's surgeon of the Resolution, expired, after he had lingered under a consumption upwards of a twelvemonth. He was a sensible, intelligent young man; an agreeable companion; had great skill in his profession; and had acquired a considerable portion of knowledge in other branches of science. Our readers will doubtless have observed, how useful an assistant he had proved in the course of this voyage; and had it pleased God to have prolonged his life to a later period, the public might have received from him such communications on the various parts of natural history of the several places he visited, as would have abundantly shewn he was worthy of a higher commendation than we have here given him. His funeral was performed with the usual ceremonies at sea; after which Mr. Law, surgeon of the Discovery, was removed into the Resolution, and Mr. Samwell, the surgeon's first mate of the Resolution, was appointed to succeed Mr. Law as surgeon of the Discovery.

SOON after Mr. Anderson had resigned his breath, we discovered land to the westward, distant 12 leagues. We supposed it to be an island; and the Commodore, to perpetuate the memory of the de-

ceased, for whom he had a very great regard, distinguished it by the name of Anderson's Island. On Tuesday, the 4th, at three in the afternoon, we saw land extending from N. N. E. to N. W. We steered to-

wards it till four, when, being four or five miles distant from it, we tacked; and, not long afterwards, the wind failing, we let go our anchors in 13 fathoms, over a sandy bottom, at the distance of about two leagues from land. Our lat. was now 64 deg. 27 min. N. and long. 194 deg. 18 min. E. We could at intervals, discern the coast extending from E. to N. W. and an island of considerable elevation, bearing W. by N. nine miles distant. The land before us, which we imagined to be the continent of America, appeared rather low next the sea; but inland it rose in hills, which seemed to be of a tolerable height. It had a greenish hue, and was apparently destitute of wood, and free from snow. While our ships remained at anchor, we observed that the tide of flood came from the eastward, and set to the westward, till between the hours of ten and eleven; from which time, till two o'clock the next morning, the stream set to the E. and the water fell three feet. The flood running both longer and stronger than the ebb, we concluded that there was a westerly current betwixt the tide. Wednesday the 5th, at ten o'clock in the morning, we ran down, and soon after anchored between the island and the continent in seven fathoms. Not long after we had cast anchor, Captain Cook, accompanied by Mr. King and some other officers, landed upon the island. He hoped to have had from it a prospect of the coast and sea towards the west; but in that direction the fog was so thick, that the view was not more extensive than it was from our ships. The coast of the continent seemed to incline to the north, at a low point, named by us Point Rodney, which bore from the island N. W. half W. at the distance of three or four leagues; but the high land, which assumed a more northerly direction, was perceived at a much greater distance. The lat. of this island is 64 deg. 30 min. N. and its long. is 193 deg. 57 min. E. It is about 12 miles in circumference. The surface of the ground principally consists of large loose stones, covered in many places with moss and other vegetables; of which 20 or 30 different species were observed, and most of them were in flower. But the Captain saw not a tree or shrub either on the island or upon the neighbouring continent. Near the beach where he landed, was a considerable quantity of wild purslain, long-wort, pease, &c. some of which he took on board for boiling. He saw several plovers, and other small birds; a fox was also seen. He met with some decayed huts, built partly under-ground. People had lately been upon the island; and it is more than probable that they often repair to it, there being a beaten path from one end to the other. At a small distance from that part of the shore where our gentlemen landed, they found a sledge, which induced Captain Cook to give the island the appellation of Sledge Island. It appeared to be such a one as is used by the Russians in Kamtschatka, for the purpose of conveying goods from one place to another over the snow or ice. It was about 20 inches in breadth, and 10 feet in length, had a sort of rail-work on each side, and was shod with bone. Its construction was admirable, and its various parts were put together with great neatness; some with wooden pins, but for the most part with thongs or lashings of whale bone; in consequence of which, the Captain imagined that it was entirely the workmanship of the natives. We weighed anchor at three o'clock A. M. of the 6th, and made sail to the N. W. with a light breeze from the fourthward. Having afterwards but little wind, and that variable, we made but a slow progress; and, at eight o'clock in the evening, finding the ships getting into shoal-water, we anchored in seven fathoms, our distance from the coast being about two leagues. Sledge Island then bore S. 51 deg. E. nine or ten leagues distant. Soon after we had let go our anchors, the weather, which had been misty, cleared up, and we perceived high land extending from N. 40 deg. E. to N. 30 deg. W. seemingly disjoined from the coast near which we lay at anchor, which appeared to extend to the north-eastward. We at the same time saw an island bearing N. 81 deg. W. at the distance of eight or nine leagues.

It seemed to be of small extent, and was named King's Island. We rode at anchor till eight the next morning, when we weighed, and steered a N. W. course. The weather being clear towards the evening, we obtained a sight of the north-western land, distant about three leagues. We passed the night in making short boards, the weather being rainy and misty, and the wind inconsiderable. Between four and five in the morning of the 8th, we again had a sight of the N. W. land; and not long afterwards having a calm, and being driven by a current towards the shore, we thought proper to anchor in 12 fathoms water, at the distance of about two miles from the coast. Over the western extremity is a lofty peaked hill, situate in the long. of 192 deg. 18 min. E. and in the lat. of 65 deg. 30 min. N. A north-easterly breeze springing up at eight o'clock, we weighed, and made sail to the south-eastward, hoping to find a passage between this N. W. land and the coast, near which we had cast anchor in the evening of the 6th. But we quickly got into seven fathoms water, and perceived low land connecting the two coasts, and the elevated land behind it. Persuaded that the whole was a continued coast, we now tacked and steered for its north-western part, near which we anchored in 17 fathoms. The weather at present was very thick and rainy; but at four the next morning it cleared up, and enabled us to discern the neighbouring land. A lofty steep rock or island bore W. by S. another island to the northward of it, and considerably larger, bore W. by N. the peaked hill before mentioned, S. E. by E. and the point that was under it, S. 22 deg. E. Under this hill is some low land, extending towards the N. W. the extreme point of which was now about one league distant, bearing N. E. by E. Over it, and also beyond it, we observed some high land, which we imagined was a continuation of the continent. This point of land, which the Commodore distinguished by the name of Cape Prince of Wales, is the western extreme of all America hitherto known. It stands in the long. of 191 deg. 45 min. E. and in the lat. of 65 deg. 46 min. N. We fancied that we saw some people on the coast; and perhaps we were not mistaken in our supposition, as some elevations like flags, and others resembling huts, were observed at the same place. This morning, at eight o'clock, a faint northerly breeze arising, we weighed anchor; but our sails were scarcely set, when it began to blow and rain with great violence, there being at the same time misty weather. The wind and current were in contrary directions, raising such a sea, that it often broke into the ship. Having pled to windward with little effect till two o'clock in the afternoon, we stood for the island which we had perceived to the westward, intending to cast anchor under it till the gale should abate. But upon our near approach to this island, we found that it was composed of two small islands, neither of which exceeded three or four leagues in circumference. As these could afford us little shelter, we did not come to an anchor, but continued to stretch towards the W. and about eight o'clock in the evening we saw land extending from N. N. W. to W. by S. the distance of the nearest part being six leagues. We stood on till ten o'clock, and then made a board towards the E. in order to pass the night.

On Monday the 10th, at break of day, we resumed our westward course for the land seen by us the preceding evening. At eleven minutes after seven o'clock, it extended from S. 72 deg. W. to N. 41 deg. E. Betwixt the fourth-western extremity, and a point bearing W. six miles distant, the coast forms a spacious bay, in which we dropped our anchors at ten in the forenoon, about two miles from the northern shore, over a gravelly bottom, at the depth of ten fathoms. The northern point of this bay bore N. 43 deg. E. its southern point S. 58 deg. W. the bottom of the bay, N. 60 deg. W. between two and three leagues distant, and the two islands that we had passed the preceding day, were at the distance of 14 leagues, bearing N. 72 deg. E. When steering for this bay we observed, on the

north shore, a village, and some people, who seemed to have been thrown into confusion, or fear, at the sight of our vessel. We could plainly perceive persons running up the country with burdens upon their shoulders. At this village Captain Cook proposed to land; and accordingly went with three armed boats, accompanied by some of the officers. Thirty or forty men, each of whom was armed with a spontoon, a bow, and arrows, stood drawn up on an eminence near the houses; three of them came down towards the shore, on the approach of our gentlemen, and were so polite as to pull off their caps, and make them low bows. Though this civility was returned, it did not inspire them with sufficient confidence to wait for the landing of our party; for, the instant they put the boats ashore, the natives retired. Captain Cook followed them alone, without any thing in his hand; and, by signs and gestures, prevailed on them to stop, and accept some trifling presents: in return for these, they gave him two fox-skins, and a couple of sea-horse teeth. The Captain was of opinion, that they had brought these articles down with them for the purpose of presenting them to him; and that they would have given them to him, even if they had expected no return. They seemed very timid and cautious: intimating their desire, by signs, that no more of our people should be suffered to come up. On the Captain's laying his hand on the shoulder of one of them, he started back several paces; in proportion as he advanced, they retreated, always in the attitude of being ready to make use of their spears; while those on the eminence were prepared to support them with their arrows. Insensibly, the Captain, and two or three of his companions, introduced themselves among them. The distribution of a few beads among some of them, soon created a degree of confidence, so that they were not alarmed, when the Captain was joined by a few more of his people; and, in a short time, a kind of traffic was entered into. In exchange for tobacco, knives, beads, and other articles, they gave a few arrows, and some of their clothing; but nothing that our people had to offer, could induce them to part with a spear or a bow. These they held in continual readiness, never quitting them, except at one time, when four or five persons laid theirs down, while they favoured our party with a song and a dance; and even then, they placed them in such a manner, that they could lay hold of them in a moment. Their arrows were pointed either with stone or bone, but very few of them had barbs; and some of them had a round blunt point. What use these are applied to we cannot say, unless it be to kill small animals without damaging the skin. Their bows were such as we had observed on the American coast: their spontoons, or spears, were of iron or steel, and of European or Asiatic workmanship; and considerable pains had been taken to embellish them with carving, and inlayings of brass, and of a white metal. Those who stood with bows and arrows in their hands, had the spear slung by a leathern strap over their right shoulder. A leathern quiver, slung over their left shoulder served to contain arrows; and some of these quivers were exceedingly beautiful, being made of red leather, on which was very neat embroidery, and other ornaments. Several other things, and particularly their cloathing, indicated a degree of ingenuity far surpassing what any one would expect to find among so northern a people.

The Americans we had seen since our arrival on that coast, had round chubby faces, and high cheek-bones, and were rather low of stature. The people among whom we now were, far from resembling them, had long visages, and were stout and well made: upon the whole, they appeared to be a very different nation. No women, nor children of either sex, were observed, nor any aged persons, except one man, whose head was bald, and he was the only one who bore no arms: the others seemed to be select men, and rather under than above the middle age. The elderly man had a black mark across his face, which was not perceived in any of the others; all of them had their ears perforated, and some had glass beads hanging to them. These

were the only fixed ornaments seen about them, for they wear none to their lips: this is another particular, in which they differ from the Americans we had lately seen. Their apparel consisted of a pair of breeches, a cap, a frock, a pair of boots, and a pair of gloves, all made of the skins of deer, dogs, seals, and other animals, and extremely well dressed; some with the hair or fur on, and others without it. The caps were made in such a manner, as to fit the head very close; and besides these caps, which were worn by most of them, we procured from them some hoods, made of dog-skins, that were sufficiently large to cover both head and shoulders. Their hair was apparently black, but their heads were either shaved, or the hair cut close off, and none of them wore beards. Of the few articles which they obtained from our people, knives and tobacco were what they set the most value upon.

In the village we saw both their winter and their summer habitations; the former are exactly like a vault, the floor of which is sunk below the surface of the earth. One of them, which Captain Cook examined, was of an oval figure, about twenty feet in length, and twelve or more in height; the framing consisted of wood, and the ribs of whales, judiciously disposed, and bound together with smaller materials of the same kind. Over this framing, a covering of strong coarse grafs was laid, and that again was covered with earth; so that on the outside, the house had the appearance of a little hillock, supported by a wall of stone, of the height of three or four feet, which was built round the two sides, and one end. At the other end of the habitation, the earth was raised sloping, to walk up to the entrance, which was by a hole in the top of the roof, over that end. The floor was boarded, and under it was a sort of cellar, in which the Captain saw nothing but water: at the end of each house was a vaulted room, which he supposed was a store-room. These store-rooms communicated, by a dark passage, with the house; and with the open air, by a hole in the roof, which was even with the ground one walked upon; but they cannot be said to be entirely below ground; for one end extended to the edge of the hill, along which they were made, and which was built up with stone. Over it stood a kind of fentry box, or tower, formed of the large bones of great fish. Their summer huts were of a tolerable size, and circular, being brought to a point at the top. Slight poles and bones, covered with the skins of sea animals, composed the framing. Captain Cook examined the inside of one: there was a fire-place just within the door, where a few wooden vessels were deposited, all very dirty. Their bed-places were close to the side, and occupied about one-half of the circuit: some degree of privacy seemed to be observed; for there were several partitions, made with skins. The bed and bedding consisted of deer-skins, and most of them were clean and dry. About the houses were erected several stages, ten or twelve feet in height, such as we had seen on some parts of the American coast. They were composed entirely of bones, and were apparently intended for drying their fish and skins, which were thus placed out of the reach of their dogs, of which they had great numbers. These dogs are of the fox kind, rather large, and of different colours, with long soft hair, that resembles wool. They are, in all probability, used for the purpose of drawing their sledges in winter; for it appears that they have sledges, as the Captain saw many of them laid up in one of their winter huts. It is, likewise, not improbable, that dogs constitute a part of their food, for several lay dead, which had been killed that morning. The canoes of these people are of the same kind with those of the northern Americans, some, both of the large and small sort, being seen lying in a creek, near the village. From the large bones of fish, and other sea-animals, it appeared, that the sea furnished them with the greater part of their subsistence. The country seemed extremely barren, as our gentlemen saw not a tree or shrub. At some distance towards the west, they observed a ridge of mountains covered with snow, that had fallen not long before.

Some of us at first, supposed this land to be a part of the island of Alafchka, laid down in Mr. Stæhlin's map before mentioned; but from the appearance of the coast, the situation of the opposite shore of America, and from the longitude, we soon conjectured that it was, more probably, the country of the Tschutki, or the eastern extremity of Asia, explored by Beering in the year 1728. In admitting this, however, without farther examination, we must have pronounced Mr. Stæhlin's map, and his account of the new northern Archipelago, to be either remarkably erroneous, even in latitude, or else to be a mere fiction; a judgment which we would not presume to pass, upon a publication so respectably vouched, without producing the most decisive proofs. Our party having remained with these people between two and three hours, they returned on board; and, soon after, the wind becoming southerly, we weighed anchor, stood out of the bay, and steered to the N. E. between the coast and the two islands. At noon, the next day, August 11, the former extended from S. 80 deg. W. to N. 84 deg. W. the latter bore S. 40 deg. W. and the peaked hill, over Cape Prince of Wales, bore S. 36 deg. E. The latitude of the ship was 66 deg. 5 min. N. the longitude 191 deg. 19 min. E. our soundings were 28 fathoms; and our position nearly in the middle of the channel, between the two coasts, each being at the distance of about seven leagues. From this station we steered to the eastward, in order to make a nearer approach to the American coast. In this course the water gradually shoaled; and there being very little wind, and all our endeavours to encrease our depth failing, we were obliged at last to cast anchor in six fathoms: which was the only remedy remaining, to prevent the ships driving into more shallow water. The nearest part of the western land bore W. 12 leagues distant: the peaked mountain over Cape Prince of Wales, bore S. 16 deg. W. and the most northern part of the American continent in sight, E. S. E. the distance of the nearest part being about four leagues. After we had anchored, a boat was dispatched to sound, and the water was found to shoal gradually towards the land. While our ships lay at anchor, which was from six to nine in the evening, we perceived little or no current, nor did we observe that the water rose or fell. A northerly breeze springing up, we weighed, and made sail to the westward, which course soon brought us into deep water; and, during the 12th, we plied to the northward in sight of both coasts, but we kept nearest to that of America. On the 13th, at four in the afternoon, a breeze arising at S. we steered N. E. by N. till four o'clock the next morning, when, seeing no land, we directed our course E. by N. and between the hours of nine and ten, land appeared, which we supposed was a continuation of the continent. It extended from E. by S. to E. by N. and, not long afterwards, we descried more land, bearing N. by E. Coming rather suddenly into 13 fathoms water, at two in the afternoon, we made a trip off till four, when we again stood in for the land; which, soon after, we saw, extending from N. to S. E. the nearest part being at the distance of three or four leagues. The coast here forms a point, named by us Point Mulgrave, which is situated in the latitude of 67 deg. 45 min. N. and in the longitude of 194 deg. 51 min. E. The land seemed to be very low near the sea, but a little farther it rises into hills of a moderate height; the whole was free from snow, and apparently destitute of wood. We now tacked, and bore away N. W. by W. but, in a short time afterwards, thick weather, with rain, coming on, and the wind increasing, we hauled more to the westward.

Saturday the 15th, at two o'clock A. M. the wind veered to S. W. by S. and blew a strong gale, which abated towards noon. We now stood to the N. E. till six the next morning, when we steered rather more easterly: in this run, we met with several sea-horses, and great numbers of birds; some of which resembled sand-larks, and others were not larger than hedge-sparrows. We also saw some shags, so that we judged we were not far from land; but, having a thick fog, we could not expect to see any; and as the wind blew strong,

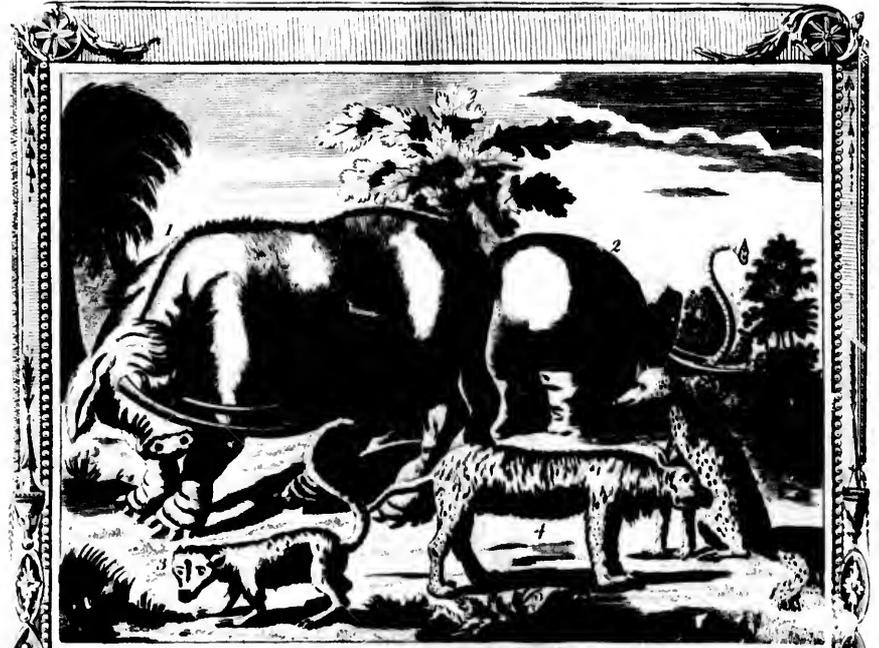

it was not deemed prudent to continue a course which was most likely to bring us to it. From the noon of this day, to six o'clock in the morning of the following, we steered E. by N. a course which brought us into fifteen fathoms water. We now steered N. E. by E. thinking, by such a course, to increase our depth of water. But in the space of six leagues, it shoaled to 11 fathoms, which induced us to haul close to the wind, that now blew at W. About twelve o'clock, both sun and moon were clearly seen at intervals, and we made some hasty observations for the longitude, which, reduced to noon, when the latitude was 70 deg. 33 min. N. gave 197 deg. 41 min. E. The time-keeper, for the same time, gave 198 deg. In the forenoon, we perceived a brightness in the northern horizon, like that reflected from ice, usually called the blink. Little notice was taken of it, from a supposition that it was improbable we should so soon meet with ice. The sharpness of the air, however, and gloominess of the weather, for the two or three preceding days, seemed to indicate some sudden change. About an hour afterwards, the sight of an enormous mass of ice, left us no longer in any doubt respecting the cause of the brightness of the horizon. Between two and three o'clock, we tacked close to the edge of the ice, in 22 fathoms water, being then in the latitude of 70 deg. 41 min. north, and unable to stand on any farther, for the ice was perfectly impenetrable, and extended from W. by S. to E. by N. as far as the eye could reach. Here we met with great numbers of sea-horses, some of which were in the water, but far more upon the ice. The Commodore had thoughts of hoisting out the boats to kill some of these animals: but, the wind freshening, he gave up the design; and we continued to ply towards the south, or rather towards the west, for the wind came from that quarter. We made no progress; for, at twelve on the 18th, our latitude was 70 deg. 44 min. north, and we were almost five leagues farther to the east. We were, at present, close to the edge of the ice, which was as compact as a wall, and appeared to be at least ten or twelve feet in height: but, farther northward, it seemed to be much higher. Its surface was exceedingly rugged, and, in several places, we saw pools of water upon it. We now stood to the south, and, after running six leagues, shoaled the water to seven fathoms; but it soon increased to the depth of nine fathoms. At this time, the weather, which had been hazy, becoming clearer, we saw land extending from S. to S. E. by E. at the distance of three or four miles. The eastern extremity forms a point, which was greatly encumbered with ice, on which account it was distinguished by the name of Icy Cape. Its latitude is 70 deg. 29 min. north, and its longitude 198 deg. 20 min. east. The other extreme of the land was lost in the horizon; and we had no doubt of its being a continuation of the continent of America. The Discovery being about a mile astern, and to leeward, met with less depth of water than we did; and tacking on that account, the Commodore was obliged to tack also, to prevent separation. Our present situation was very critical. We were upon a lee-shore in shoal water; and the main body of the ice to windward, was driving down upon us. It was evident, that if we continued much longer between it and the land, it would force us ashore, unless it should chance to take the ground before us. It appeared almost to join the land to leeward, and the only direction that was free from it was to the south westward. After making a shore board to the north, Captain Cook made a signal for the Discovery to tack, and his ship tacked at the same time. The wind proved in some measure favourable, so that we lay up S. W. and S. W. by W.

Wednesday the 19th at eight in the morning, the wind veering to west, we tacked to the northward; and, at twelve, the latitude was 70 deg. 6 min. north, and the longitude 196 deg. 42 min. east. In this situation, we had a considerable quantity of drift ice about our ships, and the main ice was about two leagues to the north. Between one and two, we got in with the edge of it. It was less compact than that which we had observed to-

wards the north; but it was too close, and in too large pieces to attempt forcing the ships through it. We saw an amazing number of sea-horses on the ice, and as we were in want of fresh provisions, the boats from each ship were dispatched to procure some of them. By seven in the evening, we had received, on board the *Resolution*, nine of these animals; which, till this time, we had supposed to be sea-cows; so that we were greatly disappointed, particularly some of the sailors, who, on account of the novelty of the thing, had been feasting their eyes for some days past. Nor would they now have been disappointed, nor have known the difference, if there had not been two or three men on board, who had been in Greenland, and declared what animals these were, and that no person ever eat of them. Notwithstanding this, we made them serve us for provisions, and there were few of our people who did not prefer them to our salt meat. The fat of these animals is, at first, as sweet as marrow; but, in a few days, it becomes rancid, unless it is salted, in which state it will keep much longer. The lean flesh is coarse and blackish, and has a strong taste; but the heart is almost as well tasted as that of a bullock. The fat, when melted, affords a good quantity of oil, which burns very well in lamps; and their hides, which are of great thickness, were extremely useful about our rigging. The teeth, or tusks, of most of them were, at this time, of a very small size; even some of the largest and oldest of these animals, had them not exceeding half a foot in length. Hence we concluded, that they had lately shed their old teeth. They lie upon the ice in herds of many hundreds, huddling like swine, one over the other; and they roar very loud; so that in the night, or when the weather was foggy, they gave us notice of the vicinity of the ice, before we could discern it. We never found the whole herd sleeping, some of them being constantly upon the watch. These, on the approach of the boat would awake those that were next to them; and the alarm being thus gradually communicated, the whole herd would presently be awake. However, they were seldom in a hurry to get away, before they had been once fired at. Then they would fall into the sea, one over the other in the utmost confusion; and, if we did not happen, at the first discharge, to kill those we fired at, we generally lost them, though mortally wounded. They did not appear to us to be so dangerous as some authors have represented them, not even when they were attacked. They are, indeed, more so, in appearance, than in reality. Vast multitudes of them would follow, and come close up to the boats; but the flash of a musket in the pan, or even the mere pointing of one at them, would send them down in a moment. The female will defend her young one to the very last, and at the expence of her own life, whether upon the ice or in the water. Nor will the young one quit the dam, though she should have been killed; but, if you destroy one, you are sure of the other. The female, when in the water, holds her young one between her fore fins. Mr. Pennant, in his Synopsis of Quadrupeds, has given a very good description of this animal under the name of the Arctic Walrus. Why it should be called a sea-horse, is difficult to determine, unless the word be a corruption of the Russian name *Morse*; for they do not in the least resemble a horse. It is, doubtless, the same animal that is found in the Gulf of St. Lawrence, and there called a sea-cow. It is certainly more like a cow than a horse; but this resemblance consists in nothing but the snout. In short, it is an animal not unlike a seal, but incomparably larger. The length of one of them, which was none of the largest, was nine feet four inches from the snout to the tail, the circumference of its body at the shoulder, was seven feet ten inches; its circumference near the hinder fins was five feet six inches, and the weight of the carcass, without the head, skin, or entrails, was eight hundred and fifty-four pounds. The head weighed forty-one pounds and a half, and the skin two hundred and five pounds. It may not be improper to remark, that, for some days before this time, we had often seen flocks of ducks flying to the south. They were of two spe-

No. 68.

cies, the one much larger than the other. The larger sort was of a brown colour; and of the small sort, either the duck or drake was black and white, and the other brown. Some of our people said that they also saw geese. This seems to indicate, that there must be land to the northward, where these birds, in the proper season, find shelter for breeding, and whence they were now on their return to a warmer climate.

After we had got our sea-horses on board, we were, in a manner, surrounded with the ice; and had no means of clearing it, but by steering to the southward, which we did till three o'clock the next morning, with a light westerly breeze, and, in general, thick, foggy weather. Our soundings were from 12 to 15 fathoms. We then tacked and stood to the northward till ten o'clock, when the wind shifting to the N. we stood to the W. S. W. and W. At two in the afternoon, we fell in with the main ice, and kept along the edge of it, being partly directed by the roaring of the sea-horses, for we had an exceeding thick fog. Thus we continued sailing till near midnight, when we got in among the loose pieces of ice. The wind being easterly, and the fog very thick, we now hauled to the southward; and, at ten the next morning, the weather clearing up, we saw the American continent, extending from S. by E. to E. by S. and, at noon, from S. W. half S. to E. the distance of the nearest part being five leagues. We were at present in the latitude of 69 deg. 32 min. N. and in the longitude of 195 deg. 48 min. E. and, as the main ice was not far from us, it is evident, that it now covered a part of the sea; which, a few days before, had been free from it; and that it extended farther towards the S. than where we first fell in with it. During the afternoon we had but little wind; and the master was sent in a boat to observe whether there was any current, but he found none. We continued to steer for the American land till eight o'clock, in order to obtain a nearer view of it, and to search for a harbour; but seeing nothing that had the appearance of one, we again stood to the N. with a gentle westerly breeze. At this time, the coast extended from S. W. to E. the nearest part being at the distance of four or five leagues. The southern extreme seemed to form a point, to which the name of Cape Lithburne was given. It is situate in the latitude of 69 deg. 5 min. N. and in the longitude of 194 deg. 42 min. E. and appeared to be tolerably high land, even down to the sea; but there may be low land under it, which we might not then see, being not less than ten leagues distant from it. In almost every other part, as we advanced to the north, we had found a low coast, from which the land rises to a moderate height. The coast now before us was free from snow, except in one or two places, and had a greenish hue. But we could not discern any wood upon it.

Saturday the 22d, the wind was southerly, and the weather for the most part foggy, with some intervals of sunshine. At eight in the evening, we had a calm, which continued till midnight, when we heard the surge of the sea dashing against the ice, and had many loose pieces about us. A light piece now arose at N. E. and the fog being very thick, we steered to the S. to get clear of the ice. At eight the next morning, the fog dispersed, and we hauled towards the W. for the Commodore finding we could not get to the N. near the coast, by reason of the ice, resolved to try what could be done at a distance from it; and as the wind seemed to be fixed at N. he considered it as a favourable opportunity. In our progress to the westward, the water gradually deepened to 28 fathoms. With the northerly wind the air was sharp and cold; and we had fogs, sunshine, showers of snow and sleet alternately. On the 26th, at ten in the morning, we fell in with the ice. At twelve, it extended from N. W. to E. by N. and seemed to be thick and compact. We were now, by observation, in the latitude of 69 deg. 36 min. N. and in the longitude of 184 deg. E. and it appeared that we had no better prospect of getting to the N. here, than nearer the shore. We continued steering to the W. till five in the afternoon, when we were, in some degree, embayed by the ice, which was very close in the

the Macegar Fair
and Duke's Head.

N. W. and N. E. quarters, with a great quantity of loose ice about the edge of the main body. At this time, we had baffling light airs, but the wind soon settled at S. and increased to a fresh gale, accompanied with showers of rain. We got the tack aboard, and stretched to the E. as this was the only direction in which the sea was free from ice.

Thursday the 27th, at four o'clock, A. M. we tacked and stood to the westward, and at seven o'clock in the evening, we were close in with the edge of the ice, which lay E. N. E. and W. S. W. as far in each of those directions as the eye could reach. There being but little wind, Captain Cook went with the boats, to examine the state of the ice. He found it consisting of loose pieces, of various extent, and so close together, that he could scarcely enter the outer edge with a boat; and it was as impracticable for the ships to enter it, as if it had been so many rocks. He particularly remarked, that it was all pure transparent ice, except the upper surface, which was rather porous. It seemed to be wholly composed of frozen snow, and to have been all formed at sea. For, not to insist on the improbability of such prodigious masses floating out of rivers, none of the productions of the land were found incorporated, or mixed with it; which would certainly have been the case, if it had been formed in rivers, either great or small. The pieces of ice that formed the outer edge of the main body, were from forty to fifty yards in extent, to four or five; and the Captain judged, that the larger pieces reached thirty feet or more, under the surface of the water. It is thought it highly improbable, that this ice could have been the production of the preceding winter. He was rather inclined to suppose it to have been the production of many winters. It was equally improbable, in his opinion, that the little that now remained of the summer, could destroy even the tenth part of what now subsisted of this great mass; for the sun had already exerted upon it the full force and influence of his rays. The sun, indeed, according to his judgment, contributes very little towards reducing these enormous masses. For though that luminary is above the horizon a considerable while, it seldom shines out for more than a few hours at a time, and frequently is not seen for several successive days. It is the wind, or rather the waves raised by the wind, that brings down the bulk of these prodigious masses, by grinding one piece against another, and by undermining and washing away those parts which are exposed to the surge of the sea. This was manifest, from the Captain's observing, that the upper surface of many pieces had been partly washed away, while the base, or under part, continued firm for several fathoms round that which appeared above water, like a shoal round a high rock. He measured the depth of water upon one, and found that it was 15 feet, so that the ships might have sailed over it. If he had not measured this depth, he would have been unwilling to believe, that there was a sufficient weight of ice above the surface, to have sunk the other so much below it. It may thus happen, that more ice is destroyed in one tempestuous season, than is formed in several winters, and an endless accumulation of it is prevented. But that there is constantly a remaining store, will be acknowledged by every one who has been upon the spot. A thick fog, which came on while the Commodore was thus employed with the boats, hastened him aboard sooner than he could have wished, with one sea-horse to each ship. Our party had killed many, but could not wait to bring them off. The number of these animals, on all the ice that we had seen, is really astonishing. We spent the night standing off and on, among the drift ice, and at nine o'clock the next morning, the fog having in some degree dispersed, boats from each of the ships were dispatched for sea-horses; for our people by this time began to relish them, and those we had before furnished ourselves with, were all consumed. At noon, our latitude was 69 deg. 17 min. N. our longitude 183 deg. E. and our depth of water was 25 fathoms. At two in the afternoon, having got on board as many sea-horses as were deemed sufficient, and the

wind freshening at S. S. E. we hoisted in the boats, and steered to the S. W. But being unable to weather the ice upon this tack, or to go through it, we made a board to the eastward, till about eight o'clock, then resumed our course to the S. W. and were obliged before midnight to tack again, on account of the ice. Not long after, the wind veering to the N. W. and blowing a stiff gale, we stretched to the S. W. close hauled.

Friday the 29th, in the morning, we saw the main ice towards the N. and soon after, perceived land bearing S. W. by W. In a short time after this, more land was seen, bearing W. It shewed itself in two hills, resembling islands, but soon the whole appeared connected. As we made a nearer approach to the land, the depth of water decreased very fast, so that, at twelve o'clock, when we tacked, we found only eight fathoms; being three miles from the coast, which extended from S. 30 deg. E. to N. 60 deg. W. the latter extremity terminating in a bluff point, being one of the hills mentioned before. The weather was now very hazy, with drizzling rain; but, soon afterwards, it cleared up, particularly to the southward, westward, and northward. This enabled us to have a tolerable view of the coast; which resembles, in every respect, the opposite coast of America; that is, low land next the sea, with higher land farther back. It was totally destitute of wood, and even of snow; but was, probably, covered with a mossy substance, that gave it a brownish hue. In the low ground that lay between the sea and the high land, was a lake, extending to the south-eastward farther than we could see. As we stood off, the molt westerly of the two hills above-mentioned, came open off the bluff point, in a N. W. direction. It had the appearance of an island, but it might perhaps be connected with the other by low land, though we did not see it. And if that be the case, there is a two-fold point, with a bay between them. This point, which is rocky and steep, received the name of Cape North. It is situated nearly in the latitude of 68 deg. 56 min. N. and in the longitude of 180 deg. 51 min. E. The coast beyond it doubtless assumes a very westerly direction; for we could discern no land to the northward of it, though the horizon was there pretty clear. Wishing to see more of the coast to the westward, we tacked again, at two in the afternoon, thinking we should be able to weather Cape North; but finding we could not, the wind freshening, a thick fog arising, with much snow, and being apprehensive of the ice coming down upon us, the Commodore relinquished the design he had formed of plying to the westward, and again stood off shore. The season was now so far advanced, and the time when the froit generally sets in was so near, that Captain Cook did not think it consistent with prudence, to make any farther attempts to discover a passage into the Atlantic Ocean this year, in any direction, so small was the probability of success. His attention was now directed to the search of some place, where we might recruit our wood and water; and the object that principally occupied his thoughts was, how he should pass the winter, so as to make some improvements in navigation and geography, and, at the same time, be in a condition to return to the northward the ensuing summer, to prosecute his search of a passage into the Atlantic. Having stood off till our soundings were eighteen fathoms, we made sail to the eastward, along the coast, which, we were now pretty well convinced, could only be the continent of Asia. The wind blowing fresh, and there being, at the same time, a thick mist, and a very heavy fall of snow, it was requisite that we should proceed with particular caution: we therefore brought to, for a few hours, in the night. Early the next morning, the 30th, we steered such a course as we judged most likely to bring us in with the land, being guided, in a great measure, by the land; for the weather was extremely thick and gloomy, with incessant showers of snow. At ten o'clock we obtained a sight of the coast, which was at the distance of four miles, bearing S. W. Soon afterwards, our depth of water having decreased to seven fathoms, we hauled off. A very low point now bore S. S. W. distant two or three miles; to the eastward of which

which there seemed to be a narrow channel, that led into some water which we saw over the point. It is not improbable, that the lake above-mentioned communicates here with the sea. At noon, the mist dispersing, we had a view of the coast, which extended from S. E. to N. W. by W. Some parts of it were apparently higher than others; but the greatest part of it was rather low, with high land farther up the country. It was almost entirely covered with snow, which had fallen very lately. We ranged along the coast, at the distance of about two leagues, till ten o'clock in the evening, when we hauled off; but resumed our course early on the following morning, when we had another view of the coast, extending from W. to S. E. by S. At eight o'clock the eastern part bore S. and was found to be an island, which at twelve was four or five miles distant, bearing S. W. half S. It is of a moderate height, between four and five miles in circumference, with a steep rocky coast. It is situate in the lat. of 67 deg. 45 min. N. about three leagues from the continent; and is distinguished in the chart by the appellation of Burney's Island. The inland country about this part abounds with hills, some of which are of considerable elevation. The land in general was covered with snow, except a few spots on the coast, which still continued to be low, but somewhat less so than farther towards the W. During the two preceding days, the mean height of the mercury in the thermometer had been frequently below the freezing point, and in general, very little above it; inasmuch that the water in the vessels upon deck, was often covered with a sheet of ice. We continued to steer S. S. E. almost in the direction of the coast, till five o'clock in the afternoon, when we saw land bearing S. 50 deg. E. which proved to be a continuation of the coast. We hauled up for it without delay; and at ten in the evening, being a-breadth of the eastern land, and doubtful of weathering it, we tacked, and made a board towards the W. till after one o'clock the next morning.

Tuesday, the 1st of September, we again made sail to the E. The wind was now very unsettled, continually varying from N. to N. E. Between eight and nine, the eastern extremity of the land was at the distance of six or seven miles, bearing S. by E. A head-land appeared at the same time, bearing E. by S. half S. and not long after we could discern the whole coast that lay between them, and a little island at some distance from it. The coast now in sight seemed to form several rocky points, that were connected by a low shore, without any appearance of an harbour. At a distance from the sea, many hills presented themselves to our view, the highest of which were involved in snow; in other respects, the whole country had a naked aspect. At seven o'clock in the evening, two points of land beyond the eastern head, opened off in the direction of S. 37 deg. E. Captain Cook was now convinced of what he had before imagined, that this was the country of the Tschutski, or the north-eastern coast of Asia; and that Beering had proceeded thus far in the year 1728; that is, to this head, which, according to Muller, is denominated Serdze Kamen, on account of a rock upon it, that is of the figure of a heart. There are indeed many high rocks on this cape, some one or other of which may perhaps be shaped like a heart. It is a promontory of tolerable height, with a steep rocky cliff fronting the sea. Its lat. is 67 deg. 3 min. N. and its long. 188 deg. 11 min. E. To the E. of it the coast is elevated and cold; but to the W. it is low, and extends N. W. by W. and N. N. W. and it is nearly of the same direction all the way to Cape North. The depth of water is every where the same at an equal distance from the shore; and this is likewise the case on the opposite coast of America. The greatest depth we met with, as we ranged along it, was 23 fathoms. During the night, or in thick foggy weather, the soundings are no bad guide to those who sail along either of these coasts. On the 2d, at eight in the morning, the most advanced land to the south-eastward, bore S. 25 deg. E. and, from this particular

point of view, had an insular appearance. But the thick showers of snow that fell in quick succession, and settled on the land, concealed from our sight at this time a great part of the coast. In a short time after, the sun, which we had not seen for near five days, broke out during the intervals between the showers, by which means the coast was in some degree freed from the fog, so that we obtained a sight of it, and found that the whole was connected. The wind was still northerly, the air was cold, and the mercury in the thermometer did not rise above 35 deg. and was sometimes not higher than 30 deg. At 12 o'clock our lat. was 66 deg. 37 min. N. Cape Serdze Kamen was 12 or 13 leagues distant, bearing N. 52 deg. W. the most southerly point of land that we had in our sight, bore S. 41 deg. E. our soundings were 22 fathoms; and the distance of the nearest part of the shore was about two leagues. The weather was now fair and bright: and as we were ranging along the coast, we saw several of the natives and some of their dwelling-places, which had the appearance of hillocks of earth. In the course of the evening we passed the Eastern Cape, or the point before-mentioned; from which the coast trends to the south-westward. This is the same point of land that we had passed on the 11th of the preceding month. Those who gave credit to Mr. Stæhlin's map, then supposed it to be the eastern point of his island Alafchka; but we were by this time convinced, that it is no other than the eastern promontory of Asia; and perhaps it is the upper Tschukotkoi Nofs, though the promontory which received that name from Beering, is situated further towards the S. W. Muller, in his map of the discoveries of the Russians, places the Tschukotkoi Nofs nearly in the lat. of 75 deg. N. and extends it somewhat to the eastward of this cape. But Captain Cook was of opinion, that he had no good authority for so doing. Indeed his own, or rather Dethneff's, account of the distance between the river Anadir and the Nofs, cannot well be reconciled with so northerly a position. For he says, that with the most favourable wind, a person may go by sea from the Nofs to the river Anadir in three whole days, and that the journey by land is very little longer. But Captain Cook, having hopes of visiting these parts again, deferred the discussion of this point to another opportunity. In the mean time, however, he concluded, as Beering had done before him, that this was the easternmost point of all Asia. It is a peninsula of considerable elevation, joined to the continent by a very low and apparently narrow isthmus. It has next the sea, a steep rocky cliff, and off the very point are several rocks resembling spires. It stands in the long. of 190 deg. 22 min. E. and in the lat. of 66 deg. 6 min. N. and is 13 leagues distant, in the direction of N. 53 deg. W. from Cape Prince of Wales, on the coast of America. The land about this promontory consists of valleys and hills. The former terminate at the sea in low shores, and the latter in steep rocky points. The hills appeared like naked rocks; but the valleys, though destitute of tree or shrub, were of a greenish hue.

Having passed the Cape, we steered S. W. half W. towards the northern point of St. Lawrence's Bay, in which our ships had anchored on the 10th of August. We reached it by eight o'clock the following morning, and saw some of the natives at the place where we had before seen them, as well as others on the opposite side of the bay. Not one of them, however, came off to us, which was rather remarkable, as the weather was sufficiently favourable, and as those whom we had lately visited had no reason to be displeased with us. These people are certainly the Tschutski, whom the Russians had not hitherto subdued; though it is manifest that they must carry on a traffic with the latter, either directly, or by the interposition of some neighbouring nation; as their being in possession of the spoons we saw among them, cannot otherwise be accounted for. The Bay of St. Lawrence is, at the entrance, at least five leagues in breadth, and about four leagues deep, growing narrower towards the bottom, where it seemed to be pretty well sheltered from the sea winds, provided there

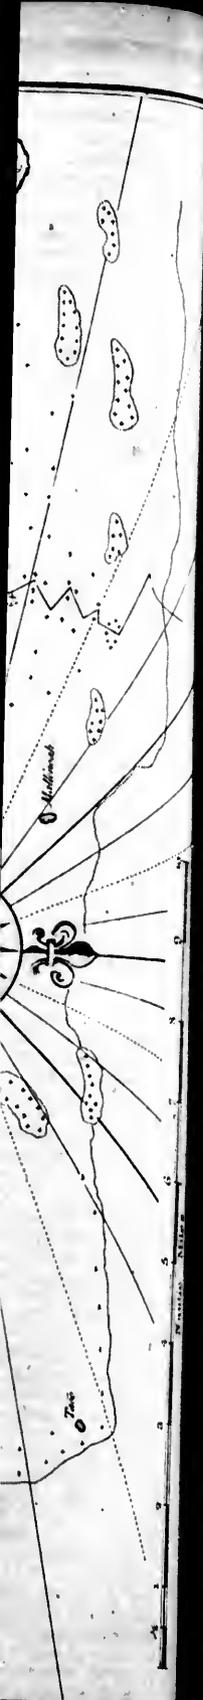

there is a competent depth of water for ships. The Commodore did not wait to examine it, though he was extremely desirous of finding a convenient harbour in those parts, to which he might resort in the succeeding spring. But he wished to meet with one where wood might be obtained, and he knew that none could be found here. From the southern point of this bay, which is situated in the lat. of 65 deg. 30 min. N. the coast trends W. by S. for the space of about nine leagues, and there seems to form a deep bay or river; or else the land in that part is so low that we could not discern it. In the afternoon, about one o'clock, we saw what was first supposed to be a rock, but it was found to be a dead whale, which some Asiatics had killed, and were then towing ashore. They seemed to endeavour to conceal themselves behind the fish, in order to avoid being seen by us. This, however, was unnecessary, for we proceeded on our course without taking notice of them. On the 4th, at break of day, we hauled to the north-westward, for the purpose of gaining a nearer view of the inlet seen the day before; but the wind, not long after, veering to that direction, the design was abandoned; and steering towards the S. along the coast, we passed two bays, each about six miles deep. The most northerly one is situate before a hill, which is rounder than any other we had observed upon the coast. There is an island lying before the other bay. It is a matter of doubt whether there is a sufficient depth of water for ships in either of these bays, as when we edged in for the shore, we constantly met with shoal water. This part of the country is extremely naked and hilly. In several places on the lower grounds, next the sea, were the habitations of the natives, near all of which were erected stages of bones, like those before-mentioned. This day, at noon, our lat. was 64 deg. 38 min. N. and our long. 188 deg. 15 min. E. the nearest part of the shore was at the distance of three or four leagues; and the most southern point of the continent in sight, bore S. 48 deg. W. By this time the wind had veered to the N. and blew a light breeze; the weather was clear, and the air sharp. The Commodore did not think proper to follow the direction of the coast, as he perceived that it inclined westward towards the gulph of Anadir, into which he had no motive for going. He therefore steered a southerly course, that he might have a sight of the isle of St. Lawrence, which had been discovered by Beering. This island was quickly seen by us, and at eight in the evening it bore S. 20 deg. E. supposed to bear the distance of 11 leagues. The most southerly point of the main land was at that time 12 leagues distant, bearing S. 83 deg. W. Captain Cook conjectured, that this was the point which is called by Beering the eastern point of Suchotki, or Cape Tschukotkoi: an appellation which he gave it with some propriety, because the natives, who said they were of the nation of the Tschutski, came off to him from this part of the coast. Its lat. is 64 deg. 13 min. N. and its long. 186 deg. 36 min. E. The more the Captain was convinced of his being at present upon the Asiatic coast, the more he was at a loss to reconcile his observations with Mr. Stæhlin's map of the New Northern Archipelago; and he could find no other method of accounting for so important a difference, than by supposing that he had mistaken some part of what Mr. Stæhlin denominates the island of Alafchka for the continent of America, and had missed the channel by which they are separated. But even on that supposition there would still have been a considerable variation. The Captain considered it as an affair of some consequence to clear up this point during the present season, that he might have only one object in view in the following one. And as these northerly islands were said to abound with wood, he had some hopes if he should find them, of procuring a competent supply of that article, of which we began to stand in great need. With this view he steered over for the coast of America; and the next day, about five o'clock in the afternoon, land was seen bearing S. three quarters E. which we imagined was Anderson's

island, or some other land near it. On Sunday, the 6th, at four in the morning, we had a sight of the American coast, near Sledge Island; and at six in the evening of the same day, that island was at the distance of about ten leagues, bearing N. 6 deg. E. and the most easterly land in view bore N. 49 deg. E. If any part of what Captain Cook had conjectured to be the coast of the American continent, could possibly be the island of Alafchka, it was that now in sight; in which case he must have missed the channel between it and the main land, by steering towards the W. instead of the E. after he had first fallen in with it. He was, therefore, at a loss where to go, for the purpose of clearing up these doubts. On the 7th, at eight o'clock in the evening, we had made a near approach to the land, Sledge Island bore N. 85 deg. W. about eight leagues distant; and the eastern part of the coast bore N. 70 deg. E. with elevated land in the direction of E. N. At this time we perceived a light on shore, and two canoes with people in them came off towards us. We brought to, in order to give them time to approach; but they refused all our tokens of amity, and kept at the distance of a quarter of a mile. We therefore left them, and proceeded along the coast. The next morning, at one o'clock, observing that the water shoaled pretty fast, we anchored in ten fathoms, and remained in that situation till day-light came on. We then weighed, and pursued our course along the coast, which trended E. and E. half S. At seven o'clock in the evening we were abreast of a point, situated in the long. of 197 deg. E. and in the lat. of 64 deg. 21 min. N. beyond which the coast assumes a more northerly direction. At eight this point, which received the appellation of Cape Darby, bore S. 64 deg. W. the most northern land we had in view, bore N. 34 deg. E. and the distance of the nearest part of the shore was one league. In this situation we let go our anchors in thirteen fathoms, over a muddy bottom.

On Wednesday the 9th, at break of day, we weighed, and made sail along the coast. We now saw land, which we supposed to be two islands; the one bearing E. the other S. 70 deg. E. Not long afterwards, we found ourselves near a coast covered with wood; a pleasing sight, to which we had not been lately accustomed. As we advanced northward, land was seen in the direction of N. E. half N. which proved a continuation of the coast, upon which we now were: we likewise perceived high land over the islands, apparently, at a considerable distance beyond them. This was imagined to be the continent, and the other land the isle of Alafchka; but it was already a matter of doubt, whether we should discover a passage between them, for the water gradually shoaled, as we proceeded further towards the N. In consequence of this, two boats were dispatched a-head to sound; and the Commodore ordered the Discovery, as she drew the least water, to lead, keeping nearly in the middle channel, between the coast and the most northerly island. In this manner we continued our course till three o'clock in the afternoon, when, having passed the island, our soundings did not exceed three fathoms and a half; and the Resolution once brought the mud up from the bottom. In no part of the channel could a greater depth of water be found, though we had sounded it from one side to the other; we therefore deemed it high time to return.

At this time a head-land on the western shore, to which the name of Bald-head was given, was about one league distant, bearing N. by W. The coast extended beyond it as far as N. E. by N. where it appeared to terminate in a point; behind which the coast of the high land that was seen over the islands stretched itself. The shore on the western side of Bald-head, forms a bay, in the bottom of which is a beach, where we perceived many huts of the natives. We continued to ply back during the whole night, and by day-break on the 10th had deepened our water six fathoms. At nine o'clock, when we were about three miles from the W. shore, Captain Cook, accompanied by Mr. King, went with two boats in search of wood and water. They landed in that part, where the coast projects into a bluff head,

head, composed of perpendicular strata of a dark blue rock, intermixed with glimmer and quartz. Adjoining to the beach is a narrow border of land, which was at this time covered with long grass, and where they observed some angelica. The ground, beyond this, rises with some abruptness; towards the top of this elevation they found a heath, that abounded with berries of various kinds: further onward the country was rather level, and thinly covered with small spruce trees, birch, and willows. They saw the tracks of foxes and deer upon the beach, in many parts of which, there was a great abundance of drift-wood: there was also no want of fresh water. Our gentlemen and their attendants having returned on board, the Commodore had thoughts of bringing the ships to an anchor here; but the wind then shifting to N. E. and blowing rather on this shore, he stretched over to the opposite one, expecting to find wood there likewise. At eight in the evening, we anchored near the southern end of the most northerly island, for such we then imagined it to be. The next morning, however, we found that it was a peninsula, connected with the continent by a low isthmus, on each side of which a bay is formed by the coast. We plied into the southernmost of these bays, and cast anchor again about twelve o'clock, in five fathoms water, over a muddy bottom; the point of the peninsula, to which the name of Cape Denbigh was given, being one league distant, in the direction of N. 68 deg. W. We observed on the peninsula, several of the natives, and one of them came off in a small canoe. Captain Cook gave this man a knife and some beads, with which he appeared to be well pleased; we made signs to him to bring us some provisions, upon which he instantly quit- ted us, and paddled towards the shore. Happening to meet another man coming off, who had two dried salmon, he got them from him; and when he returned to our ship he refused to give them to any body except Captain Cook: Some of our people fancied, that he asked for him under the name of Capitane; but in this they were perhaps mistaken. Others of the inhabitants came off soon afterwards, and gave us a few dried fish, in exchange for such trifles as we had to barter with them. They shewed no dislike for tobacco, but they were most desirous of knives. In the afternoon, Mr. Gore was dispatched to the peninsula, to procure wood and water; of the former of which articles we observed great plenty upon the beach. At the same time a boat from each of the ships was sent to round the bay; and at three o'clock, the wind freshening at N. E. we weighed anchor, and endeavoured to work further in, but that was quickly found to be impracticable, by reason of the shoals which extended entirely round the bay, to the distance of upwards of two miles from the shore, as the officers who had been sent out for the purpose of sounding reported. We therefore stood off and on with the ships, waiting for Lieutenant Gore, who returned about eight o'clock in the evening, with the launch loaded with wood. He informed the Commodore, that he had found but little fresh water, and that the wood could not be procured without difficulty, on account of the boats grounding at some distance from the beach. As this was the case, we stood back to the other shore, and the next morning at eight, all the boats and a detachment of men with an officer, were sent to get wood from the place where Captain Cook had landed on the 10th. After having continued for some time to stand off and on with the ships, we at length cast anchor in less than five fathoms, at the distance of half a league from the coast, whose southern point bore S. 26 deg. W. Cape Denbigh was about 26 miles distant, bearing S. 72 deg. E. Bald-head was nine leagues off, in the direction of N. 60 deg. E. and the island near the eastern shore, S. of Cape Denbigh, named by Captain Cook Belborough Island, was 15 leagues distant, bearing S. 52 deg. E. This being a very open road, and therefore not a secure station for the ships, the Commodore resolved not to wait till our stock of water was completed, as that would take up some time; but only to furnish both ships with wood, and afterwards to seek

No. 69.

a more commodious place for the former article. Our people carried off the drift-wood that lay on the beach, and performed that business with great expedition; for, as the wind blew along the shore, the boats were enabled to sail both ways. In the afternoon Captain Cook went on shore, and took a walk into the country, which in those parts where there was no wood, abounded with heath, and other plants, several of which had plenty of berries, all ripe. Scarce a single plant was in flower. The underwood, such as birch, alders, and willows, occasioned walking to be very troublesome among the trees, which were all spruce, and none of which exceeded seven or eight inches in diameter; but some were observed lying on the beach, that were above twice that size. All the drift-wood that we saw in these northern parts was fir.

Sunday the 13th, a family of the natives came near the spot where our people were occupied in taking off wood. The Captain saw only the husband and wife, and their child, besides a fourth person, who was the most deformed cripple he had ever seen. The husband was nearly blind, and neither he nor his wife were such well-looking people as many of those whom we had met with on this coast. Both of them had their lower lips perforated; and they were in possession of some glass-beads, resembling those we had seen before among their neighbours. Iron was the article that pleased them most. For four knives which had been formed out of an old iron-hoop, the Captain obtained from them near four hundred pounds weight of fish, that had been lately caught by them. Some of these were trout, and others were, with respect to size and taste, somewhat between a herring and a mullet. The Captain gave a few beads to the child, who was a female; upon which the mother immediately burst into tears, then the father, next after him the cripple, and at last, to add the finishing stroke to the concert, the child herself. This music, however, was not of long duration. Mr. King had on the preceding day been in company with the same family. His account of this interview is to the following purport: While he attended the wooding party, a canoe filled with natives approached, out of which an elderly man and woman (the husband and wife above-mentioned) came ashore. Mr. King presented a small knife to the woman, and promised to give her a much larger one in exchange for some fish. She made signs to him to follow her. After he had proceeded with them about a mile, the man fell down as he was crossing a stony beach, and happened to cut his foot very much. This occasioned Mr. King to stop; upon which the woman pointed to her husband's eyes, which were covered with a thick whitish film. He afterwards kept close to his wife, who took care to apprise him of the obstacles in his way. The woman had a child on her back, wrapped up in the hood of her jacket. After walking about two miles, they arrived at an open skin-boat, which was turned on one side, the convex part towards the wind, and was made to serve for the habitation of this family. Mr. King now performed a remarkable operation on the man's eyes. He was first desired to hold his breath, then to breathe on the distempered eyes, and afterwards to spit on them. The woman then took both the hands of Mr. King, and pressing them to the man's stomach, held them there for some time, while she recounted some melancholy history respecting her family; sometimes pointing to her husband, sometimes to her child, and at other times to the cripple, who was related to her. Mr. King purchased all the fish they had, which consisted of excellent salmon, salmon-trout, and mullet. These fish were faithfully delivered to the person he sent for them. The woman was short and squat, and her visage was plump and round. She wore a jacket made of deer skin, with a large hood, and had on a pair of wide boots. She was punctured from the lip to the chin. Her husband was well made, and about five feet two inches in height. His hair was black and short, and he had but little beard. His complexion was of a light copper cast. He had two holes in his lower lip, in which, however, he had no ornaments. The teeth of both of them were

7 D

black,

black, and appeared as if they had been filed down-level with the guns.

Before night, on Sunday the 13th, we had amply furnished the ships with wood, and had conveyed on board about a dozen tons of water to each. On the 14th a party was detached on shore to cut brooms, and likewise the branches of spruce-trees for brewing beer. About twelve o'clock all our people were taken on board, for the wind freshening had raised so heavy a surf on the beach, that our boats could not continue to land without extreme difficulty and danger. As doubts were still entertained whether the coast, upon which we now were, belonged to an island, or to the continent of America, lieutenant King was dispatched by the Commodore, with two boats, well manned and armed, to make such a search as might tend to remove all difference of opinion on the subject. He was instructed to proceed towards the north as far as the extreme point seen on Wednesday the 9th, or a little further, if he should find it necessary; to land there, and, from the heights, endeavour to discover whether the land he was then upon, imagined to be the island of Alaschka, was really an island, or was connected with the land to the eastward, supposed to be the American continent. If it proved to be an island, he was to examine the depth of water in the channel between it and the continent, and which way the flood tide came: but, if he should find the two lands united, he was to return immediately to the ship. He was directed not to be absent longer than four or five days; and it was also mentioned in his instructions, that, if any unforeseen or unavoidable accident should force our ships off the coast, the rendezvous was to be at the harbour of Samganoodha. On Tuesday the 15th, the ships removed over to the bay on the south eastern side of Cape Denbigh, where we cast anchor in the afternoon. Not long after, several of the inhabitants came off in canoes, and gave us some dried salmon in exchange for trifling articles. Early the next morning, nine men, each in a separate canoe, paid us a visit, with the sole view of gratifying their curiosity. They approached the ship with caution, and drawing up abreast of each other, under our stern, favoured us with a song; while one of their number made many ludicrous motions with his hands and body, and another beat upon a sort of drum. There was nothing savage, either in the song, or the gestures with which it was accompanied. There seemed to be no difference, either with respect to size or features, between these people, and those whom we had seen on every other part of the coast, except King George's Sound. Their dress, which chiefly consisted of the skins of deer, was made after the same mode; and they had adopted the practice of perforating their lower lips, and affixing ornaments to them. The habitations of these Americans were situated close to the beach. They consist merely of a sloping roof, without any side-walls, formed of logs, and covered with earth and grass. The floor is likewise laid with logs. The entrance is at one end, and the fire-place is just within it. A small hole is made near the door of the hut, for the purpose of letting out the smoke. A party of men was dispatched, this morning, to the peninsula for brooms and spruce. Half the remainder of the people of both ships were, at the same time, permitted to go ashore and gather berries. These returned on board about twelve o'clock, and the other half then landed for the same purpose. The berries found here were hurtle-berries, heath-berries, partridge-berries, and wild currant-berries. Captain Cook also went ashore himself, and took a walk over part of the peninsula. He met with very good grass in several places, and scarcely observed a single spot on which some vegetable was not growing. The low land by which this peninsula is united to the continent, abounds with narrow creeks, and likewise with ponds of water, several of which were at this time frozen over. There were numbers of buffaloes and geese, but they were so shy, that it was impossible to get within musquet-shot of them. Some snipes were also seen; and, on the higher grounds, were partridges of two species; where there was wood, musquitoses were numerous. Some of

the officers, who went further into the country than Captain Cook did, met with some of the natives of both sexes, who treated them with civility and kindness. The Commodore was of opinion, that this peninsula had been an island in some distant period; for there were marks of the sea having formerly flowed over the isthmus; and even at present it appeared to be kept out by a bank of sand, stones, and wood, which the waves had thrown up. It was manifest from this bank, that the land here encroached upon the sea, and it was not difficult to trace its gradual formation.

Lieutenant King returned from his expedition about seven o'clock this evening. He had set out at eight o'clock at night, on the 14th. The crews of the boats rowed without intermission towards the land, till one in the morning of the 15th. They then set their sails, and stood across the bay, which the coast forms to the westward of Bald-Head. They afterwards, about three o'clock, again made use of their oars, and, by two in the afternoon, had got within two miles of Bald-Head, under the lee of the high land. At that time all the men in the boat belonging to the Resolution, except two, were so oppressed with fatigue and sleep, that Mr. King's utmost endeavours to make them put on were perfectly ineffectual. They, at length, were so far exhausted as to drop their oars, and fall asleep at the bottom of the boat. In consequence of this, Mr. King, and two gentlemen who were with him, were obliged to lay hold of the oars; and they landed, a little after three o'clock, between Bald-Head and a point that projects to the eastward. Mr. King, upon his landing, ascended the heights, from which he could see the two coasts join, and that the inlet terminated in a small creek or river, before which there were banks of sand or mud, and in every part shoal water. The land, for some distance towards the north, was low and swampy; then it rose in hills; and the perfect junction of those, on each side of the inlet, was traced without the least difficulty. From the elevated situation in which Mr. King took his survey of the Sound, he could discern many spacious valleys, with rivers flowing through them, well wooded, and bounded by hills of a moderate height. One of the rivers towards the N. W. seemed to be considerable; and he was inclined to suppose, from its direction, that it discharged itself into the sea at the head of the bay. Some of his people, penetrating beyond this into the country, found the trees to be of a larger size the further they proceeded. To this inlet Captain Cook gave the name of Norton's Sound, in honour of Sir Fletcher Norton, now Lord Granley; a near relation of Mr. King. It extends northward as far as the latitude of 64 deg. 55 min. N. The bay, wherein our ships were now at anchor, is situated on the south-eastern side of it, and is denominated Chacktoole by the natives. It is not a very excellent station, being exposed to the S. and S. W. winds. Nor is a harbour to be met with in all this Sound. We were so fortunate, however, as to have the wind from the N. E. and the N. during the whole time of our continuance here, with very fine weather. This afforded an opportunity of making a great number of lunar observations, the mean result of which gave 197 deg. 13 min. E. as the longitude of the anchoring place on the western-side of the Sound, while its latitude was 64 deg. 31 min. N. With respect to the tides, the night flood rose two or three feet, and the day flood was scarcely perceivable. Captain Cook being now perfectly convinced, that Mr. Stehlin's map was extremely erroneous, and having retraced the continent of America to the space which that gentleman had occupied with his imaginary island of Alaschka, thought it now high time to quit these northerly regions, and retire to some place for the winter, where he might obtain provisions and refreshments. He did not consider Petropaulowska, or the harbour of St. Peter and St. Paul in Kamtschatka, as likely to furnish a sufficient supply. He had likewise other reasons for not going thither at present; the principal of which was, his great unwillingness to remain inactive for six or seven months, which would have been the consequence of passing the winter

winter in any of these northern countries. He at length concluded, that no situation was so convenient for our purpose as the Sandwich Islands. To them, therefore, he formed a resolution of repairing. But a supply of water being necessary before he could execute that design, he determined, with a view of procuring this essential article, to search the coast of America for a harbour, by proceeding along it to the southward. If he should not meet with success in that search, his intention was to reach Samganooha, which was appointed for our place of rendezvous, in case the ships should happen to separate.

On Thursday, the 17th, in the morning we weighed anchor with a light easterly breeze, and steering to the southward, attempted to pass within Beborough Island; but, though it is six or seven miles distant from the continent, we were prevented, by meeting with shoal water. Having but little wind all the day, we did not pass that island before it was dark, and the night was spent under an easy sail. On the 18th, at day break, we resumed our progress along the coast. At noon, our soundings were no more than five fathoms. Beborough Island, at this time, bore N. 42 deg. E. the most southerly land in sight, which also proved to be an island, bore S. 66 deg. W. the passage between it and the continent, was in the direction of S. 40 deg. W. and the nearest land was at the distance of about two miles. We continued to steer for this passage, till the boats which were a-head made the signal for having no more than three fathoms water. In consequence of this, we hauled without the island, and displayed the signal for the Resolution's boat to keep between the shore and the ships. This island, to which the name of Stuart's Island was given, lies in the latitude of 63 deg. 35 min. N. and is 17 leagues distant from Cape Denbigh, in the direction of S. 27 deg. W. It is six or seven leagues in circumference. Though some parts of it are of a moderate height, yet, in general, it is low, with some rocks off the western part. The greatest part of the coast of the continent is low land, but we perceived high land up the country. It forms a point, opposite the island, which was distinguished by the name of Cape Stephens, and is situated in the latitude of 63 deg. 33 min. N. and in the longitude of 197 deg. 41 min. E. Some drift wood was observed on the shores, both of the island and of the continent; but not a single tree was seen growing upon either. Vessels might anchor, upon occasion, between the continent and the N. E. side of this island, in a depth of five fathoms, sheltered from the easterly, westerly, and southerly winds. But this station would be entirely exposed to the northerly winds, the land, in that direction, being too remote to afford any security. Before we reached Stuart's Island, we passed two little islands, situate between us and the main land; and as we ranged along the coast, several of the natives made their appearance upon the shore, and, by signs, seemed to invite us to approach.

We were no sooner without the island, than we steered S. by W. for the most southern part of the continent in sight, till eight in the evening, when the depth of water having decreased from six fathoms to less than four, we tacked and stood to the northward into five fathoms, and then passed the night in standing off and on. At the time we tacked, the southernmost point of land above mentioned, which we named Point Shallow Water, bore S. half E. at the distance of seven leagues. On the 19th, at day break, we resumed our southerly course; but shoal water soon obliged us to haul more to the westward. We were at length so far advanced upon the bank, that we could not hold a N. N. W. course, as we sometimes met with only four fathoms. The wind blowing fresh at E. N. E. it was now high time to endeavour to find a greater depth of water, and to quit a coast upon which we could no longer navigate with safety. We therefore hauled the wind to the northward, and the water gradually increased in depth to eight fathoms. At this time, we were about twelve leagues distant from the continent, and nine to the W. of Stuart's Island. We saw no land to the southward of Point Shallow Water, which Captain

Cook judged to lie in the latitude of 63 deg. N. so that between this latitude and Shoal Neffs, in latitude 64 deg. the coast has not been explored. It is probably accessible only to boats, or very small vessels; or, if there are channels for vessels of greater magnitude, it would require some time to find them. From the main head, the sea within us appeared to be chequered with shoals; the water was very muddy and discoloured, and much fresher than at any of the places where our ships had lately anchored. From this we inferred that a considerable river runs into the sea, in this unexplored part. After we had got into eight fathoms water, we steered to the westward, and afterwards more southerly, for the land discovered by us on the 5th of September, which at noon on the 20th, bore S. W. by W. at the distance of ten or eleven leagues. We had now a fresh gale at N. and, at intervals, showers of hail and snow, with a pretty high sea. To the land before us, the Commodore gave the appellation of Clerke's Island. It stands in the latitude of 63 deg. 15 min. and in the longitude of 190 deg. 30 min. It seemed to be an island of considerable extent, in which are several hills, all connected by low ground, so that it looks, at a distance, like a group of islands. Near its eastern part is a little island, which is remarkable for having on it three elevated rocks. Both the greater island, and this smaller one, were inhabited. In the afternoon, about six o'clock, we reached the northern point of Clerke's Island; and having ranged along its coast till dark, we brought to during the night. Early the next morning, we again stood in for the coast, and proceeded along it in quest of an harbour, till twelve o'clock, when finding no probability of success, we left it and steered S. S. W. for the land discovered by us on the 29th of July; having a fresh gale at N. accompanied with showers of snow and sleet.

Wednesday the 23d, at day break, the land above mentioned made its appearance, bearing S. W. at the distance of six or seven leagues. From this point of view it resembled a cluster of islands; but it was found to be only one, of about thirty miles in extent, in the direction of N. W. and S. E. the south-eastern extremity being Cape Upright, which we have mentioned before. The island is narrow, particularly at the low necks of land by which the hills are connected. Captain Cook afterwards found, that it was entirely unknown to the Russians, and therefore, considering it as a discovery of our own, he named it Gore's Island. It appeared to be barren and destitute of inhabitants, at least we saw none. Nor did we observe such a number of birds about it, as we had seen when we first discovered it. But we perceived some sea-otters, an animal which we had not found to the N. of this latitude. About twelve miles from Cape Upright, in the direction of S. 72 deg. W. stands a small island, whose lofty summit terminates in several pinnacle-rocks, for which reason it obtained the name of Pinnacle Island. At two o'clock P. M. after we had passed Cape Upright, we steered S. E. by S. for Samganooha, with a gentle breeze at N. N. W. being resolved to lose no more time in searching for an harbour among islands, which we now began to suspect had no existence; at least, not in the latitude and longitude in which they have been placed by modern delineators of charts. On the 24th in the evening, the wind veered to S. W. and S. and increased to a fresh gale. We continued our easterly course till eight in the morning of the 25th, when in the longitude of 191 deg. 10 min. and in the latitude of 58 deg. 32 min. we tacked and stood to the westward; soon after which, the gale increasing, we were reduced to two courses, and close-reefed main-top-sails. In a short time after, the Resolution sprung a leak, under the starboard buttock, which was so considerable, as to keep one pump constantly employed. We would not venture to put the ship upon the other tack, from the apprehension of getting upon the shoals that lie to the N. W. of Cape Newenham; but continued to steer towards the W. till six in the evening of Saturday the 26th, when we wore and stood to the eastward; and then the leak gave us no farther trouble. This proved, and

that it was above the water-line, which gave us great satisfaction. The gale had now ceased, but the wind continued at S. and S. W. for some days longer.

On Friday the 2nd of October, at day break, we saw the isle of Oonalashka, in a S. E. direction. But as the land was obscured by a thick haze, we were not certain with respect to our situation till noon, when the observed latitude determined it. We hauled into a bay, ten miles to the westward of Samganoodha, known by the name of Egoochshac; but finding very deep water, we speedily left it. The natives visited us at different times, bringing with them dried salmon, and other fish, which our sailors received in exchange for tobacco. Only a few days before, every ounce of tobacco that remained in the ship, had been distributed among them, and the quantity was not half sufficient to answer their demands. Notwithstanding this, so thoughtless and improvident a being is an English sailor, that they were as profuse in making their bargains, as if we had arrived at a port in Virginia; by which means, in less than two days, the value of this commodity was lowered above a thousand per cent. The next day, at one o'clock in the afternoon, we anchored in the harbour of Samganoodha, and, on the morning of the 4th, the carpenters were employed in ripping off the sheathing of and under the wale of the *Resolution* on the starboard side. Many of the seams were found entirely open; it was therefore not to be wondered at, that so much water had got into the ship. We cleared the fish and spirit rooms, and the after-hold; and disposed things in such a manner, that, in case of any future leaks of the same nature, the water might find its way to the pumps. Besides this work, and completing our stock of water, we cleared the fore-hold, and took in a quantity of ballast.

The vegetables we had met with when we were here before, were now, for the most part, in a state of decay. There being great plenty of berries, one third of the people, by turns, had permission to go ashore and gather them. Considerable quantities of them were also brought to us by the inhabitants. If there were any seeds of the scurvy, among the people of either ship, these berries, and the use of spruce beer, which they were allowed to drink every other day, effectually eradicated them. We likewise procured abundance of fish; at first, chiefly salmon, both fresh and dried, which the natives brought us. Some of the fresh salmon was in the highest perfection; but there was one sort, which, from the figure of its head, we called hook-nosed, that was but indifferent. Drawing the seine several times, at the head of the bay, we caught many salmon trout, and a halibut that weighed 254 pounds. We afterwards had recourse to hooks and lines. A boat was sent out every morning, which seldom returned without eight or ten halibut, a quantity more than sufficient to serve all our people. These fish were excellent, and there were few who did not prefer them to salmon. Thus we not only obtained a supply of fish for present consumption, but had some to carry with us to sea. On the 8th, Captain Cook received, by the hands of a native of Oonalashka, named Derramoushk, a very singular present, considering the place we were in. It was a rye loaf, or rather a pye in the form of a loaf, as it enclosed some salmon, well seasoned with pepper. This man had brought a similar present for Captain Clerke, and a note for each of the Captains, written in a character which none of us understood. It was natural to imagine, that these two presents were from some Russians now in our neighbourhood, and therefore the Captains sent, by the same messenger, to these unknown friends, a few bottles of rum, wine and porter, which they supposed would be highly acceptable. Captain Cook also sent, in company with Derramoushk; Corporal Lediard, of the marines, an intelligent man, for the purpose of gaining farther information; with orders, that if he met with any Russians, he should endeavour to make them understand, that we were Englishmen, the friends and allies of their nation.

Saturday the 10th, Corporal Lediard returned with three Russian seamen, or furriers, who with several

others resided at Egoochshac, where they had some store-houses, a dwelling-house, and a sloop of about 30 tons burthen. One of these Russians was either Malter or Mate of this vessel. They were all three intelligent well-behaved men, and extremely ready to give us all the information we could desire. But for want of an interpreter, we found it very difficult to understand each other. They appeared to have a perfect knowledge of the attempts which their countrymen had made to navigate the Frozen Ocean, and of the discoveries that had been made from Kamtschatka, by Beering, Tcherikoff, and Spangenberg. But they had not the least idea to what part of the world Mr. Stæhlin's map referred, when it was laid before them. When Captain Cook pointed out Kamtschatka, and some other places upon this map, they asked him whether he had seen the islands there represented; and, on his answering in the negative, one of them put his finger upon a part of the map, where a number of islands are laid down, and said that he had cruised there in search of land, but could never meet with any. The Captain then shewed them his own chart, and found that they were strangers to every part of the coast of America, except that which lies opposite this island. One of these men said, that he had been with Beering in his American voyage; but he must then have been very young; for even now, at the distance of 37 years, he had not the appearance of being aged. Never was greater respect paid to the memory of any eminent person, than by these men to that of Beering. The trade in which they are engaged is very advantageous, and its being undertaken and extended to the eastward of Kamtschatka, was the immediate result of the second voyage of that distinguished navigator, whose misfortunes proved the source of much private benefit to individuals, and of public utility to the Russian empire. And yet, if his distresses had not accidentally carried him to the island which bears his name, where he ended his life, and from whence the remainder of his ship's crew brought back specimens of its various furs, the Russians would probably have undertaken no future voyages, which could lead them to make discoveries in this sea, towards the American coast. Indeed, after his time, their ministry seem to have paid less attention to this object; and for what discoveries have been since made, we are principally indebted to the enterprising spirit of private merchants, encouraged, however, by the superintending care of the court of Petersburg. The three Russians having remained all night with the Commodore, visited Captain Clerke the following morning, and then departed, perfectly satisfied with the reception they had met with. They promised to return in a few days, and bring with them a chart of the islands situate between Kamtschatka and Oonalashka. In the evening of the 14th, while Captain Cook and Mr. Webber were at a village, not far from Samganoodha, a Russian landed there, who proved to be the principal person among his countrymen in this and the adjacent isles. His name was Erasim Gregoroff Sin Ilimyloff. He arrived in a canoe that carried three persons, attended by twenty or thirty smaller canoes, each conducted by one man. Immediately after landing, they constructed a small tent for Ilimyloff, of materials which they had brought with them, and they afterwards made others for themselves, of their canoes and paddles, which they covered with grass. Ilimyloff having invited the Captain and Mr. Webber into his tent, set before them some dried salmon and berries. He appeared to be a man of sense; and the Captain felt no small mortification in not being able to converse with him, except by signs, with the assistance of figures, and other characters. The Captain requested him to favour him with his company on board the next day, and accordingly he came with all his attendants. He had indeed moved into the neighbourhood of our station, for the express purpose of waiting upon us. The Commodore was in hopes of receiving from him the chart which his three countrymen had promised, but he was disappointed. However, Ilimyloff assured him he should have it, and he kept his word. Captain

Captain found him very well acquainted with the geo-
graphy of those parts, and with all the discoveries which
been made in this quarter by the Russians. On see-
modern maps, he instantly pointed out their er-
he said he had accompanied Lieutenant Syndo,
or (as he called him) Synd, in his northern ex-
pedition; and, according to his account, they did
not proceed farther than the Tschukotkoi Nofs,
or rather than St. Lawrence's Bay; for he pointed on
our chart to the very place where Captain Cook landed.
From thence he said they went to an island in the lat.
of 63 deg. N. upon which they did not land. He did
not recollect the name of that island; but the Captain
conjectured, that it was the same with that to which
the appellation of Clerke's Island had been given. To
what place Synd repaired afterwards, or in what parti-
cular manner he employed the two years, during which,
according to Ismyloff, his researches lasted, he was ei-
ther unable or unwilling to inform us. Perhaps he did
not comprehend our enquiries on this point; and yet,
in almost every other thing, we found means to make
him understand us. This inclined us to suspect, that
he had not really been in this expedition, notwith-
standing what he had asserted. Not only Ismyloff, but
also the others affirmed, that they were totally un-
acquainted with the American continent to the north-
ward; and that neither Lieutenant Synd, nor any other
Russian, had seen it of late years. They called it by
the same name which Mr. Stahlin has affixed to his
large island, that is Alisichka. According to the in-
formation we obtained from Ismyloff and his country-
men, the Russians have made several attempts to gain
a footing upon that part of the North American con-
tinent, that lies contiguous to Oonalaska and the adja-
cent islands, but have constantly been repulsed by the
inhabitants, whom they represent as a very treacherous
people. They made mention of two or three Captains,
or chief men, who had been murdered by them; and
some of the Russians shewed us wounds, which they de-
clared they had received there. Ismyloff also informed us,
that in the year 1773, an expedition had been undertaken
into the Frozen Ocean in sledges, over the ice, to three
large islands that are situate opposite the mouth of the
river Kovyma. But a voyage which he said he himself
had performed, engaged our attention more than any
other. He told us that on the 12th of May, 1771, he
sailed from Bolcherezik, in Kamtschatka, in a Russian
vessel to Mareekan, one of the Kurile islands, where there
is an harbour, and a Russian settlement. From this
island he proceeded to Japan, where his continuance
appears to have been but short; for, as soon as the Ja-
panese knew that he and his companions professed the
Christian faith, they made signs for them to depart;
but did not, so far as we could understand him, offer
any insult or violence. From Japan he repaired to
Canton, in China; and from thence, in a French ship
to France. He then travelled to Peterburgh, and was
afterwards sent out again to Kamtschatka. We
could not learn what became of the vessel in which he
first embarked, nor what was the principal intention
of the voyage. His being unable to speak one word
of the French language, rendered this story rather sus-
picious; he seemed clear, however, as to the times of
his arrival at the different places, and of his departure
from them, which he put down in writing. The next
morning (Friday the 16th) he offered Captain Cook a
sea-otter skin, which he said was worth 80 roubles at
Kamtschatka. The Captain, however, thought proper
to decline the offer; but accepted of some dried fish,
and several baskets of the lily, or faranne root. In the
afternoon, Ismyloff, after having dined with Captain
Clerke, left us with all his retinue, but promised to re-
turn in a few days. Accordingly, on the 19th, he
paid us another visit, bringing with him the charts
above-mentioned, which he permitted Captain Cook
to copy, and the contents of which are the foundation
of the following remarks.

These charts were two in number, they were both
manuscripts, and bore every mark of authenticity. One
of them comprehended the Penhinsikian sea; the coast

No. 69.

of Tartary, as low as the lat. of 41 deg. N. the Kurile
Islands, and the peninsula of Kamtschatka. Since this
chart had been made, Wawseelee Irkechhoff, a naval
captain, explored, in the year 1758, the coast of Tar-
tary, from Okotfk, and the river Amur, to Japan, or 41
deg. of northern lat. We were informed by Mr. Ismy-
loff, that a great part of the sea-coast of Kamtschatka
had been corrected by himself; and he described the
instrument used by him for that purpose, which must
have been a theodolite. He also told us, that there
were only two harbours proper for shipping, on all the
eastern coast of Kamtschatka, viz. the bay of Awatka,
and the river Olutora, in the bottom of the gulph of
the same name; that there was not one harbour on its
western coast; and that Yamk was the only one, except
Okotfk, on all the western side of the Penhinsikian sea,
till we come to the river Amur. The Kurile Islands
contain but one harbour, and that is on the N. E. side
of Mareekan; where, as we have already mentioned,
the Russians have a settlement. The other chart com-
prehended all the discoveries that the Russians had
made to the eastward of Kamtschatka, towards Ame-
rica. That part of the American coast, with which
Tscherikoff fell in, is laid down in this chart between
the lat. of 58 deg. and 58 and an half deg. N. and 75
deg. of eastern long. from Okotfk, or 218 and an half
deg. from Greenwich; and the place where Beering
anchored in 59 and an half deg. of lat. and 63 and an
half deg. of long. from Okotfk, or 207 deg. from Green-
wich. To say nothing of the long, which may, from
several causes, be erroneous, the lat. of the coast disco-
vered by Beering and Tscherikoff, particularly that part
of it which was discovered by the latter, differs consi-
derably from Mr. Muller's chart. Whether the chart
now produced by Ismyloff, or that of Muller, be most
erroneous in this respect, it may be difficult to deter-
mine. According to Ismyloff's account, neither the
number nor the situation of the islands which are dis-
perfed between 52 deg. and 55 deg. of lat. in the space
between Kamtschatka and America, is properly ascer-
tained. He struck out about a third of them, assuring
us that they did not exist; and he considerably altered
the situation of others, which he said was necessary, from
the observations which he himself had made; and there
was no reason to entertain a doubt about this. As these
islands are nearly under the same parallel, different na-
vigators, misled by their different reckonings, might
easily mistake one island, or cluster of islands for ano-
ther; and imagine they had made a new discovery,
when they had only found old ones; in a position some-
what different from that which their former visitors had
assigned to them. The isles of St. Theodore, St. Ste-
phen, St. Abraham, St. Macarius, Seduction Island, and
several others, which are represented in Mr. Muller's
chart, were not to be found in this now produced to
us; nay, Ismyloff and the other Russians assured Cap-
tain Cook, that he had been frequently sought for
without effect. Nevertheless, it is difficult to believe,
that Mr. Muller could place them in his chart without
some authority. Captain Cook, however, confiding in
the testimony of these people, whom he thought com-
petent witnesses, omitted them in his chart; and made
such corrections respecting the other islands, as he had
reason to think were necessary.

We shall now proceed to give some account of the
islands, beginning with those which are nearest to
Kamtschatka, and computing the long. from the har-
bour of Petropaulowka, in the bay of Awatka. The
first is Beering's island, in 55 deg. of northern lat. and
6 deg. of eastern long. At the distance of 10 leagues
from the southern extremity of this, in the direction of
E. by S. or E. S. E. stands Maidenoi Ostroff, or the
Copper Island. The next island is Atakou, in the lat.
of 52 deg. 45 min. and in the long. of 15 deg. or 16
deg. The extent of this island is about 18 leagues in
the direction of E. and W. and it is perhaps the same
land which Beering fell in with, and to which he gave
the name of Mount St. John. We next come to a
cluster of six or more islands; two of which, Amluk and
Atghka, are of considerable extent, and each of them

7 E

hag

has a good harbour. The middle of this group lies in the lat. of 52 deg. 30 min. and 28 deg. of long. from the bay of Awatka, and its extent is about four degrees in the direction of E. and W. These are the isles that Lamyloff said were to be removed four degrees to the eastward. In the situation they have in Captain Cook's chart, was a group, comprehending 10 little islands, which we were informed were entirely to be struck out; and also two islands, situate between them and the group to which Oonalashka appertains. In the place of these two, an island, named Amoghta, was introduced.

The situation of many of these islands may, perhaps, be erroneously laid down. But the position of the largest group, of which Oonalashka is one of the most considerable islands, is free from such errors. Most of the islands that compose this cluster, were seen by us; their long. and lat. were therefore determined with tolerable accuracy; particularly the harbour of Samganoodha, in Oonalashka, which must be considered as a fixed point. This group may be said to extend as far as Halibut Isles, which are forty leagues distant from Oonalashka, towards the E. N. E. Within these isles, a passage, communicating with Bristol Bay, was marked in Lamyloff's chart, which converts about 15 leagues of the coast, that Captain Cook had supposed to be part of the continent, into an island, named Oonecmak. This passage might easily escape us, being, as we were informed, extremely narrow, shallow, and only to be navigated through with boats, or vessels of very small burthen. From the chart, as well as from the testimony of Lamyloff and his countrymen, it appears, that this isle, as far as the Russians have made any discoveries, or have extended themselves, since the time of Beering. They all affirmed, that no persons of that nation had settled themselves so far to the eastward, as the place where the natives gave the note to Captain Clerke; which being delivered to Lamyloff for his perusal, he said, that it had been written at Oomanak. From him we procured the name of Kodiak, the largest of Schumagin's Islands; for it had no name assigned to it upon the chart which he produced. It may not be improper to mention, that no names were put to the islands which Lamyloff said were to be struck out of the chart; and Captain Cook considered this as some confirmation that they have no existence. The American continent is here called by the Russians, as well as by the islanders, Alaschka; which appellation, though it properly belongs only to that part which is contiguous to Oonecmak, is made use of by them when speaking of the American continent in general. This is all the intelligence we obtained from these people, respecting the geography of this part of the globe; and perhaps this was all the information they were able to give. For they repeatedly assured Captain Cook, that they knew of no other islands, besides those which were represented upon this chart, and that no Russian had ever visited any part of the American continent to the northward, except that which is opposite the country of the Tschutkia. If Mr. Stæhlin was not greatly imposed upon, what could induce him to publish a map so singularly erroneous as his map of the New northern Archipelago, in which many of these islands are jumbled together without the least regard to truth? Nevertheless, he himself styles it "a very accurate little map."

Lamyloff continued with us till the evening of the 21st, when he took his final leave. Captain Cook entrusted to his care a letter to the Lords of the Admiralty, enclosing a chart of all the northern coasts we had visited. Lamyloff said there would be an opportunity of transmitting it to Kamtschatka, or Okotsk, in the course of the succeeding spring; and that it would be at Peterburg the following winter. He gave the Captain a letter to Major Behm, Governor of Kamtschatka, who resides at Bolcheretsk, in that peninsula; and another to the commanding officer at Petropaulowka. This gentleman seemed to possess abilities that might entitle him to a higher station than that in which we found him. He had considerable knowledge

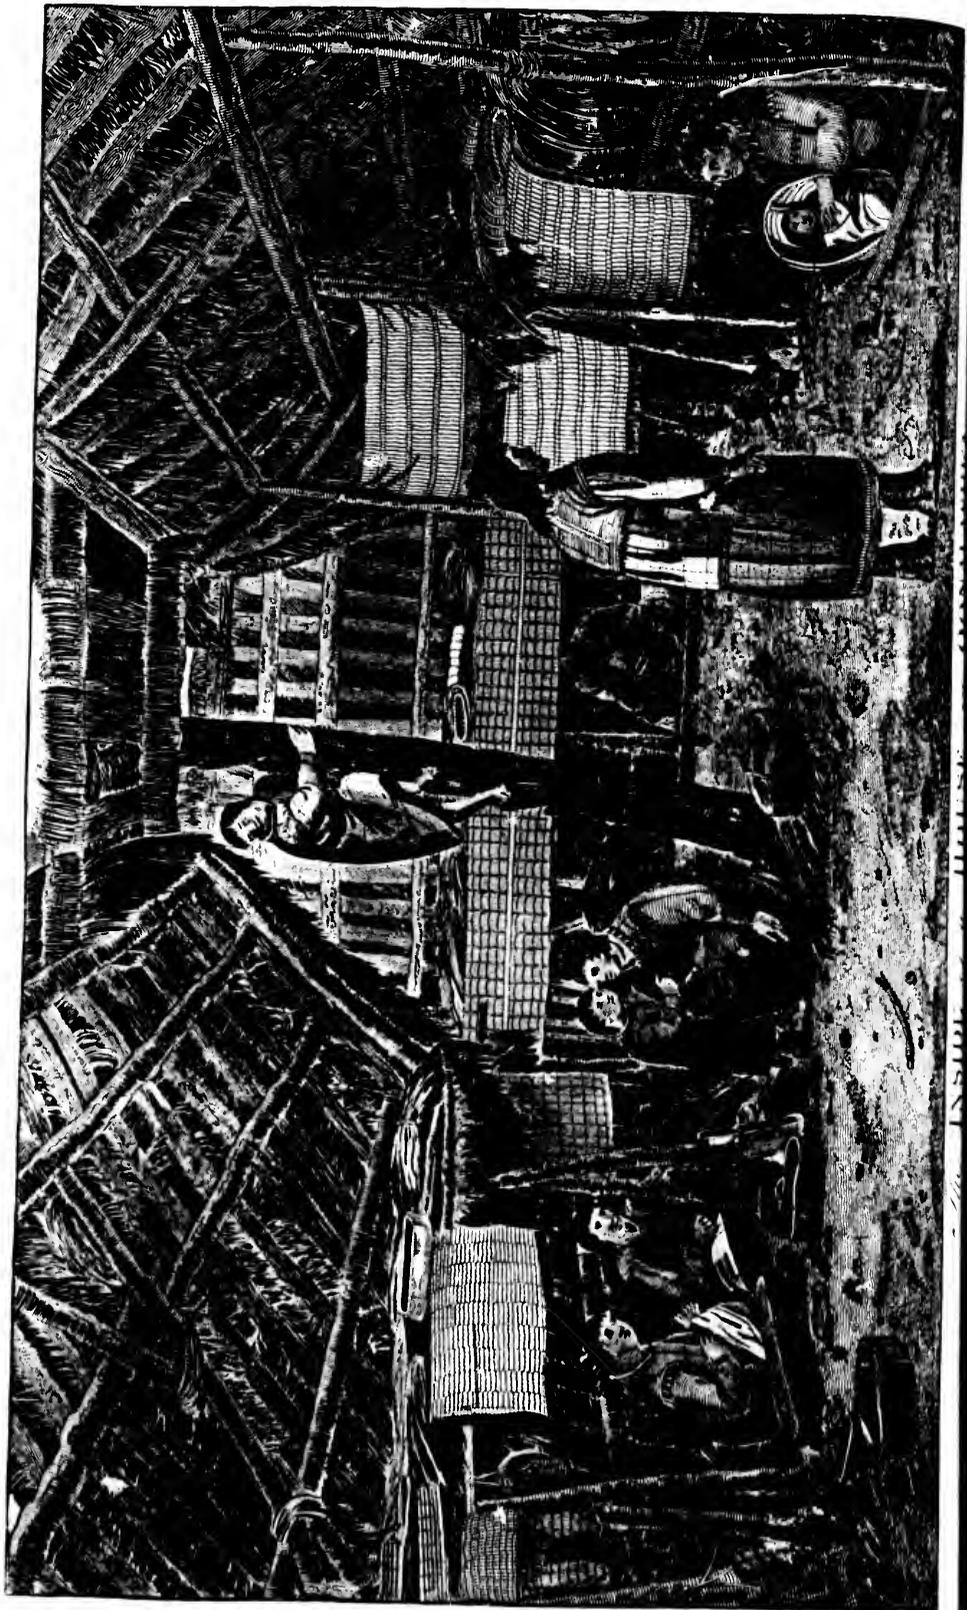

in astronomy, and in the most useful branches of the mathematics. Captain Cook made him a present of an Hadley's octant; and though, perhaps, it was the first he had ever seen, he very quickly made himself acquainted with most of the uses to which that instrument can be applied.

Thursday the 22d, in the morning, we made an attempt to get out to sea, with the wind at S. E. but did not succeed. In the afternoon of the 23d, we were visited by one Jacob Ivanovich Sopotnicoff, a Russian, who commanded a small vessel at Oomanak. This man seemed very modest, and would drink no strong liquor, of which the other Russians, whom we had met with here, were extremely fond. He appeared to know what supplies could be obtained at the harbour of St. Peter and St. Paul, and the price of the various articles, more accurately than Mr. Lamyloff. But by all accounts, every thing we should have occasion to purchase at that place, was very scarce, and bore a high price. This man informed us, that he was to be at Petropaulowka in the ensuing May; and, as we understood, was to have the charge of Captain Cook's letter. He seemed very desirous of having some token from the Captain to carry to Major Behm; and to gratify him, the Captain sent a small spying glass. After we had contracted an acquaintance with these Russians, several of our gentlemen, at different times, visited their settlement on the island, where they always met with very friendly treatment. It consisted of a dwelling-house and two store-houses. Besides the Russians, there was a number of the Kamtschadales, and of the Oonalashkans, as servants to the former. Some other natives of this island, who appeared to be independent of the Russians, lived at the same place. Such of them as belonged to the Russians, were all of the male sex; and they are either taken or purchased from their parents when young. There were at present about twenty of these, who could be considered in no other light than as children. They all reside in the same house, the Russians at the upper end, the Kamtschadales in the middle, and the Oonalashkans at the lower end, where is fixed a capacious boiler for preparing their food, which principally consists of fish, with the addition of wild roots and berries. There is no great difference between the first and last table, except what is produced by cookery, by which the Russians can make indifferent things palatable. They dress whale's flesh in such a manner as to make it very good eating; and they have a kind of pan-pudding of lalnon-roe, beaten up here and fried, which is a tolerable substitute for bread. They may, perhaps, occasionally taste real bread, or have a dish in which flour is one of the ingredients. If we except the juice of berries, which they generally sip at their meals, they drink no other liquor than pure water; and it seems to be very fortunate for them that they have nothing stronger. As the island furnishes them with subsistence, so it does in some measure with clothing. This is chiefly composed of skins. The upper garment, which is made like a waggoner's frock, reaches down to the knees. Besides this, they wear a waistcoat or two, a pair of breeches, a fur cap, and a pair of boots, the legs of which are formed of some kind of strong gut, but the soles and upper leathers are of Russian leather. Their two Chiefs, Lamyloff and Ivanovitch, wore a calico frock; and they, as well as several others, had shirts of silk. Many Russians are settled upon all the most considerable islands between Kamtschatka and Oonalashka, for the purpose of collecting furs. Their principal object is the sea-beaver or otter; but skins of inferior value also make a part of their cargoes. We neglected to enquire how long they have had a settlement upon Oonalashka, and the neighbouring islands; but if we form our judgment on this point from the great subjection the natives are under, this cannot be of a very late date. These furriers are from time to time succeeded by others. Those we saw arrived here from Okotsk in 1776, and were to return in 1781.

As for the native inhabitants of this island, they are to all appearance a very peaceable, inoffensive race of people; and in point of honesty, they might serve as a pattern

pattern to the most civilized nations. But, from what we saw of their neighbours, with whom the Russians are unconnected, we have some doubt whether this was their original disposition; and are rather inclined to be of opinion, that it is the consequence of their present state of subjection. Indeed, if we did not misunderstand the Russians, they had been under the necessity of making some severe examples before they could bring the islanders into tolerable order. If severities were really inflicted at first, the best excuse for them is, that they have produced the most beneficial effects; and, at present, the greatest harmony subsists between the Russians and the natives. The latter have their own chiefs in each island, and seem to enjoy liberty and property without molestation. Whether they are tributaries to the Russians, or not, we could never learn; but we had some reason to suppose that they are.

The people of Onalashka are in general rather low of stature, but plump, and well shaped. Their necks are commonly short, and they have swarthy chubby faces. They have black eyes and small beards. Their hair is long, black, and straight; the men wear it loose behind, and cut before; but the women generally tie it up in a bunch. The dress of both sexes is the same with respect to fashion, the only difference is in the materials. The frock worn by the women is made of the skins of seals; and that of the men, of the skins of birds; both reach below the knees. This constitutes the whole dress of the females. But, over the frock, the men wear another composed of gur, which water cannot penetrate; it has a hood to it, which is drawn over the head. Some of them wear boots; and all of them wear a sort of oval snouted cap, made of wood, with a rim that admits the head. They dye these caps with green and other colours; and round the upper part of the rim they fix the long bristles of some sea animal, on which glass beads are strung; and on the front is a small image or two formed of bone. They do not make use of paint; but the women puncture their faces slightly, and both sexes perforate the lower lip, in which they fix pieces of bone. But it is as uncommon here to see a man with this ornament, as to observe a woman without it. Some fix beads to the upper lip under the nostrils; and they all suspend ornaments in their ears.

Fish and other sea animals, birds, roots, berries, and even sea-weed, compose their food. They dry quantities of fish during the summer, which they lay up in small huts for their use in winter; and, probably, they preserve berries and roots for the same reason of scarcity. They eat most of their provisions raw. Boiling and broiling were the only methods of cookery that we saw practised among them; and the former they in all probability learnt from the Russians. Some have in their possession small brass kettles, and those who have not, make one of a flat stone, with sides of clay. Captain Cook once happened to be present, when the chief of this island made his dinner of the raw head of a large halibut, just caught. Before any part of it was given to the chief, two of his servants eat the gills, with no other dressing than squeezing out the slime. After this, one of them having cut off the head of the fish, took it to the sea, and washed it, then came with it, and seated himself by the chief; but not before he had pulled up some grass, upon a part of which the head was placed, and the rest was thrown before the chief. He then cut large pieces off the cheeks, and put them within the reach of the chief, who swallowed them with great satisfaction. When he had finished his meal, the remains of the head being cut in pieces, were given to the servants, who tore off the meat with their teeth, and gnawed the bones like so many dogs.

As the Onalashkins use no paint, they are less dirty in their persons than those savages who thus besmear themselves; but they are full as filthy in their houses. The following is their method of building: they dig, in the ground, an oblong pit, which rarely exceeds fifty feet in length, and twenty in breadth; but the dimensions are in general smaller. Over this excavation they form the roof of wood, which they cover first with grass,

and then with earth, so that the external appearance resembles a dung-hill. Near each end of the roof is left a square opening, which admits the light; one of these openings being intended only for this purpose, and the other being also used to go in and out by, with the assistance of a ladder, or rather a post, in which steps are cut. In some of the houses there is another entrance below, but this is rather uncommon. Round the sides and ends of the habitations, the families, several of which dwell together, have their separate apartments, where they sleep, and sit at work; not on benches, but in a sort of concave trench, dug entirely round the inside of the house, and covered with mats, so that this part is kept pretty clean and decent. The same cannot be said of the middle of the house, which is common to all the families. For, though it is covered with dry grass, it is a receptacle for every kind of dirt, and the place where the urine trough stands; the stench of which is by no means improved by raw hides, or leather, being almost continually steeped in it. Behind, and over the trench, they place the few effects that they have in their possession, such as their mats, skins, and apparel. Their furniture consists of buckets, cans, wooden bowls, spoons, matted baskets, and sometimes a Russian kettle or pot. All these utensils are made in a very neat manner; and yet we observed no other tools among them than the knife and the hatchet; that is, a small flat piece of iron, made like an adze, by fixing it into a crooked wooden handle.

Though the Russians live among these people, we found much less iron in possession of the latter, than we had met with among other tribes on the neighbouring continent of America, who had never seen the Russians, nor perhaps had any intercourse with them. Probably a few beads, and a small quantity of tobacco and snuff, purchase all they have to spare. There are few of them that do not both smoke and chew tobacco, and take snuff. They did not appear to be very desirous of more iron, or to want any other instruments, except sewing needles, their own being formed of bone. With these they sew their canoes, and make their clothes, and also work very curious embroidery. They use, instead of thread, the fibres of finew, which they split to the thickness which is required. All sewing is performed by the females. They are the shoe-makers, tailors, and boat-builders, or boat-coverers; for the men, in all probability, construct the wooden frame, over which the skins are sewed. They manufacture mats, and baskets of grass, which are both strong and beautiful. There is, indeed, a neatness and perfection in most of their work, that shews they are neither deficient in ingenuity nor perseverance. We did not observe a fire-place in any one of their habitations. They are lighted, as well as heated, by lamps; which, though simple, effectually answer the purpose for which they are intended. They consist of a flat stone, hollowed on one side like a plate; in the hollow part they put the oil, mixed with some dry grass, which serves for a wick. Both sexes often warm themselves over one of these lamps, by placing it between their legs, under their garments, and sitting thus over it for several minutes. These people produce fire both by collision and attrition; the first by striking two stones against each other, on one of which a quantity of brimstone has been previously rubbed. The latter method is performed by means of two pieces of wood, one of which is flat, and the other is a stick of the length of about a foot and a half. They press the pointed end of the stick upon the other piece, whirling it nimbly round as a drill, and thus fire is procured in a few minutes. This method is common in many countries. It is not only practised by these people, but also by the Kamtschadales, the Greenlanders, the Otaheiteans, the New Hollanders, and the Brazilians, and probably by other nations. Some men of learning and genius have founded an argument on this custom, to prove that this and that nation are of the same extraction. But casual agreements, in a few particular instances, will not wholly authorize such a conclusion; nor, on the other hand, will a disagreement, either in manners or customs, between two different

different nations, prove of course that they are of different extraction. We saw no offensive, nor even defensive weapon among the natives of Oonalashka. It can scarcely be supposed that the Russians found them in such a defenceless state; it is rather to be imagined, that, for their own security, they have disarmed them. Political motives, likewise, may have induced the Russians not to permit these islanders to have any large canoes; for we can hardly believe they had none such originally, as we found them among all their neighbours. However, we observed none here except two or three that belonged to the Russians.

The canoes in use among the natives are smaller than any of those we had seen upon the coast of America, from which, however, they differ but little in their construction. The form of these terminates somewhat abruptly; the head is forked, and the upper point of the fork projects without the under one, which is level with the surface of the water. It is remarkable that they should thus construct them, for the fork generally catches hold of every thing that comes in the way; to prevent which, they fix a piece of small stick from one point to the other. In other respects they build their canoes after the manner of those of the Esquimaux and Greenlanders; the frame being of slender laths, and the covering of the skins of seals. They are about twelve feet in length, eighteen inches in breadth in the middle, and twelve or fourteen inches in depth. They sometimes carry two persons, one of whom sits in the seat, or round hole, which is nearly in the middle; and the other is stretched at full length in the canoe. Round this hole is a rim or hoop of wood, about which gut-skin is sewed, which can be drawn together, or opened like a purse, with leathern strings fitted to the outer edge. The man sits in this place, draws the skin tight about his body over his gut-trock, and brings the ends of the thongs, or purse-strings, tight round his wrists; and it being close round his neck, and the hood being drawn over his head, where his cap confines it, water cannot easily penetrate, either into the canoe, or to his body. If, however, any water should find means to insinuate itself, the boatman dries it up with a piece of sponge. He makes use of a double-bladed paddle, which is held with both hands in the middle, striking the water first on one side, and then on the other, with a quick regular motion. Thus the canoe is impelled at a great rate, and in a direction perfectly straight. In sailing from Egoochshak to Samganoodha, though our ship went at the rate of seven miles an hour, two or three canoes kept pace with her. Their implements for hunting and fishing lie ready upon their canoes, under straps fixed for the purpose. They are all extremely well made of wood and bone, and are not very different from those used by the Greenlanders. The only difference is in the point of the missile dart; which, in some that we saw at this island, does not exceed an inch in length; whereas those of the Greenlanders, according to Crantz, are about eighteen inches long. Indeed these darts, as well as some others of their instruments, are extremely curious. Their darts are generally made of fir, and are about four feet in length. The bird, fish, or other animal is no sooner struck, than the pointed bone slips out of the socket, but remains fixed in its body by means of the barb. The dart then serves as a float to trace the animal, and also contributes to fatigue it considerably, so that it is easily taken. They throw these darts by the assistance of a thin piece of wood, twelve or fourteen inches long; the middle of this is slightly hollowed, for the better reception of the weapon; and at the termination of the hollow, which does not extend to the end, is fixed a short pointed piece of bone, to prevent the dart from slipping. The other extremity is furnished with a hole for the reception of the fore-finger, and the sides are made to coincide with the other fingers and thumb, in order to grasp with greater firmness. The natives throw these darts to the distance of eighty or ninety yards, with great force and dexterity. They are exceedingly expert in striking fish, both in the sea, and in rivers. They also use hooks and lines, nets and weirs. The lines are formed of twisted sinews, and the hooks of bone.

Whales, porpoises, grampuses, halibut, sword-fish, salmon, trout, cod, soals, flat-fish, and several other sorts, are found here; and there may be many more that we had not an opportunity of seeing. Salmon and halibut appear to be in the greatest plenty; and on them the people of these isles principally subsist; at least, they were the only sort of fish, except cod, that we observed to be laid up for their winter store. Seals, and all that tribe of sea animals, are not so numerous as they are in many other seas. Nor can this be thought surprizing, since there is hardly any part of the coast, on either continent, nor any of these islands, situate between them, but what is inhabited, and whose inhabitants hunt these animals for their food and clothing. Sea-horses are, indeed, to be found in prodigious numbers about the ice; and the sea-otter is scarce any where to be met with but in this sea. An animal was sometimes seen by us, that blew after the manner of whales. It had a head resembling that of a seal. It was larger than that animal, and its colour was white, with dark spots interspersed. This was perhaps the manati, or sea-cow.

Water fowls are neither found here in such numbers, nor in such variety, as in the northern parts of the Atlantic Ocean. However there are some in these parts, that we do not recollect to have seen in other countries; particularly the alea monochroa of Steller, and a black and white duck, which we judge to be different from the stone duck that Krathenimkoff has described in his History of Kamtschatka. All the other birds we saw are mentioned by this author, except some which we observed near the ice; and the greatest part of these, if not all, have been described by Martin, in his voyage to Greenland. It is somewhat extraordinary, that penguins, which are so frequently met with in many parts of the world, should not be found in this sea. Albatrosses too are extremely scarce here. The few land birds seen by us are the same with those of Europe; but there were probably many others which we had no opportunity of observing. A very beautiful bird was shot in the woods at Norton Sound; which, we understand, is sometimes found in England, and known by the appellation of chatterer. Our people saw other small birds there, but in no great abundance or variety; such as the bullfinch, the wood-pecker, the yellow-finch, and tit-mouse.

Our excursions and observations being confined to the sea coast, we cannot be expected to have much knowledge of the animals or vegetables of the country. There are few other insects besides musquitoes, and we saw few reptiles except lizards. There are no deer at Oonalashka, or any of the neighbouring islands; nor are there any domestic animals, not even dogs. Weasels and foxes were the only quadrupeds we observed; but the natives told us, that they had likewise hares, and the marmotas mentioned by Krathenimkoff. Hence it appears, that the inhabitants procure the greatest share of their food from the sea and rivers. They are also indebted to the sea for all the wood which they use for building, and other necessary purposes; as there is not a tree to be seen growing upon any of the islands, nor upon the neighbouring coast of the continent. The seeds of plants are laid to be conveyed, by various means, from one part of the world to another; even to islands lying in the midst of extensive oceans, and far distant from any other lands. It is therefore remarkable, that there are no trees growing on this part of the American continent, nor upon any of the adjacent isles. They are doubtless as well situated for receiving seeds, by the various ways we have heard of, as those coasts which have plenty of wood. Nature has, perhaps, denied to some soils the power of raising trees, without the assistance of art. With respect to the drift-wood, upon the shores of these islands, we have no doubt of its coming from America. For though there may be none on the neighbouring coast, a sufficient quantity may grow farther up the country, which may be broken loose by torrents in the spring, and brought down to the sea; and not a little may be conveyed from the woody coasts, though situated

ses, halibut, sword-fish, and several other may be many more than being. Salmon and haddock are in great plenty; and on them especially subsist; at least, except cod, that we observe in winter store. For neighbouring coast, rther up the coun- by torrents in the sea, and not a little coasts, though situ- ated

ated at a more considerable distance. But plants are to be found in great variety at Oonalashka. Several of them are such as we meet with in Europe, and also in Newfoundland, and other parts of America; and others of them, which are likewise found in Kamtschatka, are eaten by the natives both there and here. Of these, Krashenikoff has favoured us with descriptions. The principal one is the Saranne, or lily root; which is about as large as a root of garlick, round, and composed of a number of small cloves and grains. When boiled it somewhat resembles sloop; the taste of it is not disagreeable. It does not appear to be in great abundance. Among the food of the natives we may reckon some other wild roots; the stalk of a plant not unlike angelica; and berries of different species, such as cranberries, hurtle-berries, bramble-berries, and heath-berries; besides a small red berry, which, in Newfoundland, is denominated partridge berry; and another brown berry, with which we were unacquainted. This has somewhat of the taste of a sloe, but is different from it in every other respect. When eaten in a considerable quantity it is very astringent. Brandy may be distilled from it. Captain Clerke endeavoured to preserve some; but they fermented, and became as strong as if they had been steeped in spirits. There were several plants which were serviceable to us, but are not used either by the Russians or natives, such as wild purslain, pea-tops, a kind of scurvy grass, cress, and some others. On the low ground, and in the valleys is plenty of grass, which grows very thick, and to a great length. Among the inhabitants, native sulphur was seen, but we had no opportunity of learning where they got it. We found also ochre; a stone that gives a purple colour; and another that gives a very good green. In its natural state it is of a greyish green colour, coarse, and heavy. It dissolves easily in oil, but it entirely loses its properties when put into water. It seemed to be scarce in Oonalashka, but, we were told, it was in greater plenty in the island of Oonemak.

The inhabitants of Oonalashka bury their dead on the summits of hills, and raise a little hillock over their graves. There was one of these receptacles of the dead by the side of the road leading from the harbour to the village, over which was raised a heap of stones. It was observed that every one who passed it added one to it. In the country, we saw several stone hillocks, that seemed to have been raised by art; and many of them were apparently of great antiquity. These people are remarkably cheerful and friendly among each other; and always behaved with great civility to us. The Russians told us, that they never had any connections with their women, because they were not

Christians. Our people were not so scrupulous; and some of them had reason to repent that the females of Oonalashka encouraged their addresses without any reserve; for their health suffered by a distemper that is not unknown here.

We have had occasion to mention frequently, from the time of our arrival in Prince William's Sound, how remarkably the natives on this north-west side of America, resemble the Greenlanders and Esquimaux, in various particulars of person, dress, weapons, canoes, and the like. We were, however, much less struck with this, than with the affinity subsisting between the dialects of the Greenlanders and Esquimaux, and those of Oonalashka and Norton's Sound. But we must observe, with respect to the words which were collected by us on this side of America, that too much stress is not to be laid upon their being accurately represented; for, after the death of Mr. Anderson, we had few who took any great degree of pains about such matters; and we have often found that the same word, written down by two or more persons, from the mouth of the same native, differed considerably on being compared together. Nevertheless, enough is certain to authorize this judgment, that there is great reason to suppose, that all these nations are of the same extraction; and if that be the case, there is little doubt of there being a northern communication by sea, between the western side of America, and the eastern side, through Baffin's Bay; which communication, however, is perhaps effectually shut up against ships, by ice, and other obstructions; such, at least, was Captain Cook's opinion at this time.

In these parts the tides are not very considerable, except in Cook's River. The flood comes from the S. or S. E. following the direction of the coast to the N. W. Between Cape Prince of Wales and Norton Sound we found a current setting towards the N. W. particularly off that Cape, and within Sledge Island. This current, however, extended but a little way from the coast, and was neither consistent nor uniform. To the N. of Cape Prince of Wales, we observed neither tide nor current, either on the coast of America, or that of Asia. This circumstance gave rise to an opinion, which some of our people entertained, that the two coasts were connected either by land or ice; and that opinion received some degree of strength, from our never having any hollow waves from the northward, and from our seeing ice almost the whole way across. From the several observations made during our continuance in the harbour of Samganoedha, its latitude is 53 deg. 5 min. N. and its longitude 193 deg. 29 min. 45 sec. E.

C H A P. XIII.

The Resolution and Discovery take their departure from Samganoedha Harbour, in the island of Oonalashka—Sandwich Islands the appointed place of rendezvous—Pass the island of Amoghla—The strait between Oonalashka and Oonella repassed—Run to the South—One man killed, and others wounded, on board the Discovery—Mowee, one of the Sandwich islands described—A visit from a chief, named Terreebooo—Another island, called Oowbybee, discovered—The crew refuse to drink sugar-cane liquor—The corsage in the navy and merchants service compared—Favourable account of the natives of Oowbybee—The Resolution gets to the windward of the island—Is joined by the Discovery—The two ships anchor in Karakakooa Bay, after it had been examined by Bligh—In the interim, multitudes of the islanders are seen, and visits received from many of them—Karakakooa Bay described—The ships surrounded by the natives—Despotic authority of the chiefs over them—A visit from Koab—The Morai at Kakooa described—Offering made to Captain Cook—Observatories erected—The ground on which they are placed tobaccoed—Method of curing meat in tropical climates.

ON Monday, the 26th of October, we sailed from Samganoedha harbour, when, the wind being southerly, we stood to the westward. The Commodore's intention was to proceed to Sandwich Islands, in order to pass a few of the winter months there, if we should meet with the necessary refreshments, and then direct our course to Kamtschatka, so as to endeavour to arrive there by the middle of May, in the ensuing year. This being determined on, the Commodore delivered into the hands of Captain Clerke instructions how to proceed in case of

separation, Sandwich Islands being appointed for the first place of rendezvous; and for the second, Petropaulowika, in Kamtschatka. Having got out of the harbour, the wind veered to the S. E. with which we were carried to the western part of Oonalashka, by the evening. We had here the wind at S. and stretched to the westward. On Tuesday the 27th, at seven o'clock A. M. we wore, and stood to the E. The wind had now so greatly increased, as to reduce us to our three courses. It blew in heavy squalls, accompanied with snow, hail, and rain. On the 28th, in the morning, Oonalashka

lathka bore S. E. four leagues distant. We now stood to the westward; but towards evening, the wind, after it had for a short time abated, got insensibly to the N. E. increasing to a very hard gale, accompanied with rain: we therefore steered first to the southward, and then, as the wind inclined to the N. and N. W. more westerly. On Thursday the 26th, at half past six, A. M. land was descried, supposed to be the island of Amoghta. At eight, finding it not in our power to weather the island, we gave over plying, and bore away with the view of going to the N. of Oonalathka, not presuming in so hard a gale of wind to attempt a passage to the S. E. of it. When we bore away, the land extended from E. by S. half S. to S. S. W. distant four leagues. Our lat. was 53 deg. 38 min. and our long. 191 deg. 17 min. which gives a very different situation to this island from that assigned to it upon the Russian map; and Captain Cook was at a loss to determine whether it was Amoghta or not; but on the chart, Krenitzen's and Levasseur's voyage, in 1768 and 1769, an island called Amuckta is laid down, not very far from the place here alligned to Amoghta by Captain Cook. As we were steering to the N. E. at 11 o'clock we discovered a rock, elevated like a tower, bearing N. N. E. about four leagues distant, and situated in lat. 53 deg. 57 min. long. 191 deg. 2 min. This rock is not marked in the Russian map, produced by Isnyloff; yet it has a place in the chart of Krenitzen's and Levasseur's voyage. That chart also agrees with Captain Cook's, as to the general position of this group of islands. The singularly indented shores of the island of Oonalathka, are represented in both charts nearly alike. These circumstances are worthy of notice, as the more modern Russian maps of this Archipelago are so exceedingly erroneous. At three in the afternoon we had in view Oonalathka; upon which we shortened sail, and hauled the wind, being unable to run through the passage before night. Friday, the 20th, we had a very hard gale at W. N. W. with heavy squalls and snow, inasmuch that we were compelled to bear away under courses, and close-reefed top-sails. At noon, we were about the middle of the strait, between Oonalathka and Oonella, the harbour of Samganoodha, bearing S. S. E. one league distant. At three o'clock, P. M. we were through the strait, and clear of the isles, Cape Providence bearing W. S. W. distant three leagues.

On Sunday, the 1st of November, the wind was favourable, and we stood to sea. The weather was fairer than it had been at any time since we cleared Samganoodha Harbour, at it is called by the Russians, or Providence Bay, as it was named by Captain Cook. On the 2d, the wind was at S. and, in the evening, blew a violent storm, which occasioned us to bring to. Several guns were fired by the Discovery, which we immediately answered. We lost sight of her at eight o'clock; nor did she join us till ten the next morning, being the 3d. On Saturday the 7th, in lat. 42 deg. 12 min. long. 201 deg. 26 min. E. a shag, or cormorant, flew often round the ship. As it is not common for these kind of birds to go far from land, we concluded there might be some at no great distance, though we did not discover any. Having but little wind, Captain Clerke came on board with some melancholy intelligence. He informed us, that the second night after we had departed from Providence Bay, or Samganoodha, the main-tack of the Discovery gave way, by which accident John Mackintosh, seaman, was struck dead, and the boatswain, with three other mariners, much wounded. He added, that on the 3d, his ship having sprung a leak, and the rigging received considerable damage, he fired some guns as a signal for the Resolution to bring to. On the 8th we were favoured with a gentle breeze at N. attended with clear weather. On the 9th, we had eight hours calm; to which succeeded a wind from the S. accompanied with fair weather. Such of our people as could handle a needle, were now employed to repair the sails; and the carpenters were directed to put the boats in order. Thursday, the 12th, we observed in lat. 38 deg. 14 min. long. 206 deg. 17 min. The wind returned back to the northward; and on Sunday the 15th, in lat. 33 deg. 30 min. it veered to the E. We now saw a tro-

pic bird, and a dolphin, the first we had observed in our passage. On Tuesday, the 17th, the wind was southward, at which point it remained till the 19th, in the afternoon, when it was suddenly brought round by the W. to the N. The wind increased to a very strong gale, and brought us under double-reefed top-sails. We were now in lat. 32 deg. 26 min. long. 207 deg. 30 min. E. In lowering the main top-sail, in order to reef it, the violence of the wind tore it out of the foot-ropes, and it was split in several parts. We got, however, another top-sail to the yard the next morning. This gale proved to be the forerunner of the trade-wind, which, in lat. 25 deg. veered to the E. and E. S. E. We steered to the southward till Wednesday, the 25th, when we were in lat. 20 deg. 55 min. On the 26th, at day-break, we discovered land, extending from S. S. E. to W. At eight o'clock we stood for it, when it extended from S. E. half S. to W. the nearest part being about two leagues distant. We now perceived that our discovery of the group of Sandwich islands had been very imperfect, those which we had visited in our progress northward, all lying to the leeward of our present situation. An elevated hill appeared in the country, whose summit rose above the clouds. The land from this hill fell in a gradual slope, terminating in a steep rocky coast: the sea breaking against it in a most dreadful surf. Unable to weather the island, we bore up, and ranged to the westward. We now perceived people on many parts of the shore; also several houses and plantations. The country appeared to be well supplied with wood and water, and running streams were seen in various places, falling into the sea. It being of the utmost importance to procure a supply of provisions at these islands, which could not be accomplished, should a free trade with the natives be permitted; for this reason, the Commodore published an order, prohibiting all persons on board the ships from trading, except those that should be appointed by himself and Captain Clerke; and even these were under limitations of trading only for provisions and refreshments. Injunctions were also laid against admitting women into the ships, under certain restrictions; but the evil intended to have been prevented by this regulation, had already got amongst them. At noon, the coast extended from S. 81 deg. E. to N. 56 deg. W. A low flat, like an isthmus, bore S. 42 deg. W. the nearest shore being four miles distant. Our lat. was now 20 deg. 59 min. our long. 203 deg. 50 min. E. Some canoes came off, and when along-side, many of those who were in them, entered the ship without hesitation. We soon perceived that they were of the same nation as those islanders more to the leeward, whom we had already visited; and, as we understood, they were no strangers to our having been in those parts before. It was indeed too evident; these people having got the venereal disease among them, which they probably contracted by an intercourse with their neighbours, after we had left them. Our visitors supplied us with a quantity of cuttle-fish, in exchange for nails and iron. They brought but a small quantity of fruit or roots, but said they had plenty of them on their island, as well as of hogs and fowls. The horizon being clear, in the evening, we supposed the westernmost land that we could see to be an island, distinct from that off which we now were. Expecting the natives would return the next day, with the produce of their island, we plied off the whole night, and stood close in shore the next morning. We were at first visited by a few only, but towards noon numbers of them appeared, bringing with them potatoes, taro, bread-fruit, plantains, and small pigs; all of which were bartered for iron tools and nails, we having few other articles to give them. We made mutual exchanges till four in the afternoon, at which time they had disposed of all their cargoes, and not expressing any inclination to fetch more, we immediately made sail.

On Monday, the 30th, in the afternoon, being off the N. E. end of the island, some more canoes came off. Most of these belonged to Terreeboob, a chief, who came in one of them. He made the Commodore a present of three pigs; and we procured a little fruit by bartering

bartering with his people. In about two hours they all left us, except feven perfons who chofe to remain on board. Soon after, a double failing canoe arrived to attend upon them, which we towed after the whole night. In the evening another ifland was feen to the windward, called, by the natives, Owwhyhee. That which we had been off for fome days, was called Mowee.

On Tuesday, the 1ft of December, at eight o'clock A. M. Owwhyhee extended from S. 22 deg. E. to S. 12 deg. W. and Mowee from N. 41 deg. to N. 81 deg. W. Perceiving we could fetch Owwhyhee, we flood for it, when our vifitors from Mowee thought proper to embark in their canoes, and went afhore. We fpent the night, ftanding off and on the north fide of Owwhyhee. On the 2nd, in the morning, to our great furprize, we faw the fummits of the mountains covered with fnow. Though they were not of an extraordinary height, the fnow, in fome places, appeared to be of confiderable depth, and to have remained there fome time. As we drew near the fhore fome of the natives approached us, who appeared a little shy at firft; but we prevailed on fome of them to come on board; and at length prevailed on them to return to the ifland to bring us fuch refreshments as we wanted. After thefe had reached the fhore, we had plenty of company, who brought us a tolerable fupply of pigs, fruit, and roots. We traded with them till fix in the evening, when we flood off, in order to ply to windward round the ifland. In the evening of the 4th, an eclipfe of the moon was obferved. Mr. King ufed, for the purpofe of obfervation, a night-telescope, with a circular aperture at the object end. The Commodore obferved with the telescope of one of Ramsden's fextants. The mean of their obfervations made our longitude to be 204 deg. 35 min. E. Sunday, the 6th, in the evening, being near the fhore, and five leagues farther up the coaft, we again traded with the natives; but receiving only a trifling fupply, we flood in the next morning, when the number of our vifitors was confiderable. We had now procured pork, fruit, and roots, fufficient to ferve us four or five days; we, therefore, made fail, and fill plied to the windward. Among other ftores, the Commodore had procured a great quantity of fugar-cane; and having, upon trial, difcovered, that a decoction of it made very palatable liquor, he ordered fome of it to be brewed for our fhip's fervice; but on broaching a cask thereof, not one of the crew would even tafte it. Captain Cook having no other motive in preparing this beverage, than that of preferring our fpirits for a colder climate, neither exercifed his authority, nor had recourfe to perfuafion, to induce them to drink it, well knowing that, fo long as we could be plentifully fupplied with other vegetables, there was no danger of the fcurvy. But that he might not have his intention frustrated, he ordered that no grog fhould be ferved in either of the two fhips. The Commodore and his officers continued to drink this fugar-cane beer, whenever materials could be procured for brewing it. Some hops, which we had on board improved it much; and, it was, doubtlefs, extremely wholefome; though our inconfiderate crew, could not be perfuaded, but it muft be injurious to their health. About the beginning of this month, the crew of the Difcovery being much in want of provifions, Captain Clerke, againft his inclination, was under the neceffity of fubftituting flock fifh in the room of beef; but they were no fooner well in with the land, than they were vifited by many of the inhabitants, who came off in their canoes, with all forts of provifions, which their ifland afforded; and every man had leave to purchafe what he could for his own indulgence. This diffufed a joy among the mariners that is not eafy to be expreffed. From a fullnefs and difcontent, vifible in every countenance, all was chearfulnefs, mirth and jollity. Fresh provifions and kind females are the failors' foft delight; and when in poffeffion of thefe, paff hardships are inftantly forgotten; even thofe whom the fcurvy had attacked, and rendered almoft lifelefs, brightened up on this occafion, and for the moment appeared alert. We muft here obferve, that innovations of whatever kind

on board a fhip, are fure to meet with the difapprobation of the feamen, though even to their advantage. Our portable foup and four krout were condemned, at firft, as improper food for human beings. Few commanders have introduced more ufeful varieties of food and drink into their fhips than Captain Cook has done; few others, indeed, have had the opportunities, or have been driven to the neceffity of trying fuch experiments. It was, neverthelefs, owing to certain deviations from eftablifhed customs and practice, that he was enabled, in a great degree, to preferve his people from the fcurvy, a diftemper that has often made more havock in peaceful voyages, than the enemy in military expeditions.

Sunday, the 13th, having hitherto kept at fome diftance from the coaft, we now flood in, fix leagues more to the windward; and, after trading with fuch of the natives as came off to us, returned to fea. On the 15th, it was our intention to approach the fhore again, with the view of procuring a frefh fupply of fruit and roots; but the wind being then at S. E. by S. and S. S. E. we embraced the opportunity of ftretching to the eaftward, in order to get round the S. E. end of the ifland. The wind continued at S. E. the greateft part of the 16th; it was variable on the 17th, and on Friday the 18th, it was continually veering. Sometimes it blew in hard fqualls; and, at other times, it was calm, with thunder, lightning, and rain. In the afternoon it was westerly for a few hours, but it fhifted, in the evening to E. by S. The S. E. point of the ifland now bore S. W. by S. five leagues diftant. We expected to have weathered it, but, on Saturday, the 19th, at one o'clock, A. M. were left wholly at the mercy of a north-eafterly fwell, which drove us faft towards the land; fo that long before day-break, lights were feen upon the fhore, which was then diftant about a league. It was a dark night, with thunder, lightning, and rain. The calm was fucceeded by a breeze from the S. E. by E. blowing in fqualls with rain. We flood to the N. E. thinking it the beft tack to clear the coaft; but had it been day-light, we fhould have chofen the other. At day-break, the coaft extended from N. by W. to S. W. by W. about half a league diftant; a moft dreadful fuff breaking upon the fhore. We had certainly been in moft imminent danger; from which we were not yet feure, the wind veering more eafterly; fo that for a confiderable time, we were but juft able to keep our diftance from the coaft. Our fituation was rendered more alarming, by the leach-rope of the main-top-fail giving way, in confequence of which the fail was rent in two; and the top-gallant-fails gave way in the fame manner, though not half worn out. We foon, however, got others to the yards, and left the land aftern. The Difcovery was at fome diftance to the north, entirely clear from the land; nor did the appear in fight till eight o'clock. Captain Cook here remarks, that the bolt ropes to our fails are extremely deficient in ftrength or fubftance. This, at different times, has been the fource of infinite labour and vexation; and has occafioned much lofs of canvas by giving way; from whence he concludes, that the cordage, canvas, and other ftores, made ufe of in the navy, are inferior, in general, to thofe ufed in the merchants fervice. The Commodore alfo obferves, an opinion prevails among all naval officers, that the King's ftores are fuperior to any others. They may be right, he admits, as to the quantity, but not as to the quality of the ftores. This, indeed, he fays, is not often tried; for thefe articles are ufually condemned, or converted to other ufes, before they are half worn out. Only fuch voyages as ours afford an opportunity of making the trial; our fituation being fuch as to render it neceffary to wear every thing to the extreme. Captain Cook in this comparifon of fome cordage ufed in the King's fervice, with what is ufed in that of the merchants, may, in part, be right; efpecially in time of war, when part of the cordage wanted in the navy is, from neceffity, made by contract. But it is well known, that there is no better cordage than what is made in the King's yards. This we afiert, on the authority of a naval officer of diftinguifhed rank, and great professional ability, who has, at the fame time,

recommended

recommended it as a necessary precaution, that ships fitted out on discovery, should be furnished with no cordage but what is made in the King's yards; and, indeed, that every article of their stores, of every kind, should be the best that can be made.

When day-light appeared, the natives ashore displayed a white flag, we imagined, as a signal of peace and friendship. Many of them ventured out after us; but as the wind freshened, and we were unwilling to wait, they were left presently astern. In the afternoon we made another attempt to weather the eastern extreme; in which we failed. Indeed, our getting round the island was a matter of no importance, for we had seen the extreme of it to the S. E. which was all the Commodore desired; the natives having informed us, that there was no other island to the windward of this. But as we were so near accomplishing our design, we did not entirely abandon the idea of weathering it, and continued to ply. On Sunday, the 20th, at noon, the S. E. point bore S. distant three leagues. The snowy hills bore W. N. W. and we were within four miles of the nearest shore. In the afternoon we were visited by some of the inhabitants, who came off in their canoes, bringing with them pigs and plantains: the latter were highly acceptable, we having been without vegetables for some days; but this supply was scarcely sufficient for one day; we therefore stood in the next morning, till within about four miles of the land, when a number of canoes came off, laden with provisions. The people continued trading with us till four o'clock in the afternoon, at which time having obtained a good supply, we made sail, stretching off to the northward. In our intercourse with the people of this island, we met with less reserve and suspicion, than we had ever experienced among any of the Indian tribes. They frequently sent up into the ship, the articles they meant to barter, and afterwards came in themselves, to traffic on the quarter deck. The inhabitants of Otaheite, whom we so often visited, had not that confidence in our integrity. It is but justice to observe, that the natives of Owhyhee never attempted to over-reach us in exchanges, nor to commit a single theft. They perfectly understood trading, and clearly comprehended the reason of our plying upon the coast: for though they brought off plenty of pigs, and other provisions, they were particular in keeping up the price, and rather than dispose of them at what they thought under the value, they would carry them to shore again.

Tuesday, the 22nd, at eight o'clock A. M. we tacked to the southward. At noon, in lat. 20 deg. 28 min. 30 sec. the snowy peak bore S. W. half S. the preceding day we had a good view of it, and the quantity of snow seemed to have increased, and to extend lower down the hill. We stood to the S. E. till midnight, when we tacked till four. We had hopes of weathering the island, and should have succeeded, if a calm had not ensued, and left us to the mercy of a swell, which impelled us towards the land, from which we were not above the distance of two leagues. Some light pulls of wind, however, took us out of danger. As we lay in this situation, some islanders came off with hogs, fowls, and fruit. From one of the canoes we got a goose, little larger than a Muscovy duck. The colour of its plumage was dark grey; the bill and legs were black. Having purchased what the natives had brought off, we made sail, and stretched to the north. At midnight we tacked and stood to the S. E. in order to examine the weathermost side of the island, where, we were told, there was a safe harbour. In this attempt the Discovery had her main-top-mast stay-sail split, and by continuing standing to the north, she lost sight of our ship, the Resolution. Heavy complaints again prevailed among her company. The weather continuing tempestuous, their sufferings on this account, from incessant labour, and scanty of provisions, were grown confessedly grievous. Their grog, that had been stopped at our arrival on the coast, was now dealt to them as usual, and it was only by the kindest treatment from their officers, that the men could be kept to their duty. On Thursday the 24th, at day-light, she was not

in sight, but, at this time, the weather being hazy, we thought she might be following us. At noon we observed in lat. 19 deg. 55 min. and in long. 205 deg. 3 min. the S. E. point of the island bearing S. by E. six leagues distant; the other extreme bore N. 60 deg. W. when we were two leagues from the nearest shore. In the evening at six o'clock, the southernmost part of the island bore S. W. the nearest shore being seven miles distant. We had, therefore, now succeeded in our endeavours, in getting to the windward of the island. The Discovery was not yet in sight, but as the wind was favourable for her to follow us, we expected she would shortly join us. We, therefore, kept cruising off this point of the island, till Captain Clerke was no longer expected here. It was at length conjectured, that he was gone to leeward, in order to meet us that way, not having been able to weather the N. E. part of the island. Keeping generally at the distance of from five to ten leagues from the land, one canoe only came off to us till the 28th, when about a dozen appeared, bringing, as usual, the produce of the island. We were concerned that the people had been at the trouble of coming, as we could not possibly trade with them, not having yet consumed our former stock; and we were convinced by experience, that the hogs could not be kept alive, nor the roots be many days preserved from putrefaction. It was our intention, however, not to leave this part of the island before we had procured a good supply, knowing we could not easily return to it, if it should hereafter be found expedient so to do. On Wednesday the 30th, we began to be in want, but a calm prevented us from approaching the shore. A breeze, however, sprung up at midnight, which enabled us to stand in for land, at day-break, of the 31st. At ten o'clock A. M. the islanders visited us, bringing with them a quantity of fruit and roots, but only three small pigs. This scanty supply was, perhaps, owing to our not having purchased what they lately brought off; yet, for the purposes of traffic, we brought to, but were interrupted shortly with an excessive rain; and, indeed, we were too far from the shore; nor could we venture to go nearer, as we could not, for a moment, depend upon the wind's continuing where it was. The swell too was extremely high, and set obliquely upon the shore, where it broke in a most frightful surf. We had fine weather in the evening, and passed the night in making boards.

On Friday, the 1st of January, the atmosphere was laden with heavy clouds. A. D. 1779 and the New Year was ushered in with a heavy rain. We had a light breeze southerly, with some calms. At ten the rain ceased, the sky became clear, and the wind freshened. Being now about four or five miles from the shore, some canoes arrived with hogs, fruit, and roots. We traded till three in the afternoon; when, being pretty well supplied, we made sail, in order to proceed to the lee side of the island, in search of the Discovery. We stretched to the eastward till midnight, when the wind favoured us, and we went upon the other tack. The 2nd, 3d, and 4th, we passed in running down the S. E. side of the island, standing off and on during the nights, and employing part of each day in lying to, in order to give the natives an opportunity of trading with us. They frequently came off, at the distance of five leagues from the shore; but never brought much with them, either from a fear of losing their articles in the sea, or from the uncertainty of a market. On Tuesday the 5th, in the morning, we passed the south point of the island, in lat. 18 deg. 54 min. beyond which the coast trends N. 60 deg. W. A large village is situated on this point, many of whose inhabitants thronged off to the ship with hogs and women. The latter could not possibly be prevented from coming on board; and they were less reserved than any females we had ever seen. Indeed, they seemed to have visited us with no other view than to make a tender of their persons. Having obtained a quantity of salt, we purchased only such hogs as were large enough for salting; refusing all those that were under size: and we could seldom procure any that exceeded

the weight of 60 pounds. Happily for us, we had
 still some vegetables remaining, as we were now sup-
 plied with but few of those productions. Indeed, from
 the appearance of this part of the country, it seemed in-
 capable of affording them. Evident marks presented
 themselves of its having been laid waste by the explo-
 sion of a volcano; and though we had not seen any thing
 of the kind, yet the devastation it had made, in the
 neighbourhood, was very visible. The natives having
 now left us, we run a few miles down the coast in the
 evening, and passed the night in standing off and on.
 The next morning, being Thursday the 7th, we were
 again visited by the natives. Being not far from the
 shore, Captain Cook sent Mr. Bligh, in a boat, in order
 to found the coast, and also to go ashore, in search of
 fresh water. On his return, he reported, that, within
 two cables length of the shore, he found no soundings
 with a line of 160 fathoms; that, on the land, he could
 discover no stream or spring; that there was some rain-
 water in holes, upon the rocks, which the spray of the
 sea had rendered brackish; and, that the whole country
 was composed of flags and ashes, interspersed with a
 few plants. Between ten and eleven, to our great sa-
 tisfaction, the Discovery made her appearance, coming
 round the south point of the island, and joined us about
 one. Captain Clerke came on board, and acquainted
 us, that having cruised four or five days where we were
 separated, he plied round the east side of the island;
 where meeting with tempestuous weather, he had been
 driven from the coast. He had one of the islanders
 on board all this time, who had refused to leave the ship,
 though opportunities had been in his favour. At noon
 we observed in lat. 19 deg. 1 min. long. 203 deg. 26
 min. the nearest part of the coast being two leagues dis-
 tant. On the 8th, at day-break, we perceived, that
 while we were plying in the night, the current had car-
 ried us back considerably to the windward; and that
 we were now off the S. W. point of the island, where
 we brought to, in order to enable the inhabitants to trade
 with us. We spent the night in standing off and on.
 Four men and ten women, who came on board the pre-
 ceding day, were with us still. The Commodore not
 liking the company of the latter, we stood in shore on
 the 9th, about noon, solely with the view of getting rid
 of our guests; when some canoes coming off, we em-
 braced the opportunity of sending them away.

On Sunday the 10th, in the morning, we had light
 airs from the N. W. and calms; at eleven, the wind
 freshened at N. N. W. which so greatly retarded us,
 that, in the evening, at eight o'clock, the fourth snowy
 hill bore 1 deg. 30 min. E. On the 17th, at four o'clock,
 A. M. the wind being at W. we made for the land, in
 expectation of getting some refreshments. The natives
 seeing us near them, began to come off, and we con-
 tinued trading with them the whole day: though we
 procured but a very scanty supply, many of those who
 came off in their canoes not having a single thing to
 barter. From this circumstance, it appeared that
 this part of the island was extremely poor, and had al-
 ready furnished us with every thing they could spare.
 Tuesday the 12th was employed in plying off and on,
 with a fresh gale at west. A mile from the shore we
 found ground, at the depth of 55 fathoms. At five
 o'clock P. M. we stood to the southward, and at mid-
 night we had a calm. On the 13th, we had a small
 breeze S. S. E. and steered for the land. A few ca-
 noes came off to us with some hogs; but they brought
 no vegetables, which we now much wanted. In the
 evening, we had got the length of the S. W. point of
 the island, but, by the veering of the wind, we lost in the
 night all that we had gained in the day. Being in the
 same situation on the 14th, in the morning, some more
 canoes attended us; but they brought not any articles
 we stood in need of. We were now destitute of fruit
 and roots, and therefore obliged to have recourse to our
 sea provisions. Several canoes, at this juncture, ar-
 rived from the northward, from whence we were sup-
 plied with some hogs and roots. On Friday, the 15th,
 we had variable light airs till five in the afternoon, when
 a breeze sprung up at E. N. E. and enabled us to steer
 No. 70.

along shore to the northward. This day the weather
 was remarkably fine, and we had plenty of company;
 many of them continued with us all night, and their
 canoes were towed astern. On the 16th, at day-break,
 seeing the appearance of a bay, the boats from both
 ships were sent out to examine it; for we were informed
 there was a harbour, wherein we might safely moor,
 and where we should be supplied with materials to refit
 the ships, and provisions to victual them. In the even-
 ing the boats returned with the joyful news, that they
 had succeeded in their search, and that the harbour pro-
 mised fair to answer all that had been said of it. While
 our boats were employed in towing the ships into the
 bay, we had a view of the greatest number of spectators
 in canoes, and on shore, that we had ever seen assem-
 bled together in any place during this voyage. It was
 concluded that their number could not be less than a
 or 3000. While hovering on the coast, we had some-
 times been visited by 200 canoes at a time, who came to
 trade, and who brought us provisions when the weather
 would permit: we likewise obtained from them great
 quantities of cordage, salt, and divers other manufac-
 tures of the island, which the Commodore purchased
 for the use of the ships, and without which we could
 not well have proceeded; for during the blowing weath-
 er, our cordage snapped rope after rope, so that our
 spare hands were employed incessantly, in knotting and
 splicing. In the course of this day, we were attended
 by, at least, 1000 canoes, crowded with people, and
 laden with hogs, and other articles to barter. We
 were perfectly convinced of their peaceable intentions,
 not a single person having a weapon of any sort with
 him. Among such numbers as we had frequently on
 board, it might be expected, that some of them would
 discover a thievish disposition. One of them made off
 with a boat's rudder, and was not detected till it was
 too late to recover it. The Commodore imagined this
 to be a proper opportunity to shew these islanders the
 use of our fire arms. Two or three muskets, and as
 many four pounders were, by his orders, fired over the
 canoe which went away with the rudder: but it not be-
 ing our intention that the shot should take effect, the
 surrounding multitude were more surprized than terri-
 fied. At the approach of night, the most consider-
 able part of our visitors retired to the shore; but many
 at their own earnest request, were permitted to sleep on
 board: but we had good reason to think, that curiosity,
 at least with some of them, was not the only motive;
 for the next morning several articles were missing, in
 consequence of which orders were given, not to permit
 so many to stay with us on any future night. On Sun-
 day the 17th, by eleven o'clock A. M. we were safely
 moored, in company with the Discovery, in 18 fathoms
 water. The bay where we lay at anchor, called by the
 natives Karakakooa, is a convenient harbour; and hav-
 ing suffered much in our masts and rigging, we were
 happy at last to find so proper a place to refit. We
 cast anchor within a quarter of a mile of the N. E.
 shore; the south point of the bay bearing S. by W.
 and the north point W. half N. After we were moored
 the ships continued to be much crowded with the na-
 tives, and surrounded by a vast multitude of them,
 besides hundreds that, like fish, were swimming about
 the two ships. We were struck with the singularity of
 this scene, and particularly pleased with enriching our
 voyage with this important new discovery, owing to
 the opportunity of thus revisiting Sandwich Islands, and
 in consequence of not having succeeded in finding a
 northern passage homeward.

The bay of Karakakooa is situated in the district of
 Akona, on the west side of the island of Owhyhee. It
 extends about a mile in depth, and is bounded by two
 points of land, bearing S. E. and N. W. from each
 other, at the distance of half a league. The north
 point is flat and barren, on which is situated the village
 of Kowrova. A more considerable village stands at
 the bottom of the bay, called Kakooa, near a grove of
 stately cocoa-trees. A high rocky cliff, inaccessible
 from the sea shore, runs between them. Near the
 coast, on the south side, the land has a rugged appear-
 7 G

ance; beyond which the country rises gradually, and abounds with cultivated inclosures, and groves of cocoa-trees. The habitations of the people are scattered about in great plenty. Round the bay the shore is covered with a black coral rock, except at Kakooa, where there is an excellent sandy beach, with a Morai at one extremity, and a spring of fresh water at the other. The natives perceiving our intention to anchor in the bay, came off, as we have before observed, in astonishing numbers, expressing their joy by singing, shouting, and the most extravagant gestures. The decks, sides, and rigging of our ships were covered with them. Women and boys, who were unable to procure canoes, amused themselves the whole day in playing in the water. One of the chiefs who visited us, was named Pareca. Though a young man, we soon discovered him to be a person of great authority. He told Captain Cook that he was Jakaneec to the sovereign of the island, who was then on a military expedition at Blowee; from whence he was expected to return in a few days. Some presents from the Commodore attached him to our interest, and we found him extremely useful. Before we had been long at anchor, the Discovery had so many people hanging on one side, that she was seen to heel considerably; and our people found it impossible to prevent the crowds from pressing into her. Apprehensive that she might receive some injury, Captain Cook communicated his sentiments to Pareca, who instantly cleared the ship of her incumbrances, and dispersed the canoes with which she was surrounded. From this circumstance it appeared to us, that the chiefs of this island exercise a most despotic power over the commonalty. An instance similar to this happened on board the Resolution; where the crowd so far impeded the ordinary business of the ship, that we found it necessary to apply to Kancena, another chief, who had also attached himself particularly to Captain Cook. The inconvenience we suffered was no sooner mentioned, than he ordered the natives to quit the vessel immediately; when, without a moment's hesitation, we saw them all jump overboard, except one person who loitered behind, and by his manner expressed some degree of unwillingness to obey. Kancena observing this contempt of his authority, took hold of him immediately, and threw him headlong into the sea. These two chiefs were exceedingly well proportioned, and had countenances remarkably pleasing. Kancena was as fine a figure as we had ever seen. His height was about six feet, his features were regular and expressive, his deportment was easy, firm, and graceful, and he had lively dark eyes. Mention has already been made, that while we were cruising off this island, the inhabitants had acted fairly and honestly, without manifesting the least propensity to theft; which was the more remarkable, because those with whom we had hitherto had any dealings were people of the lowest rank, such as fishermen and servants: but the case was now quite altered. The multitude of islanders who blocked up the ships, afforded an opportunity of pilfering without danger of discovery, and even if discovered, must have escaped with impunity from our inferiority of number. To the encouragement of their chiefs, this alteration might also be attributed; for, as we frequently traced the booty to some great men who had it in their possession, there is little doubt but these depredations were made at their instigation. When the Resolution had got into her station, the two chiefs, Pareca, and Kancena, brought a third on board, whose name was Koah. He was represented to us as a priest, and one who, in his early time of life, had distinguished himself as a warrior. He was a little old emaciated figure, having fore red eyes, and his body covered with a leprous scurf, occasioned by the immoderate use of the ava. Being conducted to the cabin, he approached the Commodore with the greatest deference, threw a piece of red cloth over his shoulders, and retreating a few paces, made an offering of a small pig, at the same time pronouncing a discourse of a considerable length. This ceremony, during our continuance at Owhyhee, was often repeated, and from a va-

riety of circumstances, appeared to us to be a kind of religious adoration. Red cloth is what their idols are arrayed with, and a pig is their common offering to the Eatooas. At the conclusion of this ceremony, Koah dined with us, and eat heartily of what was provided for the table; but, like most of the islanders in these seas, he could hardly be induced to taste our wine or spirits a second time. In the evening, the Commodore, Mr. King, and Mr. Bailey, accompanied him on shore. As soon as we landed on the beach, we were preceded by four men, bearing each a wand tipped with dog's hair, and pronouncing with a loud voice, a short sentence. The crowd which had assembled on the shore, retired at our approach, and not an individual was to be seen, except a few persons who had prostrated themselves on the ground, near the habitations of the adjacent village.

Previous to our account of the peculiar ceremonies respecting the homage paid to Captain Cook, it may not be unnecessary to describe the Morai, already mentioned, situated on the beach of Kakooa. It consists of a square solid pile of stones, 40 yards in length, 20 broad, and 14 feet high. The top of it is flat, and it is surrounded with a wooden railing, whereon are displayed the skulls of those natives who had been sacrificed on the death of their chiefs. A ruinous wooden building is situated in the center of the area, connected with the railing by a stone wall, dividing the whole space into two parts. Five poles, about 20 feet high, supported an irregular kind of scaffold, on the side next the country; and on that towards the sea, were two small houses, with a covered communication. To the top of this pile we were conducted by Koah. At our entrance we saw two large wooden images, with most distorted features, having a long piece of wood of a conical form, inverted, proceeding from the top of their heads. Here Captain Cook was received by a tall young man, having a long beard, who presented him to the images, and chanted a kind of hymn, in which he was alluded by Koah. We were then led to that side of the Morai where the poles were erected; at the foot of which the images were erected, and ranged in the form of a semicircle; the middle figure having a high table before it, like the Whatta of Otaheite, on which we saw a putrid hog, and under it some cocoa-nuts, plantains, potatoes, bread-fruit, and pieces of sugar-cane. Captain Cook was conducted under this stand by Koah; who, having taken down the hog, held it towards him; when having again addressed him in a long and vehement speech, he suffered it to fall to the ground, and ascended the scaffold with him, though every moment in danger of falling. We now beheld, advancing in solemn procession, and entering the top of the Morai, ten men bearing a live hog, and a piece of red cloth of considerable dimensions. Advancing a few paces they stopped, and prostrated themselves; and Kaireekeca, the tall young man already mentioned, approaching them, received the cloth, and carried it to Koah, who wrapped it round the Commodore, and made him an offering of the hog. The Commodore was now aloft, in a situation truly whimsical, being swathed in red cloth, and hardly able to keep his hold on the rotten scaffolding. In this situation he was entertained with the chanting of Koah and Kaireekeca, sometimes alternately and sometimes in concert. After this service was performed, which was of considerable duration, Koah let the hog drop; upon which he immediately descended with Captain Cook. He then conducted him to the image just mentioned, to each of which he expressed himself in a sneering tone, and snapped his fingers at them as he passed. He then presented him to that in the centre, which, from its being habited in red cloth, appeared to be in the highest estimation. Before this figure Koah fell prostrate, and requested of Captain Cook to do the same; which he readily submitted to, being determined to follow Koah's directions throughout the whole of a ridiculous ceremony, in which his curiosity and vanity were equally gratified. We were now conveyed into the other division of the Morai, where a space of about 12 feet square was sunk three feet below the level of the area.

ered to us to be a kind of cloth is what their idols are their common offering to the of this ceremony, Koah tily of what was provided of the islanders in these duced to taste our wine or evening, the Commodore, accompanied him on shore. e beach, we were preceded a wand tipped with dog's. a loud voice, a short sen- ad assembled on the shore, d not an individual was to who had prostrated them- the habitations of the adja-

area. When we had descended into this, the Commo- dore was seated immediately between the two idols, one of his arms being supported by Koah, and the other by Mr. King. A second procession of natives at this time arrived with a baked hog, a pudding, some cocoa-nuts, bread fruit, and other vegetables. As they drew near, Kairekeea placed himself before them, and presented the hog to the Commodore in the usual manner, chant- ing as before; and his companions making regular re- sponses; but we observed their speeches and responses grew gradually shorter, and towards the conclusion, Kairekeea did not exceed three or four words, which was answered by the word Orono. This was a common appellation among the natives. Sometimes it was ap- plied by them to an invisible being, inhabiting heaven; at others it was used as a title of high rank in the island. At the conclusion of this offering, the natives seted themselves fronting us, and began to cut up the baked hog, to break the cocoa nuts, and to peel the vegetables. Others were employing in chewing the ava, and making the liquor in the same manner as it is extracted and done at the Friendly Isles. Kairekeea then chewed part of the kernel of a cocoa-nut, and wrapped it in a piece of cloth, with which he rubbed the Captain's head, face, hands, arms and shoulders. The ava was afterwards handed round, and when we had all tasted it, Koah and Pareea pulled the flesh of the hog in pieces, and pro- ceeded to put some of it in our mouths. Mr. King had no particular objection to being fed by Pareea, who was remarkably cleanly in his person; but Captain Cook, to whom a piece was presented by Koah, could not swallow a morsel, the putrid hog being strong in his recollection; and as the old man, from motives of civ- ility, had chewed it for him, his reluctance was much increased. This ceremony being concluded, we quitted the Morai, after distributing among the populace some pieces of iron, and other articles, with which they were much delighted. We were then conducted, in proces- sion, to the boats, the men with wands attending, and pronouncing sentences as before. We returned on board full of the idea of what we had seen, and perfectly satis- fied with the honest dispositions of our new friends. Of the singularity and novelty of the various ceremonies performed upon this occasion, we can only form con- jectures; but they were, in our opinion, highly expres- sive of respect, on the part of the inhabitants; and, as far as related to Captain Cook, they approached to ad- doration. Indeed the Commodore now seemed to be considered by them as their E-a-thu-ah-nu-eh; for from this time an Indian Chief, by the king's order, was placed at the head of his pinnace, at whose command the natives, in their canoes, as he passed them, were all silent, and would prostrate themselves till he was out of sight; and this they would do when the Captain was a- lone; but the chief had orders from the king, that whenever the Captain came ashore in his pinnace, to attend him, and conduct him to his house, which the sailors now called Cook's Altar.

On Monday, the 18th, Mr. King went on shore, at- tended with a guard of eight marines, having received orders to erect the observatory in a proper situation; by which means the waterers, and other working parties on shore, might be superintended and protected. When we had found a convenient spot for this purpose, almost in the centre of the village, Pareea offered to exercise his power in our behalf, and proposed that some houses should be taken, that our observations might not be ob- structed. This friendly offer, however, was declined, and we made choice of a potatoe field adjoining to the Morai, which was readily granted, and to prevent the intrusion of the natives, the place was consecrated by the priests, who placed their wands round the wall which enclosed it. This interdiction the natives call taboo, a term frequently repeated by these islanders, and seemed to be a word of extensive meaning. In this in- stance, it procured us more privacy than we could have wished. Not any canoes attempted to land near us,

the natives only sat on the wall, not daring to come within the tabooed space, without permission from us. The men, indeed, at our request, would bring provi- sions into the field; but our utmost endeavours were in- effectual to induce the women to give us their com- pany. Presents were tried, but without success. We endeavoured to prevail on Pareea and Koah to bring them: the Eatooa and Terreeboob they said would kill them if they did. This circumstance afforded great amusement to those on board, whither multitudes of people, women particularly, flocked in shoals, inasmuch that they were frequently obliged to clear the vessel, in order to have room to perform their necessary duties. Two or three hundred women were sometimes obliged to throw themselves into the water, where they continued to swim and play, till they could be re-admitted. On the 19th Pareea and Koah left us, in order to attend Terreeboob, who had landed on a distant part of the island. Nothing material happened on board, till Sun- day, the 24th. The caulkers were employed on the sides of the ship, and the rigging was repaired. The salting of hogs was also a principal object of the Com- modore's attention; and as we had improved in this operation since the former voyages, a detail here of the process of it may not be thought improper. To cure the flesh of animals in tropical climates, by salting, has long been thought impracticable; putrefaction mak- ing so rapid a progress, as not to allow the salt to take effect before the meat gets tainted. Captain Cook ap- pears to have been the first navigator who has attempted to make experiments relative to this business. His first attempts in 1774, in his second voyage to the Pacific Ocean, so far succeeded, as to convince him of the error of the vulgar opinion; and as his present voyage was likely to be protracted a year beyond the time that pro- visions had been supplied for the ships, he was obliged to contrive some method of procuring subsistence for the crews, or relinquish the prosecution of his discov- eries. He therefore renewed his attempts, and his most sanguine expectations were completely answered. The hogs we cured were of various sizes, from four to ten or twelve stone, fourteen pounds to the stone. They were always killed in the afternoon; and, after scalding off the hair, and removing the entrails, the pig or hog was cut into pieces, from four to eight pounds each, and the bones taken out of the legs and chins; in the larger hogs, the ribs were also taken out. The pieces were then examined circumspcctly, and wiped, and the coagulated blood taken from the veins. After this they were given to the salters before they were cold; and having been well rubbed with salt, they were placed in a heap on a stage in the open air, covered with planks, and pressed with very heavy weights. The next even- ing they were again well wiped, and carefully examined, when the suspicious parts were taken away. This done, they were put into a tub of strong pickle; after which they were examined once or twice a day; and if it hap- pened that any one piece had not taken the salt, which may be discovered by the smell of the pickle, they were instantly taken out and examined again, the sound pic- ces being put into fresh pickle. This, however, did not often happen. At the end of six days, they were ex- amined for the last time; and after being slightly pressed, they were put into barrels, having a thin layer of salt between them. Mr. King brought home some barrels of this pork, that had been pickled at Owhyhee, in Jan- uary, 1779, which was tasted in England, near Christ- mas, 1780, by several gentlemen, who were all unani- mous in their opinion, that it was perfectly sound, sweet and wholesome food. We have been informed by Mr. Mancover, a Midshipman on board the Discovery, and afterwards Lieutenant of the Martin sloop of war, that he tried the method here recommended, both with English and Spanish pork, during a cruise in the Span- ish main, A. D. 1782, and it succeeded beyond his ex- pectations.

WE had not long been settled at the observatory, before we discovered the habitations of a society of priests, who had excited our curiosity by their regular attendance at the Morai. Their huts were erected round a pond, inclosed with a group of cocoa-nut trees, by which they were separated from the beach and the village, and gave the situation an air of religious retirement. Captain Cook being made acquainted with this discovery, he resolved to visit them, and, expecting the manner of his reception would be singular, he took Mr. Webber with him, to enable him to represent the ceremony in a drawing. When arrived at the beach, the Commodore was conducted to Harrenno-Orono, or the house of Orono. On his approaching this sacred place, he was seated at the foot of a wooden idol, resembling that we had seen at the Morai. Here Mr. King again supported one of his arms. He was then arrayed in red cloth, and Kaireekkea, assisted by 12 priests, presented a pig with the usual ceremonies. After this solemnity, the pig was strangled, and thrown into the embers of a fire, prepared for that purpose. When the hair was singed off, a second offering was made, and the chanting repeated as before; after which the dead pig was held some time under Captain Cook's nose, and then laid with a cocoa-nut at his feet. This part of the ceremony being concluded, the performers sat down; and the *ava* was brewed and handed about: a baked hog was likewise brought in, and we were fed in the same manner as before related on a similar occasion. While we continued in the Bay, whenever the Commodore visited the observatory, Kaireekkea and his assistants presented themselves before him, making an offering of hogs, bread-fruit, cocoa nuts, &c. with the accustomed solemnities. Upon these occasions, some of the inferior chiefs intreated permission to make an offering to the Orono. If their request was complied with, they presented the hog themselves; in the performance of which, their countenances displayed that they were greatly impressed with awe and terror. Kaireekkea and the priests assisted, performing their accustomed orations and hymns. But their civilities extended beyond parade and ceremony: our party on shore were supplied daily by them with hogs and vegetables, sufficient for their subsistence, and to spare; and canoes laden with provisions, were regularly sent off to the ships. Nothing was demanded in return; not even the most distant hint was ever given, that they expected the least compensation. Their manner of conferring favours, appeared more like the discharge of a religious duty, than the result of mere liberality. On our asking to whom we were indebted for all this munificence, we were informed, that it was at the expence of Kaoo, the chief priest, and grandfather to Kaireekkea, who was at this time in the suit of the sovereign of the island. But we had less reason to be satisfied with the behaviour of the Earees, or warrior chiefs, than with that of the priests. In our intercourse with the former, they were always sufficiently attentive to their own interests; and,

besides their propensity to stealing, which may admit of palliation from its universality in these seas, they had other artifices equally dishonourable. The following is one instance, in which we discovered, with regret, that our good friend Koah was a party principally concerned. The chiefs who made us presents of hogs, were always generously rewarded; in consequence of which we were supplied with more than we could consume. On these occasions, Koah, who attended us constantly, petitioned usually for those that we did not absolutely want, and they were given him of course. A pig was one day presented to us by a man, whom Koah introduced as a chief. The pig we knew to be one of those that had a short time before been given to Koah. Suspecting an imposition, we found upon enquiry, that the pretended chief was one of the common people; and from other concurrent circumstances, we were perfectly convinced, that this was not the first time of our having been made the dupes of Koah's low cunning.

Sunday, the 24th, we were not a little surprized to find, that not any canoes were permitted to put off, and that the natives were confined to their houses. At length we were informed, that the Bay was tabooed, and that intercourse with us was interdicted, on account of the arrival of Terreeboob, their king. On the 25th, we endeavoured by threats and promises, to induce the inhabitants to revisit the ships. Some of them were venturing to put off, when we perceived a chief very active in driving them away: to make him desist, a musquet was fired over his head, which produced the desired effect; for refreshments were soon after to be had as usual. In the afternoon, the ships were privately visited by Terreeboob, attended only by one canoe, containing his wife and family. When he entered the ship, he fell on his face, as a mark of submission to the Commodore, as did all his attendants; and after having made an oration, which none of us understood, he presented the Captain with three barbed hogs, who, in return, put a necklace, composed of several strings of various coloured beads, round his neck, and gave him two looking-glasses, a large glass bowl, with some nails, and other trifles, which he received with much seeming satisfaction, and dispatched immediately a messenger on shore, who soon returned with several large hogs, cocoa-nuts, plantains, and sugar-canes, as much as our small cutter could carry. Having remained on deck about an hour, admiring the construction of the ship, he was conducted into the great cabin, where wine was offered him, which he refused: neither was there any thing he would take, except a head of bread-fruit; but he appeared delighted with every thing he saw; and before he departed in the evening, gave us to understand that he had 6000 fighting men, always in readiness to war against his enemies. On the 26th, at noon, the king came in great state from the village of Kowrova, and, in a large canoe, with some of his attendants in two others, paddled slowly towards the ships. Their appearance was really most superb. Terreeboob and his chiefs were in the first vessel, at-

arrival of Terreebooo, king of the ceremony—Visit from the king—Their realness in conducting a seaman—Behaviour of the natives about our departure; and The Resolution and Discovery The behaviour of the islanders on board the Discovery, and the pinnace attacked and captured made at the observatory—The king and his two sons on this occasion—Indelicacy of the chief threatens Captain Cook, is stabbed in the back, and surprizing, and much lamented

stealing, which may admit of a probability in these seas, they had no doubt. The following day we discovered, with regret, a party principally composed of us, presents of hogs, and in consequence of more than we could consume, Koah, who attended us, was angry for those that we did not give him of course. A pig was given to us by a man, whom Koah told us we knew to be one of those before given to Koah. We found upon enquiry, that some of the common people, in such circumstances, we were surprised was not the first time of our giving Koah's low cunning, but not a little surprized to be permitted to put off, and to their houses. At length the Bay was tabooed, and that on account of the king. On the 25th, we endeavoured to induce the inhabitants. Some of them were convinced a chief very active in him desired, a musquet was introduced the desired effect, after to be had as usual. We were privately visited by one canoe, containing his entered the ship, he fell on his knees to the Commodore, and after having made an oration, he presented the king's hogs, who, in return, put several strings of various colours, and gave him two look-glasses, with some nails, and other things with much seeming satisfaction. A messenger on shore, brought several large hogs, cocoa-nuts, as much as our small cutter could carry on deck about an hour, the ship, he was conducted to the Commodore, who offered him, which he refused, but he appeared delighted before he departed in the canoe that he had 6000 fighting men to war against his enemies. Some came in great haste from a large canoe, with some paddlers, slowly towards us, which was really most surprizing. We were in the first vessel, arrived

rayed in feathered cloaks, and helmets, and armed with spears and daggers. In the second came Kaoo, the chief priest, having their idols displayed on red cloth. They were figures of an enormous size, made of thick wicker-work, and curiously ornamented with mantles of feathers of various colours. Their eyes were large pearl oysters, with a black nut placed in the middle. A double row of the fangs of dogs was fixed in each of their mouths, which, as well as the rest of their features, appeared strangely distorted. The third canoe was laden with hogs and vegetables. Their images they call E-ah-tu-a, signifying their warrior gods, without which they never engage in battle. As they advanced, the priests chanted their hymns with great solemnity. After paddling round the vessels, they did not come on board as we expected, but made immediately towards the shore, at the beach where our tents were fixed. When landed, they hauled up all their canoes on the beach, drew up in martial order, and, led by the king, marched in ranks to their place of worship, distant from our tents about 50 yards; but, seeing the ground tabooed by small green boughs and wands, that marked the boundary, they all made a circuit with their images in procession, till they arrived at their Morai, where they placed their idols, and deposited their arms. Captain Cook, when he saw the king's intention of going on shore, went thither also, and landed with Mr. King and others, almost at the same instant. We ushered the chiefs into our tent, and the king had hardly been seated, when he rose up, and threw gracefully over the Captain's shoulders the rich feathered cloak that he himself wore, placed a helmet on his head, and presented him with a curious fan. Five or six other cloaks, of great beauty and value, were spread at the Commodore's feet. Four hogs were now brought forward by the king's attendants, together with bread fruit, &c. Then followed the ceremony of Terreebooo's changing names with Captain Cook; the strongest pledge of friendship among all the islanders of the Pacific Ocean: A solemn procession now advanced, consisting of priests, preceded by a venerable old personage, followed by a train of people leading large hogs, others being laden with potatoes, plantains, &c. We could perceive easily, by the countenance and the gestures of Kaireekeea, that the old man who headed the procession, was the chief priest, on whose bounty we were told we had so long subsisted. He wrapped a piece of red cloth round the shoulders of Captain Cook; and in the usual form, presented him with a pig. He was then seated next the king, and Kaireekeea and their attendants began their vocal ceremonies, Kaoo and the chiefs assisting in the responses. In the person of this king, we were surprized to recognize the same emaciated old man who came on board the Resolution, from the N. E. side of the island of Mowee; and we perceived that several of his attendants were the same persons, who at that time continued with us the whole night. Among these were the king's two youngest sons, the elder about the age of sixteen; and Maiha-Maiha, his nephew, whom we could not immediately recollect, having had his hair plastered over with a dirty paste and powder, which was no small improvement to the most savage countenance we had ever seen. The formalities of this meeting being ended, Captain Cook conducted Terreebooo and several of his chiefs on board our ship, where they were received with every possible mark of attention and respect; and the Commodore, as a compensation for the feathered cloak, put a linen shirt upon the sovereign, and girt his own hanger round him. Kaoo, and about half a dozen other ancient chiefs, remained on shore. All this time not a canoe was permitted to remain in the Bay, and those natives who did not confine themselves to their huts, lay prostrate on the ground. Before the king quitted the Resolution, he granted leave for the natives to trade with us as usual; but the women, we know not on what account, were still interdicted by the taboo; that is, to remain at home, and not have any kind of intercourse with us. At this time the behaviour of the inhabitants was so civil and inoffensive, that all apprehensions of danger were totally vanished. We trusted ourselves among them at

No. 71.

all times, and upon all occasions, without the least reserve. Our officers ventured frequently up the country, either singly, or in small parties, and sometimes continued over the whole night. In all places the people flocked about us, anxious to afford every assistance in their power, and appeared highly gratified if we condescended to accept of their services. Variety of innocent arts were practised to attract our notice, or to delay our departure. The boys and girls ran through their villages, stopping us at every opening where there was a convenient spot for dancing. At one time we were solicited to take a draught of milk from cocoa-nuts, or to accept of such other refreshment as their huts afforded; at another we were encircled by a company of young women, who exerted their skill and ingenuity in amusing us with songs and dances: but though the instances of their generosity and civility were pleasing to us, we could not but dislike that propensity to thieving, which at times they discovered, and to which they were addicted, like all the other islanders in these seas: this was a perplexing circumstance, and obliged us sometimes to exercise a severity, which we should have been happy to have avoided, if it had not been essentially necessary. Some expert swimmers were one day detected under the ships, drawing out the filling nails from the sheathing. This they performed very ingeniously with a flint stone, fastened to the end of a stick. This new art of stealing was a practice so injurious to our vessels, that we fired small shot at the offenders; but that they avoided easily, by diving under the ship's bottom: it therefore became highly necessary to make an example of one of them, which was done by giving him a good flogging on board our consort, the Discovery, where his talent for thieving had been chiefly exercised. About this time, Mr. Nelson, and four other gentlemen, set out on an excursion into the country, in order to examine its natural curiosities and productions, an account of which will be given hereafter. This afforded Kaoo a fresh opportunity of testifying his civility, and exerting his friendly disposition in our favour: for no sooner was he informed of the departure of our party, than he sent after them a large quantity of provisions, with orders that every attention and assistance should be granted them by the inhabitants of those districts through which they should pass. His civility on this occasion was so delicate and disinterested, that even the people he employed were not permitted to accept of the smallest present. At the end of six days the gentlemen returned, without having been able to penetrate farther than twenty miles into the island, owing partly to improper guides, and partly to the nature of the country, which occasioned this expedition to be attended with no small fatigue, and some danger. Mr. Nelson, however, collected a curious assortment of indigenous plants, and some natural curiosities. During their absence, every thing remained quiet at the tents, and the natives supplied the ships with such quantities of provisions, of all kinds, that orders were again given to purchase no more hogs in one day, than could be killed, salted, and stowed away the next day. This order was in consequence of a former one, to purchase all that could be procured for sea stock, by which so many of them were brought on board, that several of them died before they could be properly disposed of.

On Wednesday, the 27th, in the morning, the rudder of our ship was unhung, and sent on shore, in order to undergo a thorough repair. The carpenters at the same time were sent into the country, under the protection and guidance of some of Kaoo's people, to get planks for the head rail work, which was become rotten and decayed. In a visit, on the 28th, from Terreebooo to Captain Clerke, the latter received a present of 30 large hogs, and such a quantity of vegetables as could not be consumed by his crew in less than a week. This being an unexpected visit, made it the more extraordinary. Not having seen any of the sports or exercises of the natives, at our particular request, they entertained us in the evening with a boxing match. A vast concourse of people assembled on a level spot of ground, not far distant from our tents. In the centre, a long

long vacant space was left for them, at the upper end of which the arbitrators presided, under three standards. Slips of cloth of various colours, were pendant from these standards; as were the skins of two wild geese, some small birds, and a few bunches of feathers. The sports being ready to begin, the judges gave the signal, and two combatants appeared in view. They advanced slowly, drawing up their feet very high behind, and rubbing their hands upon the soles. As they came forward, they surveyed each other frequently from head to foot, with an air of contempt, looking archly at the spectators, distorting their features, and practising a variety of unnatural gestures. When they were advanced within the reach of each other, they held both arms straight out before their faces, at which part they always aimed their blows. They struck with a full swing of the arm, which to us had a very awkward appearance. They did not attempt to parry; but endeavoured to elude their adversary's attack, by stooping, or retreating. The battle was decided expeditiously; for if either of them fell, whether by accident, or from a blow, he was deemed vanquished; and the victor expressed his triumph by a variety of strange gestures, which usually excited a loud laugh among the spectators, for which purpose it seemed to be calculated. The successful combatant waited for a second antagonist; and, if again victorious, for a third; and so on, till at last he was defeated. In these combats it was very singular, that, when any two are preparing to attack each other, a third may advance, and make choice of either of them for his antagonist, when the other is under the necessity of withdrawing. If the combat proved long and tedious, or appeared unequal, a chief generally interfered, and concluded it by putting a stick between the combatants. As this exhibition was at our desire, it was universally expected, that some of us would have engaged with the natives; but, though our people received pressing invitations to bear a part, they did not hearken to the challenges, not having forgot the blows they received at the Friendly Islands.

This day died William Watman, a mariner of the gunner's crew. This event we mention particularly, seeing death had hitherto been uncommon among us. He was a man in years, and much respected by Captain Cook. He had served twenty-one years as a marine, and then entered as a seaman in 1772, on board the *Resolution*, and served with the Commodore in his voyage towards the South Pole. On their return he got admittance into Greenwich Hospital, at the same time with himself; and anxious to follow the fortune of his benefactor, he also quitted it with him, on the Commodore's appointment to the command of the present expedition. Watman had often been subject to slight fevers, in the course of the voyage, and was very infirm when we arrived in the bay; where, having been sent a few days on shore, he thought himself perfectly restored, and requested to return on board. His request was complied with. The day following he had a stroke of the palsy, which in two days afterwards put an end to his life. At the request of Terreeboob, the remains of this faithful seaman were buried in the Morai; the ceremony being performed with great solemnity. Kaoo and his brethren were present at the funeral, who behaved with great decorum, and paid due attention while the service was performing. On our beginning to fill up the grave, they approached it with great awe, and threw in a dead pig, together with some cocoa-nuts and plantains. For three successive nights they surrounded it, sacrificing hogs, and reciting prayers and hymns till morning. At the head of the grave, we erected a post, and nailed thereto a piece of board, whereon was inscribed the name and age of the deceased, and the day of his departure from this life. These memorials we were assured they would not remove, and, it is probable, they will be permitted to remain, so long as such frail materials can endure.

Being much in want of fuel, Captain Cook desired Mr. King to treat with the priests, for the purchase of the railing belonging to the Morai. Mr. King had his doubts respecting the decency of this overture, and ap-

prehended the proposal might be deemed impious; but in this he was much mistaken: for an application being made for the same, they expressed no kind of surprize, and the wood was delivered without the least stipulation. While our people were taking it away, Mr. King saw one of them with a carved image; and, upon enquiry, he was informed, that the whole semicircle (as mentioned in the description of the Morai) had been carried to the boats. Though the natives were spectators of this business, they did not seem to resent it; but on the contrary, had even assisted in the removal. Mr. King thought proper to mention the particulars to Kaoo; who seemed exceedingly indifferent about the matter, begging him only to restore the center image; which was immediately done, and it was conveyed to one of the priest's houses.

For some time, the king, and his chiefs, had been very importunate to know the time of our departure. From this circumstance, Mr. King's curiosity was excited to know the opinion these people had entertained of us, and what they supposed to be the object of our voyage. He took considerable pains to satisfy himself respecting these points; but the only information he could get was, that they supposed we had left our native country on account of the scantiness of provisions, and that we had visited them for the sole purpose of filling our bellies. This conclusion was natural enough, considering the meagre appearance of some of our crew: the voracity with which we devoured their fresh provisions; and our anxiety to purchase as much of it as we were able. It was a matter of entertainment to see the natives patting the bellies of the sailors (who were much improved in sleekness since their arrival at the bay) and telling them, in the best manner they could, that it was time for them to depart; but if they would return the next bread-fruit season, they should be better able to supply them. We had now continued sixteen days in the bay, during which time our consumption of hogs and vegetables, had been so enormous, that we need not be surprized at their wishing to see us take our leave. But Terreeboob had, perhaps, no other view, in his enquiries, than a desire of having sufficient notice, to prepare suitable presents for us at our departure; for when we informed him of our intention to quit the island in two days, a kind of proclamation was made, requiring the natives to bring in their hogs, and vegetables, for Terreeboob to present to the Orono.

We were this day much entertained, at the beach, with the buffooneries of one of the natives. He held in his hand an instrument of music, such as we have already described: bits of sea-weed were fastened round his neck; and, round each leg, some strong netting; whereon were fixed rows of dogs teeth, hanging loose. His dancing was accompanied with strange grimaces, and unnatural distortions of the features, which were sometimes highly ridiculous, and, upon the whole, without meaning or expression. But the wrangling and boxing matches afforded us good diversion for the evening; and, in return, we exhibited the few fire-works we had remaining. Nothing could more effectually excite the admiration of these islanders, or strike them with more exalted ideas of our superiority, than such a representation: notwithstanding this was, in every respect, much inferior to that exhibited at Hapae, yet the astonishment of these people was equally great.

The carpenters who had been sent up the country to cut planks for the head rail-work of our ship, the *Resolution*, had now been gone three days, and, not having heard from them, we began to be alarmed for their safety. We expressed our apprehensions to Kaoo, who appeared equally concerned with ourselves; but while we were planning measures with him, for sending proper persons after them, they all safely arrived. Our people had gone farther into the country than they expected, before they found any trees suitable for their purpose. This circumstance, together with the badness of the roads, and the difficulty of conveying timber to the ships, had so long detained them. They bestowed high commendations on their guides, who not

deemed impious; but for an application being made no kind of surprize, without the least stipulation it away, Mr. King's image; and, upon entering the whole semicircle (as the Morai) had been in the natives were specified not seem to resent it; mention the particulars indifferently about the centre image; and it was conveyed to

and his chiefs, had been time of our departure, King's curiosity was excited; people had entertained to be the object of our pains to satisfy himself the only information he had we had left our scantiness of provisions, for the sole purpose of son was natural enough; of some of our crew: poured their fresh provisions as much of it as we of entertainment to see of the sailors (who were since their arrival at the best manner they could, depart; but if they would ion, they should be better now continued sixteen time our consumption of n so enormous, that we wishing to see us take our perhaps, no other view, of having sufficient resources for us at our departure; of our intention to a kind of proclamation to bring in their hogs, to present to the

certained, at the beach, the natives. He held in, such as we have since were fastened round some strong netting; some strong netting; some strong netting; with strange grimaces, the features, which were upon the whole, without the wrestling and diversion for the evening the few fire-works we more effectually excite, or strike them with priority, than such a resolution was, in every prohibited at Hapacc, yet e was equally great.

sent up the country to the back of our ship, the Re-tee days, and, not having to be alarmed for their intentions to Kaoo, who had himself; but while him, for sending provisions safely arrived. Our country than they were suitable for their together with the bad-ty of conveying them. They by their guides, who not only

only supplied them with provisions, but faithfully protected their tools. Having fixed on Thursday, the 4th of February, for our departure, Terrecoboo invited Captain Cook and Mr. King to attend him on the 3d, to Kaoo's residence. On our arrival there, we saw large quantities of cloth scattered on the ground; abundance of red and yellow feathers, fastened to the fibres of cocoa-nut husks; and plenty of hatchets and iron ware, which had been received from us in barter. Not far from these was deposited an immense quantity of various kinds of vegetables; and at a little distance, a large herd of hogs. We supposed, at first, that the whole was intended as a present for us; but we were informed by Kaireckee, that it was a tribute to the king, from the inhabitants of that district. We were no sooner seated than the bundles were brought, and laid severally at Terrecoboo's feet; and the cloth, feathers, and iron, were displayed before him. The king was perfectly satisfied with this mark of civility from his people; and having selected about one third of the iron utensils, one third of the feathers, and some pieces of cloth, he ordered these to be set aside by themselves; and the remainder of the cloth, hogs, vegetables, &c. were afterwards presented to Captain Cook and Mr. King. The value and magnitude of this present, far exceeded any thing that we had before received. The whole was immediately conveyed on board; and the large hogs were set apart for sea stores; but the smaller pigs and vegetables, were divided between the crews. The same day we quitted the Morai, and got our observatories on board. The taboo was removed, and, with it vanished its magical effects; for as soon as we had quitted the place, the people rushed in, and vigilantly searched, in hopes of finding some valuable articles left behind. Mr. King being the last on shore, and waiting for the return of the boat, the inhabitants crowded about him, and having prevailed upon him to sit down among them, expressed their regret at our separation. It was even with difficulty that they would suffer him to depart. Having had, while we lay in the bay, the command of the party on shore, he became more acquainted with the natives, than those who were required to be on board. From the inhabitants in general, he experienced great kindness; but the friendship shewn by the priests was constant and unbounded. On the other hand, Mr. King was anxious to conciliate their esteem; in which he so happily succeeded, that when they were made acquainted with the time of our departure, he was urged to remain behind, and received overtures of the most flattering kind. When he endeavoured to excuse himself, by alledging, that the Commodore would not permit it, they proposed to conduct him to the mountains, and there conceal him till the departure of the ships. On Mr. King's assuring them that the ships would not sail without him, the King and Kaoo repaired to Captain Cook, (whom they supposed to be his father) requesting formally, that he might be suffered to remain behind. The Commodore unwilling to give a positive refusal, to a proposal so generously intended, assured them, that he could not part with him at present, but he should return thither the next year, when he would endeavour to oblige them.

On Thursday the 4th of February, early in the morning, having unmoored, the Resolution and Discovery set sail, and cleared the harbour, attended by a vast number of canoes. We proposed to shape our course for Mowee; as we had been informed, that in the island there was a fine harbour, and excellent water, but Captain Cook intended to finish first the survey of Owhyhee, before he went thither, hoping to meet with a road more sheltered than Karakakooa Bay. We had not been long under sail, when the king, who had omitted to take his leave of Captain Clerke, as not expecting our departure to be so sudden, came after the ships, accompanied by the young prince, in a sailing canoe, bringing with them ten large hogs, a great number of fowls, and a small turtle (a great rarity) with bread-fruit in abundance. They also brought with them great quantities of cocoa-nuts, plantains, and sugar-cane. Besides other persons of distinction, who accompanied

the king, there was an old priest, who had always shewn a particular attachment to Captain Clerke, and who had not been unrewarded for his civility. It being rather late when they reached the Discovery, they staid on board but a few hours, and then all departed, except the old priest, and some girls, who had the King's permission to remain on board, till they should arrive at some of the neighbouring isles. We were now steering with a fine breeze, but just at the close of evening, to our great mortification, the wind died away, and a great swell succeeding, with a strong current setting right in for shore, we were in the utmost danger, particularly the Discovery, of being driven upon the rocks. At this time the old priest, who had been sent to sleep in the great cabin, leaped over-board unscen with a large piece of Russian silk, Captain Clerke's property, and swam to shore.

On Friday the 5th, we had calm weather, and made but little way. Seeing a large canoe between us and the shore, we hoisted for her coming up, and to our great surprize perceived the old king, with several of his chiefs, having with them the priest who had stolen the silk, bound hand and foot, whom the king delivered to Captain Clerke, at the same time requesting that his fault might be forgiven. The king being told his request was granted, unbound him, and set him at liberty; telling the Captain that, seeing him with the silk, he judged it was not his own, therefore ordered him to be apprehended; and had taken this method of exposing him, for having injured his friend. This was a singular instance of justice, which we did not expect to see among these people. As soon as they had delivered the silk, which the king refused to accept, they departed. Having a light breeze in the night, we made a little progress to the northward.

On Saturday the 6th, in the morning, we were abreast of a deep bay, called by the natives Toe-yah-yah. We flattered ourselves with finding a commodious harbour here; for we saw some fine streams of water to the N. E. and the whole appeared to be well sheltered. These observations seeming to tally with the accounts given by Koah, who was now on board the Resolution, the master was sent in the pinnace, with Koah as his guide, to examine the bay; but, before they set off, Koah altered his name, out of compliment to us, to that of Brittanee. In the afternoon, the weather became gloomy, and such violent gusts of wind blew off the land, that we were obliged to take in all the sails, and bring to, under the mizen-stay-sail. Soon after the gale began, all the canoes left us; and Mr. Bligh, on his return, preserved an old woman and two men from drowning, whose canoe had been overcracked in the storm. We had several women remaining on board, whom the natives, in their hurry to depart, had left to shift for themselves. Mr. Bligh reported, that he had landed at a village on the north side of the bay, where he was shewn some wells of water, that would not, by any means answer our purpose; that he proceeded farther into the bay; where, instead of finding good anchorage, he observed the shores to be low, and a flat bed of coral rocks extended along the coast, and upwards of a mile from the land; the depth of water, on the outside, being twenty fathoms. During this survey Brittanee had contrived to slip away. His information having proved erroneous, he might, perhaps, be afraid of returning. In the evening the weather became more moderate, when we again made sail; but it blew so violently about midnight, as to split the fore and main-top sails.

On Sunday the 7th, in the morning, we bent fresh sails. Being now about four or five leagues from the shore, and the weather very unsettled, the canoes would not venture off, so that our female guests were under the necessity of remaining with us, though, at this time, much against their inclination; for they were all exceedingly sea sick, and many of them had left their infants on shore. The weather continued squally, yet we stood in for land, in the afternoon; and being within three leagues of it, we saw two men paddling towards us. We conjectured, that they had been driven off

the shore, by the late boisterous weather; and therefore stopped the ship's way, in order to take them in. These poor wretches were so exhausted by fatigue, that had not one of the natives on board jumped into the canoe to their assistance, they would hardly have been able to fix it to the rope thrown out for that purpose. It was with great difficulty that we got them up the ship's side, together with a child about four years of age, which had been lashed under the thwarts of the canoe, with only its head above the water. They had left the shore the morning before, and had been, from that time, without food or water. The usual precautions were taken in giving them victuals, and the child being committed to the care of the women, they were all perfectly recovered by the next morning. At midnight a gale of wind coming on, we were obliged to double reef the top-sails, and get down the top-gallant yards.

On Monday the 8th, at day-break, we found that the fore-mast had again given way; the fillets being sprung, and the parts so very defective, as to make it absolutely necessary to unstep the mast. Captain Cook for some time hesitated, whether he should return to Karakakooa, or take the chance of finding a harbour in the islands to the leeward. The bay was not so commodious, but that a better might probably be met with, either for repairing the masts, or procuring refreshments; the latter of which, it was imagined, the neighbourhood of Karakakooa had lately been pretty well drained of. It was, on the other hand, considered as an imprudent step, to leave a tolerable good harbour, which, once lost, could not be regained, for the mere possibility of meeting with a better; especially, as the failure of such a contingency, might have deprived us of any resource. We now stood on towards the land, to give the natives on shore an opportunity of releasing their friends on board; and, about noon, when we were within a mile of the shore, several canoes came off to us, but so loaded with people, that no room could be found for any of our guests; the pinnace was therefore hoisted out to land them; and the master who commanded it, was instructed to examine the south coasts of the bay for water, but returned without success. Variable winds, and a strong current to the northward, retarded their return.

On Tuesday the 9th, at eight o'clock, A. M. it blew very hard from the S. E. which occasioned us to close reef the top-sails.

On Wednesday the 10th, at two o'clock, A. M. in a heavy squall, we found ourselves close in with the breakers, to the northward of the west point of Owhyhee. We had just room to avoid them, and fired several guns to alarm the Discovery, and apprise her of danger. In the forenoon, the weather had been more moderate. A few canoes ventured to come off to us, when we were informed by those belonging to them, that much mischief had been occasioned by the late storms, and that a great many canoes had been lost. We kept beating to windward the remainder of the day; and, in the evening, were within a mile of Karakakooa bay; but we stood off and on till day-light, the next morning, when we cast anchor in our old station.

On Thursday the 11th, and part of the 12th, all hands were employed in getting out the fore-mast, and conveying it on shore. Besides the damage which the head of the mast had sustained, the heel of it was found by the carpenters, exceeding rotten, having a large hole in the middle. As the necessary repairs were likely to take up several days, Mr. Bayly and Mr. King got the astronomical apparatus on shore, and pitched their tents on the Morai, guarded by a corporal and six marines. A friendly intercourse was renewed with the priests, who, for our greater security, tabooed the place with their wands as before. The sail-makers were sent on shore to repair the damages, in their department, sustained by the late heavy gales. They occupied a house adjoining to the Morai, that was lent us by the priests. Such were the arrangements on shore. But on coming to anchor in the bay, our reception was so very different from what it had been upon our first at-

rival, that we were all astonished: no shouts were heard, no bustle or confusion, by the motions of the natives, were perceived; but we found ourselves in a solitary, deserted bay, with hardly a friend appearing, or a canoe stirring. Their curiosity, indeed, might be supposed to be diminished by this time; but the hospitable treatment we had been continually favoured with, and the friendly manner in which we parted, induced us to expect that, on our return, they would have received us with the greatest demonstrations of joy. Various were our conjectures on the cause of this extraordinary appearance, when our anxiety was in part relieved by the return of our boat, the crew of which brought us intelligence, that Terreeboob was absent, and that the bay was tabooed. This account appeared very satisfactory to many of our company; but some were of opinion, that there was, at this time, somewhat very suspicious in the behaviour of the natives; and that the taboo, or interdiction, on pretence of the king's absence, was contrived artfully, to afford him time to consult his chiefs in what manner we should be treated. Whether those suspicions were well founded, or the accounts given by the natives was the truth, we were never able to ascertain. For though it is not improbable, that our sudden return, for which they could see no apparent cause, and the necessity of which we afterwards found it very difficult to make them comprehend, might occasion some alarm; yet the unsuspecting conduct of Terreeboob, who, on his supposed arrival, the next morning, came immediately to visit Captain Cook, and the consequent return of the natives to their former friendly intercourse with us, are strong proofs that they neither meant, nor apprehended, any change of conduct. In support of this opinion, we may add the account of another accident, precisely of the same kind which happened to us, on our first visit, the day before the king's arrival. A native having sold a hog on board our ship, and received the price agreed on, Pareca, who saw the transaction, advised the seller not to part with his hog, without an advanced price. For his interference in this business, he was harshly spoken to, and pushed away; and as the taboo was soon laid on the bay, we, at first, supposed it to be the consequence of the affront offered to the chief. Both these events serve to shew how extremely difficult it is to draw any certain conclusion from the conduct of a people, with whose language and customs we were so imperfectly acquainted. Some idea, however, may be formed of the difficulties those have to encounter, who in their intercourse with these strangers, are obliged to steer their course in the midst of uncertainties, when the most serious consequences may be expected by only imaginary offences. However true or false our conjectures may be, it is certain this day, the 12th, things went on in their usual quiet course.

On Saturday the 13th, at the approach of evening, the officer who commanded the watering party of the Discovery, came to inform Mr. King, that several chiefs were assembled near the beach, and were driving away the natives, who assisted the sailors in rolling the casks to the shore; declaring, at the same time, that their behaviour seemed to be very suspicious, and he imagined they would give him some farther disturbance. Mr. King, agreeable to his request, sent a marine with him, but permitted him to take only his side arms. The officer, in a short time, returned, and informed Mr. King, that the inhabitants had armed themselves with stones, and were become very tumultuous. Mr. King therefore went himself to the watering place, attended by a marine with his musquet. Seeing them approach, the islanders threw away their stones, and, on Mr. King's application to some of the chiefs, the mob was dispersed. Every thing being now quiet, Mr. King went to meet Captain Cook, who was coming on shore in the pinnace. He related to the Commodore all that had recently happened, and received orders to fire ball at the offenders, should they again behave insolently, and in case of their beginning to throw stones. In consequence of these orders Mr. King commanded the corporal to give directions, that the sentinels

ed: no shouts were heard, the motions of the natives, and ourselves in a solitary friend appearing, or a canoe, indeed, might be supposed to be the hospitable usually favoured with, and we parted, induced us to they would have received expressions of joy. pieces

pieces should be loaded with ball, instead of shot. On our return to the tents, we heard a continued fire of the muskets from the Discovery, which we observed to be directed at a canoe, that we saw paddling towards the shore, in great haste, and pursued by one of our small boats. We immediately concluded, that the firing was in consequence of some theft, and Captain Cook ordered Mr. King to follow him with a marine armed, and to endeavour to seize the people as they came on shore. Accordingly, we ran towards the place where we imagined the canoe would land, but were too late; the people having quitted it, and made their escape into the country before our arrival. We were at this time ignorant, that the goods had been already restored; and thinking it probable, from the circumstances we had at first observed, that they might be of importance, for this reason, we were unwilling to relinquish our hopes of recovering them. Having therefore enquired of the natives which way the fugitives had gone, we followed them, till it was near dark, when judging ourselves to be three miles from the tents, and suspecting that the natives, who frequently encouraged us in the pursuit, were amusing us with false information, we thought it in vain to continue our search any longer, and therefore returned to the beach. During our absence a difference of a more serious nature had happened. The officer who had been dispatched in the small boat after the thieves, and who was returning on board with the goods that had been restored, seeing Captain Cook and Mr. King engaged in the pursuit of the offenders, seized a canoe which was drawn upon the shore. This canoe belonged to Pareea, our friend, who at that instant, arriving from on board the Discovery, claimed his property, and protested his innocence. However, the officer persisted in detaining it, in which he was encouraged by the crew of the pinnace, then waiting for the Commodore. The consequence of this imprudent conduct was, what might have been expected: a scuffle ensued; and Pareea unfortunately was knocked down, by a violent blow on the head with an oar. Several of the natives, who had hitherto been unconcerned spectators, began now to attack our people with such a shower of stones, that they were compelled to make a precipitate retreat, and swam off to a rock, at a considerable distance from the shore. The pinnace was plundered immediately by the natives, and would have been entirely demolished, had not Pareea interposed, who had not only recovered from his blow, but had also forgot it at the same instant. He ordered the crowd to disperse, and beckoned to our people to come and take possession of the pinnace; and afterwards assured them, that he would use his influence to get the things restored which had been taken out of it. After their departure, he followed them in his canoe, carrying them a midshipman's cap, and some other articles; and expressing much concern at what had happened, begged to know, if the Orono would kill him? And, whether he might be permitted to go on board the next day? He was assured that he would be well received; upon which he joined notice with the officers (their usual token of amity) and paddled over to Kowroa. When these particulars were related to Captain Cook, he was exceedingly concerned; and when the Captain and Mr. King were returning on board, the former expressed his fears, that these islanders would oblige him, though much against his inclination, to use violent measures with them; adding, they must not be permitted to suppose that they had gained an advantage over us. It was too late to take any steps this evening, the Commodore therefore only gave orders, that every native should be immediately turned out of the ships. This order having been executed, Mr. King returned to his station on shore; and the events of the day having much abated our former confidence in the natives, we posted a double guard on the Morai, with orders to send to Mr. King and let him know, if any of the natives were seen lurking about the beach. At 11 o'clock, five of the natives were seen creeping round the bottom of the Morai: they approached silently with great caution, but, perceiving they were discovered, immedi-

No. 71.

ately retired out of sight. At midnight, one of them ventured very near the observatory, when one of the sentinels fired over him; whereupon he, with some others fled with great precipitation, and we had no farther molestation during the remainder of the night. The temper of these islanders was now totally changed; and for some days past, as may be seen from our journal, they became more and more troublesome. In the course of this day, several parties of them were busy in rolling stones from the edge of the hill, with a view, as was supposed, to annoy the ships; but these were at too great a distance to receive any damage; however, the Commodore looking upon this as an insult, ordered some of our great guns to be fired among them, and, in less than ten minutes, not an Indian was to be seen near the place. In the afternoon Terreebooo came on board, and complained of our having killed two of his people, intimating, at the same time, that they had not the least intention of hurting us. He continued on board near two hours, amusing himself with seeing our armourers work, and requested that they might be permitted to make him a pahooa (an instrument used in battle, when they come to close quarters) which was immediately done.

Sunday, the 14th of February, 1779. This is that memorable day, in which are comprized the affecting incidents, and melancholy particulars, that concluded with the assassination of our beloved and honoured Commodore. Very early in the morning, a party of the islanders were perceived, who made a great lamentation, and moved slowly along to the beating of a drum, that gave scarcely a stroke in a minute. From this circumstance our people supposed, they were burying the dead who had been killed the preceding day. At day break Mr. King repaired on board the Resolution, in order to examine the time-keeper. In his way thither, he was hailed by the Discovery, and received the alarming information, that their cutter had been stolen, in some time of the night, from the buoy, where it was moored. The boat's painter had been cut two fathoms from the buoy, and the remainder of the rope was gone with the boat. This gave cause sufficient to suspect that some villany was hatching by the islanders, and that ill consequences would follow such a daring theft. With these thoughts Mr. King hastened on board the Resolution, whose whole company were by this time in motion. On his arrival, he found the marines arming, the crew preparing to warp the ship nearer to the shore, and Captain Cook loading his double barrel gun. He began with a relation of what had happened in the night at the Morai, when the Commodore interrupted him with some eagerness, and informed him of the loss of the Discovery's cutter, and of the preparations he was making to recover it; adding, that he was resolved to seize Terreebooo, and to confine him on board till the boat should be returned. It had been Captain Cook's usual practice, in all the islands of the Pacific Ocean he had visited, whenever any thing of consequence had been stolen by the natives, to get their king, or some of the principal eeres on board, where he detained them as prisoners, till the property that had been lost was restored; and this method having hitherto proved successful, he meant to pursue it on the present occasion. In consequence of this hasty determination, the Commodore gave orders to stop every canoe that should attempt to leave the bay; having resolved to seize, and destroy them, if the cutter could not be recovered by lenient measures. To this end the boats of both ships, properly manned and armed, were stationed across the bay. The islanders observing our motions, and seeing the ships warping towards the towns, of which there were two, one on each side of the harbour, they concluded that our design was to seize their boats. In consequence of which conjecture, most of their large war canoes took the alarm, and were making off, when our guns, loaded with grape and canister shot, drove them back.

Between the hours of seven and eight o'clock, Captain Cook and Mr. King quitted the ship together; the former in the pinnace, having Mr. Phillips, and nine

matines

marines with him; and the latter in a small boat. The last orders Captain Cook gave Mr. King, were, to quiet the minds of the people on his side of the Bay, by the strongest assurances that they should not be injured; to keep his people together, and to be continually on his guard. Captain Cook and Mr. King then parted; the former intending to proceed to Kowrowa, where Terreeboob refused, and the latter to the beach. When Mr. King had landed, he perceived many of the warriors of Owhyhee were clothed in their military mats, though without arms; that they were gathering together in a body from every direction; and that they assumed a very different countenance to what they usually wore upon all former occasions; he therefore, when arrived at his station on shore, issued strict orders to the marines, to continue within the tent, to charge their muskets with ball, and not, on any consideration, to quit their arms. This done, he waited upon old Kaoo, and the priests, at their respective huts, and explained to them, as well as he was able, the reason of the hostile preparations, which had so exceedingly alarmed them. He found they were no strangers to our loss of the cutter, and assured them, that though the Commodore was resolved not only to recover it, but to punish, in the most exemplary manner, the perpetrators of the theft; yet they, and all the inhabitants of the village, on our side, need not be alarmed, nor apprehend the least danger from us. He desired the priests to communicate the motives by which we were actuated in our present conduct, to the people, and to intreat them not to entertain groundless fears, but, confiding in our declarations, to remain peaceable and quiet. Mr. King having thus made known our real intention, Kaoo asked, with great emotion, if Terreeboob, the king, was to be hurt? Mr. King declared he was not; upon which both Kaoo and the rest of the priests seemed much satisfied with this assurance.

In the interval of these transactions, Captain Cook having called off the launch from the N. part of the Bay, and taken it with him, landed, regardless of appearance, at Kowrowa, with Mr. Phillips, lieutenant of the marines, a serjeant, and nine privates. He proceeded immediately into the village, where he was received respectfully; the people, as usual, prostrating themselves before him, and making their accustomed offerings of small hogs; but it was observed, that the chiefs were in some consternation on seeing the Captain and his guard, and that they soon disappeared one after another. The Commodore perceiving that his main design was not suspected, the next step he took was, to enquire for the king, and the two boys, his sons, who had been his constant guests on board the Resolution. In a short time the boys returned, with some of the natives who had been sent in search of them; and conducted Captain Cook to the habitation where Terreeboob had slept. The old king had just awoke, and the Captain addressed him in the mildest terms, assuring him, that no violence was intended against his person, or any of his people; but only against those who had been guilty of a most unprecedented act of robbery, by cutting from her moorings one of the ship's boats, without which they could neither conveniently water, nor carry on the necessary communication with the shore; requiring of the king, at the same time, to give orders for the cutter to be restored without delay; and requesting his company with him on board, till his orders should be carried into execution. Terreeboob, in reply, protested his total ignorance of the theft; said he was very ready to assist in discovering the author of it, and should be glad to see him punished; but he shewed great unwillingness to trust his person with those who had lately exercised unusual severities against his people. He was told, that the tumultuous appearance of his people, and their repeated depredations, made some uncommon severities necessary; but that not the least hurt should be done to the meanest inhabitant of his island by any person belonging to the ships; and all that was necessary for the continuance of peace, was, to pledge himself for the honesty of his people. With that view, and that only, he came to request the king

to place confidence in him, and to ntaké the Resolution his home, as the most effectual means of putting a stop to the robberies that were daily and hourly committed by his people, both at the tents, and on board the ships, and which were now so daring as to become insufferable. The king upon this remonstrance arose, and accepted the invitation.

In about half an hour Terreeboob set out with Captain Cook, to attend him on board; and every thing had a prosperous appearance. The two boys were already in the pinnace, and the rest of the party were approaching the water-side; when a woman, named Kane-kabereea, the mother of the boys, and one of Terreeboob's favourite wives, followed him, and with many tears and intreaties besought him not to venture on board. At the same time, two warriors who came along with her, laid hold of the king, insisting he should proceed no farther, and obliged him to sit down. A large body of the islanders had by this time got together, who had probably been alarmed by the discharging of the great guns, and the hostile appearances in the bay. They now began to behave outrageously, and to insult the guard. Thus situated, Mr. Phillips, Lieutenant of the marines, perceiving that his men were huddled together in the crowd, consequently unable to use their arms, should there be a necessity for so doing, proposed to the Commodore to draw them up along the rocks, close to the edge of the water; upon which the Lieutenant received orders to march, and, if any one opposed, to fire upon, or instantly dispatch him; but the natives readily making way for them to pass, Mr. Phillips drew them up in one line, within about thirty yards of the place where Terreeboob was sitting. The old king continued all this time on the ground. His eyes diffused gloomy discontent, his head drooped, and his whole countenance was impressed with every mark of terror and dejection; as if he was possessed with a foreboding consciousness of the catastrophe, in the bloody tragedy that was now about to be acted. Captain Cook, unwilling to abandon the object which occasioned him to come on shore, urged him most earnestly to proceed; but, on the other hand, if the king appeared inclined to attend him, the surrounding chiefs interposed: at first they had recourse to entreaties; but afterwards to force and violence, and even insisted on his remaining on shore; and the word was given, that Tootee was about to carry off their king, and to kill him.

Captain Cook, at length, finding that the alarm had spread too generally, and being sensible that there was not a probability of getting Terreeboob off without much bloodshed, thought it most prudent to give up the point; observing to Mr. Phillips, that it would be impossible to compel the king to go on board, without running the risk of killing a great number of the inhabitants. Thus the enterprize was abandoned by Captain Cook; nor did it appear, that his person was in the least degree of danger, till an accident happened, the report of which brought forth in an instant a number of warriors from the crowd, and occasioned a fatal turn to the whole affair. The boats stationed across the Bay, having fired at some war canoes, for attempting to get out, had unfortunately killed one of their principal chiefs. Intelligence of his death arrived at the spot where the Commodore then was, just as he had parted from the king, and was walking slowly towards the shore. The ferment it occasioned was immediately too conspicuous; the women and children were immediately sent away, and the men soon put on their war mats, and armed themselves with spears and stones. One of the natives having provided himself with two of these missive weapons, advanced towards Captain Cook, flourishing a long iron spike, or pahoo, in defiance, and threatening to throw the stone. The Captain made signs for him to desist, but the man persisting in his insolence, and repeating his menaces with strange grimaces; he was provoked to fire a charge of small shot at him; but the warrior being defended by his mat, which the shot could not penetrate, this served only to irritate and encourage the islanders, whose fighting men

now pushed forward, throwing whole volleys of stones at the marines. One of the chiefs attempted to stab Mr. Phillips with his pahooa, (some say the very same that was made by our armourers, at the request of the king, the day before) but not succeeding in his attempt, he received from him a blow with the butt end of his musquet. A general attack with stones succeeded, and the quarrel became general. On our side, the guns from the ships began to pour in their fire upon the multitude of natives, as did likewise the marine guard, and those from the boats; nevertheless, though the slaughter among the islanders was great, yet, enraged as they were, they stood an incessant fire with astonishing intrepidity, and, without giving time for the marines to charge again, they rushed in upon them with horrid shouts and yells. What followed was a scene of horror and confusion, which can more easily be conceived than related. Four of the marines, corporal Thomas, and three privates, namely Hinks, Allen, and Fadget, retreated among the rocks, and fell victims to the fury of the enemy. Three others were dangerously wounded; and the Lieutenant, who had received a stab between the shoulders with a pahooa, having fortunately reserved his fire, shot the man who had wounded him, just as he was going to repeat his blow. The last time our Commodore was distinctly seen, he was standing at the water's edge, ordering the boats to cease firing, and pull in; when a base assassin, coming behind him, and striking him on the head with his club, felled him to the ground, in such a direction, that he lay with his face prone in the water. A general shout was set up by the islanders on seeing the Captain fall, and his body was dragged on shore, where he was surrounded by the

enemy, who, snatching the dagger from each other's hands, displayed a savage eagerness to join in his destruction. It should seem that their vengeance was directed chiefly against our Commodore, by whom they supposed their king was to be dragged on board, and punished at discretion; for, having secured his body, they fled without much regarding the rest of the slain, one of whom they threw into the sea.

Thus ended the life of the greatest navigator that this or any other nation could ever boast of: who led his crews of gallant British seamen twice round the world; reduced to a certainty the non-existence of a Southern continent, about which the learned of all nations were in doubt; settled the boundaries of the earth and sea; and demonstrated the impracticability of a N. W. passage from the Atlantic to the great Southern Ocean, for which our ablest geographers had contended, and in pursuit of which vast sums had been spent in vain, and many valuable mariners had miserably perished. His death was doubtless premature; yet he lived to accomplish the great undertaking for which he seemed particularly designed. How sincerely his loss was lamented, (we speak here in the language of his panegyrist) by those who owed their security to his skill and conduct, and every consolation to his tenderness and humanity, it is impossible to describe; and the task would be equally difficult to represent the horror, dejection, and dismay, which followed so dreadful and unexpected a catastrophe. Let us therefore turn from so mournful a scene, to the pleasing contemplation of his virtues, character, and public services, the history of which our readers will find in the subsequent chap- ter.

CHAP. XV.

Memoirs of the life and public services of Captain James Cook—His birth and parentage—Education and early situation in life—His inclination for the sea, and first employment in the mercantile service—Tries his fortune in His Majesty's ship, the Eagle—Is made a Lieutenant—His behaviour under Sir William Barnaby, and when engaged in the active scenes of the war in America—His appointments, by the recommendations of Lord Colville and Sir Hugh Palliser—His first voyage to the South Seas—His second, to complete the discovery of the Southern hemisphere—His third and last voyage, in order to discover a North West passage—An account of his family, and their pensions—Observations on his character and death—Particulars which happened subsequent to his death—Bravery of Lieutenant Phillips—The islanders forced to retire—Situation of our party at the Morai—Annoyed by stones—An attempt to storm the Morai—Quitted by our people—A short truce, and pacific measures adopted—Mr. King sent to obtain a conference with some of the chiefs of Owyhee—His interview with Kaob—Contemptuous behaviour of the natives, and precautions taken on our side—A part of Captain Cook's body brought—Further provocations from the natives—Our watering parties harassed with stones—The village of Kakaona burned—Instance of bravery in one of the natives—A procession headed by Kaireketa—The bones of Captain Cook brought on board—They are committed to the deep with the usual funeral ceremonies.

HAVING related the untimely fate of our excellent Commander, Captain Cook, we now proceed to give our readers some new and authentic particulars of the life of this great navigator; the whole, we will venture to affirm, making a more correct and complete historical narrative, on so interesting a subject, than has hitherto appeared in any edition whatever of Captain Cook's voyages, under whatever authority published, or however pompously set forth.

The late Captain James Cook, the subject of these memoirs, was born at Marton, in the North Riding of Yorkshire, on February the 3d, 1728. In this particular, we may contradict the ignorant assertions foisted on the public by editors of publications of the like kind with this; but we rest our credibility on the authority of the Rev. Mr. Grenside, whose certificate, taken from the register of births in his parish, is now in the possession of our publisher. The father of Captain Cook was a day labourer to a farmer, and lived in a small village surrounded with mud walls; who afterwards removed to Great Ayton; where he was employed as a peasant by the late Thomas Scutwout, Esq. with whom he was assisted by young Cook, his son, in the different branches of husbandry. At the age of 13, this youth was put under the tuition of Mr. Pullen, a schoolmaster of Ayton, by whom he was instructed in

the arts of writing, common book-keeping, &c. and he is said to have shewn an uncommon genius in his application to the several rules of vulgar arithmetic. In January, 1745, at the age of 17, his father bound him apprentice, to learn the grocery and haberdashery business, at Snaith; but his natural inclination not having been consulted on this occasion, he soon quitted the counter in disgust, after a year and a half's servitude; and having contracted a strong propensity to the sea, his master, willing to indulge him in following the bent of his inclination, gave up readily his indentures. In July, 1746, he was bound apprentice to Mr. Walker, of Whitby, for the term of three years, which time he served to his master's full satisfaction. Under him he first sailed on board the ship Freelove, employed chiefly in the coal trade from Newcastle to London. In the spring of 1750, Mr. Cook shipped himself as a steaman on board the Maria, under the command of Captain Galkin; in which vessel he continued all that year, in the Baltic trade. In 1753, he entered on board his Majesty's ship the Eagle; "having a mind," as he expressed himself, "to try his fortune that way." Some time after, the Eagle sailed with another frigate on a cruise, in which they were very successful.

In the year 1758, we find this rising mariner, master of the Northumberland, the flag-ship of Lord Colville,

who

who

who had then the command of a squadron stationed on the coast of America. It was here, as he has often been heard to say, that, during a hard winter, he first read Euclid, and applied to the study of the mathematics and astronomy, without any assistance than what a few books, and his own industry afforded. At the same time, that he thus found means to cultivate his understanding, improve his mind, and supply the deficiencies of an early education, he was engaged in most of the busy and active scenes of the war in America. At the siege of Quebec, Sir Charles Saunders committed to his charge the execution of services, of the first importance in the naval department. He piloted the boats to the attack of Montmorency; conducted the embarkation to the heights of Abraham, examined the passage, and laid buoys for the security of the large ships in proceeding up the river. The courage and address with which he acquitted himself in these services, gained him the warm friendship of Sir Charles Saunders and Lord Colville, who continued to patronize him during the rest of their lives, with the greatest zeal and affection.

On the 1st of April 1760, he received a commission as a lieutenant, and soon after a specimen of those abilities, which recommended him to the commands, in the execution whereof he so highly displayed his merit, that his name will be handed down to posterity, as one of the most skilful navigators which this country hath produced. In 1765 he was with Sir William Barnaby, on the Jamaica station, and behaved in such a manner as gained him the approbation of the admiral. At the conclusion of the war, he was appointed, through the recommendation of Lord Colville, and Sir Hugh Palliser, to survey the Gulph of St. Lawrence, and the coasts of Newfoundland. In this employment he continued till the year 1767, when the Royal Society resolved, that it would be proper to send a navigator into the South Seas, to observe the Transit of the planet Venus over the Sun's disk: and Otaheite being fixed upon, the Endeavour, a ship built for the coal trade, was put into commission, and the command of her given to Lieutenant, the late Captain Cook, who was appointed with Mr. Charles Green to observe the Transit. In this voyage he was accompanied by Joseph Banks, Esq. since Sir Joseph, and Dr. Solander, and other ingenious artists. The Transit of Venus was observed in different parts of the island, and the Captain returned, after having been absent almost three years, in which period he had made discoveries equal to all the navigators of his country, from the time of Columbus to the present. From this period, as his services increased in usefulness to the public, so his reputation advanced to a height too great for our encomiums to reach. Perhaps no science ever received greater additions from the labours of a single man, than geography has done from those of Captain Cook; who, in his first voyage to the South Seas discovered the Society Isles; determined the insularity of New Zealand; discovered the straits which separate the two islands, called after his name; and made a complete survey of both. He afterwards explored the eastern coast of New Holland, hitherto unknown; an extent of 27 deg. of lat. or upwards of 2,000 miles.

Soon after the Captain's return to England, it was resolved to equip two ships to complete the discovery of the Southern hemisphere. It had long been a prevailing idea, that the unexplored part contained another continent. To ascertain the fact was the principal object of this expedition; and that nothing might be omitted that could tend to facilitate the enterprise, two ships were provided; the one, the Resolution, under the command of Captain Cook; the other, the Adventure, commanded by Captain Furneaux. In this second expedition round the world, Captain Cook resolved the great problem of a southern continent; having so completely traversed that hemisphere, as not to leave a possibility of its existence, unless so near the pole, as to be beyond the reach of navigation. In this voyage New Caledonia, the largest island in the Southern Pacific Ocean, except New Zealand, was discovered; as was also the island of Geor-

gia; and an unknown coast, which the Captain named Sandwich land; and having twice visited the tropical seas, he settled the situations of the old discoveries, and made several new ones.

The want of success which attended Captain Cook's attempt to discover a Southern Continent, did not set aside another plan which had been recommended some time before. This was no other than the finding out a N. W. passage, which the fancy of some chimerical projectors had conceived to be a practicable scheme. His services were required for this arduous undertaking, and he offered them without hesitation. This third and last voyage is distinguished by the extent and importance of its discoveries. Not to mention several smaller islands in the Southern Pacific, Captain Cook discovered the group, north of the equinoctial line, called Sandwich Islands; which, on account of their situation and productions, may perhaps become an object of more consequence, than any other discovery in the South Sea. He explored what had remained before unknown of the western coast of America, an extent of 3700 miles; ascertained the proximity of the two continents of Asia and America; sailed through the straits between them, and surveyed the coasts on each side, so far as to be satisfied of the impracticability of a passage in that hemisphere, from the Atlantic into the Pacific Ocean, by an eastern or western coast. In short, he completed the hydrography of the habitable globe, if we except the Japanese Archipelago, and the sea of Amur, which are still known imperfectly by Europeans. Throughout this voyage it must be confessed, that his services as a navigator are important and meritorious. The methods which he invented, and so successfully put in practice, of preserving the health, (and consequently the lives) of seamen, will transmit his name to future ages, as a friend and benefactor of mankind. It is well known among those who are conversant in naval history, that the advantages which have been sought, through the medium of long sea voyages, have always been purchased at a dear rate. That dreadful disorder which is peculiar to this service, must, without exercising an unwarrantable degree of tyranny over our seamen, have been an insuperable obstacle to our enterprises. It was reserved for Captain Cook to convince the world, that voyages might be protracted to three, or even four years, in unknown regions, and under every change of climate, without affecting the health, in the smallest degree, and even without diminishing the probability of life. A few months after his departure from England, notwithstanding he was then absent, the Royal Society voted him Sir Godfrey Copley's gold medal, as a reward for the account, which he had transmitted to that body, of the method taken to preserve the health of the crew of his ship. Captain Cook was a married man, and left several children behind him. On each of these his Majesty has settled a pension of twenty-five pounds a year, and two hundred pounds per annum on his widow.

The constitution of this great and unparalleled navigator, was robust both by nature and habit; his body having been inured to labour, and rendered capable of undergoing the severest hardships. His stomach bore, without complaining, the most coarse and ungrateful food. Indeed he submitted, with an easy self-denial, to wants of every kind, which he endured with remarkable indifference. The qualities of his mind were of the same hardy vigorous kind with those of his body. His understanding was strong and quick-sighted: his judgment, in whatever related to the services he was engaged in, quick and sure; his designs were bold and daring, yet manly and discreet. His courage was cool and determined, and accompanied with an admirable presence of mind, in the moment of danger. His manners were plain and unaffected.

Some have censured his temper as subject to haughtiness and passion; but let it be considered that these were counteracted, and frequently disarmed, by a disposition benevolent and humane. There are those who have blamed Captain Cook for his severity to the natives of different islands which we visited; but it was not

not to these alone he was severe in his discipline. He never suffered any fault in his own people, though ever so trivial, to escape unpunished. If they were charged with insulting a native, or injuring him in his property, if the fact was proved, the offender seldom escaped unpunished. By this impartial distribution of equal justice, the natives themselves conceived so high an idea of his wisdom, and his power too, that they paid him the honours bestowed on their Eatooa, or good spirit.

This is certain, that a most distinguishing feature in Captain Cook's character was, that unremitting perseverance in the pursuit of his object, which was not only superior to the opposition of dangers, and the pressure of hardships, but even exempt from the want of ordinary relaxation. During the three long voyages in which he was engaged, his eagerness and activity were never in the least abated. No incidental temptation could detain him for a moment; even those intervals of recreation, which sometimes occurred unavoidably, and were looked for by us with a longing that persons who have experienced the fatigues of service will readily excuse, were submitted to by him with a certain impatience, whenever they could not be employed in making further provisions for the prosecution of his designs. In the course of this work, we have faithfully enumerated all the particular instances in which these qualities were displayed, during the great and important enterprises in which he was engaged: and we have likewise stated the result of those services, under the two principal heads to which they may be referred, those of geography and navigation, each of which we have placed in a separate and distinct point of view.

We cannot close these memoirs, without taking a slight retrospective view of the tragical end of this truly great and worthy sea officer. It was imagined by some of those who were present, that the marines, and those who were in the boats, fired without Captain Cook's orders, and that he was anxious to prevent the farther effusion of blood; it is therefore probable, that, on this occasion, his humanity proved fatal to him; for it was observed, that while he faced the natives, no violence had been offered him; but when he turned about to give directions to the boats, he immediately received the fatal blow. Whether this was mortal or not it is impossible for any one to determine; but we are informed by a gentleman on board the Discoverer, whose veracity is unquestionable, that there was time sufficient to have secured the body of our brave Commander, had a certain lieutenant, who commanded a boat of the same ship, pulled in, instead of making off. We do not mention the name, but if our information is an undeniable fact, the dastardly officer merits justly that contempt and poverty, to which it is said he is at present reduced. We beg leave further to observe, that the natives had certainly no intention at first of destroying Captain Cook, or any of his party. The cause first originated in the death of the Eree, who was shot by one of our people in the boat: it was this circumstance which alarmed them, and, in consequence of this it was that they armed themselves. At this period Captain Cook might have returned on board with safety; but he was unfortunate in missing the man who behaved insolent to him, and shooting another; he was unfortunate in the firing of the marines; and equally so in the firing of the people in the launch; all which happened in the space of a few minutes. In short, all the causes that brought on the death of this much lamented Circumnavigator, were produced by a chain of events which could no more be foreseen than prevented. His memory we leave to the gratitude and admiration of posterity.

We now proceed to relate those particulars that have come to our knowledge, and which happened subsequent to the death of Captain Cook. We have before observed, that four of the marines, who accompanied the Commodore, were killed by the natives; the survivors, with Mr. Phillips, their lieutenant, threw themselves into the sea, and made their escape, being protected by a smart fire from the boats. On this occa-

No. 72.

sion, a striking instance of gallant behaviour, and of affection for his men, was displayed by Mr. Phillips; for he had scarcely got into the boat, when, seeing one of the marines, who was not a very expert swimmer, struggling in the water, and in danger of being taken by the islanders, he instantly leaped into the sea to his assistance, though considerably wounded himself; and after receiving a blow on his head from a stone, which had almost sent him to the bottom, he caught the marine by the hair, and brought him off in safety. Our people for some time kept up a constant fire from most of the boats (which, during the whole transaction, were at no greater distance from the land than twenty yards), in order to afford their unfortunate companions, if any of them should still remain alive, an opportunity of effecting their escape. These efforts, seconded by a few guns, that were, at the same time, fired from the Resolution, having at length compelled the enemy to retire, a small boat, manned by five midshipmen, pulled towards the shore, where they perceived the bodies lying on the ground without any signs of life: However, they judged it dangerous to attempt to bring them off with so inconsiderable a force; and their ammunition being nearly consumed, they returned to the ships, leaving the bodies in possession of the natives, together with ten stands of arms.

After the general consternation, which the news of this misfortune had diffused throughout the whole company of both ships, had in some degree subsided, their attention was called to the party at the morai, where the masts and sails were on shore, guarded by only six marines. It is difficult to describe the emotions that agitated the minds of Mr. King, and his attendants, at this situation, during the time in which these occurrences had happened, at the other side of the bay. Being at the distance only of a mile from the village of Kowroa, they could distinctly perceive a vast multitude of people collected on the spot where Captain Cook had just before landed. They heard the firing of the muskets, and observed an uncommon bustle and agitation among the crowd. They afterwards saw the islanders retreating, the boats retiring from the shore, and passing and repassing, with great stillness, between the ships. Mr. King's heart soon misgave him on this occasion. Where so valuable a life was concerned, he could not avoid being alarmed by such new and threatening appearances. Besides this, he knew that Captain Cook, from a long series of success, in his transactions with the natives of this ocean, had acquired a degree of confidence, which might, in some ill-fated moment, put him too much off his guard; and Mr. King now saw all the dangers to which that confidence might lead, without deriving much consolation from the consideration of the experience which had given rise to it. His first care, on hearing the report of the muskets, was to assure the islanders, considerable numbers of whom were assembled round the wall of our consecrated field, and seemed at a loss how to account for what they had heard and seen, that they should meet with no molestation; and that, at all events, he was inclined to continue on peaceable terms with them.

In this situation, Mr. King and his attendants remained till the boats had returned on board, when Captain Clerke perceiving, by means of his telescope, that our party was surrounded by the natives, who, he thought, designed to attack them, ordered two four-pounders to be fired at the islanders. These guns, though well aimed, did no mischief; but they gave the natives a convincing proof of their powerful effects. A cocoa-nut tree, under which some of them were sitting, was broken in the middle by one of the balls; and the other shivered a rock, which stood in an exact line with them. As Mr. King had, just before, given them the strongest assurances of their safety, he was extremely mortified at this act of hostility, and, to prevent its being repeated, instantly dispatched a boat to inform Captain Clerke, that he was, at present, on the most amicable terms with the islanders, and that, if any future occasion should arise for changing his conduct towards them, he would hoist a jack, as a signal for Cap-

7 K

tain

tain Clerke to afford him his assistance. Mr. King waited the return of the boat with the greatest impatience; and after remaining for the space of a quarter of an hour, under the utmost anxiety and suspense, his fears were at length confirmed, by the arrival of Mr. Bligh, with orders to strike the tents immediately, and to lend on board the sails, that were repairing. At the same instant, Kaireekoa having also received information of the death of Captain Cook, from a native who had arrived from the other side of the bay, approached Mr. King, with great dejection and sorrow in his countenance, enquiring whether it was true. At this time the situation of the party was highly critical and important. Not only their own lives, but the issue of the expedition, and the return of at least one of the ships, were involved in the same common danger. They had the mast of the Resolution, and the greater part of the sails, on shore, protected by only half a dozen marines. The loss of these would have been irreparable; and though the islanders had not as yet testified the smallest disposition to molest the party, it was difficult to answer for the alteration, which the intelligence of the transaction at Kowroa might produce. Mr. King therefore thought proper to dissemble his belief of the death of Captain Cook, and to desire Kaireekoa to discourage the report; apprehending that either the fear of our resentment, or the successful example of their countrymen, might perhaps lead them to seize the favourable opportunity, which at this time presented itself, of giving us a second blow. He, at the same time, advised him to bring old Kaoo, and the other priests, into a large house adjoining to the morai, partly from a regard to their safety, in case it should have been found necessary to have recourse to violent measures; and partly from a desire of having him near our people, in order to make use of his authority with the natives, if it could be instrumental in maintaining peace.

Having stationed the marines on the top of the morai, which formed a strong and advantageous post, he intrusted the command to Mr. Bligh, who received the most positive directions to act solely on the defensive; and he then went on board the Discovery, in order to confer with Captain Clerke, on the dangerous situation of our affairs. He had no sooner left the spot, than the islanders began to annoy our people with stones; and just after he had reached the ship, he heard the firing of the marines. He therefore hastily returned on shore, where he found affairs growing every moment more alarming. The natives were providing arms, and putting on their mats; and their numbers augmented very fast. He also observed several large bodies advancing towards our party along the cliff, by which the village of Kakooa is separated from the north side of the bay, where Kowroa is situated. At first they attacked our people with stones from behind the walls of their inclosures, and meeting with no resistance, they soon became more daring. A few courageous fellows, having crept along the beach, under cover of the rocks, suddenly presented themselves at the foot of the morai, with an intention of storming it on the side next the sea, which was its only accessible part; and they were not dislodged before they had stood a considerable quantity of shot, and had seen one of their number fall. The amazing courage of one of these assailants deserves to be recorded. Having returned with a view of carrying off his companion, amidst the fire of our whole party, he received a wound, which obliged him to quit the body, and retire; but, a few minutes afterwards, he again made his appearance, and receiving another wound, was under the necessity of retreating a second time. At that moment Mr. King arrived at the morai, and saw this man return a third time, faint from the loss of blood and fatigue. Being informed of what had happened, he forbade the soldiers to fire; and the islander was suffered to carry off his friend, which he was just able to accomplish; and then fell down himself, and breathed his last. About this time a strong reinforcement from both ships having landed, the natives retreated behind their walls, which affording Mr. King access to the priests, he sent one of

them to exert his endeavours to bring his countrymen to some terms, and to propose to them, that if they would desist from throwing stones, he would not allow our men to fire. This truce was agreed to, and our people were suffered to launch the mast, and carry off the sails, astronomical instruments, &c. without molestation. As soon as our party had quitted the morai, the islanders took possession of it, and some of them threw a few stones, which, however, did no mischief. Between eleven and twelve o'clock, Mr. King arrived on board the Discovery, where he found that no decisive plan had been adopted for the regulation of our future proceedings. The recovery of Captain Cook's body, and the restitution of the boat, were the objects, which, on all hands, we agreed to insist on; and Mr. King declared it as his opinion, that some vigorous methods should be put in execution, if the demand of them should not be instantly complied with. It may justly be supposed that Mr. King's feelings, on the death of a beloved and respected friend, had some share in this opinion; yet there were doubtless other reasons, and those of the most serious nature, that had some weight with him. The confidence which the success of the natives in killing our Commander, and obliging us to leave the shore, must naturally have inspired; and the advantage, however inconsiderable, which they had gained over us the preceding day, would, he had no doubt, excite them to make farther dangerous attempts; and the more particularly, as they had no great reason, from what they had hitherto observed, to dread the effects of our firearms. This kind of weapon, indeed, contrary to the expectations of us all, had produced in them no signs of terror. On our side, such was the condition of our vessels, and the state of discipline among us, that had a vigorous attack been made on us, during the night, the consequences might perhaps have been highly disagreeable. Mr. King was supported, in these apprehensions, by the opinion of the greater part of the officers on board; and nothing seemed to him more likely to encourage the islanders to make the attempt, than the appearance of our being inclined to an accommodation, which they could only impute to weakness or fear. On the other hand it was urged, in favour of more conciliatory measures, that the mischief was already done, and was irreparable; that the natives, by reason of their former friendship and kindness had a strong claim to our regard; and the more particularly, as the late calamitous accident did not appear to have taken its rise from any premeditated design; that, on the part of Terreeboob, his ignorance of the theft, his willingness to accompany Captain Cook on board the Resolution, and his having actually sent his two sons into the pinnace, must rescue his character, in this respect, from the smallest degree of suspicion; that the behaviour of his women, and the chiefs, might easily be accounted for, from the apprehensions occasioned in their minds by the armed force, with which Captain Cook landed, and the hostile preparations in the bay; appearances so unsuitable to the confidence and friendship, in which both parties had hitherto lived, that the arming of the islanders was manifestly with a design to resist the attempt, which they had some reason to expect would be made, to carry off their sovereign by force, and was naturally to be expected from a people who had a remarkable affection for their chiefs. To these dictates of humanity, other motives of a prudential kind were added; that we were in want of a supply of water, and other refreshments; that the Resolution's foremast would require seven or eight days work, before it could be stepped; that the spring was advancing very fast; and that the speedy prosecution of our next expedition to the northward, ought now to be our sole object; and that, therefore, to engage in a vindictive contest with the natives, might not only subject us to the imputation of needless cruelty, but would require great delay in the equipment of our ships. In this latter opinion Captain Clerke concurred, and though Mr. King was convinced, that an early and vigorous display of our resentment would have more effectually answered every object both of prudence and humanity, he was, upon

the whole, not sorry that the measures he had recom
 mended were rejected. For though the contemptuous
 behaviour of the islanders, and their subsequent oppo
 sition to our necessary occupations on shore, arising
 most probably from a misconstruction of our lenity, ob
 liged us at last to have recourse to violence in our own
 defence; yet he was not certain that the circumstances
 of the case would, in the opinion of the generality of
 people, have justified the use of force, on our part, in
 the first instance. Cautionary severity is ever invidi
 ous, and the rigour of a preventive measure, when it is
 the most successful, leaves its expediency the least ap
 parent.

During these deliberations, and while we were thus
 engaged in concerting some plan for our future opera
 tions, a very numerous concourse of the natives still
 kept possession of the shore; and some of them coming
 off in canoes, approached within pistol-shot of the ships,
 and insulted us by various marks of defiance and con
 tempt. It was extremely difficult to restrain the seamen
 from the use of their arms on these occasions; but, as
 pacific measures had been resolved on, the canoes were
 allowed to return unmolested. Mr. King was now or
 dered by Captain Clerke to proceed towards the shore
 with the boats of both ships, well manned and armed,
 with a view of bringing the islanders to a parley, and of
 obtaining, if possible, a conference with some of the
 Erees. If he should succeed in this attempt, he was to
 demand the dead bodies, and particularly that of Captain
 Cook: to threaten them, in case of a refusal, with our
 resentment; but by no means to fire, unless attacked;
 and not to go ashore on any account whatever. These
 instructions were delivered to Mr. King before the
 whole party, in the most positive manner; in conse
 quence of which, he and his detachment left the ships
 about four o'clock in the afternoon; and as they ap
 proached the shore, they perceived every indication of
 a hostile reception. The natives were all in motion, the
 women and children retiring; the men arming them
 selves with long spears and daggers, and putting on
 their war mats. It also appeared, that since the morn
 ing they had thrown up breast-works of stone along the
 beach, where Captain Cook had landed; in expectation,
 perhaps, of an attack at that place. When our party
 were within reach, the islanders began to throw stones
 at them with slings, but without doing any mischief.
 Mr. King concluded from these appearances, that all at
 tempts to bring them to a parley would be ineffectual,
 unless he gave them some ground for mutual confi
 dence: he therefore ordered the armed boats to stop,
 and advanced alone in the small boat, holding in his
 hand a white flag; the meaning of which, from an uni
 versal shout of joy from the natives, he had the satisfac
 tion to find was immediately understood. The women
 instantly returned from the side of the hill, whither they
 had retired; the men threw off their mats, and all feared
 themselves together by the sea-side, extending their
 arms, and inviting Mr. King to land.

Notwithstanding such behaviour seemed expressive
 of a friendly disposition, Mr. King could not avoid en
 tertaining suspicions of its sincerity. But when he saw
 Koah, with extraordinary boldness and assurance, swim
 ming off towards the boat, with a white flag in his
 hand, he thought proper to return this mark of confi
 dence, and accordingly received him into the boat,
 though he was armed; a circumstance which did not
 contribute to lessen Mr. King's suspicions. He had in
 deed long harboured an unfavourable opinion of Koah.
 The priests had always represented him as a person of a
 malicious temper, and no friend to us; and the repeated
 detections of his fraud and treachery, had convinced
 us of the truth of their assertions. Besides the melan
 choly transactions of the morning, in which he was seen
 performing a principal part, inspired Mr. King with
 the utmost horror at finding himself so near him; and
 as he approached him with feigned tears, and embraced
 him, Mr. King was so distrustful of his intentions, that
 he took hold of the point of the pahooa, which the
 chief held in his hand, and turned it from him. He in
 formed the islander that he had come to demand the

body of Captain Cook, and to declare war against the
 natives, unless it was restored without delay. Koah af
 firmed him that this should be done as soon as possible,
 and that he would go himself for that purpose; and af
 ter requesting a piece of iron of Mr. King, with marks
 of great assurance, he leaped into the water, and swam
 ashore, calling out to his countrymen, that we were all
 friends again. Our people waited with great anxiety
 near an hour for his return. During this interval, the
 other boats had approached so near the shore, that the
 men who were in them entered into conversation with
 a party of the islanders, at a little distance; by whom
 they were informed, that the Captain's body had been
 cut to pieces, and carried up the country; but of this
 circumstance Mr. King was not apprized till his return
 to the ships. He therefore now began to express some
 degree of impatience at Koah's delay; upon which the
 chiefs pressed him exceedingly to land; assuring him,
 that if he would go in person to Terreeboob, the body
 would be undoubtedly restored to him. When they
 found they could not prevail on Mr. King to go ashore,
 they endeavoured, on pretence of conversing with him
 with greater ease, to decoy his boat among some rocks,
 where they might have had it in their power to separate
 him from the other boats. It was easy to see through
 these artifices, and he was therefore very desirous of
 breaking off all communication with them; when a
 chief approached, who had particularly attached him
 self to Captain Clerke, and the officers of the Discov
 ery, on board which ship he had sailed, when we last
 quitted the bay, intending to take his passage to the
 island of Mowee. He said he came from Terreeboob,
 to acquaint our people that the body was carried up the
 country, but that it should be brought back the follow
 ing morning. There appeared much sincerity in his
 manner; and being asked if he uttered a falsehood, he
 hooked together his two fore fingers, which is here un
 derstood as the sign of veracity, in the use of which
 these islanders are very scrupulous. Being now at a loss
 how to proceed, Mr. King sent Mr. Vancouver to in
 form Captain Clerke of all that had passed; that it was
 his opinion, the natives did not intend to keep their
 word with us; and, far from being grieved at what had
 happened, were on the contrary inspired with great con
 fidence on account of their late success, and sought only
 to gain time, till they could plan some scheme for get
 ting our people into their power. Mr. Vancouver came
 back with orders for Mr. King to return on board, after
 giving the islanders to understand, that if the body was
 not restored the next morning, the town should be de
 stroyed. No sooner did they perceive our party retiring,
 than they endeavoured to provoke them by the most
 contemptuous and insulting gestures. Several of our
 people said, they could distinguish some of the natives
 parading about in the cloaths which had belonged to
 our unhappy countrymen, and among them, an Eree
 brandishing Captain Cook's hanger, and a woman hold
 ing the scabbard. In consequence of Mr. King's re
 port to Captain Clerke, of what he supposed to be the
 present temper and disposition of the inhabitants, the
 most effectual methods were taken to guard against any
 attack they might make during the night. The boats
 were moored with top-chains; additional sentinels were
 stationed in each of our ships; and guard-boats were
 directed to row round them, in order to prevent the
 islanders from cutting the cables. During the night,
 we saw a vast number of lights on the hills, which in
 duced some of us to imagine, that they were removing
 their effects farther up into the country, in consequence
 of our menaces. But it seems more probable, that they
 were kindled at the sacrifices that were performing on
 account of the war, in which they supposed themselves
 likely to be engaged; and, perhaps the bodies of our
 slain countrymen were at that time burning. We af
 terwards observed fires of the same kind, as we passed
 the island of Morotoi; and which, according to the in
 formation we received from some of the natives then on
 board, were made on account of a war they had declared
 against a neighbouring island. This agrees with what
 we learned among the Friendly and Society Isles, that

vious to any hostile expedition, the chiefs always endeavoured to animate the courage of the people, by feasts and rejoicings in the night. We passed the night without any disturbance, except from the howlings and lamentations which were heard on shore.

On Monday the 15th, early in the morning, Koah came along-side the Resolution, with a small pig and some cloth, which he desired permission to present to Mr. King. We have already mentioned, that this officer was supposed by the islanders to be the son of Captain Cook; and as the latter had always suffered them to believe it, Mr. King was probably considered as the chief after his death. As soon as he came on deck, he interrogated Koah with regard to the body; and, on his returning evasive answers, refused to accept his presents, and was on the point of dismissing him with expressions of anger and resentment, had not Captain Clerke, with a view of keeping up the appearance of friendship, judged it more proper that he should be treated with the customary respect. This artful priest came frequently to us in the course of the morning, with some trifling present or other; and as we always observed him eyeing every part of the ship with a great degree of attention, we took care he would see we were well prepared for our defence. He was extremely urgent both with Captain Clerke and Mr. King to go on shore, imputing the detention of the bodies to the other chiefs, and assuring those gentlemen, that every thing might be adjusted to their satisfaction, by a personal interview with the king. However, they did not think it prudent to comply with Koah's request; and indeed a fact came afterwards to their knowledge, which proved his want of veracity. For, they were informed, that immediately after the action in which Captain Cook had lost his life, Terreeboob had retired to a cave in the steep part of the mountain that hangs over the bay, which was accessible only by means of ropes, and where he continued for several days, having his provisions let down to him by cords. After the departure of Koah from the ships, we observed that his countrymen who had assembled by day-break, in vast crowds on the shore, flocked around him with great eagerness on his landing, as if they wished to learn the intelligence he had gained, and what steps were to be taken in consequence of it. It is highly probable, that they expected we should attempt to put our threats in execution; and they appeared fully determined to stand their ground. During the whole morning, we heard conchs blowing in various parts of the coast; large parties were perceived marching over the hills; and, upon the whole, appearances were so alarming, that we carried out a stream anchor, for the purpose of hauling the ship abreast of the town, in case of an attack; and boats were stationed off the northern point of the bay, in order to prevent a surprize from the natives in that quarter. Their warlike posture at present, and the breach of their engagement to restore the bodies of the slain, occasioned fresh debates among us concerning the measures which should now be pursued. It was at length determined, that nothing should be permitted to interfere with the repair of the Resolution's mast, and the preparations for our departure; but that we should nevertheless continue our negotiations for the restoration of the bodies of our countrymen. The greater part of this day was employed in getting the fore-mast into a proper situation on deck, that the carpenters might work upon it; and also in making the requisite alterations in the commissions of the officers.

The chief command of the expedition having devolved on Captain Clerke, he removed on board the Resolution, promoted Lieutenant Gore to the rank of Captain of the Discovery, appointed Messrs. King and Williamson first and second Lieutenants of the Resolution, and nominated Mr. Harvey, a Midshipman, who had accompanied Captain Cook during his two last voyages, to fill the vacant lieutenantancy. During the whole day, we sustained no interruption from the islanders: and in the evening, the launch was moored with a top-chain, and guard-boats stationed round each of the ships as before. About eight o'clock, it being exceedingly dark, we heard a canoe paddling towards the

ship; and it was no sooner perceived, than both the sentinels on deck fired into it. There were two of the natives in this canoe, who immediately roared out "Tin-nee," (which was their method of pronouncing Mr. King's name), and said they were friends, and had something with them which belonged to Captain Cook. When they came on board, they threw themselves at the feet of our officers, and seemed to be extremely terrified. It fortunately happened that neither of them was hurt, notwithstanding the balls of both pieces had gone through the canoe. One of these was the person who has been already mentioned under the appellation of the taboo man, who constantly attended Captain Cook with the particular ceremonies we have before described; and who, though a man of distinction in the island, could scarcely be prevented from performing for him the most humiliating offices of a menial servant. After bewailing, with many tears, the loss of the Orono, he informed us that he had brought a part of his body. He then gave us a small bundle which he brought under his arm; and it is impossible to describe the horror with which we were seized, upon finding in it a piece of human flesh of the weight of about nine or ten pounds. This, he said, was all that now remained of the body; that the rest had been cut in pieces, and burnt; but that the head, and all the bones, except those which belonged to the trunk, were in the possession of Terreeboob and the other chiefs; that what we saw had been allotted to Kaoo, the chief of the priests, for the purpose of being used in some religious ceremony; and that he had sent it as a testimony of his innocence, and of his attachment to us. We had now an opportunity of learning whether they were cannibals; and we did not neglect to avail ourselves of it. We first endeavoured, by several indirect questions, put to each of them apart, to gain information respecting the manner in which the other bodies had been treated and disposed of; and finding them very constant in one account, that after the flesh had been cut off, the whole of it was burnt; we at last put the direct question, whether they had not eaten some of it; they immediately testified as much horror at such an idea, as any European would have done; and asked, whether that was the practice among us. They afterwards asked us, with great earnestness, and with an appearance of apprehension, when the Orono would come again? and how he would treat them on his return? the same enquiry was often made in the sequel by others; and this idea is consistent with the general tenour of their conduct towards him, which indicated that they considered him as a being of a superior species. We pressed our two friendly visitants to continue on board till the next morning, but we could not prevail upon them. They informed us, that if this transaction should come to the knowledge of the king, or any of the other Erees, it might be attended with the most fatal consequences to their whole society; to prevent which, they had been under the necessity of coming to us in the dark; and the same precaution, they said, would be requisite in returning to shore. They further told us, that the chiefs were eager to take revenge on us for the death of their countrymen: and particularly cautioned us against trusting Koah, who, they assured us, was our implacable enemy; and ardently longed for an opportunity of fighting us, to which the blowing of the conchs that we had heard in the morning, was intended as a challenge. It likewise appeared from the information of these men, that seventeen of their countrymen were slain in the first action, at the village of Kowrowa, five of whom were chief; and that Kancena and his brother, our particular friends, were of that number. Eight, they said, had lost their lives at the observatory, three of whom likewise were persons of the first distinction. At eleven o'clock the two natives left us, and took the precaution to desire that one of our guard-boats might attend them, till they had passed the Discovery, lest they should again be fired upon, which, by alarming their countrymen on shore, might expose them to the danger of detection. This request was readily complied with, and we had the satisfaction to find, that they reached the land safe and undiscovered. During the remainder of this night, we

heard the same loud lamentations, as in the preceding
one. Early the following morning, we received a visit
from Koah. Mr. King was piqued at finding, that not-
withstanding the most glaring marks of treachery in his
conduct, and the positive declaration of our friends the
priests, he should still be suffered to carry on the same
scur, and to make us at least appear the dupes of his hy-
pocrisy. Our situation was indeed become extremely awk-
ward and unpromising; none of the purposes for which
this pacific plan of proceedings had been adopted, hav-
ing hitherto been in any respect promoted by it. No
satisfactory answer had been given to our demands; we
did not seem to have made any progress towards a re-
conciliation with the natives; they still remained on the
shore in hostile postures, as if determined to oppose any
endeavours we might make to go ashore; and yet it was
become absolutely necessary to attempt landing, as the
completing our stock of water would not admit of any
longer delay. However, in justice to the conduct of
Captain Clerke, we must remark, that it was highly
probable, from the great numbers of the islanders, and
from the resolution with which they seemed to expect
our approach, that an attack could not have been made
without danger; and that the loss of even a very few
men might have been severely felt by us, during the re-
mainder of our voyage: whereas the delaying to put our
menaces into execution, though, on the one hand, it di-
minished their opinion of our valour, had the effect of
occasioning them to disperse on the other. For this day,
about 12 o'clock, upon finding that we perished in our
inactivity, great bodies of them, after blowing their
conchs, and using every method of defiance, marched off,
over the hills, and never made their appearance after-
wards. Those, however, who remained, were not the
less daring and presumptuous. One of them had the
insolence to come within musquet-shot a-head of the
Resolution, and after throwing several stones at us,
waved over his head the hat which had belonged to
Captain Cook, while his countrymen ashore were exult-
ing and encouraging his audacity. Our people were
highly enraged at this insult, and, coming in a body on
the quarter-deck, begged they might no longer be ob-
liged to put up with such reiterated provocations, and
requested Mr. King to endeavour to obtain permission
for them, from Captain Clerke, to take advantage of the
first fair occasion of avenging the death of their much
lamented Commander. On Mr. King's acquainting the
Captain with what was passing, he ordered some great
guns to be fired at the islanders on shore; and promised
the crew, that, if they should be molested at the water-
ing-place, the next day, they should then be permitted
to chastise them. Before we could bring our guns to
bear, the natives had suspected our intentions, from the
huff and agitation they observed in the ship; and had
retired behind their houses and walls. We were con-
sequently obliged to fire, in some degree, at random;
notwithstanding which, our shot produced all the ef-
fects we could desire: for, in a short time afterwards,
we perceived Koah paddling towards us, with the
greatest haste; and when he arrived, we learned that
some people had lost their lives, and among the rest
Maha-maha, a principal Eree, nearly related to Ter-
rooboo. Not long after Koah's arrival, two boys swam
off from the Morai towards our vessels, each armed with
a long spear; and after they had approached pretty
near, they began in a very solemn manner to chant a
song; the subject of which, from their frequently men-
tioning the word Orono, and pointing to the village
where Captain Cook had been slain, we concluded to
be the late calamitous occurrence. Having sung for
near a quarter of an hour in a plaintive strain, during
all which time they continued in the water, they re-
paired on board the Discovery, and delivered up their
spears; and after remaining there a short time, re-
turned on shore. We could never learn who sent them,
or what was the object of this ceremony. During the
night, we took the usual precautions for the security of
the ships; and, as soon as it was dark, the two natives,
who had visited us the preceding evening, came off to
us again. They assured us, that though the effects of

No. 72.

our great guns this afternoon, had greatly alarmed the
chiefs, they had by no means relinquished their hostile
intentions, and they advised us to be on our guard.

On Wednesday, the 17th, the boats of both ships were
dispatched ashore to procure water; and the Discovery
was warped close to the beach, in order to protect the
persons employed in that service. We soon found that
the intelligence which had been sent us by the priests,
was not destitute of foundation, and that the islanders
were determined to neglect no opportunity of annoying
us, when it could be done without much hazard. The
villages, throughout this whole cluster of islands, are, for
the most part, situated near the sea; and the adjacent
ground is enclosed with stone walls, of the height of
about three feet. These, we at first supposed, were de-
signed for the division of property; but we now disco-
vered that they served for a defence against invasion,
for which purpose they were, perhaps, chiefly intended.
They consist of loose stones, and the natives are very
dexterous in shifting them, with great quickness, to
such particular situations, as the direction of the attack
may occasionally require. In the sides of the moun-
tain that stands near the bay, they have likewise holes,
or caves, of considerable depth, whose entrance is se-
cured by a fence of a similar kind. From behind both
these stations, the islanders perpetually harassed our
watering party with stones; nor could the inconsiderable
force we had on shore, with the advantage of musquets,
compel them to retreat. Thus opposed, our people
were so occupied in attending to their own safety, that,
during the whole forenoon, they filled only one ton of
water. It being therefore impossible for them to per-
form this service, till their assailants were driven to a
greater distance, the Discovery was ordered to dislodge
the enemy with her great guns; which being accom-
plished by means of a few discharges, the men landed
without molestation. The natives, however, made their
appearance again soon afterwards, in their usual method
of attack; and it was now deemed absolutely necessary
to burn down some straggling huts, near the wall be-
hind which they had sheltered themselves. In executing
the orders that were given for that purpose, our people
were hurried into acts of unnecessary devastation and
cruelty. Some allowance ought certainly to be made for
their resentment of the repeated insults, and contemptu-
ous behaviour of the islanders, and for their natural de-
sire of revenging the death of their beloved and re-
spected Commander. But, at the same time, their con-
duct strongly evinced, that the greatest precaution is re-
quisite in trusting, even for a moment, the discretionary
use of arms in the hands of private soldiers, or seamen,
on such occasions. The strictness of discipline, and the
habits of obedience, by which their force is kept di-
rected to suitable objects, lead them to conceive, that
whenever they have the power, they have likewise a
right to perform. Actual disobedience being almost the
only crime for which they expect to receive punish-
ment, they are apt to consider it as the sole measure of
right and wrong; and hence they are too ready to con-
clude, that what they can do with impunity, they may
also do consistently with honour and justice; so that the
feelings of humanity, and that generosity towards an un-
resisting enemy, which, at other times, is a striking
distinction of brave men, become but feeble restraints
to the exercise of violence, when set in opposition to
the desire they naturally have of shewing their own
power and independence.

We have before observed, that directions had been
given to burn only a few straggling houses, which af-
forded shelter to the islanders. We were therefore
greatly surprized on perceiving the whole village in
flames; and before a boat, that was sent to stop the
progress of the mischief, could reach the land, the ha-
bitations of our old and constant friends, the priests,
were all on fire. Mr. King had, therefore, great reason
to lament the illness that confined him on board this
day. The priests had always been under his protection;
and, unfortunately, the officers then on duty having fel-
dom been on shore at the Morai, were but little ac-
quainted with the circumstances of the place. Had he

7 L

been

been present himself, he might, in all probability, have been the means of preserving their little society from destruction. In escaping from the flames, several of the inhabitants were shot; and our people cut off the heads of two of them, and brought them on board. The fate of one unhappy native was much lamented by all of us. As he was repairing to the well for water, he was shot at by one of the marines. The ball happened to strike his calabash, which he instantly threw from him, and ran off. He was pursued into one of the caves above-mentioned, and no lion could have defended his den with greater bravery and fierceness; till at length, after he had found means to keep two of our people at bay for a considerable time, he expired, covered with wounds. This accident first brought us acquainted with the use to which these caverns are applied. About this time a man, advanced in years, was taken prisoner, bound, and conveyed on board the Resolution, in the same boat, with the heads of his two countrymen. We never observed horror so strongly portrayed, as in the face of this person, nor so violent a transition to immoderate joy, as when he was untied, and given to understand, that he might depart in safety. He shewed us that he was not deficient in gratitude, as he not only often returned afterwards with presents of provisions, but also did us other services.

Soon after the destruction of the village, we saw, coming down the hill, a man, accompanied by fifteen or twenty boys, who held in their hands pieces of white cloth, plantains, green boughs, &c. It happened that this pacific embassy, as soon as they were within reach, received the fire of a party of our men. This, however, did not deter them from continuing their procession, and the officer on duty came up, in time, to prevent a second discharge. As they made a nearer approach, the principal person proved to be our friend Kaireekkea, who had fled when our people first set fire to the village, and had now returned, and expressed his desire of being sent on board the Resolution. On his arrival we found him extremely thoughtful and grave. We endeavoured to convince him of the necessity there was of setting fire to the village, by which his house, and those of his brethren were unintentionally destroyed. He expostulated with us on our ingratitude and want of friendship; and, indeed, it was not till the present moment, that we knew the whole extent of the injury that had been done them. He informed us, that, confiding in the promises Mr. King had made them, and as well as in the assurances they had received from the men, who had brought us some of Captain Cook's remains, they had not removed their effects back into the country, as the other inhabitants had done, but had put every valuable article of their own, as well as what they had collected from us, into a house adjoining to the morai, where they had the mortification to see it all set on fire by our people. He had, on coming on board, perceived the heads of his two countrymen lying on deck, at which he was greatly shocked, and earnestly desired that they might be thrown over-board. This request, by the directions of Captain Clerke, was immediately complied with. In the evening our watering party returned on board, having sustained no farther interruption. We passed a disagreeable night; the cries and lamentations we heard from the shore being far more dreadful than ever. Our only consolation on this occasion, arose from the hopes that a repetition of such severities might not be requisite in future. It is somewhat remarkable, that, amidst all these disturbances, the female natives, who were on board, did not offer to leave us, or discover any apprehensions either for themselves or their friends on shore. They appeared, indeed, so perfectly unconcerned, that some of them, who were on deck when the village was in flames, seemed to admire the spectacle, and frequently exclaimed, that it was maitai, or very fine.

On Thursday, the 18th, in the morning, the treacherous Koah came off to the ships, as usual. There being no longer any necessity for keeping terms with him, Mr. King was allowed to treat him as he thought proper. When he approached the side of the Resolution, sing-

ing a song, and offering a hog, and some plantains, to Mr. King, the latter ordered him to keep off, and cautioned him never to make his appearance again without the bones of Captain Cook, lest his life should pay the forfeit of his repeated breach of faith. He did not appear much mortified with this unwelcome reception, but immediately returned on shore, and joined a party of his countrymen, who were throwing stones at our waterers. The body of the young man, who had been killed the preceding day, was found this morning lying at the entrance of the cave; and a mat was thrown over him by some of our people; soon after which they saw several of the natives carrying him off on their shoulders, and could hear them chanting, as they marched, a mournful song. At length the islanders being convinced that it was not the want of ability to chastize them, which had induced us at first to tolerate their provocations, desisted from molesting our people; and, towards the evening, a chief, named Eappo, who had seldom visited us, but whom we knew to be a man of the first distinction, came with presents from Terreeboob to sue for peace. These presents were accepted, and the chief was dismissed with the following answer: That no peace would be granted, till the remains of Captain Cook should be restored. From Eappo we understood that the flesh of all the bones of our people who had been slain, as well as the bones of the trunks, had been burnt; that the limb-bones of the marines had been distributed among the inferior chiefs; and that the remains of Captain Cook had been disposed of as follows: the head to a great Eree, called Kahooopeou; the hair to Maiha-maiha; and the arms, legs, and thighs, to Terreeboob. After it was dark, many of the natives came off with various sorts of vegetables; and we also received from Kaireekkea two large presents of the same articles.

On the 19th we were principally employed in sending and receiving the messages that passed between Captain Clerke and the old king. Eappo was very urgent, that one of our officers should go on shore; and offered to remain on board, in the mean time, as an hostage. This request, however, was not complied with; and he left us with a promise of bringing the bones the following day. Our watering party, at the beach, did not meet with the least opposition from the islanders; who, notwithstanding our cautious behaviour, again ventured themselves among us without any marks of diffidence or apprehension. On Saturday the 20th, early in the morning, we had the satisfaction of getting the fore-mast steered. This operation was attended with considerable difficulty, and some danger, our ropes being so extremely rotten, that the purchase several times gave way. Between the hours of ten and eleven, we saw a numerous body of the natives descending the hill, which is over the beach, in a sort of procession, each man carrying on his shoulders two or three sugar-canes, and some bread-fruit, plantains, and taro, in his hand. They were preceded by two drummers, who, when they reached the water-side, seated themselves by a white flag, and began beating their drums, while those who had followed them, advanced, one by one, and deposited the presents they had brought with them; after which they retired in the same order. Soon afterwards Eappo appeared in his long feathered cloak, bearing something with great solemnity in his hands; and having stationed himself on a rock, he made sign that a boat should be sent him. Captain Clerke, supposing that the chief had brought the bones of our late Commodore (which, indeed, proved to be the case), went himself in the pinnace to receive them, and ordered Mr. King to attend him in the cutter. When they arrived at the beach, Eappo, entering the pinnace, delivered the bones to Captain Clerke, wrapped up in a great quantity of fine new cloth, and covered with a spotted cloak of black and white feathers. He afterwards attended our gentlemen to the Resolution, but could not be prevailed on to accompany them on board; being, perhaps, from a sense of decency, unwilling to be present at the opening of the parcel. In this we found both the hands of Captain Cook entire, which

g, and some plantains, to him to keep off, and cause his appearance again without, lest his life should pay each of faith. He did not this unwelcome reception, shore, and joined a party throwing stones at our young man, who had been found this morning lying on a mat was thrown overboard; and soon after which they carrying him off on their backs, and then chanting, as they went. At length the islanders became not the want of ability to induce us at first to tolerate them from molesting our evening, a chief, named Eappo, and whom we knew by the name of the King's son, came with presents of peace. These presents were dismissed with the following promise: that should be granted, till the day should be restored. From the flesh of all the bones of the pig, as well as the bones of the fish; that the limb-bones of the pig should be distributed among the inferior officers of Captain Cook had been taken to a great Ere, called Pareca-maïha; and the arms, and the bones of Pareca-maïha. After it was dark, we were surrounded with various sorts of veils, and the appearance of articles.

Chiefly employed in sending presents that passed between us. Eappo was very unwilling to go on shore; and in the mean time, as we were in the boat, he was not complied with our promise of bringing the water party, at the least opposition from the shore, and our cautious behaviour, long us without any marks.

On Saturday the 20th, the satisfaction of getting the operation was attended with some danger, our ropes that the purchase several hours of ten and eleven, the natives descending the shore, in a sort of procession, with several plantains, and taro, and were followed by two drummers, water-side, seated themselves, beating their drums, and then, advanced, one by one, they had brought with them in the same order. Soon after, his long feathered cloak, and solemnity in his hands, on a rock, he made signs. Captain Clerke, supported the bones of our late friend, proved to be the case, to receive them, and then in the cutter. When Eappo, entering the pinnace, in Clerke, wrapped up in a cloth, and covered with white feathers. He attended to the Resolution, but accompanied them on board of decency, unwilling to receive the parcel. In this we obtained Cook entire, which

were well known to us from a scar on one of them, that divided the fore-finger from the thumb, the whole length of the metacarpal bone; the skull, but with the scalp separated from it, and the bones of the face wanting; the scalp, with the ears adhering to it, and the hair upon it cut short; the bones of both the arms, with the skin of the fore-arms hanging to them; the bones of the thighs and legs joined together, but without the feet. The ligaments of the joints were observed to be entire; and the whole shewed sufficient marks of having been in the fire, except the hands, which had the flesh remaining upon them, and were cut in several places, and crammed with salt, most probably with a view of preserving them. The skull was free from any fracture, but the scalp had a cut in the back part of it. The lower jaw and feet, which were wanting, had been seized, as Eappo informed us, by different Erees; and he also told us, that Terrecoboo was using every means to recover them.

The next morning, being the 21st of February, Eappo, and the king's son, came on board, and brought with them not only the remaining bones of Captain Cook, but likewise the barrels of his gun, his shoes,

and some other trifles which had belonged to him. Eappo assured us, that Terrecoboo, Maïha-maïha, and himself were extremely desirous of peace; that they had given us the most convincing proofs of it; and that they had been prevented from giving it sooner by the other chiefs, many of whom were still disaffected to us. He lamented, with the most lively sorrow, the death of six chiefs, who had been killed by our people; some of whom, he said, were among our best friends. He informed us, that the cutter had been taken away by Pareca's people, probably in revenge for the blow that he had received; and that it had been broken up the following day. The arms of the marines, which we had also demanded, had been carried off, he said, by the populace and were irrecoverable.

Nothing now remained, but to perform the last solemn offices to our excellent Commander. Eappo was dismissed with orders to taboo all the bay; and, in the afternoon, his remains having been deposited in a coffin, the funeral service was read over them, and they were committed to the deep with the usual military honours. Our feelings, on this mournful occasion, are more easy to be conceived than expressed.

C H A P. XVI.

The Taboo laid on the bay taken off, and the ships surrounded with canoes—Orders for the Resolution and Discovery to be unmoored—They weigh anchor and take their departure from Karakakooa bay—Sail in quest of a harbour on the south-east side of Mowee—Driven to leeward by the current, and strong easterly winds—Pass Tahoorowa—South-west side of Mowee described—Proceed to Wookoo—Its north-east side described—Disappointed in attempting to water—Sail to Atooi; and anchor in Wynna bay—The natives not so friendly as before—Their insolence in demanding a batchet for every cask of water—Treat our people with contempt—Steal Lieutenant King's hanger—Their insolence at the water side—Are fired at by two marines—One of them wounded—A visit from the contending Chiefs—The ships anchor off Oneebowu—Their departure—A correct, copious, and complete account of Sandwich Islands—Extent of Owhyhee, the largest of the whole group—Its districts, coasts, adjacent country, &c. described—An account of several other islands—A particular and full account of the inhabitants of Sandwich Islands—Division of the people into three classes—Genealogical account of the kings of Owhyhee and Mowee—Authority of the Erees—Tyranny of Pareca exercised on an inferior chief—An account of their religion—Their society of priests—Their ideas of a future state—A particular description of the word Taboo—A remarkable instance of jealousy—Funeral ceremonies at the death of an old Chief, &c. &c. &c.

ON the 22nd of February, 1779, during the morning, not a canoe came near the bay, the taboo, which Eappo, at our request, had laid on it the preceding day, having not yet been taken off. At length that chief came on board; when we assured him that we were now perfectly satisfied; and that, as the Orono was buried, all remembrance of the late unhappy transactions was buried with him. We afterwards requested him to take off the taboo, and to make it known, that the islanders might bring provisions to us as usual. The ships were soon surrounded with canoes, and many of the Erees came on board, expressing their grief at what had happened, and their satisfaction at our reconciliation. Several of our friends, who did not favour us with a visit, sent presents of large hogs, and other provisions. Among the rest, the old treacherous Koah came off to us, but we refused him admittance. We were now preparing to set to sea, and Captain Clerke imagining, that, if the intelligence of our proceedings should reach the islands to leeward before us, it might have a bad effect, gave orders, that the ships should be unmoored. About eight in the evening, we dismissed all the natives; and Eappo, and the friendly Kaireekoa, took their leave of us in a very affectionate manner. We immediately weighed anchor, and stood out of Karakakooa bay. The islanders were assembled in great numbers on the shore; and, as we passed along, received our last farewells, with every mark of good-will and affection. About ten o'clock P. M. having cleared the land, we stood to the northward, with a view of searching for an harbour, which the natives had often mentioned, on the south-east side of Mowee. We found ourselves, the next morning, driven to leeward, by a swell from the N. E. and a fresh gale, from the same quarter, drove us still farther to the westward. At midnight we tacked and stood four hours to the S. to

keep clear of the land; and, at day-break, on the 24th, we were standing towards a small barren island, named Tahoorowa, about seven miles S. W. of Mowee. Having now no prospect of making a closer examination of the S. E. parts of Mowee, we bore away, and kept along the S. E. side of Tahoorowa. Steering close round its western extremity, in order to fetch the W. side of Mowee, we suddenly shoaled our water, and saw the sea breaking on some rocks almost right ahead. We then kept away about a league and a half, and again steered to the northward; when we stood for a passage between Mowee, and an island named Ranai. In the afternoon, the weather was calm, with light airs from the W. We stood to the N. N. W. but observing a shoal about sunset, and the weather being unsettled, we stood towards the S. We had passed the S. W. side of this island, without being able to approach the shore. It forms the same distant view as the N. E. as seen when we returned from the N. in November, 1778; the hilly-parts, connected by a low flat isthmus, having, at the first view, the appearance of two separate islands. This deceptive appearance continued, till we were within about ten leagues of the coast, which bending a great way inward, formed a capacious bay. The westernmost point, off which the shoal runs that we have just now mentioned, is rendered remarkable by a small hillock; S. of which is a fine sandy bay; and on the shore, are several huts, with plenty of cocoa-trees about them. In the course of the day several of the natives visited us, and brought provisions with them. We presently discovered, that they had heard of our unfortunate disasters at Owhyhee. They were extremely anxious to be informed of the particulars, from a woman who had hid herself in the Resolution, in order to obtain a passage to Atooi; making particular enquiries about Pareca, and some other chiefs; and seeming much agitated

agitated at the death of Kaneena, and his brother. But, in whatever light this business might have been represented by the woman, it produced no bad effect in their behaviour, which was civil and obliging to an extreme.

On Thursday, the 25th, in the morning, the wind being at E. we steered along the S. side of Ranai, till almost noon, when we had baffling winds and calms till the evening; after which, we had a light easterly breeze, and steered for the W. of Morotoi. The current, which had set from the N. E. ever since we left Karakooa bay, changed its direction, in the course of this day, to the S. E. The wind was again variable during the night; but, early in the morning of the 26th, it settled at E. blowing so fresh, as to oblige us to double-reef the top-sails. At seven, we opened a small bay, distant about two leagues, having a fine sandy beach; but not perceiving any appearance of fresh water, we endeavoured to get to the windward of Woahoo, an island which we had seen in January, 1778. We saw the land about two in the afternoon, bearing W. by N. at the distance of about eight leagues. We tacked, as soon as it was dark, and again bore away at day-light on the 27th. Between ten and eleven, we were about a league off the shore, and near the middle of the N. E. side of the island.

The coast to the northward, consists of detached hills, ascending perpendicularly from the sea; the sides being covered with wood, and the valleys, between them, appearing to be fertile, and well cultivated. An extensive bay was observable to the southward, bounded, to the S. E. by a low point of land, covered with coconut trees; off which, an insulated rock appeared, at the distance of a mile from the shore. The wind continuing to blow fresh, we were unwilling to entangle ourselves with a lee-shore. Instead of attempting, therefore, to examine the bay, we hauled up, and steered in the direction of the coast. At noon, we were about two leagues from the island, and a-breast of the N. point of it. It is low and flat, having a reef stretching off almost a mile and an half. Between the N. point, and a head-land to the S. W. the land bends inward, and seemed to promise a good road. We therefore steered along the shore, at about a mile distance. At two, we were induced, by the sight of a fine river, to anchor in thirteen fathoms water. In the afternoon, Mr. King attended the two Captains on shore, where few of the natives were to be seen, and those principally women. The men, we were informed, were gone to Morotoi, to fight Tahyterrec; but their chief, Perreorance, remained behind, and would certainly attend us, as soon as he was informed of our arrival. To our great disappointment, the water had a brackish taste, for about two hundred yards up the river; beyond which, however, it was perfectly fresh, and was a delightful stream. Farther up, we came to the conflux of two small rivulets, branching off to the right and left of a steep romantic mountain. The banks of the river, and all that we saw of Woahoo, are in fine cultivation, and full of villages; the face of the country being also remarkably beautiful and picturesque. It would have been a laborious business to have watered at this place, Mr. King was therefore dispatched to search about the coast to leeward; but, being unable to land, on account of a reef of coral, which extended along the shore, Captain Clerke resolved to proceed immediately to Atooi. In the morning, about eight, we weighed and stood to the north; and, on Sunday, the 28th, at day light, we bore away for that island, and were in sight of it by noon. We were off its eastern extremity, which is a green flat point, about sun-set. As it was dark, we did not venture to run for the road on the S. W. side, but spent the night in plying on and off, and anchored, at nine the next morning, being Monday the 1st of March, in 25 fathoms water. In running down, from the S. E. point of the island, we saw, in many places, the appearance of shoal water, at some distance from the land. Being anchored in our old station, several canoes came to visit us; but it was very observable, that there was not that appearance of cor-

diality in their manner, and complacency in their countenances, as when we saw them before. They had no sooner got on board, but one of them informed us, that we had communicated a disorder to the women, which had killed many persons of both sexes. He at that time was afflicted with the venereal disease, and minutely described the various symptoms which had attended it. As no appearance of that disorder had been observed amongst them, on our first arrival, we were, it is to be feared, the authors of this irreparable mischief. What we had principally in view, at this place, was to water the ships with as much expedition as possible, and Mr. King was sent on shore in the afternoon, with the launch and pinnace, laden with casks. He was accompanied by the gunner of the Resolution, who was instructed to trade for some provisions; and they were attended by a guard of five marines. Multitudes of people were collected upon the beach, by whom, at first, we were kindly received; but, after we had landed the casks, they began to be exceedingly troublesome. Knowing from experience, how difficult a task it was to repress this disposition, without the interposition of their chiefs, we were sorry to be informed, that they were all at a distant part of the island. Indeed, we both felt and lamented the want of their assistance; for we could hardly form a circle, as our practice usually was, for the safety and convenience of the trading party. No sooner had we taken this step, and posted marines to keep off the populace, than a man took hold of the bayonet belonging to one of the soldier's muskets, and endeavoured to wrench it forcibly from his hand. Mr. King immediately advanced towards them, when the native quitted his hold, and retired; but immediately returned, having a spear in one hand, and a dagger in the other; and it was with difficulty that his countrymen could restrain him from engaging with the soldier. This affray was occasioned by the natives having received, from the soldier, a slight prick with his bayonet, to induce him to keep without the line. At this time, our situation required great management and circumspection; Mr. King accordingly enjoined, that no one should presume to fire, or proceed to any other act of violence, without positive commands. Having given these instructions, he was summoned to the assistance of the watering party, where he found the natives in the same mischievous disposition. They had peremptorily demanded, for every cask of water, a large hatchet; which not being complied with, they would not permit the sailors to roll them to the boats. When Mr. King had joined them, one of the natives approached him, with great insolence, and made the same demand. Mr. King told him, that as a friend, he was welcome to a hatchet, but he certainly would carry off the water, without paying for it; and instantly ordered the pinnace men to proceed; at the same time calling for three marines, from the trading party, to protect them. This becoming spirit so far succeeded, as to prevent any daring attempt to interrupt us; but they still persevered in the most teasing and insulting behaviour. Some of them, under pretence of assisting the sailors, in rolling the casks towards the shore, gave them a different direction; others stole the hats from off our people's heads, pulled them backward by the skirts of their clothes, and tripped up their heels; the populace, during all this time, shouting and laughing, with a mixture of mockery and malice. They afterwards took an opportunity of stealing the cooper's bucket, and forcibly took away his bag. Their principal aim, however, was to possess themselves of the muskets of the marines, who were continually complaining of their attempts to force them from their hands. Though they, in general, preserved a kind of deference and respect for Mr. King, yet they obliged him to contribute no share towards their work of plunder. One of them approached him, in a familiar manner, and diverted his attention, whilst another seized his hanger, which he held carelessly in his hand, and ran away with it. Such insolence was not to be repelled by force. Prudence dictated that we must patiently submit to it; at the same time, guarding against its effects as well as we were

able. Mr. King was, however, somewhat alarmed, on being soon after informed by the serjeant of marines, that, turning suddenly round, he saw a man behind him, armed with a dagger, in the position of striking. Though he might, perhaps, be mistaken, in this particular, our situation was truly critical and alarming; and the smallest error or mistake, on our part, might have been of fatal consequences.

Our people being separated into three small parties; one filling casks at the lake; another rolling them to the shore; and a third purchasing provisions; Mr. King had some intentions of collecting them together, in order to protect the performance of one duty at a time. But, on due reflection, he thought it more advisable to let them proceed as they had begun. If a real attack had been made, even our whole force could have made but a poor resistance. He thought, on the other hand, that such a step might operate to our disadvantage, as being an evident token of our fears. Besides, in the present case, the crowd was kept divided, and many of them wholly occupied in bartering. Perhaps the principal cause of their not attacking us was, their dread of the effects of our arms; and, as we appeared to place so much confidence in this advantage, as to oppose only five marines to such a multitude of people, their ideas of our superiority must have been greatly exalted. It was our business to cherish this opinion; and, it must ever be acknowledged, to the honour of the whole party, that it was impossible for any men to behave better, in order to strengthen these impressions. Whatever could be considered as a jest, they received with patience and good-nature; but, if they were interrupted by any serious attempt, they opposed it with resolute looks and menaces. At length, we so far succeeded, as to get all our casks to the sea-side, without any accident of consequence; but, while our people were getting the casks into the launch, the inhabitants, thinking they should have no farther opportunity of plundering, grew more daring and insolent. The serjeant of marines luckily suggested to Mr. King, the advantage of sending off his party first into the boats, by which means the musquets would be taken out of their reach; which, as above related, were the grand objects the islanders had in view; and, if they should happen to attack us, the marines could more effectually defend us, than if they were on shore. Every thing was now in the boats, and only Mr. King, Mr. Anderson, the gunner, and a seaman of the boat's crew, remained on shore. The pinnace laying beyond the surf, which we were under a necessity of swimming through, Mr. King ordered the other two to make the best of their way to it, and told them he would follow them. They both refused to comply with this order, and it became a matter of contest, who should be the last on shore. Some hasty expression, it seems, Mr. King had just before made use of to the sailor, which he considered as a reflection on his courage, and excited his resentment; and the old gunner, as a point of honour was now started, conceived it to be his duty to take a part in it. In this whimsical situation, they, perhaps, might have long remained, had not the dispute been settled by the stones, which began to fly plentifully about us, and by the exclamations of the people from the boats, begging us to be expeditious, as the natives were armed with clubs and spears, and pursuing us into the water. Mr. King arrived first at the pinnace, and, perceiving Mr. Anderson was so far behind, as not to be entirely out of danger, he ordered one musquet to be fired; but, in the hurry of executing his orders, the marines fired two. The natives immediately ran away, leaving only one man and woman on the beach. The man attempted to rise several times, but was not able, having been wounded in the groin. The islanders, in a short time, returned; and, surrounding the wounded man, brandished their spears at us, with an air of defiance; but, by the time we reached the ships, some persons arrived which we supposed to be the chiefs, by whom they were all driven from the shore. During our absence Captain Clerke had been under terrible apprehensions for our safety: which had been considerably increased by his misunder-

No. 73.

standing some of the natives, with whom he had conversed on board. The name of Captain Cook being frequently mentioned, accompanied with circumstantial descriptions of his death and destruction, he concluded, that they had received intelligence of the unfortunate events at Owhyhee, to which they alluded. But they were only endeavouring to make him understand, what wars had arisen on account of the goats, which Captain Cook had left at Onecheow, and that the poor goats had been slaughtered, during the contest for the property of them. Captain Clerke, applying these shocking representations to our misfortunes at Owhyhee, and to an indication of revenge, fixed his telescope upon us the whole time; and, as soon as he saw the smoke of the musquets, ordered the boats to be put off to our assistance.

On Tuesday, the 2d of March, in the morning, Mr. King was again ordered on shore, with the watering party. As we had so narrowly escaped the preceding day, Captain Clerke augmented our force from both ships, and we had a guard of forty men under arms. This precaution, however, was found to be unnecessary; for the beach was left entirely to ourselves, and the ground, extending from the landing-place to the lake, tabooed. Hence we concluded, that some of the chiefs had visited this quarter: who, being unable to slay, had considerably taken this step, that we might be accommodated with safety. Several men appeared with spears and duggers, on the other side of the river, but never attempted to molest us. Their women came over, and seated themselves close by us, on the banks; and about the middle of the day, some of the men were prevailed on to bring us hogs and roots, and also to dress them for us. When we had left the beach, they came down to the sea-side, and one of them had the audacity to throw a stone at us; but, as his conduct was highly censured by the rest, we did not express any kind of resentment. On the 3d, we completed our watering, without much difficulty; and, on returning to the ships, we were informed that several chiefs had been on board, and had apologized for the conduct of their countrymen, attributing their riotous behaviour to the quarrels then subsisting among the principal people of the island, and which had destroyed all order and subordination. At this time the government of Atooi was disputed between Toneono, who had the supreme power when we were there the preceding year, and a youth named Teavee. By different fathers, they are both the grandsons of Perecorannee, king of Woahoo; who gave Atooi to the former, and Onecheow to the latter. The quarrel originated about the goats which we had left at Onecheow the year before; they being claimed by Toneono, as that island was a dependency of his. The adherents of Teavee insisting on the right of possession, both parties prepared to support their pretensions, and a battle ensued just before our arrival, wherein Toneono had been defeated. Toneono was likely to become more affected by the consequence of this victory, than by the loss of the objects in dispute; for the mother of Teavee having married a second husband, who was not only a chief at Atooi, but also at the head of a powerful faction there, he thought of embracing the present opportunity of driving Toneono out of the island, that his son-in-law might succeed to the government. The goats, which had increased to six, and would probably have stocked these islands in a few years, were destroyed in this contest. Thursday, the 4th, we were visited, on board the Resolution, by the father-in-law, the mother, and the sister of the young prince, who made several curious presents to Captain Clerke. Among the rest, were some fish-hooks, which were made from the bones of Terrecoboo's father, who had been killed in an unsuccessful descent upon Woahoo. Also a fly-flap, from the hands of the prince's sister, which had a human bone for its handle, and had been given to her by her father-in-law, as a trophy. They were not accompanied by young Teavee, he being then engaged in the performance of some religious rites, on account of the victory he had obtained. The 5th and 6th, were employed in completing the Discovery's water.

7 M

The

The carpenters were engaged in caulking the ships, and preparing for our next cruise. We no longer received any molestation from the natives, who supplied us plentifully with pork and vegetables.

This day we were visited by an Indian, who brought a piece of iron on board, to be formed into the shape of a pahooa. It was the bolt of some large ship timbers, but neither the officers nor men could discover to what nation it belonged; though from the shape of the bolt, and the paleness of the iron, they were convinced it was not English. They enquired strictly of the native how he came possessed of it, when he informed them, that it was taken out of a large piece of timber, which had been driven upon their island, since we were there in January, 1778.

On Sunday, the 7th, we received a visit from Tono-ono, at which we were surprized. Hearing the dowager princess was on board, he could hardly be prevailed on to enter the ship. When they met, they cast an angry lowering look at each other. He did not stay long, and appeared much dejected. We remarked, however, with some degree of surprize, that the women prostrated themselves before him, both at his coming and going away; and all the natives on board treated him with that respect which is usually paid to persons of his rank. It was somewhat remarkable, that a man, who was then in a state of actual hostility with Teavee's party, should venture alone within the power of his enemies. Indeed, the civil dissensions, which are frequent in all the fourth sea islands, seem to be conducted without much acrimony; the deposed governor still enjoying the rank of an Eree, and may put in practice such means as may arise, to regain the consequence which he has lost.

On the 8th, at nine in the morning, we weighed, and proceeded towards Onecheow, and came to anchor in 20 fathoms water, at about three in the afternoon, nearly on the spot where we anchored in 1778. With the other anchor, we inoored in 26 fathoms water. We had a strong gale from the eastward in the night, and, the next morning, the ship had driven a whole cable's length, both anchors being almost brought a-head; in which situation we were obliged to continue, this and the two following days.

On Friday, the 12th, the weather being more moderate, the Master was dispatched to the N. W. side of the island, in search of a more commodious place for anchoring. In the evening he returned, having found a fine bay, with good anchorage, in 18 fathoms water. The points of the bay were in the direction of N. by E. and S. by W. A small village was situated on the N. side of the bay, to the eastward of which were four wells of good water. Mr. Bligh went far enough to the N. to convince himself that Oreehoua, and Onecheow, were two separate islands. Being now on the point of taking our final leave of the Sandwich Islands, it may be proper to give here a general and correct account of their situation, and natural history, as well as of the customs and manners of the natives; which will serve as a kind of supplement to a former description, the result of our first visit to these islands.

This group is composed of 11 islands, extending in long. from 199 deg. 36 min. to 205 deg. 6 min. E. and in lat. from 18 deg. 54 min. to 22 deg. 15 min. N. Their names, according to the natives, are, 1. Owhyhee, 2. Atooi, Atowi, or Towi; which is also sometimes called Kowi. 3. Woahoo, or Oahoo. 4. Mowee. 5. Morotoi, or Morokoi. 6. Oreehoua, or Reehoua. 7. Morotinnee, or Morokinne. 8. Tahoora. 9. Ranaa, or Orana. 10. Onecheow, or Nehecow. 11. Kahow-rowee, or Tahoorowa. These are all inhabited, except Tahoora and Morotinnee. Besides those we have enumerated, we heard of another island named Modoo-papapa, or Komodoo-papapa, situated to the W. S. W. of Tahoora; it is low and sandy, and is visited solely for the purpose of catching turtle and water-fowl. As we could never learn that the natives had knowledge of any other islands, it is most probable that no others exist in their neighbourhood. Captain Cook had distinguished this cluster of islands by the name of the Sandwich

Islands, in honour of the Earl of Sandwich, then first Lord of the Admiralty, under whose administration he had enriched Geography with so many valuable discoveries; a tribute justly due to that nobleman, for the encouragement and support which these voyages derived from his power, and for the zealous eagerness with which he seconded the views of our illustrious navigator.

The most easterly of these islands, called Owhyhee, and by far the largest of them all, is of a triangular figure, and nearly equilateral. The angular points constitute the northern, southern, and eastern extremities. The lat. of the northern extreme is 20 deg. 17 min. N. and its long. 204 deg. 2 min. E. the southern end stands in the long. of 204 deg. 15 min. E. and in the lat. of 18 deg. 54 min. N. and the eastern extremity is in the lat. of 19 deg. 34 min. N. and in the long. of 205 deg. 6 min. E. The circumference of the whole island is about 255 geographical miles, or 293 English ones. Its breadth is 24 leagues; and its greatest length, which lies nearly in a N. and S. direction, is 28 leagues and a half. It is divided into six extensive districts, namely, Akona and Koaarra, which are on the W. side; Kaoo and Opoona, on the S. E. and Aheedoo and Amakooa, on the N. E. A mountain, named Mouna Kaah, (or the mountain Kaah) which rises in three peaks, continually covered with snow, and may be discerned at the distance of 40 leagues, separates the district of Amakooa from that of Aheedoo. The coast, to the northward of this mountain, is composed of high and abrupt cliffs, down which fall many beautiful cascades of water. We once flattered ourselves with the hopes of finding a harbour round a bluff head, on a part of this coast, in the lat. of 20 deg. 10 min. N. and the long. of 204 deg. 26 min. E. but after we had doubled the point, and were standing close in, we found that it was connected, by a low valley, with another elevated head to the north-westward. The country rises inland with a gradual ascent, and is intersected by narrow deep glens, or rather chasms: it seemed to be well cultivated, and to have many villages scattered about it. The snowy mountain above-mentioned is very steep, and its lowest part abounds with wood. The coast of Aheedoo is of a moderate elevation; and the interior parts have the appearance of being more even than the country towards the N. W. We cruised off these two districts for near a month; and whenever our distance from the shore would permit, were surrounded by canoes laden with reticements of every kind. On this side of the island we often met with a very heavy sea, and a great swell; and, as there was much foul ground off the shore, we seldom made a nearer approach to the land than two or three leagues. Towards the N. E. of Apoona, the coast, which constitutes the eastern extreme of the island, is rather low and flat. In the inland parts the acclivity is very gradual; and the country abounds with bread-fruit, and cocoa-nut trees. This appeared to us to be the finest part of the whole island; and we were afterwards informed, that the king occasionally resided here. The hills, at the fourth-western extremity, rise with some abruptness from the sea-side, leaving only a narrow border of low land towards the beach. The sides of these hills were covered with verdure; but the adjacent country seemed thinly inhabited. When our ships doubled the E. point of the island, we had sight of another snowy mountain, called by the natives, Mouna Rie (or the extensive mountain) which, during the whole time we were sailing along the fourth-eastern side, continued to be a very conspicuous object. It was flat at the summit, which was perpetually involved in snow; and we once observed its sides also slightly covered with a considerable way down. According to the tropical line of snow, as determined by Monsieur Condamine, from observations made on the Cordilleras in America, the height of this mountain must be, at least, 16,020 feet. It therefore exceeds the height of the Pico de Teyde, or Peak of Teneriffe, by 380 feet, according to the computation of the Chevalier de Borda, or 724, according to that of Dr. Herdier. The peaks of Mouna Kaah seemed to be of the height of about half a mile; and

of Sandwich, then first whose administration he so many valuable discoveries that nobleman, for the which these voyages derive the zealous eagerness of our illustrious na-

lands, called Owhyhee, all, is of a triangular figure. The angular points contain the eastern extremities. The latitude is 20 deg. 17 min. N. and the southern end stands in E. and in the latitude of the northern extremity is in the longitude of 205 deg. of the whole island is 203 English ones. Its greatest length, which is 28 leagues and a half, is divided into five extensive districts, namely, on the W. side; Kaoo, Aheedoo and Amakooa, named Mouna Kaah, for it is in three peaks, continuing to be divided at the eastern side the district of Amakooa. The coast, to the north, is composed of high and abrupt mountains, and beautiful cascades of water. The hopes of finding a passage in a part of this coast, in the longitude of 204 deg. doubled the point, and it was found that it was connected, and elevated head to the north, in a gradual manner, and a gradual descent to deep plains, or rather well cultivated, and to the south. The snowy mountains, and its lowest part is a part of Aheedoo is of a moderate height, and the appearance of the country towards the south is divided into two districts for near a mile from the shore would be seen laden with refreshment. On the eastern side of the island we observed a great swell; and off the shore, we found a land than two or three miles from the coast, which is a part of the island, is rather low, and the acclivity is very gradual, and covered with bread-fruit, and other plants, and led us to be the finest we were afterwards invariably resided here. The climate, with some abundance only a narrow border. The sides of these mountains, but the adjacent country, when our ships doubled the point, we had sight of another island, named Mouna Kaah, during the whole time of our stay on the eastern side, continued to be visible. It was flat at the summit, and covered with a fine snow, and we were entirely covered with a fine snow, and according to the tropical line of the equator, the snow was of a fine white colour, from the hills in America, the snow is at least, 16,020 feet high, and the Pico de Teyde, or the highest mountain, according to the computation, is 724, according to the computation, the peaks of Mouna Kaah are about half a mile; and,

as they are wholly covered with snow, the altitude of their summits must at least be 18,400 feet.

The district of Kaoo exhibits a most horrid and dismal prospect; the whole country having, to appearance, undergone an entire change from the consequences of some dreadful convulsion. The ground is, in all parts, covered with cinders; and, in many places, intersected with blackish streaks, which seem to mark the progress of a lava that has flowed, not many centuries ago, from Mouna Roa to the shore. The fourth promontory appears like the mere dregs of a volcano. The head-land consists of broken and craggy rocks, terminating in acute points, and irregularly piled on each other. Notwithstanding the dreary aspect of this part of the island, it contains many villages, and is far more populous than the verdant mountains of Apooa. Nor is it difficult to account for this circumstance. These islanders not being possessed of any cattle, have no occasion for pasture; and are therefore inclined to prefer such ground as is either more conveniently situated for fishing, or best adapted to the cultivation of plantains and yams. Now amidst these ruins there are many spots of rich soil, which are with great care laid out in plantations; and the neighbouring sea abounds with excellent fish of various kinds. Off this part of the coast, at less than a cable's length from the shore, we did not strike ground with 160 fathoms of line, except in a small bight to the E. of the southern point, where we found from 50 to 58 fathoms of water, over a sandy bottom. It may be proper to observe, before we proceed to give an account of the western districts, that the whole coast we have described, from the northern to the southern extreme, affords not a single harbour, nor the least shelter for shipping. The south-western parts of Akona are in a condition similar to that of the adjoining district of Kaoo; but the country further towards the N. has been carefully cultivated, and is exceedingly populous. In this division of the island lies Karakakooa bay, of which we have already given a description. Scarcely any thing is seen along the coast, but the fragments of black scorched rocks; behind which, the ground, for the space of about two miles and a half, rises gradually, and seems to have been once covered with loose burnt stones. These have been cleared away by the inhabitants, frequently to the depth of three feet and upwards; and the fertility of the soil has amply repaid their labour. Here they cultivate in a rich althy mould, the cloth-plant and sweet potatoes. Groves of cocoa-nut-trees are scattered among the fields, which are enclosed with stone fences. On the rising ground beyond these, they plant bread-fruit trees, which flourish with surprising luxuriance. The district of Koarara extends from the most westerly point to the northern extreme of the island. The whole coast between them forms a spacious bay, which is called by the natives Toeyah-yah, and is bounded to the northward by two conspicuous hills. Towards the bottom of this bay, there is a low, corally ground, that extends to the distance of upwards of a mile from the shore, without which there is no good anchorage. The country, as far as the eye could reach, appeared to be fruitful and populous; but no fresh water was to be found. The soil seemed to be of the same kind with that of the district of Keoo.

Having thus described the coasts of the island of Owhyhee, and the adjacent country, we shall now relate some particulars respecting the interior parts, from the information we obtained from a party, who set out on the 26th of January, on an expedition up the country, principally with an intention of reaching the snowy mountains. Having previously procured two of the islanders to serve them as guides, they quitted the village about four o'clock in the afternoon. Their course was easterly, inclining a little to the south. Within three or four miles from the bay, they found the country already described; but the hills afterwards rose with a less gradual ascent, which brought them to some extensive plantations, consisting of the taro or eddy root, and sweet potatoes, with plants of the cloth-tree. Both the taro and the sweet potatoes are here planted at the distance of four feet from each other. The potatoes are earthed up almost to the top of the stalk, with a pro-

per quantity of light mould. The taro is left bare to the root, and the mould round it is put in the form of a basin, for the purpose of holding the rain-water; this root requiring a certain degree of moisture. At the Friendly and Society Isles, the taro was constantly planted in low and moist situations, and generally in those places where there was the conveniency of a rivulet to flood it. This mode of culture was considered as absolutely necessary; but we now found that this root, with the precaution before-mentioned, succeeds equally well in a more dry situation. It was, indeed, remarked by all of us, that the taro of the Sandwich Islands was the best we had ever tasted. The walls, by which these plantations are separated from each other, are composed of the loose burnt stones, which are met with in clearing the ground, and, being totally concealed by sugar-canes, that are planted close on each side, form the most beautiful fences that can be imagined. Our party stopped for the night at the second hut they observed among the plantations, where they supposed themselves to be six or seven miles distant from our ships. The prospect from this spot was described by them as very delightful; they had a view of our vessels in the bay before them; to the left they saw a continued range of villages, interspersed with groves of cocoa-nut-trees, spreading along the shore; a thick wood extending itself behind them; and, to the right, a very considerable extent of ground, laid out with great regularity in well cultivated plantations, displayed itself to their view. Near this spot the natives pointed out to them, at a distance from every other dwelling, the residence of a hermit, who, they said, had, in the former part of his life, been a great chief and warrior, but had long ago retired from the sea-coast of the island, and now never quitted the environs of his cottage. As they approached him, they prostrated themselves, and afterwards presented him with some provisions. His behaviour was easy, frank, and cheerful. He testified little astonishment at the sight of our people, and though pressed to accept of some European curiosities, he thought proper to decline the offer, and soon retired to his cottage. Our party represented him as by far the most aged person they had ever seen; judging him to be, at a moderate computation, upwards of a hundred years of age. As they had supposed that the mountain was not more than ten or a dozen miles distant from the bay, and consequently expected to reach it with ease early the following morning, they were now greatly surprized to find the distance scarce perceptibly diminished. This circumstance, with the uninhabited state of the country which they were on the point of entering, rendering it necessary to provide a supply of provisions, they dispatched one of their conductors back to the village for that purpose. Whilst they waited his return, they were joined by several of Kaoo's servants, whom that generous old man had sent after them, loaded with refreshments, and fully authorized, as their rout lay through his grounds, to demand, and take away with them whatever they might want. Our travellers were surprized on finding the cold here so intense. But, as they had no thermometer with them, they could only form their judgment of it from their feelings; which, from the warm atmosphere they had quitted, must have been a very fallacious method of judging. They found it, however, so cold, that they could scarce get any sleep, and the islanders could not sleep at all; both parties being disturbed, during the whole night, by continual coughing. As they, at this time, could not be at any very great height, their distance from the sea being no more than six or seven miles, and part of the road on a very moderate ascent, this uncommon degree of cold must be attributed to the easterly wind blowing fresh over the snowy mountains. Early the next morning, they proceeded on their journey, and filled their calabashes at a well of excellent water, situate about half a mile from their hut. After they had passed the plantations, they arrived at a thick wood, which they entered by a path that had been made for the convenience of the islanders, who frequently repair thither for the purpose of catching birds, as well as procuring the wild or horse-plantain. Their progress now became extremely

remely slow, and was attended with great labour; for the ground was either swampy, or covered with large stones; the path narrow, and often interrupted by trees lying across it, which they were obliged to climb over, as the thickness of the under-wood, on each side, rendered it impracticable to pass round them. They saw, in these woods, pieces of white cloth fixed on poles, at small distances, which they imagined were land marks for the division of property, as they only observed them where the wild plantains grew. The trees were of the same kind with the spice tree of New Holland; they were straight and lofty, and their circumference was from two to four feet. Having advanced nine or ten miles in the wood, they had the mortification of finding themselves, suddenly, within sight of the sea, and not very far from it; the path having turned off imperceptibly to the S. and carried them to the right of the mountain, which it was their intention to reach. Their disappointment was considerably heightened by the uncertainty under which they now were with respect to its true bearings, as they could not at present gain a view of it from the top of the highest trees. They, therefore, thought proper to walk back six or seven miles to an unoccupied hut, where they had left two of their own people, and three of the natives, with the small remnant of their provisions. Here they passed the second night, during which the air was so extremely sharp, that, by the morning, their guides were all gone off, except one.

Being at this time in want of provisions, which laid them under a necessity of returning to some of the cultivated parts of the island, they left the wood by the same path by which they had entered it. When they arrived at the plantations, they were surrounded by the islanders, from whom they purchased a fresh supply of necessaries; and prevailed upon two of them to accompany them as guides, in the room of those who had gone away. Having procured the best information they could possibly obtain with regard to the direction of their road, the party, who were now nine in number, marched for about half a dozen miles along the skirts of the wood, and then entered it again by a path leading towards the E. They passed, for the first three miles, through a forest of lofty spice-trees, which grew on a rich loam. At the back of these trees they met with an equal extent of low shrubby trees, together with a considerable quantity of thick under-wood, upon a bottom of loose burnt stones. This led them to another forest of spice-trees, and the same rich brownish soil, which was again succeeded by a barren ridge of a similar kind with the former. These ridges, as far as they could be seen, appeared to run parallel with the sea shore, and to have Mouna Roa for their centre. In passing through the woods they found many unfinished canoes, and huts in several places: but they saw none of the inhabitants. After they had penetrated almost three miles into the second wood, they arrived at two huts, where they stopped, being greatly fatigued with the day's journey, in the course of which they had walked, according to their own computation, at least twenty miles. Having found no springs from the time they quitted the plantations, they had greatly suffered from the violence of their thirst; in consequence of which they were obliged, before the evening came on, to separate into small parties, and go in quest of water. They, at last, met with some that had been left by rain in the bottom of a half-finished canoe; which, though of a reddish colour, was by no means unwelcome to them. Throughout the night, the cold was more intense than before; and though they had taken care to wrap themselves up in mats and clothes of the country, and to keep a large fire between the two huts, they could get but very little sleep, and were under the necessity of walking about for the greatest part of the night. Their elevation was now, in all probability, pretty considerable, as the ground, over which their journey lay, had been generally on the ascent. On the next morning, which was the 29th, they set out early, with an intention of making their last and greatest effort to reach the snowy mountain; but their spirits were considerably de-

pressed, on finding that the miserable pittance of water, which they had discovered the preceding night, was expended. The path, which reached no farther than where canoes had been built, being now terminated, they were obliged to make their way as well as they could; frequently climbing up into the most lofty trees, to explore the surrounding country. They arrived, about eleven o'clock, at a ridge of burnt stones, from the top of which they had a prospect of the Mouna Roa, which then appeared to be at the distance of between twelve and fourteen miles from them. They now entered into a consultation, whether they should proceed any further, or rest contented with the view before them of the snowy mountain. Since the path had ceased, their road had become highly fatiguing, and was growing still more so, every step they advanced. The ground was almost every where broken into deep fissures, which, being slightly covered with moss, made them stumble almost continually; and the intervening space consisted of a surface of loose burnt stones, which broke under their feet. Into some of these fissures they threw stones, which seemed from the noise they made, to fall to a considerable depth; and the ground sounded hollow as they walked upon it. Besides these circumstances, which discouraged them from proceeding, they found their conductors so averse to going on, that they had reason to think they would not be prevailed on to remain out another night. They, therefore, at length came to a determination of returning to the ships, after taking a survey of the country from the highest trees they could find. From this elevation, they perceived themselves surrounded with wood towards the sea; they were unable to distinguish, in the horizon, the sky from the water; and betwixt them and the snowy mountain, was a valley of about eight miles in breadth. They passed this night at a hut in the second forest; and the following day, before noon, they had passed the first wood, and found themselves nine or ten miles to the N. E. of the ships, towards which they marched through the plantations. As they walked along, they did not observe a spot of ground, that was susceptible of improvement, left unplanted, and, indeed, the country, from their account, could scarcely be cultivated to greater advantage for the purposes of the natives. They were surprised at seeing several fields of hay; and, upon their enquiry, to what particular use it was applied, they were informed, that it was intended to cover the grounds where the young taro grew, in order to preserve them from being scorched by the rays of the sun. They observed, among the plantations, a few huts scattered about, which afforded occasional shelter to the labourers: but they did not see any villages at a greater distance from the sea than four or five miles. Near one of them, which was situated about four miles from the bay, they discovered a cave, forty fathoms in length, three in breadth, and of the same height. It was open at each end; its sides were fluted, as if wrought with a chissel; and the surface was glazed over, perhaps by the action of fire. Having thus related the principal circumstances that occurred in the expedition to the snowy mountain at Owhyhee, we shall now proceed to describe the other islands of this group.

That which is next in size, and nearest in situation to Owhyhee, is Mowee. It stands at the distance of eight leagues N. N. W. from Owhyhee, and is 140 geographical miles in circuit. It is divided by a low isthmus into two circular peninsulas, of which that to the eastward is named Whamadooda, and is twice as large as that to the W. called Owhyrookoo. The mountains in both rise to a very great height, as we were able to see them at the distance of about 30 leagues. The northern shores, like those of the isle of Owhyhee, afford no soundings; and the country bears the same aspect of fertility and verdure. The E. point of Mowee is in the latitude of 20 deg. 50 min. N. and in the longitude of 204 deg. 4 min. E. To the southward, between Mowee and the adjacent islands, we found regular depths with 150 fathoms, over a bottom

ferable pittance of wa-

of sand. From the western point, which is rather low, runs a shoal, extending towards the island of Ranai, to a considerable distance; and to the S. of this, is an extensive bay, with a sandy beach, shaded with cocoa-trees. It is not improbable, that good anchorage might be met with here, with shelter from the prevailing winds; and that the beach affords a commodious landing-place. The country further back is very romantic in its appearance. The hills rise almost perpendicularly, exhibiting a variety of peaked forms; and their steep sides, as well as the deep chafms between them, are covered with trees, among which those of the bread-fruit principally abound. The summits of these hills are perfectly bare, and of a reddish brown hue. The natives informed us, that there was a harbour to the S. of the eastern point, which they asserted was superior to that of Karakakooa; and we also heard that there was another harbour, named Keepookeepoo, on the north-western side.

Ranai is about nine miles distant from Mowee and Morotoi, and is situate to the S. W. of the passage between those two isles. The country, towards the S. is elevated and craggy; but the other parts of the island had a better appearance, and seemed to be well inhabited. It abounds in roots, such as sweet potatoes, taro, and yam; but produces very few plantains, and bread-fruit trees. The S. point of Ranai is in the latitude of 20 deg. 46 min. N. and in the longitude of 203 deg. 8 min. E.

Morotoi lies at the distance of two leagues and a half to the W. N. W. of Mowee. Its south-western coast, which was the only part of it we approached, is very low; but the land behind rises to a considerable elevation; and, at the distance from which we had a view of it, appeared to be destitute of wood. Yams are its principal produce; and it may probably contain fresh water. The coast, on the southern and western sides of the island, forms several bays, that promise a tolerable shelter from the trade winds. The W. point of Morotoi is in the longitude of 202 deg. 46 min. E. and in the latitude of 21 deg. 10 min. N.

Tahoorowa is a small island situated off the south-western part of Mowee, from which it is nine miles distant. It is destitute of wood, and its soil seems to be sandy and unfruitful. Its latitude is 20 deg. 38 min. N. and its longitude 203 deg. 27 min. E. Between it and Mowee stands the little island of Morroonnee, which has no inhabitants.

Woahoo lies about seven leagues to the N. W. of Morotoi. As far as we were enabled to judge, from the appearance of the north-western and north-eastern parts (for we had not an opportunity of seeing the southern side) it is by far the finest of all the Sandwich Islands. The verdure of the hills, the variety of wood and lawn, and fertile well cultivated valleys, which the whole face of the country presented to view, could not be exceeded. Having already described the bay in which we anchored, formed by the northern and western extremes, it remains for us to observe, that, in the bight of the bay, to the southward of our anchoring-place, we met with foul rocky ground, about two miles from the shore. If the ground tackling of a ship should happen to be weak, and the wind blow with violence from the N. to which quarter the road is entirely open, this circumstance might be attended with some degree of danger: but, provided the cables were good, there would be no great hazard, as the ground from the anchoring-place, which is opposite the valley through which the river runs, to the northern point, consists of a fine sand. The latitude of our anchoring-place is 21 deg. 43 min. N. and the longitude 202 deg. 9 min. E.

The district of Atooi is about 25 leagues to the N. W. of Woahoo. Towards the N. E. and N. W. the face of the country is ragged and broken; but, to the southward, it is more even; the hills rise from the sea-side with a gentle acclivity, and, at a little distance back, are covered with wood. Its produce is the same with that of the other islands of this cluster; but its inhabitants greatly excel the people of all the neighbouring islands in the management of their plantations.

No. 73.

In the low grounds, contiguous to the bay wherein we anchored, these plantations were regularly divided by deep ditches; the fences were formed with a neatness approaching to elegance, and the roads through them were finished in such a manner, as would have reflected credit even on an European engineer. The longitude of Wymoa Bay, in this island, is 200 deg. 20 min. E. and its latitude 21 deg. 57 min. N.

Onecheow is five or six leagues to the westward of Atooi. Its eastern coast is high, and rises with abruptness from the sea; but the other parts of the island consist of low ground, except a round bluff head on the south-eastern point. It produces plenty of yams, and of the sweet root called tee. The anchoring-place at this island lies in the latitude of 21 deg. 50 min. N. and in the longitude of 199 deg. 45 min. E.

Orechoa and Tahooraa are two little islands, situate in the neighbourhood of Onecheow. The former is an elevated hummock, connected with the northern extreme of Onecheow, by a reef of coral rocks. Its latitude is 22 deg. 2 min. N. and its longitude 199 deg. 52 min. E. The latter stands to the S. E. and is uninhabited; its longitude is 199 deg. 36 min. E. and its latitude 21 deg. 43 min. N.

The climate of the Sandwich Isles is, perhaps, rather more temperate than that of the West India islands, which are in the same latitude; but the difference is very inconsiderable. The thermometer, on shore near Karakakooa Bay, never rose to a greater height than 83 deg. and that but one day: its mean height, at twelve o'clock, was 83 deg. Its mean height at noon, in Wymoa Bay, was 76 deg. and, when out at sea, 75 deg. In the island of Jamaica, the mean height of the thermometer, at twelve o'clock, is about 86 deg. at sea, 80 deg. Whether these islands are subject to the same violent winds and hurricanes with the West Indies, we could not ascertain, as we were not here during any of the tempestuous months. However, as no vestiges of their effects were any where to be seen, and as the islanders gave us no positive testimony of the fact, it is probable, that, in this particular, they resemble the Friendly and Society Isles, which are, in a great degree, free from such tremendous visitations. There was a greater quantity of rain, particularly in the interior parts, during the four winter months that we continued among these islanders, than commonly falls in the West Indies in the dry season. We generally observed clouds collecting round the summits of the hills, and producing rain to leeward; but after the wind has separated them from the land, they disperse, and are lost, and others supply their place. This occurred daily at Owhyhee; the mountainous parts being usually enveloped in a cloud; showers successively falling in the inland country; with a clear sky, and fine weather, in the neighbourhood of the shore. The winds were, for the most part, from E. S. E. to N. E. In the harbour of Karakakooa we had every day and night a sea and land breeze. The currents sometimes set to windward, and at other times to leeward, without the least regularity. They did not seem to be directed by the winds, nor by any other cause that we can assign: they often set to windward against a fresh breeze. The tides are exceedingly regular, ebbing and flowing six hours each. The flood-tide comes from the E. and at the full and change of the moon, it is high-water at three quarters of an hour after three o'clock. Their greatest rise is two feet seven inches.

The quadrupeds of these islands, are confined to three sorts, namely, hogs, dogs, and rats. The dogs are of the same species with those we saw at Oraheite, having pricked ears, long backs, and short crooked legs. We did not observe any variety in them, except in their skins; some being perfectly smooth, and others having long rough hair. They are about as large as a common turnip, and seem to be extremely sluggish in their nature; though this may, probably, be more owing to the manner in which they are treated, than to their natural disposition. They are generally fed with the hogs, and left to herd with those animals; and we do not recollect a single instance of a dog being made a companion here,

as is the custom in Europe. Indeed, the practice of eating seems to be an insuperable bar to their being admitted into society; and as there are no beasts of prey, nor objects of chase, in these islands, the social qualities of the dog, its attachment, fidelity, and sagacity, will, in all probability, remain unknown to the natives. In our observations it did not appear that the dogs in the Sandwich Islands were near so numerous, in proportion, as at Otaheite. But, on the other hand, they have a much greater plenty of hogs, and the breed is of a larger kind. We procured from them an amazing supply of provisions of this sort. We were upwards of three months, either croiling off the coast, or in harbour at Owhyhee; during all which time the crews of both ships had constantly a large allowance of fresh pork, inasmuch that our consumption of that article was computed at about 60 puncheons of 500 weight each. Besides this quantity, and the extraordinary waste, which, amidst such abundance, could not be entirely prevented, 60 more puncheons were salted for sea store. The greater part of this supply was drawn from the isle of Owhyhee alone; and yet we did not perceive that it was at all exhausted, or even that the plenty had decreased. The birds of these islands are numerous, though the variety is not great. Some of them may vie with those of any country in point of beauty. There are four species that seem to belong to the trochili, or honey-suckers of Linnæus. One of them is somewhat larger than a bullfinch; its colour is a glossy black, and the rhings and rump-vent are of a deep yellow. The natives call it hoohee. Another is of a very bright scarlet; its wings are black, with a white edge, and its tail is black. It is named eeeve by the inhabitants. The third is variegated with brown, yellow, and red, and seems to be either a young bird, or a variety of the preceding. The fourth is entirely green, with a yellow tinge, and is called akatearooa. There is also a small bird of the fly-catcher kind; a species of thrush, with a greyish breast; and a rail, with very short wings, and no tail. Ravens are met with here, but they are extremely scarce; they are of a dark brown colour, inclining to black, and their note is different from that of the European raven. We found two small birds, that were very common, and both of which were of one genus. One of these was red, and was usually observed about the cocoa-trees, from whence it seemed to derive a considerable part of its subsistence. The other was of a green colour. Both had long tongues, which were ciliated, or fringed at the tip. A bird with a yellow head was likewise very common here: from the structure of its beak, our people called it a parroquet: it, however, does not belong to that tribe, but bears a great resemblance to the *lexia flaviana*, or yellowish cross-bill of Linnæus. Here are also owls, curlews, petrels, and gannets; plovers of two species, one nearly the same as our whistling plover; a large white pigeon; the common water-hen; and a long-tailed bird, which is of a black colour, and the vent and feathers under the wings yellow.

The vegetable produce of the Sandwich Isles is not very different from that of the other islands of the Pacific Ocean. We have already observed, that the taro root, here cultivated, was superior to any we had before tasted. The bread-fruit trees thrive here, not indeed in such abundance as at Otaheite, but they produce twice as much fruit as they do on the rich plains of that island. The trees are nearly of the same height; but the branches shoot out from the trunk considerably lower, and with greater luxuriance of vegetation. The sugar-canes of these islands grow to an extraordinary size. One of them was brought to us at Atooi, whose circumference was eleven inches and a quarter; and it had fourteen feet carabie. At Oneheow we saw some large brown roots, from six to ten pounds in weight, resembling a yam in shape. The juice, of which they yield a great quantity, is very sweet, and is an excellent succedaneum for sugar. The natives are exceedingly fond of it, and make use of it as an article of their common diet; and our people likewise found it very palatable and wholesome. Not being able to procure

the leaves of this vegetable, we could not ascertain to what species of plant it belonged; but we supposed it to be the root of some kind of fern.

The natives of the Sandwich Isles are doubtless of the same extraction with the inhabitants of the Friendly and Society Islands, of New Zealand, the Marquesas, and Easter Island; a race which possesses all the known lands between the longitudes of 167 deg. and 260 deg. E. and between the latitudes of 47 deg. S. and 22 deg. N. This fact, extraordinary as it is, is not only evinced by the general resemblance of their persons, and the great similarity of their manners and customs, but seems to be established, beyond all controversy, by the identity of their language. It may not, perhaps, be very difficult to conjecture, from what continent they originally emigrated, and by what steps they have diffused themselves over so immense a space. They bear strong marks of affinity to some of the Indian tribes, which inhabit the Ladrões and Caroline Isles; and the similarity and resemblance, may also be traced among the Malays and the Bantus. At what particular time these migrations happened is less easy to ascertain; the period, in all probability, was not very late, as they are very populous, and have no tradition respecting their own origin, but what is wholly fabulous; though, on the other hand, the simplicity which is still prevalent in their manners and habits of life, and the unadulterated state of their general language, seem to demonstrate, that it could not have been at any very remote period. The natives of the Sandwich Islands, in general, exceed the middle size, and are well made. They walk in a very graceful manner, run with considerable agility, and are capable of enduring a great degree of fatigue; but, upon the whole, the men are inferior with respect to activity and strength, to the inhabitants of the Friendly Islands, and the women are less delicate in the formation of their limbs than the Otaheitean females. Their complexion is somewhat darker than that of the Otaheiteans; and they are not altogether so handsome in their persons as the natives of the Society Isles. Many of both sexes, however, had fine open countenances; and the women, in particular, had white well-set teeth, good eyes, and an engaging sweetness and sensibility of look. The hair of these people is of a brownish black, neither uniformly curling, like that of the African Negroes, nor uniformly straight, as among the Indians of America; but varying, in this respect, like the hair of Europeans. There is one striking peculiarity in the features of every part of this great nation; which is, that, even in the most handsome faces, there is always observable, a fullness of the nostril, without any flatness or spreading of the nose, that distinguishes them from the inhabitants of Europe. It is not wholly improbable, that this may be the effect of their customary method of salutation, which is performed by prelling together the extremities of their noses. The same superiority that we generally observed at other islands in the persons of the Erees, is likewise found here. Those that were seen by us were perfectly well formed; whereas the lower class of people, besides their general inferiority, are subject to all the variety of figure and make, that is met with in the populace of other parts of the world. But we met with more frequent instances of deformity here, than in any of the other islands we visited. While we were cruising off Owhyhee, two dwarfs came on board; one of whom was an old man, of the height of four feet two inches, but very well proportioned; and the other was a woman, nearly of the same stature. We afterwards saw, among the natives, three who were hump-backed, and a young man who had been destitute of hands and feet, from the very moment of his birth. Squinting is also common among them; and a man, who, they told us, had been born blind, was brought to us for the purpose of being cured. Besides these particular defects, they are, in general, extremely subject to boils and ulcers, which some of us ascribed to the great quantity of salt they usually eat with their fish and flesh. Though the Erees are free from these complaints, many of them experience still more dreadful effects from the too frequent use of the ava. Those

heads.

Though it does not appear that this drug universally
shortens life, (for Terreeboob, Kaoo, and several other
chiefs, were far advanced in years) yet it invariably
brings on a premature and decrepid old age. It is a
fortunate circumstance for the people, that the use of it
is made a peculiar privilege of the chiefs. The young
son of Terreeboob, who did not exceed 12 or 13 years
of age, frequently boasted of his being admitted to drink
ava; and shewed us, with marks of exultation, a small
spot in his side that was beginning to grow scaly. When
Captain Cook first visited the Society Isles, this pernicious
drug was very little known among them. In his
second voyage, he found it greatly in vogue at Ulitea;
but it had still gained little ground at Otaheite. During
the last time we were there, the havoc it had made
was almost incredible, inasmuch that Captain Cook
scarce recognized many of his former acquaintances. It
is also constantly drunk by the chiefs of the Friendly
Isles, but so much diluted with water, that it scarcely
produces any bad consequences. At Atooi, likewise,
it is used with great moderation; and the chiefs of that
island are, on this account, a much finer set of men,
than those of the neighbouring islands. It was remarked
by us, that, upon discontinuing the use of this root, its
noxious effects quickly wore off. We prevailed upon
our friends Kaoo and Kareekera, to abstain from it;
and they recovered surprisingly during the short time
we afterwards remained among them.

It may be thought, that to form any probable con-
jectures with regard to the population of islands, with
many parts of which we have but an imperfect acquain-
tance, to be a talk highly difficult. There are two cir-
cumstances, however, which remove much of this ob-
jection. One is, that the interior parts of the country
are almost entirely uninhabited: if, therefore, the num-
ber of those who inhabit the parts adjoining to the
coast, be ascertained, the whole will be determined with
some degree of accuracy. The other circumstance is,
that there are no towns of any considerable extent, the
houses of the islanders being pretty equally scattered in
small villages round all their coasts. On these grounds
we shall venture at a rough calculation of the number
of persons in this cluster of islands.

Karakakooa bay, in Owhyhee, is about three miles
in extent, and comprehends four villages of about 80
houses each, upon an average, in all 320; besides many
straggling habitations, which may make the whole a-
mount to 350. If we allow six people to each house,
the country about the bay will then contain 2,100 per-
sons. To these we may add 50 families, or 300 souls,
which we imagine to be nearly the number employed
among the plantations in the interior parts of the
island; making, in all, 2,400. If this number be ap-
plied to the whole coast round the island, a quarter
being deducted for the uninhabited parts, it will be found
to contain 150,000 persons. The other Sandwich
islands, by the same method of calculation, will appear
to contain the following number of inhabitants: Mowee,
65,000; Atooi, 54,000; Morooi, 36,000; Woahoo,
60,200; Ranai, 20,400; Oneehou, 10,000; and Oree-
houa, 4,000. These numbers, including the 150,000
in Owhyhee, will amount to 400,000. In this compu-
tation we have by no means exceeded the truth in the
total amount.

We must confess, notwithstanding the great loss we
sustained from the sudden resentment and violence of these
islanders, that they are of a very mild and affectionate dis-
position, equally remote from the distant gravity and re-
serve of the natives of the Friendly Isles, and the extreme
volatility of the Otaheiteans. They seem to live in the
greatest friendship and harmony with each other. Those
women who had children, shewed a remarkable affec-
tion for them, and paid them a particular and constant
attention; and the men, with a willingness that did ho-
nour to their feelings, frequently afforded their assistance

in those domestic employments. We must, however, re-
mark, that they are greatly inferior to the inhabitants
of the other islands, in that best criterion of civilized
manners, the respect paid to the female sex. Here the
women are not only deprived of the privilege of eating
with the men, but are forbidden to feed on the best sorts
of provisions. Turtle, pork, several kinds of fish, and
some species of plantains, are denied them; and we
were informed, that a girl received a violent beating,
for having eaten, while she was on board one of our ships,
a prohibited article of food. With regard to their do-
mestic life, they seem to live almost wholly by them-
selves, and meet with little attention from the men,
though no instances of personal ill-treatment were ob-
served by us. We have already had occasion to men-
tion the great kindness and hospitality, with which they
treated us. Whenever we went ashore, there was a con-
tinual struggle who should be most forward in offering
little presents for our acceptance, bringing provisions
and refreshments, or testifying some other mark of re-
spect. The aged persons constantly received us with
tears of joy, appeared to be highly gratified with being
permitted to touch us, and were frequently drawing
comparisons between us and themselves, with marks of
extreme humility. The young women, likewise, were
exceedingly kind and engaging, and attached them-
selves to us, without reserve, till they perceived, not-
withstanding all our endeavours to prevent it, that they
had cause to repent of our acquaintance. It must, how-
ever, be observed, that these females were, in all proba-
bility, of the inferior class; for we saw very few women
of rank during our continuance here. These people,
in point of natural capacity, are, by no means, below
the common standard of the human race. The excel-
lence of their manufactures, and their improvements
in agriculture, are doubtless adequate to their situation
and natural advantages. The eagerness of curiosity,
with which they used to attend the armourer's forge,
and the various expedients which they had invented,
even before our departure from these islands, for work-
ing the iron obtained from us, into such forms as were
best calculated for their purposes, were strong in-
dications of docility and ingenuity. Our unhappy friend,
Kaneena, was endowed with a remarkable quickness of
conception, and a great degree of judicious curiosity.
He was extremely inquisitive with respect to our man-
ners and customs. He enquired after our sovereign;
the form of our government; the mode of constructing
our ships; the productions of our country; our num-
bers; our method of building houses; whether we waged
any wars; with whom, on what occasions, and in what
particular manner they were carried on; who was our
deity; besides many other questions of a similar import,
which seemed to indicate a comprehensive understand-
ing. We observed two instances of persons disordered
in their senses; the one a woman at Oneehou, the other
a man at Owhyhee. From the extraordinary respect and
attention paid to them, it appeared, that the opinion of
their being divinely inspired, which prevails among
most of the oriental nations, is also countenanced
here.

We are inclined to think, that the practice of feed-
ing on the bodies of enemies, was originally prevalent
in all the islands of the Pacific Ocean, though it is not
known, by positive and decisive evidence, to exist in
any of them, except New-Zealand. The offering up
human victims, which is manifestly a relic of this
barbarous custom, still universally obtains among these
islanders; and it is not difficult to conceive why the in-
habitants of New-Zealand should retain the repast,
which was, perhaps, the concluding part of these hor-
rid rites, for a longer period than the rest of their tribe,
who were situated in more fertile regions. As the Sand-
wich islanders, both in their persons and disposition,
bear a nearer resemblance to the New-Zealanders, than
to any other people of this very extensive race, Mr.
Anderson was strongly inclined to suspect, that, like
them, they are still cannibals. The evidence, which
induced him to entertain this opinion, has been al-
ready laid down; but, as Mr. King had great doubts of the

who

who

who

the justness of his conclusions, we shall mention the grounds on which he ventured to differ from him. With regard to the intelligence received on this head from the natives themselves, it may not be improper to observe, that most of the officers on board took great pains to enquire into so curious a circumstance; and that, except in the instances above referred to, the islanders invariably denied that any such practice existed among them. Though Mr. Anderson's superior knowledge of the language of those people, ought certainly to give considerable weight to his judgment, yet, when he examined the man who had the little parcel, containing a piece of salted flesh, Mr. King, who was present on that occasion, was strongly of opinion, that the signs made use of by the islander intimated nothing more, than that it was designed to be eaten, and that it was very agreeable or wholesome to the stomach. In this sentiment Mr. King was confirmed, by a circumstance of which he was informed, after the decease of his ingenious friend Mr. Anderson, namely, that most of the inhabitants of these islands carried about with them a small piece of raw pork, well salted, either put in a calabash, or wrapped up in some cloth, and fastened round the waist: this they esteemed a great delicacy, and would frequently taste it. With regard to the confusion the lad was in, (for his age did not exceed 16 or 18 years) no person could have been surprized at it, who had been witness of the earnest and eager manner in which Mr. Anderson interrogated him. Mr. King found it less easy to controvert the argument deduced from the use of the instrument made with shark's teeth, which is of a similar form with that used by the New-Zealanders for cutting up the bodies of their enemies. Though he believed it to be an undoubted fact, that they never make use of this instrument in cutting the flesh of other animals, yet as the practice of sacrificing human victims, and of burning the bodies of the slain, still prevails here, he considered it as not altogether improbable, that the use of this knife (if it may be so denominated) is retained in those ceremonies. He was, upon the whole, inclined to imagine, and particularly from the last-mentioned circumstance, that the horrible custom of devouring human flesh has but lately ceased in these and other islands of the Pacific Ocean. Omiah acknowledged, that his countrymen, infligated by the fury of revenge, would sometimes tear with their teeth the flesh of their slain enemies; but he peremptorily denied that they ever eat it. The denial is a strong indication that the practice has ceased; for in New-Zealand, where it is still prevalent, the natives never scrupled to confess it.

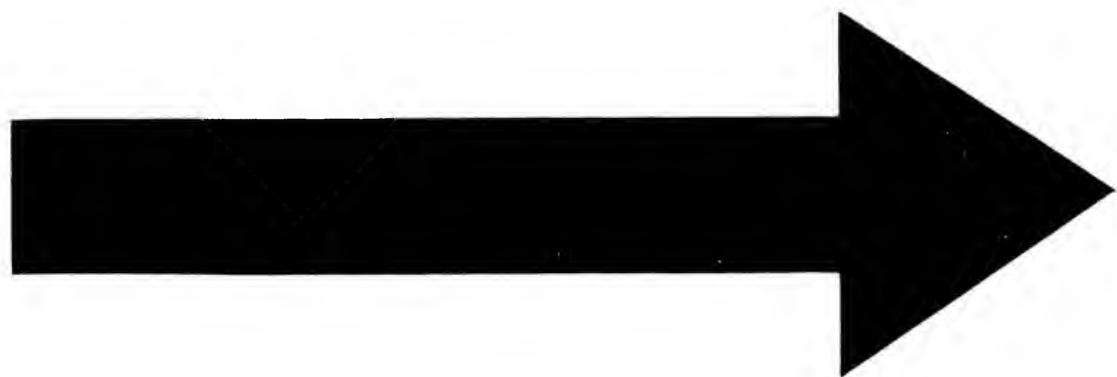

The natives of the Sandwich Islands, almost universally permit their beards to grow. There were, however, a few who cut off their beard entirely, among whom was the aged king; and others wore it only on their upper-lip. The same variety that is found among the other islanders of this ocean, with respect to the mode of wearing the hair, is likewise observable here. They have besides a fashion which seems to be peculiar to themselves: they cut it close on each side of their heads, down to their ears, and leave a ridge, of the breadth of a small hand, extending from the forehead to the neck; which, when the hair is pretty thick and curling, resembles, in point of form, the crest of the helmet of an ancient warrior. Some of them wear great quantities of false hair, flowing in long ringlets down their backs; while others tie it into one round bunch on the upper part of their heads, nearly as large as the head itself; and some into six or seven separate bunches. They use, for the purpose of daubing or smearing their hair, a greyish clay, mixed with shells reduced to powder, which they keep in balls, and chew into a sort of paste, whenever they intend to make use of it. This composition preserves the smoothness of the hair, and changes it, in process of time, to a pale yellow. Necklaces, consisting of strings of small variegated shells, are worn by both men and women. They also wear an ornament, about two inches in length, and half an inch in breadth, shaped like the handle of a cap, and made of stone, wood, or ivory, extremely well polished: this

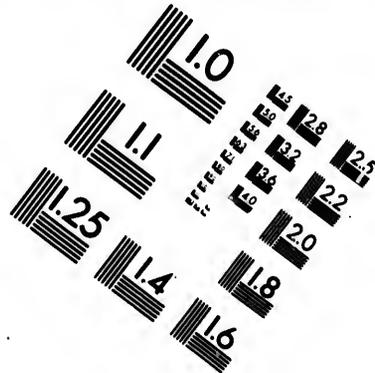

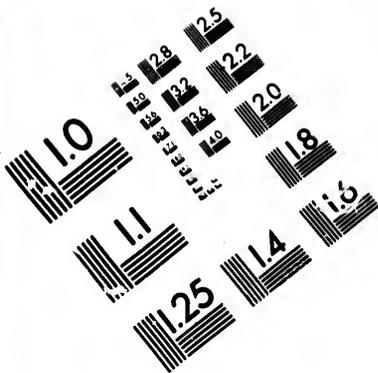

is hung round the neck by fine threads of twisted hair, which are sometimes doubled an hundred fold. Some of them, instead of this ornament, wear a small human figure on their breast, formed of bone, and suspended in a similar manner. Both sexes make use of the fan, or fly-flap, by way of use and ornament. The most common sort is composed of cocoa-nut fibres, tied loosely in bunches, to the top of a polished handle. The tail-feathers of the cock, and those of the tropic-bird, are used for the same purpose. Those that are most in esteem, are such as have the handle formed of the leg or arm bones of an enemy killed in battle: these are preserved with extraordinary care, and are handed down, from father to son, as trophies of the highest value. The practice of tattooing, or puncturing the body, prevails among these people; and, of all the islands in this ocean, it is only at New-Zealand, and the Sandwich Isles, that the face is tattooed. There is this difference between these two nations, that the New-Zealanders perform this operation in elegant spiral volutes, and the Sandwich Islanders in straight lines that intersect each other at right angles. Some of the natives have half their body, from head to foot, tattooed, which gives them a most striking appearance. It is generally done with great neatness and regularity. Several of them have only an arm thus marked; others, a leg; some, again, tattoo both an arm and a leg; and others only the hand. The hands and arms of the women are punctured in a very neat manner; and they have a remarkable custom of tattooing the tip of the tongues of some of the females. We had some reason to imagine, that the practice of puncturing is often intended as a sign of mourning, on the decease of a chief, or any other calamitous occurrence: for we were frequently informed, that such a mark was in memory of such a chief; and so of the others. The people of the lowest order are tattooed with a particular mark, which distinguishes them as the property of the chiefs to whom they are respectively subject.

The common dress of the men of all ranks consists, in general, of a piece of thick cloth, called the maro, about a foot in breadth, which passes between the legs, and is fastened round the waist. Their mats, which are of various sizes, but, for the most part, about five feet in length, and four in breadth, are thrown over their shoulders, and brought forward before. These, however, are rarely made use of, except in time of war, for which purpose they appear to be better calculated than for common use, since they are of a thick heavy texture, and capable of breaking the blow of a stone, or of any blunt weapon. They generally go bare-footed, except when they travel over burnt stones, on which occasion they secure their feet with a kind of sandal, which is made of cords, twisted from cocoa-nut fibres. Besides their ordinary dress, there is another, which is appropriated to their chiefs, and worn only on extraordinary occasions. It consists of a feathered cloak and cap, or helmet, of uncommon beauty and magnificence. This dress having been minutely described, in a former part of our work, we have only to add, that these cloaks are of different lengths, in proportion to the rank of the person who wears them; some trailing on the ground, and others no lower than the middle. The chiefs of inferior rank have likewise a short cloak, which resembles the former, and is made of the long tail-feathers of the cock, the man-of-war bird, and the tropic-bird, having a broad border of small yellow and red feathers, and also a collar of the same. Others are composed of white feathers, with variegated borders. The cap, or helmet, has a strong lining of wicker-work, sufficient to break the blow of any warlike weapon; for which purpose it appears to be intended. These feathered dresses seemed to be very scarce, and to be worn only by the male sex. During our whole continuance in Karakakooa Bay, we never observed them used, except on three occasions; first, in the remarkable ceremony of Teretoboo's first visit to our ships; secondly, by some chiefs, who appeared among the crowd on shore, when our unfortunate Commander was killed; and, thirdly, when his bones were brought to us by Eappo. The striking resemblance of this habit to the cloak and helmet which

— T. King Sculp. —

the Spaniards formerly wore, excited our curiosity to enquire, whether there might not be some reasonable grounds for imagining that it had been borrowed from them. After all our endeavours to gain information on this head, we found, that the natives had no immediate acquaintance with any other people whatever; and that no tradition existed among them of these islands having ever before received a visit from such vessels as our's. However, notwithstanding the result of our enquiries on this subject, the form of this habit seems to be a sufficient indication of its European origin; particularly when we reflect on another circumstance, viz. that it is a remarkable deviation from the general agreement of drefs, which is prevalent among the several branches of this great tribe, dispersed over the Pacific Ocean. From this conclusion, we were induced to suppose, that some Buccaneer, or Spanish ship, might have been wrecked in the neighbourhood of these islands. When it is considered, that the course of the Spanish trading vessels from Acapulco to Manila, is not many degrees to the S. of the Sandwich Isles, in their passage our, and to the N. on their return, this supposition will not, we think, be deemed improbable.

In the common drefs of the men, and that of the women, there is very little difference. The latter wear a piece of cloth wrapped round the waist, which descends half way down their thighs; and sometimes, during the cool of the evening, they throw loose pieces of fine cloth over their shoulders, like the females of Otaheite. They have another kind of drefs called the pan, which the younger part of the sex often wear: it consists of the thinnest and finest cloth, wrapped several times about the middle, and reaching down to the leg; so that it has the appearance of a full short petticoat. They cut their hair, and turn it up before, after the custom of the New Zealanders and Otaheiteans. One woman, indeed, whom we saw in Karakakooa Bay, had her hair arranged in a very singular manner: having turned it up behind, she brought it over her forehead, and doubled it back, so that it formed a kind of shade to the face, and somewhat resembled a small bonnet. Besides their necklaces, which are composed of shells, or of a shining, hard, red berry, they wear dried flowers of the Indian mallow, formed into wreaths, and likewise another elegant ornament, termed eric, which is sometimes fastened round the hair in the manner of a garland, but is usually put round the neck; though it is worn occasionally in both these ways at once. It is a kind of ruff, about as thick as a finger, formed with great ingenuity, of very small feathers, woven closely together, insomuch that the surface may be said to equal the richest velvet in smoothness. The ground is, in general, red, with alternate circles of black, yellow and green. We have already described their bracelets, of which they have a great variety. Some of the women of Atooi wear small figures of the turtle, made very neatly of ivory or wood, fastened on their fingers, in the same manner that rings are worn by us. They have likewise an ornament consisting of shells, tied in rows on a ground of strong net work, so as to strike against each other, while in motion; which both sexes, when they dance, fasten either round the ancles, or just below the knee, or round the arm. They sometimes, instead of shells, use for this purpose, the teeth of dogs, and a hard red berry. Another ornament, if it deserves that name, is a kind of mask, composed of a large gourd, having holes cut in it for the nose and eyes. The top of it is stuck full of green twigs, which appear at some distance, like a waving plume; and the lower part has narrow stripes of cloth hanging from it, somewhat resembling a beard. These masks we never saw worn but on two occasions, and both times by a number of persons assembled in a canoe, who approached the side of the ship, laughing and making droll gesticulations. We could never learn whether they were not also made use of as a defence for the head against stones, or, in some of their public sports and games, or were disguises merely for the purposes of mummery and sport.

The natives of the Sandwich Islands dwell together in small towns or villages, which contain from about 100

No. 74.

to 200 houses, built pretty close to each other, without order or regularity, and having a winding path that leads through them. They are flanked frequently, towards the sea side, with loose detached walls, which are, in all probability, intended for shelter and defence. Their habitations are of various dimensions, from 45 feet by 24, to 18 by 12. Some are of a larger size, being 50 feet in length, 30 in breadth, and entirely open at one end. These, we were informed, were designed for the accommodation of strangers or travellers, whose stay was likely to be short. Some of the best houses have a court-yard before them, railed in very neatly, with smaller habitations for servants erected round it: in this area the family usually eat and sit in the day-time. In the sides of the hills, and among the steep rocks, we saw several holes or caves, which seemed to be inhabited; but the entrance being defended by wicker-work, and, in the only one that we visited, a stone fence being observed running across it within, we supposed that they were chiefly intended as places of retreat, in case of an attack from enemies.

People of an inferior class feed principally on fish, and vegetables, such as plantains, bread-fruit, sweet potatoes, sugar-canes, yams, and taro. To these, persons of superior rank add the flesh of dogs and hogs, dressed after the same method that is practised at the Society Isles. They likewise sometimes eat fowls of a domestic kind; but these, however, are neither plentiful, nor in any degree of estimation. On our first arrival at these islands, yams, and bread-fruit, seemed scarce; but, on our second visit, we did not find this to be the case: it is therefore probable, that, as these vegetable articles are commonly planted in the interior parts of the country, the islanders might not have sufficient time for bringing them down to us, during our short continuance in Wymoa Bay. Their fish are salted, and preserved in gourd-shells, not, indeed, with a view of providing against an occasional scarcity, but from the inclination they have for salted provisions; for we found, that the chiefs had frequently pieces of pork pickled in the same manner, which they considered as a great delicacy. Their cookery is much the same as at the Friendly and Society Islands; and though some of our people disliked their taro puddings, on account of their sourness, others were of a different opinion. It is remarkable, that they had not acquired the art of preserving the bread-fruit, and making of it the four paste, named maihee, as is the practice at the Society Isles; and it afforded us great satisfaction, that we had it in our power to communicate to them this secret, in return for the generous treatment we received from them. At their meals they are very cleanly; and their method of dressing both their vegetable and animal food, was acknowledged universally to be superior to ours. The Erees begin constantly their meals with a dose of the extract of pepper root, or ava, prepared in the usual mode. The women eat apart from the other sex, and are prohibited, as before observed, from feeding on pork, turtle, and some particular species of plantains. Notwithstanding this interdiction, they would eat, privately, pork with us; but we could never prevail on them to taste the two latter articles of food. They generally rise with the sun; and having enjoyed the cool of the evening, retire to their repose a few hours after sun-set. The Erees are employed in making canoes, and mats; the Towtows are chiefly engaged in their plantations, and in fishing; and the women in the manufacture of cloth. They amuse themselves, in their leisure hours, with various diversions. The youth of both sexes are fond of dancing; and on more solemn occasions, they entertain themselves with wrestling and boxing matches, performed after the manner of the natives of the Friendly Islands; to whom, however, they are greatly inferior in these respects. Their dances, which bear a greater resemblance to those of the New Zealanders, than of the Friendly or Society Islanders, are introduced with a solemn kind of song, in which the whole number join, at the same time moving slowly their legs, and striking gently their breasts; their attitudes and manner being very easy and graceful. So

far they resemble the dancers of the Society Islands. After this has continued about the space of ten minutes, they quicken gradually their motions and the tune, and do not desist till they are oppressed with fatigue. This part of the performance is the counter-part of that of the inhabitants of New Zealand; and, as among those people, the person whose action is the most violent, and who continues this exercise the longest, is applauded by the spectators as the best dancer. It must be remarked, that, in this dance, the females only engage; and that the dances of the men resemble those we saw of the small parties at the Friendly Isles; and which may, perhaps, more properly, be termed the accompaniment of song, with the correspondent motions of the whole body. But as we saw some boxing exhibitions, of the same kind with those we had seen at the Friendly Isles, it is not improbable, that they had here likewise their grand dances, wherein both men and women were performers. Their music, on these, and other occasions, is of a rude kind; for the only instruments, we observed among them, were drums of various sizes. Their songs, however, which they are said to sing in parts, and which they accompany with a gentle motion of their arms, like those of the inhabitants of the Friendly Isles, have a very pleasing effect.

These people are greatly addicted to gambling. One of their games resembles our game of draughts; but, from the number of squares, it seems to be much more intricate. The board is of the length of about two feet, and is divided into 238 squares, 14 in a row. In playing they use white and black pebbles, which they move from one square to another. They have a game which consists in concealing a stone under some cloth, spread out by one of the parties, and rumpled in such a manner, that it is difficult to perceive where the stone lies. The antagonist then strikes, with a stick, that part of the cloth where he supposes the stone to be; and the chances being upon the whole, against his hitting it, odds of all degrees, varying with the opinion of the dexterity of the parties, are laid on the occasion. Their manner of playing at bowls nearly resembles that of ours. They often entertain themselves with races between boys and girls, on which they lay wagers with great spirit. We saw a man beating his breast, and tearing his hair, in the violence of rage, for having lost three hatchets at one of these races, which he had purchased from us with near half his property a very little time before. In swimming, both sexes are very expert; an art that, among these people, is deemed necessary, and is their favourite diversion. One particular method, in which we sometimes saw them amuse themselves, is worthy of notice. The surf, that breaks on the coast round this bay, extends about a 50 yards from the shore; and within that space, the surges of the sea are dashed against the beach with extreme violence. Whenever the impetuosity of the surf is augmented to its greatest height, they make choice of that time for this amusement, which they perform in this manner: about 20 or 30 of the natives take each a long narrow board, rounded at both ends: and set out in company with each other from the shore. They plunge under the first wave they meet, and, after they have suffered it to roll over them, rise again beyond it, and swim further out into the sea. They encounter the second wave in the same manner with the first. The principal difficulty consists in seizing a favourable opportunity of diving under it; for, if a person misses the proper moment, he is caught by the surf, and forced back with great violence; and his utmost dexterity is required, to prevent his being dashed against the rocks. When in consequence of these repeated efforts, they have gained the smooth water beyond the surf, they recline themselves at length upon the boards, and prepare for their return to shore. The surf being composed of a number of waves, of which every third is observed to be considerably larger than the rest, and to flow higher upon the shore, while the others break in the intermediate space; their first object is to place themselves on the top of the largest surge, which drives them along with astonishing rapidity towards the land. If, by mistake,

they should place themselves on one of the smaller waves, which breaks before they gain the shore, or should find themselves unable to keep their board in a proper direction on the upper part of the swell, they remain exposed to the fury of the next; to avoid which, they are under the necessity of diving again, and recovering the place from whence they set out. Those who succeed in reaching the shore, are still in a very hazardous situation. As the coast is defended by a chain of rocks, with a small opening between them in several places, they are obliged to steer their plank through one of these openings; or, in case of ill success in that respect, to quit it before they reach the rocks, and, diving under the wave, make their way back again as well as they are able. This is considered as highly disgraceful, and is attended with the loss of the plank, which we have seen dashed to pieces, at the very instant the native quitted it. The amazing courage and address, with which they perform these dangerous achievements are almost incredible. The following accident evinces, at how early a period they are so far accustomed to the water, as to lose all apprehensions of its perils, and even set them at defiance. A canoe, in which was a woman and her children, happening to overfet, one of the children, an infant of about four years old, appeared to be greatly delighted, swimming about at its ease, and playing a number of tricks, till the canoe was brought to its former position. Among the amusements of the children, we observed one that was frequently played at, and which shewed a considerable share of dexterity. They take a short stick, through one extremity whereof runs a peg sharpened at both ends, extending about an inch on each side, then throwing up a ball, formed of green leaves moulded together, and fastened with twine, they catch it on one of the points of the peg; immediately after which, they throw it up again from the peg, then turn the stick round, and catch the ball on the other point of the peg. Thus, for some time, they continue catching it on each point of the peg alternately, without missing it. They are equally expert at another diversion of a similar nature, throwing up in the air, and catching, in their turns, many of these balls; and we have often seen little children thus keep five balls in motion at once. This latter game is also practised by the young people of the Friendly Isles. The figure and dimensions of the canoes, seen by us at Atooi, have been already described. Those belonging to the other Sandwich Islands were made exactly in the same manner; and the largest we saw was a double one, the property of Terreeboob, measuring 70 feet in length, 12 in breadth, and between 3 and 4 in depth; and each was hollowed out of one tree. Their method of navigation, as well as that of agriculture, resemble those of the other islands in the Pacific Ocean. They have made considerable proficiency in the art of sculpture, and in painting or staining cloth. The most curious specimens of their sculpture, that we had an opportunity of observing, were the wooden bowls, in which the Erees drink ava. These are, in general, eight or ten inches in diameter, perfectly round, and extremely well polished. They are supported by three or four small human figures, represented in different attitudes. Some of them rest on the shoulders of their supporters; others on the hands, extended over the head; and some on the head and hands. The figures are very neatly finished, and accurately proportioned; even the anatomy of the muscles is well expressed.

Their cloth is manufactured in the same manner as at the Society and Friendly Islands. That which they intend to paint, is of a strong and thick texture, several folds being beaten and incorporated together; after which they cut it in breadths, two or three feet wide, and then paint it in a great variety of patterns, with such regularity and comprehensiveness of design, as shew an extraordinary portion of taste and fancy. The exactness with which the most intricate patterns are continued, is really astonishing, as they have no stamps, and as the whole is performed by the eye, with a piece of bamboo cane dipped in paint; the hand being supported by another piece of the same sort of cane.

They extract their colour from other vegetable articles, heite for this purpose. painting their cloth, is called denominated kipparee, by this name. They

They extract their colours from the same berries, and other vegetable articles, which are made use of at Otahete for this purpose. The operation of staining or painting their cloth, is confined to the females, and is denominated kipparee. They always called our writing by this name. The young women would frequently take the pen from our hands, and shew us that they were as well acquainted with the use of it as we ourselves; telling us, at the same time, that our pens were inferior to theirs. They considered a manuscript sheet of paper as a piece of cloth striped after the mode of our country; and it was with the greatest difficulty that we could make them understand that our figures contained a meaning in them, which theirs was destitute of. Their mats they make of the leaves of the pandanus; and these, as well as their cloths, are beautifully worked in various patterns, and stained with divers colours. Some of them have a ground of straw-colour, embellished with green spots; others are of a pale green, spotted with squares, or rhomboids, of red; and some are ornamented with elegant stripes, either in straight or waved lines of red and brown. In this branch of manufacture, whether we regard the fineness, beauty, or strength, these islanders may be said to excel the whole world. Their fishing hooks are of various sizes and figures; but those that are principally made use of are about two or three inches in length, and are formed in the shape of a small fish, serving as a bait, with a bunch of feathers fastened to the head or tail. They make their hooks of bone, mother-of-pearl, or wood, pointed and barbed with little bones, or tortoise-shell. Those with which they fish for sharks, are very large, being, in general, of the length of six or eight inches. Considering the materials of which these hooks are composed, their neatness and strength are amazing; and, indeed, upon trial, we found them superior to our own. Of the bark of the toota, or cloth-tree, neatly twisted, they form the line which they use for fishing, for making nets, and for some other purposes. It is of different degrees of fineness, and may be continued to any length. They have also a sort, made of the bark of a shrub, named areemah; and the finest is composed of human hair: this last, however, is chiefly made use of in the way of ornament. They likewise make cordage of a stronger kind, from cocoa-nut fibres, for the rigging of their canoes. Some of this, which was purchased by us for our own use, was found to be well calculated for the smaller kinds of running rigging. They also manufacture another sort of cordage, which is flat, and extremely strong, and is principally used for the purpose of lashing the roofs of their houses. This last is not twisted after the manner of the former sorts, but is formed of the fibrous strings of the coat of the cocoa-nut, plaited with the fingers, in the same manner which is practised by our seamen in making their points for the reefing of sails.

Their gourds are applied to various domestic purposes. These grow to such an enormous magnitude, that some of them will contain from ten to a dozen gallons. In order to adapt them the better to their respective uses, they take care to give them different shapes, by fastening bandages round them during their growth. Thus some of them are in the form of a dish, serving to hold their puddings, vegetables, and salted provisions: others are of a long cylindrical form, and serve to contain their fishing tackle; which two sorts are furnished with neat close covers, made also of the gourd. Others are in the shape of a long-necked bottle, and in these water is kept. They score them frequently with a heated instrument, so as to communicate to them the appearance of being painted, in a great variety of elegant designs. Their pans in which they make their salt, are made of earth lined with clay, and are in general six or eight feet square, and about two thirds of a foot in depth. They are elevated on a bank of stones, near the high-water-mark, whence the salt water is conducted to the bottom of them, in trenches, out of which they are filled; and in a short time the sun performs the process of the evaporation. The salt we met with at Onecheow and Atooi, during our first visit, was brownish, and rather

dirty; but that which we afterwards procured in Karakakooa Bay, was white, and of an excellent quality. We obtained an ample supply of it, inasmuch that, besides the quantity used by us in salting pork, we filled all our empty casks with it.

The warlike weapons of the inhabitants of these islands are daggers, which they call by the name of pahoo, spears, slings, and clubs. The pahoo is made of a black, heavy wood, that resembles ebony. It is commonly from one to two feet in length, and has a string passing through the handle, by which it is suspended from the arm. The blade is somewhat rounded in the middle: the sides are sharp, and terminate in a point. This offensive weapon is intended for close engagements, and in the hands of the natives is a very destructive one. Their spears are of two kinds, and are formed of hard wood, which, in its appearance, is not unlike mahogany. One sort is from six to eight feet in length, well polished, and increasing gradually in thickness from the extremity till within the distance of six or seven inches from the point, which tapers suddenly, and has five or six rows of barbs. It is probable that these are used in the way of javelins. The other sort, with which the warriors we saw at Atooi and Owhyhee were chiefly armed, are from 2 to 5 feet in length, and instead of being barbed, terminate towards the point, in the manner of the daggers. Their slings are the same with our common ones, except in this respect, that the stone is lodged on matting, instead of leather. Their clubs are formed indifferently of several kinds of wood: they are of various sizes and shapes, and of rude workmanship.

The inhabitants of the Sandwich Islands are divided into three classes. The Erees, or chiefs of each district, are the first; and one of these is superior to the rest, who is called, at Owhyhee, Eree-raboo, and Eree-Moce, the first name expressing his authority, and the latter signifying that, in his presence, all must prostrate themselves. Those of the second class appear to enjoy a right of property, but have no authority. Those who compose the third class, are called Towtows, or servants, and have neither rank nor property. The superior power and distinction of Terreeboob, the Eree-raboo of Owhyhee, was sufficiently evident from his reception at Karakakooa, on his first arrival. The inhabitants all prostrated themselves at the entrance of their houses, and the canoes were tabooed, till he discharged the interdiction. He was then just returned from Mowee, an island he was conceding for, in behalf of his son, Teewarro, whose wife was the only child of the king of that place, against Taheetere, his surviving brother. In this expedition he was attended by many of his warriors; but we could never learn whether they served him as volunteers, or whether they held their rank and property under that tenure. That the subordinate chiefs are tributary to him, is evidently proved in the instance of Kaoo, which has been already related. We have also observed, that the two most powerful chiefs of the Sandwich Islands, are Terreeboob and Perreecorannee; the former being chief of Owhyhee, and the latter of Waahoo, all the smaller isles being governed by one of these sovereigns: Mowee was, at this time, claimed by Terreeboob, for his son and intended successor; Atooi and Onecheow being in the possession of the grandsons of Perreecorannee. Without entering into the genealogy of the kings of Owhyhee and Mowee, it may be necessary to mention, that, when we were first off Mowee, Terreeboob and his warriors were there, to support the claims made by his wife, his son, and his daughter-in-law; and a battle had then been fought with the opposite party, in which Terreeboob had been victorious. Matters, however, were afterwards compromised; Taheetere was to have possession of the three neighbouring islands, during his life; Teewarro to be acknowledged chief of Mowee, and to succeed to Owhyhee, on the death of Terreeboob, together with the three islands contiguous to Mowee, after the decease of Taheetere. Should Teewarro, who has lately married his half sister, die, and leave no issue behind him, those islands are to descend to Maitha, whom we have frequently mentioned, he being

the son of Terreeboob's deceased brother; and should he die without issue, it is doubtful who would be the successor, for Terreeboob's two younger sons, being born of a mother who had no rank, would be debarred all right of succession. We did not see Queen Rorora, whom Terreeboob had left at Mowee; but we had an opportunity of seeing Kance Kaberaia, the mother of the two youths of whom he was so extremely fond. From what has been already mentioned, it should seem that their government is hereditary; whence it appears probable, that the inferior titles, as well as property, descend in the same channel. Respecting Perreerancee, we only discovered that he is an Eree-taboo; that he was, on some pretence, invading the possession of Taheterree; and that the islands to the leeward were governed by his grandsons.

The Erees appear to have unlimited power over the inferior classes of people; many instances of which occurred daily while we continued among them. On the other hand, the people are implicitly obedient. It is remarkable, however, that we never saw the chiefs exercise any acts of cruelty, injustice, or insolence towards them; though they put in practice their power over each other, in a most tyrannical degree: which the two following instances will fully demonstrate. One of the lower order of chiefs having shewn great civility to the master of our ship, when employed on the survey of Karakakooa Bay; Mr. King, some time afterwards, took him on board, and introduced him to Captain Cook, who engaged him to dine with us. While at table, Pareea entered, whose countenance manifested the highest indignation at seeing our guest so honourably entertained. He seized him by the hair of his head, and would have dragged him out of the cabin, if the Captain had not interfered. After much altercation, we could obtain no other indulgence (without quarrelling with Pareea) than, that our guest should be permitted to remain in the cabin, on condition that he seated himself on the floor, while Pareea occupied his place at the table. An instance somewhat similar happened when Terreeboob came first on board the Resolution; where Maiha-maiha, who attended the king, seeing Pareea upon deck, turned him most ignominiously out of the ship; even though we knew Pareea to be a man of the first consequence in the island. Whether the lower class of people have their property secured from the rapacity of the great, we cannot possibly say, but it appears to be well protected against theft and depredation. All their plantations, their houses, their hogs, and their cloth, are left unguarded, without fear or apprehension of plunderers. In the plain country, they separate their possessions by walls; and, in the woods, where horse plantains grow, they use white flags to discriminate property, in the same manner as they do bunches of leaves at Otaheite. These circumstances strongly indicate, that, where property is concerned, the power of the Erees is not arbitrary, but so far limited, as to afford encouragement to the inferior orders to cultivate the soil, which they occupy distinct from each other.

The information we obtained, respecting the administration of justice is very imperfect. If a quarrel arose among the lower class of people, the matter was referred to some chief for his decision. When an inferior chief had offended one of superior rank, his punishment was dictated by, and the result of, the feelings of the superior at that moment. If the offender should fortunately escape the first transports of the great man's rage, he perhaps found means, through the mediation of friends, to compound for his offence, by all, or a part of his effects. As to the religion of these people, it resembles that of the Society and Friendly Islands. In common with each other, they all have their Morais, their Whattas, sacred orations, hymns, and sacrifices. These are convincing proofs that their religious rites and tenets are derived from the same source. The ceremonies here are, indeed, longer, and more numerous than in the islands above-mentioned; and though in all these places, the care and performance of their religious rites, is committed to a

particular class of people; yet we had never found a regular society of priests, till we arrived at Kakooa, in Karakakooa Bay. Orono was the title given to the principal of this order; a title which seemed to imply something sacred in a high degree, and which almost received adoration in the person of Omeeah. The privilege of holding the principal offices in this order, is doubtless limited to certain families. Omeeah, the Orono, was Kaa's son, and Kaireekeea's nephew. Kaireekeea presided in all religious ceremonies at the Morai, in the absence of his grandfather: it was observed, likewise, that the son of Omeeah, an infant of about the age of five years, had always a number of attendants, and such other marks of distinction and esteem were shewn him, as we never observed in any similar instances. Hence we concluded, that his life was an object of much consequence, and that he would eventually succeed to the high dignity of his father. The title of Orono, we have already observed, was bestowed on Captain Cook; and it is very certain, that they considered us as a race of beings superior to themselves; frequently repeating that the great Eatooa lived in our country. The favourite little idol on the Morai, before which Captain Cook fell prostrate, is called Koonoraekaiee, and is Terreeboob's god, which they said resided also among us. An almost infinite variety of these images were to be seen, both on the Morais, and about their houses, on which they bestow different names; but they certainly were held in very little estimation; from their contemptuous expressions when speaking of, or to them, and from their exposing them to sale for mere trifles; though they generally had one particular figure in high favour, to which, while it continued a favourite, all their adoration was addressed. They arrayed it in red cloth, beat their drums, and chanted hymns before it; placed bunches of red feathers, and different vegetables at its feet; and frequently exposed a pig or a dog, to rot on the Whatta, near which it was placed. In a bay to the southward of Karakakooa, a party of us were conducted to a large house, in which we saw the figure of a black man, resting on his toes and fingers, and his head inclined backward: the limbs were well proportioned, and the whole was beautifully polished. This figure was called Mae; round which thirteen others were placed, with shapes rude and distorted. These, we were told, were the Eatoo's of deceased chiefs, whose names they repeated. Numbers of Whattas were seen within this place, with the remains of offerings on many of them. They also have in their habitations many ludicrous and obscene representations by idols, not unlike the Priapus of the ancients. Former navigators have remarked, that the Society and Friendly Islanders pay adoration to particular birds, and it seems to be a custom prevalent in these islands: ravens may here, perhaps, be objects of worship; for Mr. King saw two of these birds perfectly tame, and was told they were Eatoo's: that gentleman offered several articles for them, which were all refused; and he was particularly cautioned not to offend, or hurt them. Among their religious ceremonies may be classed the prayers and offerings made by their priests before their meals: As they always drink ava before they begin a repast, while that is chewing, the superior in rank begins a sort of hymn, in which he is soon after joined by one or more of the company; the bodies of the others are put in motion, and their hands are clapped together in concert with the fingers. The ava being ready, cups of it are presented to those who do not join in the hymn, which are held in their hands till it is concluded; when, with united voice, they make a loud response, and drink their ava. The performers are then served with some of it, which they drink, after the same ceremony has been repeated. And, if any person of a superior rank should be present, a cup is presented to him last of all; who having chanted for a short time, and hearing a response from others, he pours a small quantity on the ground, and drinks the rest. A piece of the flesh, which has been dressed, is then cut off, and together with some of the vegetables, is placed at the foot of the figure of the Eatoo; and, after another hymn

hymn has been chanted, they begin their meal. A cere-
 mony, in many respects resembling this, is also per-
 formed by the chiefs, when they drink ava between
 their regular meals. According to the accounts given
 by the natives, human sacrifices are more common here
 than in any of the islands we have visited. They have
 recourse to these horrid rites, on the commencement of
 a war, and previous to a battle, or any signal enter-
 prize. The death of every chief demands an offering
 of one or more Towtoos; and we were informed not
 less than ten were devoted to suffer, on the decease of
 Terreebooo, the king. But the unhappy victims are
 totally unacquainted with their ordained fate; which
 is, to be attacked with large clubs, wherever they may
 happen to be; and after they are dead, are conveyed
 to the place where the subsequent rites are to be per-
 formed. This brings to our remembrance the skulls of
 those who had been sacrificed on the decease of some
 principal chief, and were fixed to the Morai at Kakooa;
 at which village we received further information on this
 subject; for we were shewn a small piece of ground,
 within a stone fence, which we were told was a Here-
 eere, or burying-place of a chief. The person who gave
 us this information, pointing to one of the corners,
 added; and there lie the tangata and wahene-taboo, or
 the man and woman who became sacrifices at his fune-
 ral. The knocking out their fore teeth, may be with
 propriety classed among their religious customs. Most
 of the common people, and many of the chiefs, had
 lost one or more of them; and this, we understood, was
 considered as a propitiatory sacrifice to the Eatooa, to
 avert his anger; and not like the cutting off part of
 the finger at the Friendly Islands, to express the vio-
 lence of their grief at the decease of a friend. Concern-
 ing their opinions, respecting a future state, we had very
 defective information. Enquiring of them, whether
 the dead were gone? we were told, that the breath,
 which they seemed to consider as the immortal part,
 was fled to the Eatooa. They seemed also to give
 a description of some place, which they suppose to be
 the abode of the dead; but we could not learn, that
 they had any idea of rewards and punishments.

Here an explanation of the word Taboo may not be
 improperly introduced. On asking the reasons of the
 intercourse being interdicted, between us and the islan-
 ders, the day preceding Terreebooo's arrival, we were
 informed, that the Bay was tabooed. The same inter-
 diction took place, by our desire, when we interred the
 remains of Captain Cook. The most implicit obedi-
 ence, in these two instances, was rendered by the na-
 tives; but whether on religious principles, or in de-
 ference to civil authority, we cannot pretend to deter-
 mine. The ground whereon our observatories were
 fixed, and the place whereon our masts were deposited,
 were tabooed, and the operation was equally efficacious.
 This consecration was performed by the priests only;
 and yet, at our request, the men ventured on the spot
 which was tabooed; whence it should seem they enter-
 tained no religious apprehensions, their obedience be-
 ing limited merely to our refusal. No inducements
 could bring the women near us; on account, it is pre-
 sumed, of the Morai adjoining; which they are, at all
 times, prohibited from approaching; not only here, but
 in all the islands of the south seas, women, it has been ob-
 served, are always tabooed, or forbidden to eat certain
 articles of food. We have seen many of them, at their
 meals, have their meat put into their mouths by others;
 and, on our requesting to know the reason of it, we
 were informed that they were tabooed, and not per-
 mitted to feed themselves. This prohibition was al-
 ways the consequence of assisting at any funeral, touch-
 ing a dead body, and many other occasions. The
 word taboo, is indifferently applied, either to persons
 or things; as the natives are tabooed, the bay is ta-
 bood, &c. This word is also expressive of any thing
 sacred, devoted, or eminent. The king of Owhyhee
 is called Eree-taboo, and a human victim, tangata-ta-
 booo; and, among the Friendly Islanders, Tonga, where
 the king resides, is called Tonga-taboo.

With respect to their marriages, very little can be

said, except that such a compact seems to exist among
 them. It has already been mentioned, that, when Ter-
 reebooo had left his queen Rora-rora, at Mowee, ano-
 ther woman cohabited with him, by whom he had chil-
 dren, and seemed particularly attached to her; but
 whether polygamy is allowed, or whether it is mixed
 with concubinage, either among the principal or infe-
 rior orders, we saw too little of, to warrant any conclu-
 sions. From what we observed of the domestic con-
 cerns of the lower class of people, one man and one
 woman seemed to have the direction of the house, and
 the children were subordinate to them, as in civilized
 countries. The following is the only instance of any
 thing like jealousy, which we have seen among them,
 and which shews, that, among married women of rank,
 not only fidelity, but even a degree of reserve, is re-
 quired. At one of their boxing matches, Omeah rose
 two or three times from his place, and approaching his
 wife, with strong marks of displeasure, commanded her
 as we supposed, to withdraw. Whether he thought her
 beauty engaged too much of our attention, or whatever
 might be his motives, there certainly existed no real
 cause of jealousy. She, however, continued in her place,
 and at the conclusion of the entertainment, joined our
 party, and even solicited some trifling presents. She
 was informed that we had not any about us, but that, if
 she would accompany us to the tent, she should be wel-
 come to make choice of what she liked. She was, ac-
 cordingly, proceeding with us; which being observed
 by Omeah, he followed in a great rage, seized her by the
 hair, and, with his fists, began to inflict severe corporal
 punishment. Having been the innocent cause of this
 extraordinary treatment, we were exceedingly concerned
 at it; though we understood it would be highly im-
 proper for us to interfere between husband and wife of
 such superior rank. The natives, however, at length
 interposed, and, the next day, we had the satisfaction of
 meeting them together, perfectly satisfied with each
 other; besides, what was extremely singular, the lady
 would not permit us to rally the husband on his beha-
 viour, which we had an inclination to do; plainly telling
 us, that he had acted very properly.

We had twice an opportunity, at Karakakooa Bay,
 of seeing a part of their funeral rites. Hearing of the
 death of an old chief, not far from our observatories,
 some of us repaired to the place, where we beheld a
 number of people assembled. They were seated round
 an area, fronting the house where the deceased lay; and
 a man, having on a red feathered cap, came to the door,
 constantly putting out his head, and making a most la-
 mentable howl, accompanied with horrid grimaces, and
 violent distortions of the face. A large mat was after-
 wards spread upon the area, and thirteen women and
 two men, who came out of the house, sat down upon it
 in three equal rows; three of the women, and the two
 men being in front. The women had feathered ruffs
 on their necks and hands, and their shoulders were de-
 corated with broad green leaves, curiously scoloped.
 Near a small hut, at one corner of this area, half a do-
 zen boys were placed, waving small white banners, and
 taboo sticks, who would not permit us to approach
 them. Hence we imagined, that the dead body was
 deposited in the hut; but we were afterwards informed
 that it remained in the house, where the tricks were
 playing at the door by the man in the red cap. The com-
 pany seated on the mat, sung a melancholy tune, accom-
 panied with a gentle motion of the arms and body. This
 having continued some time, they put themselves in a
 posture between kneeling and sitting, and their arms
 and bodies into a most rapid motion, keeping pace, at
 the same time, with the music. These last exertions
 being too violent to continue, at intervals they had
 slower motions. An hour having passed in these cere-
 monies, more mats were spread upon the area, when
 the dead chief's widow, and three or four other elderly
 women came out of the house with slow and solemn
 pace; and, seating themselves before the company, be-
 gan to moan most bitterly, in which they were joined
 by the three rows of women behind them; the two men
 appearing melancholy and pensive. They continued

with little variation, till late in the evening, when we left them; and, at day-light, in the morning, the people were dispersed, and every thing appeared perfectly quiet. We were then given to understand, that the body was removed; but we could not learn how it was disposed of. While we were directing our enquiries to this object, we were addressed by three women of rank, who signified to us, that our presence interrupted the performance of some necessary rites. Soon after we had left them, we heard their cries and lamentations; and, when we met them a few hours afterwards, the lower parts of their faces were painted perfectly black. We had also an opportunity of observing the ceremonies at the funeral of one of the ordinary class. Hearing some mournful cries, issuing from a miserable hut, we entered it, and discovered two women, whom we supposed to be mother and daughter, weeping over the body of a man who had that moment expired. They first covered the body with cloth: then lying down by it, they spread the cloth over themselves, beginning a melancholy kind of song, and repeating frequently *Aweh medoah! Aweh taneel! Oh my father! Oh my husband!* In one corner of the hut a younger daughter lay prostrate on the ground, having some black cloth spread over her, and repeating the same expressions. On our quitting this melancholy scene, we found many of their neighbours collected together at the door, who were all perfectly silent, and attentive to their lamentations.

Mr. King was willing to have embraced this opportunity of knowing in what manner the body would be disposed of; and therefore, after being convinced that it was not removed till after he went to bed, he ordered the sentries to walk before the house, and if there were any appearance of removing the body, to acquaint him with it. The sentries, however, were remiss in the performance of their duty, for, before the morning, the body was taken away. On asking, how it had been disposed of, they pointed towards the sea, perhaps thereby indicating, that it had been deposited in the deep, or that it had been conveyed to some burying ground beyond the bay. The place of interment for the chiefs, is the morai, or herce erees, and those who

are sacrificed on the occasion, are buried by the side of them. The morai in which the chief was interred, who, after a spirited resistance, had been killed in the cave, is adorned with a hanging of red cloth round it. Having thus laid before our readers a circumstantial and comprehensive account of the whole group of the Sandwich Islands, we proceed to relate the transactions, incidents and events, during our second Expedition to the North, by the way of Kamtschatka, and on our return home, by the way of Canton, and the Cape of Good Hope, from March 1779, to August 1780. But it may not be amiss to close this chapter, with an abstract of the astronomical observations, which were made at the observatory in Karakakooa Bay, for determining its latitude and longitude; to which we shall add the latitude and longitude of the Sandwich Islands, collected into one point of view. The latitude of the observatory, deduced from meridian zenith distances of the sun, and some particular stars, we found to be 19 deg. 28 min. N. and its longitude, deduced from 233 sets of lunar observations, to be 204 deg. E.

ON Monday, the 15th of March 1779, we weighed anchor, and passing to the N. of Tahoorwa, stood to the S. W. in expectation of falling in with the island of MODOOPAPAPPA, the natives having assured us, that it lay in that direction, within five hours sail of Tahoorwa. The next day at five o'clock P. M. we made a signal for the Discovery to come under our stern, having given over all hopes of seeing MODOOPAPAPPA. On Wednesday, the 17th, we steered W. Captain Clerke intending to keep in the same parallel of latitude, till we made the longitude of Awatka Bay; and then to steer N. for the harbour of St. Peter and St. Paul, which was also fixed on as our rendezvous, if we should happen to separate. This track was chosen, because we supposed it to be yet unexplored, and we might probably meet with some new islands in our passage. On Tuesday, the 30th, the winds and unsettled state of the weather, induced Captain Clerke to alter his plan, and, at six in the evening, we began to steer N. W. which we

continued till Tuesday, the 6th of April, at which time we lost the trade wind. The fine weather we met with between the tropics, had not been idly spent. The carpenters found sufficient employment in repairing the boats. The best bower cable had been so much damaged that we were obliged to cut forty fathoms from it. The airing of sails and other stores, which from the leakiness of the decks, and sides of the ship, were perpetually subject to be wet, had now become a troublesome part of duty. For some time past, even the operation of mending the sailors' old jackets, had risen into a duty both of difficulty and importance. It may be necessary to inform those who are unacquainted with the habits of seamen, that they are so accustomed, in ships of war, to be directed in the care of themselves by their officers, that they lose the very idea of foresight, and contract the thoughtlessness of infants. Had these people been left to their own discretion alone, the whole crew would have been very thinly clad, before the

are buried by the side of the chief was interred, had been killed in the ring of red cloth round it, under a circumstantial and the whole group of the to relate the transactions, our second Expedition to Karcatka, and on our return, and the Cape of Good Hope, to August 1780. th of April, at which time fine weather we met with had been idly spent. The employment in repairing the deck had been so much delayed to cut forty fathoms from other stores, which from the sides of the ship, were had now become a troublesome time past, even the old jackets, had risen and importance. It may who are unacquainted with they are so accustomed, in the care of themselves at the very idea of foresight, less of infants. Had these discretion alone, the whole thinly clad, before the voyage

voyage had been half finished. It was natural to expect, that their experience, during the voyage to the N. last year, would have made them sensible of the necessity of paying some attention to these matters; but if such reflections ever occurred to them, the impression was so transient, that, upon returning to the tropical climates, their fur jackets, and the rest of their clothes, adapted to a cold country, were kicked about the decks as things of no value; though it was known in both ships, that we were to make another voyage towards the pole. They were, of course, picked up by the officers; and, being put into casks, restored about this time to the owners. In the afternoon of Wednesday, the 7th, we observed some of the sheathing floating by the ship; and, on examination, found that 12 or 14 feet had been washed off from under the larboard-bow, where the leak was supposed to have been; which, ever since leaving the Sandwich Islands, had kept our people almost constantly at the pumps, making 12 inches water in an hour; but, as we had always been able to keep it under with the hand-pumps, it gave us no great uneasiness, till Tuesday, the 13th, when, about six o'clock, P. M. we were greatly alarmed by a sudden inundation, that deluged the whole space between decks. The water which had lodged in the coal-hole, not finding a sufficient vent into the well, had forced up the platforms over it, and in a moment set every thing afloat. Our situation was now exceedingly distressing; nor did we perceive immediately any means of relief. At last we thought of cutting a hole through the bulk-head that separated the coal-hole from the fore-hold, and, by that means, to make a passage for the body of water into the well. As soon as a passage was made, the greatest part of the water emptied itself into the well, and enabled us to get out the rest in buckets: but the leak was now so much increased, that we were obliged to keep one half of our people pumping and bailing constantly, till the noon of Thursday, the 15th. Our men bore, with great cheerfulness, this excessive fatigue, which was much increased by their having no dry place to sleep in; on which account they had their full allowance of grog. On Thursday, the 22nd, the cold was exceedingly severe; and the ropes were so frozen, that it was with difficulty they could be forced through the blocks. On Friday, the 23d, in latitude 52 deg. 9 min. longitude 160 deg. 7 min. we saw mountains covered with snow, and a high conical rock, distant about four leagues; and soon after this imperfect view we were enveloped in a thick fog. According to our maps, we were now but 8 leagues from the entrance of Awatka Bay; therefore when the weather cleared up, we stood in to take a nearer survey of the country. A most dismal and dreary prospect presented itself. The coast is straight, and uniform, without bays or inlets. From the shore, the ground rises in moderate hills, and behind them are ranges of mountains, whose summits penetrate the clouds. The whole was covered with snow, except the sides of some cliffs which rose perpendicularly from the sea. The wind blew strong from the N. E. with hazy weather and sleet, from the 24th to the 28th. The ship resembled a complete mass of ice; the shores being so incrufted with it, as to double their dimensions in circumference: in short, the experience of the oldest seaman among us had never met with such continued showers of sleet, and that extreme cold which we had now to encounter. Soon after our departure from Karakakooa Bay, Captain Clerke was taken ill, and during this run, the sea was in general so rough, and the Resolution so leaky, that the sail-makers had no place to repair the sails in, except the Captain's apartments, which in his declining state of health, was a serious inconvenience to him. At this time the inclemency of the weather, the difficulty of working our ships, and the incessant duty required at the pumps, rendered the service intolerable to the crew, some of whom were much frost bitten, and others were confined with colds.

Sunday, the 25th, we were favoured with a transient glance of the entrance of Awatka Bay; but, in the

present state of the weather, we could not presume to venture into it. For this reason we again stood off, when we lost sight of the Discovery; but this gave us little concern, being now so near the place of rendezvous. Wednesday, the 28th, in the morning, the weather cleared up, and we had a fine day, when our men were employed in taking the ice from the rigging, sails, &c. that in case of a thaw, which was now expected, it might not fall on our heads. At noon, in latitude 52 deg. 44 min. longitude 159 deg. the entrance of Awatka Bay, bore N. W. The mouth of it opens in the direction of N. N. W. On the S. side, the land is moderately high, rising to the northward into a bluff-head. Three remarkable rocks lie in the channel between them, not far from the N. E. side, and, on the opposite side, a single rock of considerable size. At three o'clock, P. M. we stood into the bay, with a fair wind from the southward, having from 22 to 7 fathoms soundings. There is a look-out house on the north-head, used as a light-house, when any of the Russian ships are expected upon the coast. It had a flag-staff, but we could not perceive any person there. Having passed the mouth of the bay, which extends about four miles in length, a circular basin presented itself of about 25 miles in circumference; in this we anchored about four o'clock; fearing to run foul of a shoal mentioned by Muller to lie in the channel. Great quantities of loose ice drifted with the tide in the middle of the bay, but the shores were blocked up with it. Plenty of wild fowl, of various kinds, were seen; also large flights of Greenland pigeons, together with ravens and eagles. We examined every corner of the bay, with our glasses, in order to discern the town of St. Peter and St. Paul, which, from the accounts we had received at Oonalashka, we supposed to be a place of strength and consequence. At length we discovered, to the N. E. some miserable log-houses, and a few conical huts, amounting, in the whole, to about 30, which, from their situation, notwithstanding all the respect we wished to entertain for a Russian Ostrog, or Town, we concluded to be Petropaulofka. In justice, however, to the hospitable treatment we found here, it may not be amiss to anticipate the reader's curiosity, by assuring him that our disappointment proved, in the end, a matter of entertainment to us. In this wretched extremity of the earth, beyond conception barbarous and inhospitable, out of the reach of civilization, bound and barricaded with ice, and covered with summer snow, we experienced the tenderest feelings of humanity, joined to a nobleness of mind, and elevation of sentiment, which would have done honour to any clime and nation.

On Sunday the 29th, in the morning, at day-light, Captain King was sent with the boats to examine the bay, and to present the letters to the Russian Commander, which he had brought from Oonalashka. Having proceeded as far as we were able with the boats, we got upon the ice, which extended near half a mile from the shore. The inhabitants had not yet seen either the ship, or the boats; for even after we had got upon the ice, we could not perceive any signs of a living creature in the town. We sunk at every step almost knee deep in the snow, and though we found tolerable footing at the bottom, yet the weak parts of the ice not being discoverable, we were constantly exposed to the danger of breaking through it. This accident, at last, actually happened to Captain King; who stepping on quickly over a suspicious spot, in order to press with less weight upon it, he came upon a second before he could stop himself, which broke under him, and in he fell. Fortunately he rose clear of the ice; and a man who was a little way behind with a boat hook, throwing it out, the Captain, by that means, was enabled to get upon firm ice again. The nearer we approached the shore, we found the ice still more broken. The fight of a sledge advancing towards us, however, afforded some comfort. But instead of coming to our relief, the driver stooped short, and called out to us. Captain King immediately held up Ismyloff's letters; in consequence of which, the man turned about, and drove full speed back

back again, followed with the execrations of some of our party. Unable to draw any conclusion from this unaccountable behaviour, we still proceeded towards the Ostrog, though with the greatest circumspection; and, when at the distance of about a quarter of a mile from it, we observed a body of armed men advancing to meet us. To avoid giving them any alarm, and to preserve the most peaceable appearance, the Captain, and Mr. Webber, marched in front, and the men, who had boat-hooks in their hands, were stationed in the rear. The armed party consisted of about 30 soldiers, headed by a person with a cane in his hand. Within a few paces of us he halted, and drew up his men in martial order. Captain King presented Ismyloff's letters to him, but in vain endeavoured to make him understand that we were English, and had brought these dispatches from Oonalashka. After an attentive examination of our persons, he conducted us towards the village in solemn silence, halting frequently his men, and ordering them to perform different parts of their manual exercise; with a view, as we supposed, to convince us, that if we should presume to offer any violence, we should have to deal with those who knew how to defend themselves. During the whole of this time, the Captain was in his wet clothes, shivering with cold; yet he could not avoid being diverted with this military parade, though it was attended by an unseasonable delay. Arriving, at length, at the habitation of the commanding officer of the party, we were ushered in; and, after giving orders to the military without doors, our host appeared, accompanied by the secretary of the port. One of the letters from Ismyloff was now opened, and the other sent express to Bolcheretsk, a town on the west side of Kamtschatka, and the place of residence of the Russian Commander of this province.

It appeared to us extraordinary, that the natives had not seen the Resolution the preceding day when we cast anchor, nor this morning, till our boats approached the ice. The first sight of the ship, we understood, had struck them with a considerable panic. The garrison was put instantly under arms; two field-pieces were placed before the Commander's house; and powder, shot, and lighted matches, were all in readiness. The officer who had conducted us to his dwelling, was a serjeant, and also the Commander of the Ostrog. After he had recovered from the alarm which our arrival had produced, the kindness and hospitality of his behaviour was astonishing. His house, indeed, was intolerably hot, but remarkably neat and clean. After this Capt. King had his clothes changed, by putting on a complete suit of the serjeant's, at his earnest request, which was doubtless the best he could procure; and, considering our visit was unexpected, was ingeniously conducted. To have made soup and bouillie would have required some time; instead therefore of this, we had some cold beef sliced, with boiling water poured over it. The next course was a large roasted bird, the taste of which was most delicious, though we were unacquainted with its species. Having eaten a part of this, it was removed, and fish was served up, dressed in two different ways. Soon after which, the remainder of the bird appeared again in savoury and sweet pates. Our liquor was what the Russians distinguish by the name of quass, and was the most indifferent part of our entertainment. The serjeant's wife served up several of the dishes, and was not permitted to sit down at table with us. Our repast being finished, during which our conversation was limited to a few bows, and other personal tokens of mutual respect, we strove to explain to our host the occasion of our visit to this port. Probably, Ismyloff's letters we had delivered made him readily comprehend our meaning; but as there was not a person in the place, who understood any other languages than those of Russia or Kamtschatka, we found it extremely difficult to comprehend what he endeavoured to communicate to us. Having spent much time in our attempts to understand each other, the sum of the intelligence we had received appeared to be, that though we could not be supplied with provisions or stores at this

place, yet those articles were to be procured in great plenty at Bolcheretsk. That he doubted not, but the Commander would readily supply us with what we wanted; but that, till he received his orders, neither he, nor any of the natives could even venture on board the vessel. It being now time for us to depart, and as Mr. King's clothes were not yet dry, he had again recourse to the serjeant's benevolence, for his permission to carry those on board which he had borrowed of him. This request was cheerfully complied with, and a sledge, with five dogs and a driver, was instantly provided for each of our party. This mode of conveyance afforded high entertainment for the sailors; and they were delighted still more, when they found that the two boat-hooks had a sledge appropriated solely for their conveyance. These sledges are so light, and so admirably well constructed for the purposes intended, that they went safely and expeditiously over the ice, and over parts of it which we should have found extremely difficult to have passed on foot. On our return, the boats were towing the Resolution towards the village; and, at seven, we moored close to the ice; the entrance of the Bay bearing S. by E. and the Ostrog N. distant one mile and a half. On Friday, the 30th, the casks and cables were taken to the quarter-deck, to lighten the vessel forward, and the carpenters proceeded to stop the leak which had occasioned us so much trouble. In the middle of the day we had such warm weather, that the ice began to break away very fast, and almost choked up the entrance of the bay. Several of our officers waited upon the serjeant, who received them with great civility; and Captain Clerke sent him a present of two bottles of rum, thinking he could not send him any thing more acceptable. In return, he received twenty fine trouts, and some excellent fowls of the grouse kind. Though the Bay swarmed with ducks and Greenland pigeons, our sportsmen had no success; for, being exceedingly shy, they could not kill any.

On Saturday, the 1st of May, in the morning, we saw our consort, the Discovery, standing in the Bay; a boat was immediately dispatched to her assistance, and she was moored in the afternoon close by the Resolution. On the 3d, in the morning, two sledges having been observed to drive into the village, Mr. King was ordered on shore, to learn whether an answer was arrived from the Commander of Kamtschatka. The distance from Bolcheretsk to St. Peter and St. Paul's is 135 English miles. The dispatches were sent off in a sledge, drawn by dogs, on the 29th, at noon, and returned with an answer early this morning; so that they performed a journey of 270 miles in little more than three days and a half. For the present, the return of the Commander's answer was concealed from us. While Mr. King was on shore, his boat, and another belonging to the Discovery, were bound fast to the ice. In this situation, the Discovery's launch was sent to their assistance, which soon partook of the same fate: but on the 4th, the floating ice was drifted away, by the wind changing, and the boats were set at liberty, without sustaining the smallest damage. At 10 o'clock A. M. several sledges having arrived at the edge of the ice, a boat was sent from the ship to conduct those who were in them on board. One of them proved to be a Russian merchant from Bolcheretsk, whose name was Fedositch; and the other a German, named Port, with dispatches from Major Behm, Commander of Kamtschatka, to Captain Clerke. Arriving at the edge of the ice, and seeing distinctly the magnitude of the ships, within 200 yards of them, they were exceedingly alarmed; and before they ventured to embark, stipulated that two of our boat's crew should remain on shore, as hostages for their safety. It afterwards appeared, for what reasons we could not conceive, that Ismyloff, in his letter to the Commander, had mentioned our ships as two small trading vessels; and that the serjeant, having seen them at a distance only, had not rectified the mistake. When they had arrived on board, we perceived, by their timid behaviour, that they entertained some very extraordinary apprehensions. However, an uncommon degree of satisfaction was visible

able in their countenances, when the German found a person among us, with whom he could enter into conversation. Mr. Webber spoke that language fluently, and convinced them, though not without difficulty, that we were Englishmen and friends. Mr. Port was introduced to Captain Clerke, to whom he delivered the Commander's letter. It was written in the German language, and merely complimentary, giving him and his officers an invitation to Bolcheretsk. Mr. Port, at the same time, acquainted him, that the Major had conceived a very wrong idea of the size of the ships, and of the service they were engaged in; Ifmy-Joff, in his letter, having represented them as two small packet-boats, and cautioned him to be on his guard, insinuating, that he suspected us to be no better than pirates. In consequence of this letter, he said, there had been various conjectures formed about us at Bolcheretsk. We were much diverted with the fears and apprehensions of these people; and especially with an account given by Mr. Port, of the serjeant's extreme caution the day before. On seeing Mr. King and some other gentlemen come on shore he concealed him and the Russian merchant in the kitchen, to give them an opportunity of listening to our conversation with each other, in order to discover whether we were Englishmen or not.

Being now enabled, by the aid of an interpreter, to converse with the Russians, our first enquiries were directed to the means of procuring a supply of fresh provisions and naval stores; particularly the latter, for the want of which we had been in great distress. On enquiry, it appeared, that the whole flock of live cattle, which the country about the Bay could furnish, amounted only to two heifers; and these the serjeant very readily promised to secure for us. Our next applications were made to the merchant, whose terms for serving us were so exorbitant that Captain Clerke thought it expedient to send an express to the Commander, to learn the price of stores at Bolcheretsk. This determination being communicated to Mr. Port, he dispatched a messenger to the Commander at Bolcheretsk, to acquaint him with our intentions, and to remove the suspicions that had been entertained respecting the purposes of our voyage. For the above service Mr. King was fixed upon, and ordered to prepare for setting out the next day, together with Mr. Webber, who was to accompany him as interpreter. That day, and the next, however, the weather proved too stormy for beginning a journey through so desolate and wild a country: but on Friday, the 7th of May, the weather became more favourable, and we set out in the ship's boats, early in the morning, in order to reach the entrance of the Awatka at high-water, on account of the shoals at the mouth of that river. The country boats were to meet us here, to conduct us up the stream. Captain Gore was also added to our party, and we were likewise accompanied by Mr. Port and the Russian merchant, with two Cossacks, having been previously furnished with warm furred cloathing; a very necessary precaution, as it began to snow briskly immediately after our setting out. About eight o'clock we were stopped by shoal water, within a mile of the mouth of the river; when some Kamtschadales took us and our baggage, in some small canoes, and conveyed us over a bank of sand, which the rapidity of the river had thrown up, and which, we were informed, was continually shifting. Having passed this shoal, the water again deepened, and we were furnished with a commodious boat, resembling a Norway yawl, to convey us up the river, together with canoes for the reception of our baggages. The breadth of the mouth of Awatka is about a quarter of a mile, but it gradually narrowed as we advanced. Having proceeded a few miles, we passed several branches, many of which, we were told, emptied themselves into other parts of the Bay; and that some of those on the left ran into the Paratounca river. For the first 10 miles, the general direction of the river from the Bay, is to the N; and afterwards it turns to the westward. Except this bend, it chiefly preserves a straight course; and flows through a low flat country, to

the distance of 30 miles from the sea, which is subject to frequent inundations. Six men were employed in pushing us on with long poles, three of them being at each end of the boat; and proceeded against the stream, at the rate of about three miles an hour. Our conductors endured this severe labour for 10 hours; stopping only once, and that for a short space of time, to take a little refreshment. Having been informed at our first setting out, that we could easily reach Karatchin that night, we were greatly disappointed to find ourselves 15 miles from that place at sun-set. This was attributed to the delay in passing the shoals, both at the entrance of the river, and in many other places. Our men being exceedingly fatigued, and as the difficulty of navigating the river would have increased by the darkness of the night, we declined all thoughts of proceeding on our journey that evening: we therefore fixed upon a place that was tolerably well sheltered, and, clearing it of the snow, erected a small marquee, which we had providentially taken with us; and, with the assistance of a good fire, and some excellent punch, passed the night agreeably. Our principal inconvenience was, the being obliged to keep at a considerable distance from the fire; for as soon as it was lighted, it thawed every part round it into an absolute puddle. The Kamtschadales were extremely alert and expeditious in erecting our marquee, and cooking our provisions; but we were much surprized at finding they had brought with them their utensils for making tea, considering it as a most intolerable hardship if they cannot, two or three times a day, regale themselves with drinking tea. When day-light appeared, we proceeded on our journey, and, before we had made much progress, were met by the Toion; or chief of Karatchin, who being apprized of our coming, had provided canoes that were better accommodated for navigating the higher parts of the river. A commodious vessel, (made by lashing two canoes together) furnished with fur cloaks, and lined with bear-skins, was also procured for us. We now proceeded rapidly, the Toion's people being remarkably expert in this kind of business. At tea we arrived at the Ostrog, named Karatchin, and the seat of his command, where we were received by the Kamtschadale men and women, and some Russian servants belonging to the merchant, Fedofitch. They were all attired in their best habiliments; those of the women being gay and pleasing, and consisting of a loose robe of white nankeen, gathered close round the neck, and fastened with a silk collar. A short jacket, without sleeves, was worn over this, consisting of different coloured nankeens; and they had petticoats made of a slight Chinese silk. Their shifts, which were also made of silk, had sleeves extending to the wrists; and their heads were bound with coloured silk handkerchiefs, which entirely concealed the hair of the married women; but the unmarried ones placed the handkerchief under the hair, permitting it to flow loosely down the shoulders.

The Ostrog of Karatchin is pleasantly situated on the side of the river, and composed of three log-houses, nineteen balagans, or summer habitations, and three jourts, which are houses under ground. The Toion, to whose dwelling we were then conducted, was a plain decent man, sprung from a Russian mother, and a Kamtschadale father. His house, like all others in this country, consisted of only two apartments. All the furniture in the outer room, was a long narrow table, with a bench round it, and the inner apartment, which was the kitchen, was also very scantily furnished. But, the hearty welcome, and kind attention of our host, amply compensated for the poverty of his habitation. His wife, an excellent cook, served us with various sorts of fish and game, and different kinds of heath-berries, which had been preserved since the last year. Whilst we were dining in this miserable hut, the guests of absolute strangers; and at the extremity of the habitable globe, a solitary half-worn pewter spoon attracted our attention. Its form was familiar to us, and the word London was stamped upon the back of it. It is impossible to express the anxious hopes, and tender re-

membrances, this circumstance excited in us. Those who have been long absent from their native country, will readily conceive what inexpressible pleasure such trifling incidents can give.

We had now quitted the river, and the next part of our journey was to be performed on sledges; but the thaw had been so great in the day-time, as not to permit us to set out, till the snow was become hard and firm by the coldness of the evening. This furnished us with an opportunity of walking about the village, which was the only place in this country, that we had seen free from snow. It was situated on a flat, of about a mile and an half in circuit. The leaves of the trees were just budding, and the verdure was strongly contrasted with the surrounding hills, which remained covered with snow. The soil appearing to be capable of producing common vegetables, we were surprized to find that not a spot of it was cultivated. Neither were the inhabitants possessed of cattle of any sort. In short, their situation, during the winter months, must be wretched beyond conception. They were now removing from their jouts to their balagans, which gave us an opportunity of observing both these sorts of habitations. The people invited us, very civilly, into their houses; cheerfulness and content were visible in every countenance, to which the approaching change of season might perhaps contribute. On returning to our host's, supper was prepared for us, consisting of the same articles which composed our former repast. When we had finished our meal, we entertained the Toion and his wife with punch made of some of our spirits; and Captain Gore, with his wonted generosity, made them some valuable presents, after which, they retired to the kitchen, leaving us in the other room; on the benches of which we spread our bear-skins, and sought a little repose; having first settled with our conductors, to proceed on our journey, when the ground was judged to be in a suitable condition. The melancholy howlings of the dogs awakened us about nine the same evening. During the whole time our baggage was lashing upon the sledges, their horrid noise continued; but, when they were yoked, and prepared for travelling, a cheerful yelping succeeded, which ceased the instant they marched off. We shall here give our readers an accurate description of a sledge brought over by Captain King, and late in the possession of Sir Ashton Lever. The length of the body is about four feet and an half, and the breadth one foot. It is made in the form of a crescent, of light tough wood, fastened together with wicker work; and, among the principal people, is elegantly stained with red and blue; the seat being covered with furs or bear-skins. It has four legs, about two feet in height, resting on two long flat pieces of wood, of the breadth of five or six inches, extending a foot beyond the body of the sledge, at each end. These turn up before, somewhat like a skait, and are shod with the bone of some sea-animal. The carriage is ornamented at the fore part with tassels of coloured cloth, and leather thongs. It has a cross bar, to which the harness is joined; and links of iron, or small bells, are hanging to it, which, by the jingling, is supposed to encourage the dogs. They seldom carry more than one person at a time, who sits aside, with his feet on the lower part of the sledge, having his baggage and provision, in a bundle behind him. The usual number of dogs employed in drawing this carriage is five; four of them yoked two and two, and the other acting as leader. The reins, being fastened to the collar, instead of the head, have no great command; and are therefore usually hung upon the sledge; the driver depending principally on their obedience to his voice. Great care and attention are consequently used in training up the leader, which frequently becomes very valuable on account of his steadiness and docility; the sum of forty roubles (or ten pounds) being no unusual price for one of them. The rider has also a crooked stick, answering the purpose both of whip and reins; with which, by striking in the snow, he can regulate the speed of the dogs, or even stop them at his pleasure.

When they are inattentive to their duty, he often chastises them by throwing it at them. The dexterity of the riders, in picking this stick up again, is very remarkable, and is the most difficult manœuvre in the exercise of their profession; nor is it, indeed, surprizing that they should be skilful in a practice in which they are so materially interested; for they assured us, that if a driver should happen to lose his stick, the dogs immediately discover it; and, unless their leader is both steady and resolute, they will instantly set off full speed, and never stop till their strength is exhausted; or till the carriage is overturned and dashed to pieces, or hurried down a precipice, when all are buried in the snow. The accounts of the speed of these animals, and of the hardships and fatigues they suffer, would have appeared incredible, had they not been supported by the greatest authority. We ourselves were witnesses of the extraordinary expedition with which the messenger returned, who had been dispatched to Bolcheretik with the news of our arrival at St. Peter and St. Paul's, though the snow was exceedingly soft. The Governor of Kamtschatka assured us, that this journey was usually performed in two days and an half, and that he had once received an express from that harbour in 23 hours. Throughout the winter, the dogs are fed on the offals of dried and stinking fish; and, even this miserable food is withheld from them, a day before they set out on a journey, and they are not permitted to eat a morsel of any thing till they arrive at the end of it. They are frequently kept fasting for two entire days, in which time they will perform a journey of great extent. The shape of these dogs resembles that of the Pomeranian breed, but they are considerably larger.

As we did not chuse to rely upon our own skill, we had each of us a man to conduct the sledge, which, in the condition the roads then were, proved a very laborious business: for, as the thaw had been prevalent in the vallies, through which was our regular road, we were obliged to travel along the sides of the hills; our guides being under the necessity of supporting the sledges, on the lower sides, with their shoulders, for many miles together. Mr. King was attended by a good-natured Cossack, who was so imperfect in his business, that he was continually overturned, which afforded entertainment to his companions. The party consisted of ten sledges in the whole. That which conducted Captain Gore, was formed of two lashed together, and was plentifully furnished with furs and bear-skins. It was drawn by ten dogs, yoked four abreast; and those which were laden with heavy baggage, were drawn by the same number. We had not proceeded more than four miles on our journey, when it began to rain, which, together with the darkness of the night, threw us into some confusion. It was, after some little consultation, agreed, that we should continue where we were, till day-light; we therefore secured our sledges, wrapped ourselves up in furs, and waited patiently for the morning. At three o'clock we were summoned to proceed; our guides expressing their apprehensions, that if we waited any longer, the thaw would perhaps stop us, and prevent our advancing or returning. Though we had many difficulties to encounter, owing principally to the bad condition of the road, we got safe to an ofstrog about two in the afternoon. It is called Natchekin, and is situated on a small stream, which falls into the Bolchoireka, at some distance below the town. It is 25 miles from Karatchin; which, by their account, we could have compassed in four hours, had the frost continued; but the snow was so soft that the poor animals sunk up to their bellies at almost every step; and it was indeed surprizing that they should be able to support themselves under so fatiguing a journey. This inconsiderable ofstrog consists of one log-house, the residence of the Toion, one jout, and five balagans. We were received here with the same civility and hospitality as at Karatchin; and, in the afternoon, were conducted to a remarkable hot spring, at a small distance from this village. Before we came very near it, we saw a rising steam from it, as from a boiling

boiling cauldron; and, when we approached it, we perceived a strong sulphureous effluvia. A basin of about three feet in diameter, is formed by the main spring; besides which, there are several lesser springs, of equal heat, in the adjacent ground; by which means the whole spot, consisting of about an acre, was so very hot that we could not remain two minutes in the same place. The water issuing from these springs, supplies a small bathing pond, and afterwards a little rivulet, which conducts it into the river, at the distance of about 150 yards. Great cures, they informed us, had been effected by this bath, in rheumatism, scorbutic ulcers, swelled and contracted joints, and many other disorders. Where these springs flow, the ground is on a gentle ascent, having a green hill of a moderate size behind it. Some plants seemed to thrive here with great luxuriance, among which we observed the wild garlick.

Monday, the 10th, in the morning, we embarked on the Bolchoireeka; and, going with the stream, expected to arrive at our journey's end the following day. Though Bolchoireeka is 80 miles from Natchekin, we were informed, that, in the summer, when the melting of snow on the mountains has rendered the river full and rapid, the canoes have often gone there in a single day; but now they told us we should be much longer, the ice having broken up only three days before our arrival, and our boat being the first boat that had attempted to pass. There was but too much truth in this intelligence; for we were greatly impeded by the shallows; and, though the stream was rapid in many places, we frequently had ripplings and shoals, and were under the necessity of hauling the boats over them. On each side of the river, the country was romantic, but not diversified; the course of it being between craggy mountains, of a most dreary and barren aspect; with nothing to vary the scene, except now and then the sight of a bear, or a flock of wild-fowl. This, and the following night, we slept under our marquise, on the banks of the river, and suffered greatly from the severity of the weather.

Wednesday the 12th, at day-light, we had passed the mountains, and were proceeding through a low extensive plain, on which were a number of shrubby trees. At nine in the morning we reached an ostrog, called Oparchin, of about the same magnitude as Karatchin, and supposed to be 50 miles from Natchekin. A serjeant and four Russian soldiers had been here two days, waiting for our arrival; who instantly dispatched a light boat to Bolchoireeka to give intelligence of our approach. A magnificent canoe, plentifully furnished with skins and furs, was prepared for our reception, and we were very commodiously equipped; but our fellow-travellers were excluded. It gave us some concern to be separated from our old companion Mr. Port, who daily grew more shy and distant, as we drew nearer to the completion of our journey. He acknowledged, indeed, before we set out, that he was not entitled to the respect we had shewn him; but, finding him discreet, and not presuming, we had insisted on his faring as we did, throughout the journey. We performed the remainder of our passage, with the utmost ease and expedition; for as we descended, the river grew more rapid, and had very few obstructions. On our approaching Kamtschatka, we judged, from an appearance of great stir and bustle, that our reception was to be in form. This circumstance was disagreeable to us, as decent cloathing had long been scarce among us; and our travelling habits formed a strange assemblage of the modes of India, Europe, and Kamtschatka. To make a parade through the metropolis in this motley trim, we thought would appear ridiculous; and, as we observed a crowd of people collected on the banks of the river, and were informed that the commander would receive us at the water-side, we stopped at the house of a soldier, about a quarter of a mile before we came to the town. Here we dispatched Mr. Port with a message to his excellency, acquainting him, that, as soon as we had put off our travelling dresses, we would attend him at his own house to pay our respects to him; and entreated him not to think of waiting to conduct us. He persisted, however, in his resolution of paying us

this compliment, and we immediately proceeded to join him at the entrance of the capital. We were all remarkably awkward and defective in making our first salutations; not having been accustomed to bowing and scraping, for at least two years and an half. The commander received us in a most engaging manner; but we had the mortification to discover, that he had almost wholly forgot the French language; so that only Mr. Webber had the satisfaction of conversing with him, as he spoke the German, which was his native tongue. Major Behm was accompanied by Captain Shmaleff, the next in command, and another officer; the whole body of merchants attended also. We were conducted to the commander's house where we were politely and respectfully received by his lady, who had prepared tea and other refreshments for us. The first compliments being over, Captain Gore desired Mr. Webber to acquaint the Major, that we were distressed for want of naval stores, fresh provisions, flour, and other necessaries; and that we were convinced we could not receive much assistance from him, in the country about Awatska Bay, from what we had already seen and heard; that the impossibility of conveying heavy stores over the peninsula, at that season, we were but too sensible of, from the difficulties we had encountered in our journey; and that we could not delay the prosecution of our voyage, to wait for any material change. Here the Major interrupted Mr. Webber, by observing, that we knew not what they were capable of doing; that he should not bestow a thought upon the difficulties of supplying our wants: he only wished to know what articles we stood in need of, and the time he could be allowed for procuring them. After expressing our acknowledgments for his obliging condiscension, we presented him an account of the naval stores, cattle, and flour, we were directed to purchase; and informed him, that we intended to prosecute our voyage about the 5th of June. After this, the conversation became more general, and it might naturally be supposed, that we were anxious to obtain some information respecting our native country. Having been three years absent, we entertained the most flattering expectations of receiving some interesting intelligence from Major Behm: but we were greatly disappointed, when he assured us, that he could not communicate any intelligence of a much later date than that of our quitting England. The commander, supposing we might be fatigued, and desirous of repose, begged leave to conduct us to our lodgings, at about seven o'clock. It was useless to protest against a compliment, to which we had no other title than that of being strangers. That alone, with this generous Livonian, was sufficient to counterbalance every other consideration. In going along, we passed two guard-houses, where the men were under arms, in compliment to Captain Gore, and were conducted to a neat decent house, which the Major had appointed for our residence, while we continued at Kamtschatka. We had two sentinels posted at our door, and a serjeant's guard in an adjoining house. Having disposed of us in our apartments, the Major took his leave, promising to visit us the next day. We were now at leisure to discover the conveniences which he had amply provided for us. Our fellow traveller, Mr. Port, and a soldier, of a rank between that of a serjeant and a corporal, (called a pulproperfack) were fixed upon to be our male domestics. We had also a housekeeper, and a cook, who were ordered to obey Mr. Port's directions in dressing us a supper, after the English mode of cookery. In the course of the evening, we were favoured with a number of civil messages, from the principal inhabitants of the town, politely observing, that their attending to pay their respects to us at that time, would add to our fatigues, but they would do themselves that honour the next morning. Such attention and politeness in so uncultivated and desolate a country, formed a contrast highly in favour of its inhabitants; and, in addition to their civility, at sun-set, the serjeant brought the report of his guard to Captain Gore. In the morning of the 13th, compliments were sent us by the Major, Captain Shmaleff, and the most respectable

spectable people of the town, from all whom we were honoured with visits soon after. The two former having, after we had retired to rest, enquired of Mr. Port what articles we stood in the greatest need of on board the ships; they insisted on our sharing with their garrison, in the small stock of provisions they had then remaining; lamenting, at the same time, that our arrival should happen to be in that season of the year, when scarcity reigned universally among them; the sloops from Okotsk not being yet arrived with their annual supply. We thankfully accepted the liberal offer of these hospitable strangers; on condition, however, that we should be made acquainted with the price of the articles we received from them, that Captain Clerke might draw upon the Victualling Office, in London, for the amount. This was refused in the most positive terms; and, though repeatedly urged, the Major always stopped us short, by saying, that his mistress would be highly gratified at his rendering every assistance in his power to the English, who are her good friends and allies; and that it would give her a peculiar satisfaction to find, that, in such remote regions, her dominions had afforded any relief to vessels engaged in such important services. He added, that he could not, therefore, act so contrary to the principles of his Emperors, as to think of receiving any bills; but, if we insisted on it, we might give him a bare certificate of the articles he might supply us with, which he would transmit to the court of Russia, as evidence of having performed his duty. All farther acknowledgments, continued he, must be submitted to the two courts; but you must excuse me from acceding to your proposal. This matter being adjusted, he requested to be informed respecting our private wants, saying he should consider it as offering him an affront, if we applied to any of the merchants, or had dealings with any other person except himself.

Not having it in our power to make an adequate return for such singular generosity, he had only our thanks and admiration. At this moment, Mr. King recollected, that Captain Clerke had sent by him a set of the engravings to Captain Cook's second voyage, desiring him to present it, in his name, to the commander. Nothing could have been more acceptable to him than this present, the Major being an enthusiast in all matters relative to discoveries. Captain Clerke had also given Mr. King a discretionary power, of permitting the commander to see a chart of the discoveries made in the present voyage; and, judging from his situation and disposition of mind, that he would be highly gratified by such a communication; though, from motives of delicacy, he had only asked a few general questions on the subject, Mr. King reposed in him that confidence, which his whole conduct so justly merited. He felt this compliment as it was intended he should, and was struck at beholding, in one view, the whole of that coast on the side of Asia and America, which his countrymen had been so long employed in acquiring an imperfect knowledge of. Except this mark of confidence, and the set of copper-plates already mentioned, we had nothing with us deserving of his acceptance; for it was hardly worth noticing, that Mr. King prevailed on his son (who was quite a youth) to accept of a silver watch; and contributed to his little daughter's happiness, by presenting her with two pair of ear-rings, of French paste. He also gave Captain Shmaleff the thermometer which he had used on his journey, when he engaged to keep a register of the temperature of the air for one whole year, and to transmit it to Mr. Muller, with whom he was acquainted. This day we dined at the commander's, who, ever studious to gratify our curiosity, had prepared variety of dishes dressed after the Russian and Kamtschadale manner, besides a number of others in the English style. In the afternoon, we took a survey of the town, and the adjacent country. The situation of Bolcheretsk is in a low swampy plain, extending to the sea of Okotsk, being about 40 miles in length, and of a considerable breadth. It lies north of the Bolchoi-reaka, (or great river) and on a peninsula, which has been separated

from the continent by a large canal, under the directions of the present commander; which has added strength to it as a fortress, and rendered it much less subject to inundations. The depth of the river, below the town, is from six to eight feet, and the breadth about a quarter of a mile. At the distance of 22 miles, it empties itself into the sea of Okotsk, where it is capable of admitting pretty large vessels. No corn, of any kind, is cultivated in this part of the country; and the Major assured us, that his was the only garden that had been planted. In general, the earth was covered with snow; the parts which were free from it, were full of black turfy hillocks. We saw about 20 or 30 cows, and the commander had six good horses. These, and their dogs, are their only tame animals: being obliged to keep a great number of the latter, they can rear only such cattle as are a match for them in strength and size. For, during the whole of the summer season, the dogs are turned loose, to provide entirely for themselves; and are sometimes so ravenous, that they will even venture to attack the bullocks.

In Bolcheretsk the buildings are all in the same style; they consist of logs of wood, and are thatched. The Major's house is considerably larger than the rest, and has three capacious rooms, neatly papered; but the tale, which covered the windows, gave them a disagreeable and mean appearance. The town consists of low buildings, in rows of five or six habitations each, connected together by a passage extending the whole length of them; having the kitchen and store house on one side, and the dwelling apartments on the other. There are also barracks for the Russian soldiers and cosacks; a tolerable church; a court-room; and, at the end of the town, a number of Balagans. The number of the inhabitants is between five and six hundred. A handsome entertainment was given by the Major, in the evening, to which were invited all the respectable inhabitants of both sexes. The next day we made a private application to Fedositch, the merchant, in order to purchase some tobacco; the sailors having been without that favourite commodity for upwards of a year. This, however, like other similar transactions, came immediately to the knowledge of the commander; and, in a very short time after, we were surprized to find four bags of tobacco in our house, each containing upwards of 100 pounds; which the Major requested might be presented to our sailors, in his name, and that of the garrison under his command. By the same conveyance, we received 20 loaves of sugar, and as many pounds of tea, which they requested the officers to accept of; as they understood that we were almost destitute of those articles. A present was also sent by Madame Behm, for Captain Clerke, which consisted of honey, butter, figs, rice, and other articles; accompanied with her best wishes, that, in his infirm state, they might prove serviceable to him. We strenuously endeavoured to oppose this profusion of bounty, and were extremely anxious to refrain it; fully convinced that they were giving us almost the whole stock of their garrison. But the answer we received from the Major, on these occasions, generally was, That he had been in distress himself, and he was sensible that we must now be in that situation. The length of time, indeed, since we had touched at any known port, appeared to them almost incredible, and seemed to require the evidence of our maps, and other concurrent circumstances, to obtain their credit. Among the latter, we shall mention a curious fact, which Major Behm related to us this morning, and which he said he should not have known how to account for, but for our arrival. Among the people of the north of Asia, it is well known, that the Tichuski only have maintained their independence, and resisted all the efforts of the Russians to reduce them. The last attempt was in 1750, and, after variety of temporary advantages on each side, the Russian forces retreated, after having lost their commanding officer. The Russians afterwards removed their frontier fortresses, from the Anadyr to the Ingiga, a river which runs into the northern extremity of the sea of Okotsk, and gives its name to a gulph, west of that of Pen-

the canal, under the direction; which has added and rendered it much less the depth of the river, be- light feet, and the breadth the distance of 22 miles, of Okotk, where it is ca- ge vessels. No corn, of is part of the country; and is was the only garden that al, the earth was covered ere free from it, were full few about 20 or 30 cows, good horses. think. On the day of our arrival at Bolcheretsk, the Major had received dispatches from this fort, acquaint- ing him, that a party of the Tschutski had arrived there, with voluntary offers of friendship and a tribute. That, on asking the cause of so unexpected an alteration in their sentiments, they had acquainted his people, that two large Russian boats had visited them, towards the end of the preceding summer; that they had been shown the greatest kindness by the people who were in them, and had entered into a league of amity with them; and that, in consequence of this, they came to the Russian fort, in order to settle a treaty upon terms agreeable to both nations. This remarkable tale had given rise to much speculation, both at Ingiginsk and Bolcheretsk; and must have remained utterly unintel- ligible, had it not been elucidated by us. It was no small satisfaction to us, to have thus shewn the Rus- sians, even by accident, the best method of collecting tri- bute, and extending their dominions; in hopes that the good understanding, which this event has produced, may rescue a brave people from such powerful invaders.

This day being Friday, the 14th, we were engaged to dine with Captain Shmaleff, who, in order to vary our amusements, entertained us with an exhibition of dancing, in the Russian and Kamtschadale style. It is im- possible to convey an adequate idea of this uncouth ex- hibition. The figure of the Russian dance, resembled those of our hornpipes, and consisted of one, two, or four performers at a time. Their steps were exceed- ingly short and quick, their feet being raised but a very little way from the ground; their arms were hung down close to the sides, the body being kept, the whole time, erect and immovable, except when the performers passed each other, when the hand was suddenly raised with an awkward motion. But, if the Russian dance was unmeaning and ridiculous, the Kamtschadale was infinitely more so. The principal aim, in their per- formances, is to represent the clumsily gestures of the bear, which the inhabitants of this country have fre- quent opportunities of observing in various situations. To describe the awkward postures, exhibited on these occasions, would appear tedious and uninteresting. In general, however, the body was bowed, and the knees bent, whilst the arms were employed in imitating the motions of that awkward animal. Much time had been spent in our journey to Bolcheretsk, and being informed that our return might, perhaps, be more dif- ficult and tedious, we were obliged to acquaint the Major this evening, with our intention of departing the next day. We could not think of leaving our new ac- quaintance without regret; and were agreeably sur- prized, when the Major promised to accompany us, if we would stay but one day longer. He told us, that he had made up his dispatches, and resigned the com- mand of Kamtscharka to Captain Shmaleff; having made the necessary preparations for his departure to Okotk, which was shortly to take place; but that he should be happy in postponing his journey, and attend- ing us to St. Peter and St. Paul's, in order to be satis- fied, that nothing which could be done to serve us, should be omitted. For the articles which Mr. King had given to the Major's children, he received, the next morning, a most magnificent Kamtschadale dress, such as the principal Toions wear on the most solemn occa- sions. This habit, as we were informed by Fedotitch, must have cost, at least, 120 roubles. He also, at the same time, was presented with a handsome sable muff, as a present from his daughter.

Saturday, the 15th, we dined with the commander, who, willing to give us an opportunity of seeing as much as we could of the manners and customs of the country, invited all the principal inhabitants of the town, to his house this evening. The dresses of the women were splendid, after the Kamtschadale manner. Captain Shmaleff's lady, and the wives of the other officers of the garrison, were dressed in a pretty taste, partly in the Siberian, and partly in the European mode. Madame Behm, in particular, appeared in a grand European dress. The richness and variety of

No. 75.

the silks worn by the women, as well as the singularity of their dress, was very striking; and the whole had the air of some enchanted scene, in the midst of the most desert and dreary country in the universe. The entertainments of this night were dancing and singing. As we had fixed upon the next morning for our depart- ure, we retired early to our apartments, where three travelling dresses presented themselves to our view, made after the Kamtschadale mode, which had been provided for us by the commander. He came to us himself soon after, to see that proper care was taken in packing up our things. We had, indeed, no inconsiderable load of baggage; for, exclusive of his liberal presents, Cap- tain Shmaleff, and several other individuals, shewed us many instances of kindness and generosity. On the 16th, early in the morning, we were preparing for our departure, when we were invited to take our leave of Madame Behm, in our passage to the boats. Already impressed with sentiments of the warmest gratitude, for the benevolent and generous treatment we had re- ceived at Bolcheretsk, which were much heightened by the affecting scene which followed. On quitting our apartments, we saw all the soldiers and cosacks of the garrison drawn up on one side; and, on the other, were all the male inhabitants of the town, in their best cloathing; the whole body of the people joining in a melancholy song, which, we were informed, it was usual to sing on the departure of friends. Thus we marched till we ar- rived at the commander's house, preceded by the drums and music belonging to the garrison. Here we were received by Madame Behm, accompanied by several ladies, habited in long silk cloaks, lined with furs of various colours; forming a most splendid appearance. Having partook of some refreshment which had been provided for us, we proceeded to the water-side at- tended by the ladies, who joined with the rest of the people in the song; and, having taken leave of Ma- dame Behm, after assuring her that the sense of the hos- pitality of Bolcheretsk, would be indelible in our hearts, we were too much affected not to hasten into the boats. At putting off, we received three cheers, which we im- mediately returned; and, on doubling a point, where we last beheld our friendly entertainers, they still added to our feelings, by a farewell cheer! On our return, the stream was so exceedingly rapid, that, notwithstanding the utmost exertions of our conductors, we did not ar- rive at the first village, Opatchin, till the 17th in the evening, which did not exceed the rate of 20 miles a day. On the 19th, we reached Natchekin, and crossed the plain to Karatchin on the 20th. The road was in much better order than when we passed it before, as it froze smartly in the night of the 19th. We proceeded down the Awatka river on Friday, the 21st, and passed over the shoals, at the entrance of the bay, before it was dark. During the whole of our journey, we were highly pleased with the willingness and alacrity, with which the Toions and the Kamtschadales assisted us at the different ostrogs. On seeing the Major, joy ap- peared in every countenance; and they were much af- fected upon being informed that he would shortly leave them. A messenger had been dispatched from Bolche- retik to Captain Clerke, acquainting him with the na- ture of our reception; and that the Major intended to accompany us on our return; apprising him, at the same time, of the day he might expect us. We ob- served, with pleasure, as we approached the harbour, all our boats coming towards us. The men were all clean, and the officers as well arrayed as their ward- robes would then permit them to be. The Major was struck at the healthy appearance of our sailors, and was surprized to see that many of them had no other cover- ing than a shirt and trowsers, though it actually snowed at that very instant. Major Behm had expressed an in- clination to visit the ships before he landed; but, being informed that Captain Clerke was extremely ill, he thought it would be improper to disturb him at so late an hour; it being then after nine o'clock. Mr. King therefore attended him to the serjeant's house, and at- terwards went on board to communicate to Captain

7 R

Clerke

Clerke what had happened at Bolcheretsk. He was much concerned to find that, during his absence, that officer's health was considerably impaired, instead of growing better, as we flattered ourselves it might, from undisturbed repose in the harbour, and a milk and vegetable diet. The next morning, Mr. King conducted the Major to the ships; where he was received with every possible mark of distinction, and saluted with 13 guns. He was attended by the commander of a Russian galliot, two merchants from Bolcheretsk, a master of a sloop, and the priest of the village of Paratouca. Having visited the Captain, and taken a view of the two ships, he returned to dine on board the Resolution. . . . the course of the afternoon, the curiosities which we had collected were shewn him, and an assortment of each article presented to him by Captain Clerke. Here we cannot suppress an instance of great generosity and gratitude in our sailors; who, being informed of the handsome present which had been made them by the Major, voluntarily requested that their grog might be withheld, and their allowance of spirits presented to the garrison of Bolcheretsk; saying they knew brandy was extremely scarce in that country, the soldiers on shore having offered four roubles a bottle for it. We could not but admire this extraordinary sacrifice, knowing how much the sailors felt, when abridged or deprived of their grog. Indeed, they never had that article withheld from them but in warm weather, that they might enjoy a greater proportion when it was most necessary; but this generous proposal would deprive them of it, even in the inclement season we had naturally to expect in our northern expedition. The officers, however, would not permit them to suffer by their generosity, and substituted, in the room of the small quantity of brandy, which the Major consented to accept, an equal quantity of rum. A dozen or two of Cape wine for Madam Behm, and some other trifling presents which we were enabled to make, were accepted with great politeness. The tobacco was distributed the next morning, among the crews of both vessels; every man that chewed or smoked tobacco being allowed three pounds, and the others who did not, only one. We have already observed that the Major had resigned the command of Kamtschatka, and was speedily to repair to Peterburgh; and he now expressed his willingness to convey any dispatches we might chuse to commit to his care. Such an opportunity was not to be neglected; and Captain Clerke requested him to take the charge of some papers relative to our voyage, to the British Ambassador at the Russian court. At first, we intended to transmit only a concise journal of our proceedings; but, after mature consideration, Captain Clerke was of opinion, that the whole account of our discoveries might safely be committed to the care of a man, who had given the strongest proofs of probity and virtue. Considering also, that a very hazardous part of the voyage was still to be performed, he resolved to send, by him, the whole of Captain Cook's journal; together with his own, from the death of that commander, till our arrival at Kamtschatka; and also a chart of our discoveries. Mr. Bayly and Mr. King also determined to send an account of our proceedings to the board of longitude. From these precautions, had any accident befallen us, the Admiralty would have become possessed of the principal facts of our voyage. It was farther resolved, that a smaller packet should be dispatched from Okotik, which the Major supposed would reach Peterburgh by December; and that he expected to arrive there himself in February or March. The Major was entertained alternately in the two ships, as well as we were able, the three following days. On Thursday, the 25th, he departed, and was saluted with 13 guns; the sailors, at their own request, expressing their regard for him by three cheers. Mr. King and Mr. Webber attended him, the next morning, some few miles up the Awatska river, where the Russian priest and his family were waiting to bid a last adieu to their commander. When taking our leave of the Major, it is difficult to say, whether the worthy priest and his family or ourselves were

most affected. Though our acquaintance had been of short duration, his behaviour had inspired us with the highest esteem for him; and we could not part (perhaps for ever) with one, to whom we were under such infinite obligations, without indulging the most tender feelings. Exclusive of the stores, which might probably be carried to a public account, the value of the private presents be bestowed on us, must have amounted to upwards of 200 pounds. But, however extraordinary this generosity may appear, it was exceeded by his delicacy in conferring favours, and his ingenious endeavours to prevent our feeling the weight of obligations, which he knew we were unable to requite. In supporting a public character, and maintaining the honour of his sovereign, he is still more entitled to our admiration, as he was actuated by sentiments the most noble and enlarged. The service in which we were engaged, he told us, was for the general benefit of mankind; and entitled us to the offices of humanity, and the privileges of citizens, in whatever country we might be driven. That, by affording us such relief as was in his power, he was certain that he was acting agreeably to the wishes of his empress; and that he could not so entirely forget her character, or his own honour, as to barter for the performance of a duty. Among other things, he said, he made a particular point of setting a good example to the Kamtschadales, who were just emerging from a state of barbarism; that they considered the Russians as their patterns, in every respect; and that he hoped they would, in future, think it a duty incumbent on them to render strangers every assistance in their power, and believe it to be the universal practice of all polished and civilized nations. The Major having, so far as he was capable, relieved our present distresses, he was not unmindful of our future wants; and, imagining we should not be able to discover the passage we were in search of, and that we should return to Kamtschatka; he procured from Captain Clerke, the particulars of what flour and cordage he should want, promising to send them from Okotik, to wait our arrival. He also presented the Captain with a written paper, enjoining every Russian subject to assist us to the utmost of their abilities. Having thus given a narrative of the journey of our party to, and their return from Bolcheretsk, their reception there, and the departure of Major Behm, we shall now recount the transactions which passed at Petropaulowska during our absence.

On Friday, the 7th of May, not long after we had quitted the bay of Awatska, a great piece of ice drove against the Resolution, and brought home the small bower anchor; in consequence of which the other anchor was weighed, and the ship was moored again. The carpenters, who were occupied in stopping the leak, were under the necessity of taking off great part of the sheathing from the bows; and many of the trunnels were found to be so loose and rotten, that they were drawn out easily with the fingers. On Tuesday the 11th, heavy gales blew from the N. E. which obliged both vessels to strike their yards and top-masts; but the weather becoming more moderate in the afternoon, and the ice having drifted away as far as the mouth of the harbour of Petropaulowska, they warped close to the shore for the greater convenience of procuring wood and water, and again moored, as before: the mouth of the bay shut in by the most southerly point of Rakowina harbour, bearing S. and the town N. half W. at the distance of half a mile. On the 12th, a party was detached to cut wood, but made little progress in that service, on account of the snow, which still covered the ground. A convenient spot, ahead of the ships, was cleared, where there was a good run of water; and a tent being pitched for the cooper, the empty casks were landed, and the sail-makers sent ashore. On Saturday, the 15th, as the beach was then clear of ice, a party was sent to haul the seine, and caught a plentiful supply of fine flat-fish for the companies of both ships. From this time, indeed, till we quitted the harbour, we were even overpowered with the great quantities of fish which came in from every quarter. The Toions, both

of this town, and of Paratouca, a neighbouring village, had received orders from Major Behm to employ, in our service, all the Kamtschadales; so that it frequently happened, that we could not take into the ships the presents which were sent us. They generally consisted of herrings, trout, flat fish, and cod. The former, which were in their highest perfection, and of a delicious flavour, were in extreme plenty in this bay. The people of the Discovery, at one time, surrounded such an amazing quantity in their seine, that they were obliged to throw out a very considerable number, lest the net should be broken to pieces; and the cargo they landed was still so abundant, that, besides having a sufficient stock for immediate use, they filled as many casks as they could conveniently spare for salting; and, after sending on board the Resolution a tolerable quantity for the same purpose, they left behind several bushels upon the beach.

The ice and snow now began rapidly to disappear, and plenty of nettle-tops, celery, and wild garlic, were gathered for the use of the crews; which being boiled with portable soup and wheat, furnished them with an excellent and salutary breakfast; and with this they were every morning supplied. The birch-trees were also tapped, and the sweet juice, of which they produced great quantities, was constantly mixed with the brandy allowed to the men. On the 16th, a small bullock was killed, which the serjeant had procured for the ship's companies. Its weight was 272 pounds. It was served out to both the crews for their Sunday's dinner, and was the first fresh beef which they had tasted since the departure of our vessels from the Cape of Good Hope, in December, 1776; a period of almost two years and a half. This evening John Macintosh, the carpenter's mate expired, after having been afflicted with a dysentery ever since we had left the Sandwich Isles. He was a peaceable and industrious man, and greatly regretted by his mates. Though we was the fourth person that we had lost by sickness during our voyage, he was the first who, from his age and constitution, could be said to have had, on our setting out, an equal chance of life with the rest of his companions. Watman was supposed by us to be about 60 years old; and Roberts, and Mr. Anderson, from the decline which had manifestly commenced before our departure from England, most probably could not, under any circumstances, have lived to a later period than they did.

Captain Clerke's health continuing daily to decline, notwithstanding the salutary change of diet which Kamtschatka afforded him, the priest of Paratouca, as soon as he was informed of the weak state he was in, supplied him every day with milk, bread, fowls, and fresh butter, though his habitation was 16 miles from the harbour where our ships were stationed. On our arrival, the Russian hospital, near the town of St. Peter and St. Paul, was in a very deplorable state. All the soldiers were, in a greater or less degree, afflicted with the scurvy, many being in the last stage of that disorder. The rest of the Russian inhabitants were likewise in a similar condition; and we observed, that our friend the serjeant, by drinking too freely of the spirits he had received from us, had brought on himself, in the course of a few days, several of the most alarming symptoms of that disease. Captain Clerke, desirous of relieving them from this lamentable state, put them all under the care of our surgeons, and gave orders, that a supply of sour kroust, and malt, for wort, should be furnished for their use. A surprising alteration soon took place in the figures of most of them; and their speedy recovery was chiefly attributed to the effects of the sweet wort.

On Tuesday, the 1st of June, 250 poods, or 9,000 pounds weight of rye flour, were brought on board the Resolution; and the Discovery received a proportional quantity. We were supplied with this flour from the stores of Petropaulouska. The men were now put on their full allowance of bread, which, from the time of our leaving the Cape of Good Hope, they had not been indulged in. The same day we completed our stock of water, 65 tons having been conveyed on board. Fri-

day, the 4th, we had fresh breezes, and heavy rains, so that we were disappointed in our design of dressing the ships, and obliged to content ourselves with firing 21 guns, in honour of his Majesty's birth-day, and celebrating it, in other respects, in the best manner we could. Port, who, on account of his skill in languages, was left with us, partook, as well as the serjeant, (in the capacity of commandant of the place) of the entertainment of the day. The worthy priest of Paratouca, having been informed that it was the anniversary of our sovereign's birth, gave likewise a sumptuous feast, at which several of our gentlemen were present, who were highly pleased with their entertainment, of which dancing formed a part. On the 6th, 20 head of cattle arrived, having been sent us, by the directions of the commander, from the Verchnei Oltrog, which stands on the river Kamtschatka, at the distance of almost a hundred miles from this place. These cattle were of a moderate size; and, though the Kamtschadales had been 17 days in driving them down to the harbour, were in good condition when they arrived. The four succeeding days were employed in making preparations for putting to sea, and on Friday, the 11th, about two o'clock in the morning, we began to unmoor. Before, however, we had got up one anchor, so violent a gale sprung up from the N. E. that we thought proper to unmoor again, supposing, from the position of the entrance of the Bay, that the current of wind would, in all probability, set up the channel. The pinnace was dispatched to examine the passage, and returned with intelligence, that the wind blew violently from the S. E. with a great swell, setting into the bay; so that any attempt to get out to sea would have been attended with considerable risque. Mr. Port now took his leave of us, carrying with him the box containing the journals of our voyage, which Major Behm was to take charge of, and the packet that was to be forwarded by express. On the 12th, the gale having abated, we began unmooring again; but, after having broken the messenger, and received a running purchase with a six inch hauler, which likewise broke three times, we were, at last, under the necessity of heaving a strain at low water, and waiting for the flowing of the tide to raise the anchor. This measure succeeded, though not without damaging the cable. About three o'clock in the afternoon, the best bower was weighed, and we set sail; but, at eight, the tide making against us, and the wind being inconsiderable, we anchored in ten fathoms water, off the mouth of Rakowina harbour: the Oltrog being at the distance of between two and three miles, bearing N. by E. half E. the elevated rock on the western side of the passage, bearing S. and the needle rocks, on the eastern side of the passage, S. S. E. half E.

On Sunday, the 13th, at four o'clock, A. M. we got under way with the tide of ebb; and, as there was a perfect calm, the boats were dispatched a-head for the purpose of towing the ships. About 10, a south-easterly wind springing up, and the tide having turned, we were obliged to let go our anchors again, in seven fathoms; the Oltrog bearing N. half E. at the distance of a mile from the land that was nearest to us; and the three needle rocks being in the direction of S. half E. In the afternoon, Captain Gore and Lieutenant King landed on the east side of the passage, where they observed, in two different places, the remains of spacious villages; and, on the side of a hill, they saw an old ruined parapet, with four or five embrasures. It had guns mounted on it in Beer's time, as that navigator himself informs us; and commanded the passage up the mouth of the bay. Not far from this spot, were the ruins of some subterraneous caverns, which our two gentlemen conjectured to have been magazines. About six o'clock P. M. we weighed anchor, with the ebb tide, and turned to windward; but, two hours after, a thick fog coming on, we were under the necessity of bringing to, our soundings not affording us a sufficient direction for steering betwixt several sunken rocks, situated on each side of the passage we were to make. The next morning, the fog in some degree dispersing, we weighed as soon as the tide began to ebb; and, there being little

le wind, the boats were sent a-head to tow; but, about 10 o'clock, both the wind and tide set in so strong from the sea, that we were once more obliged to cast anchor, in 13 fathoms water, the high rock being at the distance of six furlongs, in the direction of W. one quarter S. We continued, during the remainder of the day, in this situation, the wind blowing fresh into the mouth of the bay. Towards the evening, the weather was extremely dark and cloudy with an unsettled wind.

On the 15th, we were surprized, before day-light, with a rumbling noise, that resembled distant thunder; and when the day appeared, we found that the sides and decks of our ships were covered, near an inch thick, with a fine dust like emery. The air was at the same time loaded and obscured with this substance; and, towards the volcano mountain, which stands to the northward of the harbour, it was exceedingly thick and black, insomuch that we were unable to distinguish the body of the hill. About 12 o'clock, and during the afternoon, the loudness of the explosions increased; and they were succeeded by showers of cinders, which, in general, were of the size of peas, though many of those that were picked up from the deck were larger than a hazel nut. Several small stones, which had undergone no alteration from the action of fire, fell with the cinders. In the evening we had dreadful claps of thunder, and vivid flashes of lightning, which, with the darkness of the sky, and the sulphureous smell of the air, produced a very awful and tremendous effect. Our distance from the foot of the mountain was, at this time, about eight leagues. On the 16th, at day-break, we got up our anchors, and stood out of the bay; but the wind falling, and the tide of ebb setting across the passage on the eastern shore, we were driven very near the three needle rocks, situated on that side of the entrance, and were under the necessity of hoisting out the boats, for the purpose of towing the ships clear of them. At 12 o'clock, we were at the distance of six miles from the land; and our depth of water was 43 fathoms, over a bottom of small stones, of the same kind with those which had fallen upon our decks, after the late eruption of the volcano. The country had now a very different appearance from what it had on our first arrival. The snow, except what remained on the summits of some very lofty mountains, had vanished; and the sides of the hills, which abounded with wood in many parts, were covered with a beautiful verdure. As our Commander intended to keep in sight of the coast of Kamtschatka, as much as the weather would allow, in order to ascertain its position, we continued to steer towards the N. N. E. with variable light winds, till Friday, the 18th. The volcano was still observed to throw up immense volumes of smoke; and we did not strike ground with 150 fathoms of line, at the distance of 12 miles from the shore. This day the wind blew fresh from the S. and the weather became so thick and hazy, that it was imprudent to make any further attempts at present to keep in sight of the land. However, that we might be ready, whenever the fog should clear up, to resume our survey, we ran on in the direction of the coast, (as represented in the Russian charts) and fired signal guns for the Discovery to proceed on the same course. At 11 o'clock, just before we lost sight of land, Cheepoonkoi Nofs, so denominated by the Russians, was at the distance of seven or eight leagues, bearing N. N. E. On the 20th, at three o'clock in the morning, the weather becoming clearer, we stood in towards the land; and, in the space of an hour afterwards, saw it a-head, extending from N. W. to N. N. E. at the distance of about five leagues. The northern part we conjectured to be Kronotkoi Nofs; its position in the Russian charts, nearly agreeing with our reckoning in respect to its latitude, which was 54 deg. 42 min. N. though, in point of longitude, we differed considerably from them; for they place it 1 deg. 48 min. E. of Awatka; whereas our computation makes it 3 deg. 34 min. E. of that place, or 162 deg. 17 min. E. of Greenwich. The land about this cape is very elevated, and the inland mountains were, at this time, covered with snow. There is no appearance of inlets or bays in the coast; and the

shore breaks off in steep cliffs. We had not long been gratified with this view of the land, when the wind freshened from the S. W. bringing on a thick fog, which obliged us to stand off in the direction of N. E. by E. The fog dispersing about noon, we again steered for the land, expecting to fall in with Kamtschatkoi Nofs, and gained a sight of it at day-break on the 21st. The S. W. wind being soon after succeeded by a light breeze that blew off the land, we were prevented from approaching the coast sufficiently near to determine its direction, or describe its aspect. At noon, our longitude was 163 deg. 50 min. and our lat. 55 deg. 52 min. the extremes of the land bore N. W. by W. three quarters W. and N. by W. three quarters W. and the nearest part was at the distance of about 24 miles. At nine in the evening, when we had approached about 6 miles nearer the coast, it appeared to form a projecting peninsula, and to extend 11 or 12 leagues in the direction nearly of N. and S. It is level, and of a moderate elevation; the southern extreme terminates in a low sloping point; that to the northward forms a steep bluff head; and between them, 10 or 12 miles to the S. of the northern cape, there is a considerable break in the land. On both sides of this break, the land is low. A remarkable hill, resembling a saddle, rises beyond the opening; and a chain of lofty mountains, capped with snow, extends along the back of the whole peninsula. As the coast runs in an even direction, we were uncertain with respect to the position of Kamtschatkoi Nofs, which, according to Mr. Muller, forms a projecting point towards the middle of the peninsula; but we afterwards found, that, in a late Russian map, that appellation is given to the southern cape. The latitude of this, from several accurate observations, was 56 deg. 3 min. and its longitude, 163 deg. 20 min. To the S. of this peninsula, the great river Kamtschatka runs into the sea. The season being too far advanced for us to make an accurate survey of the coast of Kamtschatka, it was the design of Captain Clerke, on our course to Bering's Straights, to ascertain chiefly the respective situations of the projecting points of the coast. We therefore steered across a spacious bay, laid down between Kamtschatkoi Nofs and Olutorikoi Nofs, with a view of making the latter; which is represented by the Russian geographers, as terminating the peninsula of Kamtschatka, and as being the southern limit of the country of the Korics.

On Tuesday, the 22d, we passed a dead whale, which emitted a most horrible smell, perceivable at the distance of three or four miles. It was covered with a very considerable number of gulls, petrels, and other oceanic birds, which were regaling themselves upon it. On the 24th, the wind, which had shifted about during the three preceding days, settled at S. W. bringing on clear weather, with which we proceeded towards the N. E. by N. across the bay, having no land in sight. In the course of this day we observed a great number of gulls, and were disgusted with the indelicate manner of feeding of the arctic gull, which has procured it the appellation of the parasite. This bird, which is rather larger than the common gull, pursues the latter species whenever it meets them; the gull, after flying about for some time, with loud screams, and manifest indications of extreme terror, drops its excrement, which its pursuer instantly darts at, and catches in its beak before it falls into the sea.

On Friday, the 25th, at one o'clock, P. M. when in the latitude of 59 deg. 12 min. and in the longitude of 168 deg. 35 min. a very thick fog came on about the time we expected to obtain a view of Olutorikoi Nofs, which (if Muller's position of it, in the latitude of 59 deg. 30 min. and in the longitude of 167 deg. 36 min. is right) could then have been only 12 leagues from us; at which distance, we might easily have discerned land of a moderate height. Our depth of water, at present, was so great, that we had no ground with 160 fathoms of line. The fog still continuing, prevented us from making a nearer approach to the land, and we steered E. by N. at five o'clock, which is a little more easterly than the Russian charts represent the trending of the coast

Asiatic coast, till about seven o'clock in the evening; at which time we had approached within two or three leagues of the eastern cape of that continent. The Cape is an elevated round head of land, and extends about five miles from N. to S. It forms a peninsula, which is connected with the continent by a narrow isthmus of low land. It has a bold shore; and three lofty, detached, spiral rocks, are seen off its N. part. It was at present covered with snow, and the beach encompassed with ice. We were now convinced of our having been under the influence of a strong current setting to the northward, which had occasioned an error of twenty miles in our computation of the latitude at noon. At the time of our passing this Strait the last year, we had experienced a similar effect. Having now ascertained our position, we steered N. by E. At ten o'clock in the evening, the weather clearing up, we saw, at the same instant, the remarkable peaked hill near Cape Prince of Wales, on the North American coast, and the East Cape of Asia, with the two islands of St. Diomedé between them. In the course of this day, we saw several large white gulls, and great numbers of very small birds of the hawk kind. The beak of the latter was compressed, and large in proportion to the body of the bird: the colour was dark brown, or rather black, the breast whitish, and towards the abdomen a reddish brown hue was visible. On the 6th, at twelve o'clock, our latitude was 67 deg. and our longitude 191 deg. 6 min. Having already passed many large masses of ice, and observed that it adhered, in several places, to the shore of the Asiatic continent, we were not greatly surprised when we fell in, about three o'clock, with an extensive body of it, stretching towards the W. This appearance considerably discouraged our hopes of proceeding much further to the N. this year, than we had done the preceding. There being little wind in the afternoon, the boats were hoisted out in pursuit of the sea-horses, great numbers of which were seen on the detached pieces of ice; but they returned without success: these animals being extremely shy, and before our people could come within gun-shot of them, always retreated into the water. At seven o'clock P. M. having hoisted in the boats, we stood on to the north-eastward, with a fresh southerly breeze, intending to explore the American continent, between the latitudes of 68 deg. and 69 deg. which, on account of the foggy weather, we had not an opportunity of examining the last year. In this attempt we were partly disappointed again: for, on the 7th, about six o'clock in the morning, we were stopped by a large body of ice, stretching from N. W. to S. E. but, not long afterwards, the horizon becoming clear, we had a view of the American coast, at the distance of about ten leagues, extending from N. E. by E. to E. and lying between 68 deg. and 68 deg. 20 min. of northern latitude. The ice not being high, we were enabled by the clearness of the weather to see over a great extent of it. The whole exhibited a compact solid surface, not in the least thawed; and seemed also to adhere to the land. Soon after, the weather becoming hazy, we lost sight of the land; and it being impossible to approach nearer to it, we steered to the N. N. W. keeping the ice close on board; and having, by noon, got round its western extremity, we found that it trended nearly N. Our longitude, at this time, was 192 deg. 34 min. and our latitude 68 deg. 22 min. We proceeded along the edge of the ice, to the N. N. E. during the remainder of the day, passing through many loose pieces which had been separated from the main body, and against which our vessels were driven with great violence, notwithstanding our utmost caution. About eight in the evening, we passed some drift-wood: at midnight the wind veered to the N. W. and there were continued showers of snow and sleet. The thermometer had now fallen from 38 deg. to 31 deg. On Thursday, the 8th, at five o'clock, the wind shifting more to the northward, we could continue no longer on the same tack, by reason of the ice, but were under the necessity of standing towards the W. Our depth of water, at this time, was 19 fathoms; from which, upon comparing

it with our remarks on the soundings in the preceding year, we inferred, that our present distance from the coast of America did not exceed six or seven leagues; but our view was circumscribed within a much narrower compass, by a heavy fall of snow. Our latitude, at noon, was 69 deg. 21 min. and our longitude 192 deg. 42 min. At two o'clock P. M. the weather became clearer, and we found ourselves close to an expanse of ice, which, from the mast-head, was discovered to consist of very large compact bodies; united towards the exterior edge, but, in the interior parts, some pieces were observed floating in vacant spaces of the water: it extended from W. S. W. to N. E. by N. We bore away towards the S. along the edge of it, endeavouring to get into clearer water; for the strong northerly winds had drifted down such numbers of loose pieces, that we had been encompassed with them for some time, and were unable to prevent the ships from striking against several of them. On the 9th, a fresh gale blew from the N. N. W. accompanied with violent showers of snow and sleet. We steered W. S. W. and kept as near the main body of ice as we could; but had the misfortune to damage the cut-water against the drift pieces, and rub off some of the sheathing from the bows. The flocks, indeed, which our ships received, were frequently very severe, and were attended with considerable hazard. Our latitude, at noon, was 69 deg. 12 min. and our longitude 188 deg. 5 min.

We had now sailed almost 40 leagues to the W. along the edge of the ice, without perceiving any opening, or a clear sea beyond it towards the N. no prospect therefore remained of making further progress to the northward at present. For this reason Captain Clerke determined to bear away to S. by E. the only quarter which was clear, and to wait till the season was somewhat more advanced, before he made any further attempt to penetrate through the ice. He proposed to employ the intermediate time in surveying the bay of St. Lawrence, and the coast situate to the S. of it, as it would be a great satisfaction to have a harbour so near, in case of future damage from the quantity of ice in these parts. We were also desirous of paying another visit to the Tschutski; and more particularly since the accounts we had heard of them from Major Behm. In consequence of this determination, we made sail to the southward, till the 10th at noon, when we passed considerable quantities of drift ice, and a perfect calm ensued. The latitude, at this time, was 68 deg. 1 min. and the longitude 188 deg. 30 min. This morning we saw several whales; and in the afternoon, there being great numbers of sea-horses on the pieces of ice that surrounded us, we hoisted out the boats, and dispatched them in pursuit of those animals. Our people had more success on this occasion, than they had on the 6th; for they returned with three large ones, and a young one, besides having killed or wounded some others. They were witnesses of several striking instances of parental affection in these animals. All of them, on the approach of the boats towards the ice, took their young ones under their fins, and attempted to escape with them into the sea. Some, whose cubs were killed or wounded, and left floating upon the surface of the water, rose again, and carried them down, sometimes just as our men were on the point of taking them into the boat; and could be traced bearing them to a considerable distance through the water, which was stained with their blood. They were afterwards observed bringing them, at intervals, above the surface, as if for air, and again plunging under it, with a horrid bellowing. The female, in particular, whose young one had been killed, and taken into the boat, became so furious, that she even struck her two tusks through the bottom of the cutter. About eight o'clock in the evening, an easterly breeze sprung up, with which we continued to steer to the southward; and, at midnight, fell in with many extensive bodies of ice. We attempted to push through them under an easy sail, that the ships might sustain no damage; and when we had proceeded a little further towards the S. nothing was visible but a very large and compact mass of ice, extending

foundings in the pre-
 sent distance from
 the coast fix or seven leagues;
 and within a much nar-
 rowed of snow. Our latitude,

tending to the N. E. S. W. and S. E. as far as the eye
 could reach. This formidable obstacle prevented our
 visiting the Tschutski; for no space remained open, ex-
 cept back again to the northward. We therefore tacked,
 at three o'clock in the morning of the 11th, and stood
 to that quarter. The lat. at noon, was 67 deg. 49 min.
 and the long. 188 deg. 47 min. On Monday, the 12th,
 we had light winds and hazy weather. On examining
 the current, we found it set towards the N. W. at the
 rate of half a mile an hour. We continued our northerly
 course, with a breeze from the S. and fair weather, till
 10 o'clock in the morning of the 13th, when we again
 found ourselves close in with a solid mass of ice, to which
 we could perceive no limits from the mast-head. This
 was an effectual discouragement to all our hopes of pe-
 netrating further; which had been greatly raised, by our
 having now advanced almost 10 leagues, through a
 space, which, on the 9th, had been found to be occupied
 by impenetrable ice. Our situation, at this time, was
 nearly in the middle of the channel, betwixt the two
 continents; our lat. was 69 deg. 37 min. and the
 main body of the ice extended from W. S. W. to E.
 N. E.

In that part of the sea where we now were, there was
 no probability of getting further to the north, Captain
 Clerke therefore determined to make a final attempt on
 the coast of America, for Balin's Bay, since we had
 found it practicable to advance the furthest on this side,
 in the preceding year. We accordingly, during the re-
 mainder of the day, worked to the windward, with a
 fresh breeze from the east. We observed several fulmars,
 and arctic gulls, and passed two trees, both of which
 seemed to have lain a long time in the water. The
 larger one was, in length, ten or eleven feet, and in cir-
 cumference, about three, without either the bark or
 branches. We continued our course to the eastward
 on the 14th, with thick foggy weather. The next day,
 the wind blowing fresh from the west, and having, in
 some measure, dispersed the fog, we immediately steer-
 ed to the north, in order to have a nearer view of the ice;
 and we were soon close in with it. It extended from
 N. N. W. to N. E. and was solid and compact: the ex-
 terior parts were ragged, and of various heights; the in-
 ner surface was even; and, as we supposed, from 8 to
 10 feet above the level of the sea. The weather becom-
 ing moderate during the rest of the day, we shaped our
 course according to the trending of the ice, which, in
 several places, formed deep bays. On Friday, the 16th,
 the wind freshened, in the morning, and was accompa-
 nied with frequent and thick showers of snow. At eight
 o'clock in the forenoon, we had a strong gale from the
 W. S. W. which brought us under double-reefed top-
 sails; when the weather in some degree clearing up,
 we found ourselves, as it were embayed; the ice having
 suddenly taken a turn to the south eastward, and en-
 compassing us in one compact body, on all sides, but the
 south. In consequence of this, we hauled our wind to
 the southward, being, at that time, in 56 fathoms wa-
 ter, and in the lat. of 70 deg. 8 min. N. and, as we ima-
 gined, at the distance of about 25 leagues from the A-
 merican coast. At four in the afternoon, the ice in-
 creasing, we got the top-gallant-yards down upon the
 deck, furled the mizen top-sail, and close-reefed the
 fore and main top-sails. About eight o'clock, finding
 that our soundings had decreased to 22 fathoms, which
 we considered as an indication of our near approach to
 the coast of America, we tacked and steered to the
 northward. In the night we had boisterous weather,
 attended with snow; but the next morning it was clear
 and moderate; and, at eight o'clock, we got the top-
 gallant-yards across, and bore away, with the wind still at
 W. S. W. Our lat. at noon, was 69 deg. 55 min. and our
 long. 194 deg. 30 min. The wind slackened in the even-
 ing, and, about midnight, we had a calm. A light breeze
 arising from the E. N. E. at five in the morning of the
 18th, we continued our progress towards the N. with a
 view of regaining the ice as soon as possible. We saw
 numbers of sea-parrots, and small ice-birds, and also
 many whales; and passed several logs of drift-wood.
 The lat. at 12 o'clock, was 70 deg. 26 min. and the

long. 194 deg. 54 min. Our soundings, at the same
 time, were 23 fathoms; and the ice extended from N.
 to E. N. E. being about one league distant. At one
 o'clock in the afternoon, observing that we were close
 in with a firm united mass of ice, stretching from E. to
 W. N. W. we tacked, and, the wind veering to the
 westward, stood to the E. along the edge of it, till 11
 in the evening. A very thick fog then coming on, and
 the depth of water decreasing to 19 fathoms, we hauled
 our wind to the southward. About nine o'clock in the
 evening a white bear swam close by the Discovery; it
 afterwards went towards the ice, on which were likewise
 two others. The weather clearing up, at one in the
 morning of Monday, the 19th, we bore away to the N.
 E. till two o'clock, when we were again so completely
 embayed by the ice, that no opening remained, except
 to the southward; to which quarter we therefore directed
 our course, and returned through a very smooth water,
 with favourable weather, by the same way we had come
 in. We were unable to penetrate further towards the
 N. than at this time, when our lat. was 70 deg. 33 min.
 which was about five leagues short of the point to which
 we had advanced the preceding summer. We stood to
 the S. S. W. with light winds from the N. W. near the
 edge of the main body of ice, which was situated on our
 left-hand, extending between us and the American coast.
 At noon, our lat. was 70 deg. 11 min. and our long. 196
 deg. 15 min. and our soundings were 16 fathoms. We
 supposed, from this circumstance, that the icy Cape was
 at the distance of only seven or eight leagues from us;
 but, though the weather was in general pretty clear,
 there was, at the same time a haziness in the horizon;
 so that we could not expect to have an opportunity of
 seeing the cape. During the afternoon, two white bears
 appearing in the water, some of our people immediately
 pursued them in the jolly-boat, and were so fortunate as
 to kill them both. The larger one, which was, in all
 probability, the dam of the younger, being shot first, the
 other would not leave it, though it might have escaped
 with ease on the ice, while the men were re-loading their
 musquets; but continued swimming about, till after
 having been several times fired upon, it was shot dead.
 The length of the larger one, from the snout to the end
 of the tail was seven feet two inches; its circumference,
 near the fore legs, was four feet ten inches; the height
 of the shoulder was four feet three inches; and the
 breadth of the fore-paw was ten inches. The weight
 of its four quarters was 436 pounds. The four quarters
 of the smallest weighed 256 pounds. These animals
 furnished us with some good meals of fresh meat. Their
 flesh, indeed, had a strong fishy taste, but was infinitely
 superior to that of the sea-horse; which, however, our
 people were again persuaded, with no great difficulty,
 to prefer to their salted provisions.

On Tuesday, the 20th, at six o'clock, A. M. a thick
 fog arising, we lost sight of the ice for the space of two
 hours; but, when the weather became clearer, we again
 had a view of the main body to the S. S. E. and im-
 mediately hauled our wind, which was easterly, towards it,
 expecting to make the American coast to the S. E. which
 we effected between 10 and 11 o'clock. The lat. at
 noon, was 69 deg. 33 min. and the long. 194 deg. 53
 min. Our depth of water, at the same time, was 19 fa-
 thoms. The land was at the distance of eight or ten
 leagues, extending from S. by E. to S. S. W. half W.
 being the same we had seen the preceding year; but it
 was, at present, much more covered with snow than at
 that time; and the ice seemed to adhere to the shore.
 We continued to sail in the afternoon, through a sea of
 loose ice, and to steer towards the land, as near as the
 wind, which blew from E. S. E. would permit. A thick
 fog came on at eight o'clock in the evening, and the
 wind abated. Observing a rippling in the water, we
 tried the current, and found it set to the E. N. E. at the
 rate of a mile an hour: we therefore resolved to steer be-
 fore the wind, during the night, in order to stem it, and
 oppose the large pieces of loose ice, which were setting
 us on towards the coast. Our soundings, at midnight,
 were twenty fathoms. The next morning, at eight
 o'clock, the wind freshening, and the fog dispersing, we
 again

again had sight of the coast of America to the south-eastward, at the distance of nine or ten leagues, and hauled in for it; but the ice in a short time effectually stopped our further progress on that side, and we were obliged to bear away towards the W. along the edge of it. Our lat. at 12 was 69 deg. 34 min. our long. was 193 deg. and our soundings were 24 fathoms. A connected solid field of ice, thus baffling all our efforts to make a nearer approach to the land, and (as we had some reason to imagine) adhering to it, we relinquished all hopes of a N. E. passage to Great-Britain. Our Commander now finding it impossible to advance further to the northward on the American coast, and deeming it equally improbable, that such a prodigious quantity of ice should be dissolved by the few remaining weeks that would terminate the summer, considered it as the best step that could be taken, to trace the sea over to the coast of Asia, and endeavour to find some opening that would admit him further N. or see what more could be done upon that coast, where he hoped to meet with better success. In consequence of this determination, we steered W. N. W. during the afternoon of the 21st of July, through a great quantity of loose ice. About ten o'clock in the evening, discovering the main body of ice through the fog, right a-head, and very near us, and being unwilling to stand to the southward, so long as we could possibly avoid it; we hauled our wind, which was easterly, and made sail to the N. but in the space of an hour afterwards, finding that the weather became clearer, and that we were surrounded by a compact field of ice on all sides, except to the S. S. W. we tacked, and steered in that direction, for the purpose of getting clear of it. On the 22d, at noon, our lat. was 69 deg. 20 min. and our long. 187 deg. 30 min. In the afternoon we again came up with the ice, which extending to the N. W. and S. W. obliged us to proceed to the southward, in order to weather it. It may not here be improper to remark, that, since the 8th of July, we had twice traversed this sea, in lines almost parallel with the run we had just now made; that we were unable in the first of those traverses, to penetrate so far N. by eight or ten leagues, as in the second; and that in the last we had again met with a connected mass of ice, generally about five leagues to the southward of its position in the preceding run. This makes it evident, that the large compact fields of ice, observed by us, were moveable, or diminishing; but, at the same time, it does not authorize any expectation of advancing much farther, even in the most favourable seasons. About seven o'clock in the evening, the weather being hazy, and no ice visible, we made sail to the westward; but, between eight and nine, the haze dispersing, we found ourselves in the midst of loose ice, and very near the main body; we therefore stood upon a wind, which was still easterly, and continued to beat windward during the night, hoping to weather the loose pieces, which the wind drove down upon us in such quantities, that we were in great danger of being blocked up by them. On Friday, the 23d, the clear water, in which we steered to and fro, did not exceed a mile and a half, and was lessening every moment. At length, after exerting our most strenuous endeavours to clear the loose ice, we were under the necessity of forcing a passage to the S. which we accomplished between seven and eight, though not without subjecting the ship to some very severe shocks. The Discovery was not so successful; for, about 11 o'clock, when she had almost got clear out, she became so entangled by several large pieces, that her progress was stopped, and she immediately dropped to leeward, and fell, broadside foremost, on the edge of a considerable body of ice; and there being an open sea to windward, the surf occasioned her to strike with violence upon it. This mass, at length, either so far broke, or moved, as to give the crew an opportunity of making another effort to escape; but, it unfortunately happened, that, before the ship gathered way enough to be under command, she fell to leeward a second time, on another fragment, and the swell rendering it unsafe to lie to windward, and finding no prospect of getting clear, they pushed into a small opening, turtled their sails, and made the vessel fast with ice-

hooks. We beheld them in this dangerous situation at noon, at the distance of about three miles from us, in a N. W. direction; a fresh gale from the S. E. driving more ice towards the N. W. and augmenting the body that lay between us. Our lat. at this time, was 69 deg. 8 min. our long. 187 deg. and our soundings were 28 fathoms. To add to the apprehensions which began to force themselves on our minds, between four and five in the afternoon, the weather becoming thick and hazy, we lost sight of the Discovery. However, that we might be in a situation to afford her every possible assistance, we stood on close by the edge of the ice. About six o'clock the wind shifting to the north, gave us some hopes, that the ice might drift away; and release her from her danger; and in that case, as it was uncertain in what condition she might come out, we continued, every half hour, to fire a gun, with a view of preventing a separation. Our fears for her safety did not cease till nine, when we heard her guns fired in answer to ours; and not long afterwards being hailed by her, we were informed, that upon the change of wind, the ice began to separate, and that her people, setting all the sails, forced a passage through it.

On Saturday, the 24th, we steered to the S. E. till 11 o'clock A. M. when our course was again obstructed by a large body of loose ice, to which we could discover no bounds. At noon we found ourselves in lat. 68 deg. 53 min. long. 188 deg. About four in the afternoon, we had a calm, and the boats were hoisted out in pursuit of the sea-horses, which appeared in prodigious numbers. Ten of them were killed by our people, as many as could be made use of by us for eating, or for converting into lamp-oil. We held on our course with a south-westerly wind, along the edge of the ice, till four in the morning of the 25th, when perceiving a clear sea beyond it, to the south-eastward, we steered to that point. During the remaining part of the day, we continued to run towards the S. E. with no ice in sight. At noon we observed in lat. 68 deg. 38 min. long. 189 deg. 9 min. and our soundings were 30 fathoms. For the remainder of the day, and till noon of the 27th, we stood backwards and forwards, to clear ourselves of different pieces of ice. At two in the afternoon, we had sight of the continent to the S. by E. and, at four, having run, since noon, to the S. W. we were encompassed by loose masses of ice, with the main body in view, stretching in the direction of N. by W. and S. by E. as far as the eye could reach, beyond which we descried the Asiatic coast, bearing S. and S. by E. It being now necessary to come to some determination respecting the course we were next to steer, Captain Clerke dispatched a boat, with the carpenters, on board the Discovery, to make enquiries into the particulars of the damages she had lately received. In the evening they returned, with the report of Captain Gore, and of the carpenters of both vessels, that the damages sustained were such as would require three weeks to repair; and that it would be requisite, for that purpose, to make the best of their way to some port. Thus finding our farther progress to the N. as well as our nearer approach to either continent, obstructed by immense bodies of ice, we considered it as not only injurious to the service, by endangering the safety of the ships, but likewise fruitless, with respect to the design of our voyage, to make any farther attempts for the discovery of a passage. This, therefore, added to Captain Gore's representations, determined Captain Clerke to lose no more time after what he concluded to be an unattainable object, but to proceed to the bay of Awatka, to repair our damages there, and before the winter should set in, to take a survey of the coast of Japan. It is impossible to describe the joy that sparkled in the countenance of every individual, when the Captain's resolution was made known. All were completely weary of a navigation full of danger, and in which the greatest perseverance had not been rewarded with the smallest prospect of success. We therefore turned our thoughts towards home, after an absence of three years, with a delight and satisfaction as fully enjoyed, as if we had been already in sight of the Land's-end. On Wednesday, the 28th, we worked to windward, with a fresh breeze from the S. E. being still

in sight of the coast of Asia. At four in the morning, Cape Serdze Kamen bore S. S. W. distant 7 leagues. On the 29th, the wind continuing unfavourable, we made but slow progress to the southward. We had no land in view till even in the evening of the 30th, when the fog dispersing, we saw Cape Prince of Wales bearing S. by E. distant six leagues; and the island of St. Diomedé S. W. by W. We now stood to the W. and at eight made the East Cape, which at midnight, was four leagues distant, bearing W. by N. On Saturday, the 31st, at four o'clock A. M. the East Cape bore N. N. E. and the N. E. part of the Bay of St. Lawrence, W. by S. distant 12 miles. At noon, we observed in latitude 65 deg. 6 min. longitude 189 deg.

We had now passed Beering's Straits, and taken a final leave of the N. E. coast of Asia; and here we shall state our reasons for adopting two general conclusions relative to its extent, in opposition to the sentiments of Mr. Muller. The first is, that the promontory, called East Cape, is actually the most easterly point of that quarter of the globe; or in other words, that no part of that continent extends in longitude beyond 190 deg. 22 min. E. The second is, that the latitude of the north-eastermost extreme is somewhat to the south of 70 deg. N. With regard to the former, if such land really exists, it must certainly be to the N. of the 69th deg. of latitude, where the discoveries made in our present voyage terminate.

We propose therefore in the first place to investigate the probable direction of the coast beyond this point. Now, Russia being the only nation that has hitherto navigated this part of the ocean, all our information respecting the position of the coast to the northward of Cape North, is derived from the journals and charts of the persons who have been engaged, at different times, in determining the bounds of that extensive empire, and these are, in general, so confused, contradictory, and imperfect, that we cannot easily form a distinct idea of their pretended, much less collect the particulars, of their real discoveries. On this account, the extent and figure of the peninsula, inhabited by the Tschutski still remains a point, on which the Russian Geographers are divided greatly in their opinions. Mr. Muller, in the map which he published in 1754, supposes that this country extends towards the N. E. as far as the latitude of 75 deg. and to the longitude of 190 deg. E. of Greenwich; and that it ends in a round cape, which he denominates Tschukotkoi Nofs. To the S. of this cape, the coast, as he imagines, forms a bay to the W. bounded in the latitude of 67 deg. 18 min. by Serdze Kamen, the most northerly point observed by Beering in his expedition in 1728. The map published in 1776 by the academy of St. Peterburg, gives a new form to the whole peninsula, placing its north-eastermost extreme in the latitude of 73 deg. longitude 178 deg. 30 min. and the most easterly point in latitude 65 deg. 30 min. longitude 189 deg. 30 min. All the other maps we have seen, both manuscript and printed, vary between these two, apparently more according to the fancy and conjectures of the compiler, than on any grounds of more accurate intelligence. The only particular in which there is a general, coincidence, with very little variation, is the position of the East Cape, in the latitude of 66 deg. The form of the coast both to the N. and S. of the East Cape, in the map of the academy, is extremely erroneous, and may be entirely disregarded. In Mr. Muller's map, the coast towards the N. has some degree of resemblance to our survey, as far as the latter extends, except that he does not make it trend sufficiently to the W. but makes it recede only about 5 deg. of longitude, between the latitude of 66 and 69 deg. whereas it actually recedes near ten. Between the latitude of 69 and 74 deg. the coast, according to him, bends round to the N. and N. E. and forms a large promontory. On what authority he grounds this representation of the coast, comes next under our consideration.

Mr. Coxe, whose accurate researches into this subject, give great weight to his sentiments, is of opinion, that the extremity of the Nofs in question, was never

passed except by Dezhneff and his party, who failed in the year 1648, from the river Kovyma, and are imagined to have got round it into the Anadyr. As the narrative of this expedition, the substance of which has been given by Mr. Coxe, in his account of Russian discoveries, comprehends no geographical delineation of the coast along which they failed, our conjectures respecting its position must be derived from incidental circumstances; and from these it evidently appears, that the Tschukotkoi Nofs of Dezhneff, is, in reality, the promontory named by Captain Cook, the East Cape. Speaking of the Nofs, he says, that a person may sail from the isthmus to the Anadyr, with a favourable wind, in three days and three nights. This perfectly agrees with the situation of the East Cape, which is about 120 leagues from the mouth of the river Anadyr; and there being no other isthmus to the N. between that and the latitude of 69 deg. it seems evident, that, by this description, he certainly means either the Cape in question, or some other situated to the S. of it. He lays, in another place, that, opposite to the isthmus, there are two islands in the sea, upon which we observed some of the Tschutski nation, in whose lips pieces of the teeth of the sea-horse were fixed. This description coincides exactly with the two islands that lie to the S. E. of the East Cape. We observed, indeed, no inhabitants upon them; but it is by no means improbable, that a party of Americans from the opposite continent, whom this description suits, might have been accidentally there at that time, and he might easily mistake them for a tribe of the Tschutski. These two circumstances seem to us to be conclusive on the point of the Tschukotkoi Nofs, though there are others of a more dubious nature from the same authority, and which now remain to be investigated. Dezhneff, in another account, says, that in going from the Kovyma to the Anadyr, a great promontory which projects very far into the sea, must be doubled; and that this cape extends between N. and N. E. It was perhaps, from these expressions, that Muller was induced to represent the country of the Tschutski, in the form we find in his map; but, if he had been acquainted with the position of the East Cape, as determined by Captain Cook, and the striking agreement between that and the promontory or isthmus, (for it must be remarked, that Dezhneff still appears to be speaking of the same thing) in the circumstances above-mentioned, we are confident that he would not have thought those expressions of sufficient weight to authorize his extending the north eastern extreme of Asia, either so far to the N. or E. For these words of Dezhneff may be reconciled with the opinion we have adopted, if we suppose that navigator to have taken these bearings from the small bight lying to the W. of the cape. The next authority, on which Muller has proceeded, seems to have been the deposition of the Cossac Popoff, taken at the Anadirskoi Ostrog, in 1711. This Cossac was sent by land, in company with several others, to demand tribute from the independent Tschutski tribes, who inhabited the parts about the Nofs. The first circumstance, in the narrative of this journey, that can tend to lead to the situation of Tschukotkoi Nofs, is its distance from Anadirsk; and this is represented as a journey of ten weeks, with loaded rein-deer; for which reason, it is added, their day's journey was very inconsiderable. We cannot, indeed, conclude much from so vague an account, but as the distance between the East Cape and the Ostrog, exceeds 200 leagues in a direct line, and consequently may be supposed to allow 12 or 14 miles a day, its situation is not incompatible with Popoff's calculation. Another circumstance stated in this deposition is, that their route lay at the foot of a rock, named Matkol, situate at the bottom of a spacious gulph. This gulph Muller conjectures to be the bay he had laid down between the latitudes of 66 deg. and 72 deg. and he accordingly places the rock Matkol in the center of it; but it appears to be more probable, that it might be a part of the Gulph of Anadyr, which they would doubtless touch upon in their journey from the Ostrog to the East Cape. What seems, however, to

put this point beyond all dispute, and to prove that the Cape which Popoff visited cannot be to the northward of the latitude of 69 deg. is that part of his deposition which relates to an island lying off the Nofs, from whence the opposite continent might be discerned. For, as the two continents, in latitude 69 deg. diverge so far as to be upwards of 100 leagues distant, it is certainly very improbable, that the coast of Asia should again trend in such a manner to the E. as to come almost within sight of the American coast. If these arguments are allowed to be conclusive against the form and extent of the peninsula of the Tschutki, it must be evident that the East Cape is the Tschukotkoi of the earlier Russian navigators: we say earlier, because Beering, and, after him, the late Russian geographers, have affixed this appellation to the S. E. cape of the peninsula of the Tschutki, which was formerly distinguished by the name of the Anadirskoi Nofs: and, consequently, hence it will follow, that the undescribed coast, extending from the latitude of 69 deg. to the mouth of the Kovyma, must trend more or less towards the W. As an additional proof of this, we may observe, that the Tschukotkoi Nofs is constantly laid down as dividing the sea of Kovyma from that of Anadyr, which we think could not possibly be, if any large cape had projected to the N. E. in the more advanced latitudes.

Another question arising on this point is, to what degree of northern latitude this coast extends, before it inclines more immediately to the W. If the position of the mouth of the Kovyma, both with regard to its latitude and longitude, were ascertained accurately, it might perhaps be easy to form a plausible conjecture on this head. Captain Cook was always strongly induced to believe, that the northern coast of Asia, from the Indigirka eastward, has hitherto been usually laid down above two degrees to the northward of its true situation: and he has therefore, on the authority of a map that was in his possession, and on the intelligence which he received at Oonahaska, placed the mouth of the Kovyma, in his chart of the N. E. coast of Asia, and the N. W. coast of America, in the latitude of 68 deg. Should the Captain be right in this conjecture, it is probable, for the reasons we have already stated, that the coast of Asia does not, in any part, exceed 70 deg. before it trends towards the W. and consequently, that we were within one degree of its north-eastern extremity. For if the continent be imagined to extend any where to the north of Shelatkoï Nofs, it can scarcely be supposed that such an interesting circumstance would have been omitted by the Russian navigators, who mention no remarkable promontory between the Anadyr and the Kovyma, except the East Cape. Another particular, which Deshneff relates, may, perhaps, be deemed a farther confirmation of this opinion, namely, that he met with no obstruction from ice in sailing round the north-eastern extremity of Asia; though he adds, that this sea is not, at all times, so free from it; as indeed appears evidently from his not succeeding in his first expedition, and, since that, from the failure of Shalauoff, as well as from the interruptions and impediments we met with, in two successive years, in our present voyage. That part of the continent between Cape North, and the mouth of the Kovyma, is 125 leagues in longitudinal extent. About a third of this distance from the Kovyma, eastward, was explored in 1723, by Fedot Amosoff, a Sinbojarskoi of Jakuts, who informed Mr. Muller, that its direction was easterly. Since that time, it has been surveyed, with some degree of accuracy, by Shalauoff, whose chart makes it trend to the N. E. by E. as far as Shelatkoï Nofs, which he places at the distance of about 43 leagues to the E. of the Kovyma. The space, therefore, between this Nofs and Cape North, upwards of 80 leagues, is the only part of the Russian dominions now remaining unexplored. If the Kovyma, however, be erroneously laid down, in point of longitude as well as latitude (a supposition by no means improbable) the extent of the unexplored coast will diminish in

proportion. The reasons which incline us to imagine, that in the Russian charts, the mouth of the river is placed considerably too far to the W. are the following. First, because the accounts that have been given of the navigation of the Frozen Ocean, from that river, round the north-eastern extreme of Asia, to the gulf of Anadyr, do not agree with the supposed distance between those places. Secondly, because the distance from the Anadyr to the Kovyma, over land, is represented by former Russian travellers as a journey of no very great length, and easily performed. Thirdly, because the coast from the Shelatkoï Nofs of Shalauoff appears to trend directly S. E. towards the Cape. If this be really the case, it may be inferred, that, as we were, in all probability, not more than one degree to the southward of Shelatkoï Nofs, only 69 miles of the coast of Asia are unascertained.

We are of opinion, thinking it highly probable, that a N. W. passage from the Atlantic into the Pacific Ocean, does not exist to the southward of the 56th deg. of latitude. If therefore a passage really exists, it must certainly be either through Baffin's bay, or by the N. of Greenland, in the western hemisphere; or in the eastern, through the Frozen Sea, to the N. of Siberia; and on which ever side it is situated, the navigator must pass through the straits distinguished by the name of Beering's Straits. The impracticability of penetrating into the Atlantic Ocean, on either side, through these Straits, is, therefore, all that now remains to be offered to the reader's consideration. Here we must previously observe, that the sea to the northward of Beering's Straits, was found by us to be more free from ice in August than in July, and perhaps in some part of September it may be still more clear of it. But, after the autumnal equinox, the length of the days diminishes so fast, that no farther thaw can be expected; and we cannot reasonably attribute so great an effect to the warm weather in the first fortnight of the month of September, as to imagine it capable of dispersing the ice from the most northern parts of the coast of America. Admitting this, however, to be possible, it must at least be allowed, that it would be highly absurd to attempt to avoid the icy cape by running to the known parts of Baffin's Bay, (a distance of 420 leagues, or 1260 miles) in so short a space of time as that passage can be supposed to remain open. On the side of Asia there appears still less probability of success, not only from what came to our knowledge, relative to the state of the sea to the southward of Cape North, but likewise from what we have gathered from the experience of the lieutenants under the direction of Beering, and the journal of Shalauoff, respecting that on the N. of Siberia. But, the possibility of sailing round the north-eastern extremity of Asia, is undoubtedly proved by the voyage of Deshneff, if its truth be admitted; yet when we reflect, that since the time of that navigator, near a century and a half has elapsed, during which, in an age of curiosity and enterprize, no person has yet been able to follow him, we can entertain no very great expectations of the public benefits to be derived from it. But even on the supposition, that, in some remarkably favourable season, a vessel might find a clear passage round the coast of Siberia, and arrive safely at the mouth of the Lena, still there remains the Cape of Taimura, extending to the 78th deg. of latitude, which no navigator has hitherto had the good fortune to double. Some, however, contend, that there are strong reasons for believing, that the nearer approach we make to the pole, the sea is more clear of ice, and that what masses we observed in the lower latitudes, had originally been formed in the great rivers of Siberia and America, by the breaking up of which the intermediate sea had been filled. But even if that supposition be true, it is no less certain, that there can be no access to those open seas, unless this prodigious mass of ice should be so far dissolved in the summer, as to admit of a ship's making her way through it. If this be a real fact, we made choice of an improper time of the year for attempting to discover this passage,

which.

hence incline us to imagine, the mouth of the river is to the W. are the following facts that have been given in the Ocean, from that extreme of Asia, to the north the supposed distance is, because the distance is, over land, is represented as a journey of no performance. Thirdly, the Nofa of Shalauoff towards the Cape. If it be inferred, that, as we are more than one degree to the N. only 69 miles of the

it is highly probable, that the Atlantic into the Pacific to the northward of the 56th degree really exists, it must be either to the N. of the N. hemisphere, or in the sea, to the N. of Siberia; situated, the navigator distinguished by the name of the impracticability of penetration, on either side, through that now remains to be determined. Here we must be directed to the northward of us to be more free from perhaps in some parts more clear of it. But, the length of the days during the winter than can be expected, but to great an effect to the fortnight of the month of dispersing the ice of the coast of America, if possible, it must at least be highly absurd to attempt to go to the known parts of the sea, or 1260 miles) that passage can be supposed on the side of Asia there appears, not only from what we have of the state of the sea to the north, but likewise from the experience of the voyage of Beering, and the fact that on the N. of the sea of failing round the pole, is undoubtedly proved, if its truth be admitted, the time of that navigation has elapsed, during the enterprise, no person can, we can entertain no public benefits to be derived from the supposition, that, in the case of Siberia, and arrive at the 78th deg. of latitude, who had the good fortune to contend, that there are no facts that the nearer approach is more clear of ice, and in the lower latitudes, the great rivers of Siberia breaking up of which the world is full. But even if that is certain, that there can be no passage, unless this prodigious ice dissolved in the summer, her way through it. If the choice of an improper method to discover this passage, which

which should have been explored in the months of April and May, before the rivers were broken up. But several reasons may be alleged against such a supposition. Our experience at Petropaulowka, gave us an opportunity of judging what might be expected farther northward; and, upon that ground, we had some reason to entertain a doubt, whether the two continents might not, during the winter, be even joined by the ice; and this coincided with the accounts we received in Kamtschatka, that, on the coast of Siberia, the inhabitants, in winter, go out from the shore upon the ice, to distances that exceed the breadth of the sea, in some parts, from one continent to the other. The following remarkable particular is mentioned in the deposition above referred to. Speaking of the land seen from the Tchutski Nofa, it is said, that, during the summer, they sail in one day to the land in baidares, a kind of vessel formed of whale-bone, and covered with the skins of seals; and, in the winter, as they go swift with rein-deer, the journey may be performed in a day. Muller's account of one of the expeditions, undertaken for the purpose of discovering a supposed island in the Frozen Sea, is still more remarkable. His narrative is to the following purport. In 1714 a new expedition was prepared from Jakutzk, under the conduct of Alexei Markoff, who was to set sail from the mouth of the Jana; and if the Schitiki were not well adapted for sea voyages, he was to build, at a convenient place, proper vessels for prosecuting the discoveries without any great risk. Upon his arrival at Ust-jankhoe Simovie, the place where he was to embark, he dispatched an account, dated the 2nd of February 1715, to the Chancery of Jakutzk, intimating, that it was impracticable to navigate the sea, as it was constantly frozen both in winter and summer; and that, consequently, the expedition could only be prosecuted in sledges drawn by dogs. He accordingly set out in this manner, accompanied with nine persons the 10th of March, in the same year, and returned to Ust-jankhoe Simovie on the 3d of the succeeding month. The account of his journey is as follows: that for the space of seven days, he travelled with as much expedition as his dogs could draw, (which in good tracks, and favourable weather, is from 80 to 100 wersts a day) to the northward, upon the ice, without observing any island: that he was prevented from proceeding farther by the ice, which rose like mountains in that part of the sea: that he had ascended some of these, whence he could see to a great distance around him, but could discern no land: and that, at length, provisions for his dogs being deficient, many of them died, which reduced him to the necessity of returning.

Besides the above-mentioned arguments, which proceed upon an admission of the hypothesis, that the ice in this ocean comes from the rivers, others may be adduced, which afford good reason for suspecting the truth of the hypothesis itself. Captain Cook, whose opinion, with regard to the formation of ice, had originally coincided with that of the theorists we are now endeavouring to confute, found sufficient grounds, in the present voyage, for changing his sentiments. We observed, that the coasts of both continents were low; that the depth of water gradually decreased towards them, and that a striking resemblance prevailed between the two; from which circumstances, as well as from the description given by Mr. Hearne of the coppermine river, we have room for conjecturing, that whatever rivers may discharge themselves into the Frozen Ocean, from the continent of America, are of a similar nature with those on the Asiatic side; which are said to be so shallow at their entrance, as to admit only vessels of inconsiderable magnitude; whereas the ice seen by us, rises above the level of the sea, to a height that equals the depth of those rivers; so that its entire altitude must be, at least, ten times greater. Another circumstance will naturally offer itself in this place to our consideration, which seems to be very incompatible with the opinion of those who suppose that land is necessary for the formation of ice, we mean the different state of the sea about Spitzbergen, and of that

which is to the northward of Beering's Straits. It is incumbent on those objectors to explain how it happens, that in the former quarter, and in the neighbourhood of much known land, navigators annually penetrate to near 80 deg. of northern latitude; whereas, on the other side, no voyager has been able to proceed with his utmost efforts beyond the 71st deg. where, moreover, the continents diverge nearly in the direction of E. and W. and where there is not any land known to exist in the vicinity of the pole. For the farther satisfaction of our readers on this subject, we refer them to Dr. Forster's "Observations round the world," where they will find the question of the formation of the ice, discussed in a full and satisfactory manner, and the probability of open polar seas disproved by many forcible arguments.

In order to give these observations their full force, we beg leave to subjoin a comparative view of the progress made by us to the northward, at the two different seasons in which we were occupied in that pursuit; together with some general remarks respecting the sea, and the coasts of the two continents, which lie to the N. of Beering's Straits. In 1778, we did not discover the ice, till we advanced to the latitude of 70 deg. on the 17th of August: and then we found it in compact bodies, which extended as far as the eye could discern, and of which the whole, or a part, was in motion, since, by its drifting down upon our ships, we were almost hemmed in between that and the land. After we had experienced, both how fruitless and dangerous it would be to attempt to penetrate farther to the northward between the land and the ice, we stood over towards the side of Asia, between the latitudes of 69 deg. and 70 deg. After having encountered in this track very large fields of ice, and though the fogs and thickets of the weather prevented us from entirely tracing a connected line of it across, yet we were certain of meeting with it before it reached the latitude of 70 deg. whenever we made any attempts to land to the N. On the 26th of August, we were in latitude 69 deg. 45 min. longitude 184 deg. obstructed by it in such a manner, and in such quantities, that we could not pass either to the N. or W. and were under the necessity of running along the edge of it to the S. S. W. till we perceived land, which proved to be the Asiatic coast. With the season thus far advanced, the weather setting in with snow and sleet, and other indications of the approach of winter, we relinquished our enterprise for that time.

When we made a second attempt, the following season, in 1779, we did little more than confirm the remarks made by us in the first; for we never had an opportunity of approaching the continent of Asia in a higher latitude than 67 deg. nor that of America in any parts, except a few leagues between the latitude of 68 deg. and 68 deg. 20 min. that we had not seen the preceding year. We now met with obstructions from the ice 3 deg. lower; and our efforts to make farther progress to the northward, were chiefly confined to the middle space between the two coasts. We penetrated near 3 deg. farther on the side of America, than that of Asia, coming up with the ice both years sooner, and in more considerable quantities, on the latter coast. As we advanced in our northerly course, we found the ice more solid and compact: however, as in our different traverses from one side to the other, we passed over spaces which had before been covered with it, we imagined, that the greatest part of what we saw was movable. Its height, on a medium, we estimated at eight or ten feet, and that of the highest at 16 or 18 feet. We again examined the currents twice, and found that they were unequal, though they never exceeded one mile an hour. We likewise found the currents to set different ways, but more from the S. W. than from any other quarter; yet whatever their direction might be, their effect was so inconsiderable, that no conclusions, with respect to the existence of any passage towards the N. could possibly be drawn from them. We found July much colder than August. The thermometer, in the 1st of these months, was once at 28 deg. and frequently

quently at 30 deg. whereas, during the last season, in 1778, it was very uncommon in August, to have it so low as the freezing point. In both seasons, we experienced some high winds, all of which blew from the S. W. Whenever the wind was moderate from any quarter, we were subject to fogs; but they were observed to attend southerly winds more constantly than others. The straits, between the American and Asiatic continents, at their nearest approach, in lat. 66 deg. were ascertained by us to be 13 leagues, or 39 miles, beyond which they diverge to N. E. by E. and W. N. W. and in the lat. of 69 deg. their distance from each other is about 300 miles, or 100 leagues. In the aspect of the two countries to the N. of the straits, a great resemblance is discernible. Both of them are destitute of wood. The shores are low, with mountains farther inland, rising to a great height. The soundings, in the midway of the straits, were 29 and 30 fathoms, gradually decreasing as we approached either continent; with

this difference, however, that the water was somewhat shallower on the coast of America, than on that of Asia, at an equal distance from land. The bottom, towards the middle, was a soft slimy mud; and near either shore, it was a brownish sand, intermixed with a few shells, and small fragments of stones. We found but little tide or current, and that came from the W. But on the 30th of July, in the present year 1779, when in Beering's Straits, and steering to the southward, we found a current so strong as to make our passage both difficult and dangerous. It set at this time to the N. W. We might to these observations, which, we doubt not, will be highly acceptable to our very numerous friends and subscribers, add some others; but we apprehend, they will think, with us, that it is now time to resume the narrative of our voyage, which was broken off on the 31st of July, on which day, at noon, we had proceeded 18 leagues to the southward of the East Cape.

ON Sunday, the 1st of August, 1779, we observed in lat. 64 deg. 23 min. long. 189 deg. 15 min. at which time the Asiatic coast extended from N. W. by W. to W. half S. distant 12 leagues, and the land to the E. of St. Lawrence bore S. half W. On the 2d, the weather being clear, we saw the same land again, at noon, extending from W. S. W. half W. to S. E. and forming several elevated hummocks, which had the appearance of separate islands. Our lat. this day, at noon, we found to be 64 deg. 3 min. long. 189 deg. 28 min. and our soundings were 17 fathoms. We were not near enough to this land to ascertain, whether it was a group of islands, or only a single one. We had passed its most westerly point in the evening of the 3d of July, which we then supposed to be the Isle of St. Lawrence; the easternmost we failed close by in September, the preceding year, and this we denominated Clerke's Island, and found it composed of a number of lofty cliffs, connected by very low land. Though those cliffs were mistaken by us, last year, for separate islands, till we made a very near approach to the shore, we are still inclined to conjecture, that the Isle of St. Lawrence is distinct from Clerke's Island, as there appeared between them a considerable space, where we did not observe the least appearance of rising ground. In the afternoon, we likewise saw what had the appearance of a small island, to the N. E. of the land that we had seen at noon, and which, from the thickness of the weather, we had only sight of once. We supposed its distance to be 19 leagues from the island of St. Lawrence, in the direction of N. by E. half E. On the 3d, we had light variable winds, and steered round the N. W. point of the Isle of St. Lawrence. In the afternoon, a fresh breeze rising from the E. we steered to the S. S. W. and quickly lost sight of St. Lawrence. On Saturday, the 7th, at noon, we observed in lat. 59 deg. 38 min. long. 183 deg. At four o'clock, having a dead calm, part of the companies of both ships were employed in fishing, and caught a number of fine large cod, in 17 fathoms water, which were distributed equally among the crews. To this place we gave the name of the Bank of Good Providence, and as soon as the breeze sprung up, we made sail, and stood to S. W. but we were forced more to the eastward than we wished, it being our in-

tention to make Beering's Island. On Tuesday, the 10th, we were, by observation, in lat. 56 deg. 37 min. Friday, the 13th, we dispatched a boat to the Discovery, for the purpose of comparing time, and the carried the disagreeable intelligence, that Captain Clerke had been given over by the surgeon. The weather falling calm, we hove to, in order to get some fish for the sick: a few were caught, and distributed accordingly.

On Tuesday, the 17th, at five o'clock, A. M. the man at the mast-head called out, Land to the N. W. This we imagined to be the island of Mednoi, which, in the Russian charts, is placed to the S. E. of Beering's Island. It is elevated land, and was at this time apparently free from snow. By our reckoning, it lies in lat. 54 deg. 28 min. long. 167 deg. 52 min. Captain Clerke, now perceiving his end drawing near, signified his desire, that the officers would receive their orders from Mr. King; and directed for the last time, that we should repair, with all convenient speed, to the Bay of Awatka. The wind continuing westerly, we held on a southerly course, till Thursday, the 19th, when, after a few hours continuance of rain, early in the morning, it blew from the E. and became a strong gale. We made the most of it, by standing towards the W. with all the sail we could carry. On the 20th, the wind varying to the S. W. we steered a W. N. W. course. At noon, we observed in lat. 53 deg. 7 min. long. 168 deg. 49 min. On Saturday, the 21st, between five and six o'clock, A. M. we descried a very lofty peaked mountain, on the coast of Kamtschatka, known by the name of Chepooniskoi mountain, bearing N. W. by N. and distant near 30 leagues. At noon, the coast was observed to extend from N. by E. to W. with a very great haziness upon it, and distant about 12 leagues.

On Sunday the 22nd, at nine o'clock, A. M. a boat was sent off to the Discovery, to announce to Captain Gore, the death of our Commodore, Captain Charles Clerke, who paid the debt of nature when in the 38th year of his age. His death was occasioned by a consumption, which had manifestly commenced before his departure from England, and of which he had lingered during the whole continuance of the voyage.

His

His very gradual decay had for a long time rendered him a melancholy object to his friends; but the firmness and equanimity with which he bore the slow approach of death, the constant flow of good spirits which he retained even to the last hour, and a cheerful resignation to the decree of heaven, furnished them with some consolation. It was impossible not to feel an uncommon degree of compassion for a gentleman, who had experienced a series of those difficulties and hardships, which must be the inevitable lot of every seaman, and under which he at last sunk. He was bred to the navy from his youth, and had been in many engagements during the war which commenced in 1756. In the action between the Bellona and Courageux, he was stationed in the mizen-top, and was carried overboard with the mast; but was taken up, without having received the least injury. He was midshipman on board the Dolphin, commanded by Commodore Byron, when she first sailed round the world; and was afterwards on the American station. In the year 1768, he engaged in a second voyage round the world, in the situation of master's mate of the Endeavour; and, during that expedition, succeeded to a lieutenantcy. In the Resolution he made a third voyage round the world, in the capacity of second lieutenant; and, in a short time after his return, he was appointed master and commander. In the present expedition, he was appointed Captain of the Discovery, and to accompany Captain Cook. By the calamitous death of the latter, he succeeded of course, as we have already related, to the chief command. It would favour of injustice and ingratitude, not to mention, that, during the short time he was Commodore, we always observed him to be remarkably zealous for the success of the expedition. When the principal command devolved upon him, his health began rapidly to decline; and he was unequal, in every respect, to encounter the severity of a high northern climate. The vigour of his mind, however, was not, in the least, impaired by the decay of his body; and though he was perfectly sensible, that his delaying to return to a warmer region was depriving himself of the only chance of recovery; yet, so attentive was he to his duty, that he was determined not to suffer his own situation to bias his judgment to the prejudice of the service: he therefore persevered in the search of a passage, till every officer in both ships, declared they were of opinion it was impracticable, and that any farther attempts would be equally hazardous and ineffectual.

The messenger who was sent to the Discovery with the melancholy news of our Commodore's death, brought a letter from Captain Gore, containing an order for Captain King to exert his utmost endeavours to keep in company with the Discovery, and, if a separation should happen, to repair as soon as possible, to St. Peter and St. Paul. At noon, we were by observation in lat. 53 deg. 8. min. long. 160 deg. 40 min. E. Cheepoon-koï Nofs bearing W. On the 23rd, we steered for the entrance of Awatka Bay, which we saw in the evening, at the distance of 5 leagues. At eight o'clock, the light-house, which now furnished a good light, bore W. N. by W. 3 miles distant. It was now a perfect calm, but, the tide being favourable, our boats were sent ahead, which towed us beyond the narrow parts of the mouth of the harbour. On the 24th, at one o'clock A. M. we dropped anchor, the ebb tide setting against us. At nine we weighed, and before three P. M. we anchored in the harbour of St. Peter and St. Paul; having up our ensign half staff, as the body of our late Captain was in the vessel; and the Discovery followed us in a very short time. Both ships were moored in four fathoms water, muddy bottom. From the time we had set sail out of this bay, till the present time of our return, we had been in no harbour to refit, and had been driven from island to island, and from one continent to the other, till our ships had in a manner lost their sheathing, and were otherwise in a miserable condition; we therefore thought ourselves exceeding happy in arriving at port. Soon after we had anchored, we were visited by our old friend the Serjeant, still the com-

manding officer, who brought with him a present of berries, intended for our late Commodore. He was much affected at hearing of his death, and seeing the coffin that contained his remains. As the deceased had particularly requested to be buried on shore, and gave the preference to the church at Paratounga, we consulted the Serjeant about the necessary steps to be taken on this occasion, who referred us to the priest, as being the person best qualified to give us information on this subject. At the same time he signified his intention of sending an express to the Commander of Bering's Bay, with an account of our arrival; when Commodore Gore begged to avail himself of that opportunity, by conveying a letter to him, wherein he requested that 16 head of black cattle might be sent with all possible dispatch. At this time, we received intelligence of Sopsocicoff's arrival from Onalashka, who took charge of the packet sent by Captain Cook to the Admiralty, and which we had the pleasure to find had been forwarded.

Wednesday, the 25th, in the morning, Captain Gore, in consequence of the death of our late Commodore, made out the new commissions. He himself succeeded to the chief command in the Resolution; and our lieutenant, Mr. King, was appointed Captain of the Discovery. Mr. Lanyon, master's mate of the Resolution, and who had been in that capacity, in a former voyage, on board the Adventure, was appointed to the vacant lieutenantcy. In consequence of these arrangements, the following promotions took place. Lieutenants Burney and Rickman (from the Discovery) were appointed first and second lieutenants of the Resolution; and lieutenant Williamson first lieutenant of the Discovery. Captain King, by the permission of the Commodore, took in four midshipmen, who had rendered themselves useful to him in astronomical calculations; and whose assistance was become the more necessary, as we had not an ephemeris for the present year. And that astronomical observations might not be neglected to be made in either ship, Mr. Bayly took Captain King's place in the Resolution, for these purposes. This day we were attended by the Pope Romanoff Vereftagen, the worthy priest of Paratounga. His expressions of sorrow for the death of Captain Clerke did honour to his feelings; but the good old gentleman, though much concerned, started several difficulties, and appeared rather unwilling to comply with the request of the deceased. He urged, among other objections, that the Church was soon to be pulled down; that every winter it was three feet deep in water; and that in a few years no vestige of it would remain, as the new church was to be erected near the Ostrog of Awatka, upon a drier and more convenient spot. He therefore advised, that the remains of our late Commodore should be deposited at the foot of a tree, the site of which was to be included in the body of the new church, where the bones of the Captain might probably rest for ages undisturbed: however, he submitted the choice of either place entirely to Captain Gore. These reasons, whether real or fictitious, the officers who had charge of the funeral could not disprove, and therefore some of our people had orders to dig the grave where the priest should direct.

The Discovery having suffered great injury from the ice, especially on the 23d of July, and continued exceeding leaky ever since, it was apprehended that some of her timbers might have started: our carpenters were therefore sent to assist those of the Discovery in repairing her. To accommodate those who were to be employed on shore, a tent was erected, and a party was sent into the country, north of the harbour, to fell timber. The observatories were placed at the west end of the village, near which was erected a tent, as an abode for the Commodore and Captain King. When the carpenters began to rip the damaged sheathing from the larboard bow, it was discovered, that three feet of the third strake were staved, and the timbers started: and as they proceeded, the decayed state of the ship's hull became more and more apparent. The season being now far advanced, Captain King was unwilling that

any hindrance or delay should happen through him, to Captain Gore's farther views of discovery, and therefore ordered the carpenters to rip off no more of the sheathing, than should be absolutely necessary for repairing the damages occasioned by the ice. He was apprehensive of their meeting with more decayed planks, which he thought had better remain in that state, than have their places supplied with green birch, even supposing it could be procured. All hands were now fully employed in their separate departments, that we might be perfectly ready for sea, by the time the carpenters had completed their business. Four men were set apart to haul the seine for salmon, which were caught in immense quantities, and we found them of most excellent quality. After the wants of both ships were sufficiently supplied, we daily salted down almost a hoghead. We had four invalids, who were employed in gathering greens, and cooking for those who were ashore. We also landed our powder, in order to have it dried; and the blubber of the sea horses, with which both ships had completely furnished themselves, in our passage to the north, was now boiled down for oil, and was become a very necessary article, having long since expended all our candles. The cooper was also employed in his department. Both ships companies were thus engaged till Saturday, the 28th, in the afternoon, which was allowed to every man (except the carpenters) to wash their linen, and get their clothes in tolerable order, that on Sunday they might make a decent appearance.

On Sunday, the 29th, we performed the last affecting offices at the interment of Captain Clerke, our late much respected Commodore; and to make the funeral the more solemn, every officer was desired to appear in his uniform; the marines were ordered to be drawn up under arms; and the common men to be dressed as nearly alike as possible, in order to attend the corpse from the water-side to the grave. All the Russians in the garrison assembled on the occasion, assisting respectfully in the solemnity, and the worthy pastor of Paratounca joined in the procession, walking with the gentleman who read the service. The ships, at the same time fired minute guns, and the drums, muffled as usual, beat the dead march. When the corpse arrived at the grave, it was deposited under a triple discharge of three volleys, fired by the marines, which concluded the burial service. When the grave was covered, it was thought proper to fence it in by piles driven deep in the ground, and afterwards to fill up the space inclosed with stones and earth, to preserve the body from being devoured in the winter by bears, or other wild beasts, who are remarkable for their sagacity in scenting out the bodies of dead passengers, when any happen to perish, and are buried near the roads. This mournful ceremony being over, an escutcheon was prepared, and neatly painted by the ingenious Mr. Webber, with the Captain's coat of arms properly emblazoned, and placed in the church of Paratounca. Underneath the escutcheon was the following inscription.

There lies interred at the foot of a tree,
near the Orlog of St. Peter and St. Paul,
The Body of
CHARLES CLERKE, Esquire,
Commander of his Britannic Majesty's
Ships, the Resolution and Discovery;
To which he succeeded on the Death of
JAMES COOK, Esquire,
Who was killed by the natives of an Island we
discovered in the South Sea, after having ex-
plored the Coast of America, from 42 deg.
27 min. to 70 deg. 40 min. 57 sec. N.
in search of a N. W. passage
from EUROPE to the
EAST-INDIES.

The Second Attempt being made by
Captain Clerke, who sailed within some few
Leagues of Captain Cook; but was brought
up by a solid body of Ice, which he found
from the America to the Asia shore,

and almost trended due East and
West—He died at Sea,
on his return to the
Southward, on the
22nd Day of
August, 1779,
Aged 38 Years.

Another inscription was affixed to the tree under which he was interred. This tree stands on a little eminence, in the valley, north of the harbour (and at some distance from the town), where the store-houses and hospital are situated, and round which several Russian gentlemen had been buried; but none so high upon the eminence as the spot pointed out for the grave of Captain Clerke, and which Captain Gore supposed to be such a situation, as was most consonant to the wishes of the deceased. The inscription at this place was nearly the same as that in the Church, and is as follows.

Beneath this tree lies the Body of
Captain **CHARLES CLERKE**, Esquire,
Commander of His Britannic Majesty's
Ships, the Resolution and Discovery;
Which Command he succeeded to, on the 14th
of February, 1779, on the death of
Captain **JAMES COOK**,
Who was killed by the Natives of some
Islands he discovered in the South
Sea, on the Date above.
CAPTAIN CLERKE died at Sea,
of a lingering Illness, on the 22nd Day of
August, 1779.
In the 38th Year of his Age:
And was Interred on Sunday, the 29th following.

On this occasion the crews of both ships were suffered to continue on shore, and to divert themselves, each as he liked best. It was Captain Clerke's desire that they should have double allowance for three days successively, and all that while to be excused from every other duty, than what the ordinary attendance in the ships required; but the season being far advanced, and a long track of unknown sea to traverse before they could reach China, the officers representing the hardships and inconveniences that so much lost time might bring upon themselves, they very readily gave up that part of the Captain's request, and returned to their respective duties early the next day. Accordingly, on Monday the 30th, the several parties reassumed their allotted employments; and on the 2nd of September, the carpenters proceeded to rip off such of the sheathing as had been injured by the ice, from the starboard-side; having first shifted the damaged planks, and repaired and caulked the sheathing of the larboard-bow. Four feet of the plank were discovered in the third strake under the wale, so much shaken as to require to be replaced; which was accordingly done; and on the 3d the sheathing was repaired. In the afternoon we got some ballast on board; after which we unhung the rudder, and caused it to be conveyed on shore, the lead of the pintles being much worn, and a considerable part of the sheathing rubbed off. This day an ensign arrived from Bolcheretsk, with a letter from the Commander of that place to Captain Gore; from which, by the assistance of the serjeant, we understood, that proper orders had been given respecting the cattle; and that in a few days we might expect to see them: to which was added, that Captain Shmaleff, who succeeded Major Ikhn, in his command, would pay us a visit on the arrival of a sloop which he expected from Okotsk. The bearer of the letter was a son of Captain Lieutenant Synd, who about eleven years ago, was appointed to the command of an expedition on discovery, between Asia and America, and now resided at Okotsk. He told us he was appointed to receive our directions, and to supply us with every thing that our service might require: that he should remain with us, till it was convenient for the Commander to leave Bolcheretsk; and then he was to return, or the garrison would be without an officer.

ended due East and

as to require to be replaced,
one; and on the 3d the sheath-
the afternoon we got some bal-
we unhung the rudder, and
on shore, the lead of the pin-
and a considerable part of the
his day an ensign arrived from
from the Commander of that
om which, by the assistance of
d, that proper orders had been
; and that in a few days we
; to which was added, that
succeeded Major Behm, in
us a visit on the arrival of
from Okotsk. The bearer of
Captain Lieutenant Synd, who
as appointed to the command
very, between Asia and Ame-
Okotsk. He told us he was
directions, and to supply in
service might require: that
till it was convenient for the
cheretzk, and then he was to
ould be without an officer.
The

The Russians, in Kamtschatka, could not furnish us with a better account of Synd than Mr. Coxe has given us; though they seemed disposed to communicate, without reserve, what they really knew. From Major Behm we had received only this general information; that the expedition had miscarried, and that the Commander had been censured. It was evident, that he had been on the coast of America, south of Cape Prince of Wales; and as he was too far north to meet with sea otters, which the Russians seem to have in view in all their attempts at discoveries, it is probable, that his return without having made any, from whence commercial advantages might be reaped, was the cause of his disgrace, and on that account his voyage is spoken of with contempt by all the Russians. On Sunday, the 5th, all the parties that were on shore returned to the ship, and were employed in scrubbing her bottom, and getting in some single ballast. On Wednesday, the 8th, we hauled the Resolution on shore, in order to repair some damages she had received from the ice, in her cut-water. We began, about this time, to make a strong decoction from a species of dwarf pine, which is very plentiful in this country, judging it would hereafter be useful in making beer, and that we might perhaps be able to procure sugar, or a substitute, to ferment with it, at Canton. We knew, however, it would be an admirable medicine for the scurvy, and therefore were particularly desirous of procuring a considerable supply; as most of the preventives with which we had furnished ourselves, were either consumed, or had lost their efficacy through long keeping. When we had prepared about a hoghead of it, the ship's copper was found to be remarkably thin, and that, in many places, it was even cracked. This obliged us to desist, and orders were given, that, for the future, it should be used as sparingly as possible. Those navigators, who may hereafter be engaged in long voyages, would act judiciously if they provided themselves with a spare copper, or, at least, they should be fully convinced, that the copper, usually furnished, should be remarkably strong and durable. These necessary utensils are employed in so many extra services, particularly in that important one of brewing antiscorbutic decoctions, that some such provision seems absolutely necessary; and the former appears the more eligible, because a much greater quantity of fuel would be consumed in heating coppers that are very thick.

Friday, the 10th, in the morning, the boats from both the ships were ordered to tow a Russian galliot into the harbour, which had just arrived from Okotsk. She had been no less than 35 days on her passage, and, from the Light-house, had been observed a fortnight before, beating up towards the mouth of the bay. The crew had at that time dispatched their boat on shore, in order to procure water, which they much wanted; but, the wind increasing, the boat was lost: the galliot was again driven to sea, and those who were passengers suffered, with the crew, inconceivable hardships. On board this galliot were fifty soldiers, with their wives and children; they had also other passengers, and the crew consisted of 25 seamen, making in the whole, upwards of 100 persons; which, for a vessel of 80 tons, was a great number, especially as she was heavily laden with stores and provisions. This galliot, and the sloop which we saw here in May, are built in the manner of the Dutch doggers. Soon after the vessel had come to anchor, we were visited by a Put-parouchich, or sub-lieutenant, who arrived in her, and sent to take the command of this place. Some of the soldiers were intended to reinforce the garrison; and two pieces of cannon were brought on shore, to serve as an additional defence to the town; for, the honest serjeant observed shrewdly, that, as we had found the way here, others might do the same, who would not be so welcome as ourselves. On the 11th, the damages of the Resolution being repaired, we hauled her off from the shore, and, in the course of the day, we got some pitch, tar, cordage, and twine from the galliot. She also furnished us with 140 skins of flour, amounting to 13,782 English pounds troy weight. On the 13th, Ensign Synd left us to return to Bolcheretzk, with the remainder of the soldiers

who had arrived in the galliot. During his abode here, he had been our constant guest; and, on his father's account, we thought him in some degree belonging to us; and, as one of the family of discoverers, entitled to a share of our esteem. The serjeant, as being commander of the place, had hitherto been admitted to our tables; and his company was additionally welcome to us, because he was sensible and quick in his conceptions; and comprehended, better than any other person, the few Russian words that we had acquired. Whilst Ensign Synd remained among us, he very politely permitted him to enjoy the same privileges; but when the new Commander arrived from Okotsk, the serjeant, for what cause we did not understand, fell into disgrace, and was no longer permitted to sit in the company of his own officers. Our endeavours to obtain indulgence for him, we perceived would have been ineffectual; for though highly agreeable to us, it was, perhaps, incompatible with their discipline.

On Wednesday, the 15th, we had completed the stowage of the holds, got our wood and water on board, and were ready for sea; but we could not think of taking our departure, because the cattle were not yet arrived from Verchnei; and fresh provisions were now become the most important article of our wants, and essentially necessary for preserving the health of our people. Having before us a prospect of fine weather, we considered this as a favourable opportunity of engaging in some amusement on shore, and of acquiring some knowledge of the country. A party for bear-hunting was therefore proposed by Captain Gore; and on Friday, the 17th, we set out on this expedition; which was deferred to that day, in order to give a little rest to the Hospodin Ivafkin, a new acquaintance, who had arrived here on Wednesday, and intended to be one of our party. Major Behm had desired this gentleman, who resided usually at Verchnei, to attend us on our return to the harbour, and assist us as an interpreter; and, from what we had heard of him before his arrival, our curiosity to see him was much excited. He is allied to a considerable family in Russia, and his father was a general in the service of the Empress. He received his education partly in France; he had been a page to the Empress Elizabeth, and bore an Ensign's commission in her guards. At 16 years of age he was knowted, had his nose slit, and was banished to Siberia. He was afterwards transported to Kamtschatka, and had resided there 31 years. His person was tall and thin, and his visage furrowed with deep wrinkles. Old age was strongly depicted in his whole figure, though only 53 years of his existence had scarcely elapsed. Great was our disappointment when we discovered, that he had so totally forgotten the French and German languages, as not to be able to speak a single sentence, nor to comprehend readily any thing that was said to him in either of those languages. Thus were we deprived unfortunately, of what we expected would have furnished a favourable opportunity of acquiring further information respecting this country. The cause of his banishment remained a secret to every one in his country, but it was generally supposed, he had been guilty of some atrocious offence; especially as several of the Commanders of Kamtschatka have exerted their interest to get him recalled, in the reign of the present Empress; but, so far from succeeding in their applications, they were not able to change the place of his banishment. He assured us that, for 20 years, he had not tasted a morsel of bread, nor had been allowed any kind of subsistence; but had lived all that time with the Kamtschadales, on what he had procured from the chase by his own activity and toil. Afterwards a small pension was allowed him, and his situation has been rendered much less intolerable, since Major Behm was appointed to the command. Being noticed by so respectable a character, who often invited him to become his guest, others were induced to follow his example. The Major had also occasioned his pension to be augmented to 100 roubles a year, which is an Ensign's pay in every other part of the Empress's dominions, but in this province, all the officers have double pay. Major Behm informed us, that

he had obtained permission for him to go to Okotsk, where he was to reside in future; but that, at present, he should leave him behind, as he might probably be useful to us as an interpreter, on our return to the Bay.

We now set out on our hunting party, directing our course to the northward, toward a pool of water, that lies near the mouth of the river Paratounca, and which was a known haunt of the bears. We had scarce landed, when unfortunately the wind changed to the eastward, and destroyed all hopes of coming up with our game; for the Kamtschadales assured us, that it was in vain to expect to meet with bears, when to the windward of them; owing to their being possessed of an uncommon acuteness in scenting their pursuers, which enabled them, under such circumstances, to avoid the danger, though at a very great distance from them. We returned therefore to the boat, and passed the night on the beach, having brought a tent with us for that purpose. The next morning, being the 18th, we crossed the bay, and pursued our course on foot along a plain, abounding with berries, on which the bears feed; but though several of these animals were seen at a distance, we could never contrive, the weather being showery and unfavourable, to get within shot of them. Thus disappointed gain, we changed our diversion to that of spearing salmon, which we saw pushing in great numbers through the surf into a small river. Fortunately the water afforded us a little provision; for ill success had not only attended us in the chase by land, but we had failed in our expectations of shooting wild fowl, after having almost depended solely upon a supply of them for our subsistence; and on its failure, we began to think it time to return to head quarters. These sentiments entirely corresponded with those of the Hofpodin, whom former festivities had rendered unable to endure fatigue. On Sunday, the 19th, at night, we reached the ships, after having been full 12 hours upon our legs. Poor Ivalkin seemed perfectly overcome with fatigue, and was probably the more sensibly affected by it, for want of a supply of snuff; for, almost at every step, his hand sunk mechanically into his pocket, and rose instantly again with his huge empty box. When arrived at the tent, the Hofpodin's box was immediately replenished, and, regaling upon a good supper, we forgot the fatigues and disappointments of our fruitless excursion.

On Monday, the 20th, we received the disagreeable intelligence, that our much esteemed friend, the serjeant, had suffered corporal punishment, which had been inflicted on him by command of the old Put-parouchick. None of us could learn the cause of his displeasure; but it was supposed to have arisen from some little jealousy, which had been excited by our civility to the former. We were unwilling to remonstrate on this subject, till Captain Shmaleff should arrive; however, when we were next visited by the Put-parouchick, the coolness with which we received him, must have testified fully our chagrin. The 22d, being the anniversary of the King's Coronation, we fired 21 guns; and, in honour of our Royal Master, prepared as elegant a feast as our situation would allow of. The arrival of Captain Shmaleff was announced the very moment we were sitting down to dinner. We were equally pleased and surprized at this unexpected visit: first, because the Captain came so opportunely to take a share in the festivity of the day; and also, because we were lately informed, that the effects of a late illness had rendered him unequal to the journey. We had the satisfaction to hear this had been merely an excuse; and that, knowing we were distressed for tea and sugar, &c. he was hurt at the idea of coming empty handed, and therefore had deferred his setting out, waiting impatiently for the arrival of a sloop from Okotsk; but hearing no intelligence of her, and fearing we should sail before he had visited us, he was resolved to prosecute the journey, though he had nothing to present to us but apologies for the poverty of Bolcheretk. At the same time he informed us, that the reason of our not having received the black cattle, was, that the heavy rains at Verchnei, had prevented their setting out. So much generosity and politeness demanded the best answer we were capable of making;

and on coming on board the next day, we saluted him with 11 guns. Friday, the 24th, he was entertained on board the Discovery; and the day following, being the 25th, he returned to Bolcheretk. No intreaties could prevail on him to extend his visit; having, as he assured us, some expectations that the sub-governor-general would arrive in the sloop expected from Okotsk, he being on a tour through all the provinces of the governor-general of Jakutsk. Without any application from us, he reinstated the serjeant in his command, before his departure, having resolved to take the Put-parouchick with him. We also understood, that he was much offended with him for punishing the serjeant, as there did not appear to be the slightest grounds for inflicting such chastisement. Encouraged by the Captain's great readiness to oblige us, we ventured to request a small favour for another inhabitant of Kamtschatka. It was to requite an honest old soldier, who kept a kind of ordinary for the inferior officers, and who had done a thousand good offices both for them and the whole crew. The Captain obligingly complied with our wishes, and dubbed him instantly a corporal, telling him, at the same time, to thank the English officers for his very great promotion. It may not here be unnecessary to remark, that the lower class of officers in the Russian army have a greater pre-eminence above the private men, than those in the British service can possibly conceive. It was, indeed, a matter of astonishment to us, to see a serjeant assume all the state, and exact as much homage from those beneath him, as though he had been a field-officer. Besides there are several gradations of rank among them, of which other countries are wholly ignorant; there being no less than four intermediate steps between a serjeant and a private soldier. But the discipline of the Russian army, though so extremely remote from the seat of government, is remarkable for its strictness and severity; not exempting even the commissioned officers. Imprisonment, and bread and water diet, is the punishment of the latter for inconsiderable offences. A good friend of ours, an Ensign in this place, informed us, that the punishment he received for having been concerned in a drunken frolic, was three months imprisonment in the black hole, with a daily allowance only of bread and water for his subsistence; which affected his whole nervous system, that he has never since enjoyed a sufficient flow of spirits to qualify him for a convivial meeting. Captain King attended Captain Shmaleff as far as the entrance of Awatska river, and, having taken leave of him, embraced that opportunity of visiting the priest of Paratounca.

On Sunday, the 26th, Captain King attended him to his church, where his whole congregation consisted of his own family, three men, and the same number of boys, who assisted in the singing; and the whole of the service was performed with great solemnity, and devotion. Though the church is of wood, it is much superior to any other edifice, either in this town, or that of St. Peter and St. Paul. Among several paintings with which it is ornamented, are two pictures of St. Peter and St. Paul, the Apostles, presented by the navigator, Beerig, and which may vie with the first European performances, in the intrinsic richness of their draperies, the principal parts thereof being composed of thick plates of real solid silver, so fashioned as to imitate the foldings of the robes which decorate the figures, and fixed upon the canvass. Monday, the 27th, was spent by another party in the diversion of bear-hunting; when Captain King submitted himself to the directions of the parish-clerk, who had acquired great reputation as a bear hunter. About sun-set they arrived at one of the larger lakes, where it was deemed necessary to conceal themselves; and this was effected easily among some long grass, and brush-wood, of which we saw great plenty near the water's edge. We had not been long under our covert, before our ears were agreeably saluted with the growling of bears, in almost every quarter round about us; and we soon had the pleasure of beholding one of them in the water, swimming in a direct course to where we lay concealed. At this time the moon shone, so as to afford a considerable light; and as

the bear advanced towards us, three of us fired at it, almost at the same instant. Immediately the animal turned short upon one side, and set up a most horrible noise, which was neither yelling, growling, nor roaring, but a very extraordinary mixture of the whole three. We could easily perceive, that the beast was wounded severely, and that it reached the bank with difficulty; whence it retreated to some thick bushes not far distant, still continuing to make a hideous noise. The Kamtschadales supposed it to be mortally wounded; but judged it an act of imprudence to attempt to rouse it again immediately. It was then nine o'clock; and as the night became overcast, and a change of weather was to be apprehended, we thought it advisable to return home, and wait till morning for the gratification of our curiosity, when we accordingly repaired to the spot, and found the bear dead from the wounds it had received. It was a female, and larger than the ordinary size.

This account of our hunting party may convey a wrong idea of the method pursued usually in this sport, to prevent which, it may not be amiss to subjoin a few words to this subject. The natives generally contrive to reach the ground about sun-set, where the bears usually frequent. They first look out for their tracks, and attend particularly to the freshest of them; always paying a regard to the situation with respect to concealment; and taking aim at the animal as it passes by, or advances, or goes from them. These tracks are numerous between the woods and the lakes, and are often found among the long sedge grass and brakes on the margin of the water. Having determined upon a convenient spot for concealment, the hunters fix their crutches in the ground, on which they rest their firelocks, pointing them in a proper direction. They afterwards kneel or lie down, as the circumstances of their situation may require; and, having their bearspears in readiness by their side, wait the arrival of their game. These precautions are extremely necessary, that the hunters may make sure of their mark: for the price of ammunition is so high at Kamtschatka, that the price of a bear will not purchase more of it than will load a musquet four or five times. It is much more material on another consideration; for, if the first shot should not render the bear incapable of pursuit, fatal consequences too frequently ensue. The enraged beast makes immediately towards the place from whence the sound and smoke issue, and furiously attacks his adversaries. They have not sufficient time to re-load their pieces, as the bear is seldom fired at till he comes within the distance 15 yards; therefore, if he should not happen to fall, they immediately prepare to receive him upon their spears; their safety depending, in a great measure, on their giving him a mortal stab as he advances towards them. Should he parry the thrust (which these animals are sometimes enabled to do, by the strength and agility of their paws; and break in upon his opponents, the conflict becomes bloody; for it is seldom that the loss of a single life will satisfy the bear's revenge. This business, or diversion, is particularly dangerous at two seasons of the year: in the spring, when they first issue from their caves, after having subsisted the whole winter (as it is here positively asserted) solely on sucking their paws; and especially if the frost should continue to be severe, and the ice in the lakes is not broken up; as they cannot then have recourse to their customary and expected food. Thus becoming exceedingly famished, they grow fierce and savage in proportion; pursuing the inhabitants by the scent; and prowling about at a distance from their usual tracks, dart upon them unawares. Under such circumstances, as the natives have no idea of shooting flying or running, or in any manner without resting their piece, they often fall a sacrifice to their savage rapacity. The time of their copulation, is the other dangerous season to meet with them, and that is usually about September. Many instances of natural affection in these animals are frequently related by the Kamtschadales, who hence derive considerable advantages in hunting. They never presume to fire at a

No. 77.

young bear if the dam is upon the spot; for if the cub should happen to be killed, the becomes enraged to an immoderate degree; and, if she can only obtain a sight of the offender, she is sure to be revenged of him, or die in the attempt. On the other hand, if the mother should be shot, the cubs continue by the side of her after she has been a long time dead; exhibiting, by affecting gestures and motions, the most poignant affliction. The hunters, instead of commiserating their distresses, embrace these opportunities of destroying them. If the voracity of the Kamtschadales may be depended on, the sagacity of the bears is as extraordinary as their natural affection. Innumerable are the stories which they relate to this effect. They likewise acknowledge infinite obligations to the bears, for all the little progress they have hitherto made in several arts. They confess themselves indebted wholly to those animals for all their knowledge in physic and surgery; that, by observing what herbs they have applied to the wounds they have received, and what methods they have pursued when they were languid, and out of order, they have acquired a knowledge of most of those simples which they have now recourse to, either as external or internal applications. But the most singular circumstance of all is, that they admit the bears to be their dancing-masters, though the evidence of our own senses places this matter beyond dispute; for in the bear-dance of the Kamtschadales, every gesture and attitude peculiar to that animal, is faithfully exhibited. All their other dances are similar to this in many particulars; and those attitudes are thought to come nearest to perfection, which most resemble the motions of the bear.

On Tuesday, the 28th, Captain King returned from his excursion to the ships, not a little pleased, as it had afforded him an opportunity of seeing a part of the country, and of observing the manners and behaviour of the people, when under no restraint, evidently not the case when they were in company with the Russians. On the 30th, our Commodore went to Paratounca; but, before his departure, ordered Captain King to get the ships out of the harbour, that they might be in readiness to sail.

On Friday, the 1st of October, we had a violent gale of wind, which continued the whole day; but, on the 2nd, both ships warped out of the harbour, and anchored in 7 fathoms water, about a quarter of a mile from the oitrog. Fortunately for us, the day before we quitted the harbour, the cattle from Verchnei arrived; and that the men might have the full enjoyment of this seasonable supply, by eating it whilst it was fresh, the Commodore determined to stay in our present station five or six days longer. This time, however, was far from being misapplied; for the pumps, sails, and rigging of each ship, received an additional repair. Captain King having obtained permission to use the copper belonging to the Resolution, and being supplied with molasses from Captain Gore, he was enabled to brew a sufficient quantity of beer to last the crew a fortnight, and to make ten additional puncheons of strong spruce essence. This supply was the more acceptable as our last cask of spirits was now serving out, except a small quantity reserved for cases of emergency. The 3d being the name-day of the Empress of Russia, we were cordially disposed to shew it every possible respect. The pastor of Paratounca, Ivalkin, and the Serjeant, were invited to dine with us; and an entertainment was prepared for the two Toions of Paratounca, and St. Peter and St. Paul; as well as for the inferior officers of the garrison, and the most respectable of the inhabitants. All the other natives were invited to partake in common with the ships companies; a pound of excellent beef being served out to every man, and the remainder of our spirits was made into grog, and distributed among them. Twenty-one guns were fired upon the occasion; and considering we were in a very remote part of the Empress's dominions, the whole festival was conducted in a manner not unworthy to illustrious a character. On Tuesday, the 5th, we received a fresh supply of tea, sugar, and tobacco, from Bolcheretsk. Captain Shmaleff having met this present

7 X

00

on his return, he transmitted a letter with it, informing us, that the sloop from Oksk had arrived in his absence, and that Madame Shm. left had instantly dispatched a courier with these few articles, requesting our acceptance of them. On the two following days we were prevented from unmooring by reason of foul weather; but on Friday the 8th, all the boats were hoisted in, and we sailed towards the mouth of the bay; when the wind, veering to the S. obliged us to drop anchor, the Ostrog bearing N. distant half a league. On the 9th, at four o'clock, P. M. we again unmoored; but as we were raising our last anchor, we were informed that the drummer of the marines had fled from the boat of the Discovery, which had just left the village, and that he had lately been seen with a Kamtschadale woman, to whom he was known to be much attached, and who had importuned him frequently to stay behind. This man was entirely useless in the service, being lamed by a swelling in his knee; and on that very account Captain King was the more unwilling to leave him behind, lest he should become a miserable burthen to himself and the Russians. He therefore applied to the Serjeant to send parties of his men after him; and in the mean time, some sailors visited a well known haunt of his in the neighbourhood, where the drummer and his woman were found together. On his return the Discovery weighed anchor, and followed the Resolution.

Having now taken our final departure from St. Peter and St. Paul, an account of Awatka Bay, and the adjoining coast, may not be unacceptable to our friendly readers; especially as it is, perhaps, the safest and most extensive bay that has ever been discovered; and the only one, in this part of the world, that can admit vessels of a considerable burthen. The entrance thereto is in the lat. 52 deg. 51 min. N. long. 158. deg. 48 min. E. It lies in the bight of another exterior bay, formed by Cape Gavareea to the S. and Cheepoonkoi Nofs to the N. The latter of these head-lands bears from the former N. E. by N. and is 32 leagues distant. From the Cape Gavareea to the entrance of Awatka Bay, the coast takes a northerly direction, and extends about 11 leagues. It consists of ragged cliffs and rocks, and in many parts, presents an appearance of bays and inlets; but, on a nearer approach, low ground was seen to connect the head-lands. From the entrance of Awatka Bay, Cheepoonkoi Nofs bears E. N. E. distant 17 leagues. The shore on this side is flat and low, with hills behind, rising gradually to a considerable height. The latitude of Cape Gavareea is 52 deg. 31 min. This remarkable difference of the land on the sides of Awatka Bay, together with their different bearings, are very proper guides to steer for it, in coming from the southward; and when it is approached from the northward, Cheepoonkoi Nofs becomes very conspicuous; it being a high projecting head-land, and is united to the continent, by a large extent of level ground, lower than the Nofs. We are rather particular in describing this coast; for if we had possessed a good account of its form on both sides of Awatka Bay, we should, when we first visited it, have arrived two days sooner than we did, and consequently have avoided part of the tempestuous weather, which we experienced in plying off the mouth of the harbour. Besides, as the fogs are so prevalent in these seas, it often happens, that an observation for ascertaining the latitude cannot be taken. It should also be considered, that land makes a very deceptive appearance when covered with snow, or when viewed through a hazy atmosphere; both which circumstances render it necessary for every navigator to be acquainted with as many discriminating objects as possible. Should the weather be sufficiently clear to admit a view of the mountains, both on the coast and its neighbourhood, the situation of Awatka Bay may be precisely known, by the two high mountains to the S. of it. That nearest the bay is in form of a fugar-leaf: the other more inland, is flat at top, and not quite so high. There are three very conspicuous mountains to the N. of the bay: that farthest to the W. appears to be the highest; the next, a volcano-mountain, may readily be known by the smoke issuing from the

top. The third is the most northerly, and might, with some propriety, be called a cluster of mountains, as it presents several flat tops to our view. When we got within the capes, and into the outward bay, a light-house on a perpendicular head-land, pointed out the entrance into the harbour to the N. Many such rocks lie to the eastward of this head-land, stretching two or three miles into the sea, and when this or a swell are moderate, they will always shew themselves. To the S. of the entrance, about 4 miles distant from it, lies a small round island, composed chiefly of high pointed rocks, one of which is larger, and more perpendicular than the rest. The entrance into the bay is at first, about three miles wide; one mile and a half in the narrowest part; and it is four miles long, in a N. W. direction. Within the mouth is a noble bay, 20 miles in circumference, in which are the harbours of Rakowena to the E. Tarcinska to the W. and St. Peter and St. Paul to the N. The breadth of Tarcinska harbour is three miles, and the length twelve. A narrow neck of land separates it from the sea at the bottom, and it stretches to the E. S. E. The entrance of the harbour of Rakowena is impeded by a shoal in the middle of the channel, which, in general, makes it necessary to warp in, unless there should happen to be a leading wind. Were it not for this circumstance, this harbour would be preferable to the other two. It is one mile and a half broad, and three miles long, running in a S. E. and easterly direction.

But, one of the most convenient little harbours we have seen, is that of St. Peter and St. Paul. Six ships may be commodiously moored in it, head and stern, and it is, in every respect, convenient for giving them any kind of repairs. The S. side of this harbour is formed by a low, narrow, sandy neck, whereon the Ostrog is built. The mid-channel is only 270 feet across, in which there was six fathoms and a half water. The deepest within is 7 fathoms, over a muddy bottom. We found, however, some inconvenience from the toughness of the ground, which often broke the messenger, and occasioned some trouble in getting the anchors up. At the head of this harbour is the watering place. Off the eastern harbour is a shoal, and within the entrance a spit, stretching from the S. W. shore, having only three fathoms water over it. To the clear of the latter, a small island, or rather a large detached rock, on the W. shore of the entrance, must be shut in with the land to the S. of it. In order to steer clear of the former, the three needle rocks, near the light-house-head, on the E. shore of the entrance, must be kept open with the head-lands to the northward of the first small bending on the E. side of the entrance. As you come into the harbour of St. Peter and St. Paul, and approach the village, it is very necessary to keep near the eastern shore, to avoid a spit which stretches from the head-land, to the S. W. of the Ostrog.

Let it be noticed, that the observatories were placed on the W. side of the village of St. Peter and St. Paul; and from the sun's meridian altitudes, and of five stars to the N. of the zenith we found the latitude to be 53 deg. 38 sec. N. and its longitude from 146 fets of lunar observations, to be 158 deg. 43 min. 16 sec. E. At full and change of the moon it was high water, at 36 min. after four; and five feet eight inches, was the greatest rise. The tides were regular every twelve hours. It may be proper to observe further, in this place, that the time-keeper on board our ship, which was copied exactly from Mr. Harrison's, by Mr. Kendal, stopped on the 27th of April, a few days before our first arrival in Awatka Bay. During the voyage, it had always been carefully attended to, not having been trusted, even for a moment, in any other hands than those of Captain Cook and Captain King. No accident, therefore, could possibly have happened, to which its stopping could be attributed; nor could it proceed from intense cold, the thermometer being but very little below the freezing point. When the failure of the piece was first discovered, the Commodore and Captain King consulted about the measures to be pursued; whether they should suffer it to remain in a useless state, or sub-

northerly, and might, with

mit it to the inspection of a seaman on board, who had been regularly bred a watch-maker in London, and who had given many satisfactory proofs of his skill in that profession, in repairing several watches upon the voyage. Having experienced the accuracy of this time-piece, we were extremely unwilling to be deprived of its advantages. Besides, it should be considered, that the watch had already been sufficiently tried to ascertain its utility, as well in the former voyage, as during the three years of our having it on board: therefore, on the first clear day after we arrived in Awatka Bay, the time-piece was opened, in the presence of the two Captains, Clerke and King. No part of the watch appeared to be broken; but as the watch-maker was not able to make it go, he took off the cock and balance, and cleaned the pivot holes: these were extremely foul; and other parts of the work were in the same condition. Upon taking off the dial-plate, a piece of dirt was found between two teeth of the wheel, that carries the second-hand, to which cause its stopping was principally attributed. After putting the work together, and oiling it very sparingly, the watch seemed to go with freedom and regularity. Captain King having received orders to go the next day to Bolcheretsk, the time-keeper was left with Mr. Baily, in order to get its rate, by comparing it with his watch and clock; who informed him on his return, that it had gone very regularly for some days, not losing more than 17 seconds a day; and afterwards stopped again. This we supposed to be occasioned by its having been badly put together. It was therefore now a second time opened; and when again adjusted, it gained about a minute a day; when, the watch-maker in attempting to alter the regulator, broke the balance-spring. He made a new spring, but the watch went so irregularly afterwards, that we were obliged to lay it aside as quite useless. The honest mechanic was as much vexed as we were at our ill success; not so much owing, as we were convinced, to his want of skill, as to the improper tools he had to work with, and the callousness his hands had contracted from his employment as a mariner. We shall now proceed, as proposed in the contents of this chapter, to give a correct and perfect geographical and natural history of the Peninsula of Kamtschatka.

Kamtschatka is situated on the eastern coast of Asia. It extends from 52 deg. to 61 deg. N. lat. the long. of its extremity to the S. being 156 deg. 45 min. The isthmus, that joins it to the continent on the N. lies between the gulphs of Olutorfk and Penthink. Its extremity to the S. is Cape Lapatka. The whole peninsula is somewhat in the form of a shoe; and its greatest breadth is 236 computed miles, being from the mouth of the Tigil, to that of the river Kamtschatka; and towards each extremity, it gradually becomes narrower. On the N. it is bounded by the country of the Koriacks; by the N. Pacific Ocean to the S. and E. and by the sea of Okotfk to the W. A chain of high mountains extends the whole length of the peninsula, from N. to S. and almost equally divide it; whence several rivers take their rise, and make their course into the Pacific Ocean, and the sea of Okotfk. The three principal of these are, the Bolchoireka, or great river; the Kamtschatka; and the river Awatka. To the N. W. of the mouth of the Kamtschatka, lies the great lake Nerpitsch; from Nerpi, a sea; that lake abounding with those animals. A fort, called Nishnei-Kamtschatka Ostrog, is situated about 20 miles up the river, where an hospital and barracks have been built by the Russians; and this place, we understand, is now become the principal mart in the country.

Were we to judge of this country from what we saw of its soil and vegetable productions, it appears to be barren in the extreme. Neither about the bay, nor in our journey to Bolcheretsk, nor in any of our hunting excursions, did we ever perceive the smallest spot of ground, that had the appearance of a good green turf, or that seemed capable of improvement by cultivation. Indeed, the whole surface of the country, in a most striking degree, resembles that of Newfoundland. At Paratounca, however, we saw some tracks of most ex-

cellent hay; and Major Behm assured us, that the banks of the Kamtschatka, and the Bistrain, as well as many other parts of the peninsula, produce a quantity of grass, of great strength and height, which is mowed twice in every summer, and that the hay is particularly adapted to the fattening of cattle, being of a very succulent quality. This agrees with Krätschehnicoff's account, who relates, that the country which borders on the river Kamtschatka, is much superior, in point of fertility, to that of either the N. or S. The severity of the climate, it may naturally be supposed, must be in proportion to the sterility of the soil, of which it is perhaps the cause. We first saw this country in the beginning of May, 1779, when it was covered with snow, from six to eight feet in depth. On the 24th of August, when we returned, the foliage of the trees, and vegetation in general, appeared to be in the height of perfection. The weather, during the remainder of that month, and the whole of September, was not severe; but when October began, the new fallen snow again covered the tops of the hills. In computing the seasons here, Spring should certainly be omitted. Summer may be said to extend from the middle of June, till the middle of September. October may be considered as Autumn: from which period to the middle of June, it is all dreary winter. The climate in the country adjacent to the river Kamtschatka, is said to be as serene and temperate, as in many parts of Siberia under the same latitude. The inhabitants, however, are sometimes prevented, by the uncertainty of the summer season, from providing a sufficient stock of dried fish, for their food in winter; and the moisture of the air occasions worms to breed in them, which frequently destroy or spoil the greatest part. The severity of the winter, and the dreadful hurricanes of wind and snow which attend it, oblige the natives to retire to their subterraneous habitations, both for their security and warmth. We had neither thunder nor lightning during our stay at Kamtschatka, excepting on the night of the eruption of the volcano. In this peninsula volcanoes are numerous; but only three have lately been subject to eruptions. That in the neighbourhood of Awatka we have already mentioned. The volcano of Tolbatchick is situated between the river Kamtschatka and Tolbatchick, on a neck of land. The eruptions proceed from the summit of a high mountain, which terminates in pointed rocks. On the top of the mountain of Kamtschatka, supposed to be by far the highest in the peninsula, is the third volcano. Springs of hot water are said to abound in this country.

The principal trees which fell under our notice, were the birch, the poplar, and the alder; several small species of the willow, and two sorts of dwarfish cedars. One of these sorts grow upon the coast, seldom exceeding two feet in height, and creeping on the ground. Of this our essence for beer was made, and proved to be very proper for the purpose: the other, which grows much higher, is found on the mountains, and bears a kind of nut or apple. Of the birch which appears to be the most common, we remarked three sorts. Two of them were large and fit for timber; differing from each other only in the colour and texture of the bark. The third is of a dwarfish kind. The natives apply this tree to a variety of uses. When tapped, it yields a liquor in great abundance, which they drink without mixture, or any kind of preparation, as we observed frequently in our journey to Bolcheretsk. We drank some of it ourselves, and found it pleasant and refreshing, though somewhat purgative. The bark they convert into vessels for domestic purposes; and from the wood of this tree they make their sledges and canoes. Not only the birch, but every other kind of tree, in the neighbourhood of the bay, were stunted, and very small: the natives therefore are obliged to go a considerable distance up the country, to get wood of a proper size for their canoes, their balagans (or summer-houses) and many other purposes: This peninsula likewise produces great abundance of the shrub kind, as mountain ash, junipers, raspberry bushes, and wild roses. Also a variety of berries, as partridge-berries, blue-berries, black-berries, cran-berries, and crow-berries. These are preserved by mashing them

hem into a thick jam; and they constitute a considerable part of their winter provisions, serving as a general sauce to their dried fish. They also eat them in puddings, and make decoctions of them for their common beverage. We found here large quantities of wholesome vegetables in a wild state, such as chervil, garlic, onions, angelica, and wild celery. We also met with some excellent turnips, and turnip-radishes, upon a few spots of ground in the vallies. This was the utmost of their garden cultivation: yet, this account of vegetables only relates to such parts of the country as fell within our observation: near the river Kamtschatka, where, as we have already observed, both the soil and climate are the best in the peninsula, garden culture is attended to, and perhaps with success; for with the second drove of cattle which we received from Verchnei, we also received a present of cucumbers, celery, some large turnips, and other garden vegetables. Two plants are produced in this peninsula, which must not pass unnoticed. The first is called by the natives Sarana, which grows wild and in great quantities. About the beginning of August, many women are employed in collecting the roots, which, after being dried in the sun, are preserved for use. It is a maxim with the Kamtschadales, that Providence never deserts them, for the season that is prejudicial to the sarana, is always favourable for fishing; and, on the contrary, an unsuccessful fishing month, is always amply compensated by an exuberant sarana harvest. This article is variously employed in cookery. When roasted in embers, it is a better substitute for bread than any thing the country produces. When baked in an oven, and pounded, it supplies the place of flour and meal, and is mixed in all their soups, and many other dishes. It is extremely nourishing, has a pleasant bitter flavour, and may be eaten daily without cloying. We partook of these roots, boiled as we do potatoes, and found them very agreeable. The name of the other plant is Sweet Grass. When at its full growth, it is about six feet high. This plant was formerly a principal ingredient in cookery among the natives; but since the Russians have been in possession of the country, it has been chiefly appropriated to the purpose of distillation. The liquor extracted is called raka, and has the strength of brandy. Seventy-two pounds of the plant, produced generally 25 pints of raka. A vulgar well-known plant remains to be noticed, as being more essential to their subsistence than all which have hitherto been mentioned: this is the Nettle; which, as neither hemp nor flax are produced in this country, supplies materials for their fishing-nets; and on which their existence principally depends.

Many parts of this peninsula would probably admit of such cultivation, as might contribute to the comfort and convenience of the inhabitants; yet the number of wild animals it produces, must always be considered as its real riches; and no labour can be considered so productive of advantage, as what is employed upon its furrieries. And next to these, the animals that supply them are deserving of attention. These are the fox, the zebiline, or sable; the stoat, or ermine; the isatis, or arctic fox; the carlefs marmot; the varying hare; the weasel; the glutton, or wolverene; the wild sheep; the rein-deer; wolves; bears; and dogs. The most general objects of the chase are foxes, with which this country abounds, and among which are a variety of colours. The most common species is the same as the European, but their colours are more vivid and shining. Some are of a dark chestnut; others have dark-coloured stripes; the bellies of some are black, but the other part of the body is of a light chestnut. Some are wholly black; others of a dark brown; others of a stone-colour; and some few are entirely white; the last, however, are very scarce. The quality of their fur is much superior to that of the same animals in Siberia or America. The sables are much larger than those of Siberia, and their fur is thicker and brighter; but those in the neighbourhood of the rivers Olekma and Vitime, are of a finer black. The sables of the Tigil and Ouka, are said to be the best in Kamtschatka; a pair of these being sold frequently for five pounds sterling. The inferior sorts are found in the southern parts,

A rifle barrel gun, of a very small bore, a net, and a few bricks, are the whole apparatus of the sable hunters. With the first they sometimes shoot them, when seen on trees: the net is used in surrounding hollow trees, in which they usually take refuge when pursued; and the bricks are put hot into the cavities, in order to drive them out with the smoke. The skin of the arctic fox is of little value; and, on the same account, the varying hare is neglected. They are very numerous, and always become perfectly white during the winter. In the beginning of May, we observed several of this colour, but they were so extremely shy, as not to suffer us to come within gun-shot. The carlefs marmot, or mountain rat, is a beautiful creature, much smaller than a squirrel; and like that animal, feeds upon roots and berries. Its skin is of high estimation, being warm, light, and of a bright shining colour. The ermine, or stoat, is little regarded; its fur being of a very ordinary kind. The skin of the weasel is also neglected on the same account. The skin of the wolverene, or glutton, on the contrary, is in the highest repute; a Kamtschadale looking upon himself as most splendidly attired, when a small quantity of this fur appears upon his garments. The women embellish their hair with its white pats, which is considered as the most superlative piece of finery. All the bears which we had an opportunity of seeing, were of a dun brown colour. They appear generally in a company of four or five together; and frequently in the season when the fish quit the sea, and push in great quantities, up the rivers. In the winter months they are seldom visible. Of their skins, warm mattresses, and coverings for beds, are made; also comfortable bonnets, gloves, and harnesses for the sledges. The flesh, especially the fat, is held in great estimation. The wolves appear only in winter, when they are said to prowls about in large companies. Rein-deer, both wild and tame, are found in many parts of the peninsula, but none in the neighbourhood of Awatska. It is remarkable that these animals are not used here, for the purposes of carriage, as they are by their neighbours to the N. and E. Their place is indeed sufficiently supplied by dogs; yet it appears somewhat extraordinary, that they should not have preferred an animal so much more powerful and docile. The dogs resemble the Pomeranian breed, in mien and figure; but they are larger, and the hair is considerably coarser. The colour most prevalent among them, is that of a light dun, or a pale dirty yellow. These animals are all turned loose, about the latter end of May, and are obliged to shift for themselves till the ensuing winter; but they never fail to return to their respective homes, when the snow begins to make its appearance. In the winter, their food consists wholly of the head, back-bones, and entrails of salmon, which are preserved and dried for that purpose; and even with this food they are very scantily supplied. The dogs must certainly be very numerous, no less than five being yoked together for a single sledge, in which only one person is carried. In our journey to Bolcheretsk, we had occasion for 139 at two stages. It is observable, that bitches are never employed in this business, nor dogs that have been castrated. The whelps are trained to the draught, by being fastened to stakes with leathern thongs, which are elastic; and having their food placed beyond their reach, by continually pulling to obtain it, they acquire strength and a habit of drawing; both of which are essentially necessary for their destined labour. We must not omit, in our catalogue of animals, the wild mountain sheep, or argali, unknown in all parts of Europe, except those of Corfica and Sardinia. Its skin resembles that of a deer's, but in its gait and general appearance, it nearer approaches the goat. Its head is adorned with two large twisted horns, which, when the animal is full grown, weigh sometimes from 25 to 30 pounds, and are rested on the creature's back when it is running. These animals are remarkably swift and active, frequent only the most craggy and mountainous parts, and traverse the steepest rocks with an astonishing agility. Spoons, cups, and platters, are fabricated by the natives of their horns; and they often have one of the latter hanging to a belt; which serves them to drink

out of, when on their hunting expeditions. This is a gregarious creature, extremely beautiful, and its flesh is sweet, and delicately flavoured.

Of northern sea-fowl, almost every kind frequent the coast and bays of Kamtschatka, and among others the sea eagles. The inland rivers are plentifully stored with various species of wild ducks; one of which, called by the natives a-an-gitché, has a most beautiful plumage. Its cry is equally singular and agreeable. Another species is called the mountain duck. The plumage of the drake is remarkably beautiful. A variety of other water fowl were seen, which, from their magnitude, appeared to be of the goose kind. We observed in passing through the woods, some eagles of a prodigious size, but of what species we could not possibly determine. It is said, there are three different kinds. The first is the black eagle with a white head, tail, and legs: the eaglets of which are perfectly white. The second is improperly called the white eagle, though, in reality, it is of a light grey. The third is the stone coloured eagle, which is a very common sort. There are great numbers of the hawk, falcon, and bustard kind in this peninsula. Woodcocks, snipes, and grouse are also found here. Swans are very numerous, and generally make a part of the repast at all public entertainments. The vast abundance of wild fowl, in this country, was sufficiently manifest, from the many presents we received, consisting frequently of twenty brace at a time. We saw no amphibious animals on the coast, except seals, and these were extremely numerous about the bay of Awatka. The sea-otters found here, and those we met with at Nootka Sound, are exactly the same; and have already been particularly described. They were formerly in great abundance here; but since the Russians have opened a trade with the Chinese for their skins, where they bear a price superior to any other kind of fur, the hunters have been induced to be so indefatigable in the pursuit of them, that very few remain in the country. They are still found in the Kurile Islands, though the number is inconsiderable.

Fish is the main article of subsistence among the inhabitants of this peninsula, who cannot possibly derive it either from agriculture or cattle. The soil, indeed, affords some wholesome roots, and every part of the country produces great quantities of berries; but fish alone may be called their staff of life, with more propriety than bread in any other country; for neither the inhabitants, nor their domestic animals of the canine species, could possibly exist without it. Whales are common in this country, and when taken serve for a variety of uses. After cleaning their intestines, drying them, and blowing them like bladders, they deposit their oil and grease therein. Excellent snares are made of their nerves and veins; in short, no part of the whale is useless in this peninsula. We caught abundance of fine flat fish, trout, and herrings. At one haul on the 15th of May, we dragged out above 300 flat fish, besides a considerable quantity of sea-trout. The first herring season commences about the latter end of May. They visit the coast in large shoals, but continue no considerable time. These first are excellent, as are also large quantities of exceeding fine cod; and many of our empty casks were filled with the former. But notwithstanding this abundance, it is on the salmon fishery alone that the inhabitants depend for their winter sustenance. The fishing season begins about the middle of May, and continues to the end of June. The first shoals that enter the mouth of the Awatka, are the largest and most esteemed. Three feet and a half is their usual length; and they are more than proportionably deep; their average weight being from 30 to 40 pounds. We had one of the first that were taken, but not without being told, that it was the highest compliment the Kamtschadales could possibly confer upon us. It was formerly a custom among them to eat the first fish they caught, in the midst of great rejoicings, accompanied with many superstitious ceremonies. There is a smaller sort of salmon, weighing from about 8 to 15 pounds, known by the name of the red fish, which assemble in the bays, and at the mouths of the rivers, early in the month of

No. 78.

June. From this time till towards the end of September, vast quantities of them are taken upon the eastern and western coasts, where the sea receives any fresh water, and also up the rivers, almost to their very source. All the lakes which communicate with the sea abound with fish, which have much the appearance of salmon, and weigh usually about five or six pounds. The natives, we understand, do not think it worth their labour to catch them. These lakes being generally shallow, the fish become an easy prey to bears and dogs, in the summer season; and from the quantities of bones appearing upon the banks, vast numbers of them seem to have been devoured. The natives dry the principal part of their salmon, and salt but very little of it. They cut a fish into three pieces. The belly-piece is first taken off, and then a slice along each side of the back bone. The former, which is esteemed the best, is dried and smoked: the other slices are dried in the air, and are either eaten whole as a substitute for bread, or pulverized for paste and cakes. The head, tail and bones are dried, and preserved for their dogs.

The inhabitants of Kamtschatka may be divided into three classes; the Kamtschadales, the Russians and Cossacks; and a mixture produced by their intermarriages. The Kamtschadales are a people of remote antiquity, and have inhabited this peninsula for many ages; and they doubtless descended from the Mangaians; though some have imagined they sprang from the Tongusian Tartars, and others from the Japanese. The Russians, having made themselves masters of that vast extent of coast of the Frozen Sea, established posts and colonies, and appointed commissaries to explore and subject the countries still farther to the E. They soon discovered that the wandering Koriacs inhabited part of the coast of the sea of Okotk, and they found no difficulty in making them tributary. These not being at a great distance from the Kamtschadales, with whom they had frequent intercourse, a knowledge of Kamtschatka must naturally follow; and the honour of the first discovery of this peninsula is attributed to Feodor Alexieeff, a merchant, in the year 1648; but a Cossack, named Volodmer Atlassoff is the unquestionable first acknowledged discoverer of Kamtschatka. He was sent in 1697, in the capacity of commissary from Jakutsk to the Anadirsk, with directions to call in the Koriacs to his assistance, in order to discover, and make tributary, the countries beyond theirs. With sixty Russian soldiers, and as many Cossacks, he penetrated in the year 1699, into the heart of the peninsula, and gained the Tigil. In his progress he levied a tribute upon furs, and proceeded to the river Kamtschatka, on which he built an ostrog, now called Verchnei; and leaving a garrison of 16 Cossacks, returned to Jakutsk, with vast quantities of valuable tributary furs, in the year 1700. Since which time to the grand revolt of the Kamtschadales in 1731, the history of this country presents an unvaried detail of revolts, massacres, and murders, in every part of the peninsula. Though a great many of the inhabitants were lost, in quelling the rebellion of 1731, yet the country had afterwards recovered itself, and was become as populous as ever in 1767; at which period the small pox was, for the first time, introduced among them, by a soldier from Okotk. It broke out with fury, and, in its progress was as dreadful as the plague; seeming almost to threaten their entire extirpation. Twenty thousand were supposed to have died by this loathsome disorder in Kamtschatka, the Kurile Islands, and the Koreki country. The inhabitants of whole villages were sometimes swept away; of which sufficient proof remains to this day. There are eight ostrogs about the bay of Awatka, which, we were informed, had been completely inhabited, but now they are all become desolate, except St. Peter and St. Paul; and only seven Kamtschadales, who are tributaries, reside in that. At the ostrog of Paratounca only 36 native inhabitants remain, including men, women, and children; though it contained 360 before it was visited by the small pox. We passed no less than four extensive ostrogs, in our journey to Bolcheretsk, which had not a single inhabitant

7 Y

in

in either of them. We were informed by Major Behm, that those who at this time pay tribute, including the Kuriles, do not exceed 3,000. The amount of the military forces, in five sorts, is about 400, including Russians and Cossacks. Nearly the same number are said to be at Igigga; which, though in the N. of the peninsula, is under the command of Kamtschatka. The Russian traders and emigrants are not very considerable.

The government, established in this country by the Russians, considered as a military one, is remarkably mild and equitable. The natives are permitted to elect their own magistrates in their ancient mode. One of these, called a Toion, presides over each ostrog, to whom all differences are referred. In some districts, the only tribute exacted is a sable's skin; and in the Kurile islands, a sea otter's; but as the latter is considerably more valuable, the tribute of several persons is paid with a single skin; a tribute so inconsiderable can hardly be considered in any other light, than that of an acknowledgment of the Russian dominion over them. But the Russians are not only to be commended for the mildness of their government: they are also entitled to approbation for their successful endeavours in converting the natives to Christianity, there being now but very few idolaters remaining among them. It were a judgment of the other missionaries from the benevolent pastor of Paratouca, more suitable persons could not possibly be engaged in this business.

The exports of this country consist entirely of furs; and this business is chiefly conducted by a company of merchants, appointed by the Empress. Twelve was the number originally, but three have since been added. Besides a charter or grant of privileges, they are distinguished by wearing a gold medal, expressive of the Empress's protection of the fur trade. There are other inferior dealers chiefly Cossacks, in different parts of the country. At what time the principal merchants remain here, they reside either at Bolcheretsk, or the Nishnei ostrog; the trade centering wholly in those two places. This business was formerly carried on in the way of barter, but every article is at present purchased with ready money, no inconsiderable quantity of specie being circulated in that wretched country. The furs produce a high price; and the natives require few articles in return. Our sailors brought a quantity of furs from the coast of America, and were both pleased and astonished on receiving such a quantity of silver for them from the merchants; but as they could not purchase gin or tobacco, or any thing else that would afford them any degree of entertainment, the roubles were soon considered as troublesome companions, and they frequently diverted themselves by kicking them about the deck. Our men received thirty roubles of a merchant, for a sea-otter's skin, and in the same proportion for others; but the merchant understanding they had great quantities to dispose of, and perceiving they were unacquainted with traffic, he afterwards procured them at a much cheaper rate.

European articles are the principal that are imported, but they are not solely confined to Russian manufactures. They come from England, Holland, Siberia, Bucharia, the Calmucs, and China. They chiefly consist of coarse woollen and linen cloths, stockings, bonnets, and gloves; thin Persian silks, pieces of nankeen, cottons, handkerchiefs, both of silk and cotton; iron stoves, bras and copper pans, files, guns, powder and shot; hatchets, knives, looking-glasses, sugar, flour, boots, &c. These commodities, we observed, sold for three times the sum they might have been purchased for in England. And, notwithstanding the merchants have so extravagant a profit upon these imported goods, they receive still a greater advantage from the sale of the furs at Kiachta, a considerable market for them on the frontiers of China. In Kamtschatka, the best sea-otter skins usually produce about thirty roubles a-piece; at Kiachta, the Chinese merchant gives more than double that price, and disposes of them again at Peking for a much greater sum; after which, an additional profit is made of many of them at Japan. If, then, the original

value of a skin at Kamtschatka is thirty roubles, and it is afterwards transported to Okotk, thence by land 1364 miles to Kiachta, thence 760 miles to Peking, and after that to be transported to Japan, what a lucrative trade might be established between Kamtschatka and Japan, which is not above three weeks sail from it, at the utmost? It may be necessary to observe, that the principal and most valuable part of the fur trade, lies among the islands between Kamtschatka and America. Being first discovered there in 1741, and as they were found to abound with sea-otters, the Russian merchants sought anxiously for the other islands seen by that navigator, S. E. of Kamtschatka, named in Muller's map the islands of St. Abraham, Seduction, &c. They fell in with no less than three groups of islands, in these expeditions. The first, about 15 deg. E. of Kamtschatka; another, 12 deg. E. of the former; and the third, Oonalahka, and the neighbouring islands. These mercantile adventurers also proceeded as far as Shumagin's Islands, of which Kodiak is the largest. But here they met with so warm a reception, for attempting to compel the payment of a tribute, that they never ventured so far again. The three groups before-mentioned, however, were made tributary. The whole sea between Kamtschatka and America is, according to the Russian charts, covered with islands; for, as those who were engaged in these expeditions, frequently fell in with land, which they supposed did not tally with the situation laid down by preceding adventurers, they immediately supposed it to be a new discovery, and reported it accordingly on their return; and, as these vessels were usually out three or four years, and sometimes longer, such mistakes could not immediately be rectified. It is pretty certain, however, that only those islands which have been enumerated, have been discovered in that sea by the Russians, S. of 60 deg. latitude. The sea otter skins, which are certainly the most valuable article in the fur trade, are principally drawn from these islands; which being now under the Russian dominion, the merchants have factors residing in settlements there, for the sole purpose of bartering with the natives. To extend this trade, an expedition was fitted out by the admiralty of Okotk, to make discoveries to the N. and N. E. of the above-mentioned islands, and the command of it given to Lieutenant Synd. But, as this gentleman directed his course too far N. he did not succeed in the object of his voyage; for as we never found a sea-otter N. of Bristol bay, they, perhaps, avoid those latitudes where large amphibious sea animals are numerous. The Russians have not since undertaken any expedition for making discoveries to the eastward; but they will, probably, make an advantageous use of our discovery of Cook's river. Notwithstanding the general intercourse between the natives, the Russians, and Cossacks, the former are as much distinguished from the latter by their habits and disposition, as by their features and general figure.

As the persons of the natives have already been described, we shall only add, that, in their stature, they are below the common height, which Major Behm attributes to their marrying so very early; both sexes usually engaging in the conjugal state at 13 or 14 years of age. They are exceedingly industrious, and may be properly contrasted with the Russians and Cossacks, who frequently intermarry with them, apparently, for no other reason, but that they may be supported in laziness and sloth. To this inactivity may be attributed those scorbutic complaints, which most of them are dreadfully afflicted with; whilst the natives, who exercise in the open air, entirely escape them.

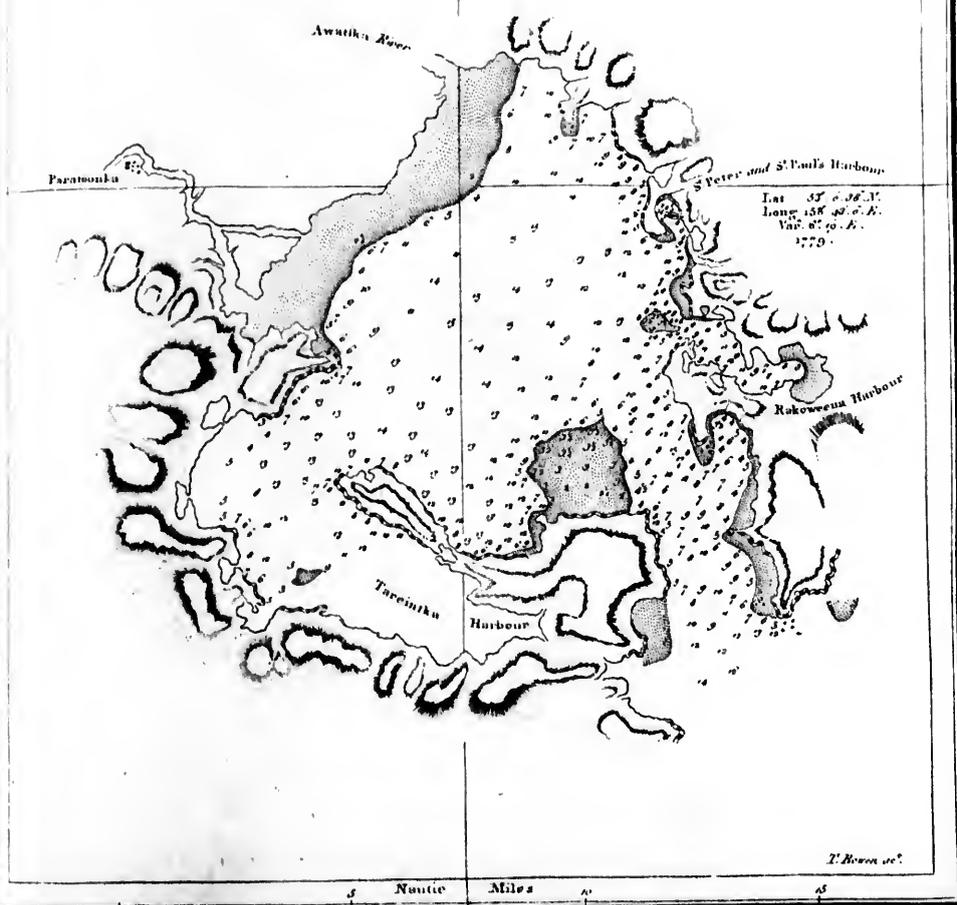

Their habitations consist of three distinct sorts; jouts, balagans, and log-houses which are here called itbas; they inhabit the first in the winter, and the second in the summer; the third are introduced by the Russians, wherein only the wealthier people reside. The jouts are thus constructed. A kind of oblong square is dug about six feet deep in the earth; the dimensions must be proportioned to the numbers who are to inhabit it, for it is usual for several to live together in the same jout. Strong wooden posts, or pillars, are fastened in the

the ground, at equal distances from each other, on which the beams intended to support the roof are extended; which is formed by joists, one end of which rest upon the ground, and the other on the beams. Between the joists, the interstices are filled up with wicker work, and turf is spread over the whole. The external appearance of a jourt, resembles a round squat hillock. A hole, serving for a chimney, window, and door, is left in the center, and the inhabitants go in and out by the assistance of a long pole, having notches deep enough to afford a little security for the toe. On the side, and even with the ground, there is another entrance, appropriated to the use of the women; but if a man passes in or out of this door, he becomes as much an object of ridicule, as a sailor who descends through lubber's hole. A jourt consists of one apartment, forming an oblong square. Broad platforms, made of boards, are extended along the sides, at the height of about six inches from the ground; which serve them for sitting on, and on which they repose; first taking care to cover them with mats and skins. The fireplace is on one side, and, on the other, their provisions and culinary utensils are stowed. When they make entertainments, the compliment is considered in proportion to the heat of the jourts; the hotter they are made, the more gracious is the reception of the guests considered. We always found them so extremely hot as to be intolerable. They generally retire to their jourts about the middle of October, and continue in them till the month of May is more than half expired. To erect a balagan, nine posts are fixed into the earth, in three regular rows, at equal distances from each other, to the height of about 12 or 13 feet from the surface. About 12 feet from the ground, rafters are laid from post to post, and securely fastened by strong ropes. The joists are laid upon these rafters, and a turf covering completes the platform or floor of the balagan. A roof of a conical figure is raised upon this, by means of long poles, which are fastened to the rafters, at one end, and meet together in a point at the top. The whole is covered, or rather thatched, with a coarse kind of grass. These summer habitations have two doors, placed directly opposite to each other, to which they ascend by the same kind of ladders that are used in the jourts. In the lower part, which is left entirely open, they dry their fish, vegetables, and other articles intended for the consumption of the winter. Though six families usually live together in one jourt, a balagan is seldom occupied by more than one at a time. The iltas, or log-houses, are thus erected: long timbers are piled horizontally, with the ends let into each other, and the seams are sealed up or caulked with moss. Like those of our mountain cottages, the roof is sloping, and thatched with grass or rushes. Each log-house has three apartments in the inside. One end may be said to be a kitchen, which extends the whole width and height of the house, and seems to be a kind of receptacle for their bulky articles, as sledges, harness, &c. This has a communication with their best apartment, which is in the middle, and is furnished with broad benches, calculated both for eating and sleeping upon.

A door leads from this into the kitchen, almost half of which is taken up with an oven, or fire-place; which is let into the wall that separates the middle apartment and the kitchen, and is so constructed as to communicate the heat to both rooms at the same time. There are two lofts over the kitchen and middle apartment, to which the inhabitants ascend by a ladder placed in the entry for that purpose. Each apartment has two small windows made of talc, and among the inferior people, of fish-skin. The boards and beams of their habitations, are smoothed only with a hatchet, for they are strangers to the plane; and the smoke has rendered them of a deep shining black.

In Kamtschatka, an offrog is called a town, and consists of several houses or habitations of the various kinds above-mentioned. Balagans are considerably the most numerous; and it is remarkable that we never saw a house of any kind that was detached from an offrog. There are, in St. Peter and St. Paul, seven log-houses, nineteen balagans, and three jourts. Paratounca is nearly of the same size. Karatchin and Natchekin have not so many log-houses as the former, but rather more balagans and jourts; whence it may be concluded that such is the most general size of an offrog.

The dress of the Kamtschadale women having already been described, we shall proceed to that of the men. The upper garment resembles that of a waggoner's frock. If for summer wear, it is made of nankeen; if intended for winter, it is made of a skin, (generally that of a deer or dog) having one side tanned, and the hair preserved on the other, which is worn innermost. A close jacket of nankeen, or some other cotton stuff, is the next under this; and beneath that, a shirt made of thin Persian silk, of a red, blue, or yellow colour. They wear also a pair of long breeches, or tight trowsers, of leather, reaching below the calf of the leg. They have likewise a pair of boots, made of dog or deer skin, with the hair innermost. They have a fur cap, having two flaps that are usually tied up close to the head, but are permitted to fall round the shoulders in bad weather. The fur dress, which was presented by Major Behm's son to Captain King, is one of those worn on ceremonious occasions by the Toions. It is shaped like the exterior garment we have just described, and consists of small triangular pieces of fur, chequered brown and white, and so ingeniously joined as to appear to be of the same skin. A border, of the breadth of six inches, curiously wrought with different coloured threads of leather, surrounds the bottom, and produces a rich effect. A fur edging of the sea-otter's skin is suspended to this. The sleeves are ornamented with the same materials. An edging of it also encircles the neck, and surrounds the opening at the breast. It is lined with a beautiful white skin. And the present was accompanied with a pair of gloves, a cap, and a pair of boots, executed with the utmost neatness, and composed of the same materials. The Russians who reside in Kamtscharka, wear the European dress; and the uniform worn by the troops here, is of a dark green turned up with red.

C H A P. XX.

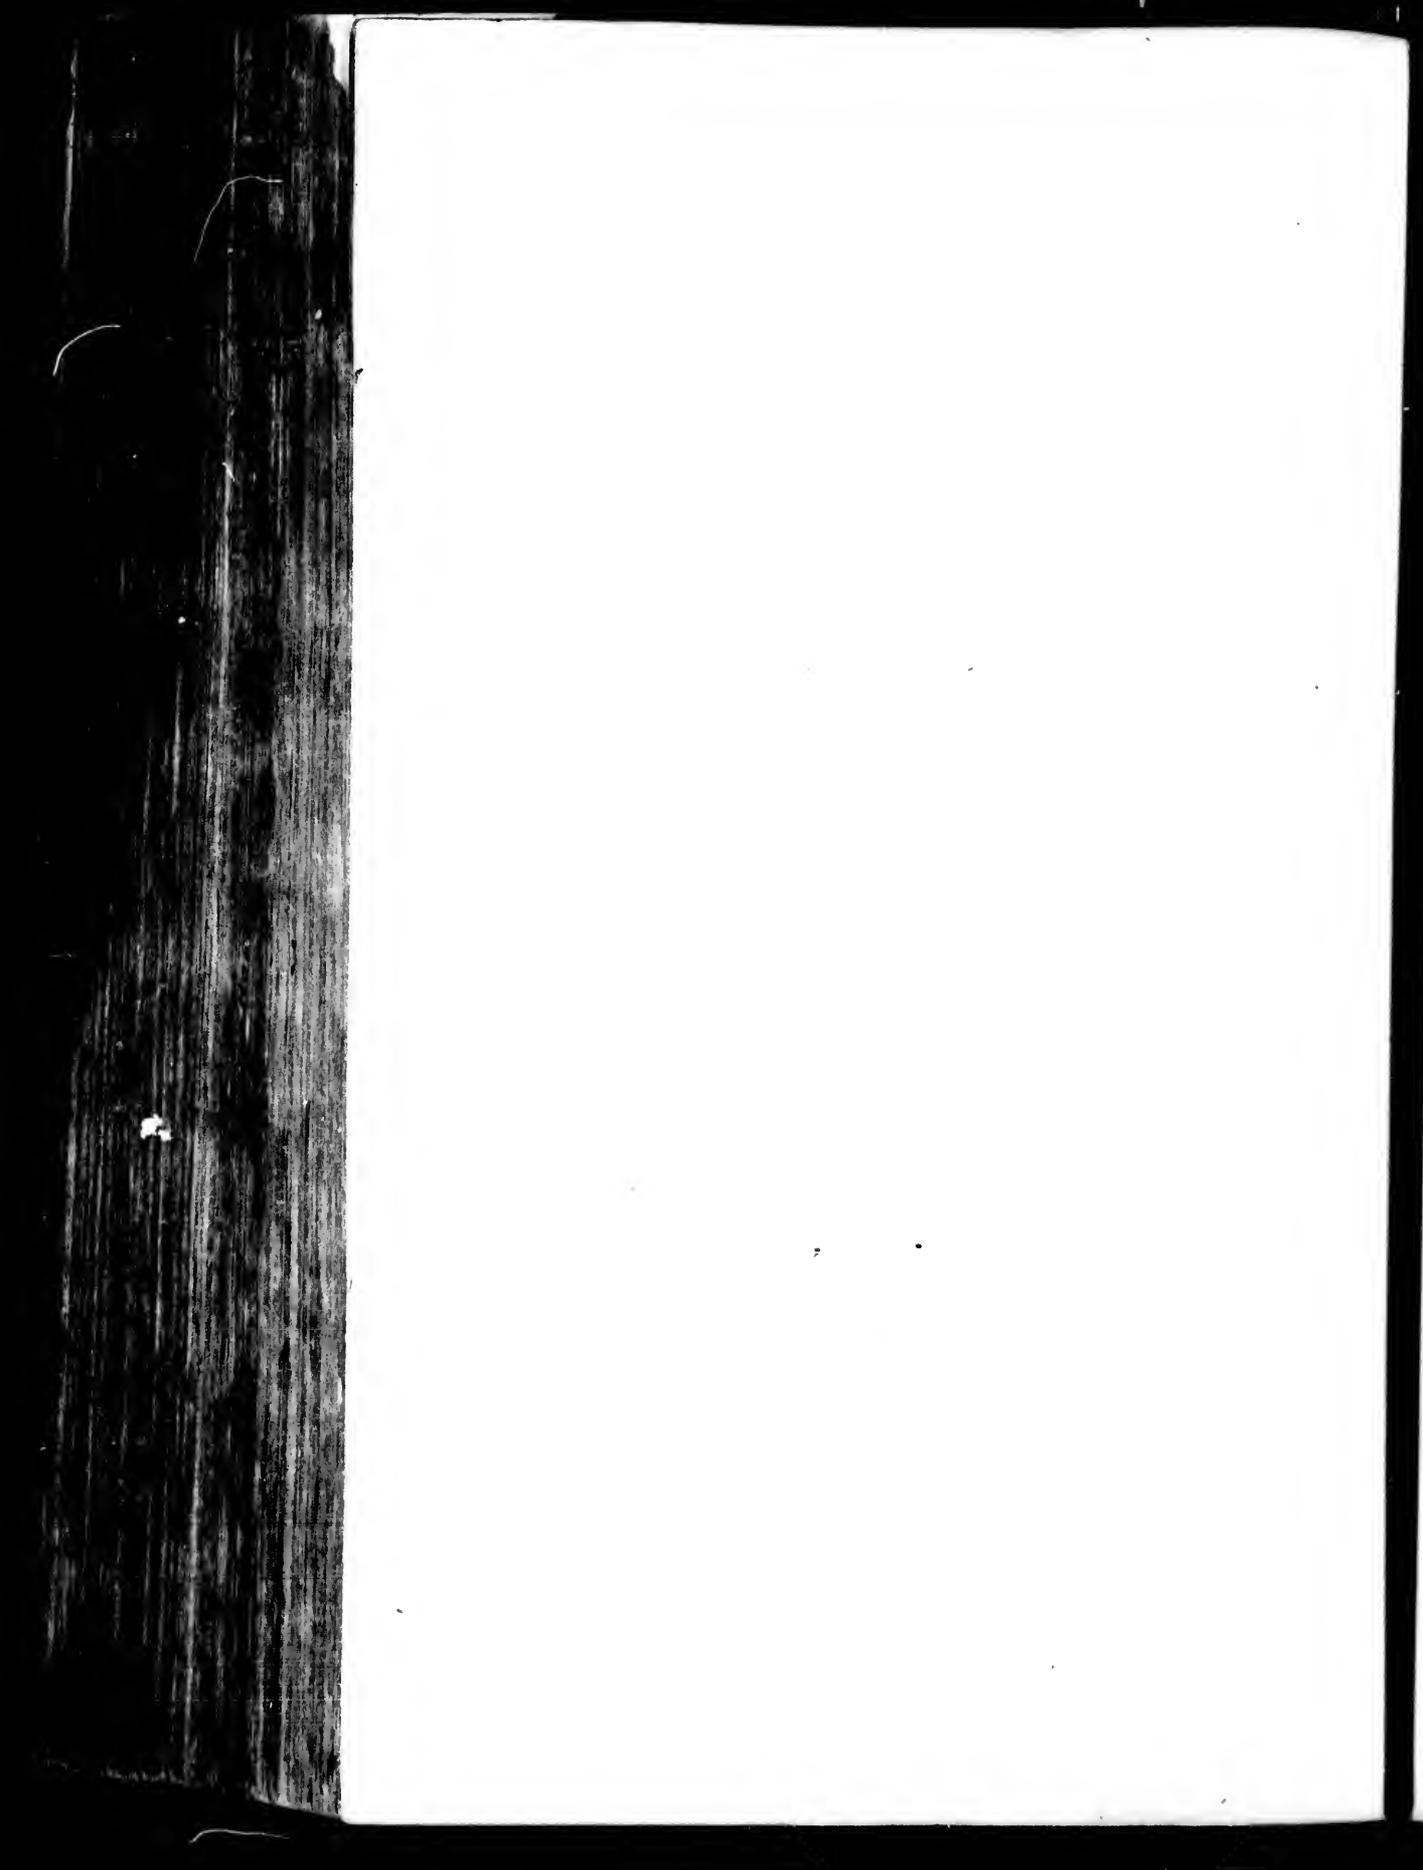

An account of the Kurile Islands—Plan of future operations—The Resolution and Discovery, on quitting the Bay of Awajish, sail along the coast—A violent storm—Proceed for the Island of Japan—Description of a Japanese vessel—Prosecution of the voyage to China, in which three islands are discovered—Fruitless search for the Bashee Islands—The Grand Ladrone Island—Journals, and other papers relating to the history of the voyage, delivered up—The ships approach Malacca—Captain King dispatched to visit the Portuguese Governor—They anchor in the Tyra—Captain King, accompanied by his second Lieutenant and others, proceed to Canton—His reception at the English Factory—Suspicious character of the Chinese—Observations relative to the city of Canton—Captain King visits a Chinese of the first distinction—His return to Malacca—Great demand for the sea-otters-skins, and its effect on our seamen—Plan of a voyage for opening a fur trade on the western coast of North-America, and making further discoveries in the neighbourhood of China and Japan—Nautical and other structures.

THE people situated to the N. and S. of Kamtschatka, being but imperfectly known, we shall, before we proceed to the continuation of our voyage, give such information as we have been able to acquire respecting the Kurile Islands, the Koreki, and Tschutski. The Kuriles are a chain of islands, extending from the southern promontory of Kamtschatka to Japan, in a S. W. direction. The inhabitants of the neighbourhood of Lopatka, who were called Kuriles, gave these islands the same name, as soon as they became acquainted with them. Spanberg makes their number amount to 22, exclusive of the very small ones. The northernmost island is called Shoemka, and lies about three leagues distant from the promontory of Lopatka, its inhabitants consisting of a mixture of natives and Kamtschadales. The next, named Paramoufir, is considerably larger than Shoemka, and is inhabited by the real natives, whose name they say, came from an island called Onecutan, a few leagues to the S. The Russians paid their first visit to these two islands in 1713, and added them to the dominions of the Empress. The others, as far as Oosheer inclusive, are now made tributary, if we may rely upon the information of the worthy pastor of Paratounca, their missionary; who pays them a visit once in three years, and mentions the islanders in the most respectable terms, extolling them for their hospitality and humanity; and that they excel their Kamtschadale neighbours as much in the gracefulness of their persons, as in their docility and understanding. Though the island of Oosheer is the farthest to the S. of any under the dominion of Russia, yet they are said to trade to Ooroop, which is the 18th in order; and is the only one that has a good harbour for vessels of burthen. Nadeegda lies to the S. of this, and is said to be inhabited by a race of men who are remarkably hairy, and who live in a state of perfect independence, like those of Ooroop. Nearly in the same direction lie a group of islands called Jeeso, by the Japanese; a name also given by them to the chain of islands between Kamtschatka and Japan. That called Matmai, the farthest to the S. belongs to the Japanese, and has a garrison and fortifications on the side towards the continent. The islands of Kunachir, and Zellany, to the N. E. of Matmai, and three others, called the Three Sisters, still farther to the N. E. are entirely independent. The inhabitants of Matmai barter with those of the islands last mentioned, as well as with those of the Kuriles to the northward. Many of the inhabitants of those islands that are under the dominion of Russia, are now converted to Christianity. And perhaps the time is not far distant, when an advantageous commerce will be carried on between Kamtschatka and this extensive chain of islands, which may afterwards produce a communication with Japan itself. The advantages that must infallibly accrue to the Russians by establishing a commerce with the Japanese are sufficiently obvious.

In the country of Koreki are two distinct nations, called the wandering and fixed Koriacs. Part of the Shmus of Kamtschatka is inhabited by the former, as well as the coast of the eastern ocean, from thence to the Anadir. The nation of the wandering Koriacs, extends westward towards the river Koyyma, and along the N. E. of the sea of Okotik, as far as the river Penskina. The resemblance between the fixed Koriacs, and the Kamtschadales, is very striking: both countries de-

pend alike on fishing for subsistence. Their clothing and habitations are equally similar. The fixed Koriacs are under the district of Ingiga, and are tributary to Russia. The wandering Koriacs are employed wholly in breeding and pasturing deer, and are said to have immense numbers in their possession; it being common for a single chief to have a herd of 5,000. Upon the flesh of these animals they subsist, having an aversion to every kind of fish. They erect no Balagans; their only habitations being somewhat like the Kamtschadale jouts, except that, in winter, they are covered with raw deer-skins, and, in summer, with such as have been tanned. Their sledges are drawn only by deer, and those that are used in drawing them feed in the same pasture with the others. When they are wanted, the herdsmen makes use of a certain cry, which, being very familiar to them, they obey, and quit the herd immediately. The two nations of the Koriacs, and the Tschutski, make use of different dialects of the same language; but it has not the smallest affinity to that of the Kamtschadale. The Tschutski are a courageous, well made, warlike race of people; and are formidable neighbours to the Koriacs of both nations, who often experience their depredations. The country inhabited by the Tschutski, is bounded by the Anadir on the S. and extends to the Tschutskoi Nofs. Their attention, like that of the wandering Koriacs, is confined chiefly to their deer, with which their country abounds. The Russians have long endeavoured to bring them under their dominion; but, though they have lost a great number of men in different expeditions, they have not yet been able to accomplish this purpose. It is now time to return to the history of our voyage, and to make known the plan of our future operations.

In the instructions for the regulation of the present voyage, the Lords of the Admiralty had intrusted the Commanding Officer of the expedition with a discretionary power, in case of not succeeding in the discovery of a passage from the Pacific Ocean into the Atlantic, to make choice, in his return to England, of whatever route he should judge proper; the Commodore therefore desired, that the principal officers would deliver their sentiments, in writing, relative to the mode in which these instructions might most effectually be carried into execution. The result of their opinions, which, to his great satisfaction, he found unanimous, and perfectly agreeing with his own, was, that the condition of the ships, their sails, cordage, &c. rendered it hazardous and unsafe to make any attempt, as the winter was now approaching, to navigate the sea between Asia and Japan, which would otherwise have opened to us the most copious field for discovery; that it was therefore most prudent to steer to the eastward of that island, and in our way thither, to sail along the Kuriles, and examine particularly those islands that are situated nearest to the northern coast of Japan, which are said to be of considerable extent, and not subject to the Russians or Japanese. Should we have the good fortune to meet with some secure and commodious harbours in any of these islands, we supposed they might prove of considerable importance, as convenient places of shelter for subsequent navigators, who might be employed in exploring the seas, or as the means of producing a commercial intercourse among the adjacent dominions of the two above-mentioned empires. Our

next object was to take a survey of the Japanese Isles; after which we designed to make the coast of China, as far to the N. as might be in our power, and then to proceed to Macao. This plan being adopted, Captain King received orders, in case the two ships should separate, to repair, without delay, to Macao.

On Saturday, the 9th of October, at six o'clock, P. M. having cleared the entrance of the Bay of Awatka, we made sail to the S. E. At midnight we had a dead calm, which continued till noon of the following day. A breeze springing up from the W. about three o'clock, P. M. we steered to the S. along the coast. A head-land now opened with Cape Gavareca, in the direction of S. by W. situated nearly 20 miles beyond it. On Monday, the 11th, at noon, we observed in lat. 52 deg. 4 min. long. 158 deg. 31 min. Cape Gavareca bearing N. by W. one quarter W. and the southern extremity S. W. half W. We were now at the distance of 9 or 10 miles from the nearest part of the coast, and perceived the whole inland country covered with snow. A point of land towards the S. formed the northern side of a deep bay, distinguished by the name of Achachnikof, to the southward of which, the land did not exhibit such a rugged and barren aspect, as was observable in that part of the country which we had before passed. On Tuesday, the 12th, at six o'clock P. M. we discerned, from the mast-head, Cape Lopatka, which is the most southern extreme of Kamtschatka. This, by accurate observations, we found to be in lat. 51 deg. and in the long. of 156 deg. 45 min. We perceived, to the N. W. of it, a very lofty mountain, whose summit was lost in the clouds. At the same instant, the first of the Kurile islands, named Shoofmka, made its appearance, in the direction of W. half S. On Wednesday, the 13th at day-break, we descried the second of the Kurile islands, named Paramoufir, by the Russians, extending from W. half S. to N. W. by W. This land was exceedingly high, and almost covered with snow. The island is the largest of the Kuriles; and its southern extremity, lands, according to our computation, in lat. 49 deg. 58 min. the northern extremity we place in lat. 50 deg. 46 min. long. 10 deg. W. of Cape Lopatka. During the two following days, the wind, blowing fresh from the W. obliged us to steer to the southward, and consequently prevented us from seeing any more of the Kuriles. On Saturday, the 16th, our lat. was 45 deg. 27 min. our long. deduced from many lunar observations taken the three preceding days, was 155 deg. 30 min. and the variation 4 deg. 30 min. E. In this situation, we were almost encompassed by the real or pretended discoveries of prior navigators; not one of which we were fortunate enough to meet with in our course. The wind having veered in the afternoon to the northward, we hauled round to the W. In the course of this day, we observed several albatrosses, fulmars, and numerous flocks of gulls: we also saw a number of fish, called grampusses by our sailors; but we were rather inclined to judge, from the appearance of those which passed close by our vessels, that they were the Kasatka, or sword-fish. Sunday, the 17th, we observed in lat. 45 deg. 7 min. long. 154 deg. On the 19th, at two o'clock A. M. we hauled our wind, and stood to the southward till five, at which time a violent storm reduced us to our courses. Though from the unfavorable state of the weather, there was but little probability of our making the land, our attention was still anxiously directed to this object; and on the appearance of day-light, we ventured to steer W. by S. We proceeded on the same course till 10 o'clock, when the wind suddenly veered round to the S. W. attended with fair weather. Scarce had we availed ourselves of this, by letting out our reefs, and setting the top-sails, when it began to blow with such vehemence, that we were under the necessity of close reefing again; and, about noon, the wind shifting more to the W. we were prevented from continuing any longer on this tack: we therefore put about, and stood towards the S. We were now in lat. 44 deg. 12 min. long. 150 deg. 40 min. so that, after all our exertions, we had the mortification of finding ourselves, according to the Russian charts, upon the same meridian with Nadcegf-

No. 78.

da, which they represent as the most southerly of all the Kurile islands. Though the violent and adverse winds that we had met with for six days past, had deprived us of an opportunity of getting in with these islands, yet the course on which we had been obliged to proceed, did not prove altogether destitute of geographical advantages: for the group of islands, comprehending Zellany, Kunathir, and the Three Sisters, which, in the maps of M. D'Anville, are laid down in the track we had just crossed, are, by this means, demonstrably removed from that position; and thus an additional proof is obtained of their being situated to the W. where Captain Spanberg has placed them, between the longitudes of 142 and 147 deg. But this space being occupied, in the French charts, by Staten Island, and part of the supposed land of Jesso, the opinion of Muller becomes highly probable, that they are all the same lands; and, as we have no reason to call in question the accuracy of Spanberg, we have, in our general chart, reinstated Kunathir, Zelany, and the Three Sisters, in their proper situation, and have totally omitted the rest. When we consider the manner in which the Russians have multiplied the islands of the northern Archipelago, not only from the want of accuracy in ascertaining their real position, but likewise from the desire, natural to mankind, of propagating new discoveries, we shall not be surprized, that the same causes should produce similar effects. It is thus that the lands of Jesso, which appear, as well from the earliest traditions among the Russians, as from the accounts of the Japanese, to be no other than the Kurile Islands, have been imagined to be distinct from the latter. De Gama's land is next on record; and this was originally represented as being nearly the same in situation with those we have just mentioned; but it was afterwards removed, in order to make room for Staten's Island, and the company's land, and as Jesso, and the most southerly of the Kuriles, had likewise possession of this space, that nothing might be lost, the former had a place provided for it westward, and the latter towards the E. As, according to the Russian charts, the isles of Kunathir and Zellany, were still to the S. we entertained some hopes of being able to make them, and, with this view, kept the head of the Resolution towards the W. as much as the wind would permit. On Wednesday, the 20th, at noon, we observed in lat. 43 deg. 47 min. long. 150 deg. 30 min. We were then standing to the W. by S. with a gentle breeze from the S. E. but about three o'clock P. M. the wind, shifting to the N. W. point, began to blow with such violence, that we were brought under our mizen stay-sail, and fore-sail. For the following 24 hours we had heavy rain, and vehement squalls; and as the wind continued to blow from the N. W. our attempts to make the land were rendered abortive; and we were at length obliged to relinquish all further thoughts of discovery to the northward of Japan. To this disappointment we submitted with the greater reluctance, as our curiosity had been considerably excited by the accounts that are given of the natives of these islands. On the 21st, in the afternoon, an accident befel our ship, the Resolution; for the leach-rope of her fore-top-sail gave way, and split the sail. This having frequently happened during the life of Captain Cook, he had, on such occasions, ordered the foot and leach-ropes of the top-sails to be taken out, and larger ones to be fixed in their room; and these likewise proving incapable of supporting the strain that was on them, gave him good reason to observe to us, that the just proportion of strength between the sail and those ropes, is extremely miscalculated in our service. On the 22d, in the morning, we let out the reefs of our top-sails, and carried more sail. At noon, we found ourselves to be in lat. 40 deg. 58 min. long. 148 deg. 17 min. variation of the needle 3 deg. E. This day some birds afforded us clear indications that we were not at any considerable distance from land: with this hope we steered to the W. N. W. in which direction were situated, at the distance of about 50 leagues, the southernmost islands, seen by Captain Spanberg, and said to be inhabited by hairy men. At eight o'clock, the following morning, a fresh breeze springing

Springing up, with which we continued our course till the evening, when we had violent squally gales, accompanied with rain; and as we had, in the course of this day, passed some patches of green grass, and observed a number of small land birds, a flag, and many flocks of gulls, we did not think it consistent with prudence, having all these signs of the vicinity of land, to stand on for the whole night: about midnight therefore we tacked, and for the space of a few hours steered S. E.

Sunday, the 24th, we again bore away to the W. N. W. and carried a press of sail till seven o'clock, P. M. when the wind veered round to the N. and blew a fresh gale. At this time our lat. was 40 deg. 57 min. long. 145 deg. 20 min. This second disappointment in our attempts to get to the N. W. the tempestuous weather with which we had been harrassed, and the small probability, at this season of the year, of its becoming more favourable to our designs, were the motives that now induced Captain Gore to abandon finally all further search for the islands situate to the northward of Japan, and to direct our course to the W. S. W. for the northern part of that island. On the 25th, at noon, we were in lat. 40 deg. 18 min. and in long. 144 deg. Flights of wild ducks were this day observed by us; a pigeon lighted upon our rigging; and many small birds, resembling linnets, flew about the ships, with a degree of vigour, that gave us reason to imagine they had not been long on the wing. We also passed a piece either of bamboo or sugar-cane, and several patches of long grass. These indications of our being at no great distance from land, determined us to try for soundings; but we could not reach the bottom with 90 fathoms of line. On the approach of evening, the wind gradually veered round to the S. with which we continued our course to the W. S. W. On Tuesday, the 26th, at day-break, we had the satisfaction of perceiving high-land towards the W. which proved to be Japan. At eight o'clock, it was at the distance of ten or twelve miles, and extended from S. by W. to N. W. A low flat cape, which apparently constituted the southern part of the entrance of a bay, bore N. W. three quarters W. Near the S. extremity, a hill of a conic figure appeared, bearing S. by W. three quarters W. To the N. of this hill, there seemed to be an inlet of very considerable depth, the northern side of whose entrance is formed by a low point of land; and as well as we were enabled to judge by the assistance of our glasses, has a small island near it towards the S. Having stood on till nine o'clock, we had, by that time, approached within five or six miles of the land, which bore W. three quarters S. We now tacked, and stood off; but as the wind failed us, we had proceeded, at noon, to no greater distance than 3 leagues from the shore. This part of the coast extended from N. W. by N. to S. half E. and was principally bold and cliffy. The low cape above-mentioned, was about six leagues distant, bearing N. W. by W. and the northern point of the inlet was in the direction of S. three quarters W. Our lat. by observation, was 40 deg. 5 min. and our long. 142 deg. 28 min. The most northerly land in view, was supposed by us to be the northern extreme of Japan. It is somewhat lower than the other parts; and from the range of the elevated lands that were discerned over it from the main-head, the coast manifestly appeared to trend to the westward. The northern point of the inlet was imagined by us to be Cape Nambu; and we conjectured, that the town, which Jansen calls Nabo, stood in a break of the high land, towards which the inlet apparently directed itself. The neighbouring country is of a moderate elevation, and has a double range of mountains. It is well furnished with wood, and exhibits a variety of pleasing hills and dales. We perceived the smoke arising from several villages or towns, and saw many houses in delightful and cultivated situations, at a small distance from the shore. While the calm continued, that we might lose no time, we put our sloop's lines overboard, in ten fathoms water, but had no success. This being the only diversion which our present circumstances would permit us to enjoy, we very sensibly felt our disappointment;

and looked back with regret to the cod-banks of the dismal regions we had lately quitted, which had furnished us with so many salutary meals, and by the amusement they had afforded, given a variety to the tedious recurrence of astronomical observations, and the wearisome succession of calms and gales. At two o'clock, P. M. the wind blew fresh from the S. and, by four, had reduced us to close reefed top-sails, and obliged us to stand off to the south-eastward; in consequence of which course, and the gloominess of the weather, we soon lost sight of land. We kept on during the whole night, and till eight o'clock the following morning, when the wind shifting to the N. and becoming moderate, we made sail, and steered a W. S. W. course, towards the land, which, however, we did not make before three in the afternoon; at which time it was seen to extend from N. W. half W. to W. The most northerly extremity was a continuation of the elevated land, the southermost we had observed the preceding day. The land to the westward, we conjectured to be the High Table Hill of Jansen. The coast, between the two extremes, was low, and could scarcely be perceived, except from the main-head. We proceeded towards the coast till eight in the evening, when our distance from it was about 5 leagues, and having shortened sail for the night, we steered in a southerly direction, sounding every four hours; but our depth of water was so great, that we did not find ground with 160 fathoms of line.

On Thursday, the 28th, at six o'clock A. M. we again saw land, 12 leagues to the southward of that we had seen the day before, and extended from W. by N. to W. S. W. At ten o'clock we saw more land in the same direction. At noon, the northern extremity of the land in view bore N. W. by N. and a peaked hill, over a steep head-land, was 15 or 16 miles distant, bearing W. by N. By observation, our lat. was 38 deg. 16 min. and our long. 142 deg. 9 min. During the remainder of the day, we continued our course to the S. W. and, at midnight, found our depth of water to be 70 fathoms, over a bottom of fine brown sand. We therefore hauled up towards the E. till the next morning, when we again had sight of land, eleven leagues to the S. of that we had seen the preceding day. The ground was low towards the sea, but gradually swelled into hills of a moderate elevation. At nine o'clock, the sky being overcast, and the wind veering to the S. we tacked and stood off to the E. Not long after, we observed a vessel, close in with the land, standing to the N. along the shore; and we also saw another in the offing, coming down on us before the wind. Objects belonging to a country so celebrated, and yet so imperfectly known, excited a general eagerness of curiosity; in consequence of which, every person on board came instantaneously upon deck to gaze at them. As the vessel to windward approached us, she hauled off to a greater distance from the shore; upon which being apprehensive of alarming those who were on board of her by the appearance of a pursuit, we brought to, and she sailed ahead of us. We might have spoken to them; but Captain Gore perceiving, by their manœuvres, that they were highly terrified, was unwilling to increase their apprehensions; and, imagining that we should have many better opportunities of a communication with the Japanese, suffered them to retire without interruption. According to the most probable conjectures we were enabled to form, the vessel was of the burthen of 40 tons; and there seemed to be six men on board her. She had only one mast, whereon was hoisted a quadrangular sail, extended aloft by a yard, the braces of which worked forwards. Three pieces of black cloth came half way down the sail, at an equal distance from each other. The vessel was lower in the middle than at each end; and from her figure we supposed, that she could not fail otherwise than large. At noon, the wind blew fresh, accompanied with much rain. By three o'clock it had increased in so great a degree, that we were reduced to our courses. The sea, at the same time, ran as high as any of our people ever remember to have seen it. About eight o'clock, in the evening,

the gale, without the smallest diminution of violence,
 shifted to the W. and by producing a sudden swell, in
 a direction contrary to that which had before prevailed,
 caused our ships to labour and strain exceedingly.
 During the storm, we had several of our sails split.
 They had, indeed, been bent for so long a time, and
 were worn so thin, that this accident had happened
 lately in both vessels almost daily; particularly when
 the sails were stiff, and heavy with rain, in which case
 they became less capable of bearing the shocks of the
 boisterous and variable winds we experienced occasion-
 ally. On Saturday, the 30th at noon, we observed in
 lat. 36 deg. 41 min. long. 142 deg. 6 min. In the af-
 ternoon, the wind shifting to the N. E. we stood to the
 S. at the distance of 18 leagues from the shore. On
 the 31st, at two o'clock A. M. the wind veered round to
 the W. and blew in violent squalls, accompanied with
 lightning and rain.

Monday, November the 1st, the wind shifted to the
 S. E. and was attended with fair weather; in conse-
 quence of which, we obtained, with four different
 quadrants, 42 sets of distances of the moon, from the
 sun and stars, each set comprehending six observations.
 These nearly coinciding with each other, we deter-
 mined, at noon, by observation, our lat. to be 35 deg.
 17 min. and our long. with great accuracy, to be 141
 deg. 32 min. At two o'clock, we again made land
 towards the W. distant 13 leagues. A hummock to the
 northward, which had an insular appearance, bore
 N. N. W. half W. We steered for the land till be-
 tween five and six, when we hauled our wind to the S.
 At this time we decried to the westward a mountain of
 extraordinary height, with a round summit, rising far in-
 land. In its neighbourhood the sea is of a moderate
 elevation; but, to the S. of the hummock island, there
 appeared at a considerable distance up the country, a
 ridge of hills, extending towards the mountain, and
 which might perhaps join it. As the weather, in the
 morning of the 2d, had a very threatening appear-
 ance, and the wind was at S. S. E. we thought it ad-
 visable to quit the neighbourhood of the shore, and
 stand off towards the E. that the ships might not be
 entangled with the land. We were not deceived in
 our prognostications; for not long afterwards, a heavy
 gale began to blow, which continued till the next day,
 and was attended with rainy and hazy weather. On
 Wednesday the 3d, in the morning, we found ourselves
 by our reckoning, upwards of 50 leagues from the coast;
 which circumstance, united to the consideration of the
 very uncommon effect of currents we had already ex-
 perienced, the advanced period of the year, the vari-
 able and uncertain state of the weather, and the small
 prospect we had of any alteration for the better, in-
 duced Captain Gore to form the resolution of leaving
 Japan, and prosecuting our voyage to China; to which
 facts may be added, that the coast of Japan, accord-
 ing to Kämpfer's description of it, is the most danger-
 ous in all the known world; that it would have been
 exceedingly hazardous, in case of distress, to have run
 into any of the harbours of that country; where, if
 we may credit the most authentic writers, the aversion of
 the natives to a communication with strangers, has
 prompted them to the commission of the most flagrant
 acts of barbarity; that our vessels were in a leaky con-
 dition; that the rigging was so rotten as to require con-
 stant repair; and that the sails were almost entirely
 worn out, and incapable of withstanding the vehemence
 of a gale of wind. As the violent currents, which set
 along the eastern coast of Japan, may perhaps be at-
 tended with dangerous consequences to those naviga-
 tors, who are not acquainted with their extreme rapidity,
 we will here subjoin a summary account of their direc-
 tion and force, as remarked by us from the 1st to the
 8th of November. On the 1st, at the time when we were
 about 18 leagues to the E. of White Point, the cur-
 rent set at the rate of 3 miles in an hour, to the N. E. and
 by N. On the 2d, as we made a nearer approach to the
 shore, we observed, that it continued in a similar direc-
 tion, but was augmented in its rapidity to 5 miles an hour.
 As we receded from the coast, it again became more

moderate, and inclined towards the E. On the 3d, at
 the distance of 65 leagues from the shore, it set, at
 the rate of 3 miles an hour, to the E. N. E. On the
 two following days, it turned to the southward, and, at
 120 leagues from the coast, its direction was S. E. and
 its rate did not exceed one mile and a half an hour.
 It again, on the 6th, and 7th, shifted to the N. E. and
 its force diminished gradually till the 8th, at which time
 we could not perceive any current.

During the 4th and 5th of November, we proceeded
 to the south-eastward, with very unsettled weather,
 having much lightening and rain. On Saturday, the
 6th, we changed our course to the S. S. W. but about
 eight o'clock, in the evening, we were obliged to stand
 towards the S. E. On the 9th at noon, we observed in
 lat. 31 deg. 46 min. long. 146 deg. 20 min. Friday,
 the 12th, a most violent gale arose, which reduced us to
 the mizen-stay-sail and fore-sail. At noon, we were in
 lat. 27 deg. 36 min. and in long. 144 deg. 25 min. On
 the 13th, we were nearly in the same situation attrib-
 uted to the island of St. Juan, yet we saw not the least
 appearance of land. At six o'clock, P. M. we steered
 to W. S. W. Captain Gore thinking it useless to stand
 any longer to the S. S. W. as we were nearly in the same
 meridian with the Ladrones, or Mariana Islands, and
 at no very considerable distance from the track of the
 Manilla galleons. On Monday, the 15th, we saw three
 islands, and bore away for the S. point of the largest,
 upon which we observed a high barren hill, flatish at
 the top, and when seen from the W. S. W. presents an
 evident volcanic crater. The earth, rock, or sand, for
 it was not easy to distinguish of which its surface is
 composed, exhibited various colours, and a considerable
 part we conjectured to be sulphur, both from its ap-
 pearance to the eye, and the strong sulphureous smell
 perceived by us in our approach to the point. The
 Resolution having passed nearer the land, several of our
 officers thought they discerned streams proceeding from
 the top of the hill. These circumstances induced the
 Commodore to bestow on this discovery, the name of
 Sulphur Island. On Friday, the 26th, at six o'clock
 A. M. the wind having considerably abated, we set our
 top-sails, let out the reefs, and bore away to the west-
 ward. At noon, we observed in lat. 21 deg. 12 min.
 long. 120 deg. 25 min. In the course of this day, we
 saw many tropic birds, and a flock of ducks; also por-
 poises and dolphins; and continued to pass many pu-
 nce stones. We spent the night on our tacks; and
 on the 27th, at six o'clock A. M. we again made fail to
 the W. in search of the Balsee Isles. On the 28th, at
 four o'clock, A. M. we had sight of the island of Prata.
 At noon, our lat. was 20 deg. 39 min. long. 116 deg.
 45 min. The extent of the Prata shoal is consider-
 able; for it is about 6 leagues from N. to S. and extends
 4 leagues to the E. of the island; its limits to the
 westward, we had not an opportunity of ascertaining.
 We carried a press of sail during the remainder of
 the day, and kept the wind, which now blew from
 the N. E. by N. in order to secure our passage to
 Macao.

On Monday, the 29th, in the morning, we passed
 some Chinese fishing-boats, the crews of which eyed us
 with marks of great indifference. At noon, our lat. by
 observation, was 22 deg. 1 min. and, since the preceding
 noon, we had run 110 miles upon a N. W. course. On
 the 30th, in the morning, we ran along the Lema Isles,
 which, like the other islands situated on this coast, are
 destitute of wood, and, as far as we had an opportunity
 of observing, devoid of cultivation. We now fired a
 gun, and displayed our colours, as a signal for a pilot.
 On the repetition of the signal, there was an excellent
 race between four Chinese boats; and Captain Gore
 engaged with the person who arrived first, to conduct
 the ship to the Typa, for the sum of 30 dollars, sending
 word, at the same time to Captain King, that as he
 could easily follow with the Discovery, that expence
 might be saved to him. In a short time afterwards a
 second pilot got on board, and immediately laying hold
 of the wheel, began to order the sails to be trimmed.
 This gave rise to a violent altercation, which was at
 length

length compromised, by agreeing to divide the money between them. In obedience to the instructions from the Lords of the Admiralty, it now became necessary to demand of the officers and men, belonging to both ships, their journals, and what other papers they might have in their possession, relative to the history of the voyage. At the same time Captain King gave the Discovery's people to understand, that whatever papers they wished should not be sent to the Lords of the Admiralty, he would seal up in their presence, and preserve in his custody till the intentions of their Lordships, respecting the publication of the history of the voyage, were accomplished, after which, he said they should be faithfully restored to them. The Captain observes upon this occasion, that it is but doing justice to his company to declare, that, as to the crew, they were the best disposed, and the most obedient men he ever knew, though the greatest part of them were very young, and had never served before in a ship of war. The same proposals were made to the people of the Resolution, and instantly complied with.

We continued working to windward, by the direction of our pilot till about six o'clock P. M. when we let go our anchors, he being of opinion, that the tide was now setting against us. During the afternoon, we stood on our tacks, between the Grand Ladrone and the island of Potoe, having passed to the east of the latter. At nine o'clock we again cast anchor in six fathoms water: the town of Macao being at the distance of 9 or 10 miles, in a N. W. direction; and the island of Potoe bearing S. half W. seven miles distant.

On the 2d of December, in the morning, one of the Chinese contractors, called Compradors, came on board, and sold us as much beef as weighed 200 weight, together with a considerable quantity of greens, oranges, and eggs. In the evening Captain Gore sent Mr. King on shore to visit the Portuguese Governor, and to request his assistance in procuring refreshments, which he thought might be done on more reasonable terms than the Comprador would undertake to furnish them; with whom we had agreed for a daily supply; for which, however, he insisted on our paying him before-hand. Upon Mr. King's arrival at the citadel, the Fort-Major informed him that the governor was sick, and not able to see company. Having acquainted the Major with his desire of proceeding immediately to Canton, the former told him, that they could not permit to provide a boat, till permission had been obtained from the Hoppo, or officer of the customs; and that it was necessary to apply, for this purpose, to the Chinese government at Canton. When the Captain was returning, the Portuguese officer asked him, if he did not mean to visit the English gentlemen at Macao? This question gave him inexpressible pleasure. He proceeded immediately to the house of one of his countrymen; from whom he received information of the French war, and of the continuance of the American war; and that five sail of English ships were now at Wampu, near Canton, in China. The intelligence we had gained concerning the state of affairs in Europe, rendered us the more anxious to accelerate our departure as much as we possibly could. The first thing that claimed the attention of the Commodore, was to provide as well as he could for the general safety of the people under his command, on their return home. The news of a French war, without letting us know the order issued by the King of France in our favour, give us much concern. Our ships were ill fitted for war; the decks fore and aft, being finished flush, had no covering for men or officers; it was therefore thought necessary to raise a kind of parapet, musquet-proof, on both decks; and likewise to strengthen the cabins as much as possible in case of action. On Thursday, the 9th, we received an answer from the English supercargoes at Canton, in which they promised to exert their most strenuous endeavours in procuring the supplies of which we were in want, with all possible dispatch; and that a passport should be sent for one of our officers. Friday, the 10th, an English merchant, from one of our East-Indian settlements, made application to Captain Gore for the assist-

ance of a few of his people, to navigate as far as Canton a vessel which he had purchased at Macao. The Commodore considering this as a good opportunity for Captain King to repair to that city, gave orders, that he should take with him his second lieutenant, the lieutenant of the marines, and 10 sailors. Accordingly, they quitted the harbour of Macao, on Saturday, the 11th; and as they approached the Bocca Tygris, which is near 40 miles distant from Macao, the coast of China appeared to the eastward in white steep cliffs. Their progress being retarded by contrary winds, and the lightness of the vessel, they did not arrive at Wampu, which is only nine leagues from the Bocca Tygris, till Saturday, the 18th. Wampu is a small town, off which the ships of various nations, who trade with the Chinese, are stationed, in order to receive their respective ladings. At Wampu, Captain King embarked in a Sampans, or Chinese boat, the most convenient for passengers that we ever saw; and in the evening we reached Canton, and disembarked at the English Factory, where the Captain was received with every mark of civility and respect. Messrs. Fitzhugh, Bevan, and Rapier, composed, at that time, the Select Committee; and the former of these gentlemen acted as president. They immediately gave the Captain an inventory of those stores with which the East-India ships were able to supply us, and he had the pleasure to find, that they were ready to be shipped, and that the provisions we might have occasion for might be had at a day's notice. Being desirous of making our stay here as short as possible, the Captain requested, that the gentlemen would endeavour to procure junks for us the next day; but we were soon convinced by them, that patience is an indispensable virtue in China. After the Captain had waited several days for the issue of his negotiation with the Chinese, and was considering what steps he should take, the commander of a country ship presented him with a letter from Captain Gore, whereby he was informed of that Commander being engaged to bring our party from Canton, and to deliver our supplies, at his own hazard, in the Tyra. All difficulties being thus removed, Captain King had leisure to bestow some attention on the purchase of our stores and provisions, which he completed on Sunday, the 26th, and, on the following day, the whole stock was conveyed on board. As Canton was likely to be the most advantageous market for furs, the Commodore had desired Captain King to take with him about 20 skins of sea-otters; most of which had been the property of our deceased Commanders; and to dispose of them at the best price he could obtain. The English supercargoes being informed of these circumstances, they directed him to a member of the Hong (a society of the principal merchants of the city) who being fully apprised of the nature of the business, seemed to be sensible of the delicacy of the Captain's situation, and therefore assured him, that, in an affair of this kind, he should consider himself as a mere agent, without seeking any profit for himself. The skins being laid before this merchant, he examined them over and over again with particular attention; and at last informed Captain King, that he could not think of offering more than 300 dollars for them. As the Captain knew he had not offered one half of their value, he, therefore, in his turn, demanded 1000 dollars; the Chinese merchant then advanced to five, and, at length to 700 dollars; upon which the Captain lowered his demands to 900. Here each of them declaring that he would not recede, they parted; but the Chinese speedily returned, and proposed finally, that they should divide the difference, which the Captain agreed to, and received 800 dollars. The subsequent remarks, relative to Canton, were collected by Captain King, from the intelligence which he received from several English gentlemen; who had resided a long time near that city.

Canton, containing the old and new town, with the suburbs, is about 10 miles in circumference. The number of its inhabitants, as near as can be computed, may be from 100 to 150,000. Exclusive of whom there are 40,000 who reside constantly in Borges, called Sampans,

to navigate as far as Can-
purchased at Macao. The
as a good opportunity for
that city, gave orders, that the

as can be computed, may
clusive of whom there are
in Borges, called Sampa-
res,

res, or floating-houses upon the river: They are moored
in rows close to each other, with a narrow passage, at
intervals, for the boats to pass up and down the river.

The streets of this city are long, narrow, and destitute
of uniformity. They are well paved with large stones,
and, in general, kept extremely clean. The houses are
built of brick, and are only one story high. They have,
for the most part, two or three courts backwards, in
which are erected the warehouses for the reception of
merchandise; and, in the houses within the city, are
the apartments for the females. Some of the meaner
sort of people, though very few, have their habitations
composed of wood.

Those that belong to the European factors, are built
on a fine quay, having a regular facade of two stories
towards the river. They are constructed, with respect
to the inside, partly after the Chinese, and partly after
the European mode. Adjoining to them are a consi-
derable number of houses which belong to the Chinese;
and are let out by them to the commanders of vessels,
and to merchants, who make only an occasional stay.
As no European is permitted to take his wife with him
to Canton, the English supercargoes live together at
one common table, which is maintained by the Com-
pany, and each of them has also an apartment appro-
priated to himself, consisting of three or four rooms.
The period of their residence rarely exceeds eight
months in a year; and as during that time, they are
almost constantly employed in the service of the Com-
pany, they may submit, with the less uneasiness, to the
restrictions under which they live. They seldom make
any visits within the walls of Canton, except on public
occasions. Nothing contributed more to give Captain
King an unfavourable opinion of the Chinese, than his
finding that several of them who had resided in that
country for near 15 successive years, had never formed
any social connection or friendship. When the last ship
departs from Wampu, they are all under the necessity
of retiring to Macao; but they leave behind them all the
money they possess in specie, which, Mr. King was in-
formed, sometimes amounts to 100,000l. sterling, and
for which they have no other security than the seals of
the Viceroy, the Mandarines, and the merchants of the
Hong; a striking proof of the excellent police main-
tained in China.

During our continuance at Canton, Mr. King ac-
companied one of the English gentlemen on a visit to a
person of the first distinction in the place. They were re-
ceived in a long room or gallery, at the further end of
which a table was placed, with a large chair behind it,
and a row of chairs extending from it, on both sides,
down the room. The captain having been previously
instructed, that the point of politeness consisted in re-
maining unseated as long as possible, readily submitted
to this piece of etiquette; after which he and his friend
were treated with tea, and some fresh and preserved
fruits. Their entertainer was very corpulent, had a dull
heavy countenance, and displayed great gravity in his
deportment. He had learned to speak a little broken
English and Portuguese. After his two guests had taken
their refreshment, he conducted them about his house
and garden; and when he had shewn them all the im-
provements he was making, they took their leave.

The Captain being desirous of avoiding the trouble
and delay that might attend an application for pass-
ports, as well as of saving the unnecessary expence of
hiring a sampan, which he was informed amounted at
least to 12 pounds sterling, had hitherto designed to go
along with the supplies to Macao, in the country mer-
chant's ship we mentioned before: but receiving an in-
vitation from two English gentlemen, who had found
means to procure passports for four, he accepted, to-
gether with Mr. Phillips, their offer of places in a Chinese
boat, and intrusted Mr. Lannyon with the superin-
tendance of the men and stores, which were to sail the
following day.

On Sunday, the 26th, in the evening, Captain King
took his leave of the supercargoes, after having returned
them thanks for their many favours; among which must
be mentioned a present of a considerable quantity of

No. 79.

tea, for the use of the companies of both ships, and a
copious collection of English periodical publications.
The latter proved a valuable acquisition to us, as they
not only served to beguile our impatience, in the pro-
secution of our tedious voyage homewards, but also en-
abled us to return not wholly unacquainted with what
had been transacting in our native country during our
absence. On the 27th, at one o'clock in the morning
ing, Messrs. King and Phillips, and, the two English
gentlemen, quitted Canton, and, about the same hour
of the succeeding day; arrived at Macao, having passed
down a channel situated to the west of that by which
we had come up.

In the absence of our party from Macao, a brisk traf-
fic had been carrying on with the Chinese for our sea-
otter-skins, the value of which had augmented every
day. One of our sailors disposed of his stock, alone,
for 800 dollars; and a few of the best skins, which were
clean, and had been carefully preserved, produced 120
dollars each. The total amount of the value, in goods
and cash, that was obtained for the furs of both our
vessels, we are confident was not less than 2,000l. ster-
ling; and it was the general opinion, that at least two-
thirds of the quantity we had originally procured from
the Americans, were by this time spoiled and worn out,
or had been bestowed as presents, and otherwise dis-
posed of in Kamtschatka. If, in addition to these facts,
we consider, that we at first collected the furs without
having just ideas of their real value; that most of them
had been worn by the savages from whom we purchased
them; that little regard was afterwards shewn to their
preservation; that they were frequently made use of as
bed-clothes, and likewise for other purposes, during
our cruise to the northward; and that, in all probabi-
lity, we never received the full value for them in China,
the benefits that might accrue from a voyage to that
part of the American coast where we obtained them,
underraken with commercial views, will certainly ap-
pear of sufficient importance to claim the public atten-
tion. So great was the rage with which our seamen
were possessed to return to Cook's River, and there
procure another cargo of skins, by which they might
be enabled to make their fortunes, that, at one time,
they were almost on the point of proceeding to a mu-
tiny. And Captain King acknowledges, that he could
not refrain from indulging himself in a project, which
was first suggested to him by the disappointment we
had met with in being compelled to leave the Ja-
panese Archipelago, as well as the northern coast of
China, unexplored; and he is of opinion, that this ob-
ject may still be happily attained, by means of our East-
India Company, not only with trifling expence, but even
with the prospect of very beneficial consequences. The
state of affairs at home, or perhaps greater difficulties
in the accomplishment of his plan than he had foreseen,
have hitherto prevented its being carried into execu-
tion; but, as the scheme seems to be well contrived,
the reader will not be displeas'd with our inserting it
here.

In the first place, Capt. King proposes, that the East-
India Company's China ships should, each, carry an ad-
ditional number of men, making 100 in the whole. Two
vessels, one of 200 tons, and the other of 150, might,
with proper notice, (as Mr. King was informed) be
purchased at Canton; and, as victualling is as cheap
there as in Europe, he has calculated that they might
be completely equipped for sea, with one year's provi-
sions and pay, for the sum of 6,000l. including the
purchase. The expence of the requisite articles for
barter is very inconsiderable.

Captain King particularly recommends that each of
the ships should have a forge, five tons of unwrought
iron, and a skilful smith, with an apprentice and jour-
neyman, who might occasionally make such tools, as
the Indians should appear to have the greatest inclina-
tion for possessing. For, though half a dozen of the
finest skins, obtained by us, were purchased with twelve
large green glass beads, yet it is very certain, that the
fancy of these people, for ornamental articles, is ex-
tremely capricious and variable; and that the only sure

8 A

commu-

commodity for their market is iron. To this might be added several bales of coarse woollen cloth, two or three barrels of glass and copper trinkets, and a few gross of large pointed case-knives. He then proposes, that two vessels, not only for the greater security of the voyage, but because single ships ought never, in his opinion, to be sent out for the purpose of discovery. For where risks are frequently to be run, and uncertain and dangerous experiments tried, it can by no means be expected that single ships should venture so far, as where some security is provided against an unfortunate accident. When the ships are prepared for sea, they will sail with the first S. W. monsoon, which usually sets in about the commencement of the month of April. They will steer a northward course, with this wind, along the Chinese coast, beginning to make a more accurate survey from the mouth of the Nankin river, or the river Kyana, in the 30th degree of latitude, which is supposed to be the remotest limit of this coast hitherto visited by European vessels. The extent of the great gulph called Whang Hay, or the Yellow Sea, being at present unknown, it may be left to the Commander's discretion, to proceed up it as far as he may think proper: he must be cautious, however, not to entangle himself in it too far, lest he should not have sufficient time left for the prosecution of the remainder of his voyage. The same discretion may be used, when he has reached the straits of Tessoï, with regard to the islands of Jesso, which, if the wind and weather should be favourable, he must not neglect to explore. Having arrived in the latitude of 51 deg. 40 min. where he will make the most southerly point of the isle of Sagaleen, beyond which we have a considerable knowledge of the sea of Okotsk, he will steer towards the S. probably about the beginning of June, and exert his endeavours to sail to the most southerly of the Kurile islands. If the accounts of the Russians may be depended on, Orooop, or Nadefchda, will furnish the ships with a commodious harbour, where they may recruit their wood and water, and provide themselves with such refreshments as the place may afford. Near the end of June the commander will direct his course to the Shumagins, whence he will proceed to Cook's River, purchasing, in his progress, as many skins as possible, without losing too much time, since he ought to sail again to the southward, and trace the coast with the utmost accuracy between the 56th and 50th degrees of latitude, the space where contrary winds drove us out of sight of land. We think it proper to observe here, that Captain King considers the purchase of skins, in this expedition, as a secondary concern, for defraying the expence; and, from our experience in the present voyage, there is no reason to doubt that 250 skins, each worth 100 dollars, may be obtained without loss of time; particularly as they will, in all probability, be met with along the coast to the S. of Cook's River.

The commander of this expedition, after having continued about three months on the American coast, will set out on his return to China in the former part of October, taking care, in his route, to avoid, as much as possible, the tracks of preceding navigators. All that remains to be added on this subject, is, that if the fur trade should become an established object of Indian commerce, many opportunities will occur of completing whatever may have been left unfinished, in the voyage of which the outlines are here delineated.

During our absence, a very ludicrous alteration took place in the dress of all our crew, in consequence of the barter which the Chinese had carried on with us for our sea-otter skins. On our arrival in the *Typa*, not only the sailors, but likewise the younger officers, were ex-

remely ragged in their apparel; for, as the voyage had now exceeded, almost by a year, the time it was at first supposed we should continue at sea, the far greater part of our original stock of European clothes had been long ago worn out, or repaired and patched up with skins, and the different manufactures we had met with in the course of the expedition. These were now mixed and coked out with the gayest silks and cottons that China could produce.

On the 30th, being Friday, Mr. Lanyon arrived with the stores and provisions, which, without delay, were stowed in due proportion on board both the ships. While in the *Typa*, Captain King was shown, in the garden of an English gentleman at Macao, the rock, under which, according to traditional accounts, Camoens, the celebrated Portuguese poet, was accustomed to sit and compose his *Lusiad*. It is an arch of considerable height, consisting of one solid stone, and forming the entrance of a grotto dug out of the elevated ground behind it. Large spreading trees overshadow the rock, which commands a beautiful and extensive prospect of the sea, and the islands dispersed about it. During our continuance in the *Typa*, we heard nothing with respect to the measurement of the ships; we were therefore reasonably conclude, that the point of straits contested, in Commodore Anson's time, by the Chinese, has, in consequence of his firmness and resolution, never since been insisted on. By the observations made while our vessels lay here, the harbour of Macao is situated in the lat. of 22 deg. 12 min. N. and the long. of 113 deg. 47 min. E. our anchoring place, in the *Typa*, in lat. 22 deg. 9 min. 20 sec. long. 113 deg. 48 min. 24 sec. E. It was high water in the *Typa*, on the full and change days, at a quarter after five o'clock, and in the harbour of Macao, at 50 minutes past five: the greatest rise was six feet one inch. We shall conclude these remarks, and this chapter, with the prices of labour, and a few articles of provisions in China.

Two mariners belonging to the Resolution make off with the six-oared cutter—Defensible state of the two ships—They unmoor and leave the Tyta—Orders of the French Court relative to Captain Cook—Pass Pulo Sapatra, and anchor in the harbour of Condore—Transactions, and incidents during our stay—A mandarine visits the ships—Information received from Condore for the description of Pulo Condore, and other islands to the first and second Histories of Captain Cook's Voyages—Presents to the Mandarin, and the bishop of Adrian—Astronomical and nautical observations—Departure of the Resolution and Discovery from Pulo Condore—Enter the straits of Banca—Description of the country that borders thereon—Enter the straits of Sunda—Mr. Wilhamson sent on board a Dutch ship to procure intelligence—The two ships anchor at Cracatoa—That island described—Proceed to Prince's Island—Unhealthy effects of the climate of Java—A sudden storm—Steer for the Cape of Good Hope—Anchor in Simon's Bay—A visit to the governor—An account of False Bay, Simon's Bay, Noah's Ark, and Seal Island—Set sail for England; and stand to the west of the islands of Ascension and St. Helena—Desery the western coast of Ireland, and endeavour, in vain, to get into Port Galway—Steer to the north of Lewis's Island—Both ships anchor at Stromness—And on Wednesday, the 4th of October, arrive safe at the Nore, after an absence of 4 years, 2 months, and 22 days—Concluding Remarks.

A. D. 1780. **O**n Tuesday, the 11th of January, two sailors, John Cave quartermaster, and Robert Spencer belonging to the Resolution, went off with a six-oared cutter; and though the most diligent search was made, both this and the following morning, we could not gain any intelligence of them. It was imagined, that these seamen had been seduced by the hopes of acquiring a fortune, if they should return to the fur islands. On the 12th, at noon, we unmoored, and scaled the guns, which, on board the Discovery, amounted at this time to ten; so that her people by means of four additional ports, could fight seven on a side. In the Resolution likewise, the number of guns had been augmented from 12 to 16; and, in each of the ships, all other precautions were taken to give our inconsiderable force a respectable appearance. We considered it as our duty to furnish ourselves with these means of defence, though there was some reason to believe, that they had in a great measure been rendered superfluous by the generosity of our enemies; for we were informed, by the public prints, which Captain King had brought with him from Canton, of instructions having been found on board all the French ships of war, that had been taken in Europe, importing, that their Commanders, if they should happen to fall in with the Resolution and Discovery, were to suffer them to proceed unmolested on their voyage. It was also reported, that the American Congress had given similar orders to the vessels employed in their service. This intelligence being further confirmed by the private letters of some of the super-cargoes, Captain King deemed it incumbent on him, in return for the liberal exceptions which our enemies had made in our favour, to refrain from embracing any opportunities of capture, and to maintain the strictest neutrality during the whole of our voyage. Having got under sail about two o'clock, P. M. we passed the fort of Macao, and saluted the garrison with eleven four-pounders, which they answered with an equal number. We were under the necessity of warping out into the entrance of the Tyta, which we gained by eight o'clock in the evening of the 13th, and lay there till nine o'clock the following morning, when we stood, with a fresh easterly breeze, to the S. between Wungboo and Potoe. At four in the afternoon, the Ladron was about two leagues distant in an eastern direction. On Saturday, the 15th, at noon, we observed in lat. 48 deg. 57 min. long. 114 deg. 13 min. On the 16th, we struck soundings over Macclisfield Bank, and found the depth of water to be 50 fathoms, over a bottom consisting of white sand and shells. We computed this part of the bank to be situated in lat. 15 deg. 51 min. and in long. 114 deg. 20 min. Thursday, the 19th, at four o'clock P. M. we had in view Pulo Sapatra, hearing N. W. by W. and distant about four leagues. Having passed this island, we stood to the westward; and on the 20th made the little group of islands known by the name of Pulo Condore, at one of which we anchored, in six fathoms water. The harbour where we now moored, has its entrance from the N. W. and affords the best shelter during the N. E. monsoon. Its entrance bore W. N. W. quarter W. and N. by W. the opening at the upper end bore S. E. by E. three quarters E. and we were about 2 furlongs distant from the shore. On the

21st, early in the morning, parties were sent out to cut wood, the Commodore's principal motive for touching at this island being to supply the ships with that article. None of the natives having as yet made their appearance, notwithstanding two guns had been fired at different times, Captain Gore thought it advisable to land, and go in search of them. Accordingly, on Sunday, the 22nd, he desired Captain King to attend him. They proceeded in their boats along shore for the space of two miles, when perceiving a road that led into a wood, they landed. Here Captain King left the Commodore, and attended by a midshipman, and four armed sailors, pursued the path, which appeared to point directly across the island. They proceeded through a thick wood up a steep hill, to the distance of a mile, when after descending, they arrived at some huts. Captain King ordered the party to stay without, lest the sight of armed men should terrify the inhabitants, while he entered and reconnoitered alone. He found, in one of the huts, an elderly man, who was in a great fright, and preparing to make off with the most valuable effects. However a few signs, particularly that most significant one of holding out a handful of dollars, and then pointing to a herd of buffaloes, and the fowls that were running about the huts in great numbers, left him without any doubts as to the objects of their visit. He pointed towards a place where the town stood, and made them comprehend, that by going thither, all their wants would be supplied. On their first coming out of the wood, a herd of buffaloes, to the number of 20 at least, came running towards them, tossing up their heads, snuffing the air, and roaring in a hideous manner. They had followed them to the huts, and now stood drawn up in a body, at a little distance; and the old man made them understand, that it would be exceeding dangerous to move, till they were driven into the woods; but so enraged were the animals grown, at the sight of them, that this was not effected without a good deal of time and difficulty. The men not being able to accomplish it, they called to their assistance a few little boys, who soon drove them out of sight. Afterward they had an opportunity of observing, that in driving these animals, and securing them, which is done by putting a rope through a hole made in their nostrils, little boys were always employed, who could stroke and handle them with impunity at times, when the men durst not approach them. Having got rid of the buffaloes, they were conducted to the town, which consists of between 20 and 30 houses, built close together; besides 6 or 7 others that are scattered about the beach. The roof, the two ends, and the side fronting the country, are neatly constructed of reeds; the opposite side, facing the sea, is entirely open; but, by means of a kind of bamboo screens, they can exclude or let in as much of the sun and air as they please. They were conducted to the largest house, where the chief, or captain, as they called him, resided, but he was absent, or would not be seen; therefore no purchases could, as they said, be made. At two o'clock, in the afternoon, they returned to the ships; as did likewise several of our shooting parties from the woods, about the same time. At five o'clock, six men in a proa, rowed up to the ships, from the upper-end of the harbour; and one of them, who was a person of decent appearance, introduced himself to Captain Gore, with an

rel; for, as the voyage had near, the time it was at first at sea, the far greater part of the ocean clothes had been long and patched up with skins, these we had met with in the these were now mixed and and cottons that China

C H A P.

ease and politeness which indicated that he had been accustomed to pass his time in other company than what Condore afforded. He brought with him a sort of certificate, written in the French language, of which the following is a translation.

"Peter George, Bishop of Adrian, Apostolic Vicar of Cochinchina, &c. The little Mandarin, who is the bearer hereof, is the real Envoy of the Court to Pulo Condore, to attend there for the reception of all European vessels, whose destination is to approach that place, &c. A Sai-Gon. 10 August, 1779."

He gave us to understand, that he was the Mandarin mentioned in it; and produced another paper, which was a letter sealed up, and addressed to the Captains of any European ships that may touch at Condore. From this letter, and the whole of Luco's conversation, the Mandarin, we had little doubt, that the vessel he expected was a French one. We found, at the same time, that he was desirous of not losing his errand, and was not unwilling to become our pilot. We could not discover from him the precise business which the ship he was waiting for designed to prosecute in Cochinchina. We shall only add, that he acquainted us, that the French vessels might perhaps have touched at Tinnon, and from thence sail to Cochinchina; and as no intelligence had been received, he imagined that this was most likely to have been the case. Captain Gore afterwards enquired, what supplies could be procured from this island. Luco replied, he had two buffaloes belonging to him, which were at our service, and that considerable numbers of those animals might be purchased for four or five dollars each. We had purchased eight of these animals; and on the 23d, early in the morning, the launches of both ships were dispatched to the town to bring them away, but our people were much at a loss to bring them on board. After consulting with the Mandarin, it was determined, that they should be driven through the wood, and over the hill, down to the bay, where our two Captains had landed. This plan was accordingly executed; but the untractableness, and amazing strength of the animals rendered it a slow and difficult operation. The mode of conducting them was, by putting ropes through their nostrils, and round their horns; but when they were once enraged at the sight of our people, they became so furious, that they sometimes tore asunder the cartilage of the nostril, through which the ropes passed, and set themselves at liberty; at other times they broke the trees, to which it was found necessary to fasten them. On such occasions, all the endeavours of our men, for the recovery of them, would have been unsuccessful, without the aid of some little boys, whom the buffaloes would suffer to approach, and by whose puerile managements their rage was quickly appeased; and when brought down to the beach, it was by their assistance, in twisting ropes about their legs, in the manner they were directed, that our people were enabled to throw them down, and, by that means, to get them into the boats; and, a circumstance very singular, they had not been a whole day on board, before they were as tame as possible. Captain King kept a male and a female for a considerable time, which became great favourites with the seamen. Thinking a breed of these animals, some of which weighed, when dressed, 700 pounds, would be an acquisition of some value, he intended to have brought them with him to England; but that design was frustrated by an incurable hurt which one of them received at sea. Besides the buffaloes, of which there are several large herds in this island, we purchased from the natives some remarkably fine fat hogs, of the Chinese breed. We procured three or four of the wild sort; several of whose tracks were seen in the woods; which also abound with monkeys and squirrels, but so shy, that it was difficult to shoot them. Here we found the cabbage-tree, and other succulent greens, with which our people made very free without asking questions. Two wells of excellent water had been discovered, in consequence of which part of the companies of both ships had been employed in providing a competent supply of it. Our numerous subscribers will

be pleased to recollect, that in our history of Captain Cook's first and second voyages, we have given a concise, though comprehensive account of Pulo Condore, Celebes, Sumatra, Java, the Philippine, Ladrones, and, in short, all the principal islands in the Indian Sea; it therefore only now remains, during the remainder of our passage home, with a view of establishing the credit and reputation of this work, and of rendering it the most complete undertaking of the kind extant, to mention a few particulars that came under our own observation, and which may be reckoned as improvements since the labours of former compilers, or the expeditions of prior navigators.

Pulo Condore signifies the island of Calabashes, its name being derived from two Malay words; Pulo implying an island, and Condore, a Calabash, great quantities of which fruit are produced here. Among the vegetable improvements of this island, may be reckoned the fields of rice that we observed; also coconuts, pomegranates, oranges, shaddock, and various sorts of pompons. We continued at this harbour till the 28th, when the little Mandarin took leave of us; at which time the Commodore gave him, at his request, a letter of recommendation to the Commanders of any other vessels that might put in here. He also bestowed on him a handsome present, and gave him a letter for the bishop of Adrian, together with a telescope, which he desired might be presented to him as a compliment for the favours we had received, through his means, at Pulo Condore. The latitude of the harbour is 8 deg. 40 min. N. and its longitude, deduced from many lunar observations, 106 deg. 18 min. 46 sec. E. At full and change of the moon it was high water at 4 h. 15 m. apparent time; after which the water continued for 12 hours, without any perceptible alteration. The transition from ebbing to flowing was very quick, being in less than five minutes. The water rose and fell seven feet four inches perpendicular.

On Friday, the 28th, we unmoored, and cleared the harbour. On the 30th, at one o'clock, P. M. we had sight of Pulo Timooan, and at five, Pulo Puiffang was seen in the direction of S. by E. three quarters E. At nine o'clock, we had, from the effect of some current, out-run our reckoning, and found ourselves close upon Pulo Aor, in the lat. of 2 deg. 46 min. N. long. 104 deg. 37 min. E. in consequence of which we hauled the wind to the E. S. E. This course we prosecuted till midnight, and then steered S. S. E. for the Straits of Banca.

On Tuesday, the 1st of February, we observed in lat. 1 deg. 20 min. N. and our long. by a number of lunar observations, we found to be 105 deg. E. Towards sunset, we had a view of Pulo Panjang; at which time our lat. was 53 min. N. On the 2d, we passed the Straits of Sunda; and, at noon, we came in sight of the small islands known by the name of Dominis, lying off the eastern part of Lingen. At one o'clock, P. M. Pulo Taya made its appearance in the direction of S. W. by W. distant 7 leagues. On the 3d, at day-break, we had sight of the three islands; and, not long afterwards, saw Monopini Hill, in the island of Banca. Having got to the W. of the shoal, named Frederic Endric, we entered the Straits of Banca, and bore away towards the S. On the 4th, in the morning, we proceeded down the Straits with the tide; and, at noon, the tide beginning to make against us, we cast anchor, at the distance of about one league from what is denominated the Third Point, on the Sumatra shore; Monopini Hill bearing N. 54 deg. W. and our lat. being 2 deg. 22 min. S. long. 105 deg. 38 min. E. At three in the afternoon we weighed, and continued our course through the Straits with a gentle breeze. In passing these Straits, ships may make a nearer approach to the coast of Sumatra than to that of Banca. On Sunday, the 6th, in the morning, we passed to the W. of Lulepara; and at five o'clock, P. M. we deflected the Sisters, in the direction of S. by W. half W. At seven we cast anchor three leagues to the northward of those islands. On the 7th, at five o'clock, A. M. we weighed, and in three hours afterwards we were in sight of the Sisters. These are two islands of very small extent, plentifully stocked with wood, and situated in 50 deg.

in our history of Captain Cook, we have given a concise account of Pulo Condore, Philippine, Ladrones, and other islands in the Indian Sea; and during the remainder of the voyage of establishing the credit of our observations, and of rendering it the most kind extant, to mention under our own observation, as improvements since the first of the expeditions of prior

the island of Calabashes, in two Malay words, Pulo Condore, a Calabath, great quantities produced here. Among the islands in this island, may be reckoned observed; also cocoa-nuts, yams, and various sorts of fruit at this harbour till the 28th, took leave of us; at which time, at his request, a letter from the Commanders of any other islands. He also bestowed on me a letter for the Governor of St. Helena with a telescope, which he presented to me as a compliment for my services through his means, at Pulo Condore, which is 8 deg. 40 min. 10 sec. E. At full and change of the moon, at 4 h. 15 m. apparent tide continued for 12 hours, and the transition from high to low, being in less than five minutes, fell seven feet four inches

unmoored, and cleared the ground at five o'clock, P. M. we had a fair wind from the S. E. three quarters E. At the effect of some current, we found ourselves close upon the island, 46 min. N. long. 104 deg. 15 min. E. which we hauled the wind to the S. E. we prosecuted till midnight, and then stood to the S. E. for the Straits of Banca. At 11 o'clock, we observed in latitude 10 deg. 15 min. S. by a number of stars, 10 deg. 15 min. S. Towards sunset, we observed in latitude 10 deg. 15 min. S. at which time our latitude was 10 deg. 15 min. S. of the small islands known as the Straits of Sunda, and being off the eastern part of the island of Pulo Taya made us 10 deg. 15 min. S. of S. W. by W. distant 7 miles, and at 11 o'clock, we had sight of the island of Banca.

Having got to the W. of Banca, we entered the Straits of Banca towards the S. On the 4th, in the morning, we stood down the Straits with the beginning to make against the wind, at a distance of about one league from the Third Point, on the Sumatra side, N. 54 deg. W. and N. S. long. 105 deg. 38 min. E. At 11 o'clock, we weighed anchor, and continued our course with a gentle breeze, which may make a nearer approach than to that of Banca. In the morning, we passed to the W. of Banca, at five o'clock, P. M. we deflected our course to the northward of Banca, at five o'clock, A. M. we stood on towards the northward of Banca, at five o'clock, A. M. we were in sight of a small island of very small extent, and situated in 50

deg. S. lat. and in long. 106 deg. 12 min. They lie nearly N. and S. from each other, encompassed by a reef of coral rocks. At noon, we had sight of the island of Java; and about four in the afternoon, we perceived two vessels in the Straits of Sunda; one of which lay at anchor near the mid-channel island, the other nearer the shore of Java. On the 8th, about eight o'clock in the morning, we weighed anchor, and proceeded through the Straits of Sunda. On Wednesday the 9th, between ten and eleven, Captain King was ordered by the Commodore to make sail towards a Dutch vessel, that now came in sight to the southward, which we imagined was from Europe; and, according to the nature of the information that might be obtained from her, either join him at Cracatoa, or to proceed to the south-eastern extremity of Prince's Island, and there provide a supply of water, and wait for him. In compliance with these instructions, Captain King bore down towards the Dutchman; and on the 10th, in the morning, Mr. Williamson went on board her; where he was informed, that she had been seven months from Europe, and three from the Cape of Good Hope; that, before her departure, the Kings of France and Spain had declared war against his Britannic Majesty; and that she had left Sir Edward Hughes at the Cape with a Squadron of men of war, and also a fleet of East-India ships. On the return of Mr. Williamson, Captain King took the advantage of a fair breeze, and made sail towards the island of Cracatoa, where he soon after perceived the Resolution at anchor, and immediately dispatched a boat to communicate to Captain Gore the intelligence procured by Mr. Williamson. When we saw our consort preparing, at the distance of near two leagues, to come to us, we fired our guns, and displayed the signal for leading a-head, by hoisting an English jack at the ensign staff. This was intended to prevent the Discovery's anchoring, on account of the foul ground, which the maps on board our ship placed in this situation. However, as Captain King met with none, but, on the contrary, found a muddy bottom, and good anchoring ground, at the depth of 60 fathoms, he remained fast till the return of the boat, which brought him orders the ensuing morning to proceed to Prince's Island.

The island of Cracatoa is the southernmost of a cluster of islands lying in the entrance of the Straits of Sunda. It has a lofty peaked hill at its southern extremity, situated in lat. 6 deg. 9 min. S. and in long. 105 deg. 15 min. E. The whole circumference of the island does not exceed nine miles. The island of Sambouricou, or Tamarin, which stands 12 miles to the northward of Cracatoa, may easily be mistaken for the latter, since it has a hill of nearly the same figure and dimensions, situated likewise near its south end. The lat. of the road where we cast anchor is 8 deg. 6 min. S. long, by observation, 105 deg. 36 min. E. It is high water on the full and change days, at seven o'clock in the morning; and the water rises three feet two inches perpendicular.

At three o'clock, A. M. on Friday, the 11th, the Discovery weighed anchor, and receded for Prince's Island; and, at noon, she came to us, and moored off its eastern extremity. On Monday, the 14th, at day break, we defiered our consort, and, at two o'clock P. M. we anchored close by her. By the 16th, both ships fluried their casks, and had replenished them with fresh water. In the evening the decks were cleared, and we prepared for sea. On Saturday, the 19th, being favoured with a westerly breeze, we broke ground, to our extreme satisfaction, for the last time in the Straits of Sunda; and on the 20th, we had totally lost sight of Prince's Island. If Mr. Lannyon had not been with us, we should probably have met with some difficulty in finding the watering place; it may, therefore, not be improper to give a particular description of its situation, for the benefit of subsequent navigators. The peaked hill on the island bears N. W. by N. from it. A remarkable tree, which grows on a coral reef, and is entirely detached from the adjacent shrubs stands just to the north of it; and a small plot of reedy grass, may be seen close by it. These marks will indicate the place where the pool dis-

charges itself into the sea; but the water here, as well as that which is in the pool, being in general salt, the casks must be filled about 50 yards higher up; where, in dry seasons, the fresh water which descends from the hills, is in great measure, lost among the leaves, and must therefore be searched for by clearing them away. The lat. of the anchoring-place at Prince's Island, is 6 deg. 36 min. 15 sec. S. and its long. 105 deg. 17 min. 30 sec. E.

We were attacked with a violent storm, attended with thunder, lightning, and heavy rain, on Friday the 25th. From the 26th to the 28th of March, we had a regular trade wind from the S. E. to E. by S. accompanied with fine weather; and as we sailed in an old beaten track, no incident worthy of notice occurred. It had hitherto been Captain Gore's intention to proceed directly to St. Helena, without stopping at the Cape, but our rudder having been for some time complaining, and, on being examined, reported to be in a dangerous state, he resolved to steer directly for the Cape, as the most eligible place, both for procuring a new main piece for the rudder, and recovering the sick.

On Monday, the 10th of April, a snow was seen bearing down, which proved to be an English East-India packet, that had left Table Bay three days before, and was cruising with orders for the China fleet, and other India ships. She told us, that, about three weeks before, Monfr. Truongollar's Squadron, consisting of six ships, had sailed from the Cape, and was gone to cruise off St. Helena, for the English East-Indiamen. The next morning we stood into Simon's Bay. At eight o'clock, we came to anchor, at the distance of one third of a mile from the nearest shore; the S. E. point of the bay bearing S. by E. and Table Mountain N. E. half N. The Naffau and Southampton East-Indiamen were here, in expectation of a convoy from Europe. We saluted the fort with eleven guns, and were complimented with an equal number in return. As soon as we had cast anchor, Mr. Brandt, the governor of this place, favoured us with a visit. This gentleman had the highest regard for Captain Cook, who had been his constant guest, whenever he had touched at the Cape; and though he had, some time before, received intelligence of his untimely fate, he was extremely affected at the sight of our vessels returning without their old Commander. He was greatly surprised at seeing most of our people in so healthy a state, as the Dutch ship which had quitted Macao, at the time of our arrival there, and had afterwards stopped at the Cape, reported, that we were in a most wretched condition, there being only 15 hands left on board the Resolution, and seven in the Discovery. What could have induced these people to propagate so infamous a story, is not very easy to conceive.

Captain King accompanied our Commodore to Cape Town, on Saturday the 15th, and the next day, in the morning, they waited on Baron Plettenberg, the Governor, who received them with every possible indication of civility and politeness. He entertained a great personal esteem for Captain Cook, and professed the highest admiration of his character, and on hearing the recital of his affecting catastrophe, broke forth into many expressions of unalloyed sorrow. In one of the principal apartments of the baron's house, he shewed our gentlemen two pictures, one of De Ruyter, the other of Van Tromp, with a vacant space left between them, which, he said, he intended to fill up with the portrait of Captain Cook; and for this purpose he requested that they would endeavour to procure one for him, on their arrival in Great-Britain, at any price. During our continuance at the Cape, we met with the most friendly treatment, not only from the Governor, but also from the other principal persons, as well as the Africans as Europeans, belonging to the place.

Eastward of the Cape lies False-Bay; and at the distance of about 12 miles from the Cape, on the western side, is Simon's-Bay, the only commodious station for shipping to lie in. To the N. N. eastward of this bay, there are some others, from which, however, it may with ease be distinguished, by a remarkable sandy

way to the N. of the town, which forms a conspicuous object. The anchoring place in Simon's Bay, is situated in the lat. of 84 deg. 20 min. S. and its long. is 18 deg. 29 min. E. In fleeing for the harbour, along the western shore, there is a small flat rock, known by the name of Noah's Ark; and about a mile to the N. eastward of it, are others, denominated the Roman Rocks. These are a mile and a half distant from the anchoring place; and either to the northward of them or between them, there is a safe passage into the bay. When the N. westerly gales are let in, the navigator, by the following bearings, will be directed to a secure and convenient station: Noah's Ark S. 51 deg. E. and the centre of the hospital S. 53 deg. W. in 7 fathoms water. But if the S. easterly winds should not have ceased blowing, it is more advisable to remain further out in 8 or 9 fathoms water. The bottom consists of sand, and the anchors, before they get hold, settle considerably. About two leagues to the eastward of Noah's Ark, stands Seal-Island, whose southern part is said to be dangerous, and not to be approached nearer than in 22 fathoms water with any degree of safety.

The signal was made for unmooring on Tuesday, May the 9th, and about noon we took our departure from Simon's-Bay. We had now provisions, live stock, water, and naval stores, aboard, in great plenty: also healthy crews, in high spirits, willing for nothing but a fair wind to shorten our passage home. On the 14th, we got into the S. E. trade wind, and stood to the W. of the islands of Ascension and St. Helena. Wednesday, the 31st, we were in lat. 12 deg. 48 min. long. 15 deg. 40 min. W. On Saturday the 10th of June, the Discovery's boat brought us word, that, in exercising her great guns, the carpenter's mate had his arm shattered in a shocking manner, by part of the wadding being left in after a former discharge; another man was slightly wounded at the same time. On the 12th, it began to blow very hard; and continued so till the next day, when we crossed the line to the northward, for the fourth time during our voyage, in the long. of 26 deg. 16 min. W.

We descried the western coast of Ireland on Saturday the 12th of August, and endeavoured in vain to get into Port Galway, but were compelled by violent southerly winds, to stand to the N. We made the island of Lewis, the wind still continuing in the same quarter.

About eleven o'clock, A. M. on Tuesday the 22d, both ships came to anchor at Stromness in Scotland, from whence the commodore sent Captain King to inform the Lords of the Admiralty of our arrival.

We arrived off Yarmouth on the 30th, in company with his Majesty's sloops of war the Fly and Alderney. Our boats were immediately sent on shore for provisions, and for a spare cable for our small hower, that we had being nearly rendered unfit for use.

The Resolution and Discovery reached the Nore in safety on the 4th of October 1780; and, on the 6th, dropped anchors at Deptford; after four years, three months, and two days absence.

During this long and hazardous voyage, the two ships never lost sight of each other for a day together except twice; the first time, owing to an accident that happened to the Discovery off the coast of Owhyhee; the second, to the fogs they met with at the entrance of Awatka Bay; a striking proof of the skill and vigilance of the subltern officers.

Another circumstance, no less remarkable, is, the

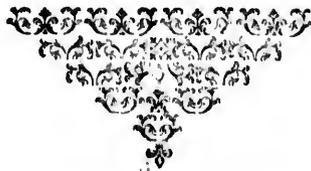

uncommon healthiness of the companies of both ships. When Captain King quitted the Discovery at Stromness, he had the satisfaction of leaving the whole crew in perfect health; and, at the same time, the number of sick persons on board the Resolution did not exceed two or three, only one of whom was incapable of service.

During the whole voyage, the Resolution lost no more than five men by sickness, three of whom were in a precarious state of health at their departure from England. The Discovery did not lose one. This singular success may, under the blessing of an all-directing Providence, be justly attributed to a strict and unremitting attention to all the salutary and well-known regulations established by Capt. Cook. However, in spite of those precautions, the baneful effects of salt provisions might have, perhaps, in the end, been severely felt, had they not availed themselves of every substitute their situation, at various times, afforded. These frequently consisting of articles, which their people had not been used to consider as food for men, and being sometimes exceedingly nauseous, it required the joint aid of persuasion, authority, and example, to conquer their prejudices and disgusts.

Sour krout and portable soup were the preventives chiefly relied on. As to the antiseptic remedies, with which they were amply supplied, they had no opportunity of trying their effects, as there did not appear the slightest symptoms of the scurvy, in either ship, during the whole voyage. Their malt and hops had also been kept as a resource, in case of actual sickness, and on examination at the Cape of Good Hope, were found entirely spoiled. About the same time, were opened some casks of biscuit, flour, malt, pease, oatmeal, and groats, which, by way of experiment, had been put up in small casks, lined with tin-foil, and found all, except the pease, in a much better state, than could have been expected, had they been packed up in the usual manner.

It happened very fortunately in the Discovery, that only one of the men that had fevers in the Straits of Sunda, stood in need of Peruvian Bark, as he alone consumed the whole quantity usually carried out by Surgeons, in such vessels as these. Had more been affected in the same manner, they would probably all have perished, from the want of the only remedy capable of affording them effectual relief. This proves the absolute necessity of allowing a sufficient quantity of this excellent medicine to such of his Majesty's ships as may be exposed to the influence of unwholesome climates.

Having thus completed, in such a manner, we presume, as to set all rivalry at defiance, the three great and interesting Voyages of this ever-to-be-honoured Navigator, Capt. Cook, and the other Voyages intended for this Collection, we shall now, agreeable to our promise, present our numerous readers with those respective productions of eminent modern travellers, which are most esteemed for their authenticity and entertainment, beginning with the interesting narrative of BRUCE'S Travels into AFRICA, to discover the Source of the Nile; and, we trust while the same accuracy and attention, hitherto preserved, shall mark our future labours, that we shall still retain that distinguished liberality and encouragement with which we have been already so eminently honoured by the PUBLIC at large.

A NEW, COMPLETE, AND GENUINE
HISTORY OF THE
TRAVELS of JAMES BRUCE, Esq.
Into *ABYSSINIA*,

To Discover the SOURCE of the NILE.

Undertaken and Performed in 1768, 1769, 1770, 1771, 1772, and 1773.

Including all the Author's Remarks and Information during his Travels and Adventures in
EGYPT, ABYSSINIA, MASUAH, &c.

Being an Entire New HISTORY of all those Interesting OCCURRENCES, DISCOVERIES, &c.
at the NILE; with a Full and Circumstantial Account of the Traveller's being made Governor
of RAS EL FEEL—his several Disastrous Interviews—the Bloody Banquet—King's Ladies at
SENAAR, &c. &c. &c.

Which, with the several other VOYAGES and TRAVELS included in this Collection, will be Embellished
with a Variety of Elegant CHARTS, MAPS, VIEWS, and other COPPER-PLATES, Engraved by Eminent Artists.

INTRODUCTION.

MR. BRUCE had long entertained a wish to attempt the discovery of the Nile; being appointed to the consulate of Algiers, he set out for Italy, through France. On his arrival at Rome, he received orders to proceed to Naples, there to wait his majesty's further commands. Having stopped there a short time, he received orders to proceed to take possession of his consulate. He returned without loss of time to Rome, and thence to Leghorn, where having embarked on board the Montreal man of war, he arrived at Algiers, where he spent a year, then prepared to take a voyage to Mahon on private business; here being disappointed in his views, he sailed in a small vessel from that port, and, having a fair wind, soon made the coast of Africa, and landed at Bona: after a favourable voyage he arrived at Tunis, and having obtained permission to visit the country in whatever direction he pleased, set out on his intended journey through the kingdoms of Algiers and Tunis; he explored the ruins at Dugga, thence proceeded the upper road to Keff, and then to Hydra, inhabited by a tribe of Arabs. From this he passed to the ancient Tipesa, another Roman colony. From hence he continued his journey in a straight line nearly S. E. and arrived at Medrahem, a superb pile of building, the sepulchre of Syphax, and the other kings of Numidia, and where, as the Arabs believe, were also deposited the treasures of those kings. Advancing still to the S. E. through broken ground and some very barren vallies, which produced nothing but game, he came to Jibhel Aurez, the Aurahus Mons of the middle age. This is not one mountain, but an assemblage of many of the most craggy fleeces in Africa. Having proceeded to the north-east as far as Tubersoke, he returned to Dugga, and from thence to Tunis. His next journey through Tunis, was by Zowan, a high mountain, where is a large aqueduct which formerly carried its

water to Carthage. He now continued his journey along the coast to Susa, through a fine country planted with olive trees, and came again to Tunis, not only without disagreeable accident, but without any interruption from sickness or other cause. He again set out from Tunis, over the desert to Tripoli, the first part of which was to Gabs, and from thence to the island of Gerba.

Afterwards he encompassed a great part of the Pentapolis, and visited the ruins of Arfinoe without any accident, and thence proceeded to Ras Sem, the petrified city, concerning which so many idle fictions have been reported.

Mr. Bruce now approaching the sea-coast, came to Ptolometa, where he met a Greek junk belonging to Lampedosa, a little island near Crete, which had been unloading corn, and was now ready to sail. At the same time the Arabs of Ptolometa told him, that the Welled Ali, a powerful tribe that occupy the whole country between that place and Alexandria, were at war among themselves, and had plundered the caravan of Morocco, and that the pilgrims composing it had mostly perished, having been scattered in the desert without water; that a great famine had been at Derna, the neighbouring town, to which Mr. Bruce intended to go; that a plague had followed, and the town, which is divided into upper and lower, was engaged in a civil war. This torrent of ill news was irresistible, and was of a kind he did not propose to struggle with; besides, there was nothing, as far as he knew, that merited the risk. He resolved, therefore, to fly from this inhospitable coast, and save to the public, at least, that knowledge and entertainment he had acquired for them.

Accordingly he embarked on board the Greek vessel, very ill accoutred, as he afterwards found, for, though it had plenty of sail, it had not an ounce of ballast. A number of people, men, women, and children,

children; flying from the calamities which attend famine, crowded in unknown to him; but the passage was short, the vessel light, and the matter, as was supposed, well accustomed to those seas. The contrary of this, however, was the truth, as he learned afterwards, when too late, for he was an absolute landman; proprietor indeed of the vessel, but this had been his first voyage. They sailed at dawn of day in very favourable and pleasant weather. It was the beginning of September, and a light and steady breeze, though not properly fair, promised a short and agreeable voyage; but it was not long before it turned fresh and cold; a violent shower of hail came on, and the clouds were gathering as if for thunder. Mr. Bruce observed that they gained no offing, and hoped, if the weather turned bad, to persuade the captain to put into Bengazi, for one inconvenience he presently discovered, that they had not provision on board for one day.

Unfortunately, however, the wind became contrary, and blew a violent storm. The vessel being in her trim with large latine sails, fell violently to leeward, and they scarce had weathered the cape that makes the entrance into the harbour of Bengazi, which is a very bad one, when all at once it struck upon a sunken rock, and seemed to be set down upon it. The wind at that instant seemed providentially to calm; but our traveller no sooner observed the ship had struck, than he began to think of his own situation. They were not far from shore, but there was an exceeding great swell at sea. Two boats were still towed astern of them, and had not been hoisted in. Roger McCormack, Mr. Bruce's Irish servant, had been a sailor on board the *Monarch* before he deserted to the Spanish service. He and the other, who had likewise been a sailor, presently unlashed the largest boat, and all three got down into her, followed by a multitude of people whom they could not hinder, and there was, indeed, something that bordered on cruelty, in preventing poor people from using the same means that they had done for preserving their lives. The mull that could be done was, to get loose from the ship as soon as possible, and two oars were prepared to row the boat ashore. Mr. Bruce had stripped himself to a short under-waistcoat and linen drawers; a silk sash, or girdle, was wrapt round him; a pencil, small pocket-book, and watch, were in the breast-pocket of his waistcoat; two Moorish and two English servants followed him; the rest more wife remained on board. They were not twice the length of the boat from the vessel, before a wave very nearly filled the boat. A howl of despair from those that were in her shewed their helpless state, and that they were conscious of a danger they could not shun. Mr. Bruce saw the fate of all was to be decided by the very next wave which was rolling in; and apprehensive that some woman, child, or helpless man, would lay hold of

him, and entangle his arms or legs, and weigh him down, he cried to his servants, both in Arabic and English, "We are all lost; if you can swim, follow me;" he then let himself down in the face of the wave.

Though Mr. Bruce was a good and practised swimmer, young, vigorous, healthy, and capable of fatigue, yet he found himself very insufficient when he came to the surf; he was, however, floated up by a large wave, in a very exhausted condition, and remained struggling with the sea, when he crept out of its reach, and lost both his under-landing and recollection. At this time the Arabs came down to plunder the vessel. Mr. Bruce, who hitherto remained insensible, was aroused from his lethargy by a blow with the butt-end of a lance, flod with iron, upon the juncture of the neck with the back-bone; after many kicks, blows, &c. they stripped him of his clothes, which had been made at Algiers, and left him naked. He found afterwards, by a young man who had accosted him, that he was taken for a Turk, his clothes having been made in the Turkish fashion. The Arab, convinced at last that he was a poor Christian from Tunis, and shipwrecked, gave him a ragged dirty baracen to cover him. He was then ordered up to a tent, examined, and he and his servants, who were all saved, allowed a plentiful supper, and every thing taken from them was restored after two days; being then mounted upon camels, they were forwarded to Bengazi, where Mr. Bruce found a small French sloop, and being known to the captain, was supplied with what money he wanted, and other necessaries. They sailed with a fair wind, and landed at Canea, where Mr. Bruce was taken very ill. From Canea he sailed for Rhodes; thence proceeded to Calatrosso, on the coast of Caramania, a part of Asia Minor, which Mr. Bruce, notwithstanding a strong inclination, was prevented from exploring, through the leverity of his illness.

On the restoration of his health, Mr. Bruce began to think of his long intended journey to Palmyra. He set out at a time appointed for Hamath, where he found his conductor, and proceeded to Haffia; from Haffia they proceeded to Cariateen, when two old men on horseback, one from the Mowalli, and another from the Anney tribe, accompanied them to Palmyra. From this he proceeded to Balbec (which is about 130 miles distance) and very fortunately arrived the same day that Emir Yousef had reduced the town and settled the government, and was decamping from it on his return home. It was fortunately for Mr. Bruce, because he was the Emir's friend, and had obtained liberty to do there what he pleased. Having made all necessary observations, Mr. Bruce arrived at Sidon in good health, and now prepared to set out on his discovery of the source of the Nile, the success of which undertaking shall be the subject of our two following books.

BOOK I.

CHAPTER I.

Mr. Bruce begins his Travels, &c.—Description of Alexandria, Rosetta, Egypt, Cairo, &c. &c. &c.—The several Adventures of Mr. Bruce during his Voyage in the Red Sea—His Arrival in the Harbour of Meshab.

ON the 15th of June 1768, Mr. Bruce sailed from Sidon, with a favourable wind, for the island of Cyprus. On the 17th they left Larnica; and on the 18th steered for Alexandria. Mr. Bruce, on his arrival here, found that the people had begun only two days before to open their doors and communicate with each other, as a terrible plague had raged in that city and neighbourhood from the beginning of March, being almost four months.

We find from Mr. Bruce's account, that Alexandria (which has been often taken since the time of

Cæsar) was at last destroyed by the Venetians and Cypriots, upon, or rather after the release of St. Lewis. The building of the present gates and walls, which some have thought to be antique, does not seem earlier than the last restoration in the thirteenth century. Some parts of the gates and walls may be of older date (and probably were those of the last Caliphs before Saladin); but, except these, and the pieces of columns which lie horizontally in different parts of the wall, every thing else is apparently of very late times, and the work has been huddled together

g elfe is apparently of
ork has been huddled
together

together in great hafte. There is nothing beautiful
or pleafant in the prefent Alexandria, but a handfome
fleet of modern houfes, where a very active and
intelligent number of merchants live upon the mife-
rable remnants of that trade, which made its glory in
the firft times. It is thinly inhabited, and there is a
tradition among the natives, that, more than once,
it has been in agitation to abandon it altogether, and
to retire to Rofetto, or Cairo, but that they have been
withheld by the opinion of divers faints from Arabia,
who have affured them, that Mecca being destroyed
fe which muft be as they think by the Rullians) Alex-
andria is then become the *holy place*, and that Maho-
met's body is to be tranfported thither.

Mr. Bruce now left this place in order to profecute
his undertaking. Egypt is full of deep dull and
fand, from the beginning of March to the firft of the
inundation. It is this fine powder and fand, railed and
loofened by the heat of the fun, and want of dew, and
not being ried fall, as it were, by any root or vegeta-
tion, which the Nile carries off with it, and buries in
the fea, and which many ignorantly fuppofe comes
from Abyffinia, where every river runs in a bed of
rock. When you leave the fea, you ftrike off neatly
at right angles, and purfue your journey to the call-
ward. Here heaps of ftones and trunks of pillars are
fet up to guide you in your road, through moving
lands, which ftand in hillocks, in proper directions,
and which conduét you fately to Rofetto, furrounded
on one fide by thefe hills of fand, which feem ready
to cover it.

The journey to Rofetto is always performed by
land, as the mouth of the branch of the Nile leading
to Rofetto, called the Bogaz, is very fhallow and
dangerous to pafs, and often tedious; befides, nobody
wifhes to be a partner for any time in a voyage with
Egyptian failors, if he can poffibly avoid it. The
journey by land is alfo reputed dangerous, and
people travel burthened with arms, which they are
determined never to ufe.

Rofetto is upon that branch of the Nile which was
called the Bolbuttie Branch, and is about four miles
from the fea. It is a large, clean, neat town, or
village, upon the eaftern fide of the Nile. It is
about three miles long, much frequented by ftudious
and religious Mahometans; among thefe too are a
confiderable number of merchants, it being the
entrepot between Cairo and Alexandria, and *vice
verfa*; here too the merchants have their factors,
who fuperintend and watch over the merchandize
which paffes the Bogaz to and from Cairo. There
are many gardens, and much verdure, about Rofetto;
the ground is low, and retains long the moifture it
imbibes from the overflowing of the Nile. Here
alfo are many curious plants and flowers brought
from different countries.

Mr. Bruce embarked for Cairo on the 30th, and
arrived there at the beginning of July. That part
in which the French are fettled is exceedingly com-
modious. There is only one long ftreet, which
contains all the merchants of that nation: it is fhut
at one end by large gates, where there is a guard,
and at the other end there is a large garden, with
fome pleafant walks. About four hundred inhabi-
tants have abfolute power, and in their own manner
adminifter what they call juftice; however, in Mr.
Bruce's time there was fome moderation, there being
only one Ali Bey. Every Bey has a great number
of fervants, faves to him, as he was to others before;
thefe are his guards, whom he occasionally promotes,
and, what is very remarkable, thefe flaves, that are
purchafed, always fucceed them in dignity and eftate,
in preference to their own children.

Mr. Bruce had an audience with the Bey, who
was a younger man than he thought; he was fitting
upon a large sofa, covered with crimfon cloth of
gold; his turban, his girdle, and the head of his
dagger, all thick covered with fine brilliants. The
Bey entered into difcourfe with him on various fub-
jects, and, after frequent interviews, fhewed him

much favour. Mr. Bruce having obtained feveral
letters and difpatches prepared for his journey, he
and his companions feured a boat to carry them to
Furhou, the refidence of Hamam, the Shekh of
Upper Egypt. This boat is called a canja, and is
one of the molt commodious ufed on any river,
being fafe and expeditious at the fame time, though
at firft it has a ftrong appearance of danger. That
on which they embarked was about 100 feet from
ftern to ftem, with two masts, main and foremast, and
two monftrous *Latine* fails, the mainfail yard being
about 200 feet in length.

There is peculiar to the Nile a certain kind of
pirates continually on the watch to rob boats, in which
they fuppofe the crew are off their guard. They
generally approach the boat when it is calm, either
fwimming under water, or when it is dark, upon
goat flkins; after which they mount with the unmolef-
tance, and take away whatever they can lay their
hands on. They are not very fond it feems of
meddling with veffels where they fee Franks or
Europeans, being in dread of fire-arms, the effects
of which they had experienced.

Mr. Bruce and his companions embarked on the
Nile at Bulac, on board this canja, December 12;
the wind being contrary, the boat was obliged to be
drawn with a rope againft the ftream. They advanced
a few miles to two convents of Coptes, called Dei-
reteen. Here they ftopped to pals the night, having
had a fine view of the pyramids of Geeza and Sac-
cara, and being then in fight of a prodigious number
of others built of white clay, and fretching far into
the defert to the fouth-weft. Two of thefe feemed
full as large as thofe which are called the pyramids of
Geeza. One of them was of a very extraordinary
form; it feemed as if it had been intended at firft
to be a very large one, but that the builder's heart
or means had failed him, and that he had brought it
to a very mifhapen difproportioned head at laft.

A tribe of Arabs was encamped on the fide of the
Nile, oppofite to their boat, a little further to the
fouth. Thefe were fubject to Cairo, or were then
at peace with its government. They are called
Howadat, being a part of the Atouni, a large tribe
that poffeffes the Isthmus of Suez, and from that go
up between the Red Sea and the mountains that
bound the eaff part of the valley of Egypt. They
reach to the length of Cofclair, where they border
upon another large tribe called Ababde, which ex-
tends from thence up into Nubia. Both thefe are
what were anciently called Shepherds, and are con-
ftantly at war with each other.

The Shekh of Howadat furnifhed Mr. Bruce with
horfes, who, with his companions, let out their veft
fails on the 13th, and paffed a very confiderable
village called Tuna, on the eaff fide of the river,
and a fmall village, confifting of about thirty houfes,
on the weft, called Shekh Atman; here the Nile is
about a quarter of a mile broad. Having made
fome few obfervations, Mr. Bruce and friends re-
turned about four o'clock in the afternoon.

They hoifted their main and fore-fails, leaving the
point of Metrahenny with a fair frefh wind; when
they had failed about two miles, they faw three men
fifhing in a manner and fituation very extraordinary.
They were on a raft of palm branches, fupported on
a float of clay jars, made falt together. The form
was triangular, like the face of a pyramid; two men,
each provided with a calling-net, flood at the two
corners, and threw their net into the ftream together;
the third flood at the third corner, which was fore-
moft, and threw his net the moment the other two
drew theirs out of the water. And this they re-
peated, in perfect time, and with furprifing regularity.
The Rais thought our travellers wanted to buy fift,
and letting go his mainfail, ordered them on board
with a great tone of fuperiority. They were in a
moment along-fide of them; and one of them came
on board, laffing his miferable raft to a rope at their
ftern. In recompence for their trouble they gave
them

them some large pieces of tobacco, and this transported them so much, that they brought them a basket of several different kinds of fish, all small, excepting one laid on the top of the basket, which was a clear salmon-coloured fish, silvered upon its sides, with a shade of blue upon its back. It weighed about 10lb. and was most excellent, being perfectly firm, and white like a perch. There are some of this kind 70lb. weight. Mr. Bruce examined their nets, they were rather of a smaller circumference than our calling nets in England; the weight, as far as he could guess, rather heavier in proportion than ours, the thread that composed them being smaller. He could not sufficiently admire their success, in a violent stream of deep water, such as the Nile; for the river was at least twelve feet deep where they were fishing, and the current very strong. These fishers offered willingly to take Mr. Bruce upon the raft to teach him; but he declined it on account of the danger. They said their fishing was merely accidental, and in course of their trade, which was selling these pouter earthen jars, which they got near Assmounein; and after having carried the raft with them to Cairo, they unnie, sell them at the market, and carry the produce home in money, or in necessaries upon their backs.

In the afternoon, about two o'clock, they came to the point of an island, where there were several villages with date trees on both sides of them. They then came to Haloutan, an island divided into several small ones, by celishes cut through it, under different Arabic names. They left the north end of the island, proceeding due south on the 15th, and passed a collection of villages called Woodan.

It is nice cultivated ground about this village, to the foot of the mountains, which is not above four miles; but it is full eight on the well, all overflowed and sown. The Nile is here but shallow, and narrow, not exceeding a quarter of a mile broad, and three feet deep; owing, as is supposed, to the resistance made by the island in the middle of the current, and by a bend it makes, thus intercepting the land brought down by the stream. The mountains here come down till within two miles of Suf el Woodan, for so the village is called. They were told there were some ruins to the westward of this, but only rubbish, neither arch nor column standing.

They passed by several villages on each side, all surrounded with palm-trees, verdant and pleasant, but conveying an idea of sameness and want of variety, such as every traveller must have felt who has sailed in the placid, muddy, green-banked rivers in Holland. The Nile, however, is here full a mile broad, the water deep, and the current strong. The wind seemed to be exasperated by the resistance of the stream, and blew fresh and steadily, as indeed it generally does where the current is violent. They passed with great velocity Nizelet Embarak, Cubabac, Nizelet Omar, Racca Kibeer, then Racca Seguiet, and came in sight of Atha, a large village at some distance from the Nile; and all the valley here was green, the palm groves beautiful, and the Nile deep.

Having passed Confadredy on the 18th, they found the Nile again divided by another fragment of the island, and inclining a little to the westward. The village Sidi Ali el Courani is on the East; it had a deserted appearance, but the wheat, which was five inches high on the banks, was more advanced than any hitherto seen. There was no appearance of villages. The river here is about a quarter of a mile broad, or a little more. They passed a convent of Cophts, with a small plantation of palms. This was a wretched building. At four miles distance stood the village of El Nizelet el Arab, consisting of miserable huts. Here they procured some excellent sugar canes, it being the last place where they discovered any.

Next they passed Boufti, a village on the west side of the Nile, two miles south of Shenniah; and, a little further, Beni Ali, where they saw for a minute the mountains on the right or west side of the Nile, run-

ning in a line nearly south, and very high. About five miles from Boufti is the village of Maniareish, on the east side of the river, and here the mountains on that side end. The country all around is well cultivated, and seemed to be of the utmost fertility; the inhabitants were better clothed, and seemingly less miserable and oppressed, than those they left behind in the places near Cairo. The Nile was very shallow at Beni Suef, and the current strong. They touched several times in the middle of the stream, and came to anchor at Baha, about a quarter of a mile above Beni Suef, where they passed the night.

In the evening of the 18th they arrived at Zohora, about a mile south of Efa. Here they passed the night. This place consisted of three plantations of dates, and was five miles from Miniet. Several villages on the western shore had been passed; those of the eastern seeming wholly unpeopled. They came to a village called Rhoda, whence they saw the magnificent ruins of the ancient city of Antinous, built by Adrian. The Rais (by desire of Mr. Bruce) hauled in his sail, and with his fore-sail full, stood S. S. E. directly under the ruins. In a short time they arrived at the landing place; when Abou Cuffi's son, Mahomet, and an Arab, who were of the party, went on shore under pretence of buying some provision, and to see how the land lay. All their fire arms were brought to the door of the cabin for fear of an alarm.

Presently Mr. Bruce, and those who remained in the boat, heard a violent contention between the two who were sent on shore and the inhabitants.

Upon this the Rais slipping, slipped off the rope from the stake, and another of the Arabs struck a strong perch or pole into the river, and twisted the rope round it. They were in a blight, or calm place, so that the stream did not move the boat.

Mahomet and the Arab came presently in sight; the people had taken Mahomet's turban from him, and they were apparently on the very worst terms. Mahomet cried to our travellers that the whole town was coming, and getting near the boat, he and the Arab jumped in with great agility. A number of people was assembled, and three boats were fired into the boat, very quickly, the one after the other.

Mr. Bruce having now uttered some threats in Arabic, immediately fired a ship blunderbuss, with pistol small bullets, but with little elevation, among the bushes, so as not to touch them; on which the pursuers disappeared, and putting their vessel into the stream, they filled their fore-sail and stood off.

The Rais attributed their safe delivery to the sacred presence of Mahomet, who observed the people had not seen them come in, but had heard of them ever since they were at Metrahenny, and had wanted to rob or murder them; that upon now hearing they were come, they had all ran to their houses for their arms, and were coming down, immediately, to plunder the boat; upon which he and the Moor ran off, and being met by these three people, and the boy, on the road, who had nothing in their hands, one of them snatched the turban off. He likewise added, that there were two parties in the town; one in favour of Ali Bey, the other friends to a rebel Bey, who had taken Miniet: that they had fought two or three days ago, among themselves, and were going to fight again, each of them having called Arabs to their assistance. So violently exasperated were Hassan and his son Mahomet, that they could hardly be dissuaded from returning again to the shore, and discharging all the guns and blunderbusses they had among the inhabitants.

After Mr. Bruce had moderated their passion, they passed Assmounein, probably the ancient Latopolis, a large town, which gives the name to the province, where there are magnificent ruins of Egyptian architecture; and after they came to Melawé, larger, better built, and better inhabited than Assmounein, the residence of the Cacheff. Mahomet Aga was there at that time with troops from Cairo; he had taken Miniet, and, by the friendship of Shekh Hamam, the great

Here Mr. Bruce procured about a gallon of brandy,
a jar of lemons and oranges preserved in honey, a
lamb, some garden stuff, &c. &c. They passed the
Molle, a small village, with a great number of acacia
trees, intermixed with the plantations of palms.

They passed several villages on the 20th; at length
reached Siout, but were obliged to stay at Tiona,
as the wind turned directly south. This is a small
town, surrounded with groves of palm trees. The
Nile is here full of sandy islands.

On the 21st they came to Gawa. The next day,
they arrived at Achmurin, where they staid till the
24th, when they visited the village Shekh Ali on the
well, two miles and a quarter distant. Now they
passed several villages, particularly Kundi, and hav-
ing set out from Beliant on the 25th, arrived at Den-
dela about 12 o'clock in the afternoon. This (even
at present) is a considerable town, all covered with
thick groves of palm trees, the fame that Juvenal de-
scribes it to have been in his time. A mile south of
the town are ruins of two temples, one of which is so
much buried under ground, that little of it is to be
seen; but the other, which is by far the most magni-
ficent, is entire, and accessible on every side. It is
also covered with hieroglyphics, both within and with-
out, all in relief; and of every figure, simple and
compound, that ever has been published, or called an
hieroglyphic. The form of the building is an oblong
square, the ends of which are occupied by two large
apartments, or vestibules, supported by monstrous
columns, all covered with hieroglyphics likewise.
Some are in form of men and beasts; some seem to be
the figures of instruments of sacrifice, while others,
in a smaller size, and less distinct form, seem to be
inscriptions in the current hand of hieroglyphics.
They are all finished with peculiar attention.

The capitals are of one piece, and consist of four
huge human heads, placed back to back against one
another, with bat's ears, and an ill-imagined, and
worse executed, fold drapery between them. Above
these is a large oblong square block, still larger than
the capitals, with four flat fronts, disposed like panels,
that is with a kind of square border round the edges,
while the faces and fronts are filled with hierogly-
phics, as are the walls and ceilings of every part of
the temple. Between these two apartments in the
extremities, there are three other apartments, resem-
bling the first, in every respect, only that they are
smaller. The whole building is of common white
stone, from the neighbouring mountains, only those
two, in which have been sunk the pirns for hanging
the outer doors (for it seems they had doors even in
those days) are of granite, or black and blue por-
phyry. The top of the temple is flat, the spouts to
carry off the water are monstrous heads of sphinxes;
the globes with wings, and the two serpents, with a
kind of shield or breast-plate between, are here fre-
quently repeated, such as we see them on the Car-
thaginian medals. The hieroglyphics have been
painted over, and great part of the colouring yet
remains upon the stones, red, in all its shades, espe-
cially that dark dusky colour called Tyrian purple;
yellow, very fresh; sky blue (that is, near the blue
of an eastern fly, several shades lighter than ours);
green of different shades: these are all the colours
preserved.

Some short time before Mr. Bruce came to Den-
dela, they saw the first crocodile, and afterwards hun-
dreds, lying upon every island, like large flocks of
cattle; yet the inhabitants of Dendera drive their
beasts of every kind into the river, and they stand
there for hours. The girls and women too, that come
to fetch water in jars, stand up to their knees in
water for a considerable time; and if we may guess
by what happens, their danger is full as little as their
fear, for none of them, as far as our travellers could
learn, had been bitten by a crocodile. However, if
the Denderites were as keen and expert hunters of

crocodiles, as some historians tell us they formerly
were, there is surely no part of the Nile where they
would have better sport than here, immediately before
their own city.

They now proceeded to Fursiout, and visited the
convent of Friars, who are of the order of the re-
formed Franciscans. Fursiout is a very considerable
well-cultivated plain. It is sown with wheat nine
miles over to the foot of the mountains, and con-
tains plantations of sugar canes. They left this place
Jan. 7th, 1769, and passed a large town called How,
on the west side of the Nile, and arrived about four
o'clock in the afternoon at El Gourni, which is a
small village distant a quarter of a mile from the Nile.

About half a mile north of El Gourni, are the mag-
nificent, stupendous sepulchres of Thebes. The moun-
tains of the Thebaid come close behind the town;
they are not connected with each other in ridges, but
stand insulated upon their bases; so that you can get
round each of them. A hundred of these, it is said,
are excavated into sepulchral, and a variety of other
apartments.

Luxor, and Carnac, which is a mile and a quarter
below it, are by far the largest and most magnificent
scenes of ruins in Egypt, much more extensive and
stupendous than those of Thebes and Dendera put
together.

There are two obelisks here of great beauty, and
in good preservation; they are less than those at
Rome, but not at all mutilated. The pavement,
which is made to receive the shadow, is to this day
so horizontal, it might still be used in observation.

At Carnac they saw the remains of two vast rows
of sphinxes, one on the right hand, the other on the
left (their heads were molly broken) and, a little
lower, a number as it should seem of termini. They
were composed of basalt, with a dog or lion's head,
of Egyptian sculpture. They stood in lines likewise,
as if intended as an avenue to some principal build-
ing.

They left Luxor on the 17th, and came to an an-
chor in the evening on the eastern shore, nearly op-
posite to Elné, which they passed over the next morn-
ing, and also the town of Edfre, where there are
considerable remains of Egyptian architecture. Elné
is the ancient Latopolis, and has very great remains,
particularly a large temple, which, though the whole
of it is of the remotest antiquity, seems to have been
built at different times, or rather out of the ruins of
different ancient buildings. The hieroglyphics upon
this are very ill executed, and are not painted. The
town is the residence of an Arab Shekh, and the in-
habitants are a very bad sort of people; but as Mr.
Bruce was dressed like an Arab, they did not molest,
because they did not know him.

They were obliged to stop at Jibbel el Siffely, a
dangerous part of the Nile, on account of the wind
failing; they passed Coom Ambo about noon, and
arrived at Daroo. On the 20th, they came to an
anchor about nine o'clock, on the south end of the
palm groves, and north end of the town of Syene.

As this was the time when Mr. Bruce was to take
leave of Europe, and launch out on his desperate
expedition, he made all necessary preparations, hav-
ing heard that a caravan was ready to set out for
Kenné, the œœni emporium of antiquity. Therefore,
at eight in the morning of the 17th of February, Mr.
Bruce mounted his servants all on horseback, and
having taken the charge of their own camels, they
advanced slowly into the desert; for all the way from
Kenné, close to the left, were desert hills; it was such
a barren way, that there was no appearance of plant
or living creature, and the sun was so exceedingly
hot, that two sticks, when rubbed together, took fire
and flamed!

They pitched their tent at half past three in Le-
geta, near some draw-wells, which were remarkably
bitter; here they waited the arrival of the caravan of
Cus, Elné, &c.

There came about twenty Turks in the evening
from

from Caramania, which is that part of Asia Minor immediately on the side of the Mediterranean opposite to the coast of Egypt; all of them neatly and cleanly dressed like Turks, all on camels, armed with swords, a pair of pistols at their girdle, and a short neat gun; their arms were in very good order, with their flints and ammunition stowed in cartridge boxes, in a very soldier-like manner. A few of these spoke Arabic, and Mr. Bruce's Greek servant, Michael, interpreted for the rest. Having been informed, that the large tent belonged to an Englishman, they came into it without ceremony. They told Mr. Bruce, that they were a number of neighbours and companions, who had set out together to go to Mecca, to the Hadje; and not knowing the language, or customs of the people, they had been but indifferently used since they landed at Alexandria, particularly somewhere about Achmin; that one of the Owam, or swimming thieves, had been on board of them in the night, and had carried off a small portmanteau, with about 200 sequins in gold; that, though a complaint had been made to the Bey of Gurgé, yet no satisfaction had been obtained; and that now they had heard an Englishman was here, whom they reckoned their countryman, they had come to propose, that they should make a common cause to defend each other against all enemies.—What they signified by *countryman* was this:—There is in Asia Minor, somewhere between Anatolia and Caramania, a district which they call Caz Dagli, and this the Turks believe was the country from which the English first drew their origin; and on this account they never fail to claim kindred with the English wherever they meet, especially if they stand in need of their assistance.

They spent the 18th, at Legda, waiting for the junction of the caravans, and the next day departed about six in the morning.

Their journey, all that day, was through a plain, never less than a mile broad, and never broader than three; the hills, on their right and left, were higher than the former, and of a brownish calcined colour, like the stones on the sides of Mount Vesuvius, but without any herb or tree upon them.

They passed a mountain of green and red marble at half past ten, and at twelve they entered a plain called Hamra, where they first observed the sand red, with a purple cast, of the colour of porphyry; and this is the reason the valley is called Hamra.

Mr. Bruce dismounted here, to examine of what the rocks were composed; and found that here began the quarries of porphyry, without the mixture of any other stone; but it was imperfect, brittle, and soft. He had not been engaged in this pursuit an hour, before they were alarmed with a report that the Atoumi had attacked the rear of the caravan; they were at the head of it. The Turks and his servants were all drawn together, at the foot of the mountain, and posted as advantageously as possible. But it soon appeared, that they were some thieves only, who had attempted to steal some loads of corn from camels that were weak, or fallen lame, perhaps in intelligence with those of their own caravans.

They left Mecir el Mafarek on the 20th, and came to the mouth of the defiles at ten o'clock. They departed early from Koraim on the 21st, and passed several defiles; at last they arrived at Colfeir.—This is a small mud-walled village, built upon the shore, among hillocks of floating sand. It is defended by a square fort of hewn stone, with square towers in the angles, which have in them three small cannon of iron, and one of brass, all in very bad condition; of no other use but to terrify the Arabs, and hinder them from plundering the town when full of corn, going to Mecca in time of famine. The walls are not high; but their ramparts are heightened by clay or mud-walls to screen the soldiers from the fire-arms of the Arabs. The port is nothing but a rock, on the east end of the town, which runs out about 400 yards into the sea, and defends the vessels which ride to the west of it, from the north and north east

winds. There is a large enclosure with a high mud wall, where every merchant has a shop or magazine for his corn and merchandize.

At this time the caravan, from Syene, arrived, escorted by 400 Ababdé, all upon camels, each armed with two short javelins, and making a whimsical appearance. The Ababdé having told strange stories about the mountain of emeralds; Mr. Bruce determined, till his captain should return, to make a voyage there. Accordingly he chose a man who had been twice at these mountains of emeralds; and with the bell boat then in the harbour, on Tuesday the 14th of March, they sailed, with the wind at north-east, from the harbour of Colfeir, about an hour before the dawn of day. They kept coasting along, with a very moderate wind, much diverted with the red and green appearances of the marble mountains upon the coast. Their vessel had one sail, like a straw matress, made of the leaves of a kind of palm tree, which they call *Doom*. It was fixed above, and drew up like a curtain, but did not lower with a yard like a sail; so that upon fresh weather, if the sail was furled, it was so top-heavy, that the ship must founder, or the mast be carried away. But, by way of indemnification, the planks of the vessel were sewed together, and there was not a nail, nor a piece of iron in the whole ship; so that when the struck upon a rock, seldom any damage attended. About nine o'clock, on the 15th, Mr. Bruce saw a large high rock, like a pillar, rising out of the sea. At first, he took it for a part of the continent; but, as he advanced nearer it, the sun being very clear, and the sea calm, he took an observation, and as their situation was lat. 25 deg. 6 min. and the island about a league distant, to the S. S. W. of them, he concluded its latitude to be pretty exactly 25 deg. 3 min. North. This island is about three miles from the shore, of an oval form, rising in the middle. It seems to be of granite; and is called, in the language of the country, *Jibbel Siberget*, which has been translated *the Mountain of Emeralds*. Very early on the 16th, Mr. Bruce took the Arab of Colfeir with him, who knew the place. They landed on a point perfectly desert; at first, sandy like Colfeir; afterwards, where the soil was fixed, producing some few plants of rue or absinthium. They advanced above three miles further in a perfectly desert country, with only a few acacia-trees scattered here and there, and came to the foot of the mountain; where, or about seven yards up from the base of it, are five pits or shafts, none of them four feet in diameter, called the *Zawrad Wells*, from which the ancients are said to have drawn the emeralds. The travellers were not provided with materials, and little endowed with inclination, to descend into any one of them, where the air was probably bad. Mr. Bruce picked up the nozels, and some fragments of jaspers, like those of which we find millions in Italy; and some worn fragments, but very small ones, of that brittle green crystal, which is the fiberget and bilur of Ethiopia, perhaps the zumrud, the smaragdus described by Pliny; but by no means the emerald, known since the discovery of the new world, whose first character absolutely defeats its pretension, the true Peruvian emerald being equal in hardness to the ruby.

Having now sufficiently satisfied curiosity, Mr. Bruce returned to his boat, and continued along the coast with an easy sail; and, after some dangerous storms, arrived on the 19th, about evening, at Colfeir: here Mr. Bruce procured a vessel, and sailed from that port on the 5th of April, and on the 6th, made the Jaffateen islands. These islands are four in number, joined by shoals and sunken rocks. They are crooked, or bent, like half a bow, and are dangerous for ships sailing in the night, because there seems to be a passage between them, to which, when pilots are attending, they neglect two small dangerous sunk rocks, that lie almost in the middle of the entrance, in deep water.

belonging to Mount Sinai. They flood out of this
harbour at day-break on the 11th and made the
Cape Mahomet.

They sailed from Cape Mahomet on the 12th,
just as the sun appeared. They passed the island of
Yorone, in the mouth of the Eilatitic Gulf, which
divides it near equally into two; or rather the
north-west side is narrower. The direction of the
gulf is nearly north and south.

On the 15th they came to an anchor at El Har,
where they lay high, craggy, and broken mountains,
called the Mountains of Ruddua. These abound
with springs of water; all sorts of Arabian and African
fruits grow here in perfection, and also every
kind of vegetable that is cultivated with any atten-
tion. About ten o'clock on the 16th, they passed
a mosque, or Shekhi's tomb on the main land, on
their left hand, called Kubbet Yambo, and before
eleven they anchored in the mouth of the port in
deep water. Yambo, corruptly called Imbo, is an
ancient city, now dwindled to a petty village.
Yambo, in the language of the country, signifies a
mountain or spring, a very copious one of excellent
water being found there among the date trees, and
it is one of the Stations of the Emir Hadje in going
to, and coming from Mecca. The advantage of the
port, however, which the other has not, and the
protection of the caille, have carried trading vessels
to the modern Yambo, where there is no water, but
what is brought from pools dug on purpose to receive
the rain when it falls.

Mr. Bruce was obliged to stay here, much against
his inclination, till the 27th of April, on account of
the several delays attending the loading of wheat, &c.

They sailed in the morning, April 28, with a
cargo of wheat that did not belong to them, and three
passengers, instead of one for whom only Mr. Bruce
had undertaken.

On the 3d of May they arrived at Jidda, close
upon the quay, where the officers of the custom-
house immediately took possession of their baggage.
This part is very extensive, consisting of several
plains, several shoals and broken rocks, with chan-
nels, however, between them and deep water.

The most remarkable occurrence which attracted
the travellers notice, was the extraordinary manner
in which trade was carried on at this place. There
were nine ships from India of great value. One
merchant, a Turk, living at Mecca, thirty hours
journey off, where no Christian dare go, whilst the
whole continent is open to the Turk for escape,
offers to purchase the cargoes of four out of nine of
these ships himself; another, of the same cast, comes
and says, he will buy none, unless he has them all.
The samples are shewn, and the cargoes of the whole
nine ships are carried into the wildest part of Arabia,
by men with whom one would not wish to trull him-
self above in the held. This is not all, two India
brokers come into the room to settle the price. One
on the part of the India captain, the other on that
of the buyer, the Turk. They are neither Maho-
metans nor Christians, but have credit with both.
They sit down on the carpet, and take an India
shawl, which they carry on their shoulders, like a
napkin, and spread it over their hands. They talk,
in the mean time, on different subjects, of the arrival
of ships from India, or of the news of the day,
as if they were employed in no serious business what-
ever. After about twenty minutes spent in handling
each others fingers below the shawl, the bargain is
concluded, say for nine ships, without one word ever
having been spoken on the subject, or pen or ink
used in any shape whatever. There never was one
instance of a dispute happening in these sales.

The mode of payment is equally extraordinary.
A private Moor, who had nothing to support him
but his character, became responsible for the pay-
ment of these cargoes; his name was Ibrahim Saraf

when Mr. Bruce was there; *i. e.* Ibrahim the broker.
This man delivers a number of coarse hempen bags,
full of what is supposed to be money. He marks the
contents upon the bag, and puts his seal upon the
string that ties the mouth of it. This is received for
what is marked upon it, without any one ever having
opened one of the bags, and, in India, it is current
for the value marked upon it, as long as the bag re-
mains.

Jidda, as well as all the east coast of the Red
Sea, is very unwholesome. Immediately without
the gate of that town, to the eastward, is a des-
ert plain filled with the huts of the Bedowens, or
country Arabs, built of long bundles of spartum, or
bent grass, put together like fascines. These Be-
dowens supply Jidda with milk and butter. There
is no stirring out of town, even for a walk, unless for
about half a mile, on the fourth side by the sea, where
there is a number of stinking pools of stagnant water,
which contributes to make the town very unwhole-
some.

Jidda, besides being in the most unwholesome part
of Arabia, is, at the same time, in the most barren
and desert situation. This, and many other incon-
veniences, under which it labours, would, probably,
have occasioned its being abandoned altogether, were
it not for its vicinity to Mecca, and the great and
sudden influx of wealth from the India trade, which,
once a year, arrives in this part, but does not con-
tinue, passing on, as through a turnpike, to Mecca;
whence it is dispersed all over the east. Very little
advantage, however, accrues to Jidda. The customs
are all immediately sent to a needy sovereign, and
a hungry set of relations, dependents, and ministers
at Mecca. The gold is returned in bags and boxes,
and passes on as rapidly to the ships as the goods do
to the market, and leaves as little profit behind.
In the mean time, provisions rise to a prodigious price,
and this falls upon the townsmen, while all the profit
of the traffic is in the hands of strangers; most of
whom, after the market is over (which does not last
six weeks) retire to Yemen, and other neighbouring
countries, which abound in every sort of provision.

Notwithstanding Jidda is the country of their pro-
phet, yet no where are there so many unmarried
women, and the permission of marrying four wives
was allowed in this district in the first instance, and
afterwards communicated to all the tribes. But
Mahomet, in his permission of plurality of wives
seems constantly to have been on his guard, against
suffering that, which was intended for the welfare
of his people, from operating in a different manner.
He did not permit a man to marry two, three, or
four wives, unless he could maintain them. He was
interested for the rights and rank of these women;
and the man so marrying was obliged to shew before
the Cadi, or some equivalent officer, or judge, that
it was in his power to support them, according to
their birth. It was not to with concubines, with
women who were purchased, or who were taken in
war. Every man enjoyed these at his pleasure, and
their peril, that is, whether he was able to main-
tain them or not. From this great scarcity of pro-
visions, which is the result of an extraordinary con-
course to a place almost destitute of the necessaries
of life, few inhabitants of Jidda can avail themselves
of the privilege granted them by Mahomet. He
therefore cannot marry more than one wife, because
he cannot maintain more, and from this cause arises
the want of people, and the large number of un-
married women.

Mr. Bruce's reception here was particularly kind;
the inhabitants did him the honour to attend him to
the water edge. All the quay of Jidda was lined
with people to see the English salute, and along with
his vessel there parted, at the same time, one bound
to Mafuah, which carried Mahomet Abd-el Cader,
governor of Dabalac, over to his government.

Mr. Bruce sailed from this harbour July 8th, on
board the same vessel as before, and suffered the

Rais to take a small loading for his own account, upon condition that he was to carry no passengers. The wind was fair, and they sailed through the English fleet at their anchors. As they had all honoured our traveller with their regret at parting, and accompanied him to the shore, the Rais was surprised to see the respect paid to his little vessel as it passed under their huge sterns, every one hoisting his colours, and saluting it with eleven guns.

On the 11th, they were towed to their anchorage in the harbour of Konfodah. Konfodah means the town of the hedge-hog. It is a small village, consisting of about two hundred miserable houses, built with green wood, and covered with mats, made of the doom, or palm-tree, lying on a bay, or rather a shallow basin, in a desert waste or plain. Behind the town are small hillocks of white sand. Nothing grows on shore except kelp, but it is exceedingly beautiful, and very luxuriant; further in there are gardens. Fish is in perfect plenty; butter and milk in great abundance; even the desert looks fresher than other deserts, which makes it probable that rain sometimes falls there. This, however, is a very unwholesome place, provision is very dear, and the water very bad.

On the 14th, in the afternoon, they passed Ras Heli, which is the boundary between Yemen, or Arabia Felix, and the Hejaz, or province of Mecca; they anchored here for the night, close under the Cape.

Every part of the sandy desert at the foot of the mountains is called *Tebama*, which extends to Mocha. It is called *Tema* in scripture, and derives its name from *Taamu* in Arabic, which signifies the sea-coast. There is little water here, as it never rains; there is also no animal but the gazel or antelope, and but a few of them. There are few birds, and those which may be found are generally silent.

Early on the 18th, they discovered the mountains, under which lies the town of Loheia. The bay was so shallow, and the tide being at ebb, they could get no nearer than within about five miles of the shore. Loheia is built upon the south-west side of a peninsula, surrounded every where, but on the east, by the sea. In the middle of this neck there is a small mountain which serves for a fortress, and there are towers with cannon, which reach across on each side of the hill to the shore. Beyond this is a plain, where the Arabs intending to attack the town, generally assemble. At Loheia they had a very uneasy sensation, a kind of prickling came into their legs, which were bare, occasioned by the salt effluvia, or steams, from the earth, which all about the town, and further to the south, is strongly impregnated with that mineral. Fish, and butchers meat, and indeed all sorts of provision, are plentiful and reasonable at Loheia, but the water is bad. It is found in the sand at the foot of the mountains, down the sides of which it has fallen in the time of the rain, and is brought to the town in skins upon camels. There is also plenty of fruit brought from the mountains by the Bedowé, who live in the skirts of the town, and supply it with milk, fire-wood, and fruit, chiefly bananas and grapes.

The government of the Inam is much more gentle than any Moorish government in Arabia or Africa; the people too are of gentler manners, the men, from early ages, being accustomed to trade. The women at Loheia are as solicitous to please as those of the most polished nations in Europe; and, though very retired, whether married or unmarried, they are not less careful of their dress and persons. At home they wear nothing but a long shirt of fine cotton-cloth, suitable to their quality. They dye their feet and hands with henna, not only for ornament, but as an astringent, to keep them dry from sweat; they wear their own hair, which is plaited, and falls in long tails behind.

They left Loheia on the 27th, in the evening, but were obliged to tow the boat out. About eleven they sailed with a wind at north-east, and passed a cluster of islands on their left. After passing some dangerous shoals, on the 30th, at seven o'clock in the morning,

with a gentle but steady wind at west, they sailed for the mouth of the Indian Ocean.

They continued their course within a mile of the shore, where in some places there appeared to be small woods, in others a flat bare country, bounded with mountains a considerable distance. The wind freshened as they advanced. About four in the afternoon they saw the mountain which forms one of the Capes of the Straits of Babelmandch, in shape resembling a gunner's quoin.

On the 31st, at nine in the morning, they came to an anchor above Jibbel Raban, or Pilots-Island, just under the Cape, which, on the Arabian side, forms the north entrance of the Straits.

After getting within the Straits, the channel is divided into two, by the island of Perim, otherwise called *Mekum*. The inmost and northern channel, or that towards the Arabian shore, is two leagues broad at most, and from twelve to seventeen fathom of water. The other entry is three leagues broad, with deep water, from twenty to thirty fathom. From this, the coast on both sides runs nearly in a north west direction, widening as it advances, and the Indian Ocean grows straiter. The coast upon the left hand is part of the kingdom of Adel, and, on the right, that of Arabia Felix.

Early on the 2d, they saw land a-head, which they took to be the main; but, upon nearer approach, and the day becoming clearer, they found two low islands to the leeward; one of which they fetched with great difficulty. They found there the flock of an old acacia-tree, and two or three bundles of wreck, or rotten sticks, which they gathered with great care; and all of them agreed, that they would eat breakfast, dinner, and supper hot, instead of the cold repast they had made in the Straits. They now made several large fires; one took the charge of the coffee, another boiled the rice; they killed four turtles, made ready a dolphin; got beer, wine, and brandy, and drank the king's health in carnell, which their regimen would not allow them to do in the Straits of Babelmandch. While this good cheer was preparing, Mr. Bruce saw with his glass, first, one man running along the coast westward, who did not stop; about a quarter of an hour after, another upon a camel, walking at the ordinary pace, who dismounted just opposite to them, and, as he thought, kneeled down to say his prayers upon the sand. They had launched their boat immediately upon seeing the trunk of the tree on the island; so they were ready, and Mr. Bruce ordered two of the men to row him on shore, which they did. It is a bay of but ordinary depth, with straggling trees, and some flat ground along the coast. Immediately behind is a row of mountains of a brownish or black colour. Mr. Bruce went on shore, and, after some little intercourse with some of the natives, whose conduct was very suspicious, he directed the Rais to stand out towards Crab-Island, and there being a gentle breeze from the shore, carrying an easy sail, they stood over upon Mocha town, to avoid some rocks or islands.

About three o'clock in the morning of the 3d, they passed Jibbel el Ouré, then Jibbel Zekir; and having a steady gale, with fair and moderate weather, passing to the westward of the island Rasib, between that and some other islands to the north-east, where the wind turned contrary, they arrived at Loheia, the 6th, in the morning, and on the 3d of September sailed from Loheia for Maluah.

The harbour of Loheia, which is by much the largest in the Red Sea, is now so shallow, and choked up, that, unless by a narrow canal through which you enter and go out, there is no where three fathom of water, and in many places not half that depth. This is the case with all the harbours on the east-coast of the Red Sea, while those on the west are deep, without any banks or bars before them.

In the evening of the 11th, they struck upon a reef of coral rocks; the Arabs were for taking immediately to the boat, till Mr. Bruce exerted his authority, and

and obliged all hands to work, and get the vessel off
while it was calm. The boat was immediately launched,
and one of Mr. Bruce's servants, the Rais, and two
sailors, were put on board. They were soon upon
the bank, where the two sailors got out, who cut their
feet at first upon the white coral, but afterwards got
bramer footing. They attempted to push the ship back-
wards, but the would not move. Poles and hand-
spikes were tried in order to stir her, but these were
not long enough. In a word, there was no appear-
ance of getting her off before morning, when they
knew the wind would rise, and it was to be feared the
would then be dashed to pieces. Other efforts were
then used, and a great cry was set up, that she began
to move. A little after, a gentle wind just made it-
self felt from the east, and the cry from the Rais was,
"Hoist the fore-sail and put it a-back." This being
immediately done, and a gentle breeze filling the fore-
sail at the time, they all pushed, and the vessel slid
gently off, free from the shoal. Mr. Bruce did not
partake of the joy so suddenly as the others did. He
had always some fears a plank might have been start-
ed; but they saw the advantage of a vessel being
seated, rather than nailed together, as the not only
was unhurt, but made very little water.

At five in the afternoon, on the 19th of September,

they came to an anchor in the harbour of Mafuah,
having been seventeen days on their passage, includ-
ing the day they first went on board, though this
voyage, with a favourable wind, is generally made
in three days; it often has, indeed, been failed in
less. Yet this must not be wholly attributed to the
weather, as they spent much time in surveying the
islands.

Mafuah, or the harbour of the Shepherds, is a
small island on the Abyssinian shore, having an excel-
lent harbour, and water deep enough for ships of any
size to the very edge of the island: here they may
ride in the utmost security, from whatever point, or
with whatever degree of strength the wind blows.
The island itself is very small, being scarcely three
quarters of a mile in length, and about half that in
breadth: one third is occupied by houses, one by
cisterns to receive the rain-water, and the last is re-
served for burying the dead. This island was the
place of much resort as long as commerce flourished:
but it fell into sudden obscurity under the oppression
of the Turks, who put the finishing hand to the ruin
of the Indian trade in the Red Sea, begun some
years before, by the discovery of the Cape of Good
Hope, and the settlements made by the Portuguese
on the continent of India.

C H A P. II.

Various Transactions at Mafuah—Account of the Diseases of the Place, &c.—Mr. Bruce's Conference with the Naybe—His Journey from Arkeeko over the Mountain Tananta—From Dixon to Adawa—His Reception there—He visits several Places, Fremona, &c.—Journey from Sird to Adderger—Transactions there—Journey over Lamalmon to Gondar—Reception there—The King's triumphal Entry—Bruce's first Audience—Manners and Customs of the Abyssinians—Description of a Bloody Banquet—Religion of the Country, &c. &c.

THOUGH Mr. Bruce, on his arrival at Mafuah,
was very tired of the sea, and desirous to land,
yet, as it was evening, he thought it advisable to
sleep on board that night, that he might have a whole
day (as the first is always a busy one) before him, and
receive in the night any intelligence from friends, who
might not choose to venture to come openly to see
him and his company in the day, at least before the
determination of the Naybe, the governor of that
place, had been heard concerning them.

A person came from Mahomet Gibberti, on the
evening, to conduct Mr. Bruce on shore. The Naybe
himself was still at Arkeeko, and Achmet, his cousin
and successor, there he had come down to receive the
duties of the merchandise on board the vessel which
brought Mr. Bruce. There were two elbow chairs
placed in the middle of the market-place. Achmet
sat on one of them, while the several officers
opened the bales and packages before him; the other
chair on his left hand was empty. He was dressed all
in white, in a long Banian habit of muslin, and a close-
buttoned frock reaching to his ancles, much like the
white frock and petticoat the young children wear in
England. This species of dress did not, in any way,
suit Achmet's shape or size; but, it seems, he meant
to be in gala. As soon as Mr. Bruce came in sight of
him, he doubled his pace: Mahomet Gibberti's ser-
vant whispered Mr. Bruce not to kiss his hand,
which indeed he intended to have done. Achmet
stood up, just as he arrived within arm's length of
him; when they touched each other's hands, carried
their fingers to their lips, then laid their hands across
their breasts: Mr. Bruce pronounced the salutation
of the inferior *Salam Alicum!* Peace be between us;
to which he answered immediately, *Alicum Salam!*
There is peace between us. He pointed to the chair,
which Mr. Bruce declined; but he obliged him to sit
down.

The greater honour that is shewn on a first meeting,
in these countries, the more considerable present is
expended. He made a sign to bring coffee directly,
as the immediate offering of meat or drink is an as-
surance of amity and friendship. Mr. Bruce now
presented the letters of the Sheriff of Mecca, and
one from Metical Aga, which latter Achmet kept, as
it was to himself, but returned the others, as Mr.
Bruce, he said, should give them himself to the Naybe
the next day.

Having drank their coffee, Mr. Bruce rose to take
his leave, and was soon wet to the skin by a great
quantity of orange flower-water, which two attend-
ants showered upon him from silver bottles, from the
right and left.

Our traveller was provided with a very commodi-
ous house, which he had no sooner entered, than a
large dinner was sent to him and his friends, by
Achmet, with a great quantity of lemons and nice
fresh water. Some short time after, their baggage
was sent unopened, which gave Mr. Bruce no small
pleasure.

A female slave came on the 10th of September,
with the proper credentials, viz. an Indian handker-
chief full of dry dates, and a pot or bottle of unvar-
nished potter's earth, which keeps the water very cool
and agreeable.

The Naybe came from Arkeeko in the morning of
the 21st. He was poorly attended by three or four
servants, miserably mounted, and about forty naked
savages on foot, armed with short lances and crooked
knives. The drum beat before him all the way from
Arkeeko to Mafuah. Upon entering the boat, the
drum on the land-side ceased, and those, in what is
called the Cattle of Mafuah, began. The cattle is a
small clay hut, and in it one twivel gun, which
is not mounted, but lies upon the ground, and is fired
always with great trepidation and some danger. The
drums

drums are earthen jars, such as they send butter into Arabia; the mouths of which are covered with a skin, so that a stranger, on seeing two or three of these together, would run a great risk of believing them to be jars of butter, or pickles, carefully covered with oiled parchment. All the procession was in the same style. The Naybe was dressed in an old shabby Turkish habit, much too short for him, and seemed to have been made about the time of Sultan Selim. He wore also upon his head a Turkish cowke, or high cap, which scarcely admitted any part of his head. In this dress, which on him had a truly ridiculous appearance, he received the casian, or investiture, of the island of Mafuah; and being thereby representative of the grand seignior, consented that day, in honour of the commission, to be called Omar Aga.

Mr. Bruce went in the afternoon to pay his respects to the Naybe, and found him sitting on a large wooden elbow-chair, at the head of two files of naked savages, who made an avenue from his chair to the door. He had nothing upon him but a coarse cotton shirt, so dirty, that it seemed all pains to clean it again would be thrown away, and so short that it scarcely reached his knees. He was very tall and lean, his colour black, had a large mouth and nose; in place of a beard, a very scanty tuft of grey hairs upon the point of his chin; large, dull, and heavy eyes; a kind of malicious, contemptuous smile on his countenance; he was altogether of a most stupid, and brutal appearance. His character perfectly corresponded with his figure, for he was a man of mean abilities, cruel to excess, avaricious, and a great drunkard.

Mr. Bruce presented his firman, which the Naybe pushed back and desired him to read. Mr. Bruce told him it was Turkish; that he had never learned to read a word of that language.—“Nor I neither,” says he; “and I believe I never shall.” Mr. Bruce then gave him the other letters he had brought with him. He took them altogether in both his hands, and laid them unopened beside him, saying, “You should have brought a moullah along with you. Do you think I shall read all these letters? Why, it would take me a month.” He then gazed upon our traveller, with his mouth open, so like an idiot, that it was with the utmost difficulty Mr. Bruce kept his gravity. This short conversation was succeeded with a long silence; at last Mr. Bruce took the opportunity to give him his present, with which he did not seem displeas'd, but rather that it was below him to tell him so; he then took his leave of the Naybe, very little pleas'd with his reception, and the small account he seem'd to make of his letters, or of himself. About this time the small-pox was raging with such violence at Mafuah, that it was fear'd the living would not be sufficient to bury the dead. The whole island was fill'd with shrieks and lamentations both night and day. They at last began to throw the bodies into the sea, which deprived our travellers of the fish, of which they had ate some kinds that were excellent.

On the 15th of October the Naybe came to Mafuah, dispatched the vessel that brought our travellers over; and, as if he had only waited till this evidence was out of the way, he, that very night, sent word, that Mr. Bruce was to prepare him a handsome present. He gave in a long list of particulars to a great amount, which he desired might be divided into three parcels, and presented three several days. One was to be given him as Naybe of Arkeeko; one as Omar Aga, representative of the grand seignior; and one for having pass'd their baggage gratis and unvisited, especially the large quadrant.

Mr. Bruce encouraged by the assurance of protection he had received, answer'd, That, having a firman of the grand seignior, and letters from Metical Aga, it was mere generosity should he give him any present at all, either as Naybe or Omar Aga; that he was not a merchant that bought and sold, nor had mer-

chandize on board, therefore had no customs to pay. Upon this he sent for Mr. Bruce to his house, where he found him in a violent fury, and many useless words pass'd on both sides. At last he peremptorily told our traveller, That unless he had 300 ounces of gold ready to pay him on Monday, upon his landing from Arkeeko, he would confine him in a dungeon, without light, air, or meat, till the bones came through his skin for want.

October the 29th, the Naybe came again from Arkeeko to Mafuah, and Mr. Bruce was told, in a very ill humour with him. He soon received a message to attend him, and found him in a large white room like a barn, with about sixty people with him. This was his divan, or grand council, with all his janizaries and officers of state, all naked, assembled in parliament. There was a comet that had appear'd a few days after their arrival at Mafuah, which had been many days visible in Arabia Felix, being then in its perihelion; and, after passing its conjunction with the sun, it now appear'd at Mafuah early in the evening, receding to its aphelion. Mr. Bruce had been observ'd watching it with great attention, and the large tubes of the telescopes had given offence to ignorant people. The first question the Naybe ask'd him was, “What that comet meant, and why it appear'd?” And before he could answer him, he again said, “The first time it was visible it brought the small-pox, which has killed above 1000 people in Mafuah and Arkeeko. It is known you convers'd with it every night at Lohcia; it has now follow'd you again to finish the few that remain, and then you are to carry it into Abyssinia. What have you to do with the comet?”

Before Mr. Bruce had time to speak, his brother, Emir Achmet, then said, “That he was inform'd, our traveller was an engineer going to Michael, governor of Tigre, to teach the Abyssinians to make cannon and gunpowder; that the last attack was to be against Mafuah.” Five or six others spoke much in the same strain; and the Naybe concluded by saying, That he would send Mr. Bruce in chains to Constantinople, unless he went to Hamazan, with his brother Emir Achmet, to the hot-wells there, and that this was the resolution of all the janizaries; for he had conceal'd his being a physician.

After much altercation between Mr. Bruce and the Naybe, the former turn'd his back, and Mr. Bruce went away exceedingly disturb'd, as it was plain his affairs were coming to a crisis for good or for evil. He observ'd, or thought he observ'd, all the people shunn'd him. He was, indeed, upon his guard, and did not wish them to come near him; but, turning down into his own gateway, a man pass'd close by him, laying distinctly in his ear, though in a low voice, first in Tigre and then in Arabic, “Be not afraid.” This hint, short as it was, gave him no small courage.

In the morning of the 6th of November while at breakfast Mr. Bruce was told, that three servants had arriv'd from Tigre; one from Janni, a young man and slave, who spoke and wrote Greek perfectly; the other two servants were Ras Michael's or rather the king's, both wearing the red short cloak lined and turn'd up with mazarine-blue, which is the badge of the king's servant, and is call'd *shikan*. Ras Michael's letters to the Naybe were very short. He said the king Harze Hannes's health was bad, and wonder'd at hearing that the physician, sent to him by Metical Aga from Arabia, was not forward'd to him instantly at Gondar, as he had heard of his being arriv'd at Mafuah some time before. He order'd the Naybe, moreover, to furnish him with necessaries, and dispatch him without further delay.

The island of Mafuah is very unwholesome, as, indeed, is the whole coast of the Red Sea, from Succz to Babelmanbeh, but more especially between the tropics. Violent fevers, call'd there *medat*, make the principal figure in this fatal list, and generally terminate the third day in death. The next com-

had no customs to pay. Bruce to his house, where he was very angry, and many useless. At last he peremptorily ordered him to go. Monday, upon his land, he confined him in a dun-geon, till the bones rotted. The Naybe came again from Mr. Bruce was told, in a few days he received a message from him in a large walled city, with fifty people with him, and a council, with all his family, all naked, assembled to see what had appeared at Mafuah, which was in Arabia Felix, being after passing its conjuncture appeared at Mafuah early in the afternoon. Mr. Bruce was with great attention, and hopes had given offence to all question the Naybe meant, and why he could answer him, he it was visible it brought above 1000 people is known you converted; it has now followed; it remains, and then you What have you to do

more disease in the low country of Arabia, the inter- mediate island of Mafuah, and all Abyssinia (for the diseases are exactly similar in all this tract) is the Peste, which is in nothing different from our Pestilence, and is successfully treated here in the same manner as in Europe. As no species of this disease, as far as Mr. Bruce saw, menaces the patient with death, especially in the beginning of the disorder, some time may be allowed for preparation to those who doubt the effect of the bark in this country. That still he apprehends the safest way is to give small doses from the beginning, on the first intermission, or even remission, though this should be somewhat obscure and uncertain. The next disease, is called *lepra*, the *begs* or the *fevere*, and is a swelling of the glands of the throat, and under the arms. The next (though not a dangerous complaint) has a very terrible appearance. Small tubercles or swellings appear all over the body, but thickest in the thighs, arms, and legs. These swellings go and come for weeks together without pain; though the legs often swell to a monstrous size, as in the dropsy. The next complaint Mr. Bruce mentions, as common in these countries, is called *Farente*, a corruption of an Arabic word, which signifies the worm of Pharaoh. This extraordinary animal only afflicts those who are in constant habit of drinking stagnant water, whether that water is drawn out from wells, as in the kingdom of Senaar, or found by digging in the sand where it is making its way to its proper level the sea, after falling down the side of the mountains after the tropical rains. This plague appears indiscriminately in every part of the body, but oftenest in the legs and arms. Upon looking at this worm, on its first appearance, a small black head is extremely visible, with a hooked beak of a whitish colour. Its body is seemingly of a white silky texture, very like a small tendon bared and perfectly cleaned. After its appearance, the natives of these countries, who are used to it, seize it gently by the head, and wrap it round a thin piece of silk or small bird's feather. Every day, or several times a day, they try to wind it upon the quill as far as it comes readily; and, upon the smallest resistance, they give over for fear of striking it.

Mr. Bruce himself experienced this complaint. About three inches of the worm were wound out upon a piece of raw silk in the first week, without pain or fever; but it was broken afterwards, though the carefulness and rathness of the surgeon, when changing a poultice on board the ship in which he returned to France: a violent inflammation followed; the leg swelled so as to scarce leave the appearance of knee or ankle; the skin, red and distended, seemed glazed like a mirror. The wound was now healed, and discharged nothing; and there was every appearance of a mortification coming on. The great care and attention procured him in the lazaretto at Marseilles, by a nation always foremost in the acts of humanity to strangers, and the attention and skill of the surgeon, recovered him from this troublesome complaint.

The last and most horrible of all these endemial diseases is the Elephantiasis, which some have chosen to call the Leprosy, or *Lepra Arabum*. During the course of it, the face is often healthy to appearance; the eyes vivid and sparkling; those affected have sometimes a kind of dryness upon the skin of their backs, which, upon scratching, leaves a meanness, or whiteness; the only circumstance, in which it resembled the leprosy; but it has no scabiness. The hair, too, is of its natural colour; not white, yellowish, or thin, as in the leprosy, but so far from it, that though the Abyssinians have very rarely hair upon their chin, Mr. Bruce has seen people apparently in the last stage of the elephantiasis, with a very good beard of its natural colour. The appetite is generally good during this disease, nor does any change of regimen affect the complaint.

When a relative or friend is dead at Mafuah, the women, friends, and visitors, place themselves in a

ring; then dance slowly, figuring in and out as in a country dance. This dance is all to the voice, no instrument being used upon the occasion; only the drum (the butter-jar before mentioned) is beat adroitly enough, and seems at once necessary to keep the dance and song in order. In Abyssinia too this is pursued in a manner more ridiculous. Upon the death of an ozoro, or any nobleman, the twelve judges (who are generally between 60 and 70 years of age) sing the song, and dance the figure-dance, in a manner truly ridiculous.

It is customary in Mafuah for people to burn myrrah and incense in their houses before they open the doors in the morning; and when they go out at night, or early in the day, they have always a small piece of rag, highly fumigated with these two perfumes, which they thrust into each nostril to keep them from the unwholesome air. Their houses are, in general, built of poles and bent grass, as in the towns of Arabia: but besides these, there are about twenty of stone, six or eight of which are two stories each; though the second seldom consists of more than one room, and that one generally not a large one. Situated as Mafuah is, in the very entrance of Abyssinia, a very plentiful country, yet all the necessaries of life are scarce and dear. Their quality too, is very indifferent, notwithstanding a considerable trade is carried on; but it is all done in a slovenly manner, and for articles where a small capital is invested.

Mr. Bruce waited upon the Naybe at his own house on the 13th, and was received with more civility than usual: he repeated his visit, by appointment, next day, having first struck his tent, and got all his baggage in readiness. He received him as before, then told him with a grave air, "that he was willing to further his journey into Habesh to the utmost of his power, provided he shewed him that consideration which was due to him from all passengers; that as, by his tent, baggage, and arms, he saw he was a man above the common sort, which the grand seignior's firman, and all his letters testified, less than 1000 patakas offered by him would be putting a great affront upon him; however, in consideration of the governor of Tigré, to whom he was going, he would consent to receive 300, upon his swearing not to divulge this, for fear of the shame that would fall upon him abroad. Mr. Bruce answered in the same grave tone, that he thought him very wrong to take 300 patakas with shame, when receiving a thousand would be more honourable as well as more profitable; therefore he had nothing to do but put that into his account-book with the governor of Tigré, and settle his honour and his interest together. As for himself, he was sent for by Metcal Aga, on account of the king, and was proceeding accordingly, and if he opposed his going forward to Metcal Aga, he should expect ten thousand patakas from Metcal Aga, for the trouble and loss of time he had been at, which he and the Ras would no doubt settle with him." The Naybe made no reply, but muttered with vexation.

Early on the 15th, Mr. Bruce again struck his tent, and had his baggage prepared, to shew they were determined to stay no longer. At eight o'clock, he went to the Naybe, and found him almost alone, when he received him in a manner that, for him, might have passed for civil. He began with a considerable degree of eloquence, or fluency of speech, a long enumeration of the difficulties of their journey, the rivers, precipices, mountains, and woods they were to pass; the number of wild beasts every where to be found; as also the wild savage people that inhabited those places; the most of which, he said, were luckily under his command, and he would recommend to them to do them all manner of good offices. He commanded two of his secretaries to write the proper letters, and then ordered them coffee. In the mean time came in a servant covered with dust and seemingly fatigued, as having arrived in haste from afar. The Naybe, with a considerable deal of uneasiness and confusion, opened the letters, which were said

to bring intelligence, that the Harata, Shio, and Tora, the three nations who possessed that part of Samhar, through which the road led to Dobarwa, the common passage from Mahnah to Tigre, had revolted, driven away his servants, and declared themselves independent. He then (as if all was over) ordered his secretary to stop writing; and, lifting up his eyes, began, with great seeming devotion, to thank God they were not already on their journey; for, innocent as he was, when our travellers should have been cut off, the fault would have been imputed to him. Angry as Mr. Bruce was at to have faced a facee, he could not help bursting out into a fit of loud laughter, when the Naybe put on his feverish countenance, and desired to know the reason of his laughing at that time. "It is now two months (said Mr. Bruce) since you have been throwing various objections in my way; can you wonder that I do not give into the grofs and impious? This same morning, before I took my tent, in presence of your nephew Achmet, I spoke with two Shaio (said Achmet) from Samhar, who brought letters to Acinuta, which I had, all was in peace. Have you rather patience than that of this morning? The Naybe was for some time without speaking; then said, "If you are weary of living, you are welcome to go; but I will do my duty in warning those that are desirous of their and your danger, that, when the mischief happens, it may not be imputed to me." "No number of naked Shaio (said Mr. Bruce) unless instructed by you, can ever be bound on our road, that will venture to attack us. The Shaio have no fire-arms; but if you have lent on purpose some of your soldiers that have fire-arms, these will discover by what authority they come. For our part, we cannot fly; we neither know the country, the language, nor the watering-places, and we shall not attempt it. We have plenty of different sorts of fire-arms, and your servants have often seen at Mahnah we are not ignorant of the use of them. We, it is true, may lose our lives, that is in the hand of the Almighty; but we shall not fail to leave enough on the spot, to give sufficient indication to the king and Ras Michael, who it was that were our assassins." Mr. Bruce then rose very abruptly to go away. The countenance of the Naybe now changed in a moment. In his turn he burst out into a loud fit of laughter, which surpris'd our traveller full as much as his, some time before, had done him. Every feature of his treacherous countenance was altered and softened into complacency; and he, for the first time, bore the appearance of man. He then confessed, that the whole was only a pretence to keep them there. "But since you are resolv'd to go, be not afraid; the roads are safe enough. I will give you a person to conduct you, that will carry you in safety, even if there was danger; only go and prepare such remedies as may be proper for the Emir, and leave them with my nephew Achmet, while I finish my letters." This Mr. Bruce willingly consented to do, and on his return found every thing ready for their departure.

Mr. Bruce and his party left Atkeeko on the 15th, taking road southward, along the plain, which is not here above a mile broad, and covered with short grass, nothing different from ours, only that the blade is broader. After an hour's journey Mr. Bruce pitched his tent at Laberhey, near a pit of rain-water. The mountains of Abyssinia have a singular aspect from this, as they appear in three ridges. The first is of no considerable height, but full of gullies and broken ground, thinly covered with shrubs; the second, higher and steeper, still more rugged and bare; the third is a row of sharp, uneven-edged mountains, which would be counted high in any country in Europe. Far above the top of all, towers that stupendous mass, the mountain of Faranta, probably one of the highest in the world, the point of which is buried in the clouds, and very rarely seen but in the clearest weather; at other

times abandoned to perpetual mist and darkness, the feat of lightning, thunder, and of storm.

A messenger from the Naybe arrived in the evening at their tent at Laberhey, and carried away their guide Salooné. It was not till the next day that he appeared again, and with him Achmet, the Naybe's nephew, who went into the tent, called for coffee, and, while drinking it, told Mr. Bruce he was not to go to Dobarwa, though it is the best road, the best being preferable to the easiest. He then gave his orders to Salooné, and took his leave of the travellers.

They left Laberhey on the 16th, in the evening, and after continuing about an hour along the plain, their grass ended, the ground becoming dry, stony, and gravelly, and they then entered into a wood of acacia-trees of considerable size.

Early on the 17th, they left their station on the side of a green hill at Hamdanou; for some time their road lay through a plain thick with such acacia-trees that their buds and leaves were all torn and bloody with the strokes of the scythes by which they had half past even, they entered the mouth of a narrow valley, through which a stream of water ran very swiftly over a bed of pebbles. It was the first clear water they had seen since they left Syria, and gave them unexpressed pleasure.

The next day they continued their journey, the road still winding between mountains, and a small current of a river, flowing on each side with rose and ficomore trees of a good size. At half past eight o'clock, they encamped at a place called Tanna, where the mountains are very steep, and broken very abruptly into hills and precipices. Tanna was by much the most agreeable station they had seen; the trees were thick, full of leaves, and gave them abundance of very dark shade.

On the 20th, they began to ascend the hills, or eminences, which serve as the roots or skirts of the great mountain Faranta. The road was on each side bordered with nabec, or junep trees of great beauty, and ficomores perfectly deprived of their verdure and branches. The country here is every where deprived of the shade it would enjoy from these fine trees, by the barbarous axes of the Harata. They found every where immense flocks of antelopes; as also partridges of a small kind that willingly took refuge upon trees; neither of these seemed to consider our travellers as enemies. In the afternoon, they began to ascend the mountain, through a most rocky, uneven road, if it can deserve the name, not only from its incredible steepness, but from the large holes and gulches made by the torrents, and the huge monstrous fragments of rocks, which, loosened by the water, had been tumbled down into their way. It was with great difficulty they could creep up, each man carrying his knapsack and arms. The quadrant had hitherto been carried by eight men, four to relieve each other; but these were ready to give up the undertaking upon trial of the first few hundred yards. At last, Mr. Bruce and a stranger Moor who had followed them, carried the head of it for about 300 yards over the most difficult and steepest part of the mountain, which before had been considered as impracticable by all. This Moor's name was Yafine, recommended to Mr. Bruce by Metical Aga, a person whom he had discovered to be of a most sagacious turn of mind, firm heart, and strenuous nerves: never more dilligently for these qualities than in the hour of imminent danger; at other times remarkable for quickness and silence, and a constant study of his Koran.

From the extreme weariness in the exertions they had made, they found it impossible to pitch their tents; add to this, there was not earth enough covering the bare sides of Faranta to hold fast a tent-pin; there were, however, variety of caves near them, and throughout the mountain, which had served for houses to the old inhabitants; and in these they found a quiet and not inconvenient place of repose, during the present night.

Early

Early on the 21st, Mr. Bruce, having encouraged
his company with good words, increase of wages,
and hopes of reward, they began to encounter the
other half of the mountain. His baggage moved
much more briskly than the preceding day. The
upper part of the mountain was, indeed, steeper,
more craggy, rugged, and slippery, than the lower,
and impeded more with trees, but not embarrassed
so much with large stones and holes. Their knees
and hands, however, were cut to pieces by frequent
falls, and their faces torn by the multitude of thorny
bushes. At last, they gained the top of the moun-
tain, upon which is situated a small village called
Halai, the first they had been since their leaving
Malah. It is chiefly inhabited by poor servants
and shepherds, keeping the flocks of men of sub-
stance living in the town of Dixan. The plain on
the top of the mountain Taranta was, in many places,
sown with wheat, which was then ready to be cut
down, though the harvest was not yet begun. The
grain was clean, and of a good colour, but inferior
in size to that of Egypt. It did not, however, grow
thick, nor was the stalk above fourteen inches high.
The water is very bad on the top of Taranta, being
only what remains of the rain in the hollows of the
rocks, and in pits prepared for it. Being very tired,
they pitched their tent on the top of the mountain.
The night was remarkably cold, at least appeared
so to them, whose pores were opened by the exces-
sive heat of Malah. The dew began to fall strongly,
and continued till an hour after sun-set, though
the sky was perfectly clear, and the smallest stars
were perceptible.

Our traveller killed a large eagle here, about six
feet ten inches from wing to wing. It seemed very
tame till shot. The ball having wounded it but
slightly, when on the ground it could not be pre-
vented from attacking the men or beasts near it with
great force and fierceness, so that Mr. Bruce was
obliged to slay it with a bayonet. It was of a dirty
white; only the head and upper part of its wings were
of a light brown.

On the 22d in the morning they left their station
on the top of Taranta, and soon after began to de-
scend on the side of Tigré through a broken and un-
even road. After this they began to mount a small
hill, from which they had a distinct view of Dixan.
They pitched their tent near some marshy ground for
the sake of water, at three quarters past ten, but it
was very bad, having been for several weeks stagnant.
They law here the people busy at their wheat harvest;
others, who had finished theirs, were treading it out
with cows or bullocks. They make no use of their
straw; sometimes they burn it, and sometimes leave
it on the spot to rot.

They came to Dixan at half an hour after four in
the afternoon. Halai was the first village, so is this
the first town in Abyssinia, on the side of Taranta.
Dixan is built on the top of a hill, perfectly in the
form of a sugar loaf; a deep valley furrounds it every
where like a trench, and a road winds spirally up the
hill till it ends among the houses.

Mr. Bruce's baggage had passed the trench, and had
reached the low town through which Saloomé had
conducted him, under pretence of getting a speedy
shelter from the heat: but he overacted his part; and
Janni, his servant, who spoke Greek, giving Mr.
Bruce a hint to go no further, he turned short towards
the house, and sat down with his firelock upon a stone
at the door. Their baggage quickly followed, and
all was put safe in a kind of court enclosed with a
sufficient stone-wall.

Soon after Haji Abdeleader, Achmet's friend,
came to them, inviting Mr. Bruce civilly to his house,
and declaring to him the friendly orders he had re-
ceived from Achmet concerning him; bringing along
with him also a goat, some butter, and honey. Mr.
Bruce excused himself from leaving Janni's friend,
the Christian, where he had first alighted; but he re-
commended Yafine to him, for he had begun to show

great attachment to Mr. Bruce. In about a quarter
of an hour came Saloomé with about twenty men,
and demanded our travellers, in the name of the
Naybe, as his strangers: he said they owed him
money for conducting them, and likewise for the cus-
tom-house dues. In a moment near an hundred men
were assembled round Haji Abdeleader, all with
shields and lances, and Mr. Bruce expected to see a
fray of the most furious kind. But Abdeleader, with
a twitch in his hand, went gravely up to Saloomé, and
after chiding his party with great authority, he held
up his stick twice over Saloomé's head, as if to strike
him; then ordered him, if he had any demands, to
come to him in the evening; upon which both parties
dispersed, and left them in peace. The matter was
settled very amicably in the evening with Saloomé.

The town of Dixan consists of Moors and Chris-
tians, and is very well peopled; yet the only trade of
either of these sects is a very extraordinary one, that
of selling children. The Christians bring such as
they have stolen in Abyssinia to Dixan as a lure de-
posit; and the Moors receive them there, and carry
them to a certain market at Mafuah, whence they are
sent over to Arabia or India. The priests of the
province of Tigré, especially those near the rock
Damo, are openly concerned in this inhuman prac-
tice; and some of these have been licensed by Michael
to carry it on as a fair trade, upon paying for many
firelocks for each dozen or score of slaves.

Mr. Bruce and his party left Dixan on the 25th of
November, descending the very deep hill on which
the town is situated. Haji Abdeleader had attended
them thus far before he left them, and the noted Sa-
loomé came likewise, to see if some occasion would
offer of doing them further mischief; but the king's
servants, now upon their own ground, began to take
upon them a proper consequence. One of them
went to meet Saloomé at the bank of the river; and,
making a mark on the ground with his knife, declared
that his patience was quite exhausted by what he had
been witness to at Mefuah and Dixan; and if now
Saloomé, or any other man belonging to the Naybe,
offered to pass that mark, he would bind him hand and
foot, and carry him to a place, where he should be
left tied to a tree, a prey to the lion and hyena. They
all returned, and there our traveller's persecution
from the Naybe ended. But it was very evident, from
Achmet's behaviour and discourse, had they gone by
Dobarwa, which was the road proposed by the Naybe,
their sufferings would not have been as yet half finished,
unless they had ended with their lives. They re-
mained, during the night, under a tree seven feet
and a half in diameter.

Early on the 26th, they left their most pleasant
quarters under the tree, and set forward with great alac-
rity. About a quarter of a mile from the river they crossed
the end of the plain Zarai. Though this is but three
miles long, and one where broadest, it was the largest
plain they had seen since their passing Taranta, whose
top was now covered wholly with large, black, and
very heavy clouds, from which they heard and saw
frequent peals of thunder, and violent streams of
lightning. This plain was sown partly with wheat,
partly with Indian corn; the first was cut down, the
other not yet ripe.

They left Hadawi on the 27th, continuing their
journey down a very steep and narrow path between
two stony hills; then ascended one still higher upon
the top of which stands the large village of Gou-
bubba, whence they had a prospect over a consider-
able plain, all sown with the different grain this coun-
try produces, wheat, barley, teff, and tocusso; sim-
sim (or sesame) and nook; the last is used for oil.

About five o'clock in the afternoon, they had a
violent shower of hailstones. Nothing is more com-
mon than aggravation about the size of hail; but,
flooping to take up one, Mr. Bruce thought as large
as a nutmeg, he received a blow from another just
under his eye, which he imagined had blinded him,
and which occasioned a swelling all the next day.

Yafine,

Yafine, the Moor, already mentioned, who was recommended by Metical Aga, during the four days Mr. Bruce had staid at a place called Kello, had told him his whole history. It seems he had been settled in a province of Abyffinia, near to Sennaar, called Ras el Feel; had married Abd el Jilleel, the Shekh's daughter; but, growing more popular than his father-in-law, he had been persecuted by him, and obliged to leave the country. He began now to form hopes, that, if Mr. Bruce was well received, as he saw, in all appearance, he was to be, he might, by his interest, be appointed to his father-in-law's place; especially if there was war, as every thing seemed to indicate. Abd el Jilleel was a coward, and incapable of making himself of personal value to any party. On the contrary, Yafine was a tried man, an excellent horseman, strong, active, and of known courage; having been twice with the late king Yafous in his invasions of Sennaar, and both times much wounded there.

They began, on the 5th of December, for the first time, to see the high mountains of Adowa, nothing resembling in shape to those of Europe, nor, indeed, any other country. Their sides were all perpendicular rocks, high like steeples, or obelisks, and broken into a thousand different forms.

Afterwards they passed the Mareb, which is the boundary between Tigré and the Baharnaqath, on this side. It runs over a bed of soil; is large, deep, and smooth; but, upon rain falling, it is more dangerous to pass than any river in Abyffinia, on account of the frequent holes in its bottom. They then entered the narrow plain of Yecha, wherein runs the small river, which either gives its name to, or takes it from it. At eleven o'clock, they rested by the side of the mountain whence the river falls. All the villages that had been built here bore the marks of the justice of the governor of Tigré. They had been long the most incorrigible banditti in the province. He surrounded them in one night, burnt their houses, extirpated the inhabitants, and would never suffer any one since to settle in those parts.

On the 6th of December, they again proceeded on their journey, and in about three hours travelling on a very pleasant road, over easy hills, and through hedge-rows of jessamine, honey-suckles, and many kinds of flowering shrubs, they arrived at Adowa, where Michael Suhul, governor of Tigré, once resided.

Adowa is situated on the declivity of a hill, on the west side of a small plain, surrounded every where by mountains. This plain is watered by three rivulets which are never dry in the midst of summer. There are fish in these three streams, but none of them remarkable for their size, quantity, or goodness. The best are those of Mai Gogua, a clear and pleasant rivulet, running very violently, and with great noise. There are many agreeable spots to the south-east of the convent, on the banks of this river, which are thick-shaded with wood and bushes. Adowa consists of about 300 houses, and occupies a much larger space than would be thought necessary for these to stand on, by reason that each house has an enclosure round it of hedges and trees; the last chiefly the wanzey. The number of these trees so planted in all the towns, screen them so, that, at a distance, they appear for many woods. Adowa was not formerly the capital of Tigré, but has accidentally become so upon the accession of this governor, whose property, or paternal estate, lay in and about it. His mansion-house is not distinguished from any of the others in the town, unless by its size; it is situated upon the top of the hill, and resembles a prison rather than a palace; for there are in and about it above three hundred persons in irons, some of whom have been there for twenty years, mostly with a view to extort money from them; and, what is the most unhappy, even when they have paid the sum of money which he asks, they do not get their deliverance from his mercilefs hands: most of them are kept in cages like wild beasts, and treated every way in the same manner.

The appearance of their kind and hospitable lord, Janni, particularly interested our travellers. He had sent servants to conduct them from the passage of the river, and met them himself at the outer-door of his house. He had his own short white hair, covered with a thin muslin turban, a thick well-shaped beard, as white as snow, down to his waist. He was clothed in the Abyffinian drs, all of white cotton, only he had a red silk sash, embroidered with gold, about his waist, and sandals on his feet; his upper garment reached down to his ankles. He had a number of servants and slaves about him of both sexes; and, when Mr. Bruce approached him, he seemed disposed to receive him with marks of humility and inferiority, which mortified him much, considering the obligations he was under to him, the trouble he had given, and was unavoidably still to give him. Mr. Bruce embraced him with great acknowledgements of kindness and gratitude, calling him Father, a title he always used in speaking either to him or of him afterwards, when he was in higher fortune, which he constantly remembered with great pleasure. It conducted them through a court-yard planted with jessamine, to a very neat, and, at the same time, large room, furnished with a silk sofa; the floor was covered with Persian carpets and cushions. All round, flowers and green leaves were thrown upon the court-yard; and the windows and sides of the room were full of ever-greens, in commemoration of the Christmas festival that was at hand. Mr. Bruce stopped at the entrance of this room; for his feet were both dirty and bloody; and it is not good breeding, to show or speak of your feet in Abyffinia, especially if any thing ails them; and at all times, they are covered. Janni immediately perceived the wounds that were upon his feet. Both their clothes and flesh were torn to pieces at Taranta, and several other places, but he thought they had come on mules furnished them by the Naybe. For the young man Mr. Bruce had sent to him from Kella, following the genius of his countrymen, though telling truth was just as profitable to him as lying, had chosen the latter, and seeing the horse he had got from the Baharnaqath, had figured, in his own imagination, a multitude of others, and told Janni that there were with Mr. Bruce horses, asses, and mules, in great plenty, so that when Janni saw them palling the water, he took our traveller for a servant, and expected, for several minutes, to see the splendid company arrive, well-mounted upon horses and mules caparisoned.

Janni was so shocked at Mr. Bruce's saying, that he performed this terrible journey on foot, that he burst into tears, uttering a thousand reproaches against the Naybe for his hard-heartedness and ingratitude, as he had twice, as he said, hindered Michael from going in person and sweeping the Naybe from the face of the earth. Water was immediately procured to wash their feet. And here began another contention: Janni insisted upon doing this himself, which made Mr. Bruce run out into the yard, and declare he would not suffer it. After this, the like dispute took place among the servants. It was always a ceremony in Abyffinia, to wash the feet of those that come from Cairo, and who are understood to have been pilgrims at Jerusalem. No sooner was this finished, than a great dinner was brought, exceedingly well dressed. But no consideration or entreaty could prevail upon their kind landlord to sit down and partake with them. He would stand all the time, with a clean towel in his hand, though he had plenty of servants; and afterwards dined with some visitors, who had come out of curiosity, to see a man arrived from so far. It was long before Mr. Bruce cured his kind landlord of these respectful observances, which troubled him very much, nor could Janni wholly ever get rid of them.

Adowa is the seat of a very valuable manufacture of coarse cotton cloth, which circulates all over Abyffinia, instead of silver money; each web is sixteen peck long of $1\frac{1}{2}$ width, their value a pataka; that is,

Mr. Bruce visited the remains of the Jesuits' convent of Fremona, Jan. 10, 1770. It is built upon the even ridge of a very high hill, in the middle of a large plain, on the opposite side of which stands Adowa. It rises from the east to the west, and ends in a precipice on the east; it is also very steep to the north, and slopes gently down to the plain on the south. The convent is about a mile in circumference, built substantially with stones, which are cemented with lime-mortar. It has towers in the flanks and angles; and, notwithstanding the ill-usage it has suffered, the walls remain still entire to the height of twenty-five feet. It is divided into three, by cross walls of equal height. The first division seems to have been destined for the convent, the middle for the church, and the third division is separated from this by a wall, and stands upon a precipice.

ten for the ounce of gold. The houses in Adowa are all of rough stone, cemented with mud instead of mortar. That of lime is not used but at Gondar, where it is very bad. The roofs are in the form of cones, and thatched with a reedy sort of grass, something thicker than wheat straw. Excepting a few spots taken notice of as they came to Adowa, this was the only part of Tigré where there was soil sufficient to yield corn; the whole of the province besides is one entire rock.

They have three harvests annually at Adowa, and all the neighbourhood. The first seed time is in July and August; it is the principal one for wheat, which they then sow in the middle of the rains. In the same season they sow toulso, telf, and barley. From the 20th of November, they reap first their barley, then their wheat, and last of all their telf. In the room of these they sow immediately upon the same ground, without any manure, barley, which they reap in February; and then often low telf, but more frequently a kind of vetch, or pea, called Shimbra; these are cut down before the first rains, which are in April. With all these advantages of triple harvests, which cost no following, weeding, manure, or other expensive processes, the farmer in Abyssinia is always poor and miserable. The cattle roam at discretion through the mountains. The herdsmen set fire to the grass, bent, and brushwood, before the rains, and an amazing verdure immediately follows. As the mountains are very steep and broken, goats are chiefly the flocks that graze upon them. It is not the extreme height of these mountains in Abyssinia that occasions surprise, but the number of them, and the extraordinary forms they present to the eye. Some of them are flat, thin, and square, in shape of a hearth-stone, or slab, that scarce would seem to have hale sufficient to resist the action of the winds. Some are like pyramids, others like obelisks or prisms, and some, the most extraordinary of all the rest, pyramids pitched upon their points, with their base uppermost.

Mr. Bruce visited the remains of the Jesuits' convent of Fremona, Jan. 10, 1770. It is built upon the even ridge of a very high hill, in the middle of a large plain, on the opposite side of which stands Adowa. It rises from the east to the west, and ends in a precipice on the east; it is also very steep to the north, and slopes gently down to the plain on the south. The convent is about a mile in circumference, built substantially with stones, which are cemented with lime-mortar. It has towers in the flanks and angles; and, notwithstanding the ill-usage it has suffered, the walls remain still entire to the height of twenty-five feet. It is divided into three, by cross walls of equal height. The first division seems to have been destined for the convent, the middle for the church, and the third division is separated from this by a wall, and stands upon a precipice.

Janni still continued his kindness and hospitality. He had already represented Mr. Bruce in the most favourable light to the Itegbé, or queen-mother, (whose servant he had long been) to her daughter Ozoro Esther, and Ozoro Atain; but, above all, to Michael, with whom his influence was very great; and, indeed, to every body he had any weight with, his own countrymen, Greeks, Abyssinians, and Mahometans; and, as they afterwards found, he had raised their curiosity to a great pitch.

Our travellers set out from Adowa on the 17th, resuming their journey to Gondar; in the morning of the next day they ascended one of those hills, through a very rough stony road, and again came into the plain, wherein stood Axum, once the capital of Abyssinia.

The ruins of Axum are very extensive; but, like the cities of ancient times, consist altogether of public buildings. In one square, which Mr. Bruce apprehended to have been the centre of the town, there are forty obelisks, none of which have any hieroglyphics upon them. Axum is watered by a small stream, which flows all the year from a fountain in the nar-

row valley, where stand the rows of obelisks. The spring is received into a magnificent basin of 150 feet square, and thence it is carried, at pleasure, to water the neighbouring gardens, where there is little fruit, excepting pomegranates, neither are these very excellent. The present town of Axum stands at the foot of the hill, and may have about six hundred houses. There are several manufactures of coarse cotton cloth; and here too the best parchment is made of goats skins, which is the ordinary employment of the monks.

Mr. Bruce left Axum in the morning of the 20th of January; the road was at first sufficiently even, through small valleys and meadows; they began to ascend gently, but through a road exceedingly difficult in itself, by reason of large stones standing on edge, or heaped one upon another; apparently the remains of an old large causeway, part of the magnificent works about Axum. The last part of the journey made ample amends for the difficulties and fatigue they had suffered in the beginning. For the road, on every side, was perfumed with variety of flowering shrubs, chiefly different species of jessamine; one in particular of these, called Agam, impregnated the whole air with the most delicious odour, and covered the small hills through which they passed, in such profusion, that they were, at times, almost overcome with its fragrance. The country all round had now the most beautiful appearance, and this was heightened by the smell of weather, and a temperature of air neither too hot nor too cold.

When they had lost sight of the ruins of this ancient capital of Abyssinia, they overtook three travellers driving a cow before them; they had black goat skins upon their shoulders, and lances and shields in their hands; in other respects were but thinly clothed; they appeared to be soldiers. The cow did not seem to be fatted for killing, and it occurred to our travellers that it had been stolen. This, however, was not their business, nor was such an occurrence at all remarkable in a country so long engaged in war. They saw that their attendants attached themselves in a particular manner to the three soldiers who were driving the cow, and held a short conversation with them. Soon after, the drivers suddenly tript up the cow, and gave the poor animal a very rude fall upon the ground, which was but the beginning of her sufferings. One of them sat across her neck, holding down her head by the horns, the other twilled the halter about her fore feet, while the third, who had a knife in his hand, to Mr. Bruce's very great surprise, in place of taking her by the throat, got allride upon her belly before her hind legs, and gave a very deep wound in the upper part of her buttock. From the time Mr. Bruce had seen them throw the beast upon the ground, he had rejoiced, thinking, that when three people were killing a cow, they must have agreed to sell part of her to them; and he was much disappointed upon hearing the Abyssinians say, that they were to pass the river to the other side, and not encamp where he intended. Upon Mr. Bruce's proposing they should bargain for part of the cow, his men answered, what they had already learned in conversation, that they were not then to kill her, that she was not wholly theirs, and they could not sell her. This awakened Mr. Bruce's curiosity; he let his people go forward, and staid himself, till he saw, with the utmost astonishment, two pieces, thicker and longer than our ordinary beef steaks, cut out of the higher part of the buttock of the beast. How it was done he cannot positively say, because judging the cow was to be killed from the moment he saw the knife drawn, he was not anxious to view that catastrophe, which was by no means an object of curiosity; whatever way it was done, it surely was adroitly, and the two pieces were spread upon the outside of one of their shields. One of them still continued holding the head, while the other two were busied in curing

the wound. This too was done not in an ordinary manner; the skin which had covered the flesh that was taken away was left entire, flapped over the wound, and was fastened to the corresponding part by two or more small skewers, or pins. Whether they had put any thing under the skin between that and the wounded flesh, Mr. Bruce cannot tell; but at the river side where they were, they had prepared a cataplasm of clay, with which they covered the wound; they then forced the animal to rise, and drove it on before them, to furnish them with a fuller meal when they should meet their companions in the evening.

They pitched their tent this day in a small plain, by the banks of a quick clear running stream; the spot is called Mai Shum. A peasant had made a very neat little garden on both sides of the rivulet, in which he had sown abundance of onions and garlic, and he had a species of pumpkin, which Mr. Bruce thought was little inferior to a melon. This man guessed by their arms and horses that they were hunters, and he brought them a present of the fruits of his garden, and begged their assistance against a number of wild boars, which carried havoc and desolation through all his labours, marks of which were, indeed, too visible every where. Such instances of industry are very rare in this country, and demanded encouragement. Mr. Bruce paid him, therefore, for his greens; and sent two of his servants with him into the wood, and got on horseback himself. Mirza, his horse, indeed, as well as his master, had recruited greatly during their stay at Adowa, under the hospitable roof of their good friend Jami.

They killed five boars, all large ones, in the space of about two hours; one of which measured six feet nine inches; and, though he ran at an amazing speed near two miles, so as to be with difficulty overtaken by the horse, and was struck through and through with two heavy lances loaded at the end with iron, no person dared to come near him on foot, and he defended himself above half an hour, till, having no lances left, Mr. Bruce shot him with a horse pistol. But the misfortune was, that after their hunting had been crowned with such success, they did not dare to partake of the excellent venison they had acquired; for the Abyssinians hold pork of all kinds in the utmost detestation; and our traveller was now become cautious, lest he should give offence, being at no great distance from the capital.

In the course of their journey, Mr. Bruce heard a cry from his servants, "Robbers! Robbers!" He immediately got upon his mule to learn what alarm this might be, and saw, to his great surprize, part of his baggage strewed on the ground, the servants running, some leading, others on foot driving such of their mules as were unloaded before them; in a word, every thing in the greatest confusion possible. Having got to the edge of the wood, they faced about, and began to prepare their fire-arms; but as Mr. Bruce saw the king's two servants, and the man that Jami sent with them endeavouring all they could to pitch the tent, he forbade them to fire, till they should receive orders from him. Mr. Bruce now rode immediately up to the tent, and in his way was saluted from among the bushes with many stones, one of which gave him a violent blow upon the foot. At the same instant he received another blow with a small unripe pumpkin, just upon the belly, where he was strongly defended by the coarse cotton cloth wrapped several times about him by way of sash or girdle. As robbers fight with other arms than pumpkins, when Mr. Bruce saw this fall at his feet, he was no longer under apprehension.

Our traveller now advanced towards them, crying out, they were friends, and Ras Michael's friends; and desired only to speak to them, and he would give them what they wanted. A few stones were the only answer, but they did no hurt. Mr. Bruce then gave Yafine his gun, thinking that might have given of-

fence. The top of the tent being now up, two men came forward making great complaints, but of what he did not understand, only that they seemed to accuse our travellers of having wronged them. In short they found the matter was this: one of the Moors had taken a heap of flraw, which he was carrying to his ass, and the proprietor, at seeing this, had alarmed the village. Every body had taken lances and shields; but, not daring to approach for fear of the fire-arms, they had contented themselves with throwing stones from their hiding-places, at a distance from among the bushes. Mr. Bruce and his people immediately told them, however, that though, as the king's guest, he had a title to be furnished with what was necessary, yet, if they were averse to it, he was very well content to pay for every thing they furnished, both for his men and beasts; but that they must throw no stones, otherwise they should defend themselves. The tent being now pitched, and every thing in order, a treaty soon followed. They consented to sell them what they wanted, but at extravagant prices, which, however, Mr. Bruce was content to comply with. But a man of the village, acquainted with one of the king's servants, had communicated to him, that the pretence of the Moor's taking the flraw was not really the reason of the uproar, for they made no use of it except to burn; but that a report had been spread abroad, that an action had happened between Fahl and Ras Michael, in which the latter had been defeated, and the country, no longer in fear of the Ras, had indulged themselves in their usual excesses, and, taking them for a caravan of Mahometans with merchandise, had resolved to rob them.

They arrived at the town of Siré on the 22d, and pitched their tent in a strong situation, in a very deep gully on the west extremity of the town.

Siré, the province properly so called, reaches from Axum to the Tacazzé. The town of Siré is situated on the brink of a very steep, narrow valley; and through this the road lies, which is almost impassable. In the middle of this valley runs a brook bordered with palm-trees, some of which are grown to a considerable size, but bear no fruit. The town is larger than that of Axum; it is in form of a half-moon fronting the plain, but its greatest breadth is at the west end; all the houses are of clay, and thatched; the roofs are in the form of cones, as, indeed, are all in Abyssinia. Siré is famous for a manufacture of coarse cotton cloths, which pass for current money through all the province of Tigré, and are valued at a drachm, the tenth part of a wakea of gold, or near the value of an imperial dollar each; their breadth is a yard and a quarter. Besides these, beads, needles, coils, and incense, at times only, are considered as money. The articles depend greatly on chance, whether any are current for the time or not; but the latter is often demanded; and, for the first, there are modes and fashions among these barbarians, and all, except those of a certain colour and form, are useless. These people were not of a humour to buy and sell with them. They were not perfectly satisfied that Michael was alive, and waited only for a confirmation of the news of his defeat, to make their own terms with all strangers unfortunate enough to fall into their hands. On the other hand, our travellers were in possession of superior force, and knowing their inclinations, they treated them pretty much in the manner they would have done by them.

Although Siré is situated in one of the finest countries in the world, like other places, it has its inconveniences. Putrid fevers, of the very worst kind, are almost constant here; and there did then actually reign a species of these that daily swept away a great number of people.

Here Mr. Bruce heard the good news that Ras Michael, on the 10th of this month, had come up with Fahl at Fagitta, and entirely dispersed his army, after killing 10,000 men. This account, though not confirmed by any authority, struck all the mutinous

being now up, two men complaints, but of what that they seemed to ac- cing wronged them. In was this: one of the aw, which he was carry- tor, at seeing this, had body had taken lances to approach for fear of ented themselves with ding-places, at a distance Mr. Bruce and his people ever, that though, as the to be furnished with what ere avails to it, he was or every thing they for- d bealls; but that they wife they should defend now pitched, and every followed. They con- y wanted, but at extra- Mr. Bruce was com- man of the village, ac- ing's servants, had com- petence of the Moors ly the reason of the up- f it except to hunt, but d abroad, that an action l and Ras Michael, in feared, and the country, had indulged themselves aking them for a caravan andite, had relolved to

of this province with awe; and every man returned to his duty for fear of incurring the displeasure of this severe governor, which they well knew would instantly be followed by more than an adequate portion of vengeance, especially against those that had not accompanied him to the field.

Early on the 24th, they struck their tent at Siré, and passed through a vast plain. All this day they could discern no mountains, as far as eye could reach, but only some few detached hills, standing separate on the plain, covered with high-grass, which they were then burning, to produce new with the first rains. The country to the north is altogether flat, and perfectly open; and though they could not discover one village this day, yet it seemed to be well inhabited, from the many people they saw on different parts of the plain, some at Harvell, and some herding their cattle.

They encamped at Addergerly on the 30th, near a small rivulet called Mai-Lami, the river of limes, or lemons, in a plain scarce a mile square, surrounded on each side with very thick wood in form of an amphitheatre. Above this wood, are bare, rugged, and barren mountains. Midway in the cliff is a miserable village, that seems rather to hang than to stand there, scarce a yard of level ground being before it to hinder its inhabitants from falling down the precipice. The wood is full of lemons and wild citrons, from which it acquires its name. Before the tent, to the westward, was a very deep valley, which terminated this little plain in a tremendous precipice.

This night the hyenas devoured one of the bell of their mules. They are here in great plenty, and so are lions; the roaring and grumbling of the latter, in the part of the wood nearest their tent, greatly disturbed their bealls, and prevented them from eating their provender. Mr. Bruce lengthened the strings of his tent, and placed the bealls between them. The white ropes, and the tremulous motion made by the impression of the wind, frightened the lions from coming near them. They had procured from Jani two small brass bells, such as the mules carry, and had tied these to the flum strings of the tent, where their noise, no doubt, greatly contributed to the safety of their bealls, from these ravenous, yet cautious animals, so that they never saw them; but the noise they made, and, perhaps, their smell, so terrified the mules, that, in the morning, they were drenched in sweat, as if they had been a long journey. The brutish hyena was not to be deterred. Mr. Bruce shot one of them dead on the night of the 31st of January, and on the 2d of February, he fired at another so near, that he was confident of killing him. Whether the balls had fallen out, or that he had really missed him with the first barrel, he knew not, but he gave a snarl and a kind of bark upon the first shot, advancing directly upon him, as if unhurt. The second shot, however, took place, and laid him without motion on the ground. Yafine and his men killed another with a pike; and such was their determined coolness, that they stalked round about our travellers with the familiarity of a dog, or some other domestic animal brought up with man. However, they were still more incommoded by a smaller animal, a large, black ant, little less than an inch long, which, coming out from under the ground, demolished their carpets, which they cut all into shreds, and part of the lining of their tent likewise, and every bag or sack they could find. Their bite causes a considerable inflammation, and the pain is greater than that which arises from the bite of a scorpion; they are called *gandam*.

On the first of February, the Shum sent his people to value, as he said, their merchandise, that they might pay custom. Many of the Moors, in their caravan, had left them to go a near way to Hauza. Mr. Bruce had at most five or six asses, including those belonging to Yafine. He humoured them so far as to open the cases where were the telescopes and quadrant, or, indeed, rather shewed them open,

as they were not flint from the observation he had been making. They could only wonder at things they had never before seen. On the 2d of February the Shum came himself, and a violent altercation ensued. Mr. Bruce, however, getting the better, on the 4th of February, in the morning, they left Addergerly. While employed in making ready for their departure, which was just at the dawn of day, a hyena, unseen by any of them, fastened upon one of Yafine's asses, and had almost pulled his tail away. Mr. Bruce was busied at gathering the tent pins into a sack, and had placed his mulker and bayonet ready against a tree, as it is usual at that hour, and the close of the evening, in order to be on their guard against any banditti. A boy, who was servant to Yafine, saw the hyena first, and flew to Mr. Bruce's mulker. Yafine was disjoining the poles of the tent, and, having one half of the largell in his hand, he ran to the assistance of his ass, and in that moment the mulker went off, luckily charged with only one ball, which gave Yafine a flesh wound between the thumb and forefinger of his left hand. The boy instantly threw down the mulker, which had terrified the hyena, and made him let go the ass; but he stood ready to fight Yafine, who, not amuling himself with the choice of weapons, gave him so rude a blow with the tent-pole upon his head, that it felled him to the ground; others with pikes, put an end to his life. They were then obliged to turn their cares towards the wounded. Yafine's wound was soon seen to be a trifle; besides, he was a man not easily alarmed on such occasions. But the poor ass was not so soon comforted. The flump remained, the tail hanging by a piece of it, which they were obliged to cut off. The next operation was actual cautery; but, as they had made no bread for breakfast, their fire had been nearly out. They therefore were obliged to tie the flump round with whip-cord, till they could get fire enough to heat an iron. What sufficiently marked the voracity of these beasts, the hyenas, was, that the bodies of their dead companions, which our travellers hauled a long way from them, and left there, were almost entirely eaten by the survivors the next morning. They continued their journey along the side of a hill, through thick wood and high grass; then descended into a steep, narrow valley, the sides of which had been shade with high trees, but in burning the grass the trees were consumed likewise; and the shoots from the roots were some of them above eight feet high since the tree had thus suffered that same year.

On the 8th of February they began to ascend Lamalmon, through a very narrow road, or rather path, for it scarcely was two feet wide any where. It was a spiral winding up the side of the mountain, always on the very brink of a precipice. Torrents of water, which in winter carry prodigious stones down the side of this mountain, had divided this path into several places, and opened to our travellers a view of that dreadful abyss below, which few heads can bear to look down upon. They were here obliged to unload their baggage, and, by slow degrees, crawl up a hill, carrying them little by little upon their shoulders round these chafins, where the road was intersected. The mountains grew steeper, the paths narrower, and the breaches more frequent as they ascended. Scarce were their mules, though unloaded, able to scramble up, but were perpetually falling; and, to increase their difficulties, which, in such cases, seldom come single, a large number of cattle was descending, and seemed to threaten to push them all into the gulf below. After two hours of constant toil, at nine o'clock, they alighted in a small plain called Kedus, or St. Michael, from a church and village of that name, neither beast nor man being able to go a step further.

The plain of Kedus, or St. Michael, is at the foot of a steep cliff which terminates the west side of Lamalmon. It is here perpendicular like a wall, and a few trees only upon the top of the cliff. Over this

this precipice flow two streams of water, which never are dry, but run in all seasons. They fall into a wood at the bottom of this cliff, and preserve it in continual verdure all the year, though the plain itself below is all rent in chasms, and cracked by the heat of the sun. These two streams form a considerable rivulet in the plain of St. Michael, and are a great relief both to men and cattle in this tedious and difficult passage over the mountain.

The air of Lamalmon is pleasant and temperate. They here found their appetite return, with a cheerfulness, lightness of spirits, and agility of body, which indicated that their nerves had again resumed their wonted tone, which they had lost in the low, poisonous, and sultry air on the coast of the Red Sea. The sun here is indeed hot, but in the morning a cool breeze never fails, which increases as the sun rises high. In the shade it is always cool. Lamalmon is the pass through which the road of all caravans to Gondar lies. It is here they take an account of all baggage and merchandise, which they transmit to the Negadé Ras, or chief officer of the customs at Gondar, by a man whom they send to accompany the caravan. There is also a present, or awide, due to the private proprietor of the ground: and this is levied with great rigour and violence, and, for the most part, with injustice; so that this station, which, by the establishment of the custom-house, and nearness to the capital, should be in a particular manner attended to by government, is always the place where the first robberies and murders are committed in unsettled times. Though our travellers had nothing with them which could be considered as subject to duty, they submitted every thing to the will of the robber of the place, and gave him his present. If he was not satisfied, he seemed to be so, which was all they wished for.

Leave of departure was granted early in the morning of the 9th, but it was with great regret they were obliged to abandon Geer Mahometan friends into lands that seemed disposed to shew them no favour. The king was in Maiffa, or Danot, that is to say, far from Gondar, and various reports were spread abroad about the success of the campaign. These people only waited for an unfavourable event, to make a pretence for robbing travellers of every thing they had. The persons whose right it was to levy these contributions were two, a father and son; the old man was dressed very decently, spoke hute, but smoothly, and had a very good carriage. He professed a violent hatred to all Mahometans, on account of their religion; a sentiment which seemed to promise nothing favourable to their friend Yafine and his companions: but, in the evening, the son, who seemed to be the active man, came to their tent, and brought them a quantity of bread and bouza, which his father had ordered before. He seemed to be much taken with our travellers' fire-arms, and was very inquisitive about them. Mr. Bruce gave him every sort of satisfaction, and, little by little, saw he might win his heart entirely; which he very much wished to do, that he might free his companions from bondage. This young man, was a good soldier; and, having been in several actions under Ras Michael, as fusilier, he brought his gun, and insisted on shooting at marks. Mr. Bruce honoured him in this: but as he used a rifle which he did not understand, he found himself overmatched, especially by the greatness of the range, for he shot straight enough. He then shewed him the manner they shot flying, there being quails in abundance, and wild pigeons, of which he killed several on the wing, which left him in the utmost astonishment. Having got on horseback, Mr. Bruce next went through the exercise of the Arabs, with a long spear and a short javelin. This was more within his comprehension, as he had seen something like it; but he was wonderfully taken with the fierce and fiery appearance of his horse, and, at the same time, with his docility, the form of his saddle, bridle, and accoutrements. He threw at last the sandals off

his feet, and twined his upper garment into his girdle, and set off at so furious a rate, that Mr. Bruce could not help doubting whether he was in his sober understanding. It was not long till he came back, and with him a man servant carrying a sheep and a goat, and a woman carrying a jar of honey-wine. Mr. Bruce had not yet quitted the horse; and when he saw what his intention was, he put Mirza to a gallop, and, with one of the barrels of the gun, shot a pigeon, and immediately fired another into the ground. There was nothing after this that could have surprised him, and it was repeated several times at his desire; after which he went into the tent, where he invited himself to Mr. Bruce's house at Gondar. There he was to teach him every thing he had seen. They now swore perpetual friendship; and a horn or two of hydromel being emptied, Mr. Bruce introduced the case of his fellow-travellers, and obtained a promise that they should have leave to set out together. He would, moreover, take no awide, and said, he would be favourable in his report to Gondar. Matters were far advanced, when a servant of Michael's arrived sent by Petro, Janni's brother, who had obtained leave from Ozoro Eshler. This put an end to all difficulties. Our young soldier also kept his word, and a mere trifle of awide was given, rather by the Moor's own desire than from demand, and the report of the baggage, and dust thereon, were as low as could be wished. News was now brought them, that Ras Michael had actually beaten Fassil, forced him to retire to the other side of the Nile, and was then in Maiffa, where it was thought he would remain with the army all the rainy season. This was just what Mr. Bruce could have wished, as it brought him once to the neighbourhood of the fountains of the Nile, without the smallest shadow of danger or loss.

February the 9th, they took leave of the friends they had so newly acquired at Lamalmon. They began to ascend what still remained of the mountain, which though steep and full of bushes, was much less difficult than that which they had passed. At a quarter past seven they arrived at the top of Lamalmon, which has, from below, the appearance of being sharp-pointed. On the contrary, they were much surprised to find there a large plain, part in pasture, but more bearing grain. It is full of springs, and seems to be the great reservoir from whence arise most of the rivers that flow from Abyssinia. A multitude of streams issue from the very summit in all directions; the springs boil out from the earth in large quantities, capable of turning a mill. They plough, sow, and reap here in all seasons; and the husbandman must blame his own indulgence, and not the soil, if he has not three harvests. They saw, in one place, people busy cutting down wheat; immediately next to it, others at the plough; and the adjoining field had green corn in the ear; a little further, it was not an inch above the ground. The mountain is every where so steep and high, that it is not enough to say against the will, but without the assistance of those above, no one from below can venture to ascend. On the top is a large plain, affording plenty of pasture, as well as room for ploughing and sowing for the maintenance of the army; and there is water, at all seasons, in great plenty, and even fish in the streams upon it; so that, although the inhabitants of the mountain had been often besieged for a considerable time together, they suffered little inconvenience from it, nor ever were taken unless by treason; except by Christopher de Gama and his Portuguese, who are said, by their own historians, to have stormed this rock, and put the Mahometan garrison to the sword.

The next day they continued along the plain on the top of Lamalmon; and, after having suffered, with infinite patience and perseverance, the hardships and danger of this long and painful journey, at forty minutes past ten they were gratified, at last, with the sight of Gondar, and arrived there on the 11th.

Abba Salama, at that time filled the post of Azeb Saat, or guardian of the fire. It is the third dignity

filled the post of Acob . It is the third dignity of

of the church, and he is the first religious officer in the palace. He had a very large revenue, and still a greater influence. He was a man exceedingly rich, and of the very worst life possible; though he had taken the vows of poverty and chastity, it was said he had at that time above seventy mistresses in Gondar. His way of seducing women was extraordinary as the number seduced. It was not by gifts, attendance, or flattery, the usual means employed on such occasions; when he had fixed his desires upon a woman, he forced her to comply, under pain of excommunication. He was exceedingly eloquent and bold, was a man of a pleasing countenance, short, and of a very fair complexion; indifferent, or rather averse to wine, but a monstrous glutton; nice in what he had to eat, to a degree scarcely before known in Abyssinia; a mortal enemy to all white people, whom he classed under the name of Franks, for which the Greeks, uniting their interests at favourable times, had often very nearly overfet him.

On the 12th, about ten o'clock, Mr. Bruce, dressed in his Moorish habit, went to Ayto Aylo, and found him with several great plates of bread, melted butter, and honey, before him, of one of which he and our traveller ate; the rest were given to the Moors, and other people present. There was with him a priest of Kofcam, and they all set out for that palace as soon as they had finished breakfast. They passed the brook of St. Raphael, a suburb of Gondar, where is the house of the Abuna; and upon coming in sight of the palace of Kofcam, they all uncovered their heads, and rode slowly. As Aylo was all-powerful with the Iteghé, indeed her first counsellor and friend, their admittance was easy and immediate. They alighted, and were shewn into a low room in the palace. Ayto Aylo went immediately to the leghe, or queen, to inquire about Welled Hawaryat, who was then ill, and his audience lasted two long hours. He returned to them with the news, that Welled Hawaryat was much better, by a medicine a faint from Waldubba had given him, which consisted in some characters, written with common ink upon a tablet, which characters were washed off by a medical liquor, and then given him to drink. It was agreed, however, that the complaint was the final pos, and the good it had done him was, he ate heartily of *brind*, or raw beef, after it, though he had not ate before since his arrival, but called perpetually for drink.

Before Mr. Bruce entered on his charge of physician, he flated to those present in the palace, the disagreeable talk now imposed upon him, a stranger without acquaintance or protection, having the language but imperfectly, and without power or control among them. He professed his intention of doing his utmost, although the disease was much more serious and fatal in this country than in his own; but he insisted one condition should be granted him, which was, that no directions as to regimen or management, even of the most trifling kind, as they might think, should be suffered, without his permission and superintendence. This being assented to, Mr. Bruce set the servants to work. There were apartments enough. He opened all the doors and windows, fumigating them with incense and myrrh in abundance, and washed them with warm water and vinegar. The common and fatal regimen in this country, and in most parts in the east, has been to keep their patient from feeling the smallest breath of air; but drink, a fire, and a quantity of covering are added in Abyssinia, and the doors shut so close as even to keep the room in darkness, whilst this heat is further augmented by the constant burning of candles. Ayabdar, Ozoro Altah's remaining daughter, and the son of Mariam Barca, were both taken ill at the same time, and happily recovered. A daughter of Kafmat Boro, by a daughter of Kafmat Esh-té, died, and her mother, though she survived, was a long time ill afterwards. Ayabdar was very much marked, he was Mariam Barca's son. At this time,

Ayto Confu, son of Kafmat-Netcho by Ozoro Eshter, had arrived from Tcherkin, a lad of very great hopes, though not then fourteen. He came to his mother without Mr. Bruce's knowledge or her's, and was infected likewise. Last of all the infant child of Michael, the child of his old age, took the disease, and though the weakest of all the children, recovered well. The patients, being all likely to do well, were removed to a large house of Kafmat Esh-té, which stood within the boundaries of Kofcam, while the rooms underwent another lustration and fumigation, after which they all returned; and Mr. Bruce got, as his fee, a present of the neat and convenient house formerly belonging to Basba Eusebius, which had a separate entry, without going through the palace.

March the 10th, the army marched into the town in triumph, and the Ras at the head of the troops of Tigré. He was bareheaded; over his shoulders, and down to his back, hung a pallium, or cloak, of black velvet, with a silver fringe. A boy, by his right stirrup, held a silver wand of about five feet and a half long, much like the staves of our great officers at court. Behind him all the soldiers, who had slain an enemy and taken the spoils from them, had their lances and firelocks ornamented with small threads of scarlet cloth, one piece for every man he had slain. Remarkable among all this multitude was Hagos, door-keeper of the Ras. This man, always well-armed and well mounted, had followed the wars of the Ras from his infancy, and had been so fortunate in this kind of single combat, that his whole lance and javelin, horse and person, were covered over with the threads of scarlet cloth. At this last battle of Fagitta, Hagos is said to have slain eleven men with his own hand. Indeed, there is nothing more fallacious than judging of a man's courage by these marks of conquests. A good horseman, armed with a coat of mail, upon a strong, well-fed, well-winded horse, may, after a defeat, kill as many of these wretched, weary, naked fugitives as he pleases, confining himself to those that are weakly, mounted upon tired horses, and covered only with goat-skins, or those that are flying on foot.

The head-dress of the governors of provinces was very remarkable. A large broad fillet was bound upon their forehead, and tied behind their head. In the middle of this was a horn, or a conical piece of silver, gilt, about four inches long, much in the shape of our common candle extinguishers. This is called *kin*, or horn, and is only worn in reviews or parades after victory. Next to these came the king, with a fillet of white mullin about three inches broad, binding his forehead, tied with a large double knot behind, and hanging down about two feet on his back. About him were the great officers of state, such of the young nobility as were without command; and after these, the household troops. Then followed the Kanitz Kitzera, or executioner of the camp, and his attendants; and, last of all, amidst the king's and the Ras's baggage, came a man bearing the stuffed skin of the unfortunate Woolheka upon a pole, which he hung upon a branch of the tree before the king's palace appropriated for public executions.

Mr. Bruce constantly attended his patients at Kofcam: at all which times he had been received with the greatest cordiality and marks of kindness by the Iteghé, and orders given for his free admittance, upon all occasions, like an officer of her household.

Mr. Bruce was informed, on the 14th, that all his recommendatory letters were to be read. He expected at the ordinary hour, about five in the afternoon, to be sent for, and had rode out to Kofcam with Ayto Heikel, the queen's chamberlain, to see the child, who was pretty well recovered of all its complaints, but very weak. In the interim, Mr. Bruce was sent for to the Ras, with orders to dispatch a man with the king's present, to wait for him at the palace, whither he was to go after leaving Michael. Five in the evening was fixed as the hour. Mr. Bruce

Bruce came a little before the time, and met Ayto Aylo at the door. He squeezed him by the hand, and said, "Refuse nothing, it can be all altered afterwards; but it is very necessary, on account of the priests and the populace, you should have a place of some authority, otherwise you will be robbed and murdered the first time you go half a mile from home: fifty people have told me that you have chests filled with gold, and that you can make gold, or bring what quantity you please from the Indies; and the reason of all this is, because you refused the queen and Ozoro Ellher's offer of gold at Koscam, and which you must never do again.

Mr. Bruce and his friends went in and saw the Ras, who was an old man, sitting upon a sofa; his white hair was dressed in many short curls. He appeared to be thoughtful, but not displeased; his face was lean, his eyes quick and vivid, but seemed to be a little sore from exposure to the weather. He seemed to be about six feet high, though his lameness made it difficult to guess with accuracy. His air was perfectly free from constraint, what the French call *dégagez*. They must have been bad physiognomists that did not discern his capacity and understanding by his very countenance. Every look conveyed a sentiment with it: he seemed to have no occasion for other language; and, indeed, he spoke little. Mr. Bruce offered, as usual, to kiss the ground before him; and of this he seemed to take little notice, stretching out his hand, and shaking Mr. Bruce's upon his rising.

Mr. Bruce sat down with Aylo, three or four of the judges, Heikel the queen's chamberlain, and others, who whispered something in his ear, and went out; which interruption prevented Mr. Bruce from speaking as he was prepared to do, or give him his present, which a man held behind him. A tedious incongruous conversation then ensued, after which Mr. Bruce gave the present, and retired.

Our traveller went afterwards to the king's palace, and met Aylo and Heikel at the door of the presence-chamber. Tecla Mariam walked before them to the foot of the throne: after which Mr. Bruce advanced and prostrated himself upon the ground. "I have brought you a servant, says he to the king, from so distant a country, that if you ever let him escape, we shall never be able to follow him, or know where to seek him." To this the king made no reply, nor did he shew any alteration of countenance. Five people were standing on each side of the throne, all young men, three on his left, and two on his right. One of these, the son of Tecla Mariam (afterwards Mr. Bruce's great friend) who stood uppermost on the left hand, came up, and taking hold of him by the hand, placed him immediately above him; when seeing Mr. Bruce had no knife in his girdle, he pulled out his own and gave it to him. Upon being placed, Mr. Bruce again kissed the ground. The king was in an alcove; the rest went out of sight from where the throne was, and sat down. The usual questions were now put to Mr. Bruce about Jerusalem and the holy place—where his country was? which it was impossible to describe, as they knew the situation of no country but their own—why he came so far—whether the moon and the stars, but especially the moon, was the same in his country as in theirs? and a great many such idle and tiresome questions. He had several times offered to take his present from the man who held it, that he might offer it to his majesty and go away; but the king always made a sign to put it off, till, being tired to death with standing, he leaned against the wall. Mr. Bruce was absolutely in despair, and scarcely able to speak a word, inwardly mourning the hardness of his lot in this his first preferment, and sincerely praying that it might be his last promotion in that court. However, he was at last permitted to retire.

We shall now proceed in a description of the place, according to Mr. Bruce's information.—At Mafuah, that is, on the coast of the Red Sea, begins an imaginary division of Abyssinia into two, which is rather

a division of language than strictly to be understood as territorial. The first division is called *Tigré*, between the Red Sea and the river Tacazzé. Between that river and the Nile, westward, where it bounds the Galla, it is called *Ambara*. But whatever convenience there may be from this division, there is neither geographical nor historical precision in it, for there are many little provinces included in the first that do not belong to *Tigré*: and, in the second division, which is *Ambara*, that which gives the name, is but a very small part of it. Mafuah, in ancient times, was one of the principal places of residence of the Baharnagath, who, when he was not there himself, constantly left his deputy or lieutenant. In summer he resided for several months in the island of Dahalac, then accounted part of his territory. He was, after the King and Betwudet, the person of the greatest consideration in the kingdom, and was invested with sen-dick and nagareet, the kettle-drum and colours, marks of supreme command. *Tigré* is the next province in Abyssinia, as well for greatness as riches, power, and dignity, and nearest Mafuah. It is bounded by the territory of the Baharnagath, that is, by the river Mareb on the east, and the Tacazzé upon the west. It is about one hundred and twenty miles broad from E. to W. and two hundred from N. to S. This is its present situation. The hand of usurping power has abolished all distinction on the west side of the Tacazzé; besides, many large governments, such as Endera and Amalow, and great part of the Baharnagath, were swallowed up in this province to the east. What, in a special manner, makes the riches of *Tigré*, is, that it lies nearest the market, which is Arabia; and all the merchant so destined to cross the Red Sea must pass through this province, so that the governor has the choice of all commodities wherewith to make his market. The strongest male, the most beautiful female slaves, the purest gold, the largest teeth of ivory, all must pass through his hands. Fire-arms, moreover, which for many years have decided who is the most powerful in Abyssinia, all these come from Arabia, and not one can be purchased without his knowing to whom it goes, and after his having had the first refusal of it. Siré, a province about twenty-five miles broad, and not much more in length, is reckoned as a part of *Tigré* also, but this is not a new usurpation. It lost the rank of a province, and was united to *Tigré* for the misbehaviour of its governor Kasmai Claudius, in an expedition against the Shaggalla in the reign of Yafous the Great. After passing the Tacazzé, the boundary between Siré and Samen, we come to that mountainous province called by the last name. A large chain of rugged mountains, where is the Jew's Rock, reaches from the south of Tigie down near to Waldubba, the low, hot country that bounds Abyssinia on the north. On the N. E. of *Tigré* lies the province of Begender. It borders upon Angot, whose governor is called Angot Ras; but the whole province now, excepting a few villages, is conquered by the Galla. It has Ambara, which runs parallel to it, on the south, and is separated from it by the river Bahilo. Both these provinces are bounded by the river Nile on the west. Begender is about 180 miles in its greatest length, and 60 in breadth, comprehending Latta, a mountainous province, sometimes depending on Begender, but often in rebellion. Begender is the strength of Abyssinia in horsemen. It is said that, with Latta, it can bring out 35,000 men; but this, as far as ever Mr. Bruce could inform himself, is a great exaggeration. They are exceeding good soldiers when they are pleased with their general, and the cause for which they fight; otherwise, they are easily divided, great many private interells being continually kept alive, as it is thought industriously, by government itself. It is well stocked with cattle of every kind, all very beautiful. The mountains are full of iron mines; they are not so steep and rocky, nor so frequent, as in other provinces, if we except only Latta, and abound in all sort of wild fowl and game. Ambara is the next province,

vince,

vince, between the two rivers Bashilo and Geshen. The length of this country from E. to W. is about 120 miles, and its breadth something more than 40. It is a very mountainous country, full of nobility; the men are reckoned the handsomest in Abyssinia, as well as the bravest. Between the two rivers Geshen and Samba, is a low, unwholesome, though fertile province, called Walaka; and southward of that is Upper Shoa. This province, or kingdom, was famous for the retreat it gave to the only remaining prince of the house of Solomon, who fled from the massacre of his brethren by Judith, about the year 900, upon the rock of Damo. Here the royal family remained in security, and increased in number, for near 400 years, till they were reformed. Gojam, from north-east to south-east, is about 80 miles in length, and 40 in breadth. It is a very flat country, and all in pasture; has few mountains, but those are very high ones, and are chiefly on the banks of the Nile, to the south, which river surrounds the province. On the south-east of the kingdom of Gojam is Damot. It is bounded by the Temci on the east, by the Gult on the west, by the Nile on the south, and by the high mountains of Amid Amid on the north. It is about 40 miles in length from north to south, and something more than 20 in breadth from east to west. On the other side of Amid Amid is the province of Agows, bounded by those mountains on the east; by Buré and Umbarma, and the country of the Gongas, on the west; by Damot and Gatat upon the south, and Dingleber on the north. South from Dembea is Kuara, a very mountainous province confining upon the Pagan blacks, or Shangalla, called Gongas and Guba, the Macrobi of the ancients.—It is a very unwholesome province, but abounding in gold, not of its own produce, but that of its neighbourhood, these Pagans, Guba, Nuba, and Shangalla. Nara, and Ras el Feel, Tchelga, and on to Techerkin, is a frontier wholly inhabited by Mahometans. Its government is generally given to a stranger, often to a Mahometan; but one of that faith is always deputy-governor. The use of keeping troops here is to defend the friendly Arabs and Shepherds, who remain in their allegiance to Abyssinia, from the resentment of the Arabs of Senaar, their neighbours; and, by means of these friendly Arabs and Shepherds, secure a constant supply of horses for the king's troops. It is a barren stripe of a very hot, unwholesome country, full of thick woods, and fit only for hunting. The inhabitants, fugitives from all nations, are chiefly Mahometans, but very bold and expert horsemen, using no other weapon but the broad sword, with which they attack the elephants and rhinoceroses. There are many other small provinces, which occasionally are annexed, and sometimes are separated.

The crown of Abyssinia is hereditary, and has always been so, in one particular family, supposed to be that of Solomon by the queen of Saba, Negalla Arab, or queen of the south. It is nevertheless elective in this line; and there is no law of the land, nor custom, which gives the eldest son an exclusive title to succeed to his father. The practice has, indeed, been quite the contrary. When, at the death of a king, his sons are old enough to govern, and, by some accident, not yet sent prisoners to the mountain, then the eldest, or he that is next, and not confined, generally takes possession of the throne by the strength of his father's friends; but if no heir is then in the low country, the choice of the king is always according to the will of the minister, which passes for that of the people; and his inclination and interest being to govern, he never fails to choose an infant whom he afterwards directs, ruling the kingdom absolutely during the minority, which generally exhausts, or is equal to the term of his life. The king is anointed with plain oil of olives, which, being poured upon the crown of his head he rubs it into his long hair indecently enough with both his hands, pretty much as his soldiers do with theirs when they get access to plenty of butter. The crown is made

in the shape of a priest's mitre, or head-piece; it is a kind of helmet, covering the king's forehead, cheeks, and neck. It is lined with blue taffaty; the outside is half gold and half silver, of the most beautiful fillagane work. The king goes to church regularly, his guards taking possession of every avenue and door through which he is to pass, and nobody is allowed to enter with him, because he is then on foot, excepting two officers of his bed-chamber who support him: He kisses the threshold and side-posts of the church-door, the steps before the altar, and then returns home: sometimes there is service in the church, sometimes there is not; but he takes no notice of the difference. He rides up stairs into the presence chamber on a mule, and lights immediately on the carpet before his throne; and Mr. Bruce has sometimes seen great indecencies committed by the said mule in the presence-chamber, upon a Persian carpet. The Scrah Maffery, an officer so called, with a long whip, begins cracking and making a noise, worse than twenty French postillions, at the door of the palace before the dawn of day. This chases away the hyena and other wild beasts; this, too, is the signal for the king's rising, who sits in judgment every morning sitting, and after that, about eight o'clock, he goes to breakfast. There are six noblemen of the king's own choosing who are called Baalmaal, or gentlemen of his bed-chamber; four of these are always with him. There is a seventh, who is the chief of these, called Azeleffa el Camilha, groom of the robe, or shoe. He is keeper of the king's wardrobe, and the first officer of the bed-chamber. These officers, the black slaves, and some others, serve him as menial servants, and are in a degree of familiarity with him unknown to the rest of the subjects. When the king sits to consult upon civil matters of consequence, he is shut up in a kind of box opposite to the head of the council table. The persons that deliberate sit at the table, and, according to their rank, give their voices, the youngest or lowest officer always speaking first. The first that give their votes are the Shalaka, or colonels of the household-troops. The second are the great butlers, men that have the charge of the king's drink. The third is the Badjerund, or keeper of that apartment in the palace called the *lion's bottle*; and after these the keeper of the banqueting-house. The next is called Lika Magwaf, an officer that always goes before the king to hinder the pressure of the crowd. In war, when the king is marching, he rides constantly round him at a certain distance, and carries his shield and his lance; at least he carries a silver shield, and a lance pointed with the same metal, before such kings as do not choose to expose their person. No prince ever lost his life in battle till the coming of the Europeans into Abyssinia, when both the excommunicating and murdering of their sovereigns seem to have been introduced at the same time. After the Lika Magwaf comes the Palambaras; after him the Fit-Autaris; then the Gera Kafmati, and the Kanya Kafmati, their names being derived from their rank or order in encamping, the one on the right, the other on the left of the king's tent; Kanya and Gera signifying *the right and the left*; after them the Dakakin Biletana Geeta, or the under chamberlain; then the secretary for the king's commands; after him the right and left Azages, or generals; after them Rak Maffery, after him the basha, after him Kafinati of Damot, then of Samen, then Amhara, and, last of all, Tigre, before whom stands a golden cup upon a cushion, and he is called Nebrit, as being governor of Axum, or keeper of the book of the law supposed to be there. After the governor of Tigre comes the Acab Saat, or guardian of the fire, and the chief ecclesiastical officer of the king's household. Some have said, that this officer was appointed to attend the king at the time of eating, and that it was his province to order both meat and drink to be withdrawn whenever he saw the king inclined to excess. After the Acab Saat comes the first master of the household; then the Betwudet, or

Ras; last of all the king gives his sentence, which is final, and sends it to the table, from the balcony where he is then sitting, by the officer called Kal-Haize.

The next remarkable ceremony, is that of adoration, invariably observed in Abyssinia to this day, as often as you enter the sovereign's presence. This is not only kneeling, but an absolute prostration. You first fall upon your knees, then upon the palms of your hands, then incline your head and body till your forehead touch the earth; and, in case you have an answer to expect, you lie in that posture till the king, or somebody from him, desires you to rise.

Another practice in Abyssinia was to beset the king's doors and windows within his hearing, and there, from early morning to night, to cry for justice as loud as possible, in a distressed and complaining tone, and in all the different languages they are masters of, in order to their being admitted to have their supposed grievances heard. In a country so ill governed as Abyssinia is, and so perpetually involved in war, it may be easily supposed there is no want of people, who have real injuries and violence to complain of: but if it were not so, this is so much the constant usage, that when it happens (as in the middle of the rainy season) that few people can approach the capital, or stand without in such bad weather, a set of vagrants are provided, maintained, and paid, whose sole business is to cry and lament, as if they had been really very much injured and oppressed; and this they tell you is for the king's honour, that he may not be lonely by the palace being too quiet. This, of all their absurd customs, was the most grievous and troublesome to Mr. Bruce.

The king of Abyssinia wears his hair long; he wears his diadem while marching, as a mark of sovereignty, that does not impede or incommode him, as any other heavier ornament would do, especially in hot weather. This fillet surrounds his head above the hair, leaving the crown perfectly uncovered. It is an offence of the first magnitude for any person at this time, to wear any thing upon his head, especially white, unless for Mahometans, who wear caps, and over them a large white turban; or for priests, who wear large turbans of muslin also. The kings of Abyssinia anciently sat upon a gold throne, which is a large, convenient, oblong, square seat, like a small bedstead, covered with Persian carpets, damask, and cloth of gold, with steps leading up to it. It is still richly gilded; but the many revolutions and wars have much abridged their ancient magnificence. It is, in Abyssinia, high-treason to sit upon any seat of the king's; and he that presumed to do this would be instantly hewn to pieces, if there was not some other collateral proof of his being a madman.

In Abyssinia it is considered as a fundamental law of the land, that none of the royal family, who has any deformity or bodily defect, shall be allowed to succeed to the crown; and for this purpose, any of the princes, who may have escaped from the mountain of Wechné, and who are afterwards taken, are mutilated in some of their members, that thus they may be disqualified from ever succeeding.

They have several kinds of bread in Abyssinia, some of different sorts of tseff, and some of tocouffo, which also vary in quality. The king of Abyssinia eats of wheat bread, though not of every wheat, but of that only that grows in the province of Dembea, therefore called the king's food. It always has been, and still is the custom of the kings of Abyssinia, to marry what number of wives they choose; that these were not, therefore, all queens; but that among them there was one who was considered particularly as queen, and upon her head was placed the crown, and she was called Iteghé. The king of Abyssinia never is seen to walk, nor to set his foot upon the ground, out of his palace: and when he would dismount from

the horse or mule on which he rides, he has a servant with a stool, who places it properly for him for that purpose. He rides into the anti-chamber to the foot of the throne, or to the stool placed in the alcove of his tent. He very often judges capital crimes himself. No man is condemned by the king in person to die for the first fault, unless the crime be of a horrid nature, such as parricide or sacrilege. And, in general, the life and merits of the prisoner are weighed against his immediate guilt; so that if his first behaviour has had more merit towards the state than his present delinquency is thought to have injured it, the one is placed fairly against the other, and the accused is generally absolved when the sovereign judges alone. When a prisoner is condemned in capital cases, he is not again remitted to prison, which is thought cruel, but he is immediately carried away, and the sentence executed upon him. The capital punishments in Abyssinia, are the cross, and flaying alive. Lapidation, or stoning to death, is the next. This is chiefly inflicted upon strangers, called *Franks*, for religious causes. The Catholic priests in Abyssinia that have been detected there, in these latter days, have been stoned to death, and their bodies still lie in the streets of Gondar, in the squares or wall-places, covered with the heaps of stone which occasioned their death by being thrown at them. There are three of these heaps at the church of Abbo, all covering Franciscan friars; and besides them, a small pyramid over a boy who was stoned to death with them, about the first year of the reign of David the 15th. Among capital punishments may be reckoned likewise the plucking out of the eyes, a cruelty which Mr. Bruce had but too often seen committed during the short stay he made in Abyssinia. This is generally inflicted upon rebels. After the slaughter of the battle of Fagitta, twelve chiefs of the Pagan Galla, taken prisoners by Ras Michael, had their eyes torn out, and were afterwards abandoned to starve in the valleys below the town. Several prisoners of another rank, noblemen of Tigre, underwent the same misfortune; and, what is wonderful, not one of them died in the operation, nor its consequences, though performed in the coarsest manner with an iron forceps, or pincers. The dead bodies of criminals slain for treason, murder, and violence, on the highway at certain times, are seldom buried in Abyssinia. The streets of Gondar are strewn with pieces of their carcases, which bring the wild beasts in multitudes into the city as soon as it becomes dark, so that it is scarcely safe for any one to walk in the night. The dogs used to bring pieces of human bodies into the house, and court-yard, to eat them in greater security.

Though the Abyssinians were so anciently and nearly connected with Egypt, yet they never seem to have made use of paper, or papyrus, but imitated the practice of the Persians, who wrote upon skins, and they do so to this day. This arises from their having early been Jews.

The Abyssinians neither eat nor drink with strangers, though they have no reason for this; and it is now a mere prejudice, because the old occasion for this regulation is lost. They break, or purify, however, every vessel a stranger of any kind shall eat or drink in. It is infamy for a man to go to market to buy any thing. He cannot carry water or bake bread; but he must wash the clothes belonging to both sexes; and, in this function, the women cannot help him. The men carry their burdens on their heads, the women on their shoulders. No man eats veal, although every one very willingly eats of a cow. They eat no wild or water-fowl, not even the goose, which was a great delicacy in Egypt. The reason of this is, that, upon their conversion to Judaism, they were forced to relinquish their ancient municipal customs, as far as they were contrary to the Mosaic law; and the animals, in their country, not corresponding in form, kind, or name, with those mentioned in the Septuagint, or original

original Hebrew, it has followed, that there are many of each class that know not whether they are clean or not; and a wonderful confusion and uncertainty have followed through ignorance or mistake, being unwilling to violate the law in any one instance through not understanding it.

The following is Mr. Bruce's account of a polyphemus banquet. "In the capital, where one is safe from surprize at all times, or in the country or villages, when the rains have become so constant, that the valleys will not bear a horse to pass them, or that men cannot venture far from home, through fear of being surrounded and swept away by temporary torrents, occasioned by sudden showers on the mountains; in a word, when a man can say he is safe at home, and the spear and shield are hung up in the hall, a number of people of the best fashion in the villages, of both sexes, courtiers in the palace, or citizens in the town, meet together to dine between twelve and one o'clock. A long table is set in the middle of a large room, and benches beside it for a number of guests who are invited. Tables and benches the Portuguese introduced amongst them; but bull hides, spread upon the ground, served them before, as they now do in the camp and country. A cow or bull, one or more, as the company are numerous, is brought close to the door, and his feet strongly tied. The skin that hangs down under his chin and throat, is cut only so deep as to arrive at the fat, of which it totally consists, and, by the leparation of a few small blood vessels, six or seven drops of blood only fall upon the ground. They have no stone, bench, nor altar, upon which these cruel assassins lay the animal's head in this operation. Having fastened the Mosical law, as they think by pouring these six or seven drops upon the ground, two or more of them fall to work; on the back of the beast, and on each side of the spine they cut skin deep; then putting their fingers between the flesh and the skin, they begin to strip the hide of the animal half way down the ribs, and so on to the buttock, cutting the skin wherever it hinders them commodiously to strip the poor animal bare. All the flesh on the buttocks is then cut off, and in solid square pieces, without bones, or much effusion of blood; and the prodigious noise the animal makes is a signal for the company to sit down to table. There are then laid before every guest, instead of plates, round cakes, if they may be so called, about twice as big as a pan-cake, and something thicker and tougher. It is unleavened bread of a fourth taste, far from being disagreeable, and very easily digested, made of a grain called telf. It is of different colours, from black to the colour of the whitest wheat-bread. Three or four of these cakes, are generally put upon permitt, for the food of the person opposite to whose seat they are placed. Beneath these are four or five of ordinary bread, and of a blackish kind. These serve the maller to wipe his fingers upon, and afterwards the servant for bread to his dinner. Two or three servants then come, each with a square piece of beef in their bare hands, laying it upon the cakes of telf, placed like dishes down the table, without cloth or any thing else beneath them. By this time all the guests have knives in their hands, and the men have the large crooked ones, which they put to all sorts of uses during the time of war. The women have small clasped knives, such as the worst of the kind made at Birmingham, sold for a penny each. The company are so arranged that one man sits between two women; the man with his long knife cuts a thin piece, which will be thought a good beef-steak in England, while you see the motion of the fibres yet perfectly distinct, and alive in the flesh. No man in Abyssinia, of any fashion whatever, feeds himself, or touches his own meat. The women take the steak and cut it length-ways like strings, about the thickness of a little finger, then cross-ways into square pieces, something smaller

than dice. This they lay upon a piece of the telf bread, strongly powdered with black pepper, or Cayenne pepper, and sossak salt; they then wrap it up in telf bread like a cartridge. In the mean time, the man having put up his knife, with each hand resting upon his neighbour's knee, his body flooping, his head low and forward, and mouth open very like an idiot, he turns to the one whole cartridge is still ready, who fluffs the whole of it into his mouth, which is so full that he is in constant danger of being choked. This is a mark of grandeur. The greater the man would seem to be, the larger piece he takes in his mouth; and the more noise he makes in chewing it, the more polite he is thought to be. They have, indeed, a proverb that says, "Beggars and thieves only eat small pieces, or without making a noise." Having dispatched this morsel, which he does very expeditiously, his next female neighbour holds forth another cartridge, which goes the same way, and so on till he is fastid. He never drinks till he has finished eating; and, before he begins, in gratitude to the last one that fed him, he makes up two small rolls of the same kind and form; each of his neighbours open their mouths at the same time, while with each hand he puts their portion into their mouths. He then falls to drinking out of a large handsome horn; the ladies eat till they are fastid, and then all drink together. A great deal of mirth and joke goes round, very seldom with any mixture of acrimony or ill-humour. During all this time, the unfortunate victim at the door is bleeding indeed, but bleeding life. As long as they can cut off the flesh from his bones, they do not meddle with the thighs, or the parts where the great arteries are. At last they fall upon the thighs likewise; and soon after the animal, bleeding to death, becomes so tough that the cannibals, who have the rest of it to eat, find very hard work to separate the flesh from the bones with their teeth like dogs. In the mean time, those within are very much elevated; love lights all its fires, and every thing is permitted with absolute freedom. There is no coyne, no delays, no need of appointments or retirement, to gratify their wishes; there are no rooms but one, in which they sacrifice to Bacchus and to Venus."

There is no such thing as marriage in Abyssinia, unless that which is contracted by mutual consent, without other form, subsisting only till dissolved by dissent of one or other, and to be renewed or repeated as often as it is agreeable to both parties, who when they please, cohabit together again as man and wife, after having been divorced, had children by others, or whether they have been married, or had children with others or not. Upon separation they divide the children. The eldest son falls to the mother's first choice, and the eldest daughter to the father. If there be but one daughter, and all the rest sons, she is assigned to the father. If there be but one son, and all the rest daughters, he is the right of the mother. If the numbers are unequal after the first election, the rest are divided by lot. There is no such distinction as legitimate and illegitimate children from the king to the beggar; for supposing any one of their marriages valid, all the issue of the rest must be adulterous bastards.

The king in his marriage uses no other ceremony than this: he sends an Azage to the house where the lady lives, when the officer announces to her, it is the king's pleasure that she should remove instantly to the palace. She then dresses herself in the best manner, and immediately obeys. Thenceforward he assigns her an apartment in the palace, and gives her a house elsewhere in any part the choofes. Then, when he makes her Iteghé, it seems to be the nearest resemblance to marriage; for, whether in the court or the camp, he orders one of the judges to pronounce in his presence, that he, the king, has chosen his hand-maid, naming her, for his queen; upon which the crown is put upon her head, but she is not anointed.

The crown being hereditary in one family, but elective in the person, and polygamy being permitted, mult have multiplied these heirs very much, and produced constant disputes, so that it was found necessary to provide a remedy for the anarchy and effusion of royal blood, which was otherwise inevitably to follow. The remedy was a humane and gentle one, they were confined in a good climate upon a high mountain, and maintained there at the public expence. They are there taught to read and write, but nothing else; 750 cloths for wrapping round them, 3000 ounces of gold, which is 30,000 dollars, or crowns, are allowed by the state for their maintenance. These princes are hardly used; and, in troublesome times, often put to death upon the smallest misinformation.

The accounts of the military force of this kingdom have been greatly exaggerated. The largest army that ever was in the field, was that in the rebellion before the battle of Serbraxo. When they first encamped upon the lake Tzana, the rebel army altogether might amount to about 50,000 men. Their standards are large flaves, surmounted at the top with a hollow ball; below this is a tube, in which the staff is fixed; and immediately below the ball, a narrow stripe of silk made forked, or swallow-tailed, like a vane, and seldom much broader. The standards of the infantry have their flags painted two colours cross-ways—yellow, white, red, or green. The horse have all a lion upon their flag, some a red, some a green, and some a white lion. The black horse have a yellow lion, and over it a white star upon a red flag, alluding to two prophecies, the one, "Judah is a young lion," and the other, "There shall come a star out of Judah." This had been discontinued for want of cloth till the war of Begender, when a large piece was found in Joas's wardrobe, and was thought a certain omen of his victory, and of a long and vigorous reign. This piece of cloth was said to have been brought from Cairo by Yafous II. for the campaign of Senaar, and, with the other standards and colours, was surrendered to the rebels when the king was made prisoner.

The king's household troops should consist of about 8000 infantry, 2000 of which carry firelocks, and supply the place of archers; bows have been laid aside for near a hundred years, and are now only used by the Wanto Shangalla, and some other barbarous inconsiderable nations. These troops are divided into four companies, each under an officer called Shalaka, which answers to our colonel. Every twenty men have an officer, every fifty a second, and every hundred a third; that is, every twenty have one officer who commands them, but is commanded likewise by an officer who commands the fifty; so that there are three officers who command fifty men, six command a hundred, and thirty command five hundred, over whom is the Shalaka; and this body they call *Bet*, which signifies a *house*, or *apartment*, because each of them goes by the name of one of the king's apartments.

There are four regiments, that seldom, if ever, amount to 1600 men, which depend alone upon the king, and are all foreigners, at least the officers; these have the charge of his person while in the field. In times, when the king is out of leading-strings, they amount to four or five thousand, and then oppress the country; for they have great privileges. At times, when the king's hands are weak, they are kept incomplete out of fear and jealousy.

Before the king marches, three proclamations are made. The first is, "Buy your mules, get ready your provision, and pay your servants; for, after such a day, they that seek me here shall not find me." The second is about a week after, or according as the exigency is pressing; this is, "Cut down the kantuffa in the four quarters of the world, for I do not know where I am going." This kantuffa is a terrible thorn which very much molests the king and nobility in their march, by taking hold of their long

hair, and the cotton cloth they are wrapped in. The third and last proclamation is, "I am encamped upon the Angrab, or Kahha; he that does not join me here, I will chastise him for seven years."

The rains generally cease the eighth of September; a sickly season follows, till they begin again about the 20th of October; they then continue pretty constant, but moderate in quantity, till Hedar St. Michael, the eighth of November. All epidemic diseases cease with the end of these rains, and it is then the armies begin to march.

There are more churches in Abyssinia than in any other country. Every great man that dies thinks he has atoned for all his wickedness if he leaves a fund to build a church, or has built one in his lifetime. The king builds many. Wherever a victory is gained, there a church is erected in the very field thinking with the putrid bodies of the slain. Formerly this was only the case when the enemy was Pagan or Infidel; now the same is observed when the victories are over Christians. The situation of a church is always chosen near running water, for the convenience of their purifications and ablutions, in which they observe strictly the Levitical law. They are always placed upon the top of some beautiful round hill, which is surrounded entirely with rows of the oxycedrus, or Virginia cedar, which grows here in great beauty and perfection, and is called *Ara*. There is nothing adds so much to the beauty of the country as these churches and the plantation about them. In the middle of this plantation of cedars is interspersed, at proper distances, a number of these beautiful trees called *Cullo*, which grow very high, and are all extremely picturesque. The churches are all round, with thatched roofs; their funnels are perfect cones; the outside is surrounded by a number of wooden pillars, which are nothing else than the trunks of the cedar tree, and are placed to support the edifice, about eight feet of the roof projecting beyond the wall of the church, which forms an agreeable walk, or colonade, around it in hot weather, or in rain. The inside of the church is in several divisions, according as is prescribed by the law of Moses. The hill is a circle somewhat wider than the inner one; here the congregation sit and pray. Within this is a square, and that square is divided by a veil or curtain, in which is another very small division answering to the holy of holies. This is so narrow that none but the priests can go into it. Whoever enters a church must be bare-footed, and if bare-footed, may go through every part of it, if he has any such curiosity, provided he is pure, that is, has not been concerned with women for twenty-four hours before, or touched carrion or dead bodies; for in that case he is not to go within the precincts, or outer circumference of the church, but stand and say his prayers at an awful distance among the cedars: which distance every person of both sexes, under Jewish disqualifications, are obliged to observe; and this is always a place belonging to the church, where, unless in Lem, the greatest part of the congregation may be seen; but this is left to the person's own conscience; and if there was either great inconvenience in the one situation, or great satisfaction in the other, the case would be otherwise.

On first entering the church, they put off their shoes; but leave a servant there with them, or else they would be stolen, if good for any thing, by the priests and monks before they come out of the church. At entering they kiss the threshold, and the two door-posts, go in and say what prayer they please; that finished, they come out again, and their duty is over. The churches are full of pictures, painted on parchment, and nailed upon the walls, in a manner little less slovenly than paltry prints in beggarly country ale-houses.

Nothing embossed, nor in relief, ever appears in any of their churches; all this would be reckoned idolatry, so much so, that they do not wear a cross, as has been represented, on the top of the ball of

the fendick, or standard, because it calls a shade; but there is no doubt that pictures have been used in their churches from the very earliest age of Chriillianity.

The Abyssinians receive the holy sacrament in both kinds in unleavened bread, and in the grape bruised with the hulk together as it grows, so that it is a kind of marmalade, and is given in a flat spoon: whatever they may pretend, some mixture seems necessary to keep it from fermentation in the state that it is in, unless the dried cluster is fresh bruised juft before it is used, for it is little more fluid than the common marmalade of confectioners; but it is perfectly the grape as it grew, bruised, bones and skin together. Some means, however, have been used, as Mr. Bruce supposes, to prevent fermentation, and make it keep; and though this is constantly denied, he has often thought he tasted a flavour that was not natural to the grape itself.

A quantity of excellent strong wine is made at Dreedra, south-west from Gondar, about thirty miles, which would more than supply the quantity necessary for the celebration of the eucharist in all Abyssinia twenty times over. The people themselves are not fond of wine, and plant the vine in one place only; but a small black grape, of an excellent flavour, grows plentifully wild in every wood in Tigré.

Large pieces of bread are given to the communicants in proportion to their quality; and Mr. Bruce has seen great men, who, though they opened their mouths as wide as conveniently a man can do, yet, from the respect the priest bore him, such a portion of the loaf was put into his mouth that water ran from his eyes, from the incapacity of chewing it, which, however, he does as indecently, and with fallas much noise, as he eats at table.

After receiving the sacrament of the eucharist in both kinds, a pitcher of water is brought, of which the communicant drinks a large draught; and well he needs it to wash down the quantity of bread he has just swallowed. He then retires from the steps of the inner division, upon which the administering priest stands, and, turning his face to the wall of the church, in private says some prayer with seeming decency and attention.

The Abyssinians are not all agreed about the state of souls before the resurrection of the body. The opinion which generally prevails is, that there is no third state: but that, after the example of the thief,

the souls of good men enjoy the beatific vision immediately upon the separation from the body. Their circumcision is performed with a sharp knife, or razor. There is no laceration with the nail, no formula or repetition of words, nor any religious ceremony at the time of the operation, nor is it done at any particular age, and generally it is a woman that is the surgeon.

There is another ceremony which regards the women also, and which Mr. Bruce calls *in-jon*. As soon as a near relation dies in Abyssinia, a brother or parent, cousin-german or lover, every woman in that relation, with the nail of her little finger, which she leaves long on purpose, cuts the skin of both her temples, about the size of a sixpence; and therefore you see either a wound or a scar in every fair face in Abyssinia; and in the dry season, when the camp is out, from the loss of friends, they seldom have liberty to heal till peace, and the army return with the rains.

The Abyssinians, like the ancient Egyptians, their first colony, in computing their time, have continued the use of the solar year. They have another way peculiar to themselves; they read the whole of the four evangelists every year in their churches. They begin with Matthew, then proceed to Mark, Luke, and John, in order; and when they speak of an event, they write and say it happened in the days of Matthew, that is, in the first quarter of the year, while the gospel of St. Matthew was yet reading in the churches. They compute the time of the day in a very arbitrary, irregular manner. The twilight is very short, almost imperceptible, and was still more so when the court was removed further to the southward in Shoa. As soon as the sun falls below the horizon, night comes on, and all the stars appear. This term, then, the twilight, they choose for the beginning of their day, and call it *Naggé*, which is the very time the twilight of the morning falls. The same is observed at night, and *Melet* is meant to signify the instant of beginning the twilight, between the sun's falling below the horizon and the stars appearing. Mid-day is by them called *Kater*, a very old word, which signifies *culmination*, or a thing's being arrived or placed at the middle or highest part of an arch. All the rest of times, in conversation, they describe by pointing at the place in the heavens where the sun then was, when what they are describing happened.

CH A P. III.

Mr. Bruce appointed Governor of Ras el Feel—Account of the Battle of Banja—Conspiracy against Michael—Description of Gondar, Emfras, and Lake Ezana—A Visit to the great Cataract of Alata—Mr. Bruce passes the Nile—An Alarm on approaching the Army—He joins the King—A Retreat towards Gondar—Dangerous Passage of the Nile—Battle of Linjour—Peace with Fasil—Arrival at Gondar—Retreat to Tigré.

MR. BRUCE being one day at court, met the king's secretary Tecla Mariam, who informed him, with a smiling countenance, that he was made the governor of Ras el Feel. Mr. Bruce stood motionless with astonishment, particularly as he was at that identical time, endeavouring to get Yafine appointed deputy of Ras el Feel. He now found the power in his own hands; and, after having recovered himself a little from his surprise, went to Ayto Confu to kiss his hand as his superior; but this he would by no means suffer him to do. A great dinner was provided them by the Iteghé; and Yafine being sent for, was appointed, clothed, that is, invested, and ordered immediately to Ras el Feel to his government, to make peace with the Davaina, and bring all the horses he could get with him from thence, or from Atbara. The having thus provided for Yafine, and secured, as he thought, a retreat to Sennaar for himself, gave him the first real pleasure that he had re-

ceived since his landing at Masuah; and that day, seeing himself in company with all his friends, and the hopes of this country, for the first time since his arrival in Abyssinia, he abandoned himself to joy.

However, his constitution was too much weakened to bear any excesses. The day after, when he went home to Emfras, he found himself attacked with a slow fever, and thinking that it was the prelude of an ague, with which he was often tormented, he fell to taking bark, without any remission, or, where the remission was very obscure, he shut himself up in the house, upon his constant regimen of boiled rice, with abundant draughts of cold water. There was about this time a piece of bad news circulated at Gondar, that Kasmati Boro, whom the Ras had left governor at Damot, had been beaten by Fasil, and obliged to retire to his own country in Gojam, to Stadis Amba, near the passage of the Nile, at Mipé; and that Fasil, with a much larger army of Galla than

that

that

that he had brought to Fagitta, had taken possession of Buré, the usual place of his residence.

After Fahl's defeat at Fagitta, and the affront he received at Alfoa in the heart of his own country, he had continued his route to Buré, a district of the Agows, where was his constant residence. After this he had crossed the Nile into the country of Bizamo; and Boro de Gago had taken up his residence at Brué, when Michael returned to Gondar; but no sooner had he heard of his arrival in those parts, than he marched with a number of horse, and forced his rival to retire to Gogam. A very obstinate battle was fought at Banja, in which the Agows were entirely defeated by Fahl, seven of their chiefs killed, all men of great consequence, among whom was Ayamico, a very near relation of the king.

The news was first brought by a son of Nanna Georgis, chief of the Agows, who escaped from the battle. Michael was at dinner, and Mr. Bruce was present. It was one of his carousals for the marriage of Powullen, when young Georgis came into the room, in a torn and dirty habit, unattended, and almost unperceived, and presented himself at the foot of the table. Michael had then in his hand a cup of gold, it being the exclusive privilege of the governor of the province of Fagite to drink out of such a cup; it was full of wine; before a word was spoken, and upon the first appearance of the man, he threw the cup and wine upon the ground, and cried out, "I am guilty of the death of these people." Every one arose, the table was removed, and Georgis told his misfortune, that Nanna Georgis his father, Zeogam Georgis, the next in rank among them, Avamico the king's relation, and four other chiefs, were slain at Banja, and their race nearly extirpated by a victory gained with much bloodshed, and after cruelly punished in retaliation for that of Fagitta. A council was immediately called, where it was resolved, that, though the rainy season was at hand, the utmost expedition should be made to take the field; that Gulho and Powullen should return to their provinces, and increase their army to the utmost of their power; that the king should take the low road by Foggora and Dara, there to join the troops of Beg order and Ambari, cross the Nile at the mouth of the lake, above the second cataract, as it is called, and march thence straight to Buré, which, by speedy marches, might be done in five or six days.

No resolution was ever embraced with more alacrity, the cause of the Agows was the cause of Gondar, and Fenne would cite immediately follow. The king's troops and those of Michael were all ready, and had just refreshed themselves by a week's restivity. Gulho and Powullen, after having sworn to Michael that they never would return without Fahl's head, decamped next morning with very different intentions in their hearts; for no sooner had they crossed Beggender than they entered into a conspiracy in form against Michael, which they had long meditated; they had resolved to make peace with Fahl, and swear with him a solemn league, that they were but to have one cause, one council, and one interest, till they had deprived Michael of his life and dignity.

Mr. Bruce, at this time, found himself declining in health, to which the irregularities of the fall week had greatly contributed. He obtained leave from the king to go to Emfras, a town about twenty miles south from Gondar, where a number of Mahometan tent-makers lived. Gulho had a house there, and a pleasant garden, which he very willingly gave Mr. Bruce the use of, with this advice, however, which at the time he did not understand, rather to go on to Ambara with him, for he would there sooner recover his health, and be more in quiet, than with the king or Michael. As the king was to pass immediately under this town, and as mules of those that loaded and unloaded his tents and baggage were Mahometans, and lived at Emfras, he could not be better situated, or more at his liberty and ease than at Emfras.

Gondar, the metropolis of Abyssinia, is situated

upon a hill of considerable height, the top of it nearly plain, on which the town is placed. It consists of about ten thousand families in times of peace; the houses are chiefly of clay, the roofs thatched in the form of cones, which is always the construction within the tropical rains. On the west end of the town is the king's house, formerly a structure of considerable consequence; it was a square building, flanked with square towers; it was formerly four stories high; and from the top of it, had a magnificent view of all the country southward to the lake of Tzana. Great part of this house is now in ruins, having been burnt at different times; but there is still ample lodging in the two lowest floors of it, the audience-chamber being above one hundred and twenty feet long.

Mr. Bruce left Gondar the 4th of April at eight o'clock in the morning, and the next day arrived at Emfras, after a very pleasant, though not interesting excursion. The town is situated on a steep hill, and the way up to it is almost perpendicular, like the ascent of a ladder. The houses are all placed about the middle of the hill, fronting the well, in number about 300. Above these houses are gardens, or rather fields, full of trees and bushes, without any sort of order, up to the very top. Emfras commands a view of the whole lake of Tzana, and part of the country on the other side. It was once a royal residence. On a small hill is a house of Hatzé Hannes, in form of a square tower, now going fall to ruin.

The lake of Tzana is much the largest expanse of water known in that country. Its extent, however, has been greatly exaggerated. Its greatest breadth is 35 miles; but it decreases greatly at each extremity, where it is not sometimes above ten miles broad. Its greatest length is 49 miles from north to south, and which extent this lake has in length. In the dry months, from October to March, the lake shrinks greatly in size; but after that all those rivers are full which are on every side of it, and fall into the lake, like radii drawn to a centre, then it swells, and extends itself into the plain country, and has of course a much larger surface.

News was received on the 12th of May, that the king had marched to Ledda, and on the 15th, Mr. Bruce and his friends heard the king's kettle-drums. Forty-five of these instruments constantly go before him, beating all the way while he is on his march. The Mahometan town near the water was plundered in a minute, but the inhabitants had long before removed every thing valuable.

Early on the 14th, Mr. Bruce mounted his horse, with all his men servants, leaving the women kivas, and an old man to take care of the house. It was very unsafe to travel in such company at such an hour. Early as it was, the king was then in council, and Ras Michael, who had his advisers assembled also in his tent, had just left it to go to the king's. There was about 500 yards between their tents, and a free avenue constantly left, in which it is a crime to stand, or even to cross, unless for messengers sent from one to the other. Our traveller took an opportunity of paying a visit to the great cataract of Alata. The first thing our traveller saw thence was the bridge, which consists of one arch of about twenty-five feet broad. Fragments of the parapets remained, and the bridge itself seemed to bear the appearance of frequent repairs, and many attempts to ruin it; otherwise, in its construction, it was exceedingly commodious. The Nile here is confined between two rocks, and runs in a deep trough, with great roaring and impetuous velocity. They were told no crocodiles were ever seen so high, and were obliged to remount the stream above half a mile before they came to the cataract, through trees and bushes of a beautiful and delightful appearance. The cataract itself was a most magnificent sight. The missionaries say the fall is about sixteen ells, or fifty feet. The measuring is long, indeed, very difficult; but, by the position of long sticks, and poles of different lengths, at different heights of the rock, from the water's edge, Mr. Bruce

thinks it is nearer forty feet than any other measure.

The river had been considerably increased by rains,
and fell in one sheet of water, without any interval,
above half an English mile in breadth, with a force
and noise that was truly terrible, and which stunned,
and made him, for a time, perfectly dizzy. A thick
fog, or haze, covered the fall all round, and hung
over the course of the stream both above and below,
marking its track, though the water was not seen. The
river, though swelled with rain, preserved its natural
channels, and fell, as far as he could discern, into a
deep pool, or basin, in the solid rock, which was
full, and in twenty different eddies to the very foot of
the precipice; the stream, when it fell, seeming part of
it to run back with great fury upon the rock, as well
as forward in the line of its course, raising a wave,
of violent ebullition, by chafing against each other.

Mr. Bruce and his friends resumed their journey
on the 22d of May. They set out accordingly at six
o'clock in the morning, ascending some hills covered
with trees and shrubs of inexpressible beauty, and
many of extraordinary fragrance. They continued
ascending about three miles, till they came to the top
of the ridge within sight of the lake. As they rose,
the hills became more bare and less beautiful.

Having passed the Nile, Mr. Bruce found himself
more than ordinarily depressed: his spirits were sunk
almost to a degree of despondency, and yet nothing
had happened since that period more than was expected
before. This disagreeable situation of mind continued
the whole night. Impatient of suffering any
longer, he leaped out of bed, and went to the door
of the tent, where the outward air perfectly awakened
him, and restored his strength and courage. All was
still, and at a distance he saw several bright fires, but
lower down, and more to the right than he expected,
which made him think he was mistaken in the situ-
ation of Karcagna. It was then near four in the
morning of the 25th. He called upon his compa-
nions, happily buried in deep sleep, as he was de-
termined, if possible, to join the king that day. They
accordingly were three or four miles from Deidera
when the sun rose; there had been little rain that
night, and they found very few torrents on their
way; but it was slippery, and unceasingly walking, the rich
fishing trodden into a confluence like palle. A
half before nine they heard a gun fired, which gave
them some joy, as the army seemed not to be far off;
eleven minutes after, they heard several dropping shots;
and, in less than a quarter of an hour's time a general
muzz began from right to left, which ceased for an
instant, and then was heard again as faint as ever;
about the occasion of which they were divided in
opinion. The firing continued much in the same way,
rather flacker, but apparently advancing nearer them;
a fire sign that their army was beaten and retreating.
They, therefore, made themselves ready, and mounted
on horseback, that they might join them. They had
not gone far in the plain before they had a sight of the
enemy, to their very great surprise and no small con-
flict. A multitude of deer, buffaloes, boars, and
various other wild beasts, had been alarmed by
the noise and daily advancing of the army, and gradu-
ally driven before them. The country was all
overgrown with wild oats, a great many of the vil-
lages having been burnt the year before the inhabi-
tants had abandoned them: in this shelter the wild
beasts had taken up their abodes in very great num-
bers. When the army pointed towards Karcagna to
the left, the silence and solitude on the opposite side
made them turn to the right to where the Nile makes
a semi-circle, the Jemma being behind them, and
much overflowed. When the army, therefore, instead
of marching south and by ead towards Samcen, had
turned their course north-west, their faces towards
Gondar, they had fallen in with these innumerable
herds of deer and other beasts, who, confined be-
tween the Nile, the Jemma, and the lake, had no
way to return but that by which they had come. These
animals, finding men in every direction in which they

attempted to pass, became desperate with fear; and,
not knowing what course to take, fell a prey to the
troops. The soldiers, happy in an occasion of pro-
curing animal food, presently fell to firing wherever
the beasts appeared; every loaded gun was discharged
upon them, and this continued for very near an hour.

His majesty and Ras Michael were in the most
violent agitation of mind; though the cause was before
their eyes, yet the word went about that Woodage
Afael had attacked the army; and this occasioned a
great panic and disorder, for every body was convinced
with reason that he was not far off. The firing, how-
ever, continued, the balls flew about in every direc-
tion, some few were killed, and many people and
horses were hurt; still they fired, and Ras Michael,
at the door of his tent, crying, threatening, and
tearing his grey locks, found, for a few minutes, the
army was not under his command. At this instant,
Kafmati Netcho, whose Fit-Aurra's had fallen back
on his front, ordered his kettle-drums to be beat
before he arrived in the king's presence; and this
being heard, without it being known generally who
they were, occasioned another panic. The king or-
dered his tent to be pitched, his standard to be let
up, his drums to beat (the signal for encamping) and
the firing immediately ceased. But it was a long
while before all the army could believe that Woodage
Afael had not been engaged with some part of it
that day. Mr. Bruce coming up with the army, he
asked one of the generals, whether they were now
marching? He said, that as soon as the news of the
conspiracy were known, a council was held, where
it was the general opinion they should proceed briskly
forward, and attack Fafil alone at Buie, then turn to
Gondar, to meet the other two; but then they had it
upon the very best authority that great rains had fallen
to the southward; that the rivers, which were so
frequent in that part of the country, were mostly
impassable, so there would be great danger in meeting
Fafil with an army spent and fatigued with the diffi-
culty of the roads. It was, therefore, determined,
and the Ras was decidedly of that opinion, that they
should keep their army entire for a better day, and
immediately cross the Nile, and march back to Gondar;
that they had accordingly wheeled about, and that day
was the first of their proceeding, which had been in-
terrupted by the accident of the firing. Mr. Bruce
then waited upon the king, and staid a considerable
time with him.

Early on the 26th, the army marched towards the
Nile. In the afternoon they encamped, between two
and three, on the banks of the river Coga. On the
27th, they left the river Coga, marching down upon
the Nile, and passed the church of Marian Net, as
they call the church of St. Anne. Here the superior,
attended by about fifty of his monks, came in pro-
cession to welcome Ras Michael; but he, it seems,
had received some intelligence of ill-offices the people
of this quarter had done to the Agows by Fafil's di-
rection; he, therefore, ordered the church to be
plundered, and took the superior, and two of the
leading men of the monks, away with him to Gondar;
several of the others were killed and wounded, with-
out provocation, by the soldiers, and the rest dispersed
through the country. They arrived about four on
the banks of the Nile, and took possession in a line
of about 600 yards of ground. From the time they
decamped from Coga, they had violent rain, thunder,
lightning, &c. The Abyssinian armies pass the Nile
at all seasons. It rolls with it no trees, stones, nor
impediments; yet the sight of such a monstrous mass
of water terrified our traveller, and made him think
the idea of crossing would be laid aside. It was plain
in the face of every one, that they gave themselves
over for lost; an universal dejection had taken place,
and it was but too visible that the army was defeated
by the weather, without having seen an enemy. A
cold and brisk gale now sprung up at N. W. with
a clear sun; and soon after four, when the army ar-
rived on the banks of the Nile, these temporary tor-
ments

rents were all subsided, the fun was hot, and the ground again becoming dry.

Ras Michael's Fit-Auraris, with about 400 men, had passed in the morning, and had sent back word to the king, that his men had passed swimming, and with very great difficulty; that he doubted whether the horses, or loaded mules, could cross at any rate; but if it were resolved to make the trial, they should do it immediately, without staying till the increase of the river. He said both banks were composed of black earth, slippery and miry, which would become more so when horses had puddled it; he advised, above all, the turning to the right immediately after coming ashore, in the direction in which he had fixed poles, as the earth there was hard and firm, besides having the advantage of some round stones, which hindered the beasts from slipping or sinking. Instead, therefore, of retreating there that night, it was resolved that the horse should cross immediately. The first who passed was a young man, a relation of the king, brother to Avamico, killed at the battle of Banja; he walked in with great caution, marking a track for the king to pass. He had gone upon rather solid ground, about twice the length of his horse, when he plunged out of his depth, and swam to the other side. The king followed him immediately with a great degree of haste, Ras Michael calling to him to proceed with caution, but without success. Afterwards came the old Ras on his mule, with several of his friends swimming to a winn and without their horses on each side of him, in a manner truly wonderful. He seemed to have lost his accustomed calmness, and appeared a good deal agitated; forbade, upon pain of death, any one to follow him directly, or to swim over, or, as their custom is, holding their mules by the tail. As soon as these were safely ashore, the king's household and black troops, and Mr. Bruce with them, advanced cautiously into the river, and swam happily over, in a deep stream of reddish coloured water which ran without violence above upon a level. Each horseman had a mule in his hand, which swam after him, or by his side, with his coat of mail and head-piece tied upon it. It is impossible to describe the confusion that followed; night was hard upon them, and, though it increased their loss, it, in great measure, concealed it; a thousand men had not yet passed, though on mules and horses; many mired in the muddy landing-place, fell back in the stream, and were carried away and drowned. Of the horse belonging to the king's household, one hundred and eighty in number, seven only were missing; with them Ayto Aylo, vice-chamberlain to the queen, and Tecla Mariam the king's uncle, a great friend of Ras Michael's, both old men. There was no baggage tent of the Ras and that of the king excepted) which had as yet come over, and these were wet, being drenched in the river. The Fit-Auraris had left, ready made, two rafts for Ozoro Eilher, and the other two ladies, with which the might have easily been conducted over, and without much danger; but the Ras had made Ozoro Eilher pass over in the same manner he had crossed himself, many swimming on each side of her mule. She would have fain staid on the east side, but it was in vain to remonstrate. She was with child, and had fainted several times; but yet nothing could prevail with the Ras to trust her on the bank till morning. She crossed, however, safely, though almost dead with fright. The night was cold and clear, and a strong wind at north-west had blown all the afternoon. The river had abated towards mid-night, when, whether from this cause, or, as they alleged, that they found a more favourable ford, all the Tigé infantry, and many mules lightly loaded, passed with less difficulty than any of the rest had done, and with them several loads of flour; luckily also, Mr. Bruce's two tents and mules, to his great consolation, came safely over when it was near morning. Still the army continued to pass, and those that could swim seemed best off. Ayto Aylo, the queen's chamberlain, and Tecla Mariam,

were probably drowned at the first attempt to pass, as they were never after heard of. Before day-light the van and the centre had all joined the king; the number that had perished was never distinctly known, for those that were missing were thought to have remained on the other side with Kella Yafous, at least for that day.

Kella Yafous crossed Amlac Olha, on the 25th, with some degree of difficulty, and was obliged to abandon several baggage mules. He advanced after this with as great diligence as possible to Delakur, and found the ford, though deep, much better than he expected. He had pitched his tent on the high road to Gondar, before Welleta Yafous, the enemy, knew he was decamped, and of this passage he immediately advised Michael, refreshing his troops for any emergency. About two in the afternoon Welleta Yafous appeared with his horse on the other side of the Nile, but it was then too late. Kella Yafous was so strongly posted, and the banks of the river so guarded with fire-arms, down to the water-edge, that Fasil and all his army would not have dared to attempt the passage, or even approach the banks of the river.

When Ras Michael received this intelligence, he dispatched the Fit-Auraris, Netcho, to take post upon the ford of the Kelti, a large river, but rather broad than deep, about three miles off. He himself followed early in the morning, and passed the Kelti just at sun rise, without halting; he then advanced to meet Kella Yafous, as the army began to want provisions, the little flour that had been brought over, of which the soldiers had taken with them, being nearly exhausted during that night and the morning after. It was found too, that the men had but little powder, none of them having recovered their quantity since the burning of the deers; but what they had was in perfect good order, being kept in horns and small wooden bottles, corked in such a manner as to be secured from water of any kind. Kella Yafous therefore, being in possession of the baggage, powder, and the provisions, a junction with him was absolutely necessary, and they expected to effect this at Wamadega, about twenty miles from their last night's quarters. Between twelve and one they heard the Fit-Auraris engaged; and there was sharp firing on both sides, which soon ceased. Michael ordered his army immediately to halt; he sent the king, and Billitana Gueta Tecla, commander of the van; Welleta Michael, and Ayto Tecla's Sire, the rear. Having marched a little farther, he changed his order of battle. It was not long before the Fit-Auraris's two challengers arrived, running like deer along the plain, which was not absolutely flat, but sloped gently down, declining not a fathom in fifteen. Their account was, that they had fallen in with Fasil's Fit-Auraris; that they had attacked him bravely, and, though the enemy were greatly superior, being all horse except a few musqueteers, had killed four of them. The Ras, having first heard the message of the Fit-Auraris alone, he sent a man to report it to the king; and, immediately after that, he ordered two horsemen to go full gallop along the east-side of the hill, the low road to Wamadega, to warn Kella Yafous of Fasil's being near at hand; he likewise directed the Fit-Auraris to advance cautiously till he had seen Fasil, and to pursue no party that should retreat before him.

Shortly after, Fasil appeared at the top of the hill, with about 2000 horse. It was a fine sight, but the evening was beginning to be overcast. After having taken a full view of the army, they all began to move slowly down the hill, beating their kettle drums. Fasil sent down a party to skirmish with these; and he himself halted after having made a few paces down the hill. The two bodies of horse met just half way, and mingled together, as appeared at least, with very decisive intention; but whether it was by orders or from fear, for they were not overmatched in numbers, the Abyssinian horse turned their backs and came precipitately down, so that they were afraid

the first attempt to pass it. Before day-break all joined the king; the Ras never distinctly known, were thought to have been Kella Yafous, at least

Abba Obba, on the 28th, and was obliged to fly. He advanced as far as possible to Delakus, much better than his tent on the high plain. In this passage he refreshed his troops for the afternoon. Wellseta's horse on the other side was too late. Kella Yafous on the banks of the river forced him to the water-edge, but he did not dare to attempt the banks of the river. He used this intelligence, he sent Natcho, to take possession of the river, but rather a few miles off. He himself went, and passed the Kelti river; he then advanced the army began to wear out that had been brought had taken with them, thinking that night and the day too, that the men had them having returned during of the day; but in good order, being kept in bottles, corked in such a way that no water of any kind was in possession of the provisions, a junction was made and they expected about twenty miles from between twelve and one engaged; and there was much loon ceased. Immediately to him; he sent Abba Tecla, commander, and Abba Tecla, and a little further, he was not long before the messengers arrived, running which was not absolutely declining to a station that they had fallen they had attacked but my were greatly surprised few musketeers, had Ras, having full force alone, he sent a man immediately after this, to full gallop along the road to Walmadege, being near at hand; he was to advance could to pursue no party

at the top of the hill, as a fine sight, but the vercast. After having they all began to move they their kettle drums, with these; and made a few paces of horse met just half as appeared at least, but whether it was by were not overmarched they turned their backs that they were afraid they

they would break in upon the foot. Several shots were fired from the centre at them by order of the Ras, who cried out aloud, in derision, "Take away these horses and send them to the mill." They divided, however, to the right and left, into the two grassy valleys under cover of the musketry, and a very few horses of Fasil's were carried in along with them, and slain by the soldiers on the side of the hill. On the king's side, no man of note was missing but Wellseta Michael, nephew of Ras Michael, whose horse falling, he was taken prisoner by Fasil, and carried off.

Now the whole army advanced at a very brisk pace, hooping and screaming, according to their custom, in a most harsh and barbarous manner, crying out *Hatsé Ali!* but Fasil, who saw the forward commencement of the king's troops, and that a few minutes would lay him under necessity of risking a battle, which he did not intend, withdrew his troops at a smart trot over the smooth downs, returning towards Bokkon Abba. This is what was called the battle of Linjour, from a village burnt by Ras Michael last campaign. The Ras, who saw that Fasil would not fight, easily penetrated his reasons; and no sooner was he gone, and his own drums silent, than he heard a negareet beat, and knew it to be that of Kella Yafous. His general encamped upon the river Awoley, leaving his tents and baggage under a proper guard, and had marched with the best and fiercest of his troops to join Michael before the engagement. All was joy at meeting; every rank of men joined in extolling the merit and conduct of their leaders.

Next day the army marched to Dingleber, a high hill, or rock, approaching to close to the lake as scarcely to leave a passage between. Upon the top of this rock is the king's house. As they arrived very early there, and were now out of Fasil's government, the king insisted upon treating Ras Michael and all the people of consideration. Unfortunately, however, when his majesty sat down to dinner, an accident happened that occasioned great repudiation among all his servants. A black eagle was chased into the king's tent by some of the birds of prey that hover about the camp; and it was after in the mouth of every one, that the king would be dethroned by a man of inferior birth and condition. Every body at that time looked to Fasil: the event proved the application false, though the omen was true. Powullen of Bengender was as low-born as Fasil, as great a traitor, but more successful, to whom the ominous presage pointed; and, though we cannot but look upon the whole as accident, it was but too soon fulfilled.

Two horsemen arrived at Dingleber, from Fasil, on the 29th, in the evening, clad in habits of peace, and without arms; they were known to be two of his principal servants, were grave, genteel, middle-aged men. They had an audience early after their coming, first of the Ras, then of the king. They said, and said truly, that Fasil had repulsed the Kelti, was encamped on the opposite side, and was not yet joined by Wellseta Yafous. Their errand was, to desire that the Ras might not fatigue his men by unnecessary hurrying on to Gondar, because he might rest assured of receiving no further molestation from Fasil their master, as he was on his march to Buré. They told the Ras the whole of the conspiracy, as he as it regarded him, and the agreement that Powullen and Gulho had made with their master to surround him at Dendera: they mentioned, moreover, how sensible Fasil was of their treason towards him; that, instead of keeping their word, they had let him to engage the king and the Ras's whole force, at a time when they knew the greatest part of his Galla troops were retired to the other side of the Nile, and could be assembled with difficulty: that if the Ras by chance had crossed at Delakus, as Kella Yafous had done, instead of embarrassing his army

among the rivers of Maittha, and crossing the Nile at that most dangerous place near Amlic-Obba (a passage never before attempted in the rainy season) the consequence would have been, that he must have either fought at great disadvantage with an inferior army against the Ras, or have retired to Metelakel, leaving his whole country to the mercy of his enemies. Fasil declared his resolution never again to appear in arms against the king, but that he would hold his government under him, and pay the accustomed taxes punctually: he promised also, that he would renounce all manner of connection with Gulho and Powullen, as he had already done, and that he would take the field against them next season with his whole force, whenever the king ordered him. The messengers concluded, with desiring the Ras to give Fasil his grand-daughter, Wellseta Selassé, in marriage, and that he would then come to Gondar without distrust or apprehension. Though the Ras did not believe all this, he made no difficulty in agreeing to every thing that they desired. He promised the grand-daughter; and, as earnest of his believing the rest, the king's two negareets were brought to the door of the tent, where, to the very great surprise of our travellers, they heard it proclaimed, "Fasil is governor of the Agow, Maittha, Gojam, and Damot; prosperity to him, and long may he live a faithful servant to the king our master!"—This was an extraordinary revolution in so small a space of time. It was scarce 43 hours since Fasil had laid a scheme for drowning the greater part of the army in the Nile, and cutting the throats of the residue on both sides of it; it was not twenty-four hours, since he had met them to fight in open field, and now he was become the king's lieutenant general in four of the most opulent provinces of Abyssinia. This was produced, however, by the necessity of the times, and both parties were playing at the same game, who should over-reach the other. Fasil's messengers were magnificently clothed, and it was first intended they should have gone back to him; but, after reflection, another person was sent, these two choosing to go to Gondar with the king, to remain hostages for Fasil's word, and to bring back his investiture from thence. Buré. Soon after this, they arrived at Gondar. Several of the great officers of state reached Gondar, and many others met them at Abba Samuel. The king would fain have persuaded Mr. Bruce to accompany him to Tigie, but this our traveller declined. He then advised Mr. Bruce to live entirely at Kalcum with the Iteghe, without going out, unless Fasil came to Gondar, and to send him a full account how he was treated. Upon this they parted with inexpressible reluctance.

Our traveller, much impressed with the peculiar kindness and condescension of this king, expatiates much in his favour. He was, however, like his countrymen, much addicted to superstition, and wayward, for ever, by ridiculous omens. He imagined Mr. Bruce competent in the talk of foretelling, especially when he talked with confidence of his speedy return—"Then" (says he, in an humble, complaining tone) "you, Yagoube, could tell me if you pleased, whether I shall or not return in safety, and what is to befall me: those instruments and those wheels, with which you are so constantly looking at the stars, can certainly be for no other use than prying into futurity." Mr. Bruce assured him, that these were only instruments to guide ships at sea and which all travellers required in order to mark the roads they take, that, being once traced, they might thus be made known to all mankind, and certified even to strangers. He further assured his majesty, that he was, like others, totally ignorant of the decrees of Providence, and that what made him speak of his return as certain, was merely from observations and the consequent reflections which he made, which were, in his opinion, more to be relied on than prophecies and divinations by stars.

B O O K I I.

C H A P T E R I.

Mr. Bruce's Second Journey to discover the Source of the Nile—An Interview with Fasil—His Character, &c.—Journey continued—They pass the Nile—Arrive at Goutto—Mountains of the Moon—Disimulation of Waddi—Bruce's Behaviour to him—A Reconciliation, &c.—Arrival at the Source of the Nile—Description thereof—Mr. Bruce's Reception among the Inhabitants—Their Character, Trade, &c. &c.

ON the 27th of October, Mr. Bruce prepared for his departure from Gondar. But, about twelve o'clock, he was told a message from Ras Michael had arrived with great news from Tigré. He went immediately to Koseam as fast as he could gallop, and found there Guebra Christos, a man used to bring the jars of bouza to Ras Michael at his dinner and supper; low men are always employed on such errands, that they may not, from their consequence, excite a desire of vengeance. The message that he brought was to order bread and beer to be ready for 30,000 men who were coming with the king, as he had just decamped from before the mountain Haramat, which he had taken, and put Za Menfus to the sword, with every man that was in it; this message struck the queen with such a terror that for the whole day after she was invisible.

They left Gondar on the 28th, passed the river Kahha, at the foot of the town, and reached Bamba, where Fasil was encamped on the 30th. Bamba is a collection of villages, in a valley now filled with soldiers. They went to the left with their guide, and got a tolerable house, but the door had been carried away. Fasil's tent was pitched a little below them, larger than the others, but without further distinction: it was easily known, however, by the lights about it; and by the nagaret, which still continued beating: he was then just alighting from his horse. Mr. Bruce immediately sent Ayto Aylo's servant, whom he had with him, to present his compliments, and acquaint him of his being on the road to visit him. He thought now all his difficulties were over: for he knew it was in his power to forward them to their journey's end; and his servants, whom he saw at the palace near the king, when Fasil was invested with his command, had assured Mr. Bruce, not only of an effectual protection, but also of a magnificent reception, if he chanced to find him in Mantla.

However, it was near eight at night of the 30th, before Mr. Bruce received a message to attend him. He repaired immediately to his tent, and after announcing himself, waited about a quarter of an hour before he was admitted; he was sitting upon a cushion with a lion's skin upon it, and another stretched like a carpet before his feet, and had a cotton cloth, something like a dirty towel, wrapped about his head; his upper cloak, or garment, was drawn tight about him over his neck and shoulders, so as to cover his hands. Mr. Bruce bowed, and went forward to kiss one of them, but it was so entangled in the cloth, that he was obliged to kiss the cloth instead of the hand. This was done either as not expecting he should pay him that compliment, as he certainly should not have done, being one of the king's servants, if the king had been at Gondar, or else it was intended for a mark of disrespect, which was very much of a piece with the rest of his behaviour afterwards. There was no carpet or cushions in the tent, and only a little straw, as if accidentally, thrown thinly about it. Mr. Bruce sat down upon the ground, thinking him sick, not knowing what all this meant; he looked stedfastly at our travellers, saying softly, in Amharic, "How do you do? Are you very well?" Mr. Bruce made the usual answer. There was only one old man present, who was sitting on the floor mending a mule's bridle. He took him at first for an attendant, but observing that a servant uncovered held a candle to him, he thought he was

one of his Galla; but then he saw a blue silk thread, which he had about his neck, which is a badge of Christianity all over Abyssinia, and which a Galla would not wear. Mr. Bruce was unable to conjecture what he was. Ayto Aylo's servant, who stood behind Mr. Bruce, now pushed him with his knee, as a sign that he should speak, which he accordingly began to do with some difficulty. Fasil's behaviour was exceedingly haughty and impertinent, and Mr. Bruce, in the course of conversation, was at last provoked, that his nose burst out in a stream of blood; and, that instant, Aylo's servant took hold of Mr. Bruce by the shoulder, to hurry him out of the tent. Fasil seemed to be a good deal concerned, for the blood streamed out in plenty; our traveller then returned to his tent, and the blood was soon stanch'd by washing his face with cold water. He now went to bed, and falling into a sound sleep, was waked near mid-night by two of Fasil's servants, who brought each of them a lean live sheep; they said they had brought the sheep, and were come to ask how Mr. Bruce was, and to stay all night to watch the house for fear of the thieves in the army; they likewise brought their master's order for him to come early in the morning to him, as he wanted to dispatch him on his journey before he gave the Galla liberty to return. This dispelled every doubt, but it raised his spirits so much, that, out of impatience for morning, he slept very little more that night.

Fasil, having sent for Mr. Bruce the next morning, invited him to partake of a great breakfast; honey and butter, and raw beef in abundance, as also some stewed dishes that were very good. He was very hungry, having tasted nothing since dinner the day before; and he had had much exercise of body as well as of mind. They were all very cheerful, every one saying something about the Agows, or of the Nile. Mr. Bruce, at last, thus addressed Fasil: "Your continual hurry, said he, all the times I have seen you, has put it out of my power till now to make you the acknowledgement it is ordinary for strangers to present when they visit great men in their own country, and ask favours of them." Mr. Bruce then took a napkin, and opened it before him; he seemed to have forgotten the present altogether; but from that moment he saw his countenance changed, he was like another man. "O Yagoube, said he, a present to me! you should be sensible that is perfectly needless; you were recommended to me by the king and the Ras; you know we are friends, and I would do twenty times as much for yourself, without recommendation from either; besides, I have not behaved to you like a great man." It was not a very hard thing to conquer these scruples; he took the several pieces of the present one by one in his hands, and examined them; there was a crimson silk sash, made at Tunis, about five yards long, with a silk lining of the same colour; it was as beautiful a web of silk as ever Mr. Bruce saw; it had a small waved pattern wrought in it; the next was a yellow, with a red narrow border, or stripe, and a silver wrought fringe, but neither so long nor thick as the other; the next were two Cyprus manufactured sashes, silk and cotton, with a satin stripe, the one broader than the other, but five yards long each; the next was a Persian pipe, with a long pliable tube, or worm, covered with Turkey leather, with an amber mouth piece, and a crystal vase for smoking tobacco through

Description thereof—Mr.*

I saw a blue silk thread, which is a badge of a, and which a Galla was unable to conjecture's servant, who flooded him with his knee, which he accordingly. Fasil's behaviour impertinent, and Mr. fation, was at last profusion in a stream of blood; want took hold of Mr. rry him out of the tent, cal concerned, for the our traveller then reood was soon slouched water. He now went ound sleep, was waked's servants, who brought ep; they said they had come to ask how Mr. ight to watch the foudle army; they likewise for him to come early in ented to dispatch him on the Galla liberty to re doubt, but it raised hi impatience for morning, ight.

Bruce the next morning, eat bre akfast; honey and abundance, as also some y good. He was very gence dinner the day ch exercise of body as all very cheerful, every the Agows, or of the thus addressed Fasil: he, all the times I have power till now to make is ordinary for strangers eat men in their own hem." Mr. Bruce then before him; he seemed t altogether; but from untenantance changed, he Yagoube, said he, a sensible that is perfect. ended to me by the king e friends, and I would ourself, without reles, I have not behav. t was not a very hand est he took the leveral me in his hands, and eximon his faith, made a g, with a silk lunge of cantinal a web of silk a small waved pattern yellow, with a red nar silver wrought fen as the others; the next fathes, silk and cre one broader than the by the next was a P. rials, or worm, covered an amber mouth piece, taking tobacco through water,

water, a great luxury in the eastern countries; the next were two blue bowls, as fine as the one he had just then broken, and of the same sort. Fasil folded up the napkin with all the articles, and gave them to an officer: after which the tent was again cleared for consultation; and, during this time, he had called his man of confidence, whom he was to send with us, and instructed him properly. Mr. Bruce plainly saw that he had gained the ascendancy; and, in the expectation of Ras Michael's speedily coming to Gondar, he was as willing to be on his journey the one way, as he was the other. "Friend Yagoube, said Fasil, I am heartily sorry that you did not meet me at Bure before I set out; there I could have received you as I ought; but I have been tormented with a multitude of barbarous people, who have turned my head, and whom I am now about to dismiss. I go to Gondar in peace, and to keep peace there, for the king on this side the Tacazzé has no other friend than me; Powulihen and Gisho are both traitors, and so Ras Michael knows them to be. I have nothing to return you for the present you have given me, for I did not expect to meet a man like you here in the fields; but you will quickly be back; we shall meet on better terms at Gondar; the head of the Nile is near at hand; a horse-man, express, will arrive there in a day. I have given you a good man, well known in this country to be my servant; he will go to Geelh with you, and return you to a friend of Ayto Axlo's and mine, Shalaka Welled Amlat; he has the dangerous part of the country wholly in his hands, and will carry you safe to Gondar; my wife is at present in his house; fear nothing, I shall answer for your safety: when will you set out? to-morrow?" Mr. Bruce replied, with many thanks for his kindness, that he wished to proceed immediately, and that his servants were already far off, on their way. Hereupon Fasil addressed Mr. Bruce, "Throw off those clothes; they are not decent; I must give you new ones, you are my vassal. The king granted you Geelh, where you are going, and I must invest you." A number of Fasil's servants then hurried him out; our traveller presently threw off his trowsers, and his two upper garments, and remained in his waistcoat; these were presently replaced by new ones, and he was brought back in a minute to Fasil's tent, with only a fine loose muslin under garment or cloth around him, which reached to his feet. Upon his coming back to the tent, Fasil took off the one that he had put on himself new in the morning, and put it about Mr. Bruce's shoulders with his own hand, his servants throwing another immediately over him, saying at the same time to the people, "Bear witness, I give to you, Yagoube, the Agow Geelh, as fully and freely as the king has given it me." Mr. Bruce bowed and kissed his hand, as is customary for feudatories, and he then pointed to him to sit down.

"Hear what I say to you, continued Fasil, I think it right for you to make the bell of your way now, but it will be the sooner back at Gondar. You need not be alarmed at the wild people who are going after you, though it is better to meet them on your way, than when they are getting to their homes; they are commanded by Welletta Yalous, your friend, and is very grateful for the me comes you sent him at Gondar: he has not been able to let you, being too much busied with those wild people; but he loves you, and will take care of you, and I must give you more of that physic when we meet at Gondar. Mr. Bruce bowed and continued—"It is me that I say; you know seven people (our traveller never saw more) that like Fasil in his life,—these are all leaders and chiefs of the Galla savages, as you please; they are all your brethren. You may go through their country as if it were your own, without a man hurting you; you will soon relate to them all; for it is their custom to be a stranger of distinction, like you, when he is quarrell, sleeps with the filler, daughter, or near relation of the principal men among them. I dare

say, you will not think the customs of the Galla contain greater hardships than those of Amhara." He then jabbered something to them in Galla, which Mr. Bruce did not understand. "When Ras Michael, continued Fasil, came from the battle of Faguta, the eyes of forty-four brethren and relations of these people present were pulled out, at Gondar, the day after he arrived, and they were exposed upon the banks of the river Angrab to starve, where most of them were devoured by the hyænas; you took three of them up to your house; nourished, clothed, protected, and kindly treated them." "They are now in good health, said Mr. Bruce, and want nothing; the Itgehé will deliver them to you. The only other thing I have done to them was, I got them baptised: I do not know if that will dispense them; I did it as an additional protection to them, and to give them a title to the charity of the people of Gondar." "As for that, said Fasil, they do not care the least about baptism; it will neither do them good nor harm, they do not trouble themselves about these matters; give them meat and drink, and you will be very welcome to baptise them all from morning to night; after such good care these Galla are all your brethren, they will die for you before they see you hurt." After some further conversation, Fasil turned about to his seven chiefs, who all got up, himself, Mr. Bruce, and his companions; they stood round in a circle, and raised the palm of their hands, while he and his Galla together repeated a prayer about a minute long; the Galla seeming with great devotion. "Now, said Fasil, go in peace, you are a Galla; this is a curse upon them, and their children, their corn, grass, and cattle, if ever they lift their hand against you or yours, or do not defend you to the utmost, if attacked by others, or endeavour to defeat any design they may bear is intended against you." Upon this, Mr. Bruce offered to kiss his hand before he took his leave, and they all went to the door of the tent, where there was a very handsome grey horse bridled and saddled. "Take this horse, said Fasil, as a present from me; it is not so good as your own, but depend upon it, it is the horse which I rode upon yesterday, when I came here to encamp; but do not mount it yourself, drive it before you saddled and bridled as it is; no man of Maittha will touch you when he sees that horse; it is the people of Maittha, whose houses Michael has burnt, that you have to fear, and not your friends the Galla. Mr. Bruce then took the most humble and respectful leave of him possible, and also of his new-acquired brethren, the Galla, praying inwardly he might never see them again. Mr. Bruce then turning to Fasil, according to the custom of the country to superiors, asked him leave to mount on horseback before him, and was speedily out of sight.

November the 2d, they pursued their journey in a direction southward, and passed the church of Boskou Abbo; ever memorable to them, as being the station of Fasil in May, when he intended to cut them off after their passage of the Nile. At three quarters after ten in the morning, they passed the final river Awooli, which either gives its name to, or receives it from, the district through which it passes; it falls into the Nile about four miles below; is a clear, small, brisk stream; its banks covered with verdure not to be described. All the lush territory of Awooli is by much the most pleasant that our traveller had been in Abyssinia, perhaps it is equal to any thing the east can produce; the whole is finely shaded with acacia trees, which, in the sultry parts of Africa, produce the Arabian gum. These trees grow seldom above fifteen or sixteen feet high, then flatten and spread wide at the top, and touch each other, while the trunks are far asunder, and under a vertical sun, leave you, many miles together, a free space to walk in a cool, delicious shade.

Having passed the Atlas, and several villages belonging to Goutto, they had, for the first time, a distinct view of the high mountain of Geelh, the long-

wilted for end of their dangerous and troublesome journey. Under this mountain are the fountains of the Nile; about thirty miles, as near as they could conjecture in a straight line, without counting the deviations or crookedness of the road. At two o'clock in the afternoon of the second of November, they came to the banks of the Nile; the passage is very difficult and dangerous, the bottom being full of holes made by considerable springs, light sinking sand, and, at every little distance, large rocky stones; the eastern side was muddy and full of pits, the ground of clay; the Nile here is about 260 feet broad, and very rapid; its depth about four feet in the middle of the river, and the sides not above two. Its banks are of a very gentle, easy descent; the western side is chiefly ornamented with high trees of the saxe, or willow tribe, growing straight, without joints or knots, and bearing long pointed pods full of a kind of cotton.

When they had passed the Nile, they arrived at Gouto, the village so called, and took up their lodgings in the house of a considerable person, who had abandoned it upon their approach, thinking them part of Falil's army. Though this habitation was of use in protecting them from the poor, yet it hurt them by alarming, and so depriving them of the assistance of the opulent, such as the present owner, who, if he had known they were strangers from Gondar, would have willingly heard and entertained them, but a relation and friend of Shalaka Weiled Amdae.

Having heard distinctly the noise of the cataract, and having till a full hour and a half of light, Mr. Bruce determined to visit the water fall, lest he should be thereby detained the next morning. Being well-armed, Mr. Bruce set out for the cataract; and, after riding through a plain, hard country, in some parts very stony, and thick covered with trees, in some things more than half an hour's easy galloping all the way, they came straight to the cataract, conducted thereto by the noise of the fall. This, known by the name of the First Cataract of the Nile, did not by its appearance come up to the idea they had formed of it, being scarce fifteen feet in height, and about fifty yards over; but in many places the sheet of water is interrupted, and leaves great intervals of rock. The sides are neither so woody nor verdant as those of the cataract of the Amar; and it is in every respect magnificent, or deserving to be seen, than is the noble cataract at Alata before described, erroneously called the Second Cataract. Mr. Bruce, having finished his curiosity at this cataract, galloped back the same road that he had come, without having seen a single person here he left Gouto.

Early on the 3d of November, they left the village of Gouto, and continued, for the first part of the day, through a plain country full of acacia trees. They resumed their journey from thence, and at length arrived at a triple ridge of mountains, the first one rising behind the other, nearly in form of three concentric circles, which seemed to suggest an idea, that they are mountains of the moon, or the *Montes Lunae* of antiquity, at the foot of which the Nile was said to rise; in fact, there are no others. These mountains are all of them excellent soil, and every where covered with fine pasture; but as this unfortunate country had been for ages the theatre of war, the inhabitants have only ploughed and sown the top of the mountain to the reach of enemies or marching armies; in the middle of the mountain are villages built on a white fort of galls, which makes them conspicuous at a great distance; the bottom is all grass, where their cattle feed continually under their eye; they, upon any alarm, they drive up to the top of the mountains out of danger.

When they arrived at the top of the mountain, they had a distinct view of all the remaining territory of Socala, the mountain Geeth, and church of St. Michael Geeth, about a mile and a half distant from St. Michael Socala, where they then were. They saw immediately below them, the Nile itself strangely diminished in size, and now only a brook

that had scarcely water to turn a mill. Mr. Bruce was now interrupted in his observations, by an alarm that they had lost Wollo their guide. Though Mr. Bruce had long expected something from his behaviour, he did not think, for his own sake, it could be his intention to leave them. Various conjectures immediately followed; some thought he had resolved to betray and rob them; some conceived it was an instigation of Lab's to him, in order to their being treacherously murdered; some again supposed he was slain by the wild beasts, especially those apes or baboons, whose voracity, ferocity, and fierce appearance, were exceedingly magnified. Mr. Bruce began to think, that he might be ill, for he had before complained, and that the sickness might have overcome him upon the road; and this, too, was the opinion of Ayto Ayo's servant, who said, however, with a significant look, that he could not be far off; they, therefore, sent him, and one of the men that drove the mules, back to look after him; and the other had gone but a few hundred yards when they found him coming, but so dejected and so very ill, that he said he could go no further than the church, where he was positively resolved to take up his abode that night. Mr. Bruce felt his pulse, examined every part about him, and saw, he thought, evidently, that nature ailed him. Without losing his temper, however, Mr. Bruce told him firmly, that he perceived he was in a condition, that he should consider he was a physician, as he knew he cured his master's first friend, Wollo Yalons; that the feeling of his hand told him as plain as his tongue could have done, that nothing ailed him; that it told him likewise he had in his heart a sprank to play, which would turn out very much to his disadvantage. He seemed dismayed after this, said little, and only desired them to halt for a few minutes, and he should be better; "for, Ayto Ayo, requires strength in us all to pass another great hill before we arrive at Geeth."

"Lying, said Mr. Bruce, is no purpose; I know where Geeth is as well as you do, and that we have no more mountains or bad places to pass through; therefore, if you choose to stay behind, you may; but to-morrow I shall inform Wollo Yalons at Dire of your behaviour." He said this with the most determined air possible, and left them, walking as hard as he could down to the ford of the Nile. Wollo remained above with the servants, who were loading their mules; he seemed to be perfectly cured of his lameness, and was in close conversation with Ayto Ayo's servant for about ten minutes, when Mr. Bruce did not choose to interrupt, as he felt that man was already in possession of part of Wollo's secret. This being over, they all came down to Mr. Bruce as he was hitching a branch of a yellow-bark tree, a number of which hang over the ford. The whole company passed, and Wollo, seeming to do as well as ever, ascended a gentle rising hill, near the top of which is St. Michael Geeth. The Nile here is not four yards over, and not above four inches deep, where they crossed; it was indeed become a very trifling brook, but ran swiftly over a bottom of small stones, with hard black rock appearing about them; it is at this place very easy to pass, and very limpid, but, a little lower, full of inconsiderable falls, the ground rises gently from the river to the southward, full of small hills and eminences, which soon ascend and descend almost imperceptibly. The whole company had halted on the north side of St. Michael's church, and there Mr. Bruce reached them without affecting any hurry.

In the afternoon, about four o'clock, the day having been very hot for some hours, they were sitting in the shade of a grove of magnificent cedars, intermixed with some very large and beautiful eucalyptus, all in the flower; the men were lying on the grass, and the beasts lay, with the burdens on their backs, on the most luxuriant herbage. Mr. Bruce said indifferently to Wollo, in passing, that he was glad to see him recovered; that he would presently be well,

ce, is to no purpose. I
 ll as you do, and that we
 or had places to pass
 choose to flay behind you
 I inform Wellela Yabou
 ." He said this with de-
 e, and left them, walking
 to the ford of the Nile.
 h the servants, who were
 nted to be perfectly curi-
 a close conversation was
 about ten minutes, when
 e to interrupt, as he had
 the session of part of Woldo
 they all came down to Mr.
 a branch of a yellow-ro-
 over the ford. The
 Woldo, seeming to
 gently rising hill, near
 d Geeth. The Nile here
 d not above four paces
 it was indeed become
 a swiftly over a bottom of
 k rock appearing and
 ously easy to pass, and
 all of inconsiderable height
 the river to the four-
 and eminences, which you
 imperceptible. The whole
 south side of St. Michael's
 ce reached them without

four o'clock, the day hav-
 hours, they were sitting
 magnificent cedars, mag-
 and beautiful cuso-trees,
 were lying on the grass,
 burdens on their backs,
 age. Mr. Bruce said no-
 thing, that he was glad to
 would precisely be well,
 and

and should fear nothing. He then got up, and de-
 scended to speak with Mr. Bruce alone, taking Aylo's
 servant along with him. "Now, said our traveller
 very calmly, I know by your face you are going to
 tell me a lie. I do swear to you solemnly, you
 shall never, by that means, obtain any thing from
 me, no not to much as a good word; truth and
 good behaviour will get you every thing; what ap-
 pears a great matter in your sight is not perhaps
 of such value in mine; but nothing except truth and
 good behaviour will answer to you; now I know for
 a certainty that you are no more sick than I am."—
 "Sir, said he, with a very confident look, you are
 right; I did counterfeit; I neither have been, nor
 am, I at present any way out of order, but I thought
 it best to tell you to, not to be obliged to discover
 another reason that has much more weight with me
 why I cannot go to Geeth. Much less flew myself
 at the sources of the Nile, such I confess are not
 much beyond it, though I declare to you there is
 still a hill between you and those fountains."—
 "And pray, said Mr. Bruce calmly, what is this mighty
 reason? Have you had a dream, or a vision in that
 trance you fell into when you lagged behind below
 the church of St. Michael Sacala?" "No, says he,
 neither I saw, nor dream, nor devil neither; I
 wish it was no worse; but you know as well as I, that
 my master Fahl defeated the Agows at the battle of
 Bejpa. I was there with my master, and killed several
 men, among whom some were of the Agows of this
 village Geeth, and you know the usage of this coun-
 try, when a man, in these circumstances, falls into
 their hands, his blood must pay for their blood."
 Upon this Mr. Bruce burst out into a violent fit of
 laughter, which very much disconcerted him. "There,
 said our traveller, did not I say to you it was a lie that
 you were going to tell me? Do not think I dislike
 or dispute with you the vanity of having killed men;
 many men were slain at that battle; somebody must
 and you may have been the person who slew them;
 but do you think that I can believe that Fahl, so deep
 in that account of blood, could rule the Agows in
 the manner he does, if he could not put a servant of
 his in safety among them 20 miles from his residence;
 do you think I can believe this?" "Come, come,
 said Aylo's servant to Woldo, did you not hear that
 truth and good behaviour will get you every thing
 you ask? Sir, continued he, I see this affair vexes
 you, and what this foolish man wants will neither
 make you richer nor poorer; he has taken a great
 care for that crimson silk-fash which you wear about
 your middle. I told him to flay till you went back
 to Gondar; but he says he is to go no further than to
 the house of Shalaka Welled Amiac in Martha, and
 does not return to Gondar; I told him to flay till
 you had put your mind at ease, by seeing the foun-
 tain of the Nile, which you are so anxious about.
 He said, after that had happened, he was sure you
 would not give it him, for you seemed to think little
 of the cascade at Goutto, and of all the fine rivers
 and churches which he had shewn you; except the
 head of the Nile shall be finer than all these, when
 in reality, it will be just like another river, you will
 then be disappointed, and not give him the fash."

Our traveller thought there was something very
 natural in these suspicions of Woldo; besides, he said
 he was certain that, if ever the fash came into the
 sight of Welled Amiac, by some means or other, he
 would get it into his hands. This rational discourse
 had pacified Mr. Bruce a little; but it must have been
 fine indeed to have flood for a minute between him
 and the accomplishment of his wishes. Mr. Bruce
 then laid his hand upon the pistols that stuck in his
 girdle, and drew them out to give them to one of his
 lute, when Woldo, who apprehended it was for ano-
 ther purpose, ran some paces back, and hid himself
 behind Aylo's servant. Mr. Bruce, after having
 taken off his fash, gave it to him, but threatened him
 hard in case he detected him in any further tricks.

Woldo took the fash, but seemed terrified at the

threat, and began to make apologies. He then car-
 ried our traveller round to the fourth side of the
 church, out of the grove of trees that surrounded it.
 "This is the hill, said he, that, when you were on
 the other side of it, was between you and the foun-
 tains of the Nile; there is no other; look at that
 hillock of green sod in the middle of that watery spot,
 it is in that the two fountains of the Nile are to be
 found: Geeth is on the face of the rock where you
 green trees are; if you go the length of the foun-
 tains, pull off your shoes as you did the other day;
 for these people are all Pagans, worse than those that
 were at the ford, and they believe in nothing that
 you believe, but only in this river, to which they
 pray every day as if it were God; but this perhaps
 you may do likewise." Half undressed as Mr. Bruce
 was, by loss of his fash, and throwing his shoes off,
 he ran down the hill towards the little island of green
 sods, which was about two hundred yards distant;
 the whole side of the hill was thick grown over with
 flowers, the large bulbous roots of which appearing
 above the surface of the ground, and their stems
 coming off on treading upon them, occasioned two
 very severe falls before he reached the brink of the
 marsh. Mr. Bruce, after this, came to the island of
 green turf, which was in form of an altar, apparently
 the work of art, and he stood in rapture over the
 principal fountain which rises in the middle of it.
 The situation of Mr. Bruce's mind at present may be
 easier conceived than expressed.

Now Mr. Bruce proceeds to describe the sources
 of the Nile, which have, as he says, remained to our
 days as unknown as they were to antiquity, no good
 or genuine voucher having yet been produced ca-
 pable of proving that they were before discovered,
 or seen by the curious eye of any traveller, from
 the earliest ages to this day; and it is with confidence
 Mr. Bruce proposes to his reader, that he will con-
 sider him as still standing at these fountains, and pa-
 tiently hear from him the recital of the origin and
 circumstances of this the most famous river in the
 world, which are not to be found in books, or from
 any other human authority whatever, and which, by
 the care and attention he has paid to the subject, will,
 he hopes, be found satisfactory here.

The Agows of Damot pay divine honors to the
 Nile; they worship the river, and thousands of cat-
 tle have been offered, and still are offered, to the
 spirit supposed to reside at its source. They are di-
 vided into clans, or tribes; and it is worthy of obser-
 vation, that it is said there never was a feud, or he-
 reditary animosity between any two of these clans;
 or, if the seeds of any such were sown, they did not
 vegetate longer than till the next general convoca-
 tion of all the tribes, who meet annually at the source
 of the river, to which they sacrifice, calling it by the
 name of the *God of Peace*. One of the least con-
 siderable of these clans, for power and number, has
 still the preference among its brethren, from the cir-
 cumstance that, in its territory, and near the miser-
 able village that gives it name, are situated the much
 fought-for springs from which the Nile rises.

Though Geeth is not further distant from these than
 600 yards, yet it is not in sight of the sources of the
 Nile. The country upon the same plain with the
 fountains, terminates in a cliff about 300 yards deep
 down to the plain of Affoa, which flat country con-
 tinues in the same subaltern degree of elevation, till
 it meets the Nile again about seventy miles south-
 ward, after it has made the circuit of the provinces
 of Gojam and Damot.

There is a prodigious cave in the middle of this
 cliff, in a direction straight north towards the foun-
 tains; there are many bye-paths in it, so that it is
 very difficult for a stranger to extricate himself; it is
 a natural labyrinth, large enough to contain the in-
 habitants of the village, and their cattle. In this
 large cliff, Mr. Bruce tired himself part of several
 days, endeavouring to reach as far northward as pos-
 sible; but the air, when he had advanced something
 above

above one hundred yards, seemed to threaten to extinguish his candle by its dampness, and the people were beside it at all disposed to gratify his curiosity further, after assuring him that there was nothing at the end more remarkable than what he then saw, which he had reason to believe was the cave. The face of this cliff, which fronts to the south, has a most picturesque appearance from the plain of Aloa below, parts of the houses at every stage appearing, through the thickets of trees and bushes with which the whole face of the cliff is thickly covered; impenetrable fences of the very worst kind of thorn, hide the mouths of the caverns above mentioned, even from sight; there is no other communication with the houses, either from above or below, but by narrow winding sheep-paths, which through these thorns are very difficult to be discerned, for all are allowed to be overgrown with the utmost wildness, as a part of their defence; lofty and large trees, most of them of the thorny kind, tower high up above the edge of the cliff, and seem to be a fence against people falling down into the plain; these are all at their proper season covered with flowers of different sorts and colours, so are the bushes below on the face of the cliff; every thorn in Abyssinia bears a beautiful flower. From the edge of the cliff of Geesh, above where the village is situated, the ground slopes with a very easy descent due north, and lands you at the edge of a triangular marsh above eighty six yards broad, in the line of the fountains, and two hundred and eighty-six yards two feet from the edge of the cliff above the house of the priest of the river, where Mr. Bruce lived. In the middle of the marsh, near the bottom of the mountain of Geesh, arises a hillock of a circular form, about three feet from the surface of the marsh itself, though apparently founded much deeper in it. The diameter of this is something short of twelve feet, it is surrounded by a shallow trench, which collects the water, and voids it eastward; it is firmly built with sod or earthen turf, brought from the sides, and constantly kept in repair, and this is the altar upon which all their religious ceremonies are performed. In the middle of this altar is a hole, obviously made, or at least enlarged, by the hand of man. It is kept clear of grass, or other aquatic plants, and the water in it is perfectly pure and limpid, but has no ebullition or motion of any kind discernible upon its surface. This mouth, or opening of the source, is some parts of an inch less than three feet diameter, and the water stood at that time, the 5th of November, about two inches from the lip or brim, nor did it either increase or diminish during all the time of his stay at Geesh, though they made plentiful use of it. This spring is about six feet six inches deep. At the distance of ten feet from the first of these springs, a little to the west of south, is the second fountain, about eleven inches in diameter; but this is eight feet three inches deep. And about twenty feet distant from the first, is the third source, its mouth being something more than two feet large, and it is five feet eight inches deep. Both these last fountains stand in the middle of small altars, made, like the former, of firm sod, but neither of them above three feet diameter, and having a foot of less elevation than the first. The altar in this third source seemed almost dissolved by the water, which in both stood nearly up to the brim; at the foot of each appeared a clear and brisk running rill; these uniting, joined the water in the trench of the first altar, and then proceeded directly out, pointing eastward, in a quantity that would have filled a pipe of about two inches diameter. The water from these fountains is very light and good, and perfectly tasteless; it was at this time most intensely cold, though exposed to the mid day without shelter, there being no trees nor bushes nearer it than the cliff of Geesh on its south-side, and the trees that surround Saint Michael Geesh on the north, which, according to the custom of Abyssinia, is, like other churches, planted in the midst of a grove.

Mr. Bruce had procured from the English ships, while at Jidda, some quick-silver, perfectly pure and heavier than the common sort; warming, therefore, the tube gently at the fire, he filled it with this quick-silver, and, to his great surprise, found that the Nile stood at the height of 22 English inches. Suspecting that some air might have infiltrated itself into the tube, he laid it by in a warm part of the tent, covered till morning, and returning to bed, slept there profoundly till six, when, satisfied the whole was in perfect order, he found it to stand at 22 English inches; neither did it vary sensibly from that height any of the following days he staid at Geesh; and thence he inferred, that at the sources of the Nile, he was then more than two miles above the level of the sea; a prodigious height, to enjoy a sky perpetually clear, as also a hot sun never over-cast for a moment with clouds from rising to setting. The Nile, keeping nearly in the middle of the marsh, runs east for thirty yards, with a very little increase of stream, but perfectly visible, till met by the grassy brink of the land declining from Sacala. This turns it round gradually to the S. E. and then due north; and, in the two miles it flows in that direction, the river receives many small contributions from springs that rise in the banks on each side of it: there are two, particularly one on the hill at the back of St. Michael Geesh, the other a little lower than it on the other side, on the ground declining from Sacala. These last mentioned springs are more than double its quantity: and being arrived upon the hill whereon stands the church of Saint Michael Sacala, about two miles from its source, it there becomes a stream that would turn a common mill, shallow, clear, and running over a rocky bottom about three yards wide. Nothing can be more beautiful than this spot: the small rising hills about them were all thick covered with verdure, especially with clover, the largest and best he ever saw; the tops of the heights crowned with trees of a prodigious size; the stream, at the banks of which they were sitting, was limpid and pure as the finest crystal; the ford, covered thick with a bushy kind of tree that seemed to affect to grow to no height, but thick with foliage and young branches, rather to court the surface of the water, whilst it bore, in prodigious quantities, a beautiful yellow flower, not unlike a single wild rose of that colour, but without thorns.

Mr. Bruce after having leaped over the ford fifty times, observed it no larger than a common mill stream. The Nile, from this ford, turns to the westward, and after running over loose stones occasionally, in that direction, about four miles farther, the angle of inclination increasing greatly, broken water, and a fall commences of about six feet, and thus it gets rid of the mountainous place of its nativity, and issues into the plain of Goutto, where is its first cascade. Arrived in the plain of Goutto, the river seems to have lost all its violence, and scarcely is seen to flow; but, at the same time, it there makes so many sharp, unnatural windings, that it differs from any other river Mr. Bruce ever saw, making about twelve sharp angular peninsulas in the course of five miles, through a bare, marshy plain of clay, quite destitute of trees, and exceedingly inconvenient and unpleasant to travel. After passing this plain, it turns due north, receives the tribute of many small streams, the Gometti, the Googeri, and the Kebezza, which descend from the mountains of Alornatha; and, united, fall into the Nile about twenty miles below its source; it begins here to run rapidly, and again receives a number of beautiful rivulets, which have their rise in the heights of Litchambara, the semicircular range of mountains that pass behind, and seem to enclose Alornatha. Here it begins to become a considerable stream; its banks high and broken, covered with old timber trees for the space of about three miles; it inclines to the north-east, and winds exceedingly, and is then joined by the small river Diwa from the east. As the mere names of places, through which the Nile passes, can afford

from the English ships, silver, perfectly pure; and, warning, therefore, he filled it with this at surprise, found that it had 22 English inches, and was infuanted itself a warm part of the tent, returning to bed, slept, satisfied the whole of it to hand at 22 English inches from that as he laid at Geeth; at the sources of the Nile, two miles above the height, to enjoy a sky not fun never overcast rising to setting. The middle of the marsh, was very little increase of till met by the grass on Sacala. This turns, and then due north; in that direction, the distributions from Springs side of it: there are two, the back of St. Michael's than it on the other from Sacala. There is than double its quantity the hill whereon stands Sacala, about two miles, as a stream that would clear, and running over yards wide. Nothing is spot; the small rising covered with verdure, green and hinc it ever crowned with trees of a at the banks of which and pure as the finest tick with a bushy kind to grow to no height, ng branches, rather to which it bore, in pro- yellow flower, not un- our, but without them. ped over the ford fifty than a common mid ford, turns to the well- loose stones occasion- four miles further, the greatly, broken water, t six feet, and thus it ce of its nativity, and where is its first cas- Goutto, the river seems and scarcely is seen to t there makes so many t it differs from any t, making about twenty e course of five miles, of clay, quite destitute onvenient and unplea- this plain, it turns due many small streams, the of the Kebezza, when of Atornaltha; and, ut twenty miles below un rapidly; and again niful rivulets, which s of Litchambara, the aims that pass behind, a. Here it begins to t; its banks high and ber trees for the space nes to the north-east, s then joined by the . As the mere names Nile passes, can afford

very little amusement to our readers, we shall only observe, that it empties itself at last into the Mediterranean.

All this while Woldo was left settling their reception with the chief of the village of Geeth. They found the measures taken by this man such as convinced them at once of his capacity and attachment. The miserable Agows, assembled all around him, were too much interessed in the appearance our travellers made, not to be exceedingly inquisitive how long their stay was to be among them. They saw, by the horse driven before them, that they belonged to Fahl, and suspected, for the same reason, that they were to maintain them, or in other words, that they should live at discretion upon them as long as they chose to tarry there; but Woldo, with great address, had dispelled those fears almost as soon as they were formed. He informed them of the king's grant to Mr. Bruce of the village of Geeth; that Fahl's tyranny and avarice would end that day, and another master, like Negadé Ras Georgis, was come to pass a cheerful time among them, with a resolution to pay for every labour they were ordered to perform, and purchase all things for ready money: he added, moreover, that no military service was farther to be exacted from them, either by the king or governor of Damot, nor from their present master, as he had no enemies. They found this news had circulated with great rapidity, and they met with a hearty welcome upon their arrival at the village. Woldo had asked a house from the Shum, who very civilly had granted Mr. Bruce his own; it was just large enough to serve him, but they were obliged to take possession of four or five others, and they were freely settled in them, when a Levant arrived from Fahl to intimate to the Shum his surrender of the property and sovereignty of Geeth to Mr. Bruce, in consequence of a grant from the king; he brought with him a fine, large, milk-white cow, two sheep, and two goats; the sheep and goats Mr. Bruce understood were from Woleta Yalons. Fahl also sent them six jars of hydromel, fifty wheat loaves of very excellent bread, and to this Woleta Yalons had added two middle sized horns of excellent strong spirits. Their hearts were now perfectly at ease, and they passed a very merry evening. Woldo, who had done his part to great perfection, and had reconciled the minds of all the people of the village to our travellers, had a little apprehension for himself, he thought he had lost credit with Mr. Bruce, and therefore employed the servant of Ayto Aylo to desire Mr. Bruce not to speak of the sale to Fahl's servant. Our traveller allured him, that, as long as he saw him acting properly, as he now did, it was much more probable he should give him another sale on their return, than complain of the means he had used to get this sale. This entirely removed all his fears, and, indeed, as long after as he was with them, he every day delivered their commendations more and more.

Now Woldo was perfectly nappy; he had no superior or spy over his actions; he had explained himself to the Shum, that they should want somebody to buy necessaries to make bread for our travellers, and to take care of the management of their house. They displayed their seller articles for barter to the Shum, and told him the most considerable purchases, such as oxen and sheep, were to be paid in gold. He was struck with the appearance of our traveller's wealth, and the generosity of their proposals, and told Woldo that he filled, since they were in his houses, they would take his daughters for their housekeepers. The proposal was a most reasonable one, and readily accepted. He accordingly sent for three in an instant, and they delivered them their charge. The eldest took it upon her readily; she was about sixteen years of age, of a stature above the middle size, but she was remarkably genteel, and, colour apart, her features would have made her a beauty in any country in Europe; she was, besides, very sprightly; they understood not one word of her language,

though she comprehended very easily the signs that they made. This nymph of the Nile was called by nick-name Irepone, which signifies some animal that destroys mice, but whether of the ferret or snake kind, Mr. Bruce could not perfectly understand; sometimes it was one, and sometimes another, but which it was he thought of no great consequence.

Having disposed of some of their stock in purchases, she thought herself obliged to render our travellers an account, and give back the residue at night to Woldo, with a protestation that she had not stolen or kept any thing to herself. Mr. Bruce looked upon this regular accounting as an ungenerous treatment of their benefactress. Mr. Bruce called on Woldo, and made him produce a parcel that contained the same with the first commodities they had given her; and this consisted of beads, antimony, small scissors, knives, and large needles. He then brought out a packet of the same that had not been broken, and told her, they were intended to be distributed among her friends, and that they expected no account from her; on the contrary, that, after she had bestowed these, to buy them necessaries, and for any purposes she pleased, he had still as many more to leave her at parting, for the trouble she had given herself. Mr. Bruce often thought the head of the little savage would have been turned with the possession of so much riches, and so great confidence; and it was impossible to be so blinded, as not to see that our traveller had already made great progress in her affections.

The houses being all clay and straw, there was no place for fixing his clock; he was therefore obliged to employ a very excellent watch made for him by Ellicott. The dawn now began, and a few minutes afterwards every body was at their doors; every one crowded to see them, and they breakfasted in public with very great cheerfulness. The white cow was killed, and every one was invited to his share of her. The Shum, priest of the river, would likewise have been of the party, but he declined either sitting or eating with them, though his sons were not so scrupulous.

Once a year, upon their principal fountain and altar, on the last appearance of the dog-star, or, as others say, eleven days after, this priest assembles the heads of the clans; and having sacrificed a black heifer that never bore a calf, they plunge the head of it into this fountain, they then wrap it up in its own hide, so as no more to be seen, after having sprinkled the hide within and without with water from the fountain. The carcase is then split in half, and cleaned with extraordinary care; and, thus prepared, it is laid upon the hillock over the first fountain, and washed all over with its water, while the elders, or considerable people, carry water in their hands joined (it must not be in any dish) from the two other fountains; they then assemble upon the small hill a little west of St. Michael (it used to be the place where the church now stands) there they divide the carcase into pieces corresponding to the number of the tribes, and each tribe has its privilege, or pretensions, to particular parts, which are not in proportion to the present consequence of the several clans. Geeth has a principal share, though the most inconsiderable territory of the whole; Sacala has the next; and Zeegam, the most considerable of them all in power and riches, has the least of the whole. After having ate this carcase raw, according to their custom, and drunk the Nile water, to the exclusion of any other liquor, they pile up the bones on the place where they sit, and burn them to ashes. This used to be performed where the church now stands; but Ras Sela Chrillos, some time after, having beaten the Agows, and desirous, at the Jesuits instigation, to convert them to Christianity, he demolished their altar where the bones were burnt, and built a church upon the site, the doors of which, Mr. Bruce believes, were never opened since that reign; nor is there now, as far as he could perceive, any Christian there

there who might wish to see it frequented. After Sela Christos had demolished their altars by building this church, they ate the carcase, and burnt the bones, on the top of the mountain of Geesh, out of the way of profanation, where the vestiges of this ceremony may yet be seen; but probably the fatigue attending this, and the great indifference their late governors have had for Christianity, have brought them back to a small hillock by the side of the marsh, west of St. Michael's church, and a little to the southward, where they perform this solemnity every year, and they will probably resume their first altar when the church is fallen to ruins, which they are every day privately hastening.

When their bloody banquet is finished, they carry the head, close wrapt from sight in the hide, into the cavern, which they say reaches below the fountains, and there, by a common light, without torches, or a number of candles, as denoting a solemnity, they perform their worship, the particulars of which Mr. Bruce never could learn; it is a piece of free masonry, which every body knows, and nobody ventures to reveal. At a certain time of the night they leave the cave, but at what time, or by what rule, our traveller could not learn; neither would they tell him what became of the head, whether it was ate, or buried, or how consumed. The Abyssinians have a story, probably created by themselves, that the devil appears to them; and with him they eat the head, swearing obedience to him upon certain conditions, that of sending rain, and a good season for their bees and cattle: however this may be, it is certain, that they pray to the spirit residing in the river, whom they call the Everlasting God, Light of the World, Eye of the World, God of Peace, their Saviour, Father of the Universe, &c. &c. &c.

At this time, their landlord, the Shum, made no scruple of reciting his prayers for seasonable rain, for plenty of grass, for the preservation of serpents, at least of one kind of this reptile; he also deprecated thunder in these prayers, which he pronounced very pathetically with a kind of tone or song; he called the river, "Most High God, Saviour of the World;" of the other words Mr. Bruce could not well judge, but by the interpretation of Woldo. Taole titles, however, of divinity which he gave to the river, he could perfectly comprehend without an interpreter, and for these only he is a voucher.

The Shum, upon being asked by Mr. Bruce if he had ever seen any spirit, answered, without hesitation, Yes, very frequently. He said he had seen the spirit the evening of the 3d, just as the sun was setting, under a tree, which he shewed our traveller at a distance, who told him of the death of a son, and also that a party from Fasil's army was coming; that, being afraid, he consulted his serpent, who ate readily and heartily, from which he knew no harm was to befall him from his visitors. Mr. Bruce asked him, if he could prevail on the spirit to appear to him. He said he could not venture to make that request; but said he was of a very graceful figure and appearance, he thought rather older than middle age; but he seldom chose to look at his face: he had a long white beard, his clothes not like theirs of leather, but like silk, of the fashion of the country. Mr. Bruce asked him how he was certain it was not a man, he laughed, or rather sneered, shaking his head, and saying, "No, no, it is no man, but a spirit." Mr. Bruce then desired to know why he prayed against thunder. He said, Because it was hurtful to the bees, their great revenue being honey and wax: then, why he prayed for serpents? he replied, Because they taught him the coming of good or evil. It seems they have all several of these creatures in the neighbourhood, and the richer sort always in their houses, whom they take care of, and feed before they undertake a journey, or any affair of consequence. They take this animal from his hole, and put butter and milk before him, of which he is extravagantly fond; if he does not eat, ill-fortune is shortly expected.

Previous to an invasion of the Galla, or an inroad of the enemy, they say these serpents disappear, and are no where to be found. Fasil, the sagacious and cunning governor of the country, was, as it was said, greatly addicted to this species of divination, inasmuch as never to mount his horse, or go from home, if an animal of this kind, which he had in his keeping, refused his butter and milk.

Kella Abay, or Servant of the River, was the Shum's name; he was a man about seventy, not very lean, but infirm, fully as much so as might have been expected from that age. He conceived that he might have had eighty-four or eighty-five children. That honourable charge which he possessed had been in his family from the beginning of the world, as he imagined. Indeed, if all his predecessors had as numerous families as he, there was no probability of the succession devolving to strangers. He had a long white beard, and very moderately thick; an ornament rare in Abyssinia, where they have seldom any hair upon their chin. He had round his body a skin wrapt and tied with a broad belt. Above this he wore a cloak with the hood up, and covering his head; he was bare legged, but had sandals, much like those upon ancient statues; these, however, he put off as soon as ever he approached the bog where the Nile rises, which our travellers were all likewise obliged to do. They were allowed to drink the water, but make no other use of it. None of the inhabitants of Geesh wash themselves, or their clothes, in the Nile, but in a stream that falls from the mountain of Geesh down into the plain of Allo, which runs south, and meets the Nile in its turn northward, passing the country of the Galars and Gongas.

The Agows, in whose country the Nile rises, are, in point of number, one of the most considerable nations in Abyssinia; when their whole force is raised, which seldom happens, they can bring to the field 4000 horse, and a great number of foot; they were, however, once much more powerful; several unsuccessful battles, and the perpetual inroads of the Galla, have much diminished their strength. The country, indeed, is still full of inhabitants; but from their history we learn, that one clan, called Zeegam, maintained singly a war against the king himself, from the time of Socmios to that of Yafous the Great, who, after all, overcame them by surprise and stratagem; and that another clan, the Denguis, in like manner, maintained the war against Facilidas, Hannes I. and Yafous II. all of them active princes. Their riches, however, are still greater than their power, for though their province in length is no where 60 miles, nor half that in breadth, yet Gondar and all the neighbouring country depend for the necessaries of life, cattle, honey, butter, wheat, hides, wax, and a number of such articles, upon the Agows, who come constantly in succession, a thousand and fifteen hundred at a time, loaded with these commodities, to the capital. As the dependence upon the Agows is for their produce rather than on the forces of their country, it has been a maxim with wise princes to compound with them for an additional tribute, instead of their military service; the necessities of the times have sometimes altered these wise regulations, and between their attachment to Fasil, and afterwards to Ras Michael, they have been very much reduced, whereby the state hath suffered much. As, in a long carriage, such as that of a hundred miles in such a climate, butter must melt, and be in a state of fusion, consequently very near putrefaction; this is prevented by the root of an herb, called Moc-moco, yellow in colour, and in a shape nearly resembling a carrot; this they bruise and mix with their butter, and a very small quantity preserves it fresh for a considerable time; and this is a great saving and convenience; for, supposing salt was employed, it is very doubtful if it would answer the intention; besides, salt is a money in this country, being circulated in the form of wedges, or bricks, it serves the purpose of silver coin, and is the change of gold; so that this herb is

of this necessary article, which is the principal food
of all ranks of people in this country.

Exclusive of the market of Gondar, the neigh-
bouring black savages, the woolly-headed Shangalla,
purchase the greatest part of these commodities from
them, and many others, which they bring from the
capital when they return thence; they receive in ex-
change elephants teeth, rhinoceros' horns, gold in
small pellets, and a quantity of very fine cotton; of
which goods they might receive a much greater quan-
tity were they content to cultivate trade in a fair
way, without making inroads upon these savages for
the sake of slaves, and thereby disturbing them in
their occupations of seeking for gold and hunting the
elephant.

The Agows' clothing is entirely of hides, which
they soften and manufacture in a method peculiar to
themselves; and this they wear in the rainy season,
when the weather is cold: for here the rainy seasons
are of long duration and violent, which still increases
the nearer you approach the Line. The younger
fort are chiefly naked, the married women carrying
their children about with them upon their backs;
their clothing is like a shirt down to their feet, and
girded with a belt or girdle about their middle; the
lower part of it resembles a large double petticoat,
one ply of which they turn back over their shoulders,
falling it with a broach, or skewer, across their
breast before, and carrying their children in it be-
hind. The women are generally thin, and, like the
men, below the middle size. There is no such thing
as bareness known among them. They begin to
bear children before eleven; they marry generally
about that age, and are marriageable two years be-
fore: they close child-bearing before they are thirty,
though there are several instances to the contrary.

The Agows, besides what they sell, and what they
pay to the governor of Damot, have a particular
tribute which they present to the king: one thousand
dabra of honey, each dabra containing about sixty
pounds weight, being a large earthen vessel. They
pay, moreover, fifteen hundred oxen and 1000 ounces
of gold; formerly the number of jars of honey was
four thousand, but several of these villages being daily
given to private people by the king, the quantity is
diminished by the quota so alienated. The butter is
all sold; and, since the fatal battle of Benja, the
king's share comes only to about one thousand jars.
The officer that keeps the accounts, and has the rents
paid, is called Agow Miziker; his post is worth one
thousand ounces of gold; and by this it may be judged
with what economy this revenue is collected.

Notwithstanding Mr. Bruce had with him two large
tents sufficient for his people, he was advised to take
possession of the houses to secrete their mules and
horses from thieves in the night, as also from the
assaults of wild beasts, of which this country is full.
Almost every small collection of houses has behind
a large cave, the subterraneous dwelling, dug in

the rock, of a prodigious capacity, and which must
have been a work of great labour. It is not possible
at this distance of time, to say whether these caverns
were the ancient habitations of the Agows when they
were Troglodytes, or whether they were intended
for retreats upon any alarm of an irruption of the
Galla into their country.

November the 9th, our traveller having finished
his memorandum relating to these remarkable places,
traced again on foot the whole course of this river
from its source to the plain of Goutto. He was un-
attended by any one, having with him only two hunt-
ing dogs, and his gun in his hand. The quantity of
game of all sorts, especially the deer kind, was, in-
deed, surprising; but though he was, as usual, a very
successful sportsman, he was obliged, for want of help,
to leave each deer where he fell. They sleep in the
wild oats, and do not rise till you are about to tread
upon them, and then stare at you for half a minute
before they attempt to run off.

Mr. Bruce and his friends having now finished
their business, nothing remained but to depart. They
had passed their time in perfect harmony; the address
of Woldo, and the great attachment of their friend
Ireponc, had kept their house in a cheerful abun-
dant. They had lived, it is true, too magnificently
for philosophers, but neither idly nor riotously; and,
it is the opinion of Mr. Bruce, no sovereign of Geesh
will be again so popular, or reign over his subjects
with greater mildness. Mr. Bruce had practised me-
dicine gratis, and killed, for three days successively,
a cow each day for the poor and the neighbours. He
had clothed the high priest of the Nile from head to
foot, as also his two sons, and decorated two of his
daughters with beads of all the colours of the rainbow,
adding every other little present they seemed fond of,
or that our travellers thought would be agreeable. As
for their amiable Ireponc, they had reserved for her
the choicest of their presents, the most valuable of
every article they had with them, and a large propor-
tion of every one of them; they also gave her some
gold; but she, more generous and noble in her sen-
timents than they, seemed to pay little attention to
these that announced to her the separation from her
friends; she tore her fine hair, which she had every
day before braided in a newer and more graceful
manner; she threw herself upon the ground in the
house, and refused to see our travellers mount on
horseback, or take their leave, and came not to the
door till they were already set out, then followed
them with her good wishes and her eyes as far as she
could see or be heard.

Our traveller now took his leave of Kessa Abay,
the venerable priest of the most famous river in the
world, who recommended him with great earnestness
to the care of his god, which as one of our travellers
humourously enough observed, meant nothing less
than he hoped the devil would take him. All the
young men in the village, with lances and shields,
attended them to Saint Michael Sacala.

passes the Nile at Delakos—Proceeds to Gondar—Obtains Permission to return Home—Takes Leave of the Itege
of Sofcan—His last Interviews with the Monks.*

NOVEMBER the 10th, 1770, Mr. Bruce and
his friends left Geesh on their return to Gondar,
and passed the Abay, under the church of Saint Mi-
chael Sacala. The next day, they continued their
journey in their former road, and in the afternoon
they halted at the house of Shalaka Welled Amlac,
with whom Mr. Bruce was well acquainted at Gondar;
his house is called Welled Abea Abbo, from a church
of Abbo, about an eighth part of a mile distant.

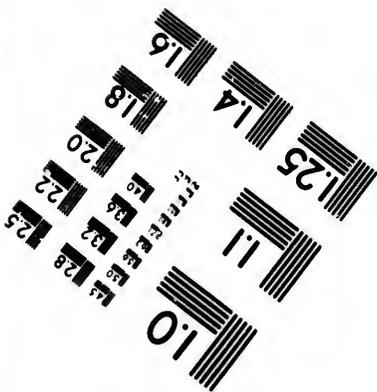

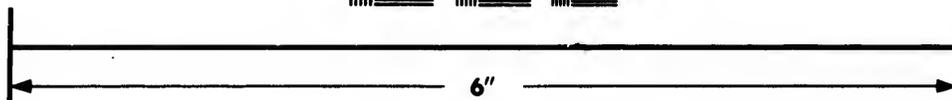

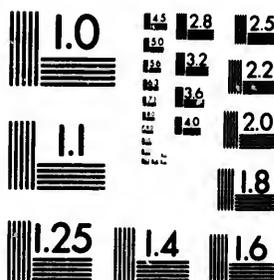

Mr. Bruce settled here with his former guide
Woldo, to his perfect satisfaction, and cancelled en-
tirely the memory of some disagreeable things
passed. He then consigned our traveller very solemnly
to Ayto Aylo's servant, in presence of Welled Amlac,
and then took his leave.

November the 12th, having settled their account

ABOUT one o'clock in the afternoon, December 26, 1771, Mr. Bruce left Gondar. He had purposed to set out early in the morning, but was detained by the impertunity of his friends. The king had delayed his setting out, by several orders sent him in the evening each day; and he plainly saw there was some meaning in this, and that he was wishing to throw difficulties in the way, till some accident, or sudden emergency, never wanting in that country, should make it absolutely impossible for him to leave Abyssinia. When, therefore, the last message came to Koseam on the 27th, at night, Mr. Bruce returned his respectful duty to his majesty, put him in mind of his promise, and somewhat peevishly, he believes, entreated him to leave him to his fortune; that his servants were already gone, and he was resolved to set out the next day.

Early the next morning, Mr. Bruce was surprised at the arrival of a young nobleman, lately made one of his bed-chamber, with fifty light-horse. As he was fatigued, that leaving Abyssinia, without parade, as privately as possible, was the only way to pass through Sennaar; he therefore insisted upon none of his friends accompanying him, and he begged to decline this escort. At one o'clock, Mr. Bruce set out by the well side of Dehra Tzai, having the mountain on their right hand. From the top of that ascent, they saw the plain and flat country below, black, and in its appearance, one thick wood, which some authors have called lately, the Shumeta, or Nubian forest.

He now advanced down the steep side of the mountain, through very strong and rugged ground, torn up by the torrents that fall on every side from above. This is called the Descent of Monra; and though both our travellers and their beasts were in great health and spirits, they could not, with their utmost endeavours, advance much more than one mile an hour.

They entered a thick wood on the 28th, winding round a hill, in a south-east direction, to get into the plain below, where they were surrounded by a great multitude of men, armed with lances, shields, slings, and large clubs or sticks, who rained a shower of stones towards them; but they were at such a distance, that all of them fell greatly short of them. Whether this was owing to fear, or not, they did not know; but supposing that it was, they thought it their interest to keep it up as much as possible. Mr. Bruce, therefore, ordered two shots to be fired over their heads; not with any intention to hurt them, but to let them hear, by the balls whistling among the leaves of the trees, that their guns carried further than any of their slings; and that, distant as they then were, they were not in safety, if they had a disposition to do harm. They seemed to understand their meaning, by gliding through among the bushes, and appearing at the top of a hill further off, where they continued hooping and crying, and making signs, which our travellers could not, neither did they endeavour to understand. While resting on the banks of the river Mogetch, they had been overtaken by two men and two women, who were driving two loaded asses, and were going to Teberkin; they had desired leave to keep company with our travellers, for fear of

danger on the road. Mr. Bruce had two Abyssinian servants, but they were not yet come up, attending one of the baggage mules that was lame. They were obliged then to have recourse to one of these stranger women, who understood the language of Tigre, and undertook readily to carry their message to a stranger, who was still very busy making tents from behind a tree, without coming one step nearer.

The message Mr. Bruce sent them was, that if they shewed the smallest appearance of further insolence, either by approaching the tent, or slinging stones that night, the next morning, when the horse he expected were come up, he would burn their town, and put every man of them to the sword. A very submissive answer was sent back, with a heap of lies in excuse of what they called their mistake. His two servants coming soon after, both of whom, hereafter, were to be in the service of Ayto Confu, went boldly one to each village, to bring two goats, some jars of bouza, and to prepare fifty loaves of bread for next morning. The goats were dispatched instantly, by way of the bouza; but when the morning came, the people had all fled from their houses, without preparing any bread. These villages were called Gimbaar. They were three in number; each situated upon the top of a pointed hill, in a direction from east to west, and made a very beautiful appearance from the plain below.

They left the inhospitable villages of Gimbaar on the 29th, not without entertaining some apprehensions of meeting the inhabitants again in the course of the day. But though they took every precaution against being surprised, that prudence could dictate, their fears of the encounter did not rise to any great height. Mr. Bruce got, indeed, on horseback, leaving his mule, and, putting on his coat of mail, leaving the fire-arms under the command of Hagl Hinael, the old Turk, he rode always about a quarter of a mile before the baggage, that they might not come suddenly upon them, as they had done the night before. However, they met with no opposition, but proceeded on to Waalia; and at half past four in the afternoon encamped in the market-place.

This Waalia is a collection of villages, each placed upon the top of a hill, and enclosing, as in a circle, an extensive flat piece of ground about three miles over, on which a very well frequented market is kept. The name is given it from a species of small pigeons, with yellow breasts and variegated backs, the fattest and best of all the pigeon kind. Waalia lies due N. W. from Gondar.

They left Waalia on the 30th, and proceeded along the Mai Lumi, or the River of Lemons. A prodigious quantity of fruit loaded the branches of these trees, even likely to break them; and these were in all stages of ripeness. Multitudes of blossoms covered the opposite part of the tree, and sent forth the most delicious odour possible. They provided themselves amply with this fruit. The natives make no use of it, but our travellers found it a great refreshment to them, both mixed with their water, and as sauce to their meat, of which they had now no great variety since their onions had failed them, and a supply of them was to be procured no longer.

Soon after they reached the pass of Dov-Doghba, a

very narrow defile, full of strata of rocks of flints, but so high, that, without leaping up, no horse or mule can ascend; the descent, though short, is very steep, choked up by huge stones, which the walking the earth from about them, has from the mountain above. Both sides are covered thick with wood and bushes, that detestable thorn the kantulla, hated in Abyssinia. Having extricated successfully from this pass, their spirits that they began to think their journey end, not reflecting how many passes danger, were still before them.

Mr. Bruce having dressed his horse according to the custom of the country, clean clothes, with no other arms but a pair of pistols at his girdle, came to mount his mule for Teberkin, on the 31st. He now saw Confu's servant, whose name was Yafous, pulling the Guinea-fow out of the pannier, where his servant and scattering them upon the ground, who interrupted him. "Throw away you shall have a better breakfast and turning to Mr. Bruce, more pleased at seeing him dressed, and that to use the Abyssinian habit, he jumped on a mule, and appeared in great spirits out at a brisker pace than usual, by the two fresh mules. They passed through several small villages; and at last pitched his tent in the market place, which seemed a beautiful lawn land shaded with fine old trees, of an excellent size, and watered by a small brook, running over beds of pebbles a

They were three in number; each situated upon the top of a pointed hill, in a direction from east to west, and made a very beautiful appearance from the plain below.

They left the inhospitable villages of Gimbaar on the 29th, not without entertaining some apprehensions of meeting the inhabitants again in the course of the day. But though they took every precaution against being surprised, that prudence could dictate, their fears of the encounter did not rise to any great height. Mr. Bruce got, indeed, on horseback, leaving his mule, and, putting on his coat of mail, leaving the fire-arms under the command of Hagi Ismael, the old Turk, he rode always about a quarter of a mile before the baggage, that they might not come suddenly upon them, as they had done the night before. However, they met with no opposition, but proceeded on to Waalia; and at half past four in the afternoon encamped in the market-place.

This Waalia is a collection of villages, each placed upon the top of a hill, and enclosing, as in a circle, an extensive flat piece of ground about three miles over, on which a very well frequented market is kept. The name is given it from a species of small pigeons, with yellow breasts and variegated backs, the fattest and best of all the pigeon kind. Waalia is due N. W. from Gondar.

They left Waalia on the 30th, and proceeded along the Mai Lumi, or the River of Leions. A prodigious quantity of fruit loaded the branches of these trees, even likely to break them; and these were in all stages of ripeness. Multitudes of blossoms covered the opposite part of the tree, and sent forth the most delicious odour possible. They provided themselves amply with this fruit. The natives make no use of it, but our travellers found it a great refreshment to them, both mixed with their water, and as sauce to their meat, of which they had now a great variety since their onions had failed them, and a supply of them was to be procured no longer. Soon after they reached the pass of Dov-Dyha, a

very

very narrow defile, full of strata of rocks, like steps of stairs, but so high, that, without leaping, or being pulled up, no horse or mule can ascend. Besides, the descent, though short, is very steep, and almost choked up by huge stones, which the torrents, after walling the earth from about them, had rolled down from the mountain above. Both sides of the defile are covered thick with wood and bushes, especially that detestable thorn the kantuffa, so justly reprobated in Abyssinia. Having extricated themselves successfully from this pass, their spirits were so elated, that they began to think their journey now at an end, not reflecting how many passes, full of real danger, were still before them.

Mr. Bruce having dressed his hair, perfumed it according to the custom of the country, and put on clean clothes, with no other arms but his knife, and a pair of pistols at his girdle, came out of the tent to mount his mule for Tcherkin, on January 2, 1772. He now saw Confu's servant, whose name was Welleta Yafous, pulling the Guinea-fowls and pigeons out of the pannier, where his servants had put them, and scattering them upon the ground, saying to those who interrupted him, "Throw away this carrion; you shall have a better breakfast and dinner to-day;" and turning to Mr. Bruce, more than ordinarily pleased at seeing him dressed, and that he continued to use the Abyssinian habit, he jumped upon his mule, and appeared in great spirits. They all set out at a brisker pace than usual, by the assistance of the two fresh mules. They passed through the middle of several small villages; and at last Mr. Bruce pitched his tent in the market place at Tcherkin, which seemed a beautiful lawn laid out for pleasure, shaded with fine old trees, of an enormous height and size, and watered by a small but very limpid brook, running over beds of pebbles as white as snow.

Welleta Yafous was so very impatient, that he would only give Mr. Bruce time to see his quadrant and other instruments safely stowed, and hurried him through a very narrow and crooked path up the side of the mountain, at every turn of which was placed a great rock or stone, the station for mulekts to enlidle the different stages of the road below, where it was straight for any distance. They at last reached the outer court, where Mr. Bruce saw a great many of his old acquaintance, whom he had known at Ozoro Elther's house at Gondar, and who all welcomed him with the greatest demonstrations of joy, as if he had come from a long journey.

Now Mr. Bruce was taken to an inner apartment, where, to his great surprise, instead of Ayto Confu, he saw his mother, Ozoro Ellher, sitting on a couch, and at her feet the secretary's daughter, the beautiful Tecla Mariam; and, soon after, the secretary himself, and several others belonging to the court. After having made a profound obeisance, "Ozoro Ellher, said Mr. Bruce, I cannot speak for surprise. What is the meaning of your having left Gondar to come into this wilderness? As for Tecla Mariam, I am not surprised at seeing her; I know she, at any time, would rather die than leave you; but that you have both come hither without Ayto Confu, and in so short a time, is what I cannot comprehend."—"There is nothing so strange in this," replied Ozoro Ellher, the troops of Begender have taken away my husband, Ras Michael, God knows where; and, therefore, being now a single woman, I am resolved to go to Jerusalem to pray for my husband, and to die there, and be buried in the Holy Sepulchre. You would not stay with us, so we are going with you. Is there any thing surprising in all this?"—"But tell me, truly, said Tecla Mariam, you that know every thing, while peeping and poring through these long glasses, did not you learn by the stars that we were to meet you here?"—"Madam, answered Mr. Bruce, if there was one star in the firmament that had announced to me such agreeable news, I should have relapsed into the old idolatry of this country, and worshipped that star for the rest of my life." Break-

fast now came in; the conversation took a very lively turn, and from the secretary our traveller learned that the matter stood thus: "The king, restoring the villages to the Iteghe, according to the stipulation of his last treaty with Powuffen, thought that he might do so far infringe upon it, from gratitude to Ras Michael, as to give part of the number to Ozoro Ellher, the Iteghe's daughter; and Ayto Confu, going to Tcherkin to hunt, he took his mother along with him to put her in possession; for the Iteghe's people were not lambs, nor did they pay much regard to the orders of the king, nor to that of the Iteghe their millrels."

Ayto Confu came about four o'clock, and with him Ayto Engedan, and a great company. There was nothing but rejoicing on all sides. Seven ladies, relations and companions of Ozoro Ellher, came with Ayto Confu; and Mr. Bruce confesses this to have been one of the happiest moments of his life. He quite forgot the disastrous journey he had before him, and all the dangers that awaited him. He began even to regret being so far in his way to leave Abyssinia for ever.

Ayto Confu's house at Tcherkin is built on the edge of a precipice, which takes its name from the mountain Amba Tcherkin. It is built all with cane very artificially, the outer wall being composed of fascines of canes, so neatly joined together as not to be penetrated by rain or wind. The entry is from the south-side of it, very crooked and difficult, half way up the rock. On the east, is a very plentiful spring, which furnishes the house with excellent water. Yet, after all, this house, though inaccessible, is not defensible, and affords very little safety to its master; for the Shangalla, with flax, or any thing combustible, tied to the point of their arrows, would easily set it on fire if they once approach it; and the Abyssinians with guns could as easily destroy it, as, on such occasions, they wrap their balls in cotton wads. The inside of the stave rooms were hung with long fringes of carpeting, and the floors were covered with the same.

There is great plenty of game about Tcherkin of every sort, elephants, rhinoceroses, and a great number of buffaloes, which differ nothing in form from the buffaloes of Egypt, but very much in temper and disposition. They are fierce, rash, and fearless of danger; and, contrary to the practice of any other creature not carnivorous, they attack the traveller and the hunter equally, and it requires address to escape from them. They seem to be, of all others, the creatures most given to ease and indulgence. They lie under the shady trees, near large pools of water, of which they make constant use, and sleep soundly all the day long. The flesh of the female is very good when fat, but that of the male, hard, lean, and disagreeable. Their horns are used in various manners by the turners, in which craft the Abyssinians are very clever.

Notwithstanding they were all happy to their visit in this enchanted mountain, the active spirit of Ayto Confu could not rest; he was come to hunt the elephant, and hunt him he would. All those that understood any thing of this exercise had assembled from a great distance to meet Ayto Confu at Tcherkin. He and Engedan, from the moment they arrived, had been overlooking, from the precipice, their servants training and managing their horses in the market-place below. Great bunches of the finest canes had been brought from Kuara for javelins; and the whole house was employed in fitting heads to them in the most advantageous manner. Mr. Bruce, though he says he should have been very well contented to have remained where he was, yet the preparations for sport of so noble a kind roused his spirits, and made him desirous to join it. On the other hand, the ladies all declared, that they thought, by leaving them, they were devoting them to death or slavery, as they did not doubt, if the Shangalla missed the hunting party, they would come forward to the mountain and slay them all. But a sufficient garrison was left, and they were well assured that the

Shangalla,

Shangalla, being informed they were out, and armed, and knowing their numbers, would take care to keep close in their thickets far out of their reach.

An hour before day, on the 6th, after a hearty breakfast, they mounted on horseback, to the number of about thirty belonging to Ayto Confu. But there was another body, both of horse and foot, which made hunting the elephant their particular business. These men dwell constantly in the woods, and know very little of the use of bread, living entirely upon the flesh of the beasts they kill, chiefly that of the elephant or rhinoceros. They are exceedingly thin, light, and agile, both on horseback and foot; are very swarthy, though few of them black; none of them woolly-headed, and all of them have European features. They are all called Agageer, a name of their profession, not of their nation, which comes from the word Agar, and signifies to hough or hamstring with a sharp weapon. More properly it means, indeed, the cutting the tendon of the heel, and is a characteristic of the manner in which they kill the elephant, which is shortly as follows:

"Two men, absolutely naked, without any rag or covering at all about them, get on horseback; this precaution is from fear of being laid hold of by the trees or bushes, in making their escape from a very watchful enemy. One of these riders sits upon the back of the horse, sometimes with a saddle, and sometimes without one, with only a switch or short stick in one hand, carefully managing the bridle with the other; behind him sits his companion, who has no other arms but a broadsword, such as is used by the Sclavonians, and which is brought from Trieste. His left hand is employed grasping the sword by the handle, and about fourteen inches of the blade is covered with whip-cord. This part he takes in his right hand, without any danger of being hurt by it; and, though the edges of the lower part of the sword are as sharp as a razor, he carries it without a scabbard. When the elephant is found feeding, the horseman rides before him as near his face as possible; or, if he lies, crosses him in all directions, crying out, "I am such a man, and such a man; this is my horse, that has such a name; I killed your father in such a place, and your grandfather in such another place, and I am now come to kill you; you are but an ass in comparison of them." This nonsense he verily believes the elephant understands, who, chafed and angry at hearing the noise immediately before him, seeks to seize him with his trunk, or proboscis; and, intent upon this, follows the horse every where, turning round with him frequently, neglectful of making his escape by running straight forward, in which consists his only safety. After having made him turn once or twice in pursuit of the horse, the horseman rides close up along side of him, and drops his companion just behind on the off side; and while he engages the elephant's attention upon the horse, the footman behind gives him a drawn stroke just above the heel, or what in man is called the tendon Achilles. This is the critical moment; the horseman immediately wheels round, and takes his companion up behind him, and rides off full speed after the rest of the herd, if they have started more than one; and sometimes an expert Agageer will kill three out of one herd. If the sword is good, and the man not afraid, the tendon is commonly entirely separated; and if it is not cut through, it is generally so far divided, that the animal, with the flesh he puts upon it, breaks the remaining part asunder. In either case, he remains incapable of advancing a step, till the horseman returning, or his companions coming up, pierce him through with javelins and lances; he then falls to the ground, and expires with the loss of blood.

"The Agageer nearest Mr. Bruce presently lamed his elephant, and left him standing. Ayto Engedan, Ayto Confu, Guebra Mariam, and several others, fixed their spears in the other, before the Agageer had cut his tendons. Mr. Bruce's Agageer, however, having

wounded the first elephant, failed in the pursuit of the second; and, being close upon him at entering the wood, he received a violent blow from a branch of a tree which the elephant had bent by his weight, and, after passing, allowed it to replace itself, when it knocked down both the riders, and very much hurt the horse. This, indeed, is the great danger in elephant-hunting; for some of the trees, that are dry and short, break, by the violent pressure of so immense a body moving so rapidly, and fall upon the pursuers, or across the roads. But the greatest number of these trees, being of a succulent quality, they bend without breaking, and return quickly to their former position, when they strike both horse and man so violently, that they often beat them to pieces, and scatter them upon the plain. Dextrous, too, as the riders are, the elephant sometimes reaches them with his trunk, with which he dashes the horse against the ground, and then sets his feet upon him, till he tears him limb from limb with his proboscis: a great many hunters die this way. Besides this, the soil, at this time of the year, is split into deep chasms, or cavities, by the heat of the sun, so that nothing can be more dangerous than the riding. As soon as the elephant is slain, they cut the whole flesh off his bones into thongs, like the reins of a bridle, and hang these, like festoons, upon the branches of trees, till they become perfectly dry, without salt, and they then lay them by for their provision in the season of the rains."

Now only two elephants remained of those that had been discovered, which were a she one with a calf. The Agageer would willingly have let these alone, as the teeth of the female are very small, and the young one is of no sort of value, even for food, its flesh shrinking much upon drying. But the hunters would not be limited in their sport. The people having observed the place of her retreat, thither they eagerly followed. She was very soon found, and as soon lamed by the Agageers; but when they came to wound her with the darts, as every one did in their turn, to their very great surprise, the young one which had been sullered to escape unheeded and unpursued, came out from the thicket apparently to great anger, running upon the horses and men with all the violence it was master of. Mr. Bruce was amazed, and as much as ever he was, upon such an occasion, afflicted, at seeing the great affection of the little animal defending its wounded mother, heedless of its own life or safety. He, therefore, cried to them for God's sake to spare the mother, though it was then too late; and the calf had made several rude attacks upon Mr. Bruce, which he avoided without difficulty; but he says he is happy to this day, in the reflection that he did not strike it. At last, making one of his attacks upon Ayto Engedan, it hurt him a little on the leg; upon which he thrust it through with his lance, as others did after, and it then fell dead before its wounded mother, whom it had so affectionately defended.

Our travellers then sought about for the buffaloes and rhinoceroses; but though there was plenty of both in the neighbourhood, they could not find them; their noise and shooting in the morning having probably scared them away. One rhinoceros was only seen by a servant. They returned in the evening to a great fire, and lay all night under the shade of trees.

Very early the next morning they were on horseback in search of the rhinoceroses, many of which they had heard make a very deep groan and cry as the morning approached; several of the Agageers then joined them; and, after they had searched about an hour in the very thickest part of the wood, one of them rushed out with great violence, crossing the plain towards a wood of canes that was about two miles distance. But though he ran, or rather trotted, with surprising speed, considering his bulk, he was, in a very little time, transixed with thirty or forty javelins; which so confounded him, that he left his purpose

purpose of going to the wood, and ran into a deep
hole, ditch, or ravine, a *cul de sac*, without outlet,
breaking above a dozen of the javelins as he entered.
Here they thought he was caught as in a trap, for
he had scarce room to turn; when a servant, who
had a gun, standing directly over him, fired at his
head, and the animal fell immediately, to all appear-
ance dead. All those on foot now jumped in with
their knives to cut him up, and they had scarce be-
gun, when the animal recovered so far as to rise
upon his knees; happy then was the man that escap-
ed first; and had not one of the Agageers, who was
himself engaged in the ravine, cut the sinew of the
hind leg as he was retreating, there would have been
a very sorrowful account of the foot-bunters that day.

When Mr. Bruce dispatched him, he was curious
to see what wound the shot had given, which had
operated so violently upon so huge an animal; and
he doubted not it was in the brain. But it had struck
him no where but upon the point of the foremost
horn, of which it had carried off above an inch; and
this occasioned a concussion that had stunned him
for a minute, till the bleeding had recovered him.
Mr. Bruce preserved the horn from curiosity. Ere
they had gone far, a wild boar arose between Mr.
Bruce and Ayto Engedan, which our traveller im-
mediately killed with his javelin. This was the sport
Mr. Bruce had been many years used to in Barbary,
and was infinitely more dexterous at it than any of the
present company; this put him more upon a par with
his companions, who had not failed to laugh at him,
upon his horse's refusal to carry him near either to
the elephant or rhinoceros.

Now Ammonios was a man of approved courage
and conduct: he had been in all the wars of Ras
Michael, and was placed about Ayto Confu, to lead
the troops, curb the presumption, and check the
impetuosity of that youthful warrior. He was tall,
and awkwardly made; slow in speech and motion,
so much as even to excite ridicule; about sixty years
of age, and more corpulent than the Abyssinians
generally are; in a word, as pedantic and grave
in his manner as it is possible to express. He spent
his whole leisure time in reading the Scripture, nor
did he willingly discourse of any thing else. He had
been bred a foot soldier; and, though he rode as
well as many of the Abyssinians, yet, having long
stirrup-leathers, with iron rings at the end of them,
into which he put his naked toe only, instead of
stirrups, he had no strength or agility on horseback,
nor was his bridle such as could command his horse
to stop, or wind and turn sharply among trees, though
he might make a tolerable figure on a plain.

A boar had wounded a horse and a footman of
Ayto Confu, and then escaped. Two buffaloes were
found by those on the right, one of which wounded
a horse likewise. Ayto Confu, Engedan, Fuebra
Marian, and Mr. Bruce killed the other with equal
share of merit, without being in any sort of danger.
All this was in little more than an hour when their
point seemed to be at the best; their horses were con-
siderably blown, not tired; and though they were
beating homewards, still they were looking very
scently for more game. Ammonios was on the left
among the bushes, and some large, beautiful, tall
spreading-trees, close on the banks of the river Be-
dowi, which stands there in pools. Whether the
buffalo found Ammonios, or Ammonios the buffalo,
is what they could never get him to explain to them;
but he had wounded the beast slightly in the buttock,
which, in return, had gored his horse, and thrown
both him and it to the ground. Luckily, however,
his cloak had fallen off, which the buffalo tore in
pieces, and employed himself for a minute with that
and with the horse, but then left them, and followed
the man as soon as he saw him rise and run. Am-
monios got behind one large tree, and from that to
another still larger. The buffalo turned very awk-
wardly, but kept close in pursuit; and there was no
doubt he would have worn out their companion, who

was not used to such quick motion. Ayto Engedan,
who was near him, and might have assisted him, was
laughing, at the droll figure Ammonios made; and
continued calling to Confu to partake of the diversion.

As soon as Mr. Bruce heard his cries, he galloped
out of the bushes to the place where he was, and
could not help laughing at his ridiculous figure, very
attentive to the beast's motions, which seemed to
dodge with great address, and keep to his adversary
with the utmost obstinacy. Confu immediately ar-
rived, and laughed more than Engedan, but did not
offer to interfere; on the contrary, he clapped his
hands, and cried, "Well done, Ammonios," swear-
ing he never saw so equal a match in his life. The
unfortunate Ammonios had been driven from tree to
tree, till he had got behind one within a few yards of
the water; but the brush-wood upon the banks, and
his attention to the buffalo, hindered him from seeing
how far it was below him. Nothing could be more
ridiculous than to see him holding the tree with both
his hands, peeping first one way, and then another,
to see by which the beast would turn. And well he
might be on his guard; for the animal was absolutely
mad, tossing up the ground with his feet both before
and behind. Mr. Bruce, thinking the joke might
become serious, cried to Ammonios to throw himself
into the water, when he should strike the beast; and
seeing the buffalo's head turned from Mr. Bruce, at
full speed, he ran the spear into the lower part of his
belly, through his whole intestines, till it came out
above a foot on the other side, and there he left it
with a view to hinder the buffalo from turning. It
was a spear which, though small in the head, had a
strong, tough, seasoned shaft, which did not break
by striking it against the trees and bushes; and it
pained and impeded the animal's motions, till Am-
monios quitting the tree, dashed through the bushes
with some difficulty, and threw himself into the river.
But here a danger occurred that Mr. Bruce had not
foreseen. The pool was very deep, and Ammonios
could not swim; so that though he escaped from the
buffalo, he would infallibly have been drowned, had
he not caught hold of some strong roots of a tree
shooting out of the bank; and there he lay in perfect
safety from the enemy till the servants went round,
and brought him out of the pool on the further
side.

During this time, the buffalo, mortally wounded,
seeing his enemy had escaped, kept his eyes intent
upon the hunters, who were about forty yards from
him, walking backwards towards the company, with
intent to turn suddenly upon the nearest horse; when
Ayto Confu ordered two men with guns to shoot him
through the head, and he instantly fell. The two
they first killed were females; this last was a bull, and
one of the largest, confessedly, that had ever been
seen. Though not fat, Mr. Bruce supposes he weighed
nearer fifty than forty stone. His horns from the
root, following the line of their curve, were about
fifty-two inches, and nearly nine where thickest in
the circumference. They were flat, not round.
Ayto Confu ordered the head to be cut off, and
cleared of its flesh, so that the horns and skeleton of
the head only remained; this he hung up in his great
hall among the probosces of elephants, and horns of
rhinoceroses, with this inscription in his own language,
"Yagoube the Kipt killed this upon the Bedowi."

The evening of the day on which they set out to
hunt, some men arrived from Ras el Feel sent by
Yafine, with camels for their baggage, nothing but
mules being used at Tcherkin. They brought word,
that the Shangalla were down near the Tacazzé, so
that now was the time to pass without fear; that Abd
el Jeleel, the former Shum of Ras el Feel, Yafine's
mortal enemy, had been seen lurking in the country
near Sanchah; but as he had only four men, and was
himself a known coward, it was not probable he would
attempt any thing against our travellers, though it
would be always better for them to keep on their
guard.

Tcherkin has a market on Saturday, in which raw cotton, cattle, honey, and coarse cotton cloths are sold. The Shangalla formerly molested Tcherkin greatly, but for thirty years past they had done little damage. The small-pox raged so violently for a number of years among them, that it greatly diminished their numbers, and consequently their power of troubling their neighbours.

They left Tcherkin on the morning of the 15th of January, and entered immediately into thick woods; but proceeded very slowly, the road being bad and unknown, if it could be called a road, and their camels overloaded.

They came to Saneaho, an old frontier territory of Abyssinia, on the 17th. The town may consist of about 300 huts or houses, neatly built of canes, and curiously thatched with leaves of the same. It rises in the midst of a plain, and resembles in shape Tcherkin Amba, though much larger; a considerable district all around belongs to it, of wilds and woods, if such as these, abandoned entirely to wild beasts, can be said to belong to any man. The east end slopes with rather a steep descent into the plain; and through that is a narrow winding road, seemingly the work of art, being obstructed at turns by huge stones, and at different stages, for the purpose of defence by guns or arrows; all the other sides of the rock are perpendicular precipices. The inhabitants of the town are Baafa, a race of Shangalla, converted to the Mahometan religion.

Our travellers proceeded but a mile and a half on the 20th, their beasts and themselves being equally fatigued, and their cloths torn all to rags, when they arrived at Guanjoek, which is a very delightful spot by the river side; small woods of very high trees, interspersed with very beautiful lawns; several fields also cultivated with cotton; variety of game, especially Guinea fowls, in great abundance, and, upon every tree, parrots, of all the different kinds and colours, compose the beauties of Guanjoek. Mr. Bruce saw no parrots, and supposes there were none; but on firing a gun, the first probably ever heard in those woods, there was such a screaming of other birds on all sides, some flying to the place whence the noise came, and some flying from it, that it was impossible to hear distinctly any other sound.

Having continued the journey from thence, at a quarter after one they came to Mariam-Ohba, and at half past three arrived at Hor-Cacamoot. Hor, in that country, signifies the dry deep bed of a torrent, which has ceased to run; and Cacamoot, the shade of death: so that Yafine's village, where they now took up their quarters, is called the valley of the shadow of death.

Hor-Cacamoot is situated in a plain in the midst of a wood, so much only of which has been cleared away as to make room for the miserable huts of which it consists, and for the small spots of ground on which they sow maffilla, or maize, to furnish them with bread. Their other food consists entirely of the flesh of the elephant and rhinoceros, and chiefly of the former; for the trouble of hunting the elephant is not greater than chasing the rhinoceros, and the difference of gain is much superior. The elephant has a greater quantity of better flesh, while his large teeth are very valuable, and afford a ready price every where. The inhabitants being little acquainted with the use of fire-arms, the smaller game, of the deer kind, are not much molested, unless by the wild Shangalla, who make use of bows and arrows, so that these animals are increased beyond imagination.

Formerly Ras el Feel consisted of thirty-nine villages. All the Arabs of Athara resorted to them with butter, honey, horses, gold, and many other commodities; and the Shekh of Athara, living upon the frontier of Senaar, entertained a constant good correspondence with the Shekh of Ras el Feel, to whom he sent yearly a Dongola horse, two razors, and two dogs. The Shekh of Ras el Feel, in return, gave him a mule and a female slave; and the effect of this

intercourse was to keep all the intermediate Arabs in their duty. But since the expedition of Yafous II. against Senaar, no peace has ever subsisted between the two states; on the contrary, all the Arabs that assisted the king, and were defeated with him, pay tribute no longer to Senaar, but live on the frontiers of Abyssinia and are protected there.

March the 17th, they set out from Hor-Cacamoot on their journey to Teawa, the capital of the province of Athara. Early in the morning of the 18th, they continued their journey through thick, and almost impenetrable woods full of thorns; and in two hours came to the bed of a torrent, though, in appearance, dry, upon digging with their hands in the loose sand, they found great plenty of fresh water exceedingly well tasted, being sheltered by projecting rocks from the action of the sun. This is called Surf el Shekh. Here they filled their girbas, for there is very little good water to be found between this and Teawa.

A girba is an ox's skin squared, and the edges sewed together very artificially by a double seam, which does not let out water, much resembling that upon the best English cricket-balls. An opening is left in the top of the girba, in the same manner as the bung-hole of a cask. Around this the skin is gathered to the size of a large handful, which, when the girba is full of water, is tied round with whip-cord. These girbas generally contain about sixty gallons each, and two of them are the load of a camel. They are then all besmeared on the outside with grease, as well to hinder the water from oozing through, as to prevent its being evaporated by the action of the sun upon the girba, which, in fact, happened to them twice, so as to put them in imminent danger of perishing with thirst.

Yafine had provided a camel and two girbas, as well as every other provision necessary for them, till they should arrive at Teawa. Surf el Shekh is the boundary of Ras el Feel. Here Mr. Bruce took an affectionate leave of his friend Yafine, who, with all his attendants, shewed, at parting, that love and attachment they had constantly preserved to Mr. Bruce since their first acquaintance.

Our travellers arrived at Imferra, on the 22nd, and from thence were two hours in going to Ralhid, for they were flying for their lives; the *Simoom*, or hot-wind, having struck them not long after they had set out from Imferra; and their little company, all but Mr. Bruce, fell sick with the quantity of poisonous vapour that they had imbibed. From Ralhid to Imferra it is about five miles; and though it is one of the most dangerous halting places between Ras el Feel and Senaar, yet they were so enervated, their stomachs so weak, and their head-achs so violent, that they could not pitch their tent, but each wrapping himself in his cloak, resigned himself immediately to sleep, under the cool shade of the large trees, invited by the pleasant breeze from the north, which seemed to be merely local, confined to this small grove, created probably by the vicinity of the water, and the agitation they had occasioned in it. In this helpless state to which they were reduced, Mr. Bruce alone continued not weakened by the *Simoom*, nor overcome by sleep. A Ganjar Arab, who drove an ass laden with salt, took this opportunity of stealing one of the mules, together with a lance and shield belonging to one of Mr. Bruce's servants. The country was so woody, and he had so much the advantage of them in point of time, and they were in so weak and discouraged a state, that it was thought in vain to pursue him one step. So he got off with his booty, unless he was intercepted by some of those wild beasts, which he would find every where in his way, whether he returned to Ras el Feel, or the frontiers of Kuara, his own country.

When they had refreshed themselves with a little sleep, their next care was to fill their girbas, or skins, with water. But before they attempted this, Mr. Bruce thought to try an experiment of mixing about twenty drops

the intermediate Arabs in expedition of Yafous II. has ever subsisted between contrary, all the Arabs that were defeated with him, payed, but live on the front of the river.

out from Hor-Casamoot, the capital of the province, the morning of the 18th, they through thick, and full of thorns; and in two torrent, though, in appearance, their hands in the loss of many of fresh water exceeded by projecting rocks. This is called Surf of their girbas, for there is found between this and

pared, and the edges sewed by a double seam, which resemble that upon the skin. An opening is left in the same manner as the bung, which is gathered to which, when the girba is with whip-cord. These but sixty gallons each, and a camel. They are then side with grease, as well as by the action of the sun fact, happened to them imminent danger of pe-

camel and two girbas, as necessary for them, till the Surf of Shekh is the Here Mr. Bruce took an and Yafine, who, with all starting, that love and affection preferred to Mr. Bruce

Imferrha, on the 23th, hours in going to Radfid, their lives; the Simoom, or in not long after they had their little company, all in the quantity of poison-bibed. From Radfid to local, and though it is one of the best places between Ras they were so enervated, their head-achs for violent their tent, but each, resigned himself into the cool shade of the large breeze from the north, local, confined to this by the vicinity of the they had occasioned in it, they were reduced, Mr. taken by the Simoom, Danjar Arab, who drove his opportunity of stealing with a lance and shield Bruce's servants. The he had so much the advantage, and they were in time, that it was thought of. So he got off with accepted by some of those kind every where in his Ras el Feel, or the front-

themselves with a little sleep, or girbas, or skins, with respect to this, Mr. Bruce of mixing about twenty drops

drops of spirit of nitre in a horn of water about the size of an ordinary tumbler. This he found greatly refreshed him, though his head-ach still continued. It had a much better effect upon his servants, to whom he gave it; for they all seemed immediately recovered, and their spirits much more so, from the reflection that they had with them a remedy they could trust to, if they should again be so unfortunate as to meet this poisonous wind or vapour.

On the 23d, they arrived at Teawa, the principal village and residence of the Shekh of Arbara, between three and four miles from the ruins of Garigana. The strength of Teawa was about 25 horse, of which about ten were armed with coats of mail. They had about a dozen of firelocks, very contemptible from the order in which they were kept, and still more so from the hands that bore them. The rest of the inhabitants might amount to twelve hundred men, naked, miserable, and deplorable Arabs, like the rest of those that live in villages, who are inferior in courage to the Arabs that dwell in tents: weak as its state was, it was the seat of government, and as such a certain degree of reverence attended it. Such was the state of Teawa. Its consequence was only to remain till the Davaina should resolve to attack it, when its corn fields being burnt and destroyed in a night by a multitude of horsemen, the bones of its inhabitants scattered upon the earth would be all its remains.

Mr. Bruce being sent for by the Shekh, found him sitting in a spacious room, in an alcove, on a large broad sofa like a bed, with India curtains gathered on each side into felloons. He called to a black boy who attended him, in a very surly tone, to bring him a pipe; and, in much the same voice, said to Mr. Bruce, "What! alone?" He replied, "Yes; what are your commands with me?" Mr. Bruce saw he either was, or affected to be, drunk, and which ever was the case, he knew it would lead to mischief; he therefore repented heartily of having come into the house alone. After he had taken two whiffs of his pipe, and the slave had left the room, "Are you prepared? said he: Have you brought the *needful* along with you?" Mr. Bruce wished to have occasion to join Soliman, his servant, and answered, "My servants are at the outer door, and have the vomit you wanted." "D—n you and the vomit too, said he, with great passion, I want money, and not poison. Where are your pialtres?" "I am a bad person, replied Mr. Bruce, to furnish you with either. I have neither money nor poison; but I advise you to drink a little warm water to clear your stomach, cool your head, and then lie down and compose yourself; I will see you to-morrow morning." Mr. Bruce was going out. "Haikim, said he, infidel, or devil, or whatever is your name, hearken to what I say. Consider where you are; this is the room where Mek Baady, a king, was slain by the hand of my father: look at his blood, where it has stained the floor, which never could be washed out. I am informed you have 20,000 piasters in gold with you; either give me 2000 before you go out of this chamber, or you shall die; I will put you to death with my own hand." Upon this he took up his sword, that was lying at the head of his sofa, and, drawing it with a bravado, threw the scabbard into the middle of the room; and, tucking the sleeve of his shirt above his elbow like a butcher, said, "I wait your answer." Mr. Bruce now slept one pace backwards, and held the little blunderbuss in his hand, without taking it off the belt. He said, in a firm tone of voice, "This is my answer: I am not a man, as I have told you before, to die like a beast by the hand of a drunkard. On your life, I charge you, stir not from your sofa." He had no need to give this injunction; he heard the noise which the closing the joint in the stock of the blunderbuss made, and thought he had cocked it, and was instantly to fire. He let his sword drop, and threw himself on his back on the sofa, crying, "For God's sake, Haikim, I was but jesting." At

the same time, with all his might, he cried, "Brahim! Mahomet! El coom! El coom!"—"If one of your servants approach me, said Mr. Bruce, that instant I will blow you to pieces: not one of them shall enter this room till they bring in my servants with them; I have a number of them armed at your gate, who will break in the instant they hear me fire." The women had come to the door, and Mr. Bruce's servants were admitted, each having a blunderbuss in his hand, and pistols at his girdle. They were now greatly an overmatch for Shekh, who sat far back on the sofa, and pretended that all he had done was in joke, in which his servants joined, and a very confused, desultory discourse followed, till the Turk, Sherrisse Imael, happened to observe the Shekh's scabbard of his sword thrown upon the floor, on which he fell into a violent fit of laughter. He endeavoured to make the Shekh understand, that drunkards and cowards had more need of the scabbard than the sword; that he, Fidele, and the other drunkard that came to their house two or three nights before, who said he was Shekh of Jehaina were just possessed of the same portion of courage and insolence. As no good could be expected from this expostulation, Mr. Bruce slept it, and took his leave, desiring the Shekh to go to-bed and compose himself, and not try any more of these experiments, which would certainly end in his shame, if not in his punishment.

Now Mr. Bruce and his servants went to the door, through the several apartments, very much upon their guard, for there was no person to light them out, and they were afraid of some treachery or ambush in the antichamber and dark passages; but they met nobody; and were, even at the outer gate, obliged to open the door themselves. Without the gate there were about twenty people gathered together, but none of them with arms; and, by the half words and expressions they made use of, they could judge they were not the Shekh's friends. They followed them for a little, but dispersed before they arrived at their house.

Mr. Bruce and his party had scarce got rid of this real danger, when the apprehension of an imaginary one struck them violently. The water at Teawa is stagnant in pools, and exceedingly bad. Either that, or the bouza, a kind of new beer which they sent them with their meat, had given all of them, at the same time, a violent diarrhoea, and Mr. Bruce was tormented with a perpetual thirst ever since they had been overtaken by the Simoom; and the bouza being acid was not only more agreeable, but, he thought, relieved him more than bad water: in this, therefore, he certainly had exceeded. When they found they were all taken ill at the same time, it came into their heads that Shekh Fidele had given them poison in their dinner, and they were very much perplexed what they should do the next day. None of them, therefore, tasted the meat sent them; when at night, their friend, the black slave, came, and to her they frankly told their doubts. The poor creature fell into such violent fits of laughing, which followed so close the one upon the other, and lasted so long, that Mr. Bruce feared she would have expired upon the spot. "It is the water, said she, it does so to all strangers; and then she fell into another great fit of laughter." "Child, answered Mr. Bruce, you know the Shekh is not our friend, and there is no easier way to get rid of us than by poison, as we eat every thing that comes from you without fear." "And so you may, said she, the Shekh could do no such thing without our knowledge, and we would rather all be burnt alive than be guilty of so vile an action. Besides, said she, this is not like Habesh, where both meat and drink, brought to you, are tasted by the bearer before you use them. There is no such thing as poison in Arbara; the lance and the knife in the field, that is the manner in which they kill one another here." They then shewed her their dinner uneaten, and she again fell into a violent fit of laughter, and took the meat away that she might warm it, and

they

they heard her laughing all the way as she went by herself. She was not long in returning with provisions in plenty, and told them, that her mistresses never were so diverted in their lives, and she left them still laughing.

All the while Mr. Bruce staid at Teawa, the behaviour of Fidele was all of a piece, and it is probable our traveller would have finished his travels in that place, had not some of his powerful friends interceded themselves in his security. However, after various impediments, on the 18th, they took leave of the Shekh to proceed on their journey. The day had been immoderately hot, and they had resolved to travel all night, though they did not say so to the Shekh, who advised them to sleep at Imgededema, where there was fresh water. But they had taken a girba of water with them, or rather, in case of accident, a little in each of the three girbas.

During the first seven hours, their journey was through a barren, bare, and sandy plain, without finding a vestige of any living creature; without water, and without grass; a country that seemed under the immediate curse of Heaven. However, after a most disagreeable journey, on the 19th, at eight in the evening they arrived at Beyla, about eleven miles west of Teawa, and thirty-one and a half miles due south. They were met by Mahomet, the Shekh, at the very entrance of the town. He said, he looked upon them as risen from the dead; that they must be good people, and particularly under the care of Providence, to have escaped the many snares the Shekh of Arbara had laid for them. Mahomet, the Shekh, had provided every sort of refreshment possible for them, and, thinking they could not live without it, he had ordered fugar for them from Sennaar. Honey for the most part hitherto had been its substitute. They had a good comfortable supper; as fine wheat-bread as ever Mr. Bruce ate in his life, brought from Sennaar, as also rice: in a word, every thing that their kind landlord could contribute to their plentiful and hospitable entertainment. Our traveller's whole company was full of joy, to which the Shekh greatly encouraged them; and if there was any alloy to the happiness, it was seeing that Mr. Bruce did not partake of it. Symptoms of an aguish disorder had been hanging about him for several days, ever since the diarrhœa had left him. He found the greatest repugnance, or nausea, at the smell of warm meat; and, having a violent head-ach, he insisted upon going to bed suppellets, after having drank a quantity of warm water by way of emetic. Being exceedingly tired, he soon fell sound asleep, having first taken some drops of a strong spirituous tincture of the bark which he had prepared at Gondar, resolving, if he found any remission, as he then did, to take several good doses of the bark in powder on the morrow, beginning at day-break, which he accordingly did with success.

April the 20th, a little after the dawn of day, the Shekh, in great anxiety, came to the place where Mr. Bruce was lying, upon a tanned buffalo's hide, on the ground. His sorrow was soon turned into joy when he found him quite recovered from his illness. He had taken the bark, and expressed a desire of eating a hearty breakfast of rice, which was immediately prepared for him. The Shekh of Beyla was an implicit believer in medicine. Seeing him take some drops of the tincture before coffee, he insisted upon pledging Mr. Bruce, and he believes would have willingly emptied the whole bottle. The Shekh, having suffered great agony with his own complaint, had passed some small stones, and was greatly better, as he said, for the soap-pills. Mr. Bruce put him in a way to prepare these, as also his lime-water. It was impossible to have done any favour for him equal to this, as his agony had been so great.

This being the time to give the Shekh a present, Mr. Bruce had prepared one for him, such as he very well deserved; but no entreaty, nor any means he could use, could prevail upon him to accept of the

meagre trifle. On the contrary, he solemnly swore, that if Mr. Bruce importuned him further, he would get upon his horse and go into the country. All that he desired, and that too as a favour, was, that when Mr. Bruce had rested at Sennaar, he might come and consult him further as to his complaints, for which he promised he should bring a recompence with him.

Notwithstanding Mr. Bruce's reception here was very kind, yet he determined to press on to Sennaar before affairs there were in a desperate situation, or some scheme of mischief should be contrived by Fidele. They had again a large and plentiful dinner, and a quantity of houza; venison of several different species of the antelope or deer kind, and Guinea-fowls, boiled with rice, were the best part of their fare, for the venison finelled and tasted strongly of milk. This was the provision made by the Shekh's two sons, boys about fourteen or fifteen years old, who had got each of them a gun with a matchlock, and whole favour he secured to a very high degree, by giving them some good gunpowder, and plenty of small leaden bullets.

They went in the afternoon to see the village, which is a very pleasant one, situated at the bottom of a hill, covered with wood, all the rest flat before it. Through this plain there are many large timber trees, planted in rows, and joined with high hedges, as in Europe, forming enclosures for keeping cattle; but of these they saw none, as they had been moved to the Dender for fear of the flies. There is no water at Beyla but what is got from deep wells. Large plantations of Indian corn are every where about the town. The inhabitants are in continual apprehension from the Arabs Daveina at Sim Sim, about 40 miles south-east from them; and from another powerful race called Wed abd el Gin, i. e. *Sons of the slaves of the Devil*, who live to the south-west of them, between the Dender and the Nile. Beyla is another frontier town of Sennaar, on the side of Sim Sim; and between Teawa and this, on the Sennaar side, and Ras el Feel, Nara, and Tchelga, upon the Abyssinian side, all is desert and waste, the Arabs only suffering the water to remain there without villages near it, that they and their flocks may come at certain seasons while the grass grows, and the pools or springs fill elsewhere.

Mr. Bruce, though he went early to bed with a full determination to set out by day-break, found it was impossible to put his design in execution, or get from the hands of their kind landlord. One of their girbas seemed to fail, and needed to be repaired. Nothing good, as he truly said, could come from the Shekh of Arbara.

They left Beyla at three o'clock in the afternoon on the 21st of April, and proceeded through a very pleasant, flat country, but without water; there had been none in their way nearer than the river Rahad. About eleven at night they alighted in a wood: The place is called Baharie, as near as they could compute, nine miles from Beyla.

At half past five o'clock in the morning of the 22d, they left Baharie, still continuing westward, and at nine they came to the banks of the Rahad. The ford is called Tehir Chaira. The river itself was now standing in pools, the water foul, stinking, and covered with a green mantle; the bottom soft and muddy, but there was no choice. The water at Beyla was so bad, that they took only as much as was absolutely necessary till they arrived at running water from the Rahad.

They met several men the next day on horseback and foot, coming out from among the bushes, who endeavoured to carry off one of their camels. They indeed were somewhat alarmed, and were going to prepare for resistance. The camel they had taken away had on it the king's and Shekh Adelan's presents, and some other things for their future need. Their clothes too, books, and papers, were upon the same camel. However, as this was only a contrivance to extort a present from Mr. Bruce, the matter was easily got over, and the camel restored.

On

On the 24th, they came to the river Dender, stand- ing now in pools, but by the vast wideness of its banks, and the great deepness of its bed, all of white sand, it should seem that in time of rain, it will contain nearly as much water as the Nile. The banks are every where thick overgrown with the rack and fig-tree, especially the latter. The wood, which had continued molly from Beyla, here failed entirely, and reached no further towards Sennaar. These two sorts of trees, however, were in very great beauty, and of a prodigious size. At six o'clock in the evening, they set out from a shady place of repose on the banks of the Dender, through a large plain, with not a tree before them; but they presently found themselves encompassed with a number of villages, nearly of a size, and placed at equal distances in form of a semi-circle, the roofs of the houses in shape of cones, as are all those within the rains. The plain was all of a red, soapy earth, and the corn just sown. This whole country is in perpetual cultivation, and though, at this time, it had a bare look, would no doubt have a magnificent one when waving with grain. At nine they halted at a village of Pagan Nuba. These are all soldiers of the Mek of Sennaar, cantoned in these villages, which, at the distance of four or five miles, surround the whole capital. They are either purchased or taken by force from Fazuelo, and the provinces to the south upon the mountains Dyr and Tegla. Having settlements and provisions given them, as also arms put into their hands, they never wish to desert, but live a very domestic and sober life. They pay adoration to the moon; and that their worship is performed with pleasure and satisfaction, is obvious every night that the thines. Coming out from the darkness of their huts, they say a few words upon seeing her brightness, and testify great joy, by motions of their feet and hands, at the first appearance of the new moon. Mr. Bruce never saw them pay any attention to the sun, either rising or setting, advancing to or receding from the meridian; but, as far as he could learn, they worship a tree, and likewise a stone, though he never could find out what tree or stone it was, only that it did not exist in the country of Sennaar, but in that wherein they were born. Their priests seemed to have great influence over them, but through fear only, and not from affection. They are distinguished by thick copper bracelets about their wrists, as also sometimes one, and sometimes two about their ancles.

About four o'clock in the afternoon of the 25th, they set out from the villages of the Nuba, intending to arrive at Balboch, where is the ferry over the Nile; but they had scarcely advanced two miles into the plain, when they were enveloped by a violent whirlwind, or what is called, at sea, the water-spout. The plain was red earth, which had been plentifully moistened by a shower in the night-time. The unfortunate camel that had been taken by the Cohala seemed to be nearly in the centre of its vortex. It was lifted up and thrown down at a considerable distance, and several of its ribs broken. Although, as far as Mr. Bruce could guess, he was not near the centre, it whirled him off his feet, and threw him down upon his face, so as to make his nose gush out with blood. Two of the servants likewise had the same fate. It plattered them all over with mud, almost as smoothly as could have been done with a trowel. It took away Mr. Bruce's sense and breathing for an instant, and his mouth and nose were full of mud when he recovered. He guesses the sphere of its action to be about 200 feet. It demolished one half of a small hut, as if it had been cut through with a knife, and dispersed the materials all over the plain, leaving the other half standing.

When they recovered themselves, they took refuge in a village, from fear only, for they saw no vestige of any other whirlwind. It involved a great quantity of rain, which the Nuba of the villages told them was very fortunate, as it portended good luck to them, and a prosperous journey; for they said, that

had dust and sand arisen with the whirlwind, in the same proportion it would have done, had not the earth been moistened, they would all infallibly have been suffocated; and they cautioned them, by laying, that tempests were very frequent at the beginning and end of the rainy season, and whenever they should see one of them coming, to fall down upon their faces, keeping their lips close to the ground, and so let it pass; and thus it would neither have power to carry them off their feet, nor suffocate them, which was the ordinary case. Their kind landlords, the Nuba, gave them a hearty welcome, and helped them to wash their clothes first, and then to dry them. They gave them a piece of roasted hog, which they ate (except Imael and the Mahometans) very much to the satisfaction of the Nuba. On the other hand, as their camel was lame, they ordered one of their Mahometan servants to kill it, and take as much of it as would serve themselves that night; they also provided against wanting themselves the next day. The rest they gave among their new-acquired acquaintance, the Nuba of the village, who did not fail to make a feast upon it for several days after; and, in recompence for their liberality, they provided them with a large jar of souza, not very good, indeed, but better than the well water. This Mr. Bruce repaid by tobacco, beads, pepper, and sibiium, which he saw plainly was infinitely more than they expected. Mr. Bruce had seldom, in his life, upon a journey, passed a more comfortable night. He had a very neat, clean hut, entirely to himself, and a Greek servant that sat near him. Some of the Nuba watched for them all night, and took care of their beads and baggage. They sung and replied to one another alternately, in notes full of pleasant melody, till Mr. Bruce fell fast asleep, involuntarily, and with regret; for, though bruised, they were not fatigued, but rather discouraged, having gone no further than two miles that day.

Early on the 26th, they set out from this village of Nuba, their way being still across this immense plain. All the morning there were terrible storms of thunder and lightning, some rain, and one shower of so large drops, that it wet them to the skin in an instant. It was quite calm, and every drop fell perpendicularly upon them. Mr. Bruce thinks he never in his life felt so cold a rain, yet it was not disagreeable; for the day was close and hot, and they should have wished every now and then to have had a moderate refrigeration: this, however, was rather too abundant. The villages of the Nuba were, on all sides, throughout this plain. At nine o'clock they arrived at Balboch, which is a large collection of huts of these people, and has the appearance of a town.

The governor, a venerable old man of about seventy, who was so feeble that he could scarcely walk, received them with great complacency, only saying, when he took Mr. Bruce by the hand, "O Christian! what dost thou, at such a time, in such a country?" Mr. Bruce was surprised at the politeness of his speech, when he called him Nazarin, the civil term for Christian in the east; whereas Infidel is the general term among these brutish people; but it seems he had been several times at Catro. Mr. Bruce had here a very clean and comfortable hut to lodge in, though they were sparingly supplied with provisions all the time they were there, but never were suffered to fast a whole day together.

Balboch is on the eastern bank of the Nile, not a quarter of a mile from the ford below. The river here runs north and south; towards the sides it is shallow, but deep in the middle of the current, and in this part it is much infested with crocodiles. Sennaar is two miles and a half S. S. W. of it. They heard the evening drum very distinctly, and not without anxiety, when they reflected to what a brutish people, according to all accounts, they were about to trust themselves.

Permission was granted on the 29th to enter Sennaar. They were conducted by Adelan's servant to a

very spacious good house belonging to the Shekh himself, having two stories, a long quarter of a mile from the king's palace. He left a message for them to repose themselves, and in a day or two to wait upon the king, and that he should send to tell them when they were to come to him. This they resolved to have complied with most exactly; but the very next morning, the 30th of April, there came a servant from the palace to summon them to wait upon the king, which they immediately obeyed. Mr. Bruce took with him three servants, black Soliman, Ismael the Turk, and his Greek servant Michael. The palace covers a prodigious deal of ground. It is all one story, built of clay, and the floors of earth. The chambers through which they passed were all unfurnished, and seemed as if a great many of them had formerly been destined as barracks for soldiers, of whom Mr. Bruce did not see above fifty on guard. The king was in a small room not twenty feet square, to which they ascended by two small flights of narrow steps. The floor of the room was covered with broad square tiles; over it was laid a Persian carpet, and the walls hung with tapestry of the same country; the whole very well kept, and in good order.

His Majesty was sitting upon a mattress, laid on the ground, which was likewise covered with a Persian carpet, and round him was a number of cushions of Venetian cloth of gold. His dress did not correspond with this magnificence, for it was nothing but a large, loose shirt, of Surat blue cotton cloth, which seemed not to differ from the same worn by his servants, except that, all round the edges of it, the seams were double-stitched with white silk, and likewise round the neck. His head was uncovered; he wore his own short black hair, and was as white in colour as an Arab. He seemed to be a man about thirty-four, his feet were bare, but covered by his shirt. He had a very plebeian countenance, on which was stamped no decided character; Mr. Bruce should rather guess him to be a soft, timid, irresolute man. At our traveller's coming forward and kissing his hand, he looked at them for a minute as if undetermined what to say. He then asked for an Abyssinian interpreter, as there are many of these about the palace. He said to him in Arabic, "I apprehend I understand as much of that language as will enable me to answer any question you have to put to me." Upon which he turned to the people that were with him, "Downright Arabic, indeed! You did not learn that language in Habesh?" said he to Mr. Bruce, who answered, "No; I have been in Egypt, Turkey, and Arabia, where I learned it; but I have likewise often spoken it in Abyssinia, where Greek, Turkish, and several other languages are used. He said, "Impossible! he did not think they knew any thing of languages, excepting their own, in Abyssinia."

Opposite the king, were sitting in the side of the room four men dressed in white cotton shirts, with a white shawl covering their heads, and part of their face, by which it was known they were religious men, or men of learning, or of the law. One of these answered the king's doubt of the Abyssinians knowledge in languages. "They have languages enough, and you know that Habesh is called the paradise of Asses." During this conversation, Mr. Bruce took the sheriffe of Mecca's letter, also one from the king of Abyssinia; he gave him the king's first, and then the sheriffe's. He took them both as Mr. Bruce gave them, but laid aside the king's upon a cushion, till he had read the sheriffe's. After this he read the king's, and called immediately again for an Abyssinian interpreter; upon which, Mr. Bruce said nothing, supposing, perhaps, he might chuse to make him deliver some message to him in private, which he would not have his people hear. But it was pure confusion, and absence of mind, for he never spoke a word to him when he came. An uninteresting conversation took place between the king and our traveller, till a little after six o'clock in the evening, when the drum beat. They then had a very comfortable dinner sent them,

camels flesh stewed with an herb of a viscous slimy substance, called Bammia. After having dined, and finished the journal of the day, Mr. Bruce fell to unpacking his instruments, the barometer and thermometer first, and, after having hung them up, was conversing with Adelan's servant when he should pay his visit to his master. About eight o'clock came a servant from the palace, telling Mr. Bruce, now was the time to bring the present to the king. He sorted the separate articles with all the speed he could, and they went directly to the palace. The king was then sitting in a large apartment, as far as he could guess, at some distance from the former. He was naked, but had several clothes lying upon his knee, and about him, and a servant was rubbing him over with very stinking butter, or grease, with which his hair was dropping as if wet with water. Large as the room was, it could be smelled through the whole of it. The king asked Mr. Bruce if ever he greased himself as he did? Mr. Bruce said, Very seldom, but fancied it would be very expensive. He then told him, that it was elephants grease, which made people strong, and preserved the skin very smooth. Our traveller said, he thought it very proper, but could not bear the smell of it, though his skin should turn as rough as an elephant's for the want of it. He said, if Mr. Bruce had used it, his hair would not have turned so red as it was, and that it would all become white presently, when that redness came off.

After having rubbed him abundantly with grease, they brought a pretty large horn, and in it something scented, about as liquid as honey. It was plain that civit was a great part of the composition. The king went out at the door, Mr. Bruce supposes into another room, and there two men deluged him over with pitchers of cold water, whilst, as he imagined, he was stark-naked. He then returned, and a slave anointed him with this sweet ointment; after which he sat down, as completely dressed, being just going to his woman's apartment where he was to sup. Mr. Bruce told him, he wondered why he did not use rose-water as in Abyssinia, Arabia, and Cairo. He said, he had it often from Cairo, when the merchants arrived; but as it was now long since any came, his people could not make more, for the rose would not grow in his country, though the women made something like it of lemon-flower. His toilet being finished, our traveller then produced his present, which he told him the king of Abyssinia had sent to him, hoping that, according to the faith and custom of nations, he would not only protect him while here, but send him safely and speedily out of his dominions into Egypt. He answered, there was a time when he could have done all this, and more, but those times were changed. Sennaar was in ruin, and was not like what it was. He then ordered some perfumed sorbet to be brought for Mr. Bruce to drink in his presence, which is a pledge that your person is in safety. The king thereupon withdrew, and went to his ladies.

On the eighth of May Mr. Bruce had an audience with Shekh Adelan at Aira, which is three miles and a half from Sennaar; they walked out early in the morning, for the greatest part of the way along the side of the Nile, which had no beauty, being totally divested of trees, the bottom foul and muddy, and the edges of the water white with small concretions of calcareous earth, which, with the bright sun upon them, dazzled and affected their eyes very much. They then struck across a large sandy plain, without trees or bushes, and came to Adelan's habitation. Within the gate was a number of horses, with the soldiers barracks behind them; they were all picketed in ranks, their faces to their master's barracks. It was one of the finest sights Mr. Bruce ever saw of the kind. They were all above sixteen hands high, of the breed of the old Saracen horses, all finely made, and as strong as our coach-horses, but exceedingly nimble in their motion; rather thick and short in the forehead, but with the most beautiful eyes,

ears, and heads in the world; they were mostly
black, some of them black and white, some of them
milk-white foaled, so not white by age, with white
eyes and white hoofs, not perhaps a great recom-
mendation. A steel shirt of mail hung upon each
man's quarters opposite to his horse, and by it an
antelope's skin, made soft like shamoy, with which
it was covered from the dew of the night. A head-
piece of copper, without crest or plume, was sus-
pended by a lace above the shirt of mail, and was the
most picturesque part of the trophy. To these was
added, an enormous broadsword, in a red leather
scabbard; and upon the pommel hung two thick
gloves, not divided into fingers as ours, but like
belgers gloves, their fingers in one poke. They
told Mr. Bruce, that, within that enclosure at Aira,
there were 400 horses, which, with the riders, and
armour complete for each of them, were all the prop-
erty of Shekh Adelan, every horseman being his
slave, and bought with his money.

Adelan was then sitting upon a piece of the trunk
of a palm-tree, in the front of one of these divisions
of his horses, which he seemed to be contemplating
with pleasure; a number of black people, his own
servants and friends, were standing round him. He
had on a long drab-coloured camel gown, lined with
yellow satin, and a camel cap like a head piece, with
two short points that covered his ears. This, it seems,
was his dress when he rose early in the morning to
visit his horses, which he never neglected. The
Shekh was a man above six feet high, rather corp-
ulent, had a heavy walk, seemingly more from affec-
tion of grandeur than want of agility. He was
about sixty, of the colour and features of an Arab,
and not of a Negro, but had rather more beard than
falls to the lot of people in this country; large pier-
cing eyes, and a determined, though, at the same
time, a very pleasing countenance.

They went into a large saloon, hung round with
mirrors and scarlet damask; in one of the longest
sides were two large sofas covered with crimson and
yellow damask, and large cushions of cloth of gold,
like to the king's. He now pulled off his camel
gown and cap, and remained in a crimson satin coat
reaching down below his knees, which lapped over
at the breast, and was girt round his waist with a scarf,
or sash, in which he had stuck a short dagger, in an
ivory sheath, mounted with gold; and one of the
largest and most beautiful amethysts upon his finger
that Mr. Bruce ever saw, mounted plain, without
any diamonds, and a small gold ear-ring in one of his
ears.

After some introductory discourse, Mr. Bruce gave
him the sherriffe's letter, which he opened, looked
at, and laid by without reading, saying only, "Aye,
Metical is a good man, he sometimes takes care of
our people going to Mecca; for my part, I never
was there, and probably never shall." Mr. Bruce
then presented his letter from Ali Bey to him. He
placed it upon his knee, gave a flap upon it with
his open hand, and then exclaimed, "What! do you
not know, have you not heard, Mahomet Abou
Dahab, his Hafnadar, has rebelled against him, ban-
nished him out of Cairo, and now sits in his place?
But don't be disconcerted at that, I know you to be
a man of honour and prudence; if Mahomet, my
brother, does not come, as soon as I can get leisure,
I will dispatch you." The servant that had conducted
Mr. Bruce to Sennaar, and was then with him, went
forward close to him, and said, in a kind of whisper,
"Should he go often to the king?"—"When he
pleases; he may go to see the town, and take a walk,
but never alone, and also to the palace, that, when
he returns to his own country, he may report that he
saw a king at Sennaar, that neither knows how to
govern, nor will suffer others to teach him; who
knows not how to make war, and yet will not sit in
peace." Mr. Bruce then took his leave of him;
there was a plentiful breakfast in the other room, to
which he sent them.

Our traveller returned home to Sennaar, very well
pleased with his reception at Aira. He had not seen,
since he left Gondar, a man so open and frank in his
manners, and who speaks without disguise what ap-
parently he had in his heart.

Mr. Bruce having come home from Aira, the next
morning he was agreeably surprised by a visit from
Hagi Belal, to whom he had been recommended by
Metical Aga, and to whom Ibrahim Scraif, the Eng-
lish broker at Jidda, had addressed him for any
money he should want at Sennaar. Belal welc-
ed him with great kindness, and repeated testimonies of
joy and wonder at his safe arrival. He had been
down at Aibara at Gerri, or some villages near it,
with merchandize, and had not yet seen the king
since he came home, but gave Mr. Bruce the very
worst description possible of the country, inasmuch
that there seemed to be not a spot, but the one he
then stood on, in which he was not in imminent dan-
ger of destruction, from a variety of independent
causes, which it seemed not possibly in his power to
avoid. In the evening, he sent Mr. Bruce some
refreshments, which he had long been unaccustomed
to: some tea, excellent coffee, some honey and
brown sugar, several bottles of rack, likewise nut-
megs, cinnamon, ginger, and some very good dates
of the dry kind which he had brought from Abarar.

This Hagi Belal was a native of Morocco. He
had been at Cairo, and also at Jidda and Mocha.
He knew the English well, and professed himself both
obliged and attached to them. It was some days
before Mr. Bruce ventured to speak to him upon
money business, or upon any probability of finding
assistance here at Sennaar. He gave him little hopes
of the latter, repeating to him what he very well
knew about the disagreement of the king and Adelan.
He seemed to place all his expectations, and those
were but faint ones, in the coming of Shekh Abou
Kalec from Kordofan. He said, nothing could be
expected from Shekh Adelan without going to Aira,
for that he would never trust himself in Sennaar, in
this king's life-time, but that the minister was absolute
the moment he assembled his troops without the town.

He came to Mr. Bruce one morning, after having
been with the king, when our traveller was himself
preparing to go to the palace. He said, he had been
sent for upon his account, and had been questioned
very narrowly what sort of a man he was. Having
answered very favourably, both of him and his na-
tion, he had asked for Metical Aga's letters, or any
other letters received concerning him from Jidda;
he said, that he had only shewn Metical's letter,
wrote in the name of the sherriffe, as also one from
himself; that there were several great officers of go-
vernment present; and the Cadi (whom Mr. Bruce
had seen the first time he had been with the king) had
read the letters aloud to them all: that one of them
had asked, how it came that such a man as our tra-
veller ventured to pass these deserts, with four or
five old servants, and what it was he came to see;
that he answered, he apprehended his chief object
at Sennaar was to be forwarded to his own country.
It was also asked, Why Mr. Bruce had not some
Englishmen with him, as none of his servants were
of that nation, but poor beggarly Kopts, Arabs, and
Turks, who were none of them of his religion. Belal
answered, That travellers, through these countries
mult take up with such people as they can find going
the same way; however, he believed some English
servants had died in Abyssinia, which country he had
left the first opportunity that had offered, being
wearied by the perpetual war which prevailed.

Some short time after this, Mr. Bruce had a mes-
sage from the palace. He found the king sitting
alone, apparently much chagrined, and in ill-humour.
He asked him, in a very peevish manner, if he was
not yet gone? to which he answered, "Your Maje-
sty knows that it is impossible for me to go a step from
Sennaar without assistance from you." He again
asked him, in the same tone as before, "How he
could

could think of coming that way?" He said, nobody imagined in Abyssinia but that he was able to give a stranger safe conduct through his own dominions. He made no reply, but nodded a sign for him to depart, which he immediately did, and so finished this short, but disagreeable interview.

Mr. Bruce was again sent for to the palace, about four o'clock that same afternoon, when the king told him, that several of his wives were ill, and desired that he would give them his advice, which he promised to do without difficulty, as all acquaintance with the fair sex had hitherto been much to his advantage. He was admitted into a large square apartment very ill-lighted, in which were about fifty women, all perfectly black, without any covering but a very narrow piece of cotton rag about their waists. While he was musing whether or not these all might be queens, or whether there was any queen among them, one of them took him by the hand and led him rudely enough into another apartment. This was much better lighted than the first. Upon a large bench, or sofa, covered with blue Surat cloth, sat three persons clothed from the neck to the feet with blue cotton shirts.

One of these, whom Mr. Bruce found to be the favourite, was about six feet high, and corpulent beyond all proportion. She seemed to him, next to the elephant and rhinoceros, to be the largest living creature he had met with. Her features were perfectly like those of a Negro; a ring of gold passed through her under lip, and weighed it down, till, like a flap, it covered her chin, and left her teeth bare, which were very small and fine. The inside of her lip she had made black with antimony. Her ears reached down to her shoulders, and had the appearance of wings; she had in each of them a large ring of gold, somewhat smaller than a man's little finger, and about five inches diameter. The weight of these had drawn down the hole where her ear was pierced, so much that three fingers might easily pass above the ring. She had a gold necklace, like what we used to call Esclavage, of several rows, one below another, to which were hung rows of sequins pierced. She had on her ancles two manacles of gold, larger than any he had ever seen upon the feet of felons, with which he could not conceive it was possible for her to walk; but afterwards he found they were hollow. The others were dressed pretty much in the same manner; only there was one that had chains which came from her ears to the outside of each nostril, where they were fastened. There was also a ring put through the grille of her nose, and which hung down to the opening of her mouth. It had altogether, something of the appearance of a horse's bridle. Upon his coming near them, the eldest put her hand to her mouth and kissed it, saying, at the same time, in very vulgar Arabic, "How do you do, merchant?" Mr. Bruce never in his life was more pleased with distant salutations than at this time. He answered, "Peace be among you! I am a physician, and not a merchant." Mr. Bruce now administered all the relief in his power, which their several complaints required.

No horse, mule, ass, or any other beast of burden, breed, or even live at Sennaar, or many miles about it. Poultry does not live there. Neither dog nor cat, sheep nor bullock, can be preserved a season there. They must go all, every half year, to the sands. Though all possible care be taken of them, they die in every place where the fat earth is about the town during the first season of the rains. Two greyhounds, which Mr. Bruce brought from Atbara, and the mules which he brought from Abyssinia, lived only a few weeks after he arrived. They seemed to have some inward complaint, for nothing appeared outwardly. Several kings have tried to keep lions, but no care could prolong their lives beyond the first rains. Shekh Adelan had two, which were in great health, being kept with his horses at grafs in the sands but three miles from Sennaar: neither rose, nor any species of

jeffamine, grow here; no tree but the lemon flowers near the city, that ever Mr. Bruce saw; the rose had been often tried, but in vain.

Sennaar is on the west side of the Nile, and close upon the banks to it. The ground whereon it stands rises just enough to prevent the river from entering the town, even in the height of the inundation, when it comes to be even with the street. The country around it is exceedingly pleasant in the end of August and beginning of September, Mr. Bruce means so far as the eye is concerned; instead of that barren, bare waste, which it appeared on their arrival in May, the corn now sprung up, and covering the ground, made the whole of this immense plain appear a level, green land, interspersed with great lakes of water, and ornamented at certain intervals with groups of villages, the conical tops of the houses presenting at a distance, the appearance of small encampments. Through this immense, extensive plain, winds the Nile, a delightful river there, above a mile broad, full to the very brim, but never overflowing. Every where on these banks are seen numerous herds of the most beautiful cattle of various kinds, the tribute recently extorted from all the Arabs, who, freed from their vexations, return home with the remainder of their flocks in peace, at as great a distance from the town, country, and their oppressors, as they possibly can.

War and treason seem to be the only employment of this horrid people, whom Heaven has separated, by almost insupportable deserts, from the rest of mankind, confining them to an accursed spot, seemingly to give them earnest in time of the only other war which he has reserved to them for an eternal hereafter. The dress of Sennaar is very singular. It consists of a long shirt of blue Surat cloth called *Mawawty*, which covers them from the lower part of the neck down to their feet, but does not conceal the neck itself; and this is the only difference between the mens and the womens dress; that of the women covers their neck altogether, being buttoned like ours. The men have sometimes a sash tied about their middle; and both men and women go bare-footed in the house, even those of the better sort of people. Their floors are covered with Persian carpets, especially the women's apartments. In fair weather, they wear sandals; and without doors they use a kind of wooden patten, very neatly ornamented with shells. In the greatest heat at noon, they order buckets of water to be thrown upon them instead of bathing. Both men and women anoint themselves, at least once a day, with camels grease mixed with civet, which they imagine softens their skin, and preserves them from cutaneous eruptions, of which they are so fearful, that the smallest pimple in any visible part of their body keeps them in the house till it disappears: for the same reason, though they have a clean shirt every day, they use one dipped in grease to lie in all night, as they have no covering but this, and lie upon a bull's hide tanned, and very much softened by this constant greasing, and at the same time very cool, though it occasions a smell that no washing can free them from.

The indigent live upon millet, made into bread or flour. The rich make a pudding of this, toasting the flour before the fire, and pouring milk and butter into it; besides which, they eat beef, partly roasted and partly raw. Their horned cattle are the largest and fattest in the world, and are exceedingly fine; but the common meat sold in the market is camels flesh. The liver of the animal, and the spare rib, are always eaten raw through the whole country. Mr. Bruce never saw one instance where it was dressed with fire. It is not then true that eating raw flesh is peculiar to Abyssinia; it is practised in this instance of camels flesh in all the black countries to the westward. Hogs flesh is not sold in the market; but all the people of Sennaar eat it publicly: men in office, who pretend to be Mahometans, eat theirs in secret.

August

August the 7th Mr. Bruce was informed by Hagi
Belal, that Sh-ekh Fidele of Teawa had been several
days in the palace with the king, and had informed
him that Mr. Bruce was laden with money, besides a
quantity of cloth of gold, the richest he had ever seen,
which the king of Abyssinia had destined as a present
to him, but which our traveller had perverted to his
own use: he added, that the king had expressed him-
self in a very threatening manner, and that he was
very much afraid he was not in safety if Shekh Ade-
lan was gone from Aira. Upon this, Mr. Bruce
desired Hagi Belal to go to the palace, and obtain
for him an audience of the king. In vain he repre-
sented to our traveller the risk he run by this measure;
he persisted in his resolution, he was tied to the stake:
to fly was impossible, and he had often overcome
such dangers by braving them.

With great unwillingness Belal went to the palace.
Whether he delivered the message, our traveller
knows not, but he returned, saying, the king was
busy and could not be seen. Mr. Bruce had, in the
interim, sent Soliman to the Gindi, or Sed el Coom,
telling him his difficulties, and the news he had
heard. In place of returning an answer, he came
directly to him himself, and was sitting with him
when Hagi Belal returned, who appeared somewhat
disconcerted at the meeting. Gundi chid Hagi Belal
very sharply, asking him what good all that tittle-
tattle did either him or Mr. Bruce, and intimated
pretty plainly, that he believed Hagi Belal did this
in concert with the king, to extort some present from
our traveller. After some further conversation,
Gindi took his leave, and Mr. Bruce attended him
down stairs, with many professions of gratitude; and
at the door he said, in a very low voice, to our tra-
veller, "Take care of you Belal, he is a dog worse
than a Christian."

It was now the 20th; and, for several days since
Adelan's departure, no provisions were sent to Mr.
Bruce's house, as before was usual. Money there-
fore became absolutely necessary, not only for their
daily subsistence, but for camels to carry their bag-
gage, provisions, and water across the desert. He
now despaired absolutely of assistance of any kind
from the king; and an accident that happened made
him lay all thoughts aside of ever troubling him more
upon the subject. There are at Mecca a number of
black eunuchs, whose services are dedicated to that
temple, and the sepulchre of Medina. Part of these,
from time to time, procure liberty to return on a
visit to their respective homes, or to the large cities
where they were sold from, on the Niger, Bornou,
Tocrar, and Tombueto, where they beg donations
for the holy places, and frequently collect large sums
of gold, which abounds in these towns and territo-
ries. One of these, called Mahomet Towashi, which
signifies Eunuch, had returned from a begging voy-
age in Sudan, or Nigritia, and was at Sennaar ex-
ceedingly ill with an intermitting fever. The king
had sent for Mr. Bruce to visit him, and the bark
in a few days had perfectly recovered him. A pro-
portional degree of gratitude had, in return, taken
place in the breast of Mahomet, who, going to Cairo,
was exceedingly desirous of taking Mr. Bruce with
him, and this desire was increased when he heard he
had letters from the Sheriffe of Mecca, and was ac-
quainted with Metical Aga, who was his immediate
master.

Nothing could be more fortunate than this ren-
counter at such a time, for he had spare camels in
great plenty, and the Arabs, as he passed them,
continued giving him more, and supported him with
provisions wherever he went; for these people, being
accounted sacred, and regarded with a certain reli-
gious awe, as being in the immediate service of their
prophet, till now used to pass inviolate wherever they
were going, however unsettled the times, or however
viciously attended.

Now every thing was ready, and the 25th of August
fixed when they should begin their journey to Atbara.

Mahomet, who passed a great part of his time at Mr.
Bruce's house, had not been seen by them for several
days, which they did not think extraordinary, being
busy themselves, and knowing that his trade demand-
ed continual attendance on the great people; but they
were exceedingly surpris'd at hearing from his black
Soliman, that he and all his equipage had set out the
night of the 20th for Atbara. This they found after-
wards was at the earnest persuasion of the king, and
was at that time a heavy disappointment to Mr. Bruce,
however fortunate it turned out afterwards.

On the night of the 25th, which was to have been
that of their departure, Mr. Bruce sat late in his
room up stairs, in the back, or most private part of
their house. His little company was holding with
him a most melancholy council on what had so re-
cently happened, and, in general, upon the unprom-
ising face of their affairs. Their single lamp was
burning very low, and suggested to them that it was
the hour of sleep, to which, however, none of them
were very much inclined. Georgis, a Greek, who,
on account of the soreness of his eyes, had laid be-
low in the dark, and had fallen asleep, came running
up stairs in a great fright, and told them he had been
awakened by the noise of men endeavouring to force
open the door; that he hearkened a little, and found
there were many of them. Their arms were all ready,
and they snatched them up and ran towards the
door; but Mr. Bruce stop'd, and planted them upon
the first landing-place in the stair-case, as he wished
not to fire till the enemy was fairly in the house, that
no excuse might remain for this their violation of
hospitality. By this time, the assailants had forced
the outer-gate, and were then in the lodge, endea-
vouring to do the same by the inner, having put a
handspike under it to lift it up from the hinges. "Are
you not madmen, said Mr. Bruce, and weary of your
lives, to attempt to force Adelan's house, when there
are within it men abundantly provided with large fire-
arms, that, upon one discharge through the door,
will lay you all dead where you now stand?" "Ullah!
Ullah! cries one of them softly, how found you
sleep! we have been endeavouring to waken you this
hour. The king is ill; tell Yagoube to come to the
palace, and open the door instantly." "Tell the
king, said Mr. Bruce, to drink warm water, and I
will see him in the morning." At this time one of
Mr. Bruce's servants fired a pistol in the air out of an
upper window, upon which they all ran off. They
seemed to be about ten or twelve in number, and
left three handspikes behind them. The noise of the
pistol brought the guard, or patrole, in about half
an hour, who carried intelligence to the Sid el Coom,
our traveller's friend, by whom he was informed in
the morning, that he had found them all out, and
put them in irons; that Mahomet, the king's ser-
vant, who met them at Teawa, was one of them; and
that there was no possibility now of concealing this
from Adelan, who would order him to be impaled.

Allairs were now come to such a crisis that Mr.
Bruce was determined to leave his instruments and
papers with Kitou, Adelan's brother, or with the
Sid el Coom, while he went to Shaddy to see Ade-
lan. But first he thought it necessary to apply to
Hagi Belal to try what funds they could raise to
provide the necessaries for their journey. Mr. Bruce
shewed him the letter of Ibrahim, the English broker
of Jidda, of which before he had received a copy and
repeated advices, and told him he should want 200
sequins at least, for his camels and provisions, as well
as for some presents that he should have occasion for,
to make his way to the great men in Atbara. Never
was surpris'd better counterfeited than by this man.
He held up his hands in the utmost astonishment,
repeating, 200 sequins! over twenty times, and asked
Mr. Bruce if he thought money grew upon trees
at Sennaar, that it was with the utmost difficulty he
could spare him 20 dollars, part of which he must
borrow from a friend.

Now Mr. Bruce's destruction seemed inevitable, no

other resources being now left. They were already indebted to Hagi Belal twenty dollars for provision; they had seven mouths to feed daily; and as they had neither meat, money, nor credit, to continue at Sennaar was impossible. They had seen, a few nights before, that no house could protect them there; and to leave Sennaar was, in their situation, as impossible as to fly there. They had neither camels to carry their provisions and baggage, nor skins for their water, nor, indeed, any provisions to carry, nor money to supply them with any of these, nor knew any person that could give them assistance nearer than Cairo, from which they were then distant about 17th of the meridian, or above 1000 miles in a straight line; great part of which was through the most barren, inhospitable deserts in the world, destitute of all vegetation, and of every animal that had the breath of life. Hagi Belal was inflexible, he began now to be weary of our travellers, to see them but seldom, and there was great appearance of his soon withdrawing himself entirely. Mr. Bruce's servants also began to murmur; some of them had known of his gold chain from the beginning, and these, in the common danger, imparted what they knew to the rest. In short, he resolved, though very unwillingly, not to sacrifice his own life and that of his servants, and the finishing his travels, now so far advanced, to childish vanity. He determined therefore to abandon his gold chain, the honourable recompence of a day full of fatigue and danger. Whom to intrust it to was the next consideration; and upon mature deliberation, he found it could be to nobody but Hagi Belal, had as he had reason to think he was. However, to put a check upon him, he sent for the Sid el Coom, in whose presence he repeated his accusation against Belal; he read the Seraff's letter in his favour, and the several letters that Belal had written him whilst he was at Gondar, declaring his acceptance of the order to furnish him with money when he should arrive at Sennaar; and he upbraided him in the strongest terms with breach of faith and duplicity.

All that he could say, however, was very far short of the violent expollation from the Gindi that immediately followed. He gave Hagi Belal many broad hints, that he looked upon this injury as done to himself, and would repay him; that though he had done this to please the king, the time might not be far off when that favour would be of very little use to him; on the contrary, it might be a reason for stripping him of all he had in the world." The force of these arguments seemed to strike Hagi Belal's imagination very powerfully. He even offered to advance 20 sequins, and to see if he could raise any more among his friends. The Gindi (a rare instance in that country) offered to lend him fifty. But the dye was now cast, the chain had been produced and seen, and it was become exceedingly dangerous to carry such a quantity of gold in any shape along with him. He therefore consented to sell it to Hagi Belal in presence of the Gindi, and they immediately set about the purchase of necessaries, with this proviso, that if Adelan, upon Mr. Bruce's going to Shaddi, did furnish him with camels and necessaries, so much of the chain should be returned.

On the 5th of September they were all prepared to leave this capital of Nubia, an inhospitable country from the beginning, and which, every day they continued in it, had engaged them in greater difficulties and dangers. They flattered themselves, that, once disengaged from this bad step, the greatest part of their sufferings was over; for they apprehended nothing, but from men, and, with very great reason, thought they had seen the worst of them.

Mr. Bruce received a message from the king, in the evening, to come directly to the palace. He accordingly obeyed, taking two servants along with him, and found him sitting in a little, low chamber, very neatly fitted up with chintz, or printed calico curtains, of a very gay and glaring pattern. He was

smoking with a very long Persian pipe through water, was alone, and seemed rather grave than in humour. He gave Mr. Bruce his hand to kiss as usual, and after pausing a moment without speaking, (during which our traveller standing before him, a slave brought him a little stool, and set it down just opposite to him; upon which he laid, in a low voice, so that Mr. Bruce could scarcely hear him, "Sit down," pointing to the stool. He sat down accordingly. Their conversation was now taking a very laconic and serious turn. "Adelan, said the king, has sent for you by my desire; Wed Abroff and all the Jehaina Arabs have rebelled, and will pay no tribute. They say you have a quantity of powerful firearms with you that will kill twenty or thirty men at a shot. He is therefore to employ you with your guns to punish those Arabs, and spoil them of their camels, part of which he will give to you." Mr. Bruce presently understood what he meant, and only answered, "I am a stranger here, and desire to hurt no man. My arms are for my own defence against robbers and violence." Adelan, continued the king, has been informed that Mahomet, my servant, who brought you from Feawa, has been guilty of a drunken frolic at the door of his house, and has sent soldiers to take him to-day, with two or three others of his companions.

I charge you when you see Adelan, to ask for Mahomet's life, or a considerable deal of blame will fall upon you. When you return back, I will send him to conduct you to the frontiers of Egypt. Upon this Mr. Bruce bowed, and took his leave. He went home perfectly determined what he was to do. He had now obtained from the king an involuntary safeguard till he should arrive at Adelan's, that is, he was sure that, in hopes Mr. Bruce might procure a reprieve for Mahomet, no trap would be laid for him on the road. He determined therefore to make the best use of his time; and every thing being ready, they loaded the camels, and sent them forward that night to a small village called Soliman, three or four miles from Sennaar; and having settled his accounts with Hagi Belal, he received back six links, the miserable remains of one hundred and eighty links, of which his noble chain once consisted. This transaction kept him the few last minutes to write a letter to the English at Judda, to recommend him for the service he had done Mr. Bruce at Sennaar; and then complied with, that he might inform the broker of him that he had received no money from his correspondent, and give him a caution never, in future circumstances, to trust Hagi Belal again.

Having left Sennaar, Mr. Bruce was overtaken on the road by a black slave, who at first gave him some apprehension, as he was alone with only one barbarian, a Nubian servant, by the side of his camel, and was going slowly. Upon inquiry, he found him to be sent from Hagi Belal, with a basket containing some green tea and sugar, and four bottles of tea, in return for his letter. He sent back the messenger, and gave the care of the basket to his own servant, and, about ten o'clock in the evening of the 5th of September, they all met together joyfully at Soliman.

They left the village of Soliman, September the 8th, and about three o'clock in the afternoon came to Wed el Lumbel, which is not a river, as the name would seem to signify, but three villages situated upon a pool of water, nearly in a line from north to south.

After meeting with various adventures in the course of their journey, but none of them of any material consequence, they arrived on the 4th of October, at Chendi, or Chundi, which is a large village, the capital of its district, the government of which belongs to Sitina, as she is called, which signifies the mistress, or the lady, she being sister to Wed Ageeb, the principal of the Arabs in this country. She had been married, but her husband was dead. She had one son, Idris Wed el Paal, who was to succeed to the government of Chendi upon

ha

his mother's death, and who, in effect, governed all
affairs of his kindred already.

Chendi has in it about 250 houses, which are not
all built contiguous, some of the best of them being
separate, and that of Sittina's is half a mile from the
town. There are two or three tolerable houses, but
the rest of them are miserable hovels, built of clay
and reeds. Sittina gave Mr. Bruce one of these
houses, which he used for keeping his instruments and
baggage from being pilfered or broken; he slept
abroad in the tent, and it was even there hot enough.
The women of Chendi are esteemed the most beau-
tiful in Atbara, and the men the greatest cowards.
This is the character they bear among their country-
men, but they had little opportunity of verifying
either.

They found the people at Chendi very much
alarmed at a phenomenon, which, though it often
happens, by some strange inadvertency, had never
been observed, even in this serene sky. The planet
Venus appeared shining with undiminished light all
day, in defiance of the brightest sun, from which she
was but little distant. The very regular and natural
appearance of this planet was immediately converted,
therefore, into a sign that there would be a bad harvest
next year, and scanty rains; that Abou Kalee with
an army would depose the king, and over-run all
Atbara; whilst some threatened Mr. Bruce as a prin-
cipal operator in bringing about these disasters. On
the other hand, without seeming over-solicitous about
heaven's location, he insinuated among the better sort,
that this was a lucky and favourable sign, a harbinger
of good fortune, plenty, and peace. The clamour
upon this subsided very much to his advantage, the
rather, because Sittina and her son Idris knew cer-
tainly Mahomet Abou Kalee was not to be in Atbara
that year.

Mr. Bruce waited upon Sittina on the 12th of Oc-
tober, who received him behind a screen, so that it
was impossible either to see her figure or face; he ob-
served, however, that there were apertures so man-
aged in the screen that she had a perfect view of him.
She expressed herself with great politeness, talked much
upon the terms in which Adelan was with the king, and
wondered exceedingly how a white man like him
should venture so far in such an ill-governed country.
She desired Mr. Bruce to come to her the next day; that
her son Idris would then be at home from the Howat,
and that he very much wished to see him. She that
day sent them plenty of provisions from her own
table.

It was so excessively hot on the 13th, that it was
impossible to suffer the burning sun. The poisonous
Sun-gnaw blew likewise as if it came from an oven.
Their eyes were dim, their lips cracked, their knees
tattering, their throats perfectly dry, and no relief
was found from drinking an immoderate quantity of
water. The people advised Mr. Bruce to dip a sponge
in vinegar and water, and hold it before his mouth
and nose, and this greatly relieved him. In the
evening he went to Sittina. Upon entering the house,
a black slave laid hold of him by the hand, and placed
him in a passage, at the end of which were two op-
posite doors. Mr. Bruce did not well know the
reason of this; but staid only a few minutes, when he
heard one of the doors at the end of the passage open,
and Sittina appeared magnificently dressed, with a
kind of round cap of solid gold upon the crown of
her head, all beat very thin, and hung round with
sequins; with a variety of gold chains, bilitaires, and
necklaces of the same metal, about her neck. Her
hair was plaited in ten or twelve small divisions like
tails, which hung down below her waist, and over
her was thrown a common cotton white garment. She
had a purple silk stole, or scarf, hung very gracefully
upon her back, brought again round her waist, with-
out covering her shoulders or arms. Upon her wrists
she had two bracelets like handcuffs, about half an
inch thick, and two gold manacles of the same at her
feet, fully an inch in diameter, the most disagreeable

and awkward part of her dress. The slave carried
him through a door at the bottom of the passage into
a room, while her mistresses vanished in at another
door at the top, and there was the screen he had seen
the day before, and the lady sitting behind it. She
was a woman scarcely forty, taller than the middle
size, had a very round plump face, her mouth rather
large, very red lips, the finest teeth and eyes he had
seen, but at the top of her nose, and between her
eye-brows, she had a small speck made of cobalt or
antimony, four-corner'd, and of the size of the
smallest patches our women used to wear; another
rather longer upon the top of her nose, and one on
the middle of her chin.

In the evening of the 20th of October, they left
Chendi, and reled two miles from the town; and, on
the 9th of November, having received all the assu-
rances possible from Idris, the guide whom Mr. Bruce
had engaged at Chendi, they committed themselves
to the desert.

On the 14th, they were at once surpris'd and ter-
rified by a sight surely one of the most magnificent
in the world. In that vast expanse of desert, from
W. and to N. W. of them, they saw a number of
prodigious pillars of sand at different distances, at
times moving with great celerity, at others halting on
with a majestic slowness; at intervals they thought
they were coming in a very few minutes to overwhelm
them; and small quantities of sand did actually more
than once reach them. About noon they began to
advance with considerable swiftness upon them, the
wind being very strong at north. Eleven of them
ranged along side of them, about the distance of three
miles.

On the 22d, their camels were reduced to five, and
it did not seem that these were capable of continuing
their journey much longer. In that case, no remedy
remained but that each man should carry his own
water and provisions. Their situation seemed to be
most desperate till the 29th, when, to their inexpress-
ible joy, they saw the palm trees at Allouan, and a
quarter before ten arrived in a grove of palm trees on
the north of that city.

They were not long arrived, before they received
from the Aga about fifty loaves of fine wheat bread,
and several large dishes of dressed meat. But the smell
of these lall no sooner reached Mr. Bruce than he
fainted upon the floor. His servants had none of
these qualms, for they partook largely and greedily
of the Aga's bounty.

Our traveller was obliged to keep his room five or
six days after his arrival; but, as soon as he got better,
he and his servants let out on dromedaries, in order
to recover his baggage. After having gone about
half an hour in their former footsteps, they had the
unspeakable satisfaction to find the quadrant and whole
baggage; and by them the bodies of their slaughtered
camels, a small part of one of them having been
torn by the haddaya, or kite.

After having received a very kind reception at this
place, Mr. Bruce, on the 11th of December, set out
for Cairo, where he arrived on the 10th of January
1773. After some stay there, he proceeded to Alex-
andria, where he arrived without any thing material
occurring. At length, Mr. Bruce happily reached
Marseilles, where his travels terminated.

*Thus, having presented the Public with the several
curious ADVENTURES of Mr. BRUCE during his
TRAVELS in AETHIOPIA, without entering into those
superfluous details, which not only render the original vo-
luminous, but soon disgust and weary the impatient reader,
we shall now, with equal accuracy and attention, proceed
with Mr. HODGES'S interesting TRAVELS in INDIA,
faithfully recording every circumstance and observation,
that may tend to the improvement and entertainment of
our NUMEROUS SUBSCRIBERS.*

A NEW, COMPLETE, AND GENUINE
HISTORY OF
TRAVELS in INDIA;

Undertaken and performed in 1780, 1781, 1782, and 1783,

By **WILLIAM HODGES, R. A.**

INCLUDING MANY NEW AND INTERESTING ACCOUNTS OF

THE COUNTRY, BUILDINGS, WARS, CURIOSITIES, RUINS, &c. with all the INFORMATION, DISCOVERIES, and ADVENTURES contained in the Memoranda and Communications of the GORVERNOR-GENERAL, WARREN HASTINGS, Esq. MR. HODGES, Major BROWN, &c. &c.

Being an Entire New History of INDIA and its ENVIRONS, containing many curious Remarks, Events, &c. more Accurate and Full than any hitherto published.

CHAPTER I.

The hearty Welcome which Strangers receive on their first Introduction to India—Description of the Hindoos—Of the Malfoolah Boats—Terrible Consequences of War—Origin and Rise of Madras—Description of Fort St. George—Its Streets, Houses, &c.—Public Buildings for the Poor, erected by Princes, &c.—The Hindoo Temple at Triplicane—Voyage to Bengal—Description of the Country—City of Calcutta—A considerable Fortrefs—Streets, Buildings, &c.—Manners of the Inhabitants—A Journey to Mongheir—Mode of Travelling—Description of Plessey—Of Moorbedabad—Of Oodzoanullab—Ruins of Zananab—Cascades, &c.—Country of Colgong—Village of Sultungunge—An Hermitage—Kind Reception at Bauglepoor—Mr. HODGES's Remarks, and Return by Water to Calcutta.

MR. Hodges expatiates much on the vast delight which accrues from a first introduction to India. When the vessel arrives at her anchoring place, she is welcomed by crowds of inhabitants, who come in boats to hail her; their ornaments of large gold earrings, and white turbans, long muslin dresses, and black faces, are very striking; their mode of salutation is bending the body very low, touching the deck with the back of the hand and the forehead three times. The Hindoos (original inhabitants of Peninsula) are the first natives to be seen. These are remarkable for delicate hands, and are very attentive, mild, and good humoured; their appearance is exceedingly varied, some are entirely naked, others so covered that scarce the face or neck is to be seen; the men are frequently met on horseback, dressed like women, and the women are often carried on men's shoulders.

The Malfoolah boat, in which they convey a stranger on shore, is a work of curious manufacture, formed without a keel, flat bottomed, with the sides raised high, and sewed together with the fibres of the cocoa-nut tree, and caulked with the same article; they are exceeding light, and admirably calculated to elude the shocks of the surf, which are here very violent. The natives manage them with great dexterity; they are commonly attended by two kattamaras (i. e. rafts) paddled each by one man, who in case of any accident are to give assistance.

From the 18th to the 21st of July 1780, great dismay and confusion were incurred by the terrible ravages of war. Numbers were pouring in from all quarters of Madras, in a most miserable manner, with the remains of their properties and families: it is supposed that about 200,000 of the country people were at this time received within the black town of Madras; the enemy had now extended their depredations even to the walls of Madras.

It was about the middle of the last century when the English formed the settlement of Madras. It was a place of no real consequence but for its trade, until the war which broke out in 1748; and was concluded in 1752, when the English were considered as sovereigns.

Fort St. George, or Madras, which is a place of considerable strength, rises from the margin of the sea; it contains many spacious and handsome streets; the houses very elegant, being covered with a flucco, called Chunam, which appears equal to the finest polished marble. Their style of building is also neat and ingenious; the roofs are flat, the porticoes open, and the colonades long; ceilings are very uncommon in the rooms, and the inner apartments are chiefly white walls.

The country near Madras is a perfect flat, on which is built, at a small distance from the fort, a small Choultry; these are public buildings found all over Hindostan, and are of Hindoo origin; they are, in fact, analogous to those buildings called Caravanserais, well known through Asia. They have been erected and endowed by the liberality of princes, or the benevolence and piety of individuals. A Bramin generally attends them, who administers relief to the poor and distressed, who are frequently supplied also with a mat to lie on; tanks, or reservoirs of water, or wells, are commonly near them. The houses on Choultry plain are for the most part beautiful pieces of architecture, and contain several magnificent and spacious apartments.

The Hindoo Temple, or Pagoda, at Triplicane, two miles on the south of Madras, is of wonderful magnitude, it is seen all over the country, the top thereof rising considerably above the trees. A large tank with steps descending to the bottom, filled with water, adjoins the temple. It is all of stone, and remarkable for its masonry. There are several half-

relieves on the surface of the temple, which Mr. Hodges supposes relate to the religion of the Hindoos.

Mr. Hodges, determined to pursue his voyage to Bengal, embarked in February 1781, and arrived in the Ganges in March. This country at first view is very unpromising; but on a nearer approach attracts the eye, there being many beautiful villas, belonging to the rich inhabitants of Calcutta, on a flat surrounded by gardens, called Garden-Reach. On the north side of the river the city of Calcutta makes a very grand appearance; it is marked by a considerable fortress, allowed to be superior to any in India. The inhabitants are very kind to strangers, and no molestation whatever is offered to any. The city extends from the western point of Fort-William, along the banks of the river, almost to the village of Cossipoor, which is about four miles and a half English. The streets are broad; the style of building, which is on a large scale, very magnificent; and the houses, being detached from each other and insulated in a great space, very superb; they are surrounded by colonades, have great projecting porticoes, and are generally attended by a flight of steps. The present inhabitants have imbibed a strange mixture of manners; they retain several old Asiatic ones, and have introduced many new European ones; thus, though we witness the passing ceremonies of the Hindoos, the different appearances of the fakirs, the pallankeens and bakeries of the natives, &c. &c. we may often see our own single-horse chaises, coaches, phaetons, &c.

About the middle of April, Mr. Hodges undertook a journey as far as Mongheir, on the Ganges, which was a distance of about 300 English miles. He proceeded by dawk-bearers (in a pallankeen) or pallankeen carriers, who are persons hired by government, and fixed at the several posts or stages for facilitating travelling; the number of persons are commonly nine, with the addition of two men or boys to carry baggage and lights in the night, both from the name of those lights (mossool) are called mossolees. Each stage is about ten English miles. All the country appears highly flourishing in tillage of every kind, and abounding with cattle. The villages, which are very populous, are remarkably neat and clean.

Plassey is distant from Calcutta about seventy English miles, and from Moorshedabad about thirty. There are few buildings of any note in Moorshedabad, except the remains of the Cuttarah, which was formerly a public seminary for men of learning among the Mussulmen. From Moorshedabad the road proceeds through the villages of Jungepoor and Sooty to Odoonallah; it is crossed by several small streams called Nullahs, some of which have ferry-boats for the accommodation of the traveller. There is a famous bridge at Odoonallah, which was built by Sultan Sujah, the second son of the Emperor Shah Jehan, in 1627. This place is two miles from Rajemahel, which is nearly eighty miles from Moorshedabad, where at a little distance are the ruins of Zanaah. From Rajemahel the public road continues by the side of the river, at the foot of the hills, to the pass of Sieri Gully, whence it enters the province of Bahar. The pass of Sieri Gully exhibits a very picturesque scene; on the top of the hill there is a ruined tomb of a Mussulman saint. Mr. Hodges was escorted by a party of Feapoys to the falls of Mootepara, in the hills, about eight English miles inland from the river. In the time of the rains the cascades may be easily discerned from the hills, the river being then near thirty feet higher than in the dry season, and the falls considerably increased, and when rain has lately fallen in the hills the cataracts may be distinctly heard at the distance of two English miles. The road is through the woods.

Mr. Hodges proceeded across the pass of Terricgully, whence the road continues by the river side,

opening in extensive glades, covered with a fine turf, and interspersed with woods only, which consist of large timber trees, that for the greater part of the year continue verdant like all other vegetable productions of the country. Further on, the road skirts the woods, and is shaded with several great trees, whereon are a variety of beautiful birds, particularly peacocks. There are several small rivers to pass, which, on account of the steepness of their banks, are very troublesome to the pallankeen carriers.

The country and prospects about Colgong are exceedingly beautiful. This place is remarkable for a considerable stream that falls into the Ganges, which by its continued force, particularly in the rainy seasons, has detached two large rocks and formed them into islands, covered with woods, full seventy yards from the shore. In the time of the rains this passage is very dangerous, and can only be effected by small boats.

Mr. Hodges now proceeded to the village of Sultungunge, opposite which, in the river, is Jehanquerry, a rocky island, with a few trees and a small hermitage on the top, inhabited by a Hindoo monk, it being considered by the Hindoos as a sacred place. From this our traveller proceeded to Bauglepoor, where he met with a very kind reception from the gentleman who then governed this district. It is about thirty or forty English miles from this to Mongheir. The country is highly cultivated, the villages very neat, and the roads exceedingly good. There are several burial-places of the Mussulmen (who, like the ancient Greeks, buried near the highways) along the side of the road. Those of superior rank have mausoleums, adorned according to their family wealth or munificence, and those of the common people are mounds of earth, covering the whole length of the body, with a small square column at the head, about three feet high, and another, not more than eighteen inches, at the feet.

There is a great variety in the country, from Calcutta to Mongheir, which is a large Indian town with an old fort, one side of which is flanked by the Ganges, and that to the land by a deep wide ditch. Here are three capital gates, the first on the side next the river, the second on the east side, and the third on the fourth; the second seems very strong, and agrees with the old style of castles.

Mr. Hodges expatiates much on the variety of travellers that are to be met with in the course of this route. Several savage-looking fakirs are to be seen; also whole families, some with camels loaded with goods, others riding on bullocks, the females in bakeries, and the younger part of the company on small horses, which are called tanyans, and are for the chief part pie-balled. The men, who march on foot, are armed with spears and match-locks, also sabres and shields slung across their backs.

Mr. Hodges departed by water from Mongheir, which afforded him an opportunity of admiring the varied shores of the Ganges, and the different boats of the country. He remarks, that it is common about this season of the year to see a small black cloud rising in the eastern part of the horizon, and spreading itself afterwards to the north-west; this phenomenon is always attended with violent thunder, lightning and rain. He also informs us, that passing by the city of Moorshedabad, in the evening of a Mussulman's holy-day, he was very much entertained at beholding the river covered with innumerable lights just floating above the surface of the water; at first he could not comprehend this uncommon appearance, but, on inquiry, understood that upon these occasions they fabricate a number of small lamps, which they light and set a-float on the river, these, by the stream constantly running down, are carried for several hours to a considerable distance. After a passage of a few days he arrived at Calcutta.

C H A P. II.

Mr. Hodges's Expedition with the Governor-General—His Observation of the Danish Settlement of Serampoor—Seat at Chheretty—French Settlement of Chandernagore—Dutch Settlement of Chinsurah—Hoogly, &c.—Arrival of the Fleet at Patna—Governor's Reception—Description of the City—Of the Mosque of Moonbier—Of Bankepour—Arrival of Mr. Hodges at Buxar—Curiosities of Gazi-poor—Proceeds to Benares—Disturbances—Sad Consequences—Period to the War—Remarks—Description of Benares—Temples, &c.—Description of the horrid Sacrifice of a Wife on the Death of her Husband—The Woods which surround the Fort of Luttee-poor—A Rocky Pass—Description of Bahjgur—Arrival of the Governor-General's Party at Daugle-poor.

THE Bengal government having deemed it expedient for the public utility, that the governor-general should make a tour through a part of the country, Mr. Hodges procured Mr. Hastings's permission to accompany him. Accordingly the former embarked in a budgerow, June 25th, 1781. The fleet consisting of all kinds of boats belonging to the country, except burs, was very large, on account of the great number who necessarily attended the governor-general.

Mr. Hodges's first observation was the Danish settlement of Serampoor, which is a small distance above Calcutta. Both sides of the river are decorated with a few houses belonging to English gentlemen; there is a very fine seat at Chheretty, about twenty miles from Calcutta. The French settlement of Chandernagore is a little above this; it seems to have been very considerable from the ruins of the fort. Adjoining this, is the town of Chinsurah, the Dutch settlement on the banks of the river. The appearance of this town is very handsome. There are several good boules and a church, with a little mole projecting into the river. This town lies nearly midway between Chandernagore and Hoogly, which, though in ruins, retain the vestiges of former munificence. Culna and Huddea, leading to Cutwa, are both considerable towns. Mr. Hodges now passed several other towns already mentioned.

On the arrival of the fleet at the city of Patna, the windows in the houses on the banks of the river, and all the tops of the buildings and every wall, were crowded. The governor-general was received by the multitude with great joy and respect. This city which is the principal seat of the province and government of Bahar, is long, narrow, and very populous; it has been long famous, having a fort, and being the residence of the political and commercial chiefs, and the courts of justice of the province; the streets, which are narrow, are seldom clean, the buildings are very lofty.

Mr. Hodges went to examine the mosque of Moonbier, on the river Soane, which is a beautiful large building, being a square with pavilions rising from the angles; in the centre there is a majestic dome, the top of which is finished by what the Indian architects call a *Callas*: the line of the curve of the dome is not broken but continued by an inverted curve until it finishes in a crescent. The outer surface is ornamented by platane leaves cut in stone, covering the whole; the lines intersect each other in great lozenges and are altogether very beautiful. The great entrance to this mosque has columns, diminishing as it were in perspective to the inner door. A large tank belongs to it, with several buildings arising from the water containing pavilions.

Bankepour is at a small distance from Patna, where there are several seats of English gentlemen, and near which is the military station of Dinapour.

Mr. Hodges followed the fleet, and having passed the mouth of the river Caramnalla, arrived at Buxar, August the 12th; from this they proceeded to Gazi-poor on the eastern shore of the Ganges; here are the ruins of a very fine palace, raised on a high bank, almost adjoining which is a building for raising water and supplying the fountains by means of pipes. There are about two miles from the river, the remains of a Serai, and some tombs at a small distance: from this Mr. Hodges proceeded to Benares, and arrived the

day after the governor landed. The affair of Chhet Sing, the Zemindar of the province, now engrossed general attention. The Zemindar (which implies simply a landholder either by a right of inheritance, or merely as a venter) met the governor-general at Buxar, attended with a considerable train, and a large fleet of boats wherein were 2000 armed men, being the most active and experienced of Benares, and intended, as imagined, to support him in the refusal of such demands as the governor-general might think proper to make. Several messages and letters having passed between the respective parties, Mr. Markham, the resident, received orders to put the Rajah under arrest; a great disturbance immediately took place, which occasioned much bloodshed and the Rajah escaped; the consequent loss of friends and the funeral ceremonies which followed, threw a gloom over all the English. Further disturbances taking place, it was deemed advisable to make for Chunar, a distance of about twenty miles, and opposite which, early the next day, the party, including servants, &c. to the number of about 400 men, safely arrived. Now the war was completely commenced with great disadvantage on the part of the English. Some desperate measures were counselled. Effective measures were, however, taken to put a final period to the war, by vigorously attacking both the forts of Patna and of Luttee-poor, which happily succeeded. Patna lies about four miles north of Chunar, and Luttee-poor ten miles beyond; Bahjgur is fifty miles from Chunar. The fort at Chunar is situated on the Ganges, near twenty miles above the city of Benares; it is built on a rock, fortified all round by a wall and towers at various distances; it was originally built by the Hindoos, and said to be of the highest antiquity.

Benares is one of the most ancient cities; the distance, from Calcutta, by the nearest road, is above 460 miles, it is a great deal more by water. The city anciently bore the name of Kasi, and is built on the north side of the river; it has a beautiful appearance, as it abounds in buildings, which are very superb. There are several Hindoo temples on the banks of the river, which are all ascended by flights of steps; in the centre of the city is a considerable Mahometan mosque, with two Minarets, the height from the water to the top of the Minarets is 232 feet. The streets are narrow and not kept in very good order: there are many ruins surrounding the city, particularly a large circular edifice, which had evidently been an Hindoo temple, or part of one, there being vestiges of some of the ornaments; and Mr. Hodges found the Grecian scroll on one part.—The temple named Viss Vilsha, particularly engaged our traveller's attention, who, on accurately observing the building in all its parts, found each column to contain the different ornaments which appeared in the other parts.

While making observations in Benares, Mr. Hodges received information of a ceremony which was to take place on the banks of the river, and which greatly excited his curiosity; this was the horrid sacrifice of the wife on the death of her husband. On repairing to the spot on the banks of the river where the ceremony was to take place, Mr. Hodges perceived the body of a man, on a bier, laid at the edge of the river, and covered with linen. There were

now only a few people assembled, it being about ten in the morning. After some time the unfortunate widow appeared, attended by the Bramins and some few relatives, with music; solemn and slow the procession, while the victim moved with a firm and steady pace. She approached the body of her departed husband, with a countenance perfectly composed, and stopping here for some time, addressed those who were near her with apparent good humour, and without the least trepidation of voice. In her left hand she held a cocoa nut, wherein a red colour was mixed up, and dipping in it the fore-finger of her right hand, she marked those who were near her, to whom she wished to shew this last act of attention. She was about 21 or 25 years of age, which is the time of beauty's decay in India, notwithstanding the remains which she preserved, proved that she was once very handsome; she was rather short, but well formed, and possessed of beautiful hands and arms. She was dressed in a loose robe of white drapery, which reached from the head to the feet. About half an hour (employed in prayer with the Bramins) was spent from the woman's first appearance to the taking up of the body, to convey it into the pile. The place of sacrifice was about a hundred yards higher, upon the bank of the river Ham, the place where Mr. Hodges stood. It was composed of dried branches, leaves, and rushes, with a door on one side, and arched and covered on the top: a man standing by the side of the door with a lighted brand. As soon as the body was taken up, the widow followed close to it, attended by the chief Bramin, and on its being deposited in the pile, she bowed to the surrounding spectators, and, without speaking, entered after it,

whereupon the door was immediately closed; fire was now administered to the combustibles, which blazed instantaneously, and still kept burning by additional fuel being occasionally thrown in. The multitude who now became numerous, and discovered more joy than grief on the occasion, accompanied the last part of this abominable ceremony, with loud and continued shouts. The only inducement Mr. Hodges had to be a spectator, was the desire of ascertaining a fact, which, at first, he could hardly believe.

When the traveller passes the open country, he enters the jungles or woods which surround the forts of Lutteeipoor. The woods chiefly consist of bamboos, which come very close to the walls, and are so very thick as to be impenetrable in many parts. The fort is erected of stone, the walls are flanked with round towers, at present the whole is in decay. There is a very high and difficult rocky pass about two miles from the fort, at the top of which the country continues flat and level, till within about four miles of Bidjegur, when it sinks, and is generally overflowed in the time of the rains. There are considerable woods between Lutteeipoor and Bidjegur intermixed with a few villages and some cultivated ground. Bidjegur is about fifty miles from Benares; the fort is seated on the top of a lofty mountain, covered with wood from the summit to the descent. As soon as this place was taken, preparations were made for the departure of the governor-general's party; they sailed towards the end of December, and early in January 1782, arrived at Bauglepoor. It being Mr. Hodges' will to remain here for some time, he took his leave of those gentlemen who departed about the end of the same month.

C H A P. III.

Mr. Hodges accompanies Mr. CLEVELAND on a Tour through Part of his District—They pass some Durgows—An Invitation to an annual Sacrifice—Description of the Chiefs who gave it—Account of the Ceremony, &c.—Rejoicing, &c.—Mr. Hodges, &c. visit Deogur—Ancient Pagodas—Trade of the Pilgrims—Mr. Hodges returns to Calcutta, seized with a dangerous illness—Recovers, and undertakes another Journey, by Permission of the Governor-General—His Arrival at Allahabad—Description of the Forts, &c.—Of Lucknow—The Nabob's Palace—Journey to Iyazabad—Description thereof—Present from the Nabob's Mother—Description of Oud, &c.

IT being proposed by Mr. Cleveland to perambulate part of the district into the hills, Mr. Hodges readily acceded. These gentlemen set out early in February, on a tour through a part of the country called the Junglettery to the westward of Bauglepoor. A great deal of wood, including much cultivated ground, and several villages, inhabited chiefly by husbandmen, are to be found in this interior part of the country. Great masses of stone being piled upon one another, render the appearance of this country very singular: several immense timber trees, overthadowing these rocks, grow out from their interstices: they are of different kinds. Some Durgows, or burial places, with little chapels adjoining, which belonged to the Mussulmans, are to be seen on some of the highest of these hills.

Some of the principal hill chiefs having invited Mr. Cleveland to the ceremony of an annual sacrifice, the gentlemen proceeded to the village on the mountain where it was to be solemnized. The chiefs, who gave this invitation, resided on a range of hills, which lie to the south and to the westward of Bauglepoor, extending south to the back of Rajmahel. Their manners differ entirely from the Hindoos; they are neither divided into castes nor tribes, and they eat of every species of provision, which the followers of Bramah cannot, being limited in this article according to their call. The ferocity of this people was entirely subdued by the mildness of Mr. Cleveland's administration. This gentleman, by a variety of attentions, had weaned them completely from their usual depredations. He ordered clothes to be made like those of the Seapoys in the Company's

service for a few, gave them fire arms, and had them instructed in the exercise of them. This inspired military courage in others, and shortly a camp was formed of a thousand men, three miles from Bauglepoor, where the strictest discipline was observed.

The gentlemen having left the village of Barkope (which is almost in the centre of the Junglettery) travelled through the flat country, and entered the hills, which are covered with wood, whence they had several beautiful prospects. On the second day of their journey they arrived at the village of the hill, where the annual sacrifice was to be solemnized. A small open hut had been erected in the village, on purpose for Mr. Cleveland's reception, and the next morning being the time appointed, every person in the neighbourhood was summoned to attend. About nine o'clock the ceremony began. A kind of altar, consisting of bamboos, was raised before a small hut, about six feet from the ground. A kid and a cock being decapitated, their heads were thrown upon the altar, and there left. This first part of the ceremony was little attended to by any of the party. Notice being given in about an hour afterwards, that the principal rite was about to be performed, the gentlemen immediately repaired to the place of rendezvous. A fine large buffalo, which had been previously purchased and fattened by the people, was now dragged with ropes, by the horns, towards the spot where the decollation of the kid and the cock was performed. The chief of the village, who had no covering except a cloth round his middle, now held a large and bright sabre in his hand, while, after much difficulty, the animal was brought to the place

of sacrifice. A concourse of people (men, women, and children) surrounded the altar. The young men being all naked, the animal was first of all hamstringed, to prevent his escape. The chief then stood on the left side of the animal, and striking the upper part of the neck near the shoulder with his sabre, set the poor animal howling and struggling for his liberty so violently, that it required no little exertion to detain him. Upwards of a quarter of an hour was spent in thus cutting the spine of the neck, and it was some time before the head was severed, even after the animal fell. A great pause and universal silence preceded the last stroke! When the chief had given it, he then stood up, and extending his arm, which held the sabre, seemed to give a signal to the people, who thereupon rushed in, and began to take up the blood of the animal, which, though mixed with the dirt of the ground, they drank up, and having besmeared each other, and tumbled about in a most frantic manner, they proceeded to eat the body, which was afterwards cut in pieces. The head, like those of the kid and cock, was, however, preserved. The sacrifice being over, each returned to his respective dwelling. Great rejoicing now took place, and the remainder of the day was spent in mirth and revelry. Singing, dancing, and drinking became universal; the last prevailed so much among the men, that the women lost half their partners.

After the sacrifice, the gentlemen returned to Bankeepoor, and the next day visited Deogar, a small village, and, being directed to a sacred spot, is much frequented by the Hindus pilgrims. Here are five ancient pagodas, which have each a small chamber in the centre of twelve feet square, with a lamp hanging over the *entrance*, which is the great object of superstition among the followers of Brahmah, being the general symbol of renovative nature. The passage is only sufficient high and broad for the admission of one person. These pagodas are formed like pyramids. The pilgrims are daily employed in carrying the water of the Ganges to the western side of the peninsula of India in large barks or bottles, containing about five quarts each; one at each end of a bamboo, which they bear on their shoulders. They charge a proportionable price for this holy water, according to the distance of the place where it is carried to, and so many are the purchasers as to render it a considerable trade.

As our travellers returned nearly in the same direction in which they came, they had of course no opportunity for further observations.

Mr. Hodges having remained about four months at Bankeepoor, proceeded for Calcutta, and arrived there May 17, 1782. Here our traveller was seized with a dangerous illness, which rendered him exceedingly weak till about the end of November. When recovered, he applied to the governor-general for permission to renew his travels, which being immediately granted, he began his next journey by land January 12, 1783, passing through Moorshedabad, Bankeepoor, &c. already mentioned.

Having rested at Benares four days, he proceeded on his journey, and, on the second day after his departure from thence, arrived at Allahabad, which is the point of confluence of the two great rivers Jumna and Ganges, and between the eastern boundaries of the Jumna and the western boundaries of the Ganges is Dooab, a country esteemed very fertile, lying between two rivers. Immediately at the point is the fort of Allahabad, built entirely of stone, and commanding from its situation the navigation of both rivers; notwithstanding which peculiar advantage, it is left to ruin. The building is entirely in the old style. The walls are flanked with round and square towers; that called Agra gate is ornamented with several small pavilions on the top, and is very handsome; there are two other gates within the exterior gate, formerly secured with portcullises. The fort, which is very extensive, has large areas within the walls, which, covered with the tumbled remains of

buildings, are now heaps of ruins. The city, as it is called, consisting only of thatched huts, is without the fort. From this Mr. Hodges proceeded to Cawnpoor, which is a large military station, on the Ganges. It is a cantonment for a brigade, amounting to ten thousand men on the war establishment; the men live in huts instead of tents, with their families; it is considered as a great encampment.

On the 27th of January Mr. Hodges arrived at Lucknow, which is supposed to be about 920 miles distance from Calcutta by the route through Benares, though some think it only 650. It is an extensive city, but the buildings are very mean, consisting only of mud walls, covered with thatch. Several consist entirely of mats and bamboos, and are thatched with leaves of the cocoa nut, palm tree, and sometimes with straw; there are very few brick houses, the streets are very bad, narrow, and crooked. When the season wet, the mire is so deep, there is scarce any walking; when dry, the heat and dull are intolerable; the foot passenger is equally annoyed by the great number of elephants, belonging to the nabob and his suite, which are continually passing the streets. Indeed the great men of this place and their servants, attend very little to the convenience of the poor.

The nabob's palace is on a high bank near the river. It commands an extensive view both of the Ganges and the country on the eastern side. There are large courts within the walls, and a durbar, where all persons, on being presented, are received by the prince. This durbar is a range of three arcades, parallel to each other, and supported by the columns in the Moorish taste. The ceiling and all are painted with ornaments and flowers, and beautifully gilt; it is ascended by steps from a flower-garden, where are planted strong scented flowers; there is nothing recommended in the exterior of the building; near the palace there is a garden, walled round, divided by a narrow disengageable road; at each angle of which is a grand pavilion, erected of brick, covered with chunam and richly ornamented.

On the 9th of February Mr. Hodges determined to make a journey to Fyzabad and the ancient city Oud; he arrived at Fyzabad the second day after setting out, which is a distance of about eighty English miles, in a fourth cardinal direction. On entering the city, Mr. Hodges was received by a person who was ordered to show the palankeen bearers to a small house in a large garden, which was allotted Mr. Hodges during his stay.

Fyzabad is a very extensive city, and, to all appearance, very populous, but its inhabitants are chiefly of the lowest class; the most eminent of the merchants, &c. having followed the court which was removed to Lucknow. Some remains of many handsome brick buildings are to be seen. The one appropriated to Mr. Hodges's accommodation, had a large beautiful pavilion over the principal entrance; it was ascended by a narrow stair-case, leading to three open rooms, commanding on one side the whole city, and on the other the garden, a vast extent of country, and the river Gogra; a mosque with three domes, was opposite the gate. Some short time after Mr. Hodges's arrival here, he was waited upon by a person from the nabob's mother, who brought him a number of dishes of various curries and pillows for his refreshment. The compliments which were in the Moorish style, were to his grand flatterer, that our traveller almost imagined himself transformed into an Indian nabob. Having returned his most respectful compliments, he partook of the repast, which was very good, but would have been better if accompanied with wine instead of water. After this Mr. Hodges proceeded to make his further observations.

The remains of the palace, built by the late nabob, now attracted his attention. This building, which covers a great extent of ground, has several areas or courts which contain many separate buildings. In the inner court are the remains of the durbar,

ruins. The city, as it is thatched huts, is without . . . Hodges proceeded to the military station, on the . . . for a brigade, amounting to the war establishment: of tents, with their furniture encampment.

CEREMONIES (over) by the people of PEGU, at their KING'S FUNERALS.

See also Plate 10, page 117.

darbar; the rest were evidently designed for public offices, or the like, but with the painting, &c. greatly gone to decay. A large extent of building, which must have been once very magnificent, is within an interior court, the principal front of which is on the banks of the river: this was designed for the nabob's private dwelling. Near this are other edifices, intended for the Zenanah, wherein some traces of gardens are to be seen. A very handsome large gate constitutes the grand entrance to the palace, the superstructure of which was a place for arms, and there is still a guard kept in it. The Nobut (i. e. a great drum) which is an appendage of royalty in India, and when beaten, which is both at fun-rite and fun-let, may be heard afar off, was fixed on the top of the gate.

The remains of the ancient city of Oud, reported to have been the first imperial city of Hindostan, are nearly adjoining Fyzabad. This is considered as a place of sanctity, and the Hindoos consequently perform pilgrimages thither, from all parts of India, continually. There are no vestiges whatever of this city's former magnificence. It is seated on the banks of Gogra, but Mr. Hodges thinks it probable, that formerly it was at a considerable distance from it, it being in a line with Fyzabad. Mr. Hodges concludes these remarks with observing, that the villages he had passed during this perambulation, were, some of them comfortable to all appearance, and others apparently distressed.

C H A P. IV.

Mr. Hodges accompanies Major Brown on an Expedition—Description of Etaya—They proceed to Jeshwontnagar—Halt at O'Kraime—Arrive at Shekoabad—Derivation of its Name—Description of the Place—The Ruins of a Hunting Seat, &c.—They proceed to Fyrozabad—Its Government and Army—They arrive at Etamadpoor—Account of a small Building, &c.—They encamp at Sbab Darab—Ruins—Palaces of the great Omrabs—Derivation of the Name of Sbab Dara—An ancient Custom—A Visit from an Omrab of high Rank—The Nabob Merzab Shuffey Khawn waited upon—Description of his wonderful Camp—A Visit to the Darbar—Old Persian Chiefs seen—Excursions—Remarks—Palace of Dara Shako—Observations—Description of Futtypoor Sicri—Of Siedpoor—Mr. Hodges takes Leave of the Major—Arrives at Dabpoor—At Nurabad—At Gwalior—Description of the Fortress—Proceeds to Gohd—Returns to Lucknow—His Departure—Voyage down the River Goomty—Fort of Jionpoor—A Mausoleum—Proceeds to Banglepoor—Arrives at Calcutta—Conclusion.

MAJOR Brown being appointed on an embassy to Mirza Shuffey Khawn, and preparing to proceed immediately on his mission through a part of the country which Mr. Hodges was very desirous to visit, our traveller wrote to the Major, signifying his wishes to accompany him. The proposal being accepted, Mr. Hodges set out on his journey to join Major Brown at Etaya on the 10th of February 1783. From the small number of pallankeen bearers, and the quantity of baggage, Mr. Hodges's luges were now short; however, he arrived at Major Brown's encampment, which was close to the town of Etaya, on the 13th. The road runs westward from Lucknow to this place, and is at many places fordable at this time of the year: there is also to the westward of the Ganges, a fordable stream called Callinuddie; this, however, is a considerable river at the time of the rains. It is tolerably well cultivated from Lucknow to Etaya, but the villages are very poor.

Etaya is situated on a very high bank of Jumna, which is a very large river, wherein are many islands of sand, which are overflowed during the periodical rains. The sides of this high bank consist of what the Indians call Concha (i. e. sand) which is formed into almost a vitrification, by the constant action of the sun. There are only two decent houses in the town, which, notwithstanding its novelty, is very large.

The Major and Mr. Hodges proceeded on the 15th to Jeshwontnagar, which is about 12 English miles from Etaya; the cultivation of the country is very middling from Etaya to this place; the villages appear desolate, and their few inhabitants very poor. They stopped at O'Kraime on the 16th, about 12 miles further, and almid at the termination of the nabob of Oud's land.

There was very little cultivation to be seen during this last day's journey: several of the villages were in ruins, and all appeared wild and desolate. Some few wretched looking people, who were begging their way, were met on the last day's march.

They arrived at Shekoabad on the 17th. There is some little cultivation from O'Kraime to this place, and such is the fulness and richness of the grain, as to demonstrate, that if properly cultivated, it would be exceedingly productive.

Shekoabad takes its name from Dara Sheko, the

Emperor Shah Jehan's eldest and most unfortunate son, who, when contending with his youngest brother Aurungzebe, was defeated, hunted down like a wild beall, and at last made prisoner. He was then stripped and seated on an elephant, to be the may-game of their victorious bands, who at last murdered him unmercifully.

They had passed this day two villages, which were superior to any hitherto met with. Several villages in ruins were seen on both sides of the road, and mud-forts or their ruins on every hillock or rising ground.

Shekoabad is very populous, and the adjacent ground seemingly well cultivated. The remains of a hunting seat, erected by Dara Sheko, and a tank belonging thereto, were here discovered. It appears to have been considerably large from the ruins. There was a small grove of palm and other trees adjoining the tank, which were all the trees to be seen in the neighbourhood: there is also a scarcity of water, there being very few wells, and those few nearly dry. They saw in Falcant, the town, the ruins of several buildings, some of which had been apparently erected on a large scale.

Having gone twelve miles further, they reached Fyrozabad, which is a considerable village; it takes its name from Purgunnah, which is a small district within a larger. At this time it was under the government of a Gofine, or Hindoo religious, which government being very favourable to agriculture, the cultivation of this place was exceeding beautiful. The Gofine had, for the protection of the poor, a camp formed in the neighbourhood, amounting to 2000 men well armed, and a small park of artillery, where Mr. Hodges saw two fine pieces of battering cannon. These soldiers, whose stature was generally six feet, and their behaviour very modest and decorous, were remarkable for their manly comeliness and beauty.

They arrived at Etamadpoor the next day, which is about twelve miles further. Here is a small building in the centre of a large tank, the sides of which, as likewise the centre building and a bridge of several arches, which communicates with it from the side of the tank, are erected with stone. Large mounds of earth, formed from the excavations in making the tank, surround the whole: there was but little water in it at the time of our travellers arrival. Hence they had a full view of the spires of Agra.

They encamped on the Shah Dara on the 23d, which is at the distance of almost ten miles from Etanadpoor, and about two on the eastern side of the river Jumna, opposite the city. Nothing but ruined buildings (some very large, as the Cutera, built by the great Shah Heli Khawn, in the reign of Aurungzebe) tombs, long walls, domes, arches, &c. &c. are to be seen here. The ruined palaces of the great omrahs are to be seen along the western bank of the river; further on, the great fort and palace of the city of Agra are to be seen, which prospect is terminated to the south-west by the elegant monument that was erected by the emperor Shah Jehan.

Shah Dara derives its name from Shah, a king, and Dara, a tent, being the spot where the emperor's tent was first fixed when he made his progress from Agra to the eastern provinces of the empire. From the time the dynasty of the Moguls was fixed in India, it was customary for the emperor, in the summer season, to take the field with a large army, attended by the whole court, artisans, bankers, &c. Accordingly, the camp became a great city, under tents, that of the emperor being in the centre of the whole, surrounded by those of the great officers of state, while each trade had its several quarter allotted to them.

Arafeeb Khawn, an omrah of high rank, waited upon Major Brown, on the 24th, from the nabob, Mirza Shuffley Khawn, who lay encamped about six miles to the north-west of Agra, and to whose camp the major and Mr. Hodges proceeded, having crossed the river Jumna, and passed through a part of the city of Agra. The next day they pitched their tents to the eastward of the nabob's encampment, in a garden, walled round, and which was formerly adorned with some magnificent buildings which are now gone to ruin.

Mirza Shuffley Khawn's camp covered a great space of ground, and as it contained shops of all kinds, might, with greater propriety, have been called a city. It contained 40,000 men, according to report, which Mr. Hodges could not credit. However, every soldier, tradesman, and artificer, had his family with him; there were 42 pieces of cannon of various calibers in the park of artillery; some of the largest guns, which were remarkable fine ones, were French pieces, but the rest, which formed the greatest number, were indifferent. The nabob's tent being of crimson velvet, in many parts embroidered with gold, and lined with silk. Mr. Hodges thinks, that, in all probability, it was formerly an imperial one; at present the appearance was very far from splendid, it being much torn and moth-eaten.

Mr. Hodges accompanied the major shortly after their arrival to the Durbar of the nabob, where they found the principal commanders, among whom there were several old Persian chiefs, whose countenances were marked with great dignity, and their beards so long as to hang down to their girdles. On being received, the ceremony of which consisted of touching the turban with the right hand, without ever rising from their seats, the gentlemen were desired to sit, and accordingly old fashioned chairs were brought, which, though greatly injured by length of time, retained the evident signs of having been formerly very richly ornamented with velvet and carved work. The nabob sat in the centre of a semicircle; his chiefs surrounding him, and a great number of attendants standing behind. Amongst these people delay seems a settled principle of etiquette, for the major's business was neither taken into consideration now nor for many days afterwards; this still was only a visit of ceremony.

Mr. Hodges took every opportunity of making excursions to Agra and its vicinities, the weather being at this season very favourable. The mornings which he chose for his excursions, were clear and very cold; the frost was so very great at times that several tanks were entirely frozen over; it was, however, very hot in the middle of the day, which time our traveller appropriated to his studies. Mr. Hodges spent most of his time at Agra.

This city is situated on the south side of the river Jumna, which is impassable at this place, and rising immediately from the water extends in a vast semicircle. It is held to be a place of great antiquity. The fort, including the present palace, is very extensive, it is constructed of a red free stone, and seems to have been very strong when first erected. It had originally a double wet ditch, which was both very deep and broad, and well supplied from the river. The city was encircled by a wall and towers, very near each other. The fort was an island formed by three ditches, one face thereof inclining to the eastward was washed by the river to the foot of the walls; the outer ditch is now entirely demolished, and the high road goes through it. The inner ditch is very bad in several places and quite dry in others.

Jehanadab was built by Shah Jehan, the grandson of Achar, who, not being able to bear Agra on account of the immense heat of summer, determined to raise a metropolis which should bear his own name. In order to people this new city, it is said that he transported thither upwards of 500,000 of the people of Agra, being one half of the inhabitants. The consequent ruins in Agra rendered it expedient for the security of the people to build another wall, forming a part of a circle within the old one, and this wall was accordingly erected by a Hindoo Raja, in the service of the emperor Aurungzebe, named Jay Singh. The empire of Jehanabad, as well as its name, is now nearly extinguished. A meer mass of ruins appears likewise between the two walls; the inner wall is also decaying fast. Near the Delhi gate of the fort, where there are the remains of a mosque, is the Choke, or Exchange, which is likewise in decay, and even the fort itself is wasting away rapidly. The imperial residence built of white marble, covered on the top with plates of copper gilt, is situated in the eastern front of the fort; the lustre of its ornaments still remains. A mosque, consisting of various beautiful ornaments, is almost adjoining. The ruins of this grand and venerable city are computed to extend no less than fourteen English miles along the banks of the river. There is considerable danger in walking among these ruins, as an unwary passenger may sink through several holes into the covered vaults, where many poisonous reptiles inhabit. The streets are very narrow, and no great judgment displayed in their construction.

The palace of Dara Sheko, which was built by that prince, is very extensive. There is a hammam or bath that Mr. Hodges went to see, which was very superb. It was lined with the finest coloured marble, and several pieces of lapis lazuli introduced amongst the ornaments, which were after the Mosaic taste, (composed of Mosaic work and flowers) and exceedingly handsome. Mr. Hodges concludes, from the great expence that was evidently bestowed upon it, that it formerly belonged to the palace of one of the great men of the court.

The tomb of the emperor Achar, stands at a place called Secundrii, on the great high road leading to Delhi, about six miles distance from Agra; this stupendous edifice is situated in a garden, regularly planted with both forest and fruit trees, and several flowering shrubs; it is also walled round, and is said to contain a space of above twenty English acres. In the centre of this garden is raised the monument, which is a square building with gates in the centre on each side, and great pavilions at the angles and over the gates. There are five several flutes which diminish gradually with pavilions at each angle. The domes of these pavilions are of white marble; the rest of the building of red stone and white marble intermixed. The fifth or upper story is entirely of white marble; here is a range of windows running round each side which are fret work, cut out of the solid slab. This story is furnished with pavilions consisting in like manner of marble, but they have been greatly damaged by lightning and an earthquake, at the people of that place report.  ion

lions is gone entirely, and the domes of the rest con-
 siderably injured. The inside of this upper story is
 curiously inlaid with black marble with quotations
 from the Koran, which, a judge of Persian writing
 assured Mr. Hodges, was in the most perfect style.
 There are large terraces on each story of this
 building, which, it is reported, had coverings of
 gold cloth, supported by pillars of silver, in the days
 of the emperors Jehanguire and Jehan. The Mol-
 lals, or priells of the Mahomedan religion, conver-
 sed with the literati under the shade of these awnings.

A grand gate leading to the garden, constitutes the
 principal entrance. The front of this is most richly
 ornamented with mosaics of different coloured mar-
 bles, inlaid in co-partments. There are two stories
 of pointed arches and large recesses on either side the
 centre. On the upper story there is a door in the
 centre, and a window over it with a balustrade in
 front, the lower recesses have one window each.
 There is one vast pointed arch in the centre; this
 part of the building rises considerably above the side
 of the two stories already mentioned. There are
 two sarcophagi of black marble on the top and some-
 what behind the front of this part of the edifice, which
 are raised on two columns: two others, answering to
 these, are immediately behind the back front of the
 gate. At each angle of the gate (this building being
 an oblong square) are minarets of white marble,
 partly fluted and rising to a great height; there are
 balustrades above the flutes, half way up the mine-
 rets, and likewise one near the top. Formerly these
 minarets were crowned with open pavilions and finish-
 ed with domes, but these have been long since de-
 stroyed. There are stair-cases in the minarets which
 lead to the two balconies, which surround them; we
 pass through this gate into a vast open hall which
 rises in a dome almost to the top of the edifice. This
 hall was richly ornamented with painting and gilding,
 by the emperor Jehanguire, son of Abar; however,
 in the course of time it went to decay, and either
 from avarice or superstition, the emperor Aurungzebe
 commanded it to be entirely defaced and the walls
 whitened. The descent into the garden is through
 an arch similar to that in the front; from this hall
 and on descending, the whole of the tomb is per-
 ceptible through an avenue of lofty trees, which is
 paved with stone, and a large square basin formerly
 filled with water, but at this time quite dry, is in the
 centre, and in the centre of this basin a fountain,
 the pipe of which only remains. There were several
 channels to be seen, evidently deliqued for aqued-
 ucts. Not far from the principal building rises a
 high open gate, exceedingly beautiful, being entire-
 ly of white marble.

This curious building from the reflection of a con-
 stant blazing eastern sun, and the varied materials
 of which it is composed, produces a glare of splen-
 dour beyond the power of pen to describe. The
 curiosity of our traveller being further excited, he
 desired to see the stone which contained the remains
 of an emperor, so highly esteemed and so highly
 honoured. An old Mollah, who attended and had
 the keys of the interior of the building (still held in
 profound veneration) acquiesced with Mr. Hodges's
 desire. This Mollah's chief employment was in
 satisfying the curiosity of travellers. A vast hall oc-
 cupying the whole space of the interior of the build-
 ing, which terminates in a dome, forms the inside of
 this curious tomb. A dim light is admitted through
 a few windows at the top, and the whole is lined
 with white marble. In the centre the body is depo-
 sited in a sarcophagus of plain white marble, on which
 the name of 'Abar' is written in black marble inlaid.

There are many tombs surrounding the monument
 of Abar, which, from their beauty, are supposed to
 contain the remains of some of his family; but the
 traditionary report is, that they are the tombs of his
 wives. The prospect from the summit of the minarets
 in the front is very beautiful and extensive.

There are several small buildings on the high road

from Agra to Delhi, the form of which is a square
 pedestal, whereon rises a cone to the height of about
 eight feet. A great number of square niches are in
 this cone, which contain the heads of malefactors,
 which are exposed for an example. Several of these,
 however, are gone to ruin.

There is a beautiful monument to the fourth-est of
 the city of Agra: it was erected by the emperor Shah
 Jehan to the memory of his beloved wife Taje
 Mahel, whose name it bears, and is called the Taje
 Mahel, by way of eminence. Formerly it joined
 the city, but at present stands two miles from it.
 Near this monument was the great bazar, or market
 for the most valuable commodities of India and
 foreign countries; this market, according to report,
 consisted of six courts, encompassed with great open
 porticoes, but there is scarce now remaining a vestige
 of this remarkable building. The monument of
 Taje Mahel rises immediately from the river, found-
 ed on a base of red free stone, at the extremity of
 which are octagon pavilions, containing each three
 stories. There are two large buildings on the same
 base, one on either side, and exactly similar, each
 being crowned with three domes of white marble, of
 which the centre dome is the largest. One of these
 buildings is a masjid, or mosque, the other was de-
 signed for the accommodation of any noble passenger,
 or curious traveller. On this base of free stone, which
 has a platform about twenty-five feet broad, another
 rests of white marble about fourteen feet high;
 it is of a square form; the angles are octagon, from
 which rise minarets, or immense columns taper-
 ing upwards, which have three several galleries run-
 ning round them, and an open pavilion crowned
 with a dome on the top of each. The minarets are
 of white marble, and contain stair-cases leading to
 the summits. The body of the building which has a
 platform, rises like all the rest from this base. The
 plan of the platform is octagon, the four principal
 sides opposed to the cardinal points of the compass:
 a vast and pointed arch is raised in the centre of each
 of the four sides, and the top above this arch is far
 more high than any other part of the building. Those
 faces which form the octagon on either side the great
 arches, have two stories of pointed arches with re-
 cesses, and a low balustrade in front: the spandals
 above the arches are very much ornamented with
 inlaid marble of various colours, and likewise the
 heads of the arches within the recesses: there are
 windows within the several arches running round the
 building, composed of an open fret-work in the solid
 slab for the purpose of illuminating the interior of
 the building. There are four octangular pavilions with
 domes from behind the octagon front, which rise con-
 siderably higher; also a cone from the centre of the
 whole, which rises equally as high as the domes of
 these pavilions; hence the great dome proceeds, which
 swells considerably outwards from its base, and finishes
 with a beautiful curve in the upper point of the cul-
 lus, whereon two balls of copper gilt rest, one above
 the other. There is a crescent above these balls, in the
 middle of which there is a spear head. This building
 is exactly uniform and finished in the most complete
 manner; it is as famous for excellence of workman-
 ship as for extent and grandeur, and when beheld at
 a distance is a beautiful prospect.

The entrance to the garden, where the Taje Mahel
 stands, is from the opposite side through a handsome
 large gate, where a large flight of steps lead to the
 garden: from the top of these there is a view of the
 centre part of the building through an avenue of cy-
 press and other different trees. This avenue is paved
 with stone, and co-partments or beds of flowers, with
 fountains at equal distances, are in the middle; four
 of the grandest fountains lie about half way up the
 avenue and rise from a square base of white marble.
 A reservoir without the building, filled from the
 river by pumps, supplies all the fountains, which are
 yet in tolerable order, and the garden still kept in
 repair. The centre building is in a good state, but
 the

the rest going to ruin. The mosque here is attended by several Mollahs at the time of prayer, who seem very decent or orderly, and are at all times ready to satisfy the curiosity of strangers. The inside of the great building consists of white marble and several curious carved flowers. The tomb is below in a chamber, and Taje Mahel's body is deposited in a sarcophagus of white marble under the centre of the edifice. A similar containing the body of Shah Jehan, her husband, is adjoining. They are exactly the same as those sarcophagi in Achar's tomb; but the space of ground occupied by the garden and buildings is only about one half of what is devoted to that emperor.

The nabob's camp moved close to Secundrii on March the 3d, where they remained till the 15th, then they removed to Gougaut, about 14 miles from Agra. The water in Gougaut is very bad, being strongly impregnated with nitre. They encamped near the small village of Krowley on the 22d, which is ten miles to the westward of Gougaut.

Krowley is one very extensive plain, which is but miserably furnished with trees and bounded by some low hills, extending to the eastward; there is very little cultivation to be met with, the soil is poor; there are some quarries of red free stone in the hills. The water here is as bad as that at Gougaut for the same reason.

They encamped on the town of Futtypoor Sieri, on the 23d, which, for extent, had water, barrenness, &c. is much the same as the country already past.

Mr. Hodges was very much entertained during these excursions with the variety of characters he met, particularly the people of the bazar (i. e. the market) with their wives and children, who, by riding their horses in full gallop, and firing behind as if pursuing and pursued by an enemy, with several other antic postures after the oriental fashions, displayed much dexterity and adroitness. The majestic movements of the elephants considerably heightened this curious scene.

Futtypoor Sieri is a very extensive town, and the adjoining country in tolerable cultivation; on the top of one of the highest hills which this town lies under, there is a large mosque, erected by Achar, in the Moorish style of building. A flight of broad steps, extending to the principal entrance, which is through a very magnificent portal ascends to this mosque from the foot of the hill. The mosque is situated in a large square, paved throughout with apartments round the sides for the different priests. The remains of a palace, occupying considerable ground, are to be seen at the foot of the hill, where the mosque is. Nothing of this but the principal gate remains, which gives but a faint idea of it. There was a lake at the back of the hills, formed by great mounds of earth artificially raised to keep in the water; and it is said, when the palace was inhabited, that a number of fine boats of every kind were, for the entertainment of the imperial family, kept on this lake, of which the banks and boundaries are now the only vestiges. There is no good water in this part of the country except at the mosque.

They encamped at Siedpoor on the 26th, which is upwards of fourteen miles from Futtypoor Sieri. This country was very superior to any hitherto passed, the cultivation being very fine. During their stay here there were several storms of wind, which the country people term aundeas and typhawns; they resemble hurricanes and are very alarming. The hot winds were also very inconvenient to our travellers.

On the 28th of April, at night, Mr. Hodges finding the necessity of directing his course towards Gwalior, took his leave of Major Brown. His baggage he sent off, under the escort of a party of seapoys, who were attacked during their march by a banditti, (who are very numerous here) but the robbers were repelled by the bravery of the havildar.

On the 29th they arrived at Dohlpoor, and the

next day crossed the river Chumbull; the road was very bad, full of ravines and deep hollow-ways. Having reached the plain, Mr. Hodges encamped under the walls of a large mud fort, which had been lately taken from the Banna of Ghod, by Madajee Scindia, the Mahratta chief. Mr. Hodges and his people were very kindly treated by the governor here, who, though he would not permit Mr. Hody to enter the fort, yet suffered his people to purchase grain and vegetables within it.

On the first of May Mr. Hodges arrived at Nura-had, which is a small town with an old stone fort in it, and a stone bridge over a small nullah (a branch of the Chumbull) consisting of seven tall, narrow-pointed arches. Two open pavilions, raised upon the bridges, crowned on each side with domes, are at the extremes of the three centre arches and small cones, all built of the same stone as the bridge; and finished with little domes, are at the extremes of the other two arches. Mr. Hodges arrived at Gwalior on the 2d. No kind of cultivation, nor even a hut was to be seen in all the excursion from Dohlpoor.

The fort of Gwalior is situated on the top of a great mountain, rising from a perfect flat country. To the west are some considerable hills. The rock on which it stands is either from nature or art, perpendicular on every side. At the north-west end is the citadel, and a palace with a chain of seven gates leading to the town at the foot of the mountain. A wall surrounds the town, which is large, containing a mosque, and the remains of some good houses.

For the further satisfaction of the curious, we shall insert a letter of Captain Jonathan Scott's, to his brother, fully descriptive of the capture of Gwalior, and the measures which were taken of penetrating into Scindia's country. Captain Jonathan Scott was at that time Persian interpreter to Major Popham.

"The fortress of Gwalior stands on a vast rock of about four miles in length; but narrow, and of unequal breadth, and nearly flat on the top. The sides are so steep, as to appear almost perpendicular in every part; for where it was not naturally so, it has been scraped away; and the height, from the plain below, is from two hundred to three hundred feet. The rampart conforms to the edge of the precipice all round, and the only entrance is by steps running up the side of the rock, defended on the side next the country by a wall and ballions, and further guarded by seven stone gateways, at certain distances from each other. The area within is full of noble buildings, reservoirs of water, wells, and cultivated land; so that it is really a little district in itself. At the north-west foot of the mountain is the town, pretty large, well-built, the houses all of stone. To have besieged this place would have been vain; for nothing but a surprise or blockade could have carried it.

"A tribe of banditti, from the district of the Rana, had been accustomed to rob about this town, and once in the dead of night had climbed up the rock, and got into the fort. This intelligence they had communicated to the Rana, who often thought of availing himself of it, but was fearful of undertaking an enterprise of such moment with his own troops. At length he informed Major Popham of it, who sent a party of the robbers to conduct some of his own spies to the spot: they accordingly climbed in the night, and found that the guards generally went to sleep after their rounds. Major Popham now ordered ladders to be made, but with so much secrecy, that, until the night of the surprise, only myself and a few others knew of it.

"On the 3d of August, in the evening, a party was ordered to be in readiness to march, under the command of Captain William Bruce; and Major Popham put himself at the head of two battalions, which were immediately to follow the storming party. To prevent, as much as possible, any noise in approaching or ascending the rock, kind of shoes, of woollen cloth, were made for

*HEADS of different GAURIAN PRIESTS, with their MITRES on,
and their MOUTHS covered.*

The BAPTISMAL CEREMONIES of the Queen-Purana's Palace in PERSIA.

the Seapoys, and luffed with cotton. At eleven o'clock the whole detachment moved from the camp at Reypoor, eight miles from Gwalior, through unfrequented paths, and reached it a little before day-break. Just as Capt. Bruce arrived at the foot of the rock, he saw the lights which accompanied the rounds moving along the ramparts, and heard the centinels cough (the mode of signifying that all is well in an Indian camp or garrison) which might have damped the spirits of many men, but served only to inspire him with more confidence, as the moment for action, that is, the interval between the passing of the rounds was now ascertained: accordingly, when the lights were gone, the wooden ladders were placed against the rock, and one of the robbers first mounted, and returned with an account that the guard was retired to sleep. Lieut. Cameron, our engineer, next mounted, and tied a rope ladder to the battlement of the wall; this kind of ladder being the only one adapted to the purpose of scaling the wall in a body (the wooden ones only serving to ascend the crag of the rock, and to assist in fixing the rope ladder). When all was ready, Capt. Bruce, with twenty Seapoy grenadiers, assembled without being discovered, and squatted down under the parapet; but, before a reinforcement arrived, three of the party had so little recollection as to fire on some of the garrison, who happened to be lying asleep near them; this had nearly ruined the whole plan: the garrison were of course alarmed, and ran in great numbers towards the place; but, ignorant of the strength of the assailants (as the men fired on had been killed outright) they suffered themselves to be stopped by the warm fire kept up by the small party of grenadiers, until Major Popham himself, with a considerable reinforcement, came to their aid. The garrison then retreated to the inner buildings, and discharged a few rockets, but soon afterwards retreated precipitately through the gate; whilst the principal officers, thus deserted, assembled together in one house, and hung out a white flag. Major Popham sent an officer to give them assurance of quarter and protection; and thus, in the space of two hours, this important and astonishing fortress was completely in our possession: we had only twenty men wounded, and none killed. On the side of the enemy, Bajpgee, the governor, was killed, and most of the principal officers were wounded.

This celebrated and ancient fortress is situated in the heart of Hindostan Proper, the ancient capital of the empire, about eighty miles to the south of Agra, and 130 from the nearest part of the Ganges: from Calcutta, by the nearest route, upwards of 800, by the ordinary road 910; and from the British frontiers 280. Some time after the circumstances already mentioned, the fort was delivered up to the Rana of Gohd: the peace being agreed on, though not finally settled, between the British government and Scindia, the chief found an opportunity to invest it once more, and was at this time before the place with 70,000 men: his success in reducing it was entirely owing to the treachery of one of the Rana's officers, who admitted a party of the Maharatta troops.

Mr. Hodges acknowledges the great attention and kindness of Messrs. Anderson's, who were then in Scindia's camp, forming the treaty of peace and alliance between the English company and Madejee Scindia, which was concluded afterwards in a very able manner. Mr. Anderson had sent for our traveller's protection an escort of Maharatta horse, which, considering the then dangerous situation of the country, was absolutely necessary; indeed, owing to the late of Gwalior at this time, Mr. Hodges was prevented from making further observations. After a stay of ten days, he was determined to pursue his journey to Lucknow with all possible expedition; accordingly he set off at night on the 12th, by dank-

bearers, leaving his servants to follow with his baggage at leisure, and reached Gohd the next day, where he stopped a few hours for refreshment.

At Gohd Mr. Hodges met an Englishman, who had been a Watch-Maker, but now commanded two battalions of the Rana's infantry. This person seemed heartily tired of his military profession, and was desirous to return to his former occupation, having now made some little property in the Rana's service, with which he wished much to retreat, but not being suffered to depart, had no means of conveying it, and therefore requested Mr. Hodges to take charge of a casket for him to Lucknow, and deliver it to his friend; with which request Mr. Hodges readily complied, though, had he foreseen the dismal, dreary, dusky, and barren country he had to pass through, he owns he would have been extremely averse to the undertaking. He met with no villages, or scarcely any human being, till he reached Chumbull, the banks of which river are very high, descending through deep ravines, where there are some huts; and here every person he met had a savage-like appearance. Mr. Hodges was two days and a night on his journey from Gwalior to Etawa: having suffered much on account of the extreme heat, he felt considerable satisfaction on reaching Etawa.

Mr. Hodges arrived at Lucknow on the 16th, but owing to the great heat and fatigue of the journey, he was taken exceedingly ill of a violent dysentery, his recovery from which was very tedious. He stayed with Colonel Polier ten days, and experienced much attention and hospitality from that gentleman, he was, however, obliged to accept of an invitation from Colonel Merlin, who had a large brick house, where he gradually recovered; the house of his former friend (Colonel Polier) being exceedingly hot, as it was only a large bungelow. These bungalow buildings in India, generally raised on a base of brick, one, two, or three feet from the ground, and consist only of one story; the following is the common plan. A large room in the centre for an eating and sitting-room and rooms at each corner for sleeping; one general thatch which comes low to each side, covers the whole; the space between the angle rooms are visanders or open porticoes, to sit in during the evenings; the centre hall is lighted from the sides with windows and a large door in the centre; sometimes the centre visanders at each end are converted into rooms.

As soon as Mr. Hodges had recovered his health and strength, he was determined to return towards Calcutta, but instead of travelling the same route by which he came, resolved to pass down the river Goomty by water; accordingly he left Lucknow on the 16th of July, but did not enter the Ganges, into which the river Goomty falls, till August the 11th, owing to the several windings of the river.

The banks of the river Goomty are in several places extremely beautiful, and particularly so at this time of the year, when they display fine verdure, and are formed of smooth sloping vegetable earth. Several villages are on its banks between Lucknow and the town of Jionpoor, but which are not so well cultivated, as might be expected from the apparent number of inhabitants. A safeguard is absolutely necessary in a voyage down this river, on account of the various depredations continually made here. Mr. Hodges saw a body of about fifty horse near a village of Sultenpoor, which belonged to a famous marauder, Rah Sing, whose robberies had rendered him an universal nuisance. This party of plunderers watched Mr. Hodges's boats the whole of one night, but they were disappointed in their views, through the vigilance of the Seapoys, and disappeared entirely at day-break.

The fort of Jionpoor, a very extensive building, is situated on a high land, and which commands the bridge. This now, is for the most part in ruins, though formerly it commanded the country from the Ganges to Lucknow entirely; both in respect to superior

strength and natural situation. Sultan Firoz Shah erected it in 1102, and once it was the seat of an empire. The great masjid or mausoleum now remaining, was built by Chaja Jehan, vizier to Sultan Mahmud Shah, during the minority of his son, when he assumed the title of Sultan Shicke (king of the east) took possession of Bahar, and fixed his residence at Jionpoor. This mausoleum he intended for his own and family's interment. In its present ruinous state it is a great pyramid in the front, which is covered with ornaments; the pyramid, the apex being cut off, is blunt at the top; a dome rises over the centre of the building (wherein are the remains of the tombs) considerably below the front of the building, which is seen from without. It also appears from the foundations now only remaining, that there has been a square of buildings in the front.

The stone bridge crossing the river at this place, consisting of sixteen pointed arches, is in tolerable good repair. There are several little shops erected of stone on both sides, on the top of the bridge. This bridge, as appears from a Persian inscription thereon, was founded in 1567, by Khan Khannah, vizier to the Emperor Achar, and Subeh of the province of Oul. The length of time, and particularly the force of the stream (which, in the time of the rains is very great) that this bridge has withstood, sufficiently evince the sound materials of its construction. It has been known that the inundations have frequently risen above the bridge, particularly in 1771, when a whole brigade (which consists of 10,000 men) of the British forces passed in boats over it. This river falls into the Ganges some small distance below the city of Benares, when Mr. Hodges proceeded straight to Buxar.

Mr. Hodges was now resolved to make a journey to Salleram, forty miles inland, the birth place of the Emperor Shere Shah, to visit the mausoleum of that emperor. The rains being now in season, it was with the greatest difficulty he passed in his palanquin; the whole ground was one continued swamp, and the bearers waded in several places above their middle in water.

This monument is exceedingly grand; it rises from the centre of a large square lake, each side bounded by masonry and descending to the water by stone steps on every side, now almost gone to ruin. Mr. Hodges imagines that it exceeds a mile. The plan is as follows: there is a square base rising from the centre of the lake, which, at each angle, has pavilions crowned with domes, and finished with a cullus. There was a bridge from this base, which appears from the now remaining ruins, to have consisted of six pointed arches, which communicated to the side of the lake, and a double flight of steps to the water on two sides. An octagon building is raised on the base, which has three pointed arches in each face, and there are pavilions finished like the former on each angle. There runs somewhat behind this an octagon with one window in each side, and pavilions on the angles similar to those below. There is likewise an octagon behind this, which, in diameter, is ninety-two feet, and from the extremes, the dome rises, which, on the top is finished by a small pavilion, similar to those already mentioned.

At present a great part of this building is covered with shrubs and trees, which have taken root within the stones, and threaten to bring this grand edifice very speedily to ruin, if not very suddenly to a total overthrow. The inside of the building is quite simple and plain; there are no traces whatever of any ornaments having been bestowed thereupon. The emperor's tomb is still remaining. It lies in the centre, surrounded with several others which belong to his children. The dome, which is now, by length of time and neglect, much disfigured, is like the rest of the building, of a fine grey free stone. The country, throughout the vicinities, is hilly: there are hills

surrounding the lakes which are formed by the excavations when it was first made; the majority of these are at present covered with trees.

Mr. Hodges, on his return to Buxar, proceeded to Bauglepoor, where he was very much grieved to find his friend Mr. Cleveland on his death-bed. This gentleman not having paid a proper attention to a delicate constitution, but so attached to public business, that, by a constant and incessant application thereto, he postponed the only salutary expedient of a more favourable climate, now died in the course of three months on board a vessel at the mouth of the Ganges, wherein he had embarked for the Cape of Good Hope. His remains were brought back in the pilot vessel, which had attended the ship, and were interred at Bauglepoor, where a handsome monument was erected to his memory; the last tribute his much afflicted friends could pay.

Mr. Hodges now proceeds to give his impartial opinion of the arts in India; there are no instances of excellence, he thinks, in sculpture among the Moors, except in the Taj Mahel at Agra, wherein there are flowers carved with much taste and ingenuity.

The amazing monuments still to be found in India, sufficiently declare the Mussulman conquerors to have been great adepts in the principles of architecture, and to have had considerable taste for grand composition. They are, in painting, however, confined to miniature, wherein, for delicacy of colour and neatness of execution, they are excellent. Their attempts are only in water colours, and as the religion of Mahomet forbids all resemblance of animated nature, it is not to be wondered that their progress therein is so slow and confined.

Mr. Hodges thinks the Hindoos superior to the Mahometans in the ornamental parts of architecture. In several of their buildings the sculpture is beautifully executed, and being cut with a peculiar sharpness and finely drawn, is deserving of great commendation. However, their paintings, which like their sculpture, are, for the most part, representations of those objects they make their religious worship, are inferior to the Moorish pictures, which are all portraits.

Mr. Hodges arrived at Calcutta on September the 24th, the time of travel was nine months and fourteen days. This journey was through a country which had been once subject to the Moguls: "Truly," Mr. Hodges says, "the greatest and richest empire," perhaps, of which the human annals can produce "an instance, and which was adorned by many really great characters in politics and arms."

Our traveller had entertained the intention of undertaking another journey from the Ganges, through the Deccan to the western coast of India. This journey he intended to have commenced at Benares and finished at Surat. Mr. Hodges strongly recommends such a journey to the attention of any artist who may hereafter be induced to visit India; this being a part unexplored, and which would, of course, afford much matter relative to the state of India, as several of the Rajahs in that part of the country are in possession of lands handed down from the earliest period of the Hindoos records. He also judges, from what he has seen of the Hindoos character, that such an undertaking would add considerably to their stock of knowledge, relative to the eastern continent, and might with the greatest safety be carried into execution.

Having now accomplished these interesting TRAVELS IN INDIA, we shall proceed with the four great Journals of Lieutenant Patterson into the country of the Hottentots and Caffraria; and trust, while we present our numerous readers with novel facts and curious discoveries, they will still approve of, and be further pleased with our collection.

A COMPLETE, NEW, AND AUTHENTIC
HISTORY OF
TRAVELS in AFRICA;

Undertaken and performed in the Years 1777, 1778, and 1779,

By Lieut. **WILLIAM PATTERSON,**

Being a **GENUINE NARRATIVE** of his **FOUR REMARKABLE JOURNEYS** into the
Country of the **HOTTENTOTS** and **CÄFFRARIA.**

Including the **Interesting PARTICULARS** of each **JOURNEY**, and **Full and Accurate ACCOUNTS** of
several **PARTS** of **AFRICA**, never before explored;

Being an **Entertaining and Circumstantial Relation** of several **CURIOUS ADVENTURES**, **PERILOUS ATTEMPTS**,
FORTUNATE ESCAPES, and various other **OCCURRENCES** contained in the **LETTERS, JOURNALS, &c.** of
LIEUTENANT PATTERSON, COLONEL GORDON, &c. with many **ILLUSTRATIVE REMARKS** by other
respective **TRAVELLERS.**

I N T R O D U C T I O N .

THE regions of Africa, which lie south of the equinoctial line, are, for the greater part, unknown. The Romans having been content with the spoils of those provinces which bordered on the Mediterranean and Red Seas, looked upon the other parts as barren and unworthy of their consideration; accordingly left them, as they were, obscure. The spirit of inquiry seemed to have entirely subsided; for even in the 16th century John Leo was ignorant of at least one half of this part of the world.

The laudable curiosity of penetrating into the several wonders, and hitherto unknown productions of nature, induced our hero (Lieut. W. Patterson) to leave a while his native country, and explore the dreary deserts of Africa, which had not as yet stimulated ambition nor induced the friends of commerce to examine those wild and scorching regions which were only inhabited by venomous reptiles and ravenous beasts.

The time of the lieutenant's arrival at the Cape of Good Hope, was about the middle of May 1777: they anchored in the Bay False; for, as the season was very late, and the state of the weather, at this time, (being that of the setting in of the quoad monsoon or winter) very variable, their passage into Table-Bay could not be effected with security. In a short time after their arrival there was a very heavy fall of rain, and the hills near the Cape, were, towards the end of the month, for several days, covered with

snow. Such unfavourable weather, of course, prevented our hero from making many observations, which otherwise he would have done; this time he therefore devoted to a few short excursions from the Cape Town, and the necessary preparation for a more extensive journey when the weather permitted.

Colonel Gordon (then captain) proposed to accompany Lieut. Patterson. This gentleman lately returned from Holland, as second in command, and appointed to succeed Colonel Du Phren, then commander in chief, was an old traveller, and had been in this country before in 1774. His information was extensive, and his knowledge of that country considerable, as he was well acquainted with the interior parts for near 1500 miles from the Cape; besides a thorough acquaintance of the Dutch language, he had also acquired that of the Hottentots, and having these advantages over many travellers, was certainly a desirable companion. Lieut. Patterson acknowledges, indeed, that he was particularly fortunate in meeting with him.

The lieutenant purposed to commence his first journey about the beginning of October, at which time the atmosphere is generally in a settled state and cultivation in maturity: he continually opened himself for his arduous undertaking, by several short excursions, which afforded him much amusement, and prepared him for those greater wonders and more interesting observations which were shortly to take place.

C H A P T E R I .

The first Journey—Departure from the Cape—Table Mountains, and Constantia Described—The Shore of Bay False explored—Description thereof—Of Hottentot Holland—Of Hang Lip—Proceed from Palmata Rivier to Knopneck Rivier—From thence to the How Hook—Description of the Hottentots—Their Dresses, Ornaments, Habitations, &c. &c.—Arrival at Zwelendam—Departure—Reed Valley—Proceed to Grandfather's Wood—Description thereof—Obanna Land—Saffron River—Elephants River—The Waggon overturned—Arrival at Ojivick Leg—Proceed through Beer Valley—Meets an Old German—The Lieutenant's Indisposition—His Friend Gordon proceeds towards the Snow Mountain—The Lieutenant returns to Jfmeko—Meets with Savages—Their Behaviour—An agreeable Excursion—Arrive at Aiquas Kloef—Reach Sure Flatia—Proceed towards Liottique Land—White Elfe River—An Adventure among the Woods—Arrival at Cape Town.

HAVING sent their waggon before them, our travellers (Patterson and Gordon) departed from Cape Town, October the 6th, 1777. They proceeded along the bottom of the Table Mountain, which leads to Constantia.

Table Mountain, notwithstanding its situation, is rather low, and produces excellent wine; but Constantia is preferable to every other part of this district, not only on account of its elevated situation, but for the superiority of the soil, which is most excellent mould. They

They passed the night at sand-fleet, where they experienced much hospitality, and also stayed here the next day on account of the unfavourable weather.

They proceeded on the 8th, along the bottom of Bay Falfe, from the point of Moefen-Berg, to very near Hottentot Holland, being a continuation of what is called the Sand-Down, which is a considerable space of ground between the Table-Bay and Bay Falfe. The greater part of this, on account of a white sand blown up by the south east winds in very large ridges, is uninhabited; there are, however, several scattered shrubs and other produce. A small fleet is near the middle of the bay, where our travellers having found some fishermen, hoped to regale themselves with oysters, but herein were disappointed, as they could not reach the banks on account of the violence of the surf; they rested at the hut about an hour, being much fatigued with the heat of the day.

About sun-set they arrived at Erf Rivier, (i. e. Frift River) which begins from the Stillen Bofch mountains, and here empties itself into Bay Falfe. On account of the late rains they had some difficulty in crossing it. When dark they heard several hyenas; at nine o'clock they reached Hottentot Holland. This is situated on the north-east side of the Bay Falfe, and surrounded on three sides by lofty mountains; it is, however, open to the south west, which affords a prospect of the Bay. Hottentot Holland's Kloaf is one of the most difficult passes there is into the country; it is a narrow road, cut through the hill (as the word Kloaf signifies) the top of which seems on a par with Table Land. The soil of Hottentot Holland is wet and marshy, but it produces good corn.

Having sent their baggage through Hottentot Holland's Kloaf, they went round the Hang Lip on the 12th, and examined all the rocks and bays in the mouth of the Bay Falfe. They took horse as far as possible, and Lieutenant Paterfon got a fall from his, upon the side of a very high precipice; he fortunately saved himself by laying hold of a shrub, which grew out of a rock; the rocks and mountains here are exceedingly rugged and unsafe. They reached the mouth of Stienbrallam river about noon, and in the morning came to a deep bay which was unknown. It is open to the north west, and being screened by lofty mountains, is well sheltered from the south-east winds. Our travellers called this Van Pletenbey's Bay. Here they agreed to stay all night, there being a small stream of excellent water, and having brought with them a portion of provisions and cloaks, in case of delay.

They pursued their journey next morning round the Hang Lip, or Cape Falfe; all the country from Hottentot to this place is uninhabited, as it entirely consists of rugged mountains and precipices. They passed Gordon's Bay, which, though the entrance is free from rocks and a fine white sandy bottom, is smaller than the first. About a mile and a half from this they came to Paterfon's Bay, which is larger than Gordon's Bay, but smaller than Van Pletenbey's Bay. Between Van Pletenbey's Bay and Gordon's Bay there is plenty of wood and lakes of fresh water. All these bays open to the north west and strike south inland. They passed Cape Falfe about two in the afternoon. Here to the S. E. is an extensive plain, covered with different kinds, but all very bad for feeding cattle. They saw a kind of antelope and several buffaloes. About evening they came to the mouth of Palmira Rivier, which it was with the greatest difficulty they could swim through, as the rains to the northward had raised it very high, and the current was exceedingly rapid. This night they had very heavy rain, attended with lightning and loud thunder. They reached Knoslick Kraal's Rivier about two in the morning. This river takes its name from a species of wild garlick, which is common there. On the first attempt which the lieutenant made to pass the river, he found himself out of his depth and got out with great difficulty, as it was exceedingly dark. Here they were obliged to stay till

day-light; in vain they attempted to kindle a fire, and the rain still continued very hard; they crossed the river as soon as ever they could see, and reached the house of Michael Otto, about nine in the morning, where they met with a very kind reception. Here they had their clothes dried, and refreshed themselves with sleep and provisions: they had been twenty-four hours without eating.

This place, situated between the Hottentot Holland mountains and the How-Hook (a steep sandy pass) produces very good wine and corn; but, though the soil be a fine rich mould, yet the pasture is coarse and does not agree with cattle in general. They proceeded, at two o'clock, on their journey through the How-Hook, where they met with a gentleman on his return to the Cape, who had been at Zwelendam. This gentleman forewarned them of the lions which are lurking about between this place and the Cape. When they had parted, our travellers crossed the Bott Rivier, and arrived at the Swart Berg, or Black Hill, about eight in the evening, where there is a warm bath. Here were several people from the Cape, using the water of the bath, which, in all cases, they imagine a specific. The hill whence the spring issues, is composed of a species of granite, with a good deal of iron. There is another bath at a little distance for slaves and Hottentots. That used by Europeans is 130 degrees in temperature, but by a stream of cold water, which runs close by the place, may be reduced to any degree of heat; the other, used by the slaves, &c. is about 115 degrees. There is excellent pasture here, and the country very pleasant.

They next directed their course eastward, a number of pleasant farms, and, in a day's journey, arrived at the first Hottentot Kraal, which consisted of about six huts, built in a circular form.

The Hottentots are as tall as the generality of Europeans; they are, in general, more slender, on account of their being either stunted in foot, or unaccustomed to exercise. Their hands and feet, compared with the other parts of their body, are very small. The root of the nose is, for the most part, very low, by which means the distance of the eyes from each other appears to be greater than in Europeans. The tip of the nose likewise is pretty flat. The iris is scarcely ever of a light colour, but has a dark brown cast, which sometimes approaches to black. Their skin is of a yellowish brown hue, which somewhat resembles that of an European who has the jaundice in a high degree; however, this colour is not in the least observable in the whites of the eyes. One does not find such thick lips among the Hottentots as among their neighbours the Negroes, the Caffres, and the Mozambiques. In fine, their mouths are of a middling size, and almost always furnished with a set of the finest teeth that can be seen; and, taken together with the rest of their features, as well as their shape, carriage, and every motion, in short their countenance, indicates health and content, or at least an air of easy ease. At the same time, this careless mien discovers marks of alacrity and resolution, qualities which the Hottentots, in fact, can exhibit upon occasion. Their heads one would suppose to be covered with a black, though not very close, frizzled kind of wool, if the natural harshness of it did not show, that it was hair, if possible, more woolly than that of the negroes. If in other respects there should, by great chance, be observed any traces of a beard, or of hair on any other parts of the body, such as are seen on the Europeans, it is, however, very trifling, and generally of the same kind as that on the head.

The women have no parts unbecoming to the rest of their sex. With respect to their dress, and method of painting themselves, the latter (if painting it may be called) consists in besmearing their bodies all over most copiously with fat, in which there is mixed up a little foot. This is never wiped off; on the contrary, they never used any thing to clean their skins, excepting

attempted to kindle a fire, and very hard; they crossed they could see, and reached about nine in the morning with a very kind reception, dried, and refreshed themselves: they had been eating.

between the Hottentot and How-Hook (a steep hardy wine and corn; but, though wild, yet the pasture is coarse) little in general. CAFFRES of HOTTENTOTS depicted for the advantage of their... in the Cape of Good Hope.

MANHOOD

cepting that when, in greasing the wheels of their waggons, their hands were befmeared with tar and pitch, they used to get it off very easily with cow-dung, at the same time rubbing their arms into the bargain up to the shoulders with this cosmetic; so that as the dust and other filth, together with their footy ointment and the sweat of their bodies, must necessarily, notwithstanding it is continually wearing off, in some measure adhere to the skin, it contributes not a little to conceal the natural hue of the latter, and at the same time to change it from a bright amber-brown to a brownish-yellow colour obscured with filth and nastiness.

Besides the pleasure the Hottentots enjoy in besmearing their bodies from head to foot, they likewise perfume themselves with powder of herbs, with which they powder their heads and bodies, rubbing it in all over them when they besmear themselves. The odour of it is at the same time rank and aromatic, and seems to come nearest to that of the poppy mixed with spices.

The Hottentots, with their skins befmeared with grease and foot, and bucku-powder, are by this means in a great measure defended from the influence of the air, and may in a manner reckon themselves dressed. In other respects, both men and women are wont to appear quite undressed; indeed, one may say naked, except a trifling covering, with which they always conceal part of their bodies. With the men this covering consists of a bag or purse made of skin, hanging quite open, the hollow part of which seems designed to receive that which with us modesty requires to be concealed; but as this piece of furniture is only fastened by a small part of its upper end to a narrow belt, in other respects hanging quite loose, it is but a very imperfect concealment; and when the wearer is walking, or otherwise in motion, it is none at all. They call this purse by the Dutch name of Jackall, the name of an animal of the fox kind common in that country, as it is almost always prepared of the skin of this creature, with the hairy side turned outward. As another covering, which decency requires of the men, we ought, perhaps, to consider the two leather straps, which generally hang from the bottom of the chine of the back down upon the thighs; each of them being of the form of an Isosceles triangle, with their points or upper ends fastened to the belt just mentioned, and with their bases, at further three fingers broad, hanging carelessly down. These straps have very little dressing belloyed upon them, so that they make somewhat of a rattling as the Hottentot runs along; and probably by fanning him, serve to produce an agreeable coolness. The only and real intention, however, of this part of their dress, is said to be to close a certain orifice when they sit down. They are at that time likewise brought forwards, so as to cover the little flap above described; for, they say, these parts should by no means be uncovered when one sits, especially at meals. Nevertheless, they have been observed sometimes to neglect this decent custom.

Among the Hottentots, as well as in all probability among the rest of mankind dispersed over the whole globe, we must acknowledge the fair sex to be the most modest; for the females of this nation, cover themselves much more scrupulously than the men. They seldom content themselves with one covering, but almost always have two, and very often three. These are made of a prepared and well-greased skin, and are fastened about their bodies with a thong, almost like the aprons of our ladies. The outermost is always the largest, measuring from about six inches to a foot over. This is likewise generally the finest and most showy, and frequently adorned with glass beads strung in different figures, in a manner that shows, even among the unpolished Hottentots, the superior neatness of the fair sex in works of ornament, as well as their powers of invention and their disposition to set off their persons to the best advantage. The outermost apron, which is

chiefly intended for show and parade, reaches about half way down the thighs. The middle one is about a third, or one half less, and is said by them to be necessary by way of reserve, and as an additional intrenchment of modesty, when their gala-garment is laid aside. The third, or innermost, which is scarcely larger than one's hand, is said to be useful at certain periods, which are much less troublesome to the fair sex here than in Europe. All these aprons, however, even to that which is decorated with beads, are not less befmeared and greasy than their bodies. In fine, the garment worn by the Hottentots for covering their bodies is a sheep skin, with the woolly side turned inwards; this pelisse, or else a cloak made of some smaller fur, is tied forwards over the breast. When the weather is not cold, they let it hang loose over their shoulders in a careless manner, when it reaches down to the calves of the legs, leaving the lower part of the legs and thighs bare; but in rainy and cold weather they wrap it round them; so that the fore part of the body likewise, is in some measure covered with it as far as below the knees. As one sheep-skin alone is not sufficient for this purpose, there is a piece sewed, or rather fastened on with a thong, sinew, or catgut, to the top of each side. In warmer weather they wear this cloak sometimes with the hair side outwards, but in that case they often take it off entirely and carry it on their arms. In general, the Hottentots do not burden themselves with a great many changes of their cloaks or Krosses, (as they call them in broken Dutch) but are content with one which serves them at the same time for clothing and bedding; and in this they lie on the bare ground, drawing themselves up in a heap so close, especially when the weather is cold, that this Kros (as they call it) or Karofs, is quite sufficient to cover them. The cloak, or Karofs, which is used by the women for the same purpose, does not differ from those used by the men in any other respect, than that the women have a long peak to their Karoffs, which they turn up, forming with it a hood or little pouch, with the hairy side inwards; in this they carry their little children, to which they now and then give the breast over their shoulders, a practice that likewise prevails with some other nations. The men in general wear no peculiar covering on their heads. A few have been seen that had a cap made of greased skin, the fur of which had been taken off in the preparation. Those who live nearest to the colonists, fancy the European hats, wearing them slouched all round, or else with one side turned up. The women in like manner frequently go bare-headed. When they cover their heads, it is with a cap in the form of a short truncated cone. It is made without any seam, of the sedgment of some animal's stomach, and is as black as foot mixed up with fat can make it. These are frequently so prepared, as to look as if they were slaggy, and others again to resemble velvet, and upon the whole make a tolerably handsome appearance. Over this cap they sometimes wear another ornament, consisting of an oval wreath, or, a crown made of a buffalo's hide, with the brown hair upwards. This is about four fingers in height, and surrounds the head so as to reach a little way down upon the forehead, and the same depth in the neck behind, without covering the upper part of the cap above described. Both the rims of this wreath, as well as the lower one on which it rests, as the upper one, are always smooth and even, and each of them set with a row of small shells, of the Cypræa kind, to the number of more than thirty, in such a manner, that being placed quite close to each other, their beautiful white enamel, together with their mouths, is turned outwards. Between these two rows of shells run one or two more in a parallel line, or else waved or indented in various fancies. It may easily be imagined, what a pretty effect these shells have, projecting from the brown fur of the buffalo's skin, and at the same time, with what additional charms a greatly Hottentot dame appears in

one of these caps and wreaths, which, however, is to the full as greasy as herself.

The ears of the Hottentots are never adorned with any pendant or other ornament hanging from them, any more than the nose, as they both are among other savages; this latter, however, is sometimes, by way of greater state, marked with a black streak of foot, or, more rarely indeed, with a large spot of red-lead; of which latter, on high days and holidays, they likewise put a little on their cheeks. The necks of the men are bare, but those of the women are decorated with what is, in their opinion, a great ornament. It consists of a thong of undressed leather, upon which are strung eight or ten shells. Appearing collectively in the form of a necklace, they certainly adorn the greasy part they are hung upon, though perhaps not in proportion to the price at which they are obtained; for these shells are commonly sold for not less than a sheep a piece, as it is said they are to be had no where else than on the most distant coast of Caffaria.

Another ornament in use with both sexes, is rings on their arms and legs. Most of these rings are made of thick leather thaps, generally cut in a circular shape, which by being beat and held over the fire, are rendered tough enough to retain the curvature that is given them. It is these rings that have given rise to the almost universally received notion, that the Hottentots wrap guts about their legs, in order to eat them occasionally. The men wear from one to five or six of these rings on their arms, just above the wrist, but seldom any on their legs. The matrons of a higher rank frequently have a considerable number of them both on their arms and legs, especially on the latter, so that they are covered with them from the feet up to their knees. These rings are of various thicknesses, viz. sometimes to that of a goose-quill, and sometimes two or three times that size. Now and then they are made of pieces of leather, forming one entire ring, so that the arms and feet must be put through them when the wearer wishes to put them on. Upon the legs they are strung on, small and great, one with another, without any peculiar nicety; and are so much larger than the legs, as to shake off and get twisted, when the wearer walks or is otherwise in motion. It may easily be imagined, that these rings give the good Hottentot matrons a world of trouble, as well in the wear as in the preparation; and at the same time are not a little clumsy and ponderous, not to mention several other inconveniencies. But such is the peculiar turn of mankind, that from the Hottentot, as unconstrained as rude in his manners, to those nations which carry the arts and sciences to the highest degree of perfection, people are universally apt to fall into such modes of dress, as are not only useless, but likewise in a great measure imprison their limbs and bodies. Rings of iron or copper, but especially of brass, of the size of a goose-quill, are considered as genteeler or more valuable than those made of leather. They are, however, sometimes worn along with these latter, to the number of six or eight at a time, particularly on the arms. The girls are not allowed to use any rings, till they are marriageable. We are informed that a traveller, who was passing through the district of Zwelendam, endeavoured to assail the chastity of a Hottentot girl, about sixteen or seventeen years of age, but in every other respect quite a woman: it is said, however, she refused his presents and offers, principally for this reason, that the old people in her craal had not yet invested her with the privilege of wearing rings. Whether this same law prevails in every craal, is not ascertained; but it does not seem extremely probable that the girls in every craal are so obedient to the laws. The Hottentots seldom wear any shoes; when they do, the leather of them is undressed, with the hairy side outwards, and undergoes no other preparation, than that of being beat and moistened. If it be of a thick or stout sort, as for example, of buffalo's hide, it is besides kept

some hours in cow-dung, by which means it is rendered very soft and pliable; afterwards some kind of grease is made use of for the same purpose. The shoes are then made of this leather in the following manner: they take a piece of leather of a rectangular form, something longer and broader than the foot of the person for whom the shoes are intended. The two foremost corners are doubled up together, and sewed down, so as to cover the forepart of the foot. This seam may be avoided, and the shoes may be made much neater at the toes, by fitting immediately over them a cap taken from the membrane in the knee joint of the hind leg of some animal. Now, in order to make this piece of skin or leather rise up to the height of an inch on both sides of the foot, and close it in neatly, it is pierced with holes at small distances all round the edge, as far as the hind-quarters, and through these holes is passed a thong, by which the rim is drawn up into gathers; further, in order to make strong hind-quarters, the back part of the piece of leather is doubled inwards, and then raised up and pressed along the heel. The ends of the thong, or gathering-string, are then threaded on both sides through the upper edge of the hind-quarters to the height of about two inches; they are then carried forwards, in order to be drawn through two of the above-mentioned holes on the inside of each rim. They are then tied over the instep, or, if it be thought necessary to tie the shoe still faster, they are carried crossways over the instep, and so downwards under the thong, which comes out from the hind-quarters, then upwards again over the ankle, and even round the leg itself, if the wearer chooses.

Shoes of this kind are certainly not without their advantages. They fit as neat upon the foot as a stocking, and at the same time preserve their form. They are easily kept soft and pliable, by constantly wearing them. Should they at any time grow rather hard above the edge, this is easily remedied by beating them and greasing them a little. They are extremely light and cool, by reason they do not cover so much of the foot as a common shoe does. They wear very well, as they are without any seam, and the soles, or rather bottoms of the shoes, are both tough and yielding. As shoes of the common tanned leather are burnt up, as it were, and are apt to slide about in the scorching African sands, and at the same time are easily torn in a stony and rocky soil, these field shoes, as they are called, made of almost raw leather, are much more durable. These may be likewise had at a much inferior price, as the leather used in the making of them is entirely undressed; and a man can make himself a pair of them in the space of an hour or two.

The Hottentots who live in these parts, or within the boundaries of the Dutch colonies, seldom make use of any weapons. Here and there, indeed, a man will furnish himself with a javelin, by way of defence against the wolves: this is called a Massagai. Their habitations are as their dress, and equally adapted to the wandering pastoral life they lead in those parts. In fact, they scarcely merit any other name than that of huts; though, perhaps, as spacious and eligible as the tents and dwelling-places were of the patriarchs of old, at least they are sufficient for the Hottentot's wants and desires; who may therefore be considered as a happy man, in being able in this point likewise so easily to satisfy them. The great simplicity of them is, perhaps, the reason, why in a Hottentot craal, or village, the huts are all built exactly alike; and that one meets there with a species of architecture, that does not a little contribute to keep envy from insinuating itself under their roofs. In fact, the equality of fortune and happiness in some measure enjoyed by these people, cannot but have a singular effect in preventing their breasts from being disturbed by this baneful passion. Every hut is disposed in the following manner. Some of them are of a circular, and others of an oblong shape, resembling a round beehive or a vault. The ground-plot is from eighteen

which means it is afterwards some kind of the same purpose. The leather in the following is broader than the foot of shoes are intended. The doubled up together, and the forepart of the foot, and the shoes may be, by fitting immediately on the membrane in the of some animal. Now, in skin or leather rise up to both sides of the foot, and proceed with holes at small, as far as the hind-quarters is passed a thong, by into gathers; further, in quarters, the back part of doubled inwards, and then the heel. The ends of ng, are then threaded on edge of the hind-quarter inches; they are then to be drawn through two es on the inside of each ver on the instep, or, if he shoe Bill faster, they are instep, and so downwards lines out from the hind-ain over the ankle, and the wearer chooses.

certainly not without their heat upon the foot as a time preserve their form, and pliable, by constantly at any time grow rather easily remedied by bea- n a little. They are ex- reason they do not cover common shoe does. They without any seam, and the the fibres, are both tough e common tanned leather d are apt to slide about in and at the same time are cky soil, these field shoes, f almost raw leather, are e may be likewise had at the leather used in the undressed; and a man can n in the space of an hour

to twenty-four feet in diameter. The highest of them are so low, that even in the centre of the arch, it is scarcely ever possible for a middle-sized man to stand upright. But neither the lowness of the hut, or that of the door, which is barely three feet high, can perhaps be considered as any inconvenience to a Hottentot, who finds no difficulty in stooping and crawling on all fours, and who is at any time more inclined to lie down than stand. The fire place is in the middle of each hut, by which means the walls are not so much exposed to danger from fire. From this situation of their fire-place, the Hottentots likewise have this additional advantage, that when they sit or lie in a circle round the fire, the whole company equally enjoys the benefit of its warmth. The door, low as it is, is the only place that lets in the day-light; and, at the same time, the only outlet that is left for the smoke. The Hottentot, injured to it from his infancy, sees it hover round him, without feeling the least inconvenience arising from it to his eyes: while, rolled up like a hedgehog, and wrapped up snug in his skin, he lies at the bottom of his hut, quite at his ease in the middle of his cloud, excepting that he is now and then obliged to peep out from beneath his sheep-skin in order to stir the fire, or perhaps to light his pipe, or else sometimes to turn the steak he is broiling over the coals. The materials for these huts are by no means difficult to be procured; and the manner of putting them together being both neat and artificial, merits commendation in a Hottentot, and is very suitable to his character. The frame of this arched roof is composed of slender rods or sprays of trees. These rods, being previously bent into a proper form, are laid, either whole or pieced, some parallel with each other, others crosswise; they are strengthened, by binding others round them in a circular form with withies. These withies, as well as the rods themselves, are taken chiefly from the Clifortia Conoides, which grows plentifully in this country near the rivers. Large mats are then laid very neatly over this lattice-work, so as perfectly to cover the whole. The aperture which is left for the door is closed, whenever there is occasion for it, with a skin fixed to it, or a piece of matting. These mats are made of a kind of cane or reed, the reeds, being laid parallel to each other, are fastened together with sinews or catgut, or else some kind of packthread, such as they have had an opportunity of procuring from the Europeans. They have it, therefore, in their power, to make their mats as long as they choose, and at the same time as broad as the length of the rush will admit of, viz. from six to ten feet. This same kind of matting is now made use of likewise by the colonists, next to the tilts of their waggons, by way of preventing the sail-cloth from being rubbed and worn by them, as well as of assisting to keep out the rain. When a Hottentot has a mind to take his house down and remove his dwelling, he lays all his mats, skins, and sprays on the backs of his cattle, which to a stranger makes a monstrous unwieldy, and, indeed, ridiculous appearance. The order or distribution of these huts in a craal or clan, is most frequently in the form of a circle with the doors inwards; by this means a kind of yard or court is formed, where the cattle is kept on nights. The milk, as soon as taken from the cow, is put to other milk which is curdled, and is kept in a leather sack; of this the hairy side, being considered as the cleaner, is turned inwards: so that the milk is never drank while it is sweet. In certain northern districts, such as Roggeveld, or Bokkeveld, where the land is, as it is called, Carrow, or dry and parched, the Hottentots, as well as the colonists, are shepherds. The Hottentots of Hottentot-Kraal hire themselves, as they are wanted, to the Dutch.

Our travellers stayed all night at the Tyger-Hoch, a place belonging to the company. They proceeded in the morning eastward, through a flat country covered with pasture. They crossed in the afternoon the Breed Rivier, where there is a ferry, which having

likewise crossed, they arrived at Zwelldam, the residence of a chief justice.

Zwelldam lies under the chain of mountains which begin near the Bay Aldgoa, and take their direction west-north-west. They have a different climate here from that of the Cape, having instead of south-east winds, storms from the north-west. They delayed here a few days, it being the season that the farmers meet for exercising. The lieutenant, during this time, made several excursions through the woods, and along the mountains. On the 20th they departed from Zwelldam, and proceeded E. N. E. towards the Reed Valley. They crossed the Buffalye Agte Rivier (signifying a river to hunt buffaloes, for which it was formerly famous) about four in the afternoon. The river here winds to the southward, and joins the Breed Rivier. Having lost their road in the evening, it was with great trouble they reached Reed Valley, which is about twelve miles distant from Zwelldam, and 120 from the Cape. The Dutch Company have possession of this place, and employ it in breeding cattle. It produces a great quantity of wild fowl, particularly several kinds of partridges. Their waggon, which they overtook here, was so much out of repair, through the ruggedness of the way, they were obliged to stop a few days to repair it.

They left this on the 26th, and proceeded to Grandfather's-Wood, where a heavy shower of rain obliged them to stop for some hours. Having sent their waggon the best road to Plata-Kloaf, they went a nearer way themselves, but could not possibly ride, as the way was exceedingly slippery. When they had crossed Pidgeon-House River, they arrived late in the evening at a farmer's house, which stood adjoining the Kloaf or pass. Their waggon did not arrive till the 28th.

This place, which is called the Land of Egypt, consists, to all appearance, of about thirteen farms, which are seemingly four or five miles distant from each other; they had some very good fruit, particularly oranges, here. The country is exceedingly fertile and delightful. They now proceeded to Channa Land, so called from a herb called Channa, used by the natives in smoking and chewing. Having now laid in a fresh supply, they pursued their journey; but the mountain proved so rugged, that on attempting to take the waggon over, it overset, but providentially sustained no injury. When they had attained the top of the mountain, they had a most delightful view of the sea and country. They now proceeded E. N. E. the road very disagreeable and rugged. In the evening they reached Rocky-River, where they staid all night, and purchased in the morning a sheep, at the price of three English shillings. Proceeding eastwards, they arrived at a peasant's house about three in the afternoon. The inhabitants, unaccustomed to strangers, were exceedingly shy, notwithstanding which they displayed much hospitality and good-nature.

On the 30th, early in the morning, they pursued their journey through a very disagreeable road, east half north, and reached the great river about one in the afternoon, where they dined. They then crossed the river, and came to another, Gold-River, in the evening. This river, on account of numerous large pools, is very dangerous to cross; it has a southerly direction, and empties itself to the westward of Catherina-Bay, in the Indian Ocean. They now proceeded, and were totally ignorant in the night where they were. At day-break they could see no inhabitants: advancing, however, towards the side of a small brook, where they had agreed to rest, they found themselves at Sleg Rivier (i. e. Snake-River). This day they travelled near forty miles. The next day they proceeded easterly through a very barren country, and reached in the afternoon a small establishment, situated under the Atguas Kloaf, on Saffron-River; they rested here all night.

Being supplied with a fresh store of provisions, they now proceeded N. N. E. towards Elephant-River.

River. At noon they reached a place called Poverty, and in the afternoon crossed it, where it was about half a mile broad. They travelled till very late this evening, and would have proceeded further, but the waggon having overturned, they were obliged to stop till it was day-light. The damage was not so great as was apprehended.

November 1, they proceeded E. by S. and arrived about eleven o'clock at an European's house, where they spent the day. Thence they proceeded easterly, and were directed to some hot baths, by observing two farmers making use of them. Having left this in the afternoon, they arrived at Tlimcko, or Ostrich Leg, in the evening. The inhabitants here are very kind; they are happy to see strangers, and ready to entertain them; they live chiefly on milk and flesh, and are totally ignorant of bread.

November 3, being supplied with a team of fresh cattle, they travelled the whole day, and perceiving fresh traces of lions, our travellers rode before the waggon with their guns loaded, in case of an attack. They reached a lake of brackish water about midnight, where they agreed to stay till morning; accordingly tied their cattle round the waggon, in order to secure them, and, to defend themselves from wild beasts, made fires on the outside all round them. There was very heavy rain, thunder, and lightning this night, which prevented them from enjoying much rest.

They proceeded early in the morning through an extensive plain called Beer-Valley, and reached some miserable huts (in the Hottentot style) about nine in the morning. They found here an old German, who having attached himself to one of the Hottentot tribes, and resided now upwards of twenty years with them, had acquired the same manners and dress.

The lieutenant being now in an ill state of health, was obliged to stay awhile with this old Hottentot-German, who accommodated him with a hut, and behaved to him with the utmost kindness; while Colonel Gordon, having parted with his friend, pursued his journey towards Snow Mountain. The lieutenant being somewhat recovered, took leave of the old German, and returned to Tlimcko, or Ostrich Leg, on the 11th. Here he stayed some time, for the purpose of exploring the mountains. Travelling is very dangerous here, there being several wild beasts, and particularly Boshiesmen, who take every opportunity of plundering the inhabitants of their cattle. The Boshiesmen are sworn enemies to the pastoral life. Some of their maxims are, to live on hunting and plunder, and never to keep any animal alive for the space of one night. By this means they render themselves odious to the rest of mankind, and are pursued and exterminated like the wild beasts, whose manners they have assumed. Others of them again are kept alive, and made slaves of. Their weapons are poisoned arrows, which, shot out of a small bow, will fly to the distance of two hundred paces; and will hit a mark with a tolerable degree of certainty, at the distance of fifty, or even a hundred paces. From this distance they can by stealth, as it were, convey death to the game they hunt for food, as well as to their foes, and even to so large and tremendous a beast as the lion: this noble animal thus falling by a weapon which, perhaps, it despised, or even did not take notice of. The Hottentot, in the mean time, concealed and safe in his ambush, is absolutely certain of the operation of his poison, which he always selects of the most virulent kind; and it is said, he has only to wait a few minutes, in order to see the wild beast languish and die.

Their bows are hardly a yard long, being at the same time scarcely of the thickness of an inch in the middle, and very much pointed at both ends. What kind of wood they are made of is unknown, but it does not seem to be of a remarkably elastic nature. The strings of the bows were made some of them of sinews, others of a kind of hemp, or the inner bark of some vegetable, and most of them are made in

a very slooply manner; which shows, that these archers depend more on the poison of the weapons, than on any exactness in the formation of them, or any other perfection in them. Their arrows are a foot and a half long. They are made of a reed one foot in length, which, at the base, or the end that receives the bow-string, has a notch of a proper size to fit it. Just above this notch there is a joint in the reed, about which strings made of sinews are wound, in order to strengthen it. The other end of the reed is armed with a highly polished bone, five or six inches long; At the distance of an inch or two from the tip of this bone, a piece of a quill is bound on very fast with sinews. This is done, in order that the arrow shall not be easily drawn out of the flesh; and thus there may be so much the longer time for the poison, which is spread on of a thick consistence like that of an extract, to be dissolved, and infect the wound. It is not common, however, for an arrow to be headed in the manner above-mentioned, with a pointed bone only; this latter being usually cut off square at the iron, and a thin triangular piece of iron fixed into it. In the state in which it is seen, as it makes part of the arrow, it is of a dark brown colour, full of small grooves and ribs, and does not appear ever to have been as white as ivory. Hence we may conclude, that on such arrows as are headed with iron, the bone is employed chiefly for giving this weapon a kind of weight and poise; and likewise, that these arrows cost the Hottentots a great deal of labour.

Their quivers are two feet long and four inches in diameter. They are made of a branch of a tree hollowed out; or, still more probable, of the bark of one of these branches taken off whole and entire, the bottom and cover to which are composed of leather. On the outside it is bedaubed with an unctuous matter, that grows hard when dry. The quivers are lined about the aperture with a serpent's skin; and, with the skin of the yellow serpent, which is considered as the most venomous of any in that country. Besides a dozen of arrows, every quiver contains a slender hone of sand-stone for whetting the iron head upon, and a brush for laying on the poison, together with a few wooden sticks, differing in thickness, but all of the same length with the arrows. For what use they are designed, cannot be ascertained. The poison is taken from several different kinds of serpents, the more venomous the better, whether their arrows are to be employed against their foes, or are only designed for shooting game; for the Hottentots know very well, that taken internally it is quite harmless.

The dwellings of these foes to a pastoral life are generally not more agreeable, than their maxims and manners. Like the wild beasts, bushes and chis in rocks by turns serve them instead of houses; and some of them are said to be so far worse than beasts, that their soil has been found close to their habitations. A great many of them are entirely naked; but such as have been able to procure the skin of any sort of animal, great or small, cover their bodies with it from the shoulders downwards as far as it will reach, wearing it till it falls off their backs in rags. As ignorant of agriculture as apes and monkeys, like them they are obliged to wander about over hills and dales after certain wild roots, berries, and plants (which they eat raw) in order to sustain a life that this miserable food would soon extinguish and destroy, were they used to better fare. Their table, however, is sometimes composed of several other dishes, among which may be reckoned the larvæ of insects, or those kind of caterpillars from which butter-flies are generated; and in like manner a sort of white ants (the termes) grasshoppers, snakes, and some sort of spiders. With all these changes of diet, the Boshiesman is nevertheless frequently in want, and to such a degree, as to waste almost to a shadow. Their stomachs are strong enough to digest a great quantity of food, as they may rather be said to bolt than

The capture of slaves from among this race of men
is by no means a difficult matter, and is effected in
the following manner. Several farmers, that are in
want of servants, join together, and take a journey
to that part of the country where the Boshiesmen live.
They themselves, as well as their Logo-Hottentots,
or else such Boshiesmen as have been caught some
time before, and have been trained up to fidelity in
their service, endeavour to spy out where the wild
Boshiesmen have their haunts. This is best discover-
ed by the smoke of their fires. They are found in
societies from ten to fifty and a hundred, reckoning
great and small together. Notwithstanding this, the
farmers will venture on a dark night to set upon them
with six or eight people, which they contrive to do,
by previously stationing themselves at some distance
round about the eraal. They then give the alarm by
firing a gun or two. By this means there is such a
consternation spread over the whole body of these
savages, that it is only the most bold and intelligent
among them, who have the courage to break through
the circle and steal off. These the captors are glad
enough to get rid of at so easy a rate; those that are
stupid, timorous, and struck with amazement, and
who, in consequence of this stupor, allow themselves
to be taken and carried into bondage, answering their
purpose much better. They are, however, at first,
treated by gentle methods; that is, the victors inter-
mix the fairest promises with their threats, and en-
deavour, if possible, to shoot some of the larger
kinds of game for their prisoners, such as buffaloes,
sea-cows, and the like. Such agreeable baits, toge-
ther with a little tobacco, soon induce them, con-
tinually cockered and sealed as they are, to go with
a tolerable degree of cheerfulness to the colonist's
place of abode. There these luxurious feasts of
meat and fat are exchanged for more moderate por-
tions, consisting for the most part of butter-milk, fru-
ments, and hally-pudding. This diet, nevertheless,
makes the Boshiesman fat in a few weeks. How-
ever, he soon finds his good living embittered by the
maundering and grumbling of his master and mistress.
The words T'guzeri and T'gumasi, which, perhaps,
are best translated by those of *Young Sorcerer* and
Serp, are expressions which he must frequently put
up with, and sometimes a few curses and blows into
the bargain; and this for neglect, remissness, or idlen-
ness; which last failure, if it cannot be said to be
born with him, is however in a manner naturalized
in him. So that, both by nature and custom, detail-
ing all manner of labour, and now, from his greater
capaculency, becoming still more foolish, and having
besides been used to a wandering life, subject to no
control, he most sensibly feels the want of his liberty.
No wonder then, that he generally endeavours to
regain it by making his escape: but what is really a
subject of wonder is, that, when one of these poor

devils runs away from his service, or more properly
bondage, he never takes with him any thing that does
not belong to him.

The lieutenant, in one of his excursions, fell in
with a party of these Boshiesmen, who behaved very
well; our traveller gave them some tobacco, for
which they made signs, and they, in return, offered
him some honey, which they had just collected in the
mountains. They had bows and arrows, and their leader
a spear in his hand, with heavy ivory rings on his
right arm; these were of the tribe of the Chonaegues.

On the 3d of December, our traveller visited the
most fertile and agreeable place he had yet seen, called
Good Hope. It lay at the source of the Ele-
phant's River, and was productive of plenty of corn,
with very little cultivation. The inhabitants sow the
grain when the river has overflowed the banks, and it
ripens here a month sooner than at the Cape, the
climate is so very favourable. This place is also
productive of excellent fruit, mulberries, apricots,
peaches, oranges, figs, &c. &c.

Lieutenant Patterson now proceeded S. W. and
passed the hot baths. He met with a great number
of ostriches, and after a fatiguing journey, reached
the dwelling of one Polkenbager, on the 11th, where
he rested two days.

Two pealants, who were on their way to the Cape,
now came up and offered our traveller a place in
their waggon, which proposal was very acceptable,
as the lieutenant's horse was exceedingly weary and
lame, through the badness of the roads. They pro-
ceeded along the banks of the Elephant's River, and
arriving at the Atquas Kloaf, rested there a day.

On the 19th, they passed the Atquas Kloaf, which
is a very rugged way. The next day our traveller
took leave of his kind waggons at Sure Flacla, and
pursued his journey towards the Hottiniqua-Land, for
the purpose of examining the extensive woods upon
the range of mountains which he had lately passed.
This night he lodged at Mr. Bota's, who behaved
with great hospitality and provided him with a guide
the next morning, when he arrived at White-Else-
River, so called from a tree of the same name.

On the 22d, the lieutenant and his guide being fur-
nished with dogs, for fear of tigers, ventured in the
woods, which begin to the north of Mossel-Bay, and
reach about 120 miles to the east, terminating at a
place called Sitlicamma. They are very thick and
produce several trees, uncommonly tall, whereon
may be seen a variety of beautiful party-coloured
birds; some of these trees grow out of the naked
strata of the rocks; the mountains are extremely
steep: an extensive plain lies between the woods and
the Indian Ocean. It is productive of a very inferior
sort of corn and wine, and though covered with grass,
the pasturage is very unwholesome. It is well inha-
bited with Europeans, whose traffic consists chiefly
in wood, which they bring in planks to the Cape.

Our traveller returned to the Cape, the same road
that he travelled with Colonel Gordon, and arrived
at the Cape-Town, January 13, 1778.

C H A P. II.

The Lieutenant commences his second Journey, with a Companion—They proceed to Tiger-Berg, &c.—A short Excursion—A Bonta-Bock hunted and killed—Detained by bad Weather—Visit Catherine-Bay—Cross the Mountains with Difficulty—Lose their People—Find them—Pursue their Journey—Observe the Prints of Lions, &c.—Visit two Bears in the Kars—Description of them—Meet an European Woman wounded with a poisoned Arrow—Arrive at Olive-Bush—Next Day at a Farm called Rhinoceros-Bosjes—Difficulty in reaching the Summit of the Mountain—Further Travels—Curious Observations—Arrive at the Tower—Pass the Baboon's Hill—Hunt an Hottentot—Shoot two Gems-Bucks—Description of them—Proceed further—The Lieutenant catches several White Ants—Journey continued—Entertained at an Hottentot Village—Pass the Copper Mountain—Meet several Natives armed—Scarcity of Provisions—Supply of three Sheep—Wild Apes, &c. seen—A small Boat invented for crossing Orange-River—An Attack by two Hippopotami—One of the Animals killed—Scarcity of Water—The Lieutenant loses his Oxen—Recover them—Procure Water—Pursue their Journey in Expectation of a Supply of Oxen—Agreeably surprised by a Provision of twelve Bullocks—Proceed on their Journey—Furnished with a Train of fresh Oxen—Reach Casper's Kloaf—An Excursion to the Camis-Berg—Provisions for a Week procured at a Dutchman's—Make for Horn-River—Arrive at the Bokke-Land—Fresh Supply—Pursue their Journey—Traverse Swart-Land—Return to Cape-Town.

LIEUT. Patterfon remained at the Cape four months, and being now determined on his fecond journey, was accompanied by a young gentleman, who, though an inhabitant of the Cape-Town, poffeffed feveral farms in the interior parts of the country, and proceeded, May 22, 1778, through a large fandy plain, to the Tiger-Berg, where they dined. The farmers being all now bufy in plowing and fowing their grain, the country had a lively appearance. They proceeded S. E. in the afternoon and fpent the night near Stillen-Bofch, at the houfe of Mr. Clutta.

On the 23d they purfued their journey to the Eaff Rivier, and made a fhort excufion to the Stillen-Bofch mountains; the country here is very fertile, productive of a variety of fruit, and plenty of corn and wine. Proceeding now E. S. E. they reached Knolllick Kraal's Rivier in the afternoon; this was impaffable till the 26th, when they made for the Worm, both about fixty miles diftant from the Cape.

On reaching the Tiger-Hock, they hunted a fpecies of antelope, called Bonta-Bock, which they killed. Two peafants who had travelled from afar, and were on their way to the Cape, informed our travellers that the country they had come through, was parched up for want of rain, and notwithstanding the rivers in this part were fo fwoln as to be impaffable, yet it was with the greateft difficulty, during their journey, they could procure water for their cattle.

They proceeded eastward on the 28th, but were obliged to flop at the firft houfe they could find, on account of the inclemency of the weather. They took up their night's lodgings about eight miles from the Tyger-Hock, and the next day advanced towards the Breed-Rivier, where it is joined by the river Zonderzynd; but were compelled to flop, from the impracticability of croffing the river. They were not the only travellers who were detained from the fame caufe; many waggons were flationed on the oppofite fide, which had been there for fome days, waiting till the water fhould fubfide. There is a ferry at this place, but it is of no ufe when the river is rapid. The man who had the charge of the ferry, was an old German, and had lived between the two rivers for many years. He very kindly propofed to get our travellers acrofs the river Zonderzynd; and offered them the ufe of his houfe till the river became paffable for the waggon. They left the Hottentots to take care of the baggage, and thankfully accepted of his offer. During their ftay here, they had much rain and fleet; and the mountains were covered with fnow. They croffed with great difficulty June 8th, and proceeded to Zwelendani, where they ftayed all night.

From Zwelendani they proceeded to Buffalye Agte Rivier, where they made fome fhort ftay. They lodged at the houfe of Mr. Van Renan, who, having fupplied them with a team of frefh oxen, accompanied them to the mouth of Gouds-Rivier on the 16th. The lieutenant vifited Catherina-Bay, about 280 miles from the Cape. This bay, which opens from the fea, W. by N. is wide, and expofes veffels very much to the S. E. winds. The place is altogether unfavourable to fhips, as very little refrefhment can be procured from any part of the adjacent country, which is both barren and poorly inhabited.

Having agreed by a pafs called Groena-Kloaf (which they were informed was the moft feecure and agreeable road at that feafon) to go through a large chain of mountains to the wellward: they accordingly directed their courfe that way, and reached the houfe of a very old man, one Jacobus Botta, on the 27th. The next day was exceedingly cold and boifterous, with heavy rain; they purfued their journey ftill to the weft, and came to a farm on the Breed-Rivier at night. The weather ftill continuing bad the 29th, they ftopped for that day, and being advifed not to proceed any further in that diretion, on account of the difficulty in croffing the rivers, they agreed to return and crofs the mountains at another place to the callward, called Plata-Kloaf.

July the 8th, they reached Plata-Kloaf, and, after fome trouble, croffed the mountains on the 10th, and arrived at Channa-Land, thence they proceeded weftward, and in the evening came to a hot bath, more temperate than thofe obferved in the firft journey.

Having a very long day's march before them, they refted here a few days, and early on the thirteenth, fent their waggon before them; they arrived at a ftream of water, where they refted for the night; there were violent claps of thunder and heavy rain; the country they had travelled was very barren and full of wild beafts.

On the 14th, perceiving a Hottentot Kraal, about two miles diftance, one of the natives was hired for a guide. Having left the waggon, Lieutenant Patterfon, defirous to fee as much of the country as poffible, with Mr. Van Renan and their guide, now purfued a different diretion, and when they had travelled till about four in the afternoon they then began to think of their baggage. They travelled till nine, through a very wild country, inhabited only by beafts, without difcovering the object of their fearch. The lieutenant then afcended the hills, in hopes of difcerning a fire on fome adjacent heights; which is the ufual fignal made by travellers in Africa when they are loft, or feparated from their companions. However, their labours being unfeceffful, they agreed to remain till day-light, at the fide of a fmall fountain; though they were far from being in either an agreeable or fafe fituation, having no fire-arms, nor any poffible means of lighting a fire. Numbers of hyenas howled about them the whole night; and in the morning, they found that a large tiger had been within ten yards of them.

On the 16th, they proceeded in fearch of their people, whom they difcovered about noon. They refted a few hours, and in the afternoon continued their journey, about fix miles to the weftward, where they ftayed all night. Their oxen and horfes were fattered to the waggon, and fires kindled around them, as ufual; they afterwards paffed a dry barren country, and, in the morning, came to a miferable hovel belonging to an European, where they ftayed all night.

On the 18th, they proceeded through what the Dutch call Karo, which is a very extenfive plain, interfperfed with fmall fucculent and fruitefeent plants. This difcription may be applicable to many parts of Africa; particularly thofe which are fituated to the north of the Cape. They travelled all this day without finding a drop of water; and in the evening arrived at a houfe called the Staart, which is pleafantly fituated on the banks of a fmall river. Here they amused themfelves with fhooting wild ducks, and a fpecies of reed-bens, which they found in great plenty.

They purfued their journey on the nineteenth, along the Verkered Valley; which is thus denominated, from the river which courfes through it, taking a diretion different from that of any other in this country. At the time we were there it was quite fall. They were now advancing towards the Coud Bokke Veld, or the cold country of antelopes; the mountains of which were covered with fnow; which frequently remains upon their fummits till the month of November. The next day they arrived at a houfe fituated on the north-eaft fide of the Whifon-Berg, or White Hill, where they remained all night. The people informed them of the danger of croffing the Great Karo, not only from its being a defart country, but alfo from parties of the Bofhiefmen Hottentots, who were at war with the Dutch; and were often lurking about to fall in with Europeans. They gave them inflances of perfons having been wounded by their poifoned arrows, and that they were very feldom cured. Notwithstanding their good advice, our travellers determined to crofs the country, keeping as much on their guard as poffible.

On the 21ft, they directed their courfe north; and in the evening took up their lodgings on the fide of a fmall ftream of water, called Thorn-River. Our hero

ed Thorn-River. Our
hero

hero made an excursion in the morning, through
the country, and in the afternoon they joined the
waggon. In the evening they found water at a place,
called Porde-Berg, or Horse Mountain, where they
rested all night.

On the 23d, they observed a fire about half a mile
from them, which they imagined had been lighted
by a party of wild Hottentots. Being resolved to see
who they were, they found them to be the servants
of a Dutchman, who lived near the Cape. They
had a large flock of sheep under their charge. The
lieutenant found them to well acquainted with the
country, that he hired one of them as a guide. They
then continued their journey about twenty miles, and
at night arrived at Unlucky-River; so called, from
a man's having been devoured by a lion some years
ago on its banks.

The next day their road lay through a dry sandy
country, with a very naked appearance. The hills
were composed of horizontal strata of a soft mould-
ering kind of stone. At noon they were informed
by a peasant (who was on his way to the Cape) that if
they did not proceed on their journey with all possible
expedition, they would not be able to come to any
place where there was water: moreover, that travel-
ling at night was very dangerous, on account of the
number of lions which inhabited that part of the
country. After a very fatiguing march they arrived
at a brackish fountain, where they rested all night.

On the 25th, they continued their route to the
northward, through much the same kind of barren
soil they had passed on the preceding day. Where-
ever they passed, they observed the fresh print of
lions and tigers; and early next morning Mr. Van
Renan saw a lion within fifty yards of him, which
our travellers afterwards pursued; but the track
brought them to a clump of thick thorny shrubs, which
prevented them from proceeding further. The next
day, they visited two of the boors who reside in the
Karo during the time when the snow lies upon the
Rogge Veld mountains. This practice is not, how-
ever, general, several of them remain in their habi-
tations, exposed to all the inclemencies of the wea-
ther. The principal cause of the migrations from
the mountains to the Karo, is a want of firewood,
which is very scarce on these heights. Those of them
that remain, in general, employ their servants, be-
fore the winter begins, in carrying wood from the
bottom of the mountain, which is certainly a very
laborious task. There are some to whom these tem-
porary removals are far from appearing a great evil.
Indeed, several of the inhabitants of this district are
so much in the habit of changing their abode, that
rather than undergo the trouble of making a proper
provision for this dreary season, they would travel
for many miles. As this desert part of the country
is inhabited only during a short part of the year, very
few houses are to be found in it. Most of the in-
habitants live in huts similar to those of the Hottentots
already described; some dwell in the tent that covers
their waggon; and, even in this situation, the boors
have the appearance of being the happiest of all human
beings. When a stranger visits them, he is treated
with the greatest hospitality; and every thing they
have is at his command. This, in general, is the
case throughout the whole country.

They proceeded on their journey this day only
about ten miles; and in the evening came to a very
mean cottage under the mountain. The inhabitants
were possessed of a very large herd of cattle, particu-
larly sheep; but at this season many die of a disease,
which they term, the burning sickness, in which they
lose most of their hair. There is a passage at this
place over the mountain, but there was now no pos-
sibility of crossing it; our travellers, therefore, pro-
ceeded to the westward, by the direction of the boors.
At night they came to a small stream of water, where
they rested.

On the 29th, they directed their course north by
west, through a hilly country. On their way they

saw several huts, which they supposed to belong to
Hottentots; but they proved such before described,
the winter residence of the Dutch boors. At one of
these huts was an European woman who had been
wounded in the arm with a poisoned arrow. Great
pains had been taken to cure her, but to no purpose;
for at different periods of the year, an inflammation
came on which was succeeded by a partial mortifica-
tion. She said, that the wound was not long in heal-
ing up; but that, in two months afterwards, there
was a certainty of its breaking out again; and this
had been the case for many years.

At night they arrived at a place called Olive-Bush,
where they rested. The man, to whom this place
belonged, was the only one, of a whole family, who
escaped from a party of the Boshtiefmen Hottentots.
Those savages had attacked them a few years before,
and put to death his mother, brother, sister, &c.

The next day they proceeded to the northward;
and, in the evening, came to a farm called Rhino-
ceros-Bosch. During the night they had much wind
and rain. Pursuing their journey, north by west,
they had the Rogge Veld Berg on their right hand.
On their way they met one of the inhabitants of the
mountain, who promised to assist them with a team
of fresh oxen to carry them to the summit, which
was very difficult of ascent. In the evening, they
rested by the side of the Rhinoceros-River; but as
they had no shelter from the incessant hail and rain,
and were unable to keep their fire lighted, their situa-
tion was extremely uncomfortable. In this condition
they remained during the whole of the following day;
and on the second of August, the promised assistance
arrived in order to conduct them up the mountain;
but it was with the utmost difficulty they could reach
the summit, the path was so very steep and rugged;
and the ton thereof so wet, that their oxen and horses
went often up to their bellies in the low ground. In
the afternoon they came to the house of their friend,
who had afforded them so much assistance, where
they stayed all night, and were hospitably entertain-
ed.

Though the soil appears to be very good here, yet
it seldom produces any considerable crop of grain.
This proceeds not only from blights, which are very
frequent here; but sometimes from heavy showers of
hail, which break down the corn about the time that
it is ready to be cut. The locusts also are fatal ene-
mies to all vegetation, and destroy every thing in
their course, not sparing even the fruit trees. The
soil of this mountain is a reddish clay; in many places
containing a quantity of saline matter, so as to be
quite perceptible to the taste. It is necessary to ob-
serve, that towards the interior parts of this country,
or rather the centre of the peninsula, the country
does not decline in a north-west direction, at least
not in proportion to the immense mountains which
progressively present themselves to view: for in-
stance, though the ascent of the mountain, called the
Rogge-Veld, is not less than two thousand feet from
the Karo, the descent is not more than one thousand
before they come to a second, which appears of equal
height with the former.

Having taken leave of their kind host, they pro-
ceeded nearly north by west, through a very hilly
country. On the 3d, in the evening, they arrived
at a miserable hut, which they found belonged to an
European who lived with the Hottentots; his name
was Swertz. He was not at home; but as our travel-
lers could not advance any further, for want of water,
they remained there during the night. The only
thing they could procure at this place was milk, for
which they gave the Hottentots some tobacco.

On the 4th, they travelled through a dry barren
country which lies between the Rogge-Veld and
Hentum. At noon they crossed the Rhinoceros-
River, where they saw several large herds of quachas;
and, in the evening, came to a very decent house,
where they were well received. This house is situated
on the very borders of the Boshtiefmen-Land;
and

and is frequently attacked by that tribe of Hottentots. As they had undergone many inconveniences for some time before, from the severity of the weather, and the want of shelter in many places through which they had passed, our travellers determined to rest here a few days, and to visit the Hentum and other countries adjoining.

In this part of the country there are many things worthy of observation. The horses in this district are yearly attacked by a disorder, for which it is very difficult, if not impossible, to account. Certain it is, that the utmost care, the feeding of them with corn, and keeping of them in stables, as much from the air as possible, does not operate as a preservative from this disease; so that those who have other farms near, remove their cattle till this season is passed. Horned cattle are exposed to equal danger from the *Amaryllis Dillicha*, or poison bulb, with which the country is covered; they are extremely fond of its leaves, which generally prove fatal.

On the 9th, we proceeded towards the Bokke-Land, which is nearly west by south, from the Hentum mountain; and, in two days, arrived at a place called the Tom, or Tower, which is a hill of a pyramidal figure, where they stayed all night. The next day (the 11th) they passed the Baboons-Hill; the road was so very bad, that it was with great difficulty they could keep the waggon upon its wheels. This night they stayed at a brackish river; and the following day were detained till noon, having killed their oxen. Here our hero visited a Hottentot Kraal, which was about a mile distant; and, as he proposed travelling over the small Nimiqua Land, he hired one of the Hottentots, who spoke Dutch, as an interpreter. In the afternoon they continued their journey as far as Thorn-River, where are many lions, so that they were obliged to fatten their oxen, and make fires as before.

On the 12th, they descended the Bokke Veld Berg, which was steep, but not very high, and came to a farm belonging to Mr. Van Renan. In this journey from the Hentum, they shortened their distance from the Cape about fifty miles.

On the 13th, they proceeded to the northern extremity of the mountain, which is quite level on this side, and almost perpendicular for more than two thousand feet. The soil is of a white sandy mould, intermixed with large fragments of a sort of ice-stone. This part of the country produces very little corn; the pasture is esteemed good for cattle; but, in the dry season, they are much distressed for want of water. The people here behaved with the utmost hospitality; particularly one Jacobus Ryke, who accompanied the lieutenant to the Great River.

They followed their waggon on the 15th, in its descent down the mountain, which was really steep and dreadful. About ten in the morning they got into a low level country. This day they shot at several of a species of antelope, called Gems-Bock, and killed two. These animals are among the largest of the antelope kind at the Cape, and in general their flesh is excellent food. They have straight slender horns, near three feet long, annulated above half of their length: the rest smooth. The space between horn and horn at the points is about fourteen inches. At their base is a black spot; in the middle of the face another; a third falls from each eye to the throat, united to that in the face by a lateral band of the same colour: the nose and rest of the face white. From the hind-part of the head, along the neck and top of the back, runs a narrow dusky line of hairs, longer than the rest, and standing above them, dilating towards the rump. Its sides are of a light reddish ash-colour; the lower part bounded by a broad longitudinal dusky band, reaching to the breast. The belly, rump, and legs are white; each leg marked below the knees with a dusky mark. The tail is covered with long black hairs; from the rump to the end of the hairs, two feet six inches long. The length of the skin about six feet six inches. When attacked

by dogs it will fit on its hind quarters and defend itself with remarkable long sharp horns.

They slept this night under a large mimosa tree, and the next morning went forward to the northward. About nine they arrived at the Great Thorn-River, where they rested a few hours during the heat of the sun. In the afternoon they continued their journey through a level country, having the Bolshiefmens-Land, or Long Hill, on their right hand, and the Karo-Berg on the left. On their way they saw several elks, eyelands, &c. The country is in most parts covered with a very curious sort of cubic iron ore. In the evening they came to a place, called the Lion's Den, which is a large hollow rock, where they found water just sufficient to supply themselves and their cattle.

The lieutenant made an excursion to the westward, and his two companions, Mr. Van Renan and Jacobus Ryke, directed their course to the northward in pursuit of game. At noon the lieutenant returned to the Lion's Den, and thence proceeded to the northward, directing his servants to follow him with the waggons. After travelling about eight miles, he found his companions at a small fountain, broiling some white ants, which they eat, and which the lieutenant declares, are by no means disagreeable.

They proceeded the next day to the north-west, through a deep sandy country. About noon they observed a habitation a little to the eastward, and found that it belonged to an European, who lived here during the winter season: this place they called the Pickled Fountain, from the water being so brackish that they could not drink it. In the afternoon they continued their journey to another fountain, called Brack Fountain. The water here was exceedingly brackish, though much better than the rest. During the night they had much rain; and in the morning good water in the hollow rocks; but our hero observed that the water, by standing a few hours, became similar in its quality to that of the fountain. They now went through a country. Most of the hills form large pyramidal loose, red, sandy stone.

On the twenty second, at noon, they came to the Hariebeel-River, which was brackish; here they rested about two hours. In the afternoon they proceeded to the westward, when they came to another house on the same river, where they stayed all night. Towards the westward this river joins another, called the Thorn-River.

On the 23d, they directed their course to the northward, and in the forenoon came to the Black-Thorn-River; which has its source at the Camis-Berg. This is one of the highest mountains in this part of the country, and supplies the greatest part of the Small Nimiqua Land with water in the summer. At this river they stayed all day, having excellent pasture and good water for their cattle; and the next day continued their journey north-west, and entered the Small Nimiqua Land. The country is very mountainous. In the afternoon they arrived under the Camis-Berg, where they met with a peasant who had been some miles to the northward, inquiring after some of his friends; he was on his way to the Cape. There being a good supply of water at this place, they resolved to continue here all night; and in the morning directed their course towards the west; having in the road passed several dangerous precipices. At noon they rested, about an hour, by a small stream of water. In the afternoon they proceeded in the same direction; and in the evening came to a house belonging to a Dutchman, situated on the banks of a pleasant river, called the Green-River. Here they stayed all night. The Hottentots, to whom they gave tobacco and hemp leaves, supplied them with plenty of milk.

Our travellers took an excursion towards the north early on the morning of the 27th. They arrived at an Hottentot's village at night, which contained about 150 inhabitants and nineteen huts. Having treated

 the

the natives with tobacco, &c. they, in return, en-
 tertained them with a dance, wherein the men form
 themselves into a circle with their flutes (which are
 made of the trunks of trees of different sizes) and the
 women stand round them, making a noise with their
 hands. Thus they continue to dance in parties, and
 being relieved every now and then by fresh couples,
 keep the entertainment up the whole night.

On the 28th, they ascended a steep mountain,
 whereby their waggon was very much injured, and
 proceeded about thirty miles to the westward. They
 reached a fountain, at noon, called by the inhabi-
 tants Eye Fountain, where there were several Hot-
 tentot huts, and in the evening arrived at a small
 stream of water, where they rested that night. The
 next day they pursued their journey N. by W.
 through a mountainous country, and came, about
 evening, to a small fountain of brackish water, which
 lay under a naked rock of a conical figure, upwards
 of 500 feet high. In the afternoon they directed
 their course to the northward, and arrived in the
 evening, at the house of one Jan Vander Hever,
 situate on the Copper-Berg-Rivier; where, having
 met a kind reception, they rested a few days.

Now, having procured a team of fresh oxen, they
 took the north direction, through a rugged country,
 where they saw several natives at a distance. They
 arrived in the evening at a small fountain where there
 was very little water, but being thirty miles distant
 from the next water, as they were informed, they
 were resolved to weather it out; indeed, they had
 experienced, for several days, a great scarcity of
 wood and water. Some natives being seen approach-
 ing, armed with bows and arrows, our travellers
 imagined they were Bush-Hottentots, and, loading
 their guns, prepared for an attack. However, hav-
 ing met, the strangers only begged some tobacco,
 which was given them with much cheer. One of
 them, who spoke Dutch, informed the lieutenant
 that they had no cattle, but lived upon roots and
 gums; and sometimes feasted on an antelope, which
 they occasionally shot with their poisoned arrows.
 Shortly after, one of the inhabitants of the Nimiqua-
 Land overtook our travellers and requested them to
 accept of his company to the Great-River. His na-
 tion being at war with the Bush-Hottentots, he was
 rather afraid, as they frequently rob the Nimiquas of
 their cattle, and often kill the people. Having trav-
 elled about thirty miles without meeting with a drop
 of water, they came at last to a small fountain in the
 evening, where they stayed all night, and the next
 day proceeded north by east, through a sandy plain;
 and about sunset came to a brackish fountain, where
 they stayed all that night.

On the 5th of September, our hero made an ex-
 cursion to the summit of an high mountain, whence
 he had an extensive view of the adjacent country to
 the north and east. At noon he returned to the wag-
 gon; and in the afternoon they directed their course
 northward, through a sandy plain, which they had
 much difficulty in crossing, the sand being so deep
 that their cattle sunk in it to their knees. Towards
 the evening Lieut. Patterson and Mr. Van Renan
 left the waggon, directing their course northward in
 search of water; and resolved not to return till they
 found some. At night they came to the Great-River,
 where they agreed to wait till the waggon arrived,
 their horses being much fatigued. At this place was
 a kind of shed, which had been built by an European
 who had lived some time on the banks; there being
 excellent pasture for cattle. They had been a whole
 day without tasting food; so that they were very glad
 to find a piece of rusty flesh of an hippopotamus, a
 species of diet which the Africans are very fond of.
 Mr. Van Renan eat very heartily of it; but a very
 small portion satisfied the lieutenant. After this re-
 gale they endeavoured to sleep; but though they were
 much fatigued, they could get no rest for the fright-
 ful cries of the hippopotami.

On the 6th, their waggon not being arrived, they

faddled their horses and returned the same way, sup-
 posing some accident had happened to it. On their
 return they found their drivers had missed the way,
 and gone more to the eastward. They discovered
 their track, and followed them to another part of the
 river. When they arrived, all their Hottentots were
 hunting the hippopotami, having no provision in
 the waggon. They had hunted the whole day with-
 out success; and one of them had been wounded by
 the animal; but the stream being rapid, had driven
 him off to the opposite shore. They observed sever-
 al natives, to whom they made repeated signs, which
 they did not seem to understand.

Having had nothing to eat for the two preceding
 days, except some wild prickly cucumbers, which
 grew here in abundance, they agreed to return the
 way they came; previous to this our travellers
 ascended a high hill, about a league to the eastward.
 When arrived at the summit, they saw a large herd
 of cattle about six miles to the eastward; on which
 they immediately returned to the waggon with the
 glad tidings, and a Hottentot was dispatched to bring
 them a sheep or a bullock, whatever it should col-
 lect. The messenger returned in the evening with three
 sheep, and the Hottentots to whom they belonged,
 who stayed with them during the night. The river
 assumes a westerly direction in this part; on both
 sides are large trees, peculiar to this country. The
 mountains have, upon the whole, a barren appear-
 ance, being in general naked rocks; though they are
 in some places adorned by a variety of succulent
 plants.

On the 7th, they pursued their journey easterly,
 along the banks of the river. In their progress they
 saw a variety of most beautiful birds; and great num-
 bers of elephants and wild apes. The next day the
 lieutenant proposed crossing the river with several of
 the Hottentots who were swimmers. They invented
 a small float, which consisted of three pieces of dry
 wood, on which they transported their guns and
 clothes. After swimming about half an hour, they
 gained the opposite shore, where they wounded an
 hippopotamus.

Our hero made an excursion at noon along the
 mountains, which were so naked that scarcely a plant
 was to be seen. Some of these mountains consist of
 a species of quartz, others of iron, and several strata
 of copper ore. Along the banks of the river there
 were many pebbles of hard agate. In the evening
 they returned to the waggon, much fatigued. The
 wind being easterly, had driven them above a thou-
 sand yards down the river. Our travellers continued
 their observation here for several days. In the
 course of one of their excursions, Mr. Van Renan,
 very narrowly escaped with his life. In crossing the
 river on the 15th, accompanied by four Hottentots,
 the whole party were attacked and pursued by two
 hippopotami. They had, however, the good for-
 tune to get upon a rock in the middle of the river,
 and their guns being loaded they killed one of these
 animals; the other swam to the opposite side. Mr.
 Van Renan's intention was to go to the northward,
 being informed that the camelopardals were in that
 part of the country, while his friend made excursions
 to the eastward through a large plain in search of
 plants.

A species of locusts come down to this plain at dif-
 ferent seasons of the year in such numbers as to de-
 stroy most of the plants. The Boshiemen esteem these
 insects excellent food. The locusts are dried and
 kept for use when they have no other provision. This
 part of the country abounds with poisonous reptiles.
 The quadrupeds are elephants, camelopardals, rhi-
 noceroses, zebras, koedoes, elks, tigers, lions, jackals,
 hyenas, &c. &c.

On the 19th, Mr. Van Renan returned. He had
 shot a camelopardalis, towards the evening, at a great
 distance from the water, to which they immediately
 directed their course, intending to send a Hottentot
 next day to skin the animal. On their return, to

their great surprize, a lion sprung up about fifty yards from the place where the cameopardalis lay; and, on their arrival, they found he had disfigured it so much, that nothing could be preserved except part of the skin of the neck, with the horns, and part of the hind quarters. After seeing this, the lieutenant resolved to cross the river with some of the Hottentots, and procure the skeleton which they left in the fields. But by this time the river began to swell, and the Hottentots refused to accompany our hero, as they would be in danger of being detained for several months on the opposite side, this being the rainy season, to the eastward of their present situation, in which quarter they discovered many thunder clouds.

They spent the whole day of the 23d in shooting at the hippopotami, one of which they killed. They saw also the method made use of by the natives to catch these animals, which is as follows: they dig large holes in the ground, along the banks of the river, about ten feet diameter, and some of them about ten feet deep. In the bottom of these pits they place pieces of wood sharpened at the points, and then cover the cavity with branches of trees and turf. When the hippopotami come out of the river in the night to graze, they often fall into these snares, and very frequently receive wounds which occasion their immediate dissolution.

The season being too far advanced to admit of their proceeding further to the north, and there being no other path than that they had already taken, they returned by the same route. In their way they were visited by two peasants of the Namiqua-Land, who were sent out on a commission to the Bothebfmen, in search of cattle which they had purloined from the inhabitants of Namiqua Land.

On the twenty-fourth they directed their course westerly. At night they came to a small fountain, called Zebras Fountain. Here was but little water; but they were, nevertheless, under the necessity of staying all night, having an extensive plain to cross, where there was not a drop of water to be seen for about fifty miles. They left this at sun set the next day, and proceeded southward, intending to travel through the dry desert. After travelling about eight miles, several of their cattle began to drop down under the yoke, which obliged them to stay the remaining part of the night without a drop of water. In the morning they missed their oxen, and sent a Hottentot out in search of them, who returned at midnight. Being exposed to the scorching heat of the sun, and entirely destitute of water, this proved a very disagreeable day.

On the 25th, they agreed it would be best to return to the river for water, and leave the waggon in its present situation. Mr. Van Renan being sick, remained to take charge of the baggage, which required some guard, from the number of Bush-Hottentots who infested this part of the country. They then directed their course towards the river, and took with them an empty cask and a cann, which they had by the waggon. They found the river to be distant from them about eight miles, in a direct line. They saw on their arrival, the remainder of two hippopotami, which they had shot some days before, thrown out of the river. After refreshing themselves, they filled their cask and cann, which the lieutenant and another carried, leaving their Hottentots to bring the cattle to the waggon. The heat of the sun, and the fatiguing journey they had over the sand, obliged them to expend great part of the water before they arrived at the waggon, which was at six in the evening. As soon as their oxen arrived, they made another attempt to proceed; but after travelling about ten miles further, their cattle appeared in the same condition as before. It was therefore agreed that Mr. Van Renan and a companion should go on to the house of one Vander Hever, which was about fifty miles to the southward of this place. Accordingly, on the 28th, they saddled their

horses, and left the lieutenant and his party in this disagreeable situation, without water or fire. The lieutenant sent a Hottentot to a rock, about ten miles distance to the south-east, where there was a little water. In the afternoon, being tired of their situation, they resolved to make a third effort; and, if they should find it impossible to proceed, to leave the waggon and return to the Orange-River, being almost exhausted for want of water. Very luckily their cattle did much better than they expected, and brought them out of that sandy desert; in which there was scarcely any thing to be seen except mice and snakes, both of which were observed in great numbers. Towards the evening they met the Hottentot whom they had sent to the rock in search of water. He brought with him about forty quarts, which refreshed them and their cattle exceedingly. In the night they arrived at the Brack-Fountain, which by this time was almost dried up; being much fatigued, they were very unwilling to leave this place. The next day the lieutenant employed the Hottentots in digging the fountain a little deeper, and, by their exertions, they procured abundance of water, both for their own use and that of the cattle. Having left this place, they pursued their journey towards the Copper-Berg, in the expectation of meeting with a supply of fresh oxen from their friend Vander Hever. About ten at night, they perceived a fire at a distance, and, on their arrival at the place, had the pleasure of finding a Hottentot with twelve bullocks under his care, which had been dispatched for our hero's assistance. They continued to travel till three o'clock in the morning, when they arrived at the Small Copper-Berg-Fountain, where they rested.

At day-break they proceeded on their journey; and at nine o'clock the lieutenant left the waggon, and directed his course through the mountainous part of the country, to make observations. He visited the Copper-Mines; and brought with him several specimens of the ore, which is very rich. In the evening he arrived at the house of Vander Hever; and about two hours afterwards his waggon arrived. They rested here several days, made many excursions, and were kindly entertained.

On the 4th of October, being furnished with a team of fresh oxen, they travelled towards the southward, and at night arrived at the Sand-River, the water of which they found brackish. Here they remained till morning, and then pursued their journey for about fourteen miles, to a place where they found excellent water. Afterwards they proceeded to Caspers-Kloof, where they remained another night.

On the seventh, our hero made an excursion to the Camis-Berg; and the next morning they pursued their journey towards the Bokke-Veld, and in their way passed several Hottentot kraals. At the Eye-Fountain they met a peasant who had travelled from the Cape, and was going towards the Orange-River.

On the 10th, they proceeded to the Green-River, where they rested during the heat of the day; and in the afternoon travelled about four miles further to the south-east. The next day they were informed of a much better path than that which they had already traversed, and which they resolved to take: they travelled the whole day, and at night arrived at a small stream of water, supposed to be the Thorn-River, where they agreed to remain till the morning.

Early on the 12th, the lieutenant ascended a high mountain to the southward, which afforded him a very extensive view of the country to the east, and the pleasure of observing they had taken the right path. After travelling about fifteen miles, they came to the house of a Dutchman at Two-Fountain, situated to the south-east of the Camis-Berg, where they procured provisions for a week, as they had an extensive country to pass before they could reach the Bokke-Veld. From this they proceeded to the Thorn-River, where they rested during the heat of

ant and his party in this out water or fire. The out to a rock, about ten h-east, where there was a oon, being tired of their make a third effort; and, sible to proceed, to leave the Orange-River, being of water. the day. In the afternoon they continued their journey to the Hautebeck-Rivier, and remained there all night.

On the 14th, they found the Brack-Fountain nearly dried up, and so bitter that their cattle refused to drink of the water. Here, however, they stayed all night, and early the next morning proceeded on their journey towards the Lion's-Den, where they flattered themselves with the hopes of finding water; but were disappointed, for not a single drop of water was discoverable in this place. They, however, unyoked their cattle, and rested about two hours. In the afternoon they proceeded towards the Stink-Fountain, which was distant about thirty miles. In the eve they lost their way, and were obliged to sleep in a dry ditch.

Early on the 16th, they saw the Bokke-Lands-Bergen to the south east of them, about twenty miles. The lieutenant and Mr. Van Renan left the waggon at an early hour, directing their course to the Bokke-Land; and sent a fresh team of oxen from thence to relieve the others, which were greatly fatigued, and scarcely able to stand, in consequence of the injury they had received in their hoofs from the sharp stones.

The next day they brought their waggon to the house of Mrs. Ryck. Our traveller's intention was to cross the country, from this place to the great nation of Caffres, which is about nine hundred miles to the south-east; but finding both their oxen and waggon in very indifferent order for so long a journey, the lieutenant altered his plan, and conceived the design of making an excursion to the Hentum, and part of the Boshiesmen's-Land. This day they had several loud claps of thunder, and heavy rain. The variable state of the weather detained our travellers here several days.

Having left the Bokke-Land, they directed their course eastward, and arrived, on the twenty-third, at the house of Christian Boeckere, where they passed the night. The following day they had stormy weather, and heavy showers of rain and sleet; and towards the evening, hail and snow. The next morning a severe frost killed most of the corn, which at this time was about a foot in height; a circumstance which in this part of the country often happens.

On the twenty-seventh, the lieutenant made an excursion to the northward, which is called the Boshiesmen's-Land, from its being inhabited by the Bosh-Hotentots, who are a very different people from the other peaceable and well-disposed inhabitants of this region. They are in fact, fierce, cruel, and dishonest. In this tour our hero visited a house belonging to a Dutchman, who had lived here for many years. A few weeks before their arrival he had been attacked by the Boshiesmen, who had killed four of his Hotentots, and wounded another. These marauders carried away also several of his cattle, which he was never able to recover.

Having left the Hentum on the 29th, they returned to the Bokke-Lands-Bergen, intending to return to the Cape, along the shore of the Atlantic Ocean. But when they arrived at the Bokke-Land, on the 31st, they were compelled to remain there several days, from the state of the weather, which was very rainy and variable. They took leave of this place on the sixth of November, accompanied by two sons of Mrs. Ryck, and an overseer of Mr. Van Renan's farms, in this part of the country, who was going on a shooting party. Our traveller also partook of the diversion, and left the waggon to proceed to a place called the Lion's-Dance, where they intended to stay all night. Their way lay through a low country of a clayey soil, called Karo. They saw much game; and the servant of Mr. Van Renan, being an excellent marksmen, shot two elks, both of which were much larger than an English bullock: the flesh of this animal is palatable though dry. At night they returned to the Lion's-Dance, where they found their waggon: and

early the next day they parted with their friends, and directed their course south-west, having the Bokke-Lands-Bergen on their left hand, and the Atlantic Ocean on their right, at the distance of about thirty miles. They travelled the whole day and till midnight, when they found a fountain of brackish water. They rested at the side of this fountain the remaining part of the night.

On the 8th, the lieutenant and Mr. Van Renan left the waggon, and directed their course west-north-west. In the afternoon they arrived at the Elephant's-River, and found it so deep that their horses swam about ten yards. They soon reached the opposite shore, where, at a little distance, was the house of a Dutchman who had lived many years on the banks of this river, and kept a small boat for transporting waggons, in time of necessity. They stayed here, waiting for their waggon, and dried their clothes. The following day was employed in transporting their baggage over the river. The country around is rather naked of trees; but produces a great variety of succulent plants. They were furnished by their benevolent host with a team of fresh oxen, which were necessary to enable them to pass through a deep sandy plain; and were accompanied by a peasant of the Nimiqua-Land, who was travelling towards the Cape. They continued their journey about twenty miles to the southward, and at night came to a large cove, called the Heer-Loddiement (i. e. gentlemen's lodgings) where they rested till the next day. In the afternoon they proceeded on their journey through a deep white sandy plain. They travelled till midnight, when they found a little water, near which they passed the night. The next morning they proceeded to a farm, called the Long-Valley, which is distant from the Elephant's-River about sixty miles. Here they stayed all night, and were, as usual, hospitably entertained. From this place they directed their course east by south, along the valley. In the night some animal sprung out of a bush, which so greatly alarmed their oxen, that it was with difficulty they could keep them still. They supposed the noise to proceed from an hyena, as they heard the cries of those animals some time after at a very considerable distance. On the fourteenth, they arrived at the Berg-Valley, where they stayed all night, at the house of Jofias Engelbright.

The lieutenant now dispatched his waggon, on the fifteenth, towards the Piquet-Berg, and together with his companion passed the day in this place, where he shot variety of birds, which he found in great abundance. The next day they proceeded on their journey; passed a place called the Crosse, where the Berg-Valley joins the Venlore-Valley, and both assume a westward direction. At noon they overtook the waggon, and rested the afternoon at the house of a Mr. Smith. Towards the evening, the lieutenant and Mr. Smith made a short excursion towards the hill, and took each of them a gun. On their return they shot four large flamingoes, from four to five and six feet long. They saw also the Yellow Snake, or Covra-Capel. Afterwards they directed their course along the Piquet-Berg, on the side of the large chain of mountains which commences at the end of the Hottiniqua-Land, and extends through the interior part of the country to about twenty miles from the Atlantic Ocean. In the afternoon they arrived at the house of a Dutchman, where they stayed all night, and were well entertained.— This farm is fruitful, producing plenty of European fruits and corn.

On the 17th, the lieutenant made an excursion to the top of the mountain, where he had a view of the Table-Land to the southward, distant about sixty or seventy miles. The mountain is well watered, and is covered with variety of grass. There is also a farm here belonging to Mr. Hana Camp, where he kept part of his cattle during summer; but in the winter it is often covered with snow. On our hero's return he saw several zebras, which inhabit the mountain;

mountain; but as they are not found in considerable numbers, shooting them is prohibited. After refreshing himself, he followed his waggon, and towards the evening overtook it. About midnight they came to the Berg-Rivier, where there is a ferry; they continued here during the remaining part of the night; and the next morning the lieutenant and Mr. Van Renan left the waggon, and traversed Black-Land, leaving the Ric-Beck's-Castiel on their left. In the afternoon they passed the Swart-Land's church, and at night came to the house of Clafs Lopper, which is

situated on the Deep River. He was just arrived from the Cape, and had brought with him some excellent wine, to which he very liberally made our travellers welcome. Hence they directed their course along the Camis-Berg, and observed the farmers now engaged in their harvest. At noon they came to a place belonging to the Dutch company, called Effens-Hook, where they refreshed themselves, and in the afternoon proceeded on their way, and after a journey of six months arrived at the Cape-Town, November 20, 1778.

C H A P. III.

In order to explore Caffraria, hitherto unknown, the Lieutenant undertakes his THIRD JOURNEY—Accompanied by Mr. Tunnies proceeds to Groot-Faders-Bosch—They pass several Rivers—Descend the Canna-Lands Height—Observe Hun's Farm—Arrive at the House of Rulof Comphor—At Crooked-River—Reach Effen-Bosch—Proceed to Camions-Rivier—Surprised by a wild Buffalo—Arrive at Van Stada's Rivier—Rest at Swart Kop's Rivier—Pick up a Companion—Observations on Zout-Van—Visited by two Caffres—Arrive at Hottentots Kow-Oha—Meet with two Dogs, &c.—Visit one of the Dutch Boers—Mr. Tunnies leaves the Parry, and Jacob Kock supplies his Place—Surrender Fleet—Visit a Kraal—Miss their Cattle which were stolen—Recover them—Proceed to Coet Viss-River—To Nantio—Proceed to Caffraria—Manners, Ornaments, &c. of the People—Description of the Chief—Of the Country—Their Return to the Cape.

NOTWITHSTANDING the Caffres are so jealous of the encroachments of the Dutch (the only Europeans they have knowledge of) that they deny all others admittance to their territory, yet our hero was determined to pay them a visit, Caffraria having been never yet explored, and on account of its remoteness, deemed unworthy the notice of the States or Company. Accordingly, Lieutenant Paterlon left Cape-Town December 23, and January 3, 1779, arrived at Zwelendam. Here a Mr. Tunnies, one of the Company's overseers, who was then going to the eastward to exchange cattle for tobacco and beads, joined our travellers, and they proceeded to Groot-Faders-Bosch.

On the 8th, they passed the Doven Hocks-Rivier, where they rested that night, and next day passed the Falte-River and Callre-Kulls-Rivier, and from this directed their course to the Gauds-Rivier, and afterwards to the Hagal-Kraal, leaving the shore of the Indian Ocean, about 120 miles distance, on their right hand.

On the 12th, with as much difficulty as before (journey the first) they passed Atquas-Kloaf, and now took the eastward direction through part of the Canna-Land.

On the 13th, in the afternoon, they descended the Canna-Lands height, which is a steep, horrid, rugged path; the country had a most miserable appearance, so very destitute that the sudden discovery of a piece of cultivated land which belonged to one Okker Hynns, afforded no small amusement. This industrious farmer, had, notwithstanding the dreariness of the situation, built a capital house and planted vineyards and gardens, which produced excellent wine and fruit, particularly peaches, apricots, figs, almonds, &c. &c. which he dried and sent to the Cape for sale. About three weeks before their arrival, there had been a very heavy storm of hail and wind; the hail-stones, which were of an enormous size, and the impetuous wind, had destroyed every thing about his house. His corn, vineyard, and fruit trees, were totally spoiled; one of his children, who was at the time keeping a flock of sheep at some distance from any shelter, was very much hurt, and many of the sheep were destroyed.

At last they travelled to a small river, about six miles distant from this place, where they continued all night: and proceeded the next day to the eastward, arriving in the evening at the house of one Rulof Comphor. This is the beginning of the Lange-Kloaf, which is about an hundred miles long, and about two miles in breadth; the soil is a strong reddish clay,

and the pasture very unwholesome for cattle. This part of the country has been very much improved of late, the farmers have cultivated corn-land, gardens, and vineyards, and in general are possessed of very good houses.

They now pursued their journey along this valley, making occasional short stages, and on the 24th arrived at the Crooked-River, which runs through a long marshy valley bounded by two ridges of hills, but not so lofty as that of the Lange-Kloaf. At the mouth of this river is a kind of bay, which may afford a safe harbour for ships. This part of the coast is but little known, particularly to the east. They reached in the afternoon a place, called Effen-Bosch, so called from a tree very useful in making waggons, which the Dutch term Effen, or Ash. Thence they proceeded to a house beautifully situated on the banks of a pleasant river, called Cablows-River, from a fish which goes by that name, and which is a species of cod, being found near its mouth. This house being the property of Mr. Van Renan, our travellers staid here a day, and visited the shore, which is only about an English mile distant. Among the rocks they found abundance of oysters, which were very good. The farm produces plenty of corn, wine, and European fruits, and the pasture here is excellent for cattle.

On the 23d they proceeded to the Camions-Rivier, where they rested during the heat of the day. On the banks of this river are woods of very large trees, which are generally frequented by wild buffaloes, so very fierce, as to render travelling hereabouts exceedingly dangerous. In the afternoon they were accompanied by a servant of Mr. Van Renan, who was going towards the Loric-Rivier. About ten o'clock at night, they arrived at the place where their waggon already was, and to their great surprise they saw a wild buffalo standing close to it, which they at first took for one of the oxen. Before they could ascertain whether this was the case or not, it sprung into the wood.

Hence they proceeded, south by east, through an uneven country, and in the evening came to Van Stada's Rivier, where they observed a beautiful wood upon the declivity of a hill, extending to the very banks of the river. On the 26th, our hero visited the sea-shore, which was five or six miles to the southward. About a thousand yards from the sea, the mouth of the river forms a lake, being dammed up by a bank of sand, which extends along the shore. In the afternoon they continued their journey through an extensive plain, where they met with

numerous herds of different animals peculiar to this country, such as the zebra, quacha, eland, and a species of antelope, called by the Dutch, hartebeest, which is the Capra Dorcas of Linnaeus, one of which they had the good fortune to shoot. It is of a brownish colour, and the flesh is palatable though dry.

In the evening they arrived at the Swart-Kops-Rivier, where they passed the night, and the next morning were overtaken by a peasant who was on his way to the Boslichsman's-Land, and was glad to accompany them, as this place lay in their way. Being a man well acquainted with the country, and the manners of the natives, his company was equally acceptable. They passed the Swart-Kops-Rivier at noon.

Zout-Pan, which is situate in this neighbourhood, is an object that cannot fail to attract the attention of travellers. This lake is a plain much above the level of the sea, and between three and four miles in circumference. At some seasons of the year it is formed into an entire mass of fine white salt, which has a very striking appearance. The heavy rains had dissolved the middle part of it, a short time before the arrival of our travellers; but round the sides was a hard crust of salt exactly resembling ice. The adjacent country is covered with variety of frutescent and succulent plants.

They were here visited by two Caffres, the first they had yet seen; for they very seldom venture so far out of their own country. At night they arrived at a place, called by the Hottentots Kow-Cha, which is much frequented by buffaloes, rhinoceroses, and lions. The soil is of a sandy loam, and produces excellent pasture for cattle, but no corn; there is, however, no proof that the land is not fit to produce grain, for no care is taken respecting cultivation at this distance from the Cape.

On the 29th they pursued their journey to the eastward, towards the Sundays-River. The face of the country, at this place, has a very barren appearance; but it produces a variety of arborescent plants, though very few of any considerable height or size, which demonstrates the poverty of the soil. On their way they saw great numbers of wild dogs, which travel in flocks, and are very destructive when they get where there are flocks of sheep. These wild dogs are common near the Cape. They are much larger than the jackall, with large irregular blotches or spots on their skin. After a very disagreeable day's march, through a dry stony country, they arrived at night at the Sundays-River, which is distant from the Cape-Town about nine hundred miles.

Next day the lieutenant visited one of the Dutch boors, who had resided in that part of the country for many years. This man was possessed of numerous herds of cattle; but had no corn, and scarcely a house to live in, though the place was favourable for both. But the generality of these people are of so indolent a disposition, that they seldom trouble themselves either to build houses or to cultivate the ground. Such as are inclined to be industrious, and wish to make the most of their advantages, never fail in deriving the sought-for benefits.

Mr. Tunies took his leave of the lieutenant on the thirty-first, and his place was supplied by Jacob Kock, an old German. Mr. Van Renan and the lieutenant went on towards the Great Fish-River. At noon they overtook their waggon, at a place which, in the Hottentot language, is called Curnow. They were informed by their servants, that they had been disturbed in the night by some elephants, which came very near the waggon. They proceeded in the afternoon to a plantation, called the Sand-Fleet, belonging to their fellow-traveller Jacob Kock.

The country here is extremely beautiful and picturesque, very hilly, and the hills are shaded with impenetrable woods; the vallies well watered and covered with grass, which affords excellent pasture for cattle. Great numbers of quadrupeds inhabit this

neighbourhood, such as panthers, lions, rhinoceroses, elephants, spring hocks, buffaloes, &c. At a little distance to the eastward are some kraals belonging to the tribe of Hottentots, called Chonacqas. These people are much darker in their complexion, and better shaped than any of the other tribes that were before seen. Whether this difference arises from their mixing with the Caffres, several of whom dwell in this part of the country, or from any other cause, our hero could not ascertain. It is not very uncommon for the Caffres and Chonacqas to quarrel, which generally ends in an engagement. In these encounters several hundreds of the Caffres sometimes unite to oppose their enemies, who very seldom bring a proportionable force into the field. But the dexterity with which the Hottentots use their bows and arrows, and the practice of poisoning the latter, render them very dangerous enemies to those who only use the halibout. The disputes between these people generally originate about cattle, of which both nations are remarkably greedy.

They now proceeded eastward, to the Boslichsman's-River, and at noon our hero visited a kraal belonging to a Hottentot captain, called De Royster. This man has upwards of two hundred Hottentots and Caffres in his service, and a few hours before their arrival, had fought against a number of Caffres, and taken many of their cattle, having beaten them entirely off the field.

After some time, they reached a lake of brackish water on February the first, and stayed here the whole night. They intended to prosecute their journey early the following morning, but missing their cattle, their first care was to dispatch their Hottentots in search of them. In a few hours one of the men returned and informed our travellers, that they had been stolen by the Caffres, that they had discerned the prints of their feet, and saw, from tracing them, that the cattle had been driven towards a village belonging to a Caffre captain, whose name was Mah-hotte. A messenger was immediately dispatched to the other Hottentots, with an order that they should follow the path of the cattle till they found them, which they did. They returned with them towards the evening, and informed the lieutenant that they were found a little way from the kraal. One of the Caffres told our travellers that they had taken the cattle to a lake, as the evening was dark, and they thought they belonged to the Hottentots with whom they had fought the day before. Though it was now late they continued their journey about twenty miles.

In the night they arrived at a place, called the K'a Cha Chow, which is one of the branches of the Boslichsman's-River, and where their companion, Jacob Kock, had formerly his residence. The old German accompanied our travellers on the 3d to the Great Fish-River. Thence they pursued their journey to the eastward, through a pleasant country, though quite uninhabited. There are numerous herds of quadrupeds to be found here, and such the amazing height of the grass, that it reached their horses bellies. This part of the country is agreeably diversified with little pleasant woods upon the declivities of the hills. In the evening they came to a place, called Now-Tio, and the next day at noon reached a small river, which at this time was almost dry; here, however, they rested a few hours, seeing a herd of buffaloes at a distance from them, which they intended to amuse themselves with shooting in the afternoon. After dinner they divided themselves into different parties, and as soon as they were within shot they attacked the buffaloes; they were about an hundred in number; five of them they shot, some of which were much heavier than an European bullock; the others fled into a wood, which was about a mile to the eastward of them. Mr. Kock had the animals skinned; their hides making such excellent things for oxen, that they are preferred to every other material for this purpose. At night they arrived at the Fish-River, where they stayed two days. During the night they

had heavy showers of rain, with loud claps of thunder. Here the river assumes a southern direction, and empties itself into the great Indian Ocean, at about twenty miles distance. The deepest parts of the river are inhabited by the hippopotami, and the adjacent woods by buffaloes, rhinoceroses, and elephants.

Mr. Van Renan having agreed to stay with the waggon, there being no possibility as yet of getting it through the impenetrable woods, the lieutenant and Mr. Kock proceeded easterly towards the Caffres, being informed that they could reach their country in two or three days. They took with them an Hottentot who was perfectly acquainted with the language of the Caffres. In passing through the thickets, on the banks of the Fish-River, they encountered considerable difficulties, till they fortunately got into an elephant's path, in which they continued till now; they then crossed the river and entered a spacious plain, remarkable for beautiful evergreens, &c.

In the evening they encamped under a large Mimosa, and during the night kindled fires. When they had passed this extensive plain, they entered a wood about eight miles broad. In many places the trees were thinly scattered; in these openings they discovered numerous herds of buffaloes, which had not the least appearance of thyness; one of them they wounded. Shortly after this they perceived a herd of elephants, about eighty in number, which approached so near that they could observe the length and thickness of their teeth.

Having left the wood, they ascended a steep mountain, where they had a view of the Indian Ocean to the southward; and to the northward, a hilly country covered with trees and evergreen shrubs, which extended about thirty miles. The prospect was bounded by a range of mountains, called the Bamboo-Berg, so called from a species of Bamboo which grows there. To the east they had a view of a pleasant country decorated with great variety of plants. The country is here well watered, and produces excellent pasture for cattle.

On the 7th, near evening time, they observed a fire about ten miles to the eastward of them upon the slope of a green hill. Their interpreter told them this was at a Caffre village. At sunset they discovered another much nearer, and saw several herds of cattle. About eight in the evening they met three of the Caffres, who were much surprised at our travellers' appearance, as they were certainly the first Europeans they had ever seen. They speedily returned and alarmed the whole village; but on the arrival of the lieutenant and his friend, they received them kindly, brought them milk, and offered a fat bullock, agreeable to their custom of hospitality. This village consisted of about fifty houses, situate on the banks of a pleasant river, called in the Caffre language, Muzn Ranie, and which belonged to their chief. It contained about three hundred inhabitants, all of whom were servants or soldiers to their chief, who was likewise the proprietor of the numerous herds of cattle. These people subsist on the milk of their cows, and on game, not being allowed to kill any of their cattle. The men milk the cows, and the women take care of the gardens and corn. Our travellers were accompanied by all these people from one village to another, till they arrived at the place belonging to the person who is denominated chief or king. His habitation was situate on a pleasant river, called Becha Cum, or Milk-River. Indeed all their houses are built on the banks of rivers or streams; but there was no corn or garden near it. The chief (whose name was Khouta) had about an hundred cows, which supplied him and his household with milk. His family consisted of about twenty-two servants, who attended him wherever he went. On the appearance of our travellers he seemed very shy, and kept at a great distance for about an hour, when a number of Caffres met and accompanied him to his house. He soon afterwards sent one of his servants

to invite the lieutenant and his party thither. The first thing our hero presented him with was some beads, which he fitely accepted: next with some tobacco; but he seemed to prefer his own, which was much lighter. He soon offered the lieutenant a herd of fat bullocks in return; this being refused, he seemed greatly affronted, and often repeated, "What do you think of our country?" After a few words between them, our hero accepted of one, which his people immediately shot; this surpris'd all the spectators, who were about six hundred persons, few of them having ever seen a gun, or heard the report of one. They had a part of the bullock dressed, which the lieutenant thought much superior to the beef near the Cape. The rest of the animal was distributed among the king and his servants; the former still seeming displeas'd that our hero would accept of nothing more in return. The lieutenant then asked him for some of their baskets, which he gave him, and also two of their lances or haffagais, which they make with great ingenuity; but the construction of the baskets, which are made by their women, is much more surpris'ing; they are composed of grass, and woven so closely that they are capable of holding any fluid. Khouta now entreated our travellers to remain with him a few days; this, however, they did not consent to; but after much persuasion, agreed to stay all night. As the weather was hot, they chose to sleep in the woods rather than in any of the huts. During the night there were two guards placed on each side the door of the chief's house, who were relieved about every two hours.

The lieutenant, allured by the pleasantness of the country, propos'd to proceed further to the east, but finding there was a river a little to the eastward of them, they determin'd on returning the same way they came.

The large palm, which grows here in abundance, is used for bread by the Caffres as well as the Hottentots. They take the pith of this plant, and after collecting a sufficient quantity, let it lie for several days till it becomes a lute foam; after this they bake it in an oven which is erected for the purpose. They also bake bread of their own corn, which is the same as the Guinea corn. But this grain is mostly used for making punch, called by some of them Pombie, which is strong and intoxicating. The men amongst the Caffres are from five feet ten inches to six feet high, and well proportioned, and in general evince great courage in attacking lions, or any beasts of prey. This nation, at this time, was divided into two parties; to the northward were a number of them commanded by one Chatha Bea, or Tambulue, who had obtained the latter denomination from his mother, a woman of the tribe of Hottentots, called Tambukies. This man was the son of a chief, called Pharoa, who died about three years before, and left two sons, Cha Cha Bea, and another named Dfirika, who claimed the supreme authority on account of his mother being of the Caffre nation. This occasioned a contest between the two brothers, in the course of which Cha Cha Bea was driven out of his territories, with a number of his adherents. The unfortunate chief travelled about an hundred miles to the northward of Khouta, where he resided, and had entered into an alliance with the Bolhiefmen Hottentots. The colour of the Caffres is a jet black, their teeth white as ivory, and their eyes large. The clothing of both sexes is nearly the same, consisting entirely of the hides of oxen, which are as pliant as cloth. The men wear tails of different animals tied round their thighs, pieces of brass in their hair, and large ivory rings on their arms; they are also adorned with the hair of lions, and leathers fastened on their heads, with many other fantastical ornaments. When they are about nine years of age they undergo the operation of being circumcised, and afterwards wear a muzzle of leather which covers the extremity of the penis, and is suspended by a leathern thong from their middle. This covering is in general ornamented with

with heads and brass rings, which they purchase
from the Hottentots for tobacco and dacka. They
are extremely fond of dogs, which they exchange
for cattle, and to such a height do they carry this
passion, that if one particularly pleases them, they
will give two bullocks in exchange for it. Their
whole exercise through the day is hunting, fighting,
or dancing. They are expert in throwing their
lances, and in time of war use shields made of the
hides of oxen. The women (as before observed)
are employed in making baskets, and cultivating their
gardens and corn; they also make the mats on which
they sleep. They rear several vegetables, which are
not indigenous to their country, such as water-melons,
tobacco, hemp, and a small sort of kidney-beans.
The men have great pride in their cattle; they cut
their horns in such a way as to be able to turn them
into any shape they please, and teach them to answer
a whistle. Some of them use an instrument for this
purpose, similar to a Bohemian's pipe. When they
with their cattle to return home, they go a little way
from the house and blow this small instrument, which
is made of ivory or bone, and so constructed as to
be heard at a great distance, and in this manner
bring all their cattle home without any difficulty.

The soil of this country is a blackish loamy ground,
and so extremely fertile, that every vegetable sub-
stance, whether sown or planted, grows with great
luxuriance. There are great variations in the cli-
mate; it seldom rains except in the summer season,
when it is accompanied with thunder and lightning.
The country is, however, extremely well supplied
with water, not only from the high land to the north,
which furnishes abundance throughout the year, but
from many fountains of excellent water, which are
found in the woods, wherein are various arborescent
plants, some of a great size, and a number of buffa-
loes, elephants, &c. also a variety of beautiful birds
and butterflies.

Having returned to their waggon, they were
accompanied by the chief and about six hundred
of his servants or soldiers, who followed them till
noon, when they took leave of them. They then
directed their course towards the Great Fifth-River,
where they staid all night; and on the 10th, left
their Hottentot, with a gun, as he was so much
fatigued that he could not keep pace with them. On
the 12th they proceeded on their return by the route
they had before taken. This day they were over-
taken by the Hottentot, who on his way had shot two
rhinoceroses, and brought part of the flesh with
him, which proved good eating, being very young
and tender.

About evening they arrived at the Now-Tio. Mr.
Van Renan left the waggon, accompanied by some
Hottentots, with an intention of shooting at a herd
of buffaloes, which they observed at about the dis-
tance of a mile. Before they returned there were
many loud claps of thunder, with lightning and
heavy rain; and it became so dark that they lost their
way. On account of the rain, those left behind
could make no fires till about nine, when the storm
was much abated, and then they lighted several,
which the wanderers soon saw. About ten they
arrived at the waggon, Mr. Van Renan having fallen
into the river, the only accident which happened to
them.

On the 13th they missed their cattle, and dis-
patched their Hottentots in pursuit of them, who
returned in the evening without having observed
any traces of them. Accordingly the lieutenant and
Mr. Kock saddled their horses the next morning,
and directing their course through the country in
search of them, found them at the Bohemian-
River, about twenty miles distant. They then, with
some of Mr. Kock's Hottentots, returned.

When they had reached Cablows-Rivier, they
agreed to remain in that place a few days. Here
they were supplied with great variety of fruit, as it
was in the height of the season for grapes, peaches,
water-melons, &c. &c. Having taken leave of their
hospitable friend, they directed their course south
by well, towards the house of their companion Mr.
Kock, which is situate on the Zie-Koc-Rivier, or
Sea-Cow-River, so called from its being formerly
inhabited by the hippopotami. Here many of their
oxen fell sick, having caught a disease called the
klow sickness, which rages among the horned cattle
in the summer, and affects their hoofs so much that
they drop off, and numbers of the cattle die. Mr.
Van Renan dispatched one of his Hottentots to his
father's house, who returned to them with a supply
of fresh cattle. They then proceeded westward.

On the first of March, in the evening, they ar-
rived at the house of a Dutchman, where they rested
that night, and the next day passed the Krome-Rivier.
In a few days they arrived at the house of one
Veraira, a wealthy farmer, where they had the mortifi-
cation to find their cattle in the same condition as
before, and those they had brought from the Cab-
lows-Rivier still worse than the others which had
previously suffered.

After a journey of three months, the lieutenant
having left Mr. Van Renan with the waggon, arrived
at the Cape, March the 23d.

C H A P. IV.

The Lieutenant, accompanied by Mr. Sebastian Van Renan, undertakes his FOURTH JOURNEY—Proceed towards Gloena-Kloaf—Arrive at Ric Beck's Castle—Berg-Rivier—Picquet-Berg—The Crois—Last Valley—Entertained by Mr. Gueff—Lange-Vallis—Jackals-Valley—They lose their Way—Reach the House of Peter Van Syl—Waggon damaged—Meet Colonel Gordon—Separate in a different Route—Arrive at Bokke-Veld—A born-River—Meet an Hottentot on the Way to Lion's-Den—Misfortunes—Visited by several Bohemian—Proceed to Brack-Fountain—Hartebeest-Rivier—Three-Fountain—Green-Rivier—Meet Colonel Gordon again—Examine Camis-Berg—Meet a Peasant and Deserter—Advised by the Natives not to proceed—Lieutenant Patterson and Colonel Gordon separate again—Continuation of the Journey—Pass several dangerous Places—A Letter from the Colonel—Hottentots murmur—The Colonel joins again the Party—Observations—The Cattle drop for Want of Grass and Water—Reach a Fountain of excellent Water—Proceed Northward—A Companion of the Colonel's lost—A large Valley discovered—Find an Ostrich Nest—Remarks—Find the Colonel's Companion—Meet with wild Men, &c.—Adventures—Rest at Water-Fal—Arrive at Lee-Fountain—Cork-Fountain—Visited by several Nimiquas—Further Progress—Meet several Hottentots—Curious Remarks—Finding several Natives eating the Gums of the Trees—Obliged to dig Pits for Water—Thunder Clouds observed—Visited by Bush-Hottentots—Continuation of the Journey—Arrive at Hier-Losfement—Supplied with fresh Oxen—Return to the Cape.

LIEUT. Patterson, accompanied by Mr. Sebastian Van Renan, now undertook his fourth journey. They proceeded to Ronde-Bofch, the house of Sebastian's father, where, on account of the badness of the weather, they staid three days. Thence they proceeded north, towards Groena-Kloaf, which coun-

try is chiefly the Dutch Company's property. Having passed a heavy sand, they arrived at a butcher's house, where they rested for a night. This part of the country is celebrated for pheasants, partridges, water-snipes, and a variety of game. They now proceeded north-east, through Swart-Land, and ar-
rived

rived at Rie Beek's Cattle, at the house of one Mr. Droyer, a wealthy farmer, where they remained two days. The lieutenant made an excursion to the Rie Beek's Cattle-Berg. On the top of this hill a piece of cannon is placed for the purpose of giving signals, to prevent surprize from an enemy, and to alarm the adjacent country. They left Mr. Droyer's on the 25th, and arrived at the Berg-Rivier, where they staid all night, and early next morning crossed it at a ferry. This day they proceeded on their journey to the Picquet-Berg, and the next arrived at the Crois, where they staid all night. Hence they proceeded westerly, along the Loll-Valley; and in the evening came to the house of Mr. Gueff. During the night of the 25th, a very heavy rain fell, which swelled the river so much that the next day they found it impassable. The farmer was much pleased with their company, and entreated them to prolong their stay for several days, to which, as the river still continued very high, they agreed. Upon seeing the waters subside, they proposed to proceed in their journey, and were assisted by their hospitable friend Mr. Gueff, who supplied them with some of his cattle, which were more accustomed to passing the flood than their own. The river was broad, and in several places the oxen were obliged to swim. When they reached the opposite shore they directed their course northward, through a high sandy country. At night they arrived at the Lange-Valley, at the house of Mrs. Low, an old French woman, who had long lived in this part of the country, and was possessed of numerous herds of cattle. They staid all night here, and the following day proceeded on their journey through a large sandy plain, towards the Hier-Lodfement, which is above forty miles distant. At night they came to the Jackals-Valley, where, though they found no water, they were obliged to remain a few hours in order to refresh their oxen, which were much fatigued. About two in the morning they proceeded to the place where they intended to rest, and which they reached at nine in the afternoon; here they found a peasant who had arrived about two hours before them. Our hero inquired which way he was going, observing he had many Hottentots and a number of guns in his waggon: he said that his course was towards the Great-River, and that he intended to accompany Colonel Gordon, whom he left at the Cape, but expected he would soon overtake them. In the afternoon they directed their course towards the Elephants-River; but unluckily in the night lost their way. They saw some fires, which they expected had been made at the place of their destination; but on their arrival at the spot, they found they had been lighted by some Hottentots who had the care of a flock of sheep belonging to a Dutchman. One of these directed them on their right way, and at two in the morning they came to the house of Peter Van Syl, who had lived on the banks of this river for many years. Their waggon was so much damaged, on their journey hither from the Cape, that they were compelled to remain here a few days in order to have it repaired; which having done, they transported their baggage and waggon across the river, at this time very high. In the evening Colonel Gordon arrived; but as he was pursuing a different route, it was agreed to meet in the Small Nimiqua-Land, and then to proceed together along the shore of the Atlantic Ocean, as far as they could possibly travel to the northward. Accordingly our hero and his party directed their course to the Bokke-Lands-Bergen, where they had appointed to receive a team of fresh oxen. When they arrived at the Bokke-Veld, they ascended the mountain, and left the waggon by a small fountain; the path being impassable on account of the heavy rains which had fallen. At this place they supplied themselves with some provision; and Mr. Seballian Van Renan took a cart with him, and sixteen bullocks belonging to his father Mr. Van Renan.

They proceeded on their journey towards the Small Nimiqua-Land, and arrived at the Thora-River, where, during the night of the sixteenth, they heard the roaring of lions, which they supposed to be about a thousand yards from them. On their way to a place, called the Lion's-Den, they met a Hottentot, who informed them, that at his kraal, the family had been visited by the same lions which they had heard, and that they had devoured two of his calves. This Hottentot was the servant of Mrs. Ryek, and lived here in the Karo during the winter season, the charge of part of her cattle having been committed to him. After travelling till night without finding a drop of water, and being so unfortunate as to lose their way, they were obliged to stop till the next morning. During the night Mr. S. Van Renan lost his horse, which it was supposed had returned to the Bokke-Veld, whence they had brought him. At day-light they proceeded on their journey, and at ten in the morning arrived at the Lion's-Den, where they rested all day, and were visited by several of the Botheesmen.

Next they proceeded to the Reed, or Brack-Fountain, where they had very indifferent water, and thence to the Hartebeest Rivier, and from this to Three-Fountain, where they staid all night, and early the following day continued their journey north-west, to the Green-River, where they had the satisfaction of meeting Colonel Gordon, who had arrived there only a few hours before them.

As their caravan made a short stay on the banks of this river, our hero took this advantage of visiting and inspecting the slope of the Camis-Berg, which is adorned with a great variety of evergreen shrubs; but this being the winter season very few were in flower.

Having been sufficiently rested, they determined on prosecuting their journey to the northward, and in the evening of the twenty-fifth, arrived at a Hottentot village, which consisted of eighteen huts, where they passed the night, and next day continued their course northward. At noon they met a peasant who had come from the Great-River, and was travelling towards the Cape, accompanied by a deserter, who had been seven years absent, and had travelled over a great part of the country. This poor fellow was a native of Sweden, and made many sensible reflections upon his misfortunes in Africa. This evening they arrived at the house of one Hermannus Engelbright, where they staid several days, and supplied themselves with necessaries for their intended journey along the shore of the Atlantic Ocean, as this was the last house they were likely to meet with in their way. It is situate on a branch of the Camis-Berg.

They were strenuously advised by the natives not to proceed further, it being they said an uninhabited desert, where neither man nor beast was visible, and where there was a great scarcity of water, and hardly a blade of grass for the support of their cattle. Notwithstanding these discouragements, they resolved to proceed as far as they possibly could; and it was agreed that one of them should set out a few days before the other, and that they should endeavour, if possible, to meet at the mouth of the Great-River. Colonel Gordon accordingly parted from them, and proceeded on his intended journey, entirely without a guide, as the natives at that time refused to accompany them. The next day, after much persuasion, the lieutenant prevailed on one, who was rather more spirited than the rest, to attend him, for which he recompensed him with some beads and tobacco; they were also accompanied by a brother of his companion, Jacobus Van Renan, who had been to the callward to shoot elephants.

August the 1st they departed from this place, and were supplied with a team of fresh oxen for two days. The day after their departure they continued their journey about ten miles to the western extremity of the mountain, where they had a view of the Atlantic

at the distance of about forty miles. They descended the mountain with much difficulty, as it was both steep and rugged; and towards the evening of the second, they arrived at a fountain of brackish water. The soil in this part of the country consists of a sandy clay.

Next they directed their course through a sandy plain. In the evening they saw the dung of elephants, and at night came to a hollow rock, where they had abundance of water; on the north and south side were lofty mountains of a conical figure, and covered with the Aloe Dichotoma.

On the 3d in the afternoon, they proceeded on their journey through a sandy country. In the night they passed several dangerous places, and saw the print of lions, which occasioned them to stay all night at a pit of brackish water. This was not a country which flattered them with the expectation of pleasure; they therefore continued their journey northward, as soon as day, along a bed of heavy sand, between two precipices. This sand is driven down by the violent torrents of water which fall here during the summer season; but at this time the ground was almost dry, and the little water they found was rather salt; at many places indeed where the water had dried up, were quantities of excellent salt. At night they arrived at the Sand-River; they were now about ten miles from the Atlantic-Ocean, where the Sand-River empties itself. The banks afforded them excellent pasture for their cattle, and as they were greatly fatigued, they agreed to rest a few days.

While they remained here, one of the Hottentots who had been upon the hill, told them that he saw two waggons about three miles to the westward, which they supposed to belong to Colonel Gordon. Soon after the lieutenant received a letter from him, and they proceeded to the Rhinoceros-Fountain. The river was frequented by a variety of water-fowl, which afforded them excellent sport; among these they found great numbers of flamingoes, of two species, one much smaller than the other. They stayed here two days, and made excursions along the shore, where they saw strata of the most beautiful rocks, some of them as white as snow, and others veined with red and other colours. Here also they saw several huts made of the ribs of whales, and others of elephants' bones; but they perceived that they had not been inhabited for some time.

On the 7th, Colonel Gordon's companion, and the two Van Renans, being informed of a herd of elephants which were seen to the northward, left them, while the rest directed their course to the mouth of the river, where was a large lake of water which communicated with the sea. Here they expected to catch some fish, but they found none that were larger than a sprat. In the afternoon they shot some wild ducks and returned to the waggon. In the evening their companions returned, finding the elephants were gone. From this place they directed their course north, through a sandy country. They travelled the whole day, and at night were informed by their guide, that they were not half way to the first water, and that, as it was extremely dark, he would not venture to conduct or direct them through the sandy downs which lay along the shore, and extended many miles to the eastward. On hearing this they determined to remain where they were till day-light, when they proceeded on their journey, through the most barren country ever seen. Several of their Hottentots complained, and wanted much to return. After travelling all day, and towards the evening, not discerning any appearance of water, the country every where being equally dry, they consulted with their guide, who seemed not perfectly to know, whether they had passed the water or not. They all agreed to set out with their guide in search of water, and leave the waggons under the care of a servant of Colonel Gordon; accordingly they took with them a few bottles, that if they should be fortunate enough

to find water, they might send some to their Hottentots, who had not tasted any for two days. After travelling about four miles, they discovered a fountain on the shore, but which at high water was overflowed by the sea. This water was extremely disagreeable, and the quantity so small as to be barely sufficient for themselves and their horses. After slightly refreshing themselves, Colonel Gordon and an Hottentot returned to the waggon and took with them some water for their servants, while the rest determined to remain at the fountain, where they shot some flamingoes, which they eat. About midnight one of their Hottentots arrived, who had been absent from them two days; he had shot a chamois-buck, part of which he brought with him, and it proved good eating.

On the succeeding day they made an excursion along the coast, which is low and rocky, with strong furls off shore, which break about four miles from the land. They tried to fish at several places, but without success; the rocks were covered with muscles, and in the inlets, or small bays, were numbers of wild ducks, many of which they shot; but they were so oily, as to prove very disagreeable food.

On the next day, having filled some empty casks, they continued their journey northward. Colonel Gordon and Lieutenant Patterson left the waggon at ten in the morning, and proceeded along the shore, where they discovered several huts, about which lay a great number of shells, which inclined our travellers to suppose that the inhabitants subsisted entirely on the fish that they contained. At about one mile distant from the shore they saw a small island, where they observed several pieces of wood stuck into the ground; but they could not perceive any huts, and were convinced, by the number of seals which they saw every where round it, that at this time it was uninhabited. Along the shore they observed many bones of seals. At nine in the evening they lost their way, and the guide advised them to continue where they were till next morning. This day Colonel Gordon's companion, Mr. Pinar, left them, and promised that he would return at night to the waggon; accordingly they made fires, that he might discern where they were, but in vain. They remained in this place during the night, having fattened their cattle as usual.

Next day they continued their course north, through a sandy country. They observed to the eastward a high ridge of sandy hills, evidently thrown up by the south-east winds, which blow here every day. Having left the waggons, they directed their course along the shore, which was much elevated. In the highest rocks they found several petrefactions of shells, some of which were about an hundred and fifty feet above the surface of the sea. Colonel Gordon's cattle began to drop down in the waggon, having had neither grass nor water for two days; but the lieutenant's waggoner kept on his journey, and unknown to him, left the others behind. At nine in the evening they overtook his waggon, and found their people had been consulting whether or not they should return, as they had not the least prospect of finding water. They supposed that Colonel Gordon's companion had lost his way, and were in great doubt whether they should ever see or hear of him more. About ten, one of the Hottentots arrived, who had left the waggon in company with him, but parted the first day. He imparted the glad-tidings, that he had found a fountain of excellent water about six miles to the northward, and brought a little with him in a calabash. This animated them greatly, and next morning Colonel Gordon and Jacobus Van Renan returned to his waggon, while the lieutenant's party directed their course to the fountain, which they reached about nine, and the others arrived at noon. This fountain is situate between the two precipices, which were much decayed and worn. This place not only afforded good water, but excellent grass for cattle, and variety of succulent plants.

In order to rest their cattle they continued here a whole day: during the interim, the lieutenant and colonel made an excursion to the sea, which was distant about nine miles.

On the 15th, they directed their course northward, and with much difficulty and fatigue penetrated about ten miles, through a sandy country. In their road along the shore they observed the traces of human feet, which appeared so recent that they concluded some person had passed that way on that day or the day preceding. They were in hopes that these might have been some of the Hottentots who accompanied Mr. Pinar, Colonel Gordon's companion. In the night they made fires as a signal, but the signal not being answered, they concluded that they must have been the wild natives; and from finding the skin of a seal, which was quite fresh, this conjecture was confirmed. All hopes of ever seeing Mr. Pinar again now vanished, as he had been absent four days in these dreary deserts, and there was no possibility of tracing his steps.

On the 16th, their road lay to the northward, and at noon they passed two hills, which they had observed during their journey the two preceding days. Being situate at a very small distance from each other, and similar in figure and size, they gave them the name of the Two Brothers; and in this desolate region there was no one who could dispute any denomination by which they chose to distinguish whatever they met with. To the northward they discovered a large valley about three miles distant, but found there was no water: this Colonel Gordon called Bunting's Valley. They were obliged to stay here all night, as their cattle was so much fatigued that it was impossible to proceed further. They were then about eight miles from the river, according to the information of their guide.

Lieutenant Patterson, Colonel Gordon, and Jacobus Van Renan left the waggons early on the 17th, and proceeded on their journey. In their way they found an ostrich nest, containing thirty-four fresh eggs, which proved excellent food. They saw several zebras, elks, and quachas. At ten in the forenoon they arrived at the river, which appeared at once to be a new creation to them, after having passed nine days in crossing an arid and sultry desert, where no living animal was to be seen, and during which their cattle had but twice tasted the luxury of a drop of water. Here they unfaddled their horses and refreshed themselves by the side of the river, under the shade of a willow, which hung over its banks; and afterwards made an excursion along the river to the eastward, hoping that they should find some appearance of their lost companion, Mr. Pinar. They observed several old uninhabited huts, where numbers of baboons bones lay, with those of various other wild beasts. About a thousand yards from the banks of the river, the country is extremely barren, and to the eastward very mountainous. On these eminences there is scarcely any apparent vegetation. The banks of the river produce lofty trees peculiar to this country. In the afternoon, their waggon not being arrived, they returned the same way they came, and found their people had taken a different direction. They followed their track, and overtook them near the mouth of the river. In the evening they launched Colonel Gordon's boat, and hoisted Dutch colours. Colonel Gordon proposed first to drink the States' health, and then that of the Prince of Orange, and the Company; after which he gave the river the name of the Orange River, in honour of that Prince, and which in our former chapters we have so termed. They agreed to remain in this situation a few days, and to visit the opposite shore, as they had in this place very good pasture for their cattle.

On the 18th, they employed themselves in fishing, and towards the evening had the great satisfaction of once more beholding their lost companion, Mr. Pinar, who arrived with three of the Hottentots. They looked dreadfully ill, having travelled five days

through sultry deserts, over sandy hills and rocky mountains, without tasting food or swallowing a drop of water. On the fifth day they discovered a small fountain, where they left one of the Hottentots, who was so exhausted that they had no expectation he could survive the day. Mr. Pinar appeared to be much less injured by his unfortunate expedition than the Hottentots; their eyes were sunk in their heads, and they seemed entirely exhausted.

On the nineteenth, they made their proposed excursion along the shore, where they found numbers of ducks, wild geese, pelicans, flamingoes, &c. The land forms a flat point, which extends from the mouth of the river, north-west half west: the Two Brothers, south-east by south, are distant about twelve miles. The mouth is about half a mile in breadth; but is enclosed by a ridge of rocks which lie a mile from the shore, in a direction east and west, and which render it impossible for ships to enter the river. The land is extremely low and barren; to the westward, sandy; and to the east, rocky. In the evening their Hottentot arrived, whom they had given up as lost.

The colonel and lieutenant crossed the river on the 20th, and left the boat in order to make an excursion to the westward. Here they observed the print of human feet, which appeared to them to be fresh. Upon this they resolved to pursue the track, and on their way saw several snares laid for the wild beasts. After travelling about five miles to the northward, they perceived some of the natives on a sandy hillock, about one mile from them; they made several signals to them, but they seemed to be quite wild, and made their escape. Our travellers continued to follow their path, which brought them to their habitation; but they were still as unable to bring about any intercourse with them as before; for the whole family immediately betook themselves to flight, except a little dog, which seemed to be equally unacquainted with Europeans. The lieutenant and friends now stayed some time, and examined their huts; where they found several species of aromatic plants which they had been drying, and a few skins of seals. Their huts were much superior to those of the generality of Hottentots; they were loftier, and thatched with grass; and were furnished with stools made of the back bones of the grampus. Several species of fish were suspended from poles stuck into the ground. Having nothing about them which they thought would prove an acceptable present, Colonel Gordon cut the buttons from his coat, and deposited them among the aromatic plants which were drying. In the mean time they again observed these natives at the same place where they had first discovered them. They made every possible sign in order to allure them to them, and dispatched one of their Hottentots, who spoke to them and assured them they had no evil intention. After some time, Colonel Gordon went to them while the lieutenant remained at their huts with the guns, and after much persuasion he induced them to return to their kraal. They were eleven in number, and were the only natives who inhabited this part of the country. Our travellers inquired after other nations, but they could give them no account, except of the Nimiquas, whence they had just come. A Nimiqua woman who lived with them, was the only one of the company who knew any thing of Europeans. Though few in number, they were governed by a chief, whose name was Cout. The mode of living amongst these people was in the highest degree wretched; and they were apparently the dirtiest of all the Hottentot tribes. Their dress was composed of the skins of seals and jackals, the flesh of which they eat. When it happens that a grampus is cast ashore, they remove their huts to the place, and subsist upon it as long as any part of it remains; and in this manner it sometimes affords them sustenance for half a year, though in a great measure decayed and putrified by the sun. They smear their skins with the oil or train; the odour of which is so powerful, that their approach may

themselves to the sight. Their arrows are the same
as those of all the other Hottentots. They carry
their water in the shells of ostrich eggs, and the blad-
ders of seals, which they shoot with bows.

Being accompanied by four of the natives, they
returned to their boat towards evening. Their
companions left behind had been the whole day em-
ployed in killing, with tolerable success; part of the
fish they had taken was given to the strangers, which
they thankfully received, and returned to their habi-
tation.

Our travellers now proposed to cross the river to their
waggons. The evening, however, being dark, their
boat overloaded, and they totally ignorant of their
course, they got into the surf, quite in the mouth of
the river, and had a very narrow escape. They were
about half an hour in great danger; but one of their
Hottentots observing the fires made by their com-
panions, they soon got into the right track.

On the 22d, they made an excursion through the
adjacent country, and the next day again crossed the
river, to inquire whether there was any possibility of
proceeding on their journey to the eastward; but of
this the natives seemed unable to give them any infor-
mation. They observed that all those people had
lost the first joint of their little finger; the reason
they gave for cutting it off was, that it was a cure for
a particular sickness to which they were subject in
their youth.

They employed the last day they intended to re-
main at this part of the river in fishing, and were
visited by their friends from the opposite shore. The
lieutenant observed they eat, with a very good appe-
tite, some old shoes which some of their Hottentots
gave them. Their own shoes are made of a piece
of leather, which merely defends the soles of their
feet from thorns, and is in general fastened to their
toes and ankle. As our travellers observed a great
number of huts along the shore which were uninhab-
ited, and yet found only eleven persons dwelling in
this part of the country, they conjectured that by
some accident several of these people had perished.
Those that remain are distinguished by the name of
the Shore-Boshtiefen.

On the twenty-fifth, in the morning, they pro-
ceeded their journey to the eastward, keeping along
the banks of the river, as they were informed that
many hippopotami were there, one of which, indeed,
they were quite near; but they had left their guns in
the waggon, which occasioned them much vexation,
as they had scarcely any provision for their Hottentots.
They still continued their course to the eastward, and
in the afternoon met Jacobus Van Renan, who had
been about six miles to the eastward, and had only
seen the prints of three hippopotami, which seemed
to be fresh, and he believed they were gone to the
mouth of the river. They informed him of that
which they had seen, and he fired several shots at the
animal, but without being able to give it a mortal
wound. Mr. Sebastian Van Renan, and Mr. Pinar,
returned to the waggon in the evening, and acquaint-
ed their friends that there were a number of lions about
twelve miles to the eastward, attracted by a dead
elephant which had been shot by Mr. Pinar during
the time he was absent from the waggons.

They now proceeded to the eastward, through a
most barren hilly country. The hills were naked and
decayed, with hardly a plant to be seen upon them;
in the lower parts here and there was a little grass:
from these appearances they judged that it would be
in vain to think of proceeding further. They agreed,
therefore, to remain a few days, and, if possible, to
shoot some game for provision on their way through

* Our readers may remember that Capt. Cook and others
have made this remark respecting the different natives they met
with, but, till now, no kind of reason has been given for this
strange custom: it has been, indeed, supposed to have proceed-
ed from some religious ceremony.

the dry country they had to pass. Mr. Pinar, how-
ever, resolved to direct his course to the eastward,
and took with him five Hottentots, each of whom
was provided with a gun.

The lieutenant likewise sent a party of his Hottentots
in search of game, on the twenty-seventh, one of
whom returned with a hart, which supplied them for
three days. Jacobus Van Renan wounded an hippo-
potamus; but it swam to a place on the opposite side,
where there was no possibility of approaching it.

The next day (August 28) they prepared their
waggon for their departure; and on the following
evening left the river, intending to travel in the
night, which they conceived would be better for their
cattle. Having travelled about three hours, their
dogs attacked a herd of zebras, which were at a little
distance from the waggons; they seemed not in the
least shy, and our travellers shot two of them, which
detained them about an hour; part of the flesh they
took with them, and it proved very good food. On
passing the Two Brothers, they observed a fire which
they supposed was made by three of their Hottentots
who had left them in the morning. They travelled
till four in the morning, when they unyoked their
bullocks in a dry sandy plain.

August the 31st, they continued their journey to
the Water Val, where they rested; and in the even-
ing of September 1st, proceeded on their route till
about two in the morning. On their way they killed
several snakes, one in particular, called the horned
snake; which species measures from twelve to eigh-
teen inches long, and is supposed to be very veno-
mous. They arrived Sept. 2, at the Sea Fountain.

On the 3d, they continued their journey through
the desert, but were obliged to stop in order to rest
their oxen, which were so much fatigued that it was
impossible to proceed further, when they were about
twelve miles from the Sand-River.

They resumed their journey on the evening of the
fourth, and next morning arrived at the river, where
they rested the following day, having excellent grass
and water for their oxen. From this they proceeded
(on the 6th) to the Small Nimiqua-Land, and stop-
ped that night on the same river, about eight miles
to the eastward of Rhinoceros-Fountain, which they
had before visited. Their provision began to be
short; but one of the Hottentots, notwithstanding
this circumstance, was determined on a good meal,
and accordingly, during the night, contrived to rob
the others of their shoes, every one of which he eat.

Hence they proceeded to Cock-Fountain, where
they arrived on the 11th. Here they were visited
by several Nimiquas, who brought them milk, for
which they were very thankful, and gave them some
tobacco and dacka in return. Among these Hot-
tentots was their guide Pedro, who had left them a
few days before; there were also two captains, one
of whom had a cane, dated "1705," and his name
engraved on the top of it, "Vulcan;" and the other
had one with the name, "Jephtah."

Early on the 12th, the lieutenant dispatched a
Hottentot to Hermanus Englebright, desiring him
to send them a supply of fresh cattle, in order to en-
able them to ascend a steep hill which lay in their
next day's journey. On their first arrival amongst
their hospitable friends, they were quite invigorated,
and delighted with the appearance of every thing
around them. They had exchanged a country un-
trodden by human feet, or only inhabited by the
most wretched of savages, for the society of friends
and generous hosts, and after a journey of six weeks,
through dry and sultry deserts, found themselves in
a land adorned with flowers of the most beautiful
colours. The contrast was truly exhilarating, though
it was not unexpected. They agreed to remain here
a few days, during which time the lieutenant lost his
companion, Colonel Gordon, who intended to direct
his course to the eastward in search of a nation, called
the Caffre tribe. The lieutenant's intention was to
proceed to the northward, to cross the Orange-River,
and

and to visit the Great Nimiqua-Land. During his stay at this place, he made several excursions along the mountains.

Having prevailed upon their friend and host, Hermannias Engelbright, to accompany them in their intended expedition, he took with him, accordingly, three good horses. They then directed their course north, over a rugged path, involved in many turnings between the branches of the Camis-Berg, and in the evening of the sad, came to a Hottentot village, which consisted of eleven huts, where they stayed all night, and proceeded the next day to the house of one Vander Hever, where they remained till the following evening, and then resumed their journey till midnight, when they reached the Copper-Mountain. At this place they had very brackish water.

On the 25th, in the afternoon, they proceeded to the Small Copper-Bergs-Fountain, where they had tolerably good water. Here our hero made an excursion along the hills, which have all a rugged appearance, and most of them contain copper ore.

They continued their journey to the Small Brack-Fountain, where they saw the fresh print of lions, and proceeded to the Great Brack-Fountain. Here they met several Hottentots who had been at the Great Nimiqua-Land, exchanging cattle for beads and tobacco. They told our travellers that the river was passable, but seemed rather to swell when they left it, which was the day before.

Having delayed here two days in exploring the adjacent parts of the country, they next directed their course north by east, through a sandy plain; and after travelling about four miles, found a large rock of a conical figure, where was a small fountain of fresh water. There were several Hottentots who came from the Orange-River. One of them was a good marksmen, and on that account they took him with them. After travelling till next day, they were obliged to stop to rest their cattle at a place from the river, about six miles distant.

Our hero and Messrs. Van Renan and Engelbright left the waggon on the first of October, and directed their course to the river. On their first arrival they were all in great hopes that it was passable, but were soon convinced of the contrary. They then resolved to proceed to the eastward, and after some days arrived at a Hottentot village, situate by a large wood on the banks of the river. Here they were informed that Colonel Gordon was about one day's journey to the eastward, and that he intended to leave his boat at that place. The lieutenant therefore sent one of the Hottentots to beg he would allow them to make use of it, in order to transport themselves over the river, which was otherwise impassable; but the river began to decrease with great rapidity before the messenger returned.

The lieutenant made an excursion through the woods on the 7th. He found them inhabited by variety of birds and monkeys, which are exceedingly shy. There are several paths made by elephants and hippopotami. The country is every where equally barren; the soil is a loose sandy clay; along the banks of the river was good grass. Here the river divides itself into three branches, which are each about a mile broad. They saw several fires to the eastward; and on the fourteenth went over the river. The stream was so rapid that they had much difficulty in crossing it. They had all their necessaries packed upon oxen, which the lieutenant hired from the Hottentots for that purpose; and this night encamped under a large ebony tree, to the northward of the river about eight miles.

Next they directed their course east-north-east, through a hilly country; and at noon passed the Lions-River, the banks of which are in general inhabited by those animals. The country is extremely barren, and covered with small sharp stones, which proved very injurious to their horses' hoofs. In the evening they arrived at a small brackish fountain,

where they stayed all night, and the next day their way lay thro' a narrow path between two high mountains. At noon they saw several of the natives, who were in search of wild honey. In the afternoon they came to a fountain of brackish water, where they stayed all night, being informed by the natives that there were numbers of the camelopardalis in this neighbourhood, one of which they were very desirous of shooting; as it is a beast so little known to Europeans, that even its existence has been matter of doubt.

About evening the lieutenant made an excursion to a hill which was at a little distance from them. When he gained the summit he saw several of the natives near a wood of mimosa, to whom he immediately endeavoured to approach. On his arrival he found they were eating the gum off the trees, on which, indeed, a great part of these people subsist. They were dressed exactly as the inhabitants of the Small Nimiqua-Land; some in the skins of jackals, and others in the skins of marmotes, sewed together; these animals being very numerous in this part of the country. Their habitation was about three miles from the fountain, which our hero visited in the evening; it consisted of six huts. Their sheep are very different from those near the Cape; these having much longer tails, and being covered with hair instead of wool, which at a distance gives them the appearance of dogs.

They proceeded on the 17th, north-east, to a small fountain of water; and took with them some of the natives who knew the country. On their arrival they were obliged to dig pits in the sand before they could come at the water. This day they made an excursion through the country, which is level and high. Here they had an extensive view to the southward of the Orange-River; and to the northward of a large plain, bounded at about the distance of four days journey, by a range of mountains in a direction from east to west. These mountains they were told formed part of the Breitas, or Breguas. The country is here inhabited by rhinoceroses, zebras, koo-does, camelopardalises, &c. &c.

During the next day they rested their horses, as they intended to direct their course west-north-west towards a hot bath. In their way they saw six camelopardalises, which they pursued; Mr. Van Renan shot one, which proved to be a male. It was 14 feet 9 inches high. These animals chiefly subsist upon the mimosa, and wild apricots. Their colour is in general reddish, or dark brown and white, and some of them black and white; they are cloven-footed; have four teats; their tail resembles that of a bullock; but the hair of the tail is much stronger, and in general black; they have eight fore teeth below, but none above, and six grinders, or double teeth, on each side above and below; the tongue is rather pointed and rough; they have no footlock hoofs; they are not swift, but can continue a long chase before they stop; which may be the reason that few of them are shot. The ground is so sharp that a horse is in general lame before he can get within shot of them. It is difficult to distinguish them at any distance, from the length of their body, which, together with the length of their neck, gives them the appearance of a decayed tree.

Our travellers, during their stay in this place, wounded two rhinoceroses; the next day they observed thunder clouds to the eastward; and being apprehensive of the river becoming impassable, they agreed to return the same way to their waggons, being informed by the natives, that after the appearance of such clouds to the eastward, they had seen the river impassable in two days, and had frequently known it to continue so till the month of May.

On the 21st, at night, they crossed the river with safety, and their Hottentots and oxen arrived on the twenty-second. They were now visited by some of the Bush-Hottentots, who had come from the eastward. Here also they parted with Hermannias Engelbright, who went on before them.

They

They remained a few days on the banks of the river,
 and then prepared their waggon, with a view of pro-
 ceeding on their journey; but a storm came on from
 the south-west, which obliged them to stay all night.
 This tempest began at noon and continued till mid-
 night, during which time it blew down several large
 trees; and stones of a large size were hurled by the
 force of the wind up very considerable eminences.
 As soon as the storm abated, they continued their
 journey to the Small Nimiqua-Land, where they ar-
 rived after a journey of five days, at the house of
 their companion Engelbright, who informed them
 that one of his horses was devoured by a lion, the
 second day after he parted from them. They remain-
 ed here a few days in order to refresh themselves, and
 to rest their cattle. They now took leave of their
 friend on the 4th of November, and directed their
 course towards the Bokke-Veld, making short stays
 for occasional observations.

The lieutenant and Mr. Van Renan left the wag-
 gon on the 10th, and in the evening arrived at the
 house of Mrs. Ryck. On the 11th they sent fresh
 oxen to their waggon, which arrived in the evening.

After a stay of a few days in this place, they re-
 sumed their journey to the north-east, towards the
 Boshmens-Land. In the evening they arrived at
 the house of Jacobus Van Renan, where about thirty
 of the Hottentots were assembled, who had made
 peace with the Dutch, and were retained in their
 service. These proved more faithful and attentive
 servants than any of those whom the Dutch had be-
 fore brought up in subjection.

They altered their direction a little in the morning
 and travelled to the northward; at night they arrived
 at a brackish fountain, situate on a river, called by
 the Hottentots, Camdinie-Rivier, where they re-
 mained all night on being informed that there were
 numbers of antelopes, called Spring-Bocks, in this
 neighbourhood, which they intended to have the
 amusement of shooting at the next day. Accordingly,
 they left the waggon the next morning, and directed
 their course north, when after ascending a high hill,
 they entered a large plain to the northward. Here
 they prepared to enjoy the proposed entertainment.
 The antelopes divided themselves into large flocks of
 at least twenty or thirty thousand in each flock. They
 pursued them from eight in the morning till noon,
 and killed and wounded several; and the Hottentots
 who accompanied them, shot several with their poi-
 soned arrows, in the use of which they are expert.
 In the afternoon they continued their journey to a
 place called the Kibiskow, where there was a Hotten-
 tot's kraal. They were here visited by four captains,
 or chiefs, who amused them during the whole night.
 The soil of this count- of a sandy loam, and the
 water is every where bad. The climate and produce
 of the country are much the same as in the vicinity
 of the Orange-River.

Our travellers now returned to the Bokke-Veld,
 and arrived there after a journey of four days.
 Thence they directed their course towards the Wind-
 hock, where they arrived in a few days more. In
 their way they had heavy showers of rain, accompa-
 nied with thunder and lightning; and the lieutenant
 was necessarily detained at the Windhock by the in-
 clemency of the weather. The land in this part of
 the country is fruitful and produces excellent fruit
 and corn; but the south-east winds, which blow from
 the mountains in the manner they do at the Cape,
 frequently prove as pernicious to the rising grain as
 they do there.

The lieutenant was conveyed by two sons of Niue
 Houds, through the Elephants-River, on the 6th of
 December. The water was so deep that it came up
 to their saddles. The same day they arrived at the
 Hlier-Lodsement. He then left the waggon and di-
 rected his course through a sandy plain, to the house
 of Mrs. Low, situate in the Long Valley.

The waggon arrived on the 8th, and the following
 day our hero was supplied with a team of fresh oxen,

84.

and proceeded to the Berg-Valley, where he stayed
 two days, making some occasional excursions through
 part of the country. When they arrived at the
 Croife, they remained there all night, and on the
 succeeding day proceeded on their journey along the
 Picquet-Berg. At night they arrived at the house
 of Abert Honna Cambi, where the lieutenant conti-
 nued two days, and made an excursion to the moun-
 tain. Then they proceeded on their journey, and
 arrived at Rie Beck's Castle, at the house of Mr.
 Droyer, where Lieutenant Patterson visited the
 Roodde-Sand, or Land-Van-Waveren, which is situ-
 ate to the eastward of Rie Beck's Castle.

This is a pleasant and fruitful country, bounded by
 the large chain of mountains which are terminated on
 the east by Hottiniqua-Land, and on the west by the
 chain of mountains which begin at Cape-Falso, they
 join to the northward, where the mountain is called
 the Winter-Hocks-Berg. This mountain is extreme-
 ly high; and during a considerable part of the year
 its summit is covered with snow. To the eastward is
 a pleasant country, called the Goudinnie, where there
 is a hot-bath. The Breed-Rivier has its source in
 this place, and to the eastward is joined by the Hexen-
 Rivier, or Witches-River. Along the west side of
 the chain of mountains, which begins at Cape-Falso,
 are situate the Parel and Draken-Styne, a well watered
 and plentiful country, which extends to the south-
 ward, and joins Stellen-Bosch. Wine is the only
 produce of this country.

Having left Rie Beck's Castle, our travellers pro-
 ceeded through Swart-Land towards the Groeva-
 Kloaf, where he arrived the following day, and found
 the farmers all busy in gathering in their harvest.
 After a journey of six months and five days, our
 hero arrived at the Cape, December 21, 1779.

The lieutenant, in noticing the poisonous reptiles
 of the country he had travelled, deems the horned
 snake the most poisonous of all; it is of a greyish co-
 lour, and about eighteen inches long: its head, which
 is very flat, is large in proportion to the size of the
 body, with small scales, which the inhabitants call
 horns, rising over its eyes.

The garter-snake is another poisonous reptile, parti-
 cularly dangerous to travellers, as it resembles the
 foil so much in colour, that it is not readily perceiv-
 ed. The yellow-snake, which is very destructive,
 is easily avoided, by means of its fire and bright yel-
 low colour. It is mostly found in rat-holes, for,
 after eating these animals, which form the chief part
 of its food, it takes possession of their holes, and
 consequently becomes dangerous to the unwary tra-
 veller, who lies down: besides these, there is the
 rust-adder, extremely dangerous to cattle. A horse
 of the lieutenant's, while grazing, was bit by one of
 them in the mouth, and lived only two days after.
 Also, the spring-adder, which is jet-black with white
 spots, from three to four feet long, and proportionably
 thick. The night-snake, which at night has the
 appearance of fire; it is very thin, and from 18 to
 20 inches long. The spitting snake, rock scorpion,
 &c. all equally pernicious. Frequent disasters have
 happened from the bites of these reptiles. This
 country likewise abounds in deleterious vegetables,
 employed as instruments of destruction by the na-
 tives.

Having now presented the Public with a complete
 history of LIEUTENANT PATTERSON'S Travels in
 Africa, we shall next proceed with the celebrated M.
 NIEBUHN'S interesting Adventures in EGYPT, ARABIA,
 &c. Adventures, which have not only increased the fame
 of the Author, but have been of considerable service to
 other Travellers: and we trust, the observations occa-
 sionally introduced, are such as will lead our attentive
 Readers to a fuller comprehension of the Discoveries
 contained in the preceding and succeeding Voyages and
 Travels.

A GENUINE, NEW, AND COMPLETE

HISTORY OF

Travels and Occasional Voyages

THROUGH AND TO

EGYPT, ARABIA, &c.

UNDERTAKEN AND PERFORMED

By **MONSIEUR NIEBUHR,**

(Captain of Engineers in the Service of the King of Denmark)

And four other DANISH TRAVELLERS.

Including the most accurate Accounts of several COUNTRIES in the EAST. The MANNERS, DRESSES, RELIGION, &c. of the respective INHABITANTS; their BUILDINGS, GOVERNMENT, and every other NECESSARY DESCRIPTION.

Interpersed with interesting Anecdotes and judicious Observations on the different ORIENTALS. The several ADVENTURES, RECEPTIONS, &c. of these TRAVELLERS, during their PERAMBULATIONS, and curious REMARKS ON EACH JOURNEY; throwing a considerable new Light on the LAWS, EVENTS, WORSHIP, CUSTOMS, &c. recorded in SACRED HISTORY.

Faithfully TRANSLATED and CORRECTED (according to the RECENT INFORMATIONs OF our most RESPECTABLE WRITERS) from the WORKS of the above CELEBRATED AUTHOR.

INTRODUCTION.

OUR celebrated and ingenious Author, M. Niebuhr, was the sole survivor of a party of five Danish travellers, who being selected as persons eminently qualified to accomplish the several purposes of the then proposed expeditions, were sent into the East at the expence of the King of Denmark, to explore the various curiosities of Egypt, but especially of Arabia. They proceeded first to Egypt. After making an excursion to Mount Sinai, and preparing themselves, by the study of the Arabic language, for the further prosecution of their journey, they sailed from Suez, down the Red Sea, to Jidda. Having landed at Jidda, they continued their journey southward to Mokha; not without occasional excursions to the N. E. into the interior parts of the country. From Mokha, they travelled nearly in a south-eastern direction to Sana, the seat of the greatest prince in Arabia. By the time they had accomplished this last journey, and returned to Mokha, two of the party were dead; and, by the pernicious influence of the climate, by the unfavourableness of the oriental mode of living to European constitutions, by their inability to relinquish European habits, and by the fatigue necessarily attending their investigations, the health of the survivors was so much impaired, that they were obliged to resolve upon leaving Arabia with the first English ship that sailed for Bombay.

M. Niebuhr and another of his companions lived to reach India. This other, after languishing for a while, died at last at Bombay.

After this event, Niebuhr remained in the East only till he could find a fit opportunity of returning safe into Europe, with the collection of curiosities which was left in his hands.

These travels afford a very faithful account of Arabia in the hands of the European public, having the advantage of the majority of wayfarers in this part of the world, not being confined to the inquiries of one man, but a party equally inspired with the spirit of investigation, and whose abilities were alike adapted to the arduous task. A body therefore of such truly valuable information is seldom to be met with in one work: valuable and peculiarly interesting, seeing it relates to a country which has been famous from the earliest ages of antiquity.

We have in this our translation omitted such remarks as have been already given in our former travels, particularly Mr. Bruce's, &c. to which the reader will be occasionally referred. Also those confined observations and proposed plans (which attempts have hitherto proved abortive) that are apparently addressed by our Author to his own countrymen, and consequently uninteresting to an ENGLISH READER.

CHAPTER I.

Our Travellers embark for Smyrna—Return to Esfneur—Account of contrary Winds—Sail from thence—Pass the Categat—Return again to Esfneur—Sail from thence the third Time—Forced back—Leave the Place for the last Time—Arrive at Marseilles—At Malta—Description of the City—Cultivation and Government—Catacombs—Enter the Archipelago—Road of Smyrna—Repair to Constantinople—Remarks on the City, &c.—Proceed to Rhodes—Dinner in a Turkish Inn—Make for Alexandria—Familiarity of the Turkish Women—Observations—Proceed to Rosetta—Thence to Cairo—To the Delta—Arrive at Sissa—At Damietta—At Bulak—Description of the Place—Remarks on the Orientals—Account of their Entertainments—Description of a Play that was acted—Curious Observations, &c.

OUR

*Ceremony of WEIGHING the GREAT MOGUL'S
In his Park near Agra.*

OUR travellers embarked January 4, 1761, on board a ship of war, commanded by Mr. Fischer, afterwards Vice-Admiral in the Danish service, for the purpose of reaching Smyrna. Being delayed three days for a fair wind, they sailed on the 7th out of the road of Copenhagen, but being tossed by storms and contrary winds they agreed on the 17th to return to Ellsineur.

January 26, they ventured again; the wind being fair, and continuing so a few days. Having passed the Categat they proceeded to some distance through the North-Sea; but the stormy weather returning again, and being tossed considerably by contrary winds, they determined on declining at present their undertaking, and came back a second time to Ellsineur, February 10. Such was the violence of the wind, that in thirty hours they were carried as far backwards as they had been before fifteen days in advancing forwards. Our travellers were exceedingly sea-sick, and one of them Mr. Van Haven, not being able to bear the tossing of the vessel any longer, proceeded by land from Copenhagen to Marseilles, where their vessel was to put in.

They left Ellsineur a third time, February 19, but were equally unfortunate and obliged to return, having scarce passed the Skagen. On the 10th of March, however, the weather became quite serene and fair, and availing themselves of this opportunity, they took a final leave of the place.

From the 12th to the 15th of this month, they encountered several storms. In the beginning of April they had very fine weather, but were detained for some time by a dead calm; they arrived within sight of Cape St. Vincent's the 21st, and May 14, reached the road of Marseilles, and anchored near St. Eustace. Here they were joined by Mr. Van Haven, who had travelled through Germany and France.

June the 3d, after examining the country, they set sail, in company with three other Danish vessels, which being bound for Smyrna, put themselves under the protection of their ship of war.

They arrived at Malta June 14, and anchored in the grand-harbour, in the middle of the cities which environ Valetta: the appearance of this city, when viewed from the harbour, is very fine; all the buildings, private and public, are of hewn stone, stone being a very common article, as the whole island is one vast rock, covered with a thin layer of vegetable earth, and this rock is so soft and calcareous, that it may be cut with the greatest facility when taken out of the quarry. Their private houses, which are built against steep, pointed rocks, have quite an oriental appearance, they have terraces on their roofs. Amongst the public buildings, that of St. John's Church is the most magnificent.

The inhabitants of this island live under a mild government; and accordingly cultivate this bare rock with such care, that it produces excellent fruits. The old capital, Civita-Vecchia, is every day more and more deserted.

Adjoining the city are some very remarkable catacombs, or more properly speaking, subterraneous dwellings, cut in the rock. They are so extensive, that it has been found proper to build up the entrances into several of the passages, to prevent the curious from losing themselves. The remains of public halls, and of a mile, which are there observable, afford reason for thinking, that the islanders once lived in these subterraneous dwellings, or at least retired into them in times of danger.

They left Malta on the 20th of June, and saw no land till the 26th, when they entered the Archipelago. On the third of July, they entered the road of Smyrna, where they staid till the 10th. A very severe dysentery, with which M. Niebuhr had been attacked, prevented him from examining the city.

They reached the isle of Tenedos on the 13th, where they found the interpreter of Mr. Gähler, at that time their ambassador at the Porte. He brought them orders to quit the vessel, and repair in a small

bark to Constantinople. In this isle they saw Turks for the first time; and their language and manners appeared to them so extraordinary, that our travellers began to despair of ease or pleasure in their intercourse with the people of the East. A man of distinction from the continent, however, so far forgot the precepts of the Alcoran, when he visited the vessel that he seemed to have come on board for no other purpose than to drink the captain's wine.

They left the ship on the 19th of July, but did not land at Constantinople till the 30th. They went immediately to Pera, where they were received by Mr. Gähler, and all lodged in his house; a piece of kind attention which contributed greatly to the recovery of our hero.

Constantinople is a city of great extent, though it appears larger than it really is, as the houses rise from the sides of hills, and consequently appear to cover a considerable space of ground. The palaces of the great, occupy much room, on account of their gardens and seraglios, and people in easy circumstances have also a large area behind their houses. The jealousy of the people of the East, renders them unwilling to admit persons into their houses with whom they have business. Artizans therefore work without doors, and spend the whole day in open palaces. The streets are full of trades-people, all busy in their respective occupations.

The population of Constantinople is very considerable, though travellers, no doubt, have exaggerated it. Its harbour, which is always full of vessels, is the finest in the world.

The medley of superb mosques and palaces, gardens and trees of all sorts, which the city displays, appears remarkably striking to a stranger. But within, the arrangement and appearance of the city, correspond not to its splendour when seen from a distance. The streets are almost all narrow, dirty, and irregular; the houses are of wood, slight, and ill built, and appear more like coops for birds than dwellings for men. Of the palaces built of stone, nothing is to be seen but the high walls that surround them. In this city, it is equally dangerous to live in stone and in wooden houses. In the former, one is liable to be buried in ruins, by earthquakes; in the latter, to be burnt, by the breaking out of a fire. The seraglio of the grand signior is a vast but very irregular edifice.

The city is plentifully supplied with water, from three great bents, or reservoirs. As this water cannot be equally distributed through the whole city, on account of the inequality of the ground, water-houses are established in proper places, from which it is served out to every person gratis. Opposite to the outer-gate of the seraglio, is a house splendidly decorated, where persons paid by the public, present water to the passengers, in vessels of gilt copper.

This capital of a great empire is almost destitute of means of defence. A double wall, and a ditch nearly filled up, are all its fortifications.

The sultan has many houses of pleasure, both in the vicinities of the capital and on the shores in the channel of the Black Sea. The Greeks have 23 churches in Constantinople, and the Armenians three, exclusive of those the two nations have in the suburbs. Resident at Pera, is a Catholic clergyman, on whom the pope confers the pompous title of archbishop, placing him at the head of a great many suppos'd bishops. The law prohibits any strange sect to build churches or chapels in the capital, notwithstanding which, several sects hold their meetings there without any molestation.

On M. Niebuhr's recovery, every preparation was made for leaving Constantinople. Notwithstanding they might have ventured to appear in their European dress at Alexandria (the inhabitants there being accustomed to see a great many Franks) yet, through the rest of Egypt, and in Arabia, as this apparel, consisting of so many pieces, and so materially different from the beautiful simplicity of the eastern garments,

garments, might have exposed them to some inconveniences, they deemed it expedient to assume the Turkish dresses, and having by means of their guide, (Mr. Gessler) obtained a passport from the Sultan, they embark'd with letters of recommendation, on board a vessel belonging to Doleigno. All vessels, on leaving Constantinople, are visited by an officer of the customs, in order to prevent the desertion of slaves, and any defraud to the revenue of the established dues.

Our heroes set sail September 11, and reached the Dardenelles on the 15th; they hoisted their sails again the 17th, and passing the isles of the Archipelago, anchored in the harbour of Rhodes the 21st. Some ships of war had arrived here, whose visits the islanders are by no means fond of, both on account of the insolence of their sailors, and the presents which every admiral expects from them.

As soon as our travellers landed, they went immediately to the house of the Danish consul; but found his doors shut, to keep out the sailors; on account of their Turkish dress, they could not obtain admission, till they met with an honest capuchin, who knew them for Europeans, and introduced them. The consul sent his interpreter to accompany them in some little excursions, which curiosity induced them to make through the island.

The city of Rhodes contains a number of noble old buildings, some of which are decorated with the armorial bearings of the most ancient families in Europe, but the palace which belonged to the grand master of the order, is now falling into ruins. The Turks neglect the fortifications; although they might know their importance, from having besieged the island so long before they could make themselves masters of it. But, notwithstanding this neglect, Rhodes is one of the best fortified places in the Ottoman empire, and the Turks think it impregnable.

Here our travellers had the curiosity, for the first time, to go to dine in a Turkish inn. Dinner was served up to them in the open street, upon a large stone seat, connected with the kitchen-wall: the meat was in a coarse, ill-fashioned, earthen plate, and they eat it without knife or fork. They had an excellent dinner, and were charged high. They went thence to drink some wine at a Jew's house, who valued himself on supplying it to all strangers. He had two handsome girls with him, whom he called his daughters, and who spoke Italian well. Their entertainment at his house cost them much dearer than their Turkish meal.

There are a great many Greeks in the isle of Rhodes, but they are not suffered to live in the city. Messrs. Van Haven and Cramer witnessed an instance of the ill-treatment which that people suffer from their conquerors. These gentlemen had gone with some Greeks to visit their bishop, in a village near the city. While they were with him, some Turkish musicians made their appearance, and insisted upon entertaining the good prelate with music, which he had no desire to hear. Although he refused their concert, the musicians would be paid; and did not retire without insulting him and his company.

Early on the morning of the 22d of September they set sail. Hitherto, they had sailed near the coasts, and among islands; and it would consequently have been vain to make observations on the course they failed. But, in the open sea, they had soon an opportunity of remarking the ignorance of the Turks in every thing relative to navigation. The maller of their ship had compasses and several instruments, but knew not what use to make of them. They were probably a part of the plunder which he had taken in some Christian ship: for the Doleignots often give themselves out for Algerines, and take European ships belonging to powers at peace with the Porte. In the course of their voyage, their Dolignot was afraid of being taken himself: for it was reported that the Maltese, or rather some privateers, with letters of marque from some Italian prince, were at that

time scouring those seas. They could not have made any defence; their ship being a heavy laden, and over-laden, and having only a few rusty guns not properly mounted.

Their captain held for Alexandria, by chance. Luckily for them, a very favourable wind sprung up, and carried them straight into the harbour in the day. The shores of Egypt are so low that they cannot be seen from a distance, and a ship approaching, without knowing her course, can hardly fail to run aground.

The captain, his secretary, and two pilots, spoke Italian tolerably well. The secretary had been at Venice, in different other Italian cities, and even at Vienna; he was at the same time imam, or almoner of the vessel. The imam's business is to direct the crew in their evening prayers, which the Mahometans perform regularly after washing. The imam then spreads his carpet, kneels with his face towards Mecca, and saying his prayers, prostrating himself from time to time, and crying *Allah akbar*, God is great. The assembly repeat his words, and regularly imitate his motions and gestures. One thing essential, is to put the thumbs behind the ears, to mark the perfect abstraction of the mind from all worldly cares, and the elevation of the soul towards heaven. Besides this public evening prayer, the Mahometans are directed by law to say other prayers, in the course of their avocations, whenever they find themselves most disposed to the duty. They make no difficulty of displaying their humility and devotion before spectators. M. Niebuhr was at first afraid to disturb them by his presence, and attempted to retire; but most of them pressed him to remain and join them. It is only the insolence of the populace, that hinders Christians from entering mosques, or witnessing their worship.

The vessel being too full, the Mussulman passengers were seated on the decks. Our travellers had hired the captain's apartment, with another long room adjoining, in order to separate themselves from the Turks. In a cabin above them, were lodged some slaves intended for the market, girls who had received a good education in the Turkish mode, and were destined for the harem of some grandee. Messrs. Niebuhr and Forkall one day, while they were in their chamber, overheard a female voice, and set their heads to the window, to observe whence it came. Those slaves observing them to be strangers, cried out, and scolded them; but one of them touched the rest. They held out to them fruits and sugar; and they put down their handkerchiefs to receive what they liked. Their language being unknown to each other, they conversed by signs. The youngest addressed a few words to our hero, several different times. Our travellers, to learn their wishes, asked the clerk of the ship, to explain the meaning of a great many Turkish words and phrases, and at length came to understand, that the girl had warned them to beware of appearing at the window, except when the crew were at prayers. Those females became at last so familiar with our travellers, as to give them notice by knocking at the window, whenever they were alone. This imprudent frolic amused them a few moments; but it might have occasioned them much serious trouble; and they came afterwards to understand, what extreme folly it is to make the slightest acquaintance with Turkish women.

On the 26th of September, in the evening, they arrived at Alexandria, and anchored in the great harbour, which Christian ships are not permitted to do; they are obliged to anchor in the small harbour, which is very dangerous. The passengers went immediately on shore; but the slaves remained till night, and were carried away with the utmost ferocity.

In the course of the voyage, eight of the crew had died suddenly; which made them afraid that the plague might be among them. Happily their fears proved vain; for their physician, who visited several of those persons, while they were ill, found no symptom of pestilential infection among them.

Alexandria,

Alexandria, or Scandria, as the Turks and Arabs call it, is situate upon a narrow isthmus, between a peninsula and the walls of the ancient city, and dividing the two harbours. The ground on which the modern city stands, seems to have risen out of the waters. Although long since divested of its ancient splendour, yet the remains of the magnificent buildings which it once possessed,—palaces, temples, and mosques, with a plentiful intermixture of palm trees, —give this city an aspect of beauty and dignity, when viewed from the harbour.

Alexandria has fallen by degrees from its grandeur, population, and wealth. The filling up of the branch of the Nile, upon which this city stands, and which is now no longer navigable, is what has chiefly contributed to its decline. It is however cleaned from time to time, as it supplies the city with soft water, which could be no where else obtained. The magnificent reservoirs of old Alexandria still remain; they were intended to contain water for the use of the city, through the whole year; which was received into them at the time of the overflowing of the Nile.

This city might be in a more flourishing condition; did not disadvantages of all sorts concur to depress it. Its inhabitants appear to have a natural genius for commerce; were it not checked by the malignant influence of the government. The inhabitants of Alexandria are in use to enter as sailors on board Christian ships; and when they have seen the world, and learned some languages, they return home, and become couriers, or interpreters, to the nations they have served. The Mahometans have commonly a great aversion to living among Christians, because they cannot join in the ceremonies of their religion. The modern Egyptians, being less attached than the other Mussulmans to the peculiarities of their religion and manners, are fitter for commercial intercourse with the Europeans.

The trade of Alexandria is, notwithstanding, very trifling; although almost all the nations of Europe have consuls here. But, as most part of those articles of traffic which are imported into Egypt, pass by Alexandria, the customs afford a considerable sum to the Sultan annually.

The Arabic is the ordinary language of the native inhabitants, both here and through all Egypt. Europeans, unskilled in Arabic, speak Italian, which is not a little used in these countries.

Several tribes of wandering Arabs are continually roaming about through Lower-Egypt; and often approach near to Alexandria. The inhabitants pay some contributions. But those troops pillage the country, so that government is obliged to send soldiers to reduce them, or drive them into the more remote provinces. During their stay at Alexandria, some hundreds of those robbers encamped within a quarter of a league of the city. They distressed the husbandmen, and plundered the travellers.

Having struggled considerably with contrary winds, they arrived, on the 2d of November, at Rosetta, as it is called in Europe, or Raschid, in the language of the country. This city is of a considerable size, and stands upon an eminence, whence opens a charming prospect of the course of the Nile, and a part of the Delta. It serves as a staple for the trade between Alexandria and Cairo. The boats of the latter city proceed no farther than to Rosetta, where they lade with goods brought by the vessels of Alexandria, which never advance up the river. For this reason, the French and Venetian consuls reside at Rosetta, as well as several European merchants, who manage the conveyance of goods belonging to their friends.

Being in haste to reach Cairo they left Rosetta on the 6th of November, and two days after passed Fue, once a considerable city, and the staple of the trade between Alexandria and Cairo. The canal between Alexandria and Fue is no longer navigable; and Fue entirely deserted. The Nile carries to much of the soil from the lands, that it gradually fills up the canals;

although they are cleaned from time to time; but in a very superficial manner. The earth taken out of the canals forms those mounds which are observed in the Delta, and which appear strange in so flat a country as Egypt.

In this season, when the country is all verdant, there is great pleasure in sailing up the Nile. A number of villages are scattered along each side of the river. The houses are indeed low, and built of unburnt bricks; but, intermixed as they are with palm trees, and pigeon-houses of a singular form, they present to the eye of the stranger, an uncommon and pleasing prospect. Near several of these villages are seen large heaps of the ruins of ancient cities.

The navigation of the Nile would be still more agreeable, were it not infested by pirates. But, when a great number of people are on board of a vessel, they keep on their guard; they discharge a few shots from time to time, to shew, that they are provided with fire arms; this keeps the robbers in awe, and renders the passage less dangerous. There is much more danger in trusting to a master of a vessel, with whom you are unacquainted, who may favour the robbers, and share their plunder. Whole villages are said to follow this trade; and for this reason the boats never stop in their neighbourhood. The inhabitants on the banks of the Nile are very dexterous in the art of swimming, which they frequently exercise in scaling from the boats, if not with open force, yet with a degree of address and audacity worthy of the most noted pick-pockets.

They reached Bulak November the 10th, which may be considered as the port of Cairo, as all boats that come by the Nile discharge their passengers and cargoes at this place.

Our hero, in advancing to Cairo, having examined one of the great branches of the Nile, was desirous of seeing the other between Cairo and Damietta. However, by the rains and other circumstances he was prevented from accomplishing his intention, till the succeeding year. In the mean time he gained some knowledge of the language of the country, and became more familiar with the manners of the East. Mr. Baurenfeind, too, who, since his arrival at Cairo, had scarce ever gone abroad, now determined to accompany our traveller. They left Bulak on the 1st of May 1762, sailing at first gently down the Nile.

From Cairo to the Delta, the river is very large, with small isles scattered through it; which, when the river overflows, are often transported, by the impetuosity of the stream, from one situation to another. This occasions frequent disputes among the villagers on the banks of the river. But, at this time, the Nile was so low, that their boat was several times a-ground. They might have proceeded with the stream, in the calm, during night, had they not been afraid of pirates. A north wind blows usually through the day, and opposes the progress of boats down the river. Violent blasts sometimes arise, and bear sand and dust before them, darkening the air, and endangering the safety of the boats, which are commonly very indifferent failers. All the villages have, indeed, guards to watch the approach of pirates, and warn passengers. But those very guards often join with the inhabitants of the villages, and sit out barks themselves, to plunder those whom they should protect.

They arrived at Sifta on the 3d of May; this is a very considerable village, between Cairo and Damietta. It has three mosques, and a church belonging to the Copts, the congregation of which consists of three hundred families. Those good people invited our traveller to see their church; it is ill-built, dirty, and hung with cobwebs. During the public worship, they stand, leaning on their staves. Their churches are adorned with bad paintings.

In the course of their voyage they saw several boats which they suspected to belong to pirates; but none of them ventured to attack them. They saw,

likewise, several rafts laden with pots and other earthen ware from Upper Egypt. Those cargoes of earthen ware are fixed upon very light planks of the timber of the palm tree, joined into a raft, the progreſs of which is directed by fix or eight men with poles in their hands. After ſelling their cargoes at Damietta, they walk home. They defend themſelves very dexterouſly, with ſlings, againſt robbers.

They paſſed by Manſura. It ſeemed of the ſame ſize as Damietta. A wall has been built upon the branch of the river near the city, to hinder the water from entering the canal that communicates with the lake of Baheira, in a larger quantity than is requiſite for watering the fields of rice, of which a great deal is raiſed in this part of the country.

Below Manſura they met twenty boats laden with bee-hives, which they were bringing up to make honey on the banks of the river. In each boat were two hundred hives, four thouſand in all. The Sandyak of Manſura lay in the neighbourhood, with a party of forty ſlaves and domeſtics, to levy the tax due upon the bees.

They arrived at Damietta on the 5th of May. This city is at leaſt as advantageouſly ſituated as Roſetta. The imports from Syria enter at this port; and it has alſo a great trade in rice, of which there is much raiſed in the neighbourhood. Yet, no Chriſtian merchant, or European monk, reſides here; although there be in Damietta, a conſiderable number of Maronites and Armenians, who communicate with the church of Rome.

Formerly, a conſul and French merchants reſided in Damietta. But, the inhabitants obſerving that thoſe ſtrangers made too free with their women, roſe up in a ſtorm, and maſſacred them all. The inhabitants of Damietta are generally reckoned more unfriendly to the Chriſtians, than any of the other inhabitants of Egypt. The memory of the Cruſades, perhaps, keeps up this inveterate averſion. But, as our travellers wore the Turkiſh dreſs, and ſpoke the language of the country tolerably well, they had nothing to fear.

There are many rice fields in the neighbourhood of this city. But towards the ſhore, the ground is covered with ſand, and conſequently barren. To travel by land from Damietta to Roſetta, it is only a journey of a day and a half. But the road is very dangerous, being infeſted with robbers.

M. Niebuhr being ſo near the ſea, went to ſee the Boghaſ, two German leagues below Damietta. This mouth of the Nile is not leſs dangerous to veſſels than that of Roſetta. It was formerly defended by a fort; but the gariſon have been frightened away by ſuppoſed apparitions. Our hero viſited it in company with ſome Mahometans, who ſaid their prayers very devoutly in that abode of ſpirits. This was the only time M. Niebuhr remarked this ſpecies of ſuperſtition among the Muſſulmans; the ſuppoſition of apparitions being unknown in Arabia.

The lake of Baheira extends from Damietta to Ghaffa. The inhabitants being poor, and from their insulated ſituation almoſt independent, are to be dreaded equally by land and water. They rob all travellers without diſtinction. This, therefore deterred our hero from examining the place.

A number of the villages on the banks of the Nile belong to beys who reſide at Cairo. They left Damietta on the 12th of May; and the wind blew ſo fair, that they reached Bulak on the 15th.

Our author now proceeds in giving his deſcriptions of Egypt, Cairo, &c. for which we ſhall refer our readers to Mr. Bruce's travels. Speaking of the inhabitants, he ſays that the Arabs and Turks from all the provinces in the Ottoman empire, form the moſt numerous part of the people of Cairo. There are alſo Magrebbins, or Arabs from Barbary, other Africans, Perſians, and Tartars: all theſe are Mahometans, and moſt of them attached to the ſect of Schafei.

After the Mahometans, the Copts are the next in number. They occupy whole quarters of the city,

and very large ſtreets. They have a great many churches, both in the capital, and at Maſr-el-atik in its vicinity. Their patriarch alſo reſides at Cairo. Theſe people are deſcended from the ancient Egyptians; and the Turks, upon this account, call them, in deriſion, the poſterity of Pharaoh. But their uncouth figure, their ſtupidity, ignorance, and wretchedneſs, do little credit to the ſovereigns of ancient Egypt. They have lived for 2000 years under the dominion of different foreign conquerors, and have experienced many viciffitudes of fortune. They have loſt their manners, their language, their religion, and almoſt their exiſtence. They are reduced to a ſmall number in compariſon of the Arabs, who have poured like a flood over this country. Of the diminution of the number of the Copts ſome idea may be formed from the reduction of the number of their biſhops. They were ſeventy in number at the period of the Arabian conqueſt; they are now only twelve.

The Jews are the moſt numerous claſs, next after the Mahometans and the Copts. Some Pharifees or Talmudiffs, reſide here, as well as Karaites, who, though not numerous, have a ſynagogue of their own. The Talmudiffs are numerous and powerful. They have long ſarved all the cuſtoms; an undertaking which brings them both wealth and credit. In the republican government of Egypt, they find it eaſier to gain ſteady protectors, than in the other provinces of Turkey, where all depends upon the caprice of a pacha, who knows not how ſoon he may loſe his place, or of the ſuperintendent of the ruſtoms who reſides in Conſtantinople. One proof of the conſequence which the Jews enjoy under the ariſtocracy of Cairo, is, that the offices of the cuſtoms are ſhut upon their Sabbath, and no goods can paſs on that day, although belonging to Chriſtians or Muſſulmans.

The Greeks have only two churches in Cairo, in one of which the ſervice is performed by the patriarch of Alexandria, and in the other by the biſhop of Mount Sinai. The Armenians, who are not numerous, have only one church, but that a handſome one. From Europe here are ſeveral French and Italian merchants, but no Dutchmen; yet the Dutch have a conſul here, as well as France and Venice.

In reſpect to the entertainments of the Eaſt, our author ſays that the Oſmanli, or Turks diſtinction, who are ſtill attached to the ancient military inſtitutions of the nation, amuſe themſelves chiefly with equeſtrian exerciſes. The principal inhabitants of Cairo meet twice a-week in a large ſquare, called Maſſabe, with a number of attendants on horſeback. In this ſquare they play at Gerid; which conſiſts in running, by two and two, with the ſtirrups looſe, purſuing one another, and toſſing ſlaves four feet long: theſe they throw with ſuch force, that if any one be not upon his guard, he is in danger of having a leg or an arm broken. Others, while riding at full gallop, throw balls into a pot placed upon a heap of ſand. Others, again, ſhoot the bow; an exerciſe in ſuch repute, that pillars are erected in honour of thoſe who exhibit extraordinary proofs of ſtrength or dexterity in launching the arrows.

When the Nile is at its greateſt height, the great about Cairo divert themſelves in little boats ſplendidly decked out, upon the birkets in the middle of the city. Upon this occaſion, they regale the inhabitants with muſic, and often with fire-works.

A man originally from Tripoli in Barbary informed them, that the pacha of that city uſed ſometimes to erect two ſcaffolds, with cords running between them, and upon theſe miniature models of ſhips of war, armed with cannons of a ſize in proportion to that of the veſſel. Theſe veſſels, thus ſuſpended in the air, and commanded by naval officers, who directed the evolutions and the fire of the ſmall artillery, preſented no unentertaining representation of a ſea fight. The captain whoſe veſſel firſt ſuffered conſiderable damage was conſidered as conquered. But this

But this

his diversion often ended in serious quarrels among the commanders, and was therefore abolished.

The noblemen's servants exercise themselves on foot, in throwing, one against another, staves five or six feet long; and thus learn to throw the Gerid, when on horseback. The common people and peasants divert themselves with cudgel-playing. Gladiators by profession there are, too, who exhibit in public. But staves are their only weapons; and a small cushion fastened under the left arm, serves them as a buckler.

The young people of the villages amuse themselves at diversions much the same as several of those which are practised in Europe. They run, leap, play at the ball, sometimes at odds and evens, and at tossing a number of small stones into the air and receiving them again into the hand.

It is natural for a people who live in seclusion from society, and in subjection to arbitrary authority, to be fond of public festivals. These are celebrated in Egypt with much pomp and ceremony, particularly the festival upon the departure of the pilgrims for Mecca, of which several authors have given a description. The other feasts, besides this, are numerous: each mosque celebrates a feast in honour of its founder; upon occasion of which there is a procession of persons of all ranks; and the people are permitted to divert themselves in an adjoining square. The Copts have their feasts, as well as the Mahometans, and contribute, by their ceremonies, to the general amusement.

Sometimes these festivals are celebrated by night. The streets are then illuminated by the blaze of resinous wood in a chafing dish, held up on a long pole. They use also another more luminous flambeau, which is a machine consisting of divers pieces of light wood, to which are hung a number of small lamps, and the whole carried on a pole, as the former. When these festivals are celebrated by day, the people divert themselves upon swings, and other similar diversions.

Throughout Egypt, Syria, and Arabia, the favorite amusement of persons in any degree above the very lowest classes, is, to spend the evening in a public coffee-house, where they hear musicians, singers, and tale-tellers, who frequent those houses in order to earn a trifle by the exercise of their respective arts. In those places of public amusement, the Orientals maintain a profound silence, and often sit whole evenings without uttering a word. They prefer conversing with their pipe; and its narcotic fumes seem very fit to allay the ferment of their boiling blood. Without recurring to a physical reason, it would be hard to account for the general relish which these people have for tobacco; by smoking, they divert the spleen and languor which hang about them, and bring themselves, in a slight degree, into the same state of spirits which the opium-eaters obtain from that drug. Tobacco serves them instead of strong liquors, which they are forbidden to use.

The koran prohibits playing for money; and for this reason the Orientals seldom play at any game of chance.

They know nothing of cards; but at Bombay our traveller met with four Arabian merchants, who played with chinese cards, so large and thick, that not one of the four but had enough to do with both hands. Some young Mahometan merchants, whom he surprised playing at Bombay, concealed their game with an appearance of anxiety, till they learned that he was an European. The Greeks are too polished, not to imitate our manners; they shew themselves good Christians, by playing with our cards, and a deep game too.

The inhabitants of the East have, however, some games, more suitable to their sedentary life, and splenetic humour, at which they play without keenness, and merely to fill up the vacant hours. Such are chess, draughts, tristraec. The Arabic names of these games, and their antiquity prove them to have been originally introduced from the East into Europe.

If the Mahometans shew any degree of passion for any one game, it is for chess, at which they spend, sometimes, whole days without interruption. But those who enter into the game with this keenness and ferocity, are reckoned dull by their companions. Instead of wooden chess-boards, they use a white linen cloth, with pieces of a different colour sewed upon it. When the game is ended, the cloth is wrapped up, with the victors and the vanquished, amicably mixed within it.

They have another game, which is played upon boards, marked with two squares, one within another, and these divided diagonally,—with stones or shells of different colours; people play at it with black and white beans. There are many others, particularly an ancient game which the Arabs call Lal el Kab; it is played with small bones of sheep or goats; and the value of the several strokes in the progress of game is determined by the appearance of one or another of the sides of the bone above. The elder Greek and Latin authors speak of this game, which must have given rise to the use of the dice.

At the time of our travellers arrival in Cairo, there was a numerous company of players, Mahometans, Christians, and Jews. Their appearance bespoke their poverty. They played their pieces, wherever they were invited, for a moderate hire. They exhibited in the open air. The court of the house was their theatre; and a screen concealed them from the audience, when they changed their dresses. Several European merchants had lived long at Cairo without seeing an Egyptian play; our travellers therefore invited the company to the house of a married Italian: but they were not much gratified either by the music or the players. The piece was in Arabic. M. Niebuhr was not then sufficiently master of this language to understand the dialogue; but the fable was explained to him. The principal character was a female; but was acted by a man in woman's dress, who had much to do to hide his beard. This heroine enticed all travellers into her tent; and after robbing them of their purses, caused them to be beaten off. She had already plundered a good many, when a young merchant, weary of the insipid repetition of the same tricks, expressed aloud his disapprobation of the piece. The other spectators, to shew that their delicacy was not inferior to his, joined his expression of disapprobation, and obliged the players to stop, although the piece was not more than half done.

Though few plays are represented in Cairo, yet puppet-shews are very common, and are to be met with through all the streets. This exhibition is represented upon a very narrow stage, a sort of box which a single person can easily carry about, and into which the performer goes. He sends forward his figures through holes in the cosser, and makes them perform the necessary movements by means of wires passing through the grooves in the lid of the box. With an instrument in his mouth, he gives his voice a shrillness answerable to the size of the figures. The whole together might merit attention, were not the pieces, which the taste of the spectators in Cairo requires to be performed, absolutely execrable. The puppets begin by paying compliments, quarrel by degrees, and end with beating one another.

The magic lantern is a favourite amusement in the East; and jugglers are to be seen in all the public streets: they are paid by a voluntary contribution of the spectators, but that so moderate, that their profession scarcely enables them to live. Monks, dressed up like human beings, also contribute to the amusement of the populace. Those who lead beasts about for exhibition, have also sheep and asses who are taught to perform some diverting tricks: but what at first surprised our travellers most of all, was to see serpents dancing; however their wonder ceased upon considering the instinct of this animal, which seems to have a natural taste for sounds.

C H A P. II.

Our Travellers delayed—Reasons thereof—Prepare for their Departure from Serriagus, &c.—Make for Suez—Proceed to Adgerud—Description thereof—Reach Bir-Suez—Account of the City—Adventures and Observations—Journey to Mount Sinai—Travel through the Plain of Girdau—See a great Mass of Rock—Enter Girondel—Jebbel Ham-mem Laurum, &c. &c.—The Valley of Favan—Description of Mount Sinai.

NOTWITHSTANDING the chief object of M. Niebuhr's voyage was to visit Arabia, yet several circumstances detained him in Egypt for nearly a year.

Christians, on account of the pretended sanctity of the pilgrims, are prohibited from travelling to Arabia by land, with the caravan for Mecca. They are under a necessity, therefore, of waiting till the season when the Red Sea becomes navigable, and vessels sail from the harbour of Suez for Jidda.

While they waited these opportunities, they found it equally impossible to visit Mount Sinai, or Jibbel-el-Mokatib, the celebrated hill of inscriptions, both of which they delighted to examine. The Egyptians had been at war, during all the last year, with a small tribe of Arabs who dwelt in the environs of Tor, which rendered such a journey impracticable before the return of the caravan from Mecca, the conductor of which had been commissioned to negotiate a peace with the offended Arabs.

The cause of this war was the intemperate rapacity of the Arabs, who gain their livelihood by hiring out camels, and carrying goods between Suez and Cairo. A number of vessels laden with corn, are sent every year from Egypt to Mecca. One of these vessels had anchored near Tor, to take in water, which is better and cheaper there than at Suez; and the captain had made his whole crew go on shore. The Arabs could not resist such a temptation; but seized the captain and the sailors, and plundered the vessel. While this supply of provisions lasted, they gave themselves little concern about the resentment of the Egyptians. But, when they had used all the corn, and durst no longer go to Cairo, for fear of having their camels taken from them, and being otherwise punished, they found themselves much at a loss for the means of subsistence. They began, therefore, to pillage the caravans which go and come regularly between Suez and Cairo. They had even the confidence to represent to government, that they would continue to rob the caravans, till an amnesty should be granted them for what was past, and security given that they and their camels might come and go in safety.

Notwithstanding the sultan calls himself sovereign of Egypt, yet so feeble is his authority, that an handful of raggamuffins ventured to brave the pride of the Ottoman throne, and came off with impunity. To restore peace and security, the regency at Cairo found themselves obliged to empower the Emir Hadgi to make the concession which the Arabs required. The treaty was accordingly concluded at a place where the caravan halted, on their return from Mecca.

Having received notice of this event, August 27, 1762, by the discharge of a cannon upon the arrival of a courier with the news, our travellers immediately prepared to set out. Preparations for such a journey as that which they proposed to make, in the East, was a very serious and difficult concern. A traveller, although he knows a little of the language, cannot but want servants, who must have been previously in those parts which he means to visit. With such, they were ill provided. Their Swedish servant was as much a stranger as themselves; they had a Greek cook who had lived long enough in Cairo, but had never been out of Egypt; an interpreter to assist their physician in his practice, who was a renegade Greek, and had never travelled before; and a young Jew of Sana, who had before travelled the same road upon which they were entering, but was regarded with sovereign contempt by the Mahometans, on account of the nation to which he belonged. None of these could be of much service to them in their intercourse

with the Arabs. They had likewise great occasion to supply themselves carefully with provisions and articles of furniture. In the deserts through which they were to travel, a tent and beds were indispensably necessary. They had a neat collection of kitchen utensils made of copper, and tinned without and within. Instead of glasses, which are so liable to be broken, they used also copper bowls completely tinned. A bottle of thick leather served them as a caraffe. Their butter they put up in a leathern jar. In a wooden box, covered with leather, and parted out into shelves, they stored their spices of all sorts; and in another similar box, they laid their candles; in the lid of the latter, they fixed an iron socket, which served them for a candlestick. They had large lanterns of folded linen, with the lid and bottom of white iron. For a table, with table linen, they had a round piece of leather, with iron rings at certain distances round it, through which cords were passed, after their meals, and the table hung, in the form of a purse, upon one of their camels. But they imprudently put their wine into great flasks, instead of goats-skin bottles, large enough, each of them to contain twenty ordinary bottles. These vases are very liable to be broken by the jolting of the camels, as they found by the loss of a part of their wine.

All except M. Niebuhr hired horses. He, out of curiosity, preferred a dromedary, and found no reason to repent of his choice. On a camel, the saddle is always open above, that it may not hurt the bunch of the animal; but a dromedary's saddle is made like a horse's, and covers the bunch. The dromedary, as well as the camel, kneels to receive a load, or a rider upon his back. At a certain signal, he droops his head and neck, so that one can alight and remount whenever there is occasion, without making the animal stop. Our hero spread his bed-clothes upon his saddle, and was thus enabled to change his posture, and to seat himself so as to avoid the direct impulse of the sun's rays. A dromedary walks with long and regular steps, and the rider, of consequence, feels the motion no otherwise than if he were rocked in a cradle. When his companions, who rode on horse-back, were weary and faint by the fatigue of riding, and by the excessive heat, he found himself as little fatigued as if he had been all day in a chaise at his ease.

The caravan with which they had designed to travel, waited a long while for the conclusion of peace between the governor of Egypt and the Arabs of Tor. On its return, they went immediately to find the Schiech from whom they had hired their beasts for the journey. He had pitched his tent near the village of Serriagus, where he, with his party, lay encamped, till they should find it proper to set out. But on that day no body must stir.

When large caravans pass through the territories of the independent Arabs, they have at their head a caravan-baschi, whose business it is to guide the caravan, and to treat with the princes who may exact duties for the liberty of passing through their dominions. This chief regulates the departure of the caravan, its journeys, and the times at which it is to rest. But small caravans, such as our travellers employed, whose expeditions are short, have no such guide. The chief merchant in the party, always halts and proceeds as he pleases, and the rest follow his example. When none of the merchants in the company is considerable enough to have this influence, the Arab who has most beasts of burden, regulates the rest. Our travellers did not know the precise time at which they were to set out, till the 28th of August, when they saw troops of passengers begin to move.

Their

Their caravan had no very formidable aspect. Being in haste to set out from Cairo before the great caravan, which goes always to Suez immediately after the departure of the vessels, they had not more than forty camels which were loaded with corn and materials for building. Three or four camels were employed in carrying an anchor. Their camel-drivers, who were but few, carried broken guns, and rusty or pointed sabres. A few Schiechs, indeed, to whom the most of their camels belonged, carried complete armour, and rode upon dromedaries. But they could not trust to them for defence; for no Arab will willingly risk his life to save a Turk. It was their part, therefore, to keep in the middle of the caravan, and on no account to leave them, or encamp apart, unless they were willing to be plundered. In some places, where the danger was least, our hero and his comrade ventured to go before the main body of the caravan, to rest and enjoy purer air for a little while.

They left Serapius on the evening of the 28th of August, and passed near by a large village, called Hanka, after which they returned into the great road, and about eleven at night, encamped in a place named El-Firn-bebad. The great road consists of a number of parallel paths, formed by camels who travel in files, just as they please. Two miles from Cairo, they saw a square area enclosed within a wall, several feet high, in which the principal inhabitants of Cairo assemble to receive the Emir Hadgi, at his return from Mecca. From this place to Adgerud, within four leagues of Suez, the country is absolutely a desert; for the space of three and twenty leagues, neither houses, water, nor the smallest spot of verdure being to be seen.

Early on the 29th, they decamped, after taking a very slight refreshment. They travelled onward, thirteen leagues, crossed the mountain of Wehbe; and about sun set, encamped near the hill of Taja. The great caravan from Mecca had passed on the preceding night; but as they travelled farther to the south, our travellers of course failed to meet them. Early on the next day, they proceeded to Adgerud, where travellers are induced to halt, by finding water fit for drinking.

Adgerud is a small castle, that has been built by the Turks for the protection of the road, and the preservation of the wells between Suez and the entrance into the desert. Although built only about the end of the sixteenth century, it is now ruinous.

Within three hours, they reached Bir-Suez, where are two deep wells, surrounded with walls, and shut up with strong gates, to exclude the Arabs from the water. This water, although bad, and almost unfit for human use, is however precious to the inhabitants of Suez, as it serves for their cattle. It is drawn from the wells in leathern buckets. Bir-Suez being only a league from Suez, they reached that city in good time. By M. Niebuhr's observations, it is thirty-two ordinary leagues, or three and twenty German miles from Cairo.

The city of Suez stands upon the western side, but not just upon the western extremity, of the Arabic gulf. It is not surrounded with walls; but the houses are built so closely together, that there are only two passages into the city, of which that nearest the sea is open, the other shut by a very insignificant gate. The houses are very forty structures; the kans being the only solid buildings in the city. Hardly any part now remains of the castle which the Turks built upon the ruins of the ancient Kollam. It is very thinly inhabited. Among its inhabitants are some Greeks, and a few families of Copts. But, about the time of the departure of the fleet, it is crowded with strangers. The ground lying around it, is all one bed of rock, slightly covered with sand. Scarcely a plant is to be seen any where in the neighbourhood. Trees, gardens, meadows, and fields, are entirely unknown at Suez. Fish is the only article of provisions plentiful here. All other necessaries of life, for both men

and the domestic animals, are brought from afar; from Cairo, which is three days journey distant from Suez; Mount Sinai, at the distance of six days journey; or Ghaffo, at the distance of seven.

At Suez, there is not a single spring of water. That at Bir-Suez is scarcely good enough for cattle, though drawn to Suez twice a-day for their use. The water of the pretended wells of Moses is still worse; and besides, these wells lie at a league and a half's distance on the other side of the gulf. The only water fit for drinking that is to be had here, comes from the wells of Naba, upon the other side of the gulf, and more than two leagues distant from Suez. The Arabs are the carriers.

Ship-building is the chief employment of the inhabitants of Suez: although wood, and iron, and all the other materials, are to be brought from Cairo upon camels, and are, of consequence, very dear. The ships built here have a very awkward rudder, made of a large beam, the use of which is dangerous and inconvenient. Our hero saw a vessel in this harbour of a different construction, which had been built at Surat. So durable was the wood of which it was formed, that, although it had been in constant use for twenty years, it was still in a perfectly sound state.

The governor of Suez was a Bey from Cairo; and he kept a very numerous household. This employment placed him in a sort of honourable exile; and being therefore very desirous of returning to the capital, he listened eagerly to any predictions respecting the period of his return thither. He assured our travellers, that a learned Mussulman had foretold the time when he was to be recalled; and he wished them to consult the unknown inscriptions in the desert, and see whether they might not confirm the prediction of the prophetic Mussulman. However Niebuhr and his party excused themselves, as ignorant of the sublime science which unveils futurity. This Bey was a Mahometan by birth, and the son of a sugar merchant.

The Schiechs, whom they had hired to conduct them to Mount Sinai, not having fulfilled their engagement, our travellers refused, upon their return to Suez, to pay the whole sum that had been stipulated. Hereupon the Schiechs threatened to kill them, but our travellers let them know that they were able to defend themselves. They then declared that they would deprive them of the water of the Naba. Mr. Van Haven replied, that this was a matter of no consequence to Europeans who drank wine; an answer which moved the Turks to laugh at the expense of the Arabs. But, as their tribe eluded their quarrel, it was seriously feared that they might execute what they threatened, and reduce the city to distress for want of water. Wherefore, the governor begged them to terminate the difference, and pay the Schiechs what they demanded: with which request M. Niebuhr cheerfully complied.

One thing that they had in view in their journey, was to examine the Hill of Inscriptions in the desert; and they were, therefore, desirous of receiving all possible information concerning so remarkable a place. On their arrival therefore at Suez, they applied to some Greeks for information concerning that hill. But none of them had ever heard of the name of Jibbel-el-Mokateb. They directed them, however, to a Schiech of the tribe of Said, who had passed his life in travelling between Suez and Mount Sinai. That Schiech was equally a stranger to the name of the Hill of Inscriptions. But, understanding that they would give a considerable reward to the person who should guide them thither, he returned next day with another Schiech, of the tribe of Saccalha, who pretended to have a particular knowledge, not only of that mountain, but of all other places in the desert where inscriptions were to be met with. However, by his answers to some questions, our travellers soon saw that he knew as little as the former of the place which they wished to visit. At last a Schiech of the

tribe of Leghat was brought them, who, by his conversation, convinced them, that he had seen stones inscribed with unknown characters. When he learned that the object of their curiosity was called Jibbel-el-Mokatteb, he assured them that this was the name of the mountain among all the Arabs who knew it. Pleased with finding, at length, an inhabitant of the desert, at least, who could guide them to the place where the inscriptions were to be seen; they determined to take him for their conductor, especially because his abode, as he told them, was near to that mountain. But the other two Schiechs, who had brought them the latter, warmly opposed their purpose, and insisted upon accompanying them as well as he. The inhabitants of Suez, advised them to take them all three, and told them, that they could not travel the desert in safety, without having guides from every one of the three tribes, that inhabited the country between Suez and Mount Sinai. Accordingly they took the three Schiechs, who supplied them with camels for themselves and their servants. To prevent disputes, they had their contract written out by the cafi of Suez, in the presence of the governor.

Being anxious to set out in time, that they might return to Suez before the first ships should sail, they chose the beginning of October: for in the succeeding months, the passage to Jidda becomes too dangerous. At this time their painter, Mr. Baurenfiend, had fallen ill, immediately after their arrival at Suez, from the excessive fatigues which he had undergone. Notwithstanding his affliction was necessary in their expedition, yet M. Niebuhr and Mr. Van Haven resolved to set out by themselves, leaving Messrs. Forkal and Cramer at Suez, to take care of Mr. Baurenfiend.

They crossed the gulf on the 6th of September 1762, and set out next morning with their Arabs. Beside the three Schiechs and their servants, they were accompanied by several of those people's friends, who had, for some time, carried water from the wells of Naha to Suez, and were now going to see their friends in the desert, hoping to live at our travellers' expence by the way. It is a rule with these people, that an Arab of distinction, travelling, must maintain all who choose to accompany him, whether it be at his own desire or not; and our travellers, as they lived at some expence, were thought to be very rich.

The first day they travelled along the coast of the Arabic gulf, through a sandy plain, having a few hills scattered over it. The Arabs call such plains, when they lie somewhat low, *saltes*, because water remains stagnant in them after heavy rains. They rested under a palm-tree, Moses' Fountains. These pretended fountains, are five holes in the sand, in a well of very indifferent water, that becomes turbid whenever any of it is drawn. As the holes bear the name of Moses, the Arabs ascribe them to the Jewish law-giver. After a day's journey of five German miles and a half, they encamped on the sand, in the plain of El-Ti.

The country through which they passed, is famous as the scene of the emigration of the Jews, under Moses. They were therefore desirous of learning from the Arabs, the names of all the places, and of all the mountains, especially in their way. Mr. Van Haven who could not resolve to make himself familiar with the Bedouins, could obtain nothing but vague and uncivil answers from them. M. Niebuhr again sought to gain the confidence and friendship of one of those Arabs, by making him some presents, and causing him to ride sometimes behind him upon his camel. From him he received honest and distinct answers. To the objects which he pointed out to him, he gave the same names coming as going. M. Niebuhr likewise measured the distances of places, by counting the steps of the camel, and comparing the number with the time in which they were travelled, by his watch. By means of a compass, he distinguished, likewise, the directions of the road. None of the Arabs understood the nature of this instrument. It is plainly,

therefore, an idle tale, that they follow the directions of the compass, in travelling through their deserts.

On the 8th of September, they travelled through the plain of Girdan. They saw, on their way, an enormous mass of rock, that had fallen from a neighbouring mountain. They entered next the valley of Girondel, and, after proceeding five miles and a half further, found themselves in the vicinity of Jibbel-Hammen-Faurum. Next day, sending their servants forward, they themselves staid to examine these environs. In the rainy season, a considerable torrent runs through the valley of Girondel. It was at this time dry; yet, by digging in the bed, to the depth of two feet, they found better water than that which is used at Suez. This valley not being deficient in water, has in it several trees, and even groves, that appear singularly striking to travellers from Cairo, who have seen no similar appearance in the previous part of their journey.

Hamman-Faurum is the name of a hot spring which rises by two apertures out of a rock, at the foot of a high mountain. It is used in baths by the neighbouring sick, who commonly stay forty days for a cure, during which their only food is but a fruit, called Laffaf, which grows here. An extensive burning-place near the baths, suggested doubts in our traveller's mind of the beneficial effects of this regimen. The tradition that the Jews passed this way, and that Pharaoh's army was drowned here, has occasioned this place to receive the name of Birket-el-Faurum. The Arabs imagine that Pharaoh is doing penance at the bottom of this well, and vomits up the sulphureous vapour with which the water is impregnated.

This eastern side of the Arabic gulph, is tolerably level and uniform. But the opposite side is one range of lofty mountains; broken, however, and divided by two vales, one of which must be passed by us travelling from Egypt to the shore of the Red Sea.

They turned by degrees towards the north-east, in pursuing the direct road to Mount Sinai, and at length entered a narrow vale, which appeared to have been cut by the torrents, in the rock. The mountains which rose upon every side of them, in uninterrupted chains, were masses of a sort of limestone intermingled with veins of granite. In several places through them, M. Niebuhr discovered a quantity of petrified shells, of a species which is to be found with the living shell-fish in it, in the Arabic gulf. One of these hills is entirely covered with flints. The granite became more and more plentiful, as they approached Mount Sinai.

Their road lay often along the brink of precipices, commonly through stony glynns, and sometimes through wide valleys, watered and fertile. Such were Usaitu, El-Hamer, and Warfan. They passed, also, in their way, by Nalbe, the seat of some Bedouins of this country. As water was sometimes at a distance from the places where they encamped, their servants were obliged to go and fetch it. They could have wished to accompany them, in order to see a little of the country; but their guides would not always permit them.

After passing through the valley of Warfan, they turned a little out of the highway, and in the same evening reached the abode of their chief of the tribe of Leghat. As it could not be far from Jibbel-el-Mokatteb, our traveller began to hope that he might take this opportunity of going thither. But the conversation of the Schiech made him soon give up that hope.

The Schiech had given notice of his arrival to several of his friends, who, to the number of ten or twelve, came to see him. Our hero left him to entertain his guests, and in the mean time ranged over several hills in the neighbourhood. He saw by accident, in a sequestered spot, a wretched tent, the dwelling of their Schiech, in which were his wife and sister, busily grinding corn. One of the women came out of the tent, to present him with a bit of gum, and did not refuse a small piece of money in return. At a
little

they follow the direction through their deserts, they travelled through the law, on their way, as had fallen from a neighbouring valley, of the distance of five miles and a half in the vicinity of Jibbel-Musa, sending their servants to examine the soil, a considerable quantity of Gironde. It was lying in the bed, to the better water than that of the valley not being deficient trees, and even groves, to travellers from Cairo, appearance in the previous

ce of his arrival to several number of ten or twelve, left him to entertain his aged over several hills saw by accident, in a tent, the dwelling of e his wife and sister, the women came out of a bit of gum, and did money in return. At a little

little further distance, he met the Schiech's son, who was tending goats, and conversed with him for a considerable time. M. Niebuhr was surpris'd at the sense, gravity, and assurance of the child, who seem'd to be, in no degree, embarrassed by the presence of a stranger. He invited our traveller very kindly to the house, to drink some excellent water which had been drawn on that same day from the well. He had here an opportunity of remarking the relation between language and manners. A tent, of which the original Arabic name is Cheime, is, however, called by these Bedouins, Beit, which signifies house; because they have no other houses than tents.

Moll of their Schiech's friends were distinguished by the same title of Schiech, although nowise superior in their air or dress, to the vulgar Arabs. The title, therefore, is supposed to mean no more among the Arabs, than master, or sir.

Being determin'd to proceed on to Mount Sinai, they set out from the dwelling of their Schiech of Beni-Leghat, on the 12th of September. The country became more mountainous, as they advanced. Yet they pass'd through some pleasant vallies; such were those of Chancela, Dabur, Barak, and Genna. Before reaching the vale of Iffratu, which, although surrounded with rocky and precipitous mountains, displays some rich and cheerful prospects, they were oblig'd to go over another lofty and almost inaccessible hill.

In this vale they met an Arabian lady attended by a servant. In respect to their Schiech, she quitted the road, alighted from her camel, and pass'd them on foot. Another woman veiled, and walking on foot, who happen'd to meet them in so narrow a part of the valley of Genna, that she could not avoid them, fat down as they pass'd, and turned her back upon them. M. Niebuhr gave her the salutation of peace; but his conductors told him, that she had turned her back in respect to them as strangers, and that he had done wrong in saluting her.

At the distance of nearly seven German miles from the dwelling of their Schiech of the tribe of Leghat, they found the abode of their other Schiech of the tribe of Said. The latter was as little willing as the former had been, to pass by near his family without seeing them. They were again therefore oblig'd to leave the highway, and to follow their conductor half a league out of the road. The Arabs set up their tents near a tree in the valley of Faran, and left them to amuse themselves there, in the best manner they could, till they went to see their friends in gardens of date-trees, scattered over the valley. They were at no great distance from their Schiech's camp, which consisted of nine or ten tents. They were inform'd that the ruins of an ancient city were to be seen in the neighbourhood. But, when the Arabs found them curious to visit it, they left them and would give them no further account of it.

The famous valley of Faran, in which they now were, has retained its name unchanged since the days of Moses, being still call'd the Valley of Faran. Its length is equal to a journey of a day and a half, extending from the foot of Mount Sinai to the Arabic Gulf. In the rainy season, it is fill'd with water; and the inhabitants are then oblig'd to retire up the hills; it was dry, however, when they pass'd through it. That part of it which they saw was far from being fertile, but serv'd as a pasture to goats, camels, and asses. The other part is said to be very fertile; and the Arabs told our travellers, that, in the districts to which their Ghafirs had gone, were many orchards of date-trees, which produc'd fruit enough to sustain some thousands of people. Fruit null, indeed, be very plenteous there; for the Arabs of the valley bring every year to Cairo an astonishing quantity of dates, raisins, pears, apples, and other fruits, all of excellent quality.

Some Arabs, who came to see them, offer'd them fresh dates, which were yellow, but scarcely ripe. The chief of their Schiech's wives (for he had two)

came likewise to see them, and present'd them with some eggs and a chicken. The two wives of the Schiech preferr'd over two different departments of his affairs. One was plac'd at some distance from where our tents happen'd to be pitch'd, in order to manage a garden of date-trees. The other was their neighbour, and superintend'd the cattle and the servants. The latter would not enter their tents; but sat down near enough to converse with them. She complain'd of her husband, who neglect'd her, she said, for her rival, and spent all his time in drawing water in Egypt, or in carrying articles of merchandise from one place to another. The European law, by which every man is confin'd to one wife, appear'd to her admirable. This was the first opportunity M. Niebuhr had of conversing, without restraint, with a Mahometan female.

They left this place on the 14th of September, and, after travelling two miles further, in the valley of Faran, arriv'd at the foot of Jibbel-Musa. Up this mountain they ascend'd a mile and a half, and encamp'd near a large mass of stone, which Moses is said by the Arabs to have divid'd into two, as it at present appears, with one blow of his rod. Among those mountains they found several springs of excellent water.

The Arabs call Jibbel-Musa, the Mount of Moses, all that range of mountains which rises at the interior extremity of the valley of Faran; and to that part of the range on which the convent of St. Catharine stands, they give the name of Tur-Sina. This similarity of name, owing, most probably, to tradition, affords ground for presumption, that the hill which they now reach'd was the Sinai of the Jews, on which Moses receiv'd the law. It is, indeed, not easily to comprehend, how such a multitude of people, as the Jews, who accompanied Moses out of Egypt, could encamp in those narrow gullies, amidst frightful and precipitous rocks. But, our hero suppos'd there are plains, that he knew not of, on the other side of the mountain.

Two German miles and a half up the mountain, stands the convent of St. Catharine. The body of this monastery is a building one hundred and twenty feet in length, and almost as many in breadth. Before it stands another small building, in which is the only gate of the convent, which remains always shut, except when the bishop is here. At other times, whatever is introduced within the convent, whether men or provisions, is drawn up by the roof in a basket, and with a cord and a pulley. The whole building is of hewn stone; which, in such a desert, must have cost prodigious expence and pains.

Before the convent is a large garden, plant'd with excellent fruit-trees. The Arabs say that the Monks enter it by a subterraneous passage.

These Greek ecclesiastics are not allow'd to receive an European without an order from the bishop of Mount Sinai, who resides ordinarily at Cairo. He had promis'd our travellers a letter, but had set out, without their knowledge, to Constantinople. By the favour of the English ambassador at Constantinople, they had obtain'd another letter from a deposed patriarch, who had resid'd three years in the convent of St. Catharine. Believing that this letter might be sufficient to gain them admittance, they present'd it to those clergymen, through a small chink in the wall. They took some time to consider, and, after making them wait long, let them know that they could not receive them, as they had not a letter from their bishop.

During this parley, many Arabs, who had observ'd the Europeans from the neighbouring hills, gather'd round them. They are paid a certain sum for every stranger that is received into the convent. When the bishop happens to be present, the gate is open'd, and the convent must entertain all the Arabs who come in. This custom is very burthenome to those poor monks, who have nothing but alms to live upon; and have their provisions, which they are oblig'd to bring from Cairo, often stolen by the way. The Arabs are

in general very dangerous neighbours. They often fire upon the convent from the adjacent rocks. They seize the monks whenever they happen to find them without the walls of the monastery, and refuse to release them, without a considerable ransom.

Not to occasion uneasiness to those monks, our travellers retired, and encamped at a quarter of a league's distance from the monastery. As a recompence for their discretion, they immediately received a present of furs, which were highly acceptable.

Our heroes wished to choose from among the Arabs who had gathered about them, a guide to conduct him to Sinai. This, however, their Ghafirs would not permit, which occasioned a quarrel among them and the other Arabs. Next day, however, their Schiechs brought him an Arab, whom they qualified with the title of Schiech of Mount Sinai, to procure him some path from them, by the right which he then arrogated to himself of attending strangers who came to visit the mountain.

Under the conduct of this newly created lord of Sinai, with their other Schiechs, our heroes attempted, on this same day, to clamber to the summit of that mountain. It is exceedingly steep. The Arabs have cut a flight of steps up the rock. Poccoke reckons three thousand of these steps to the top of the mountain, or rather bare, pointed rock.

Five hundred steps above the convent, they found a charming spring, which, by a little pains, might be improved into a very agreeable spot. A thousand steps higher stands a chapel dedicated to the Blessed Virgin; and five hundred above this, two other chapels, situated in a plain, which the traveller enters by two small gates of mason-work. Upon this plain are two trees, under which, at high festivals, the Arabs are regaled at the expence of the Greeks. His Mahometan guides, imitating the practices which they had seen the pilgrims observe, kissed the images, and repeated their prayers in the chapels.

SEPTEMBER the 16th, in the afternoon, they descended Jibbel-Musa, and passed the night at the bottom of that chitty mountain, at the opening into the valley of Faraf. Next day, after advancing three miles through the vale, they halted near the dwelling of their Schiech of the tribe of Saïd.

Their Ghafirs left them again, and went to see their friends in the gardens of date-trees. During their absence, our travellers had met with a young Arab, riding on a dromedary, who had made himself drunk in one of those gardens. Understanding that they were Europeans and Christians, he began to pour out abusive language against them, much in the same strain in which an insolent and ill-bred young man in Europe might perhaps wantonly abuse a Jew. From this incident, they judged that the Bedouins used wine. They could not help remarking, at the same time, that the law of Mahomet, with great wisdom, forbids the use of strong liquors, as they have such tendency to warm the passions, which, with the inhabitants of hot climates, have naturally but too much violence. In the cities, indeed, many of the Mahometans are in the habit of getting drunk. But, either for shame, or for fear of punishment, they never appear drunk in public; and take this vicious indulgence only in private, in their own houses. Except that young man, they never saw another Mahometan brutally drunk, during all their travels.

Their Ghafirs returned, and they continued their journey on the 20th of the month. Next day M. Niebuhr advanced before his fellow-travellers, on purpose again to view the mountain. The next day they had an opportunity of seeing a part of the road which they had passed by night, when travelling to Jibbel-Musa. In this place, near a delle, named Om-er-vidj-lein, they found some inscriptions in unknown characters, which had been mentioned to M. Niebuhr at Cairo. They are coarsely engraven, apparently with some pointed instrument of iron, in the rock, without order or regularity. Their Arab, thought the time lost which was spent in copying those inscriptions.

On the 25th of September, they arrived again at Suez. Mr. Baurenfeind was much recovered. Before they could reach the city, they had to cross the same arm of the sea, over which they had been ferried

when they set out on their journey; but they could find no boat on the Eastern side. Perceiving, however, that the tide was ebbing, they ventured toward this part of the gulf. They succeeded happily, and the north from the ruins of Kollum. Their camels walked readily; and the Arabs who walked, saw only in water to the knees. This was perhaps the first time that any Europeans attempted to pass here in this manner. This attempt proved that the waters of the gulf are much influenced by the tides, and that in the ebb, the Red Sea may be safely passed on foot.

After M. Niebuhr's return to Suez, he was desirous to examine also the western side of the gulf, and the adjoining hills. He could prevail with no person to accompany him in so dangerous an expedition, for, at the smallest distance from the city, the passenger is in no less danger of being robbed, than in the desert. At length, however, an Arab undertook to be his guide. But he trembled at the sight of every human being that they met; and indeed those whom they met, seemed to be no less afraid of them. This teased and vexed as he was, our hero could make but few interesting observations in these petty excursions.

He now, for the first time, observed an appearance with which he was singularly struck; but which he came afterwards familiar to him. An Arab, whom he saw approaching at a distance, upon a camel, appeared to move through the air, with the gigantic bulk of a tower; although he was travelling along the sand like themselves. Several travellers mention an error of vision, which is owing to a peculiar refraction produced in these torrid climates, by vapours differing greatly in their nature, from those which fill the air in temperate regions.

M. Niebuhr could learn nothing certain concerning the canal which is said to have joined the Nile with the Arabic gulf. No Arab would conduct him into that part of the country through which it is probable that the canal might pass; because the tribe who inhabit it, were at variance with the inhabitants of Suez. In the neighbourhood of Suez, he could find no trace of any canal; unless the valley of Mofbeha, between Bir-Suez and the city, may be regarded as such. After the rains, a considerable quantity

habitants draw for use: and when the waters are gone
off, it is soon covered with grass.

During their absence, several small caravans had
succeedingly arrived at Suez; and the arrival of the
great caravan from Cairo, followed soon after their
return from Mount Sinai. Although from pirates,
properly so called, there is little to be feared in the
Arabic gulf, yet, so unskilful are the mariners in
these latitudes, that they dare not venture to any dis-
tance from the coasts. This timorous mode of sailing
might expose a single vessel to the robbery of the
Arabs; to avoid which, these ships sail in little fleets;
four always setting out together, that they may join
to defend themselves.

After the arrival of the caravans, Suez seemed more
populous than Cairo; and as such a multitude could
not long find subsistence there, all were eager to set out
without delay. M. Niebuhr was recommended to the
masters of two ships that were to make the voyage.
Although now accustomed to live with the Mahome-
tans, yet, in their passage to Jidda, they suffered a
degree of uneasiness, which they had not felt upon
occasions of greater danger. Some Greeks had hinted
to them, that the Mussulmans thought Christians un-
worthy of making this voyage in the company of the
pilgrims who were journeying to the holy city; and
that upon this account they should not go abroad with
shoes upon their feet. Some of the pilgrims, indeed,
seemed to look upon them little less unfavourably
than a Capuchin going to Jerusalem would regard a
Protestant. But, to be obliged to walk without shoes
upon the deck, was not an humiliating distinction,
common to Christians; it was a restraint to which all
on board were subjected. Nobody in those vessels
but must walk upon deck without shoes.

To avoid the company of the Mahometans, they had
hired an apartment which they thought the best. In
a chamber opposite to them, lodged a rich black eu-
nuch, who was going to Mecca; and, useless as it
could not but be to him, was accompanied with his
seraglio, like a Turkish lord. In a large apartment
under theirs, were forty women and slaves, with their
children, whose crying and noise gave them no little
disturbance. Every one of the other passengers had
hired a place upon the deck, where he remained with
his bales and parcels around him, having only a small
space vacant in the middle, where he might dress his
vitals, sit, and sleep. Their Greek tailors, who
were very unskilful, were perplexed by these incum-
brances, and could not go about to manage the vessel,
without trampling upon the goods of the merchants,
which produced endless disputes.

Their vessel, although large enough to have carried
at least forty guns, was very deeply laden. Besides
her own freight, she towed after her three large flut-
tals, and one small; the three larger filled with pas-
sengers, horses, sheep, and even women of plea-
sure.

The master, an honest merchant from Cairo, whose
name was Schoreithe, would not have been distin-
guished among the seamen of Europe. He took upon
himself the talk of pilot to the vessel; but was indeed
a very unskilful pilot. Between the two compasses,
where European navigators set a light, he had placed
a large magnet, to restore, imperceptibly, as he said,
their magnetic virtue to the needles. It was with
difficulty that M. Niebuhr persuaded him to re-
move it.

With such seamen, however, they were obliged to
sail; although they durst not venture out into the
open sea, but coasted round the shores, at the risk of
being dashed in pieces upon jutting rocks, or stranded
upon banks of coral. They had paid the matter for
their passage, immediately after agreeing for it. But,
according to the custom of the country, they were
obliged to give an acknowledgement to the sailors
before going on board, which, in other places, is not
expected till passengers be leaving the vessel.

To avoid any disagreeable encounters with the other

passengers, our adventurers had taken care to go
first on board. They had yet several days to wait,
till the governor should inspect the ships, to see
whether they were not overladen. This duty he
never fails to perform; for a sum of money is payable
to him from each vessel, upon the occasion, which
constitutes a part of his revenue.

At length, after all these delays, the four ships
weighed anchor about midnight, on the 10th of Oc-
tober. The side upon which they passed would have
been dangerous, if the wind had not been favourable;
for it is covered all over with coral rocks. The ships
cast anchor every night; and they had then liberty to
go on shore, if they chose to run the hazard, in order
to see any object of curiosity.

The harbour, in which they happened to cast an-
chor, was once a place of some consideration; but
the small fort of Kalla and Tor is now ruinous, and
without a garrison. In its neighbourhood, however,
are some remarkable villages, the inhabitants of which,
as of all this barren coast, live by fishing.

The inhabitants of Beled-en-Nassara are Greek
Christians. In the neighbourhood is a convent, but
only a single ecclesiastic in it. At Bir is a well, the
water of which is better than at Naba, but not equal
to what the Arabs bring upon camels from the hills.
All the pilots who sail between Suez and Jidda, live
in the village of Jebil. Each of these pilots receive
five hundred crowns for the voyage; and gains some-
thing, besides, in the course of it, by instructing young
persons who accompany him, to learn his art, which
consists merely in distinguishing where the sand-banks
and beds of coral lie.

Mr. Forkal went on shore to visit the pretended
Valley of Elim. The ecclesiastic belonging to the
Greek convent, sent a guide to conduct him thither.
He found it overgrown with date-trees. As he did
not immediately return, a report arose in the vessel,
that he had been detained by the Arabs, for attempt-
ing to take draughts of their hills. Some merchants,
who were also janissaries, set instantly out, to relieve
and bring him back. Happily, the report turned out
to have been false; and Mr. Forkal returned, without
having met with any unpleasant accident.

They continued, till they had failed as far as Ras-
Mahommed, to cast anchor every night. But, be-
tween that cape and the coast of Arabia, they had to
cross the Red Sea at its full breadth. The Europeans
think this the safest route, as there is not, through
the whole, one rock on which a ship can be wrecked:
but the Turks think themselves undone whenever
they lose sight of land.

So many misfortunes happen, indeed, from the ig-
norance of their seamen, that they have reason for
their fears. Out of four vessels that had set out rather
too late in the foregoing year, two had perished in
these latitudes.

In their passage, they found themselves in danger
of a worse misfortune than shipwreck. The females,
who were lodged under them, more than once suffered
linen, which they were drying, to catch fire, in con-
sequence of which the vessel must have been burnt, if
our adventurers had not been alarmed by their
screams, and hastened to their assistance. The se-
cond time when this happened, their captain was
enraged, and sent down an inferior officer into the
seraglio, to beat the women for their carelessness.
The infliction of this punishment produced, at first,
no small noise among them; but it was followed by
four and twenty hours of a sweet silence. Those wo-
men were indeed extremely troublesome and indis-
creet. Hearing their voices so very near them, our
hero was tempted to look through a chink, and saw
three or four of them naked and bathing.

Nothing remarkable appeared upon the track by
which they sailed, unless a few small and desert islands,
and the summits of some distant hills. The last objects
that remained within their view upon the coast of
Egypt, were the famous mountains of emeralds, called
by the Arabs Jibbel Sumrud.

On the 17th of October, an eclipse of the sun happened, which had been foretold to the captain by Mr. Forkal. He shewed this phenomenon through glasses to the captain and the principal merchants, with which they were much pleased; for, among the Mahometans, a person who can predict an eclipse, passes for a universal scholar, and especially for a very skilful physician. Mr. Forkal was consulted by several of the passengers, who fancied themselves suddenly sick. He mentioned some harmless medicines to them, and recommended exercise and a peculiar regimen. At length, one of the pilgrims complaining that he could not see by night, he facetiously advised him to light a candle. This humorous prescription did him better service than the most profound skill in medicine could have done. Those Mussulmans were pleased to find him thus accommodate himself to their manners, and became very fond of him.

When they came near to the small isle of Kaffani, the Turks began to express their joy at having escaped the dangers of such a passage, and having to nearly reached the coast of Arabia. Cannons and muskets were fired; the ship and the boats were illuminated with lamps and lanterns; and all was exultation and jollity. The sailors went round with a box, asking a dole from the passengers; every one gave some trifle; and they then threw into the sea,—not the money,—but the box in which they had collected it.

Continuing their course, they incurred considerable danger, in doubling a cape surrounded with banks of coral, because their pilot was drunk. He had frequently asked for brandy, on pretence that he could not see the hills, or the outline of the coast, unless his sight were cleared by the drinking of a little strong liquor. They had refused him, for fear of giving offence to the other Mussulmans; but they soon saw that they are not so scrupulous, for the captain sent to them every morning for a quarter of a bottle of brandy for his pilot. The Greek merchants might perhaps have made him drunk, by adding to the dose which he received daily from the Europeans.

They arrived soon after at Jambo, a walled town near the sea, and having a safe harbour. Not having seen a single house since they had left Tor, they felt no small pleasure at the sight of Jambo.

Such as meant to take Medina, on their way to Mecca, went on shore here. Three of their party also landed, and took their sabres in their hands, like the other passengers. An inhabitant of Jambo, supposing them Turks, gave them the salutation of peace, and entered familiarly into conversation with them. But learning that they were Franks, he became vexed at having profaned his form of salutation, by addressing it to Christians, and passionately railed at the insolent audacity of these infidels, who dared to wear arms in Arabia. But the other Arabs not seconding his complaint, their fellow-travellers came on board, without meeting with any other unpleasant accident.

After stopping for one day in this harbour, they proceeded upon their voyage, retiring by degrees from the coast, near which many beds of coral rocks were scattered. They had an opportunity of seeing the town of Mastura, which stands at the foot of a hill of the same name. They doubled cape Wardan; and anchored near Rabogh, a permanent habitation of a body of Arabs, who live there in tents. They purchased from them a plentiful stock of provisions.

Pilgrims, in their first journey to Mecca, are obliged to assume the Ihram immediately after passing Cape Wardan, if the state of their health permit. This is a piece of linen, which is wrapped round the loins. The rest of the body is naked; and in this state they proceed through the rest of the pilgrimage, till they have visited the Kaaba. The only other garment they are suffered to wear, is a linen cloth upon the shoulders, which hangs down in the fashion of a scarf. But many, under pretext of indisposition, retained their ordinary dress. Others, more devout, assumed the Ihram, although they had been formerly at

Mecca; so that by the evening, they saw most of those Mussulmans dressed in a garb different from what they had worn in the morning.

On the 29th of October, they arrived in the harbour of Jidda. The same reason which had induced them to enter the ship before the other passengers, disposed them to remain in it till they had all gone on shore. Every one was eager to get away with his goods as soon as possible, and to conceal them as much as he could from the officers of the customs. They were particularly at pains to conceal their ready money, which pays two and a half per cent. duty. One of the passengers failed in this attempt; for his purse burst as he entered the boat, and his crowns fell into the sea. Those who defraud the customs, suffer no confiscation of their goods upon detection; they are only laughed at. In several places in Turkey, those detected in these practices are compelled to pay double duties.

All who had been this way in the former year, and were now returning from the city, complained bitterly of the hardships with which they had been treated by the custom-house officers. Our travellers were therefore perplexed about their ready money, not that they were unwilling to pay the duties, but they were afraid of being plundered by the Arabs. As the Mahometans are unacquainted with the use of letters of exchange, they had been obliged to carry with them in Venetian sequins, the whole sum that they intended to expend on their journey. After various thoughts, they resolved to put their money in the bottom of their medicine-chest, reserving only two hundred sequins, where they expected the officers of the customs to search. The stratagem succeeded; and no person offered to move their medicines.

We entered Jidda under strong apprehensions of ill-treatment from its inhabitants. Recollecting with what contempt Christians are regarded at Cairo, and how their companions had been insulted by the Arab at Jambo; they feared, that they might experience still more of the inhospitable insolence of the Mussulmans, as they approached nearer to their holy cities. But they found themselves agreeably disappointed. The inhabitants of Jidda, who are much accustomed to Christian merchants in the European dress, were not struck with any thing strange in their appearance, and did not seem to take much notice of them. They went freely to the coffee-houses and markets, without suffering any insults. But they understood, that none except Mussulmans, are permitted to pass through the gate that opens towards Mecca, or even to approach it; and kept therefore carefully at a distance from that gate, lest they might be discovered.

Their letters of recommendation were of great use to them. Mr. Gehler had been personally acquainted with the Pacha of Jidda, at Constantinople, and had accordingly recommended them to him. They had letters from two considerable merchants at Cairo to two of the principal merchants in Jidda. A poor Schiech had given them one to the Kiaja, the Pacha's lieutenant: a recommendation from which they had not expected much, but which was, nevertheless, of more service to them than all the rest. This Schiech was secretary to one of the principal members of the academy of Jamea-el-Ashar, at Cairo. He had been born in European Turkey, and having often heard of the superiority of the European Christians in matters of science, came frequently to see our travellers, and was eager to receive information from them. He was a truly worthy man, perfectly free from superstition, and a friend to the whole human race. Mr. Niebuhr and Mr. Forkal instructed him in the elements of botany and astronomy. He was very useful to them in the Arabic language, and explaining to them many things of which they must otherwise have remained ignorant. In his youth, he had given the Kiaja some lessons. He had written, without Mr. Niebuhr's knowledge, by the last caravan, to prepossess his old friend in our hero's favour: and gave him besides, this letter.

ing, they saw most of a garb different from morning.

they arrived in the harbor which had induced the other passengers, till they had all gone on to get away with his to conceal them as officers of the customs, to conceal their ready half per cent. duty, in this attempt; for his coat, and his crowns fell upon detection; they several places in Turkey, are compelled to pay

in the former year, and the city, complained but which they had been treated. Our travellers were their ready money, not by the duties, but they by the Arabs. As they had not time to deliver all their letters with their own hands, they sent those to the two merchants by their servant, in hopes that they might find them lodgings, but when the people understood that there were so many, they excused themselves, alleging that it was not possible to find a house large enough. Had they been fewer, they might have taken chambers in the public Kan. Their Greek servant, when they were thus at a loss for lodgings, applied to one of his countrymen, who was goldsmith to the Sheriffe of Mecca, and in great credit with the principal men in the city. This goldsmith informed him, that the Kiaja, having had previous intimation of their coming, had given him orders to do them any service in his power. He even offered them the use of his own house for a night, and promised them a whole house to themselves the next day.

Upon receiving this notice, they went instantly to deliver the Schiech's letter to the Kiaja; who received them with great politeness. They went frequently afterwards to see him; and in their answers to his questions concerning the customs and manners of Europe, they communicated to him and his friends, more just and favourable ideas of the Europeans, than they seemed to have before entertained. The Arabs consider them in the same light in which they regard the Chinese. They esteem themselves the more enlightened and ingenious people; and think they do the Europeans great honour, when they rank them in the second place. The Kiaja was fond of conversing about astronomy. Mr. Forstkal, who often visited him, persuaded him to form a garden for plants near his own house, and to bring from the interior parts of the country, the shrub which produces the balm in Mecca. The Arabs looked upon this as a happy thought; and the more so, because the balm is not to be obtained pure at Jidda, but is commonly corrupted with an intermixture of extraneous substances, before it comes there.

After a few days, they delivered their letter of recommendation to the Pacha. He had also some knowledge of astronomy, and wished to see their instruments. He thought them better than those used in the East, and shewed them to a Schiech, a learned Turk, whom he had with him. The Pacha and the Schiech spoke no language but the Turkish, to which M. Niebuhr was a stranger. But they had enough of interpreters; and, among others, three French and Italian renegades in the service of the Pacha. Yet they knew not the terms of science, either in their native language, or in the Turkish. Our hero could not, of consequence, make himself well understood by the Pacha; and their conversation upon these subjects was not long nor profound. With the Kiaja he was obliged to speak Arabic, which he found not a little difficult, being still ignorant of the terms of science in that language.

On the 11th of November, after hiring a house, they had their effects carried to the custom house, before they removed them into the city, and were happy to find, that they were not the less kindly dealt with for being known to the Kiaja. That officer sat in an elevated situation, with his clerks around him, and directed the goods of the merchants to be examined, piece by piece; but he was satisfied with opening their trunks, and did not make them be emptied. The officers of the customs expect a gratuity when they behave with discretion. The Sheriffe's goldsmith, who had taken upon himself the direction of their expence, gave them a trifle in their name publicly.

The news of the arrival of a party of Europeans, among whom was an astronomer, soon reached Mecca. The brother of the reigning Sheriffe was at that time advancing with an army to attack the city. With the Mahometans, an astronomer is always deemed an astrologer. The Sheriffe, therefore, directed his Greek goldsmith to inquire of M. Niebuhr whether he should remain in possession of the sovereign power, or be compelled to give place to his

brother? Our hero excused himself from returning an answer, as being ignorant of future events, and as cultivating allronomy only to improve the art of navigation. But Mr. Van Haven replied, that, of the two brothers, he who bore the greater resemblance to Hassan, the founder of the family, should remain victorious. This response turned out the more happily, that the reigning Sheriffe was enabled to maintain himself upon the throne.

A nobleman in Jidda asked M. Niebuhr to discover to him the thief who had stolen two hundred sequins which he had lost. He alleged the same excuse as in the former case. The nobleman then applied to a famous Schiech, who was a better astrologer. The Schiech gathered all his servants, ranged them in a line, and, after a long prayer, made each of them take into his mouth a bit of folded paper, telling them, that they who were innocent might swallow it with safety, but that the guilty person would be choaked by it. They all swallowed the paper, save one, who, being thus surpris'd and embarrassed, confessed the theft, and made restitution.

Jidda was surrounded with walls by the sultan El Guri, sovereign of Egypt, in the year 1514, to protect it from the Portuguese, then beginning to become formidable on the Red Sea. Those walls are still standing, but are now for ruinous, that a person may, in many places, enter over them on horseback. The bridge is in an equally deseneck's state; a ruinous battery, with one dismounted cannon, is all that remains to shelter it. Some cannons before the palace of the Pacha, are good for nothing but to return the salute of ships which enter the harbour. This palace is but an indifferent building, like the houses of the other Pachas through the Ottoman empire. In the city, however, are several fine buildings of coral stone. But the other houses are slight wooden fabrics, like the ordinary dwellings of the Arabs through the country. The city is entirely destitute of water. The inhabitants have none to drink, but what is collected by the Arabs, in reservoirs among the hills, and brought by them from thence upon camels.

All of distinction here dress nearly as the Turks in Cairo; but the poorer fort wear only a shirt without breeches. The Bedouins in the neighbourhood wear only the Ibbraun upon their loins. The dress of the women among the lower ranks is the same which is worn by the Arabian females in general; large drawers, a flowing shirt, and a veil. Many of the poorer people are employed in fishing, by which they seem to earn but a bare subsistence.

The country lying immediately around this city, is sandy and barren. If one may believe tradition, these regions have undergone no change since the creation; for the tomb of Eve is still shewn in a spot at no great distance from the sea. But, M. Niebuhr remarked some sure indications of the sea having receded from the surface of the land here as well as in other places. At a certain distance from the shore, are hills entirely composed of coral-rock, and having a perfect resemblance to the banks of coral lying along the coast.

As he was walking by the harbour, he had an opportunity of observing a singular practice, which the Arabs use for taking up wild ducks. The person who is in search of the game, strips, puts sea-weeds upon his head, and approaches the bird. The duck, not being alarmed at the sight of the sea-weeds, flirs not till the Arab seizes it by the feet.

Jidda has always been a part of the dominions of the Sheriffe of Mecca. A Pacha is sent by the Turkish Sultan to this city, but he is not the absolute sovereign, for the supreme authority is shared between the Sheriffe and the Turkish Governor, which latter is changed every year, and sometimes refuses to obey the Pacha. Though the trade of Jidda is considerable, yet this city is no more than a mart between Egypt and India. No money is coined in this province; the specie current is all foreign, and the same as at Constantinople and Cairo.

C H A P. IV.

Departure from Jidda—Description of the Vessel in which they take their Passage—Their Voyage—Anchor near Oufide—Port within Sight of Hali—Interview with some Arabs—Stop at a Mountain called Komeid-el-Hali—Lobeia—Adventures there—Description of the Place—Inhabitants, &c.—Departure—Route by Tehams—Country Observations.

IT being their intention to proceed immediately to Yeme, nothing detained them at Jidda but the prevalence of the north wind, which kept back the arrival of the ships going thither for coffee; for there were none else with which they could continue their voyage to the south of the Arabic gulf. At last, some of those vessels arrived in the beginning of December; and they were advised to take their passage in a ship from Maskate bound to Hodeida, for a cargo of coffee.

They went in haste to see this vessel, but were not a little surprised to find it more like a hoghead than a ship. It was only seven fathoms long, by three in breadth; it had no deck; its planks were extremely thin, and seemed to be only nailed together, but not pitched. The captain wore nothing but a linen cloth upon his loins; and his sailors, who were nine in number, and all black slaves from Africa or Malabar, had nothing to cover their nakedness, but about an hand's-breadth of linen, bound upon their haunches with a cord. Being persuaded not to believe at appearances, they agreed with the master, for their passage to Hodeida; as the Arabs of Maskate are esteemed good sailors, and manage their sails like European mariners; but the subjects of the Inam are very unskillful navigators, and use mats for sails, which it is very difficult to manage.

Their first intention had been, to go straight by sea to Mokha, as they hoped that some English vessels might be found there. But they were told, that this passage would be extremely tedious, and that they might travel more agreeably by land, and could meet with no molestation in the dominions of the Inam. However, the danger of living among Arabs, whom they represented to themselves such as those whom they had seen in the desert, still dwelt upon their imagination. But their friends considered them, that their fears were groundless; and they were accordingly determined to land at Lobeia, or rather at Hodeida, as they should thus begin the passage to travell to Aden, the Cape. The Kapt gave them leave to go to Hodeida, or governors of Hodeida and Hali. For a little while he wants to whom they had been recommended, gave them others to take of the passage to Hodeida, and the two cities. The Paeba gave orders, that the passage should pass unexamined. They had freighted the vessel for themselves, and set out on their journey laden with goods. The merchants, who took care of them, that they should be little necessary for board. A small quantity of provisions, such as rice, which they had brought with them, was divided equally for their use, and a bed upon which they might sleep if they could. Beds of mats occupied every place else, except one in the middle, which served as a kitchen. It was impossible for them to wait or take the least rest or coffee. Mr. Chamberlains watch the night between the boards. A mat of branches of trees, which was spread all over the bottom of the vessel, to keep the goods dry. It was found unadvised, when they reached Hodeida; a circumstance which proves that the powder of those vessels is more closely joined together than one would at first imagine.

They set out from Jidda on the 14th of December, and their captain ordered the practice of calling anchor every night; although the banks of coral are less numerous in the Farhein, than in the southern part of the Arabic gulf. If they had seen few towns, or villages between Suza and Jidda, they saw not more between Jidda and Lobeia.

Their voyage was uniformly safe and pleasant. They observed some flying fishes, which the Arabs

call sea-loccusts. On the sixth day of their voyage, they overtook a vessel belonging to Hodeida, which had sailed from Jidda three days before them. There was an influence of the flow sailing of the ships of Yeme, whose mat-sails receive little wind, that of the Arabs can scarce get out of the harbour. They saw also several small vessels, which proceeded in a manner, as to shew themselves to be managed by men of much more spirit than the Turkish sailors.

After seven days sailing, they anchored near Oufide, a considerable city, but consisting merely of huts. It belongs to the Sheriffs of Mecca, and is governed by one of his officers, who lives in the middle, at some distance from the city. The Sheriffs sends daily between the ville and the town, in order to attend the receipt of the customs. All the ships which are employed in carrying coffee to Jidda, anchor here, and pay a duty to the Sheriffs. There are under no necessity of stopping on the way, and the crew, however, wish to go on shore, they may obtain a general permission for the payment of their crowns.

The next morning after their departure from Oufide, where they stayed only one day, they sailed within sight of Hali, where the Sheriffs of Mecca keeps a garrison. This city is upon the coast of his dominions, and upon the border of the passage of Hedjra. The neighbouring Arabs belong to Yeme.

As their captain needed provisions, they had an early opportunity of forming acquaintance with the independent Arabs, who live between the dominions of the two Sheriffs of Mecca and Aden. They are governed by a Sheriff, who professes a religion which differs from that of the other Bedouin tribes, and is called Malomet. The Sheriff mentioned, that if the people of the country were to appear in the clothes of travellers, the reputation of their ship captain, therefore, was a great advantage to him. He thought it best to send a different shirt to the Sheriff, and went on shore to see the Sheriff. Some men, who had been to see the Sheriff, instead of a turban, they wore only a flannel cap, and a head, to contain the hair; and a cloth upon their head, to cover their eyes. Conceivably, the Sheriff of our Europeans to be expressive of respect, and to shew that they were down their faces, and that they had nothing to fear.

As they wished to purchase provisions, they went on to their tents. As they approached, two men came out to meet them, and hospitably offered them of the Sakeeds, who kill their heads with their hands, and wear upon their heads a yellowish brown, and who were almost naked, and had their faces blacked with lead ore; and some black spots impressed, as ornaments, upon their cheeks, and chin. Those beauties, whose complexion was a yellowish brown, and who were almost naked, and had their faces blacked with lead ore, and some black spots impressed, as ornaments, upon their cheeks, and chin. They were not a little surprised, that they had gotten to the tents, with their faces blacked, which they might have been enabled to get rid of, if they had been more civilly treated, and to give them bad bread with their daunties. They were not displeas'd, their paying them before-hand. Although the Sheriff in the desert, they seemed to our people more civil than most of the other Bedouin tribes.

The next day, after this interview, they had their tents mounted

mountain called Konembel, situate in the middle of the sea, and said by the Arabs to have been originally a volcano. It may possibly be the remains of that burning island which is placed by Arrian and Ptolemy in these latitudes. They saw, likewise, not far off, the city of Gesfan, situate upon a tongue of land, on the coast; but they did not venture to approach it; for the Sheriffe to whom it belongs bears the character of being inhospitable to strangers.

They arrived in the harbour of Loheia, December 29, and call anchor within a league of the town. Dola, or Emir, is the title which the Arabs give to the governors of cities. He of Loheia was an Emir, and his name was Farhan. He was a native of Africa, and entirely black; but had been brought into Arabia in his youth, and sold to a man of rank, who was since dead, after having occupied one of the first offices in the service of the Imam. He had given young Farhan a good education, and had obtained for him a small office, in which he gave so much satisfaction, that his merit soon raised him to be Dola of a considerable city.

Our travellers found him to possess the dignified politeness of a nobleman, the strictest integrity, and the candid benevolence of a true friend to mankind. They explained to him their situation; and told him that they were Europeans, and wished to go by Hodeida to Mokha, where they hoped to find some English ships, in which they might take their passage to India; but being strangers to the country through which they were to travel, had brought a letter to him from the Kiaja of Jidda, and another from one of the principal merchants in Jidda to Machesen-el-Makkawich, the chief merchant in Loheia. The Emir had known a good many Europeans, or Franks, at Mokha, but had never before seen any arrayed in the garb of the East, which is, however, universally worn by the Oriental Christians. The Mussulmans regard Christians with greater esteem than those of any other religious community except their own. When they were asked, therefore, by Emir Farhan, whether they were Franks or Nazarites, they replied that they were both; fearing that he might perhaps take the Europeans for Pagans. Machesen, the merchant was then sick; but the Emir lent for his clerk to receive the letter addressed to him.

Hitherto, this governor had known no Europeans but India merchants. I was surprised, when he understood, from the letters, that one of our travellers was a physician; another in search of plants; and a third, an observer of stars. Struck with this singularity, and supposing that they might not be in very great haste, he proposed to them to stay some time at Loheia, offering to send them to Mokha upon his own camels. Machesen, the merchant, who needed a physician, earnestly invited them, at the same time, to take up their lodgings in one of his houses.

They were delighted thus to find the Arabs more civilized the further they proceeded from Egypt, and to meet with so polite a reception among the people who were the objects of their inquiries. They were still more delighted to find that people themselves contributing to afford them opportunities of traversing their country unsuspected. To hide their joy at the proposal, they expressed their fears of danger in travelling so near the seat of the war between the Scheich of Mekkrani and the Sheriffe of Abut-Arisch. But the Emir assured them, that they should be safe from all danger at Loheia, and might travel in full security through the whole territories of his master the Imam.

They no longer hesitated to quit the vessel. The captain, not having taken the precaution to exact payment for their passage, when they came first on board, now applied to the governor, begging him to compel them to pay in full for their passage to Hodeida. The Emir generously replied, that he would pay his demand from his own purse, if they refused; and the merchant Machesen made the same promise. They did not put the generosity of their Arabian

friends to the trial; but felt themselves deeply indebted to them for their offers and services.

When they spoke of the conveyance of their baggage to the shore, the Emir sent his own boat for it; and, to spare them all trouble, directed the merchant's clerk to satisfy the officers of the customs. In the evening, he sent them an excellent sheep, as a present of welcome, and accompanied it with a letter, in which he called them his guests, and assured them of his friendship. His boat having only mat-fails, moved so slowly, that they could not bring all their effects on shore in one day, which gave them some concern, lest they might lose what remained behind, or be robbed of what lay on the shore. The Emir understanding that they were uneasy upon this head, immediately sent some soldiers to guard their baggage.

They passed the night on the shore, whither their good friend Machesen, who very naturally supposed that their cooking utensils must be yet in confusion, sent them an excellent supper. Nothing was wanting but wine; and their stock of bad brandy, which they had brought from Jidda, was by this time finished. They might have supplied themselves with wine, and other liquors, from the Jews of Sana, who manufacture large quantities of those articles: but then they should have been obliged to carry them in copper vessels, which would have rendered them noxious to the health. They offered them a sort of bowza, which they found nauseous. They were therefore obliged to content themselves with the prospect of living without strong liquors of any kind for some months.

Their trunks were carried next day to the custom-house: they were opened; and they were afraid that they might be strictly examined. But the custom-house officers behaved with great civility. The Emir's attention was fixed upon their instruments solely, and he seemed anxious to understand the use of them: they therefore explained to him whatever he wished to know.

The house assigned them for a lodging was built in the Eastern fashion, with a square court in the middle. There was not one well-furnished room in it; yet it consisted of several distinct apartments, into which the entrance was through an open gallery, which extended all around it. This lodging was far from being elegant, in comparison with the splendid inns in Europe; but in Arabia, it was both elegant and commodious. At first, their court was constantly filled with crowds of people, curious to see them. This they found troublesome; and therefore hired a porter, who suffered none to enter, but persons who had business to transact with them.

The territory of Loheia is arid and barren. The harbour is so indifferant, that even the smallest vessels are obliged to anchor at a great distance from the city: and when the tide is at ebb, laden boats cannot approach near it. Notwithstanding this disadvantage, a considerable trade in coffee is carried on from Loheia; the coffee is brought from the neighbouring hills, and exported in one large heap for sale. This coffee is not reputed to be so good as that which comes from Bout-el-Fakih, and is shipped at Mokha and Hodeida. But coffee is to be purchased here upon more reasonable terms; and the carriage to Jidda costs less. On this account, several merchants from Cairo live at Loheia, and others come annually hither to make purchases of coffee. In this city, are also forty poor Banians, employed in different trades.

Loheia, although without walls, is not entirely defenceless. Twelve towers, guarded by soldiers, stand at equal distances round it. These towers resemble those in some of the imperial cities of Germany; the height of its gates renders it necessary to climb upon them upon ladders. In Turkey, and even in Europe, it would have been dangerous to approach near such fortifications, in order to examine them. But the Arab guards sat smoking their pipes, and drinking Kifeher, and gave M. Niebuhr no interruption in his walks about them. Some of the officers even invited him to sit down and partake of their refreshments.

They put many questions to him concerning the military skill of the Europeans, and seemed to be surprised at what he told them.

Several of the houses in Loheia are built of stone; but the greater part are huts constructed in that fashion which is common among the Arabs. The walls are of mud mixed with dung; and the roof is thatched with a sort of grass which is very common there. Around the walls, within, are a range of beds made of straw, on which, notwithstanding their simplicity, a person may either sit or lie commodiously enough. Such a house is not large enough to be divided into separate apartments; it has seldom windows, and its door is only a straw mat. When an Arab has a family and cattle, he builds, for their accommodation, several such huts, and encloses the whole with a strong wooden fence. The population of the cities of Arabia, therefore, cannot be proportionate to their extent.

Lime is prepared in the neighbourhood of this city, by the calcination of coral from the sea, in the open air, and without a furnace. In the larger shells, when they were broken, our travellers often saw oblong shells, with the animal still alive within them. These seas abound in beautiful shells and uncommon fishes.

The water at Loheia is very bad, and is brought from a distance. The common people drink from a well, which is a league from the city. The bell water, which, however, cannot be pressed as good, comes from two leagues and a half distance. As wheeled carriages are unknown here, this water is carried upon camels or asses; not in skins, as in Egypt and Turkey, but in earthen jars, a number of which hang upon each side of a camel. Within two leagues of the city is a small hill which affords considerable quantities of mineral salt. The inhabitants seemed to be curious, intelligent, and polished in their manners. All were eager to see the Europeans, and the wonders which they performed. After our heroes had employed a porter, those who had no other pretext upon which they might obtain admission to them, pretended to consult their physician. One asked him to feel his pulse, and to tell him what medicines or regimen he stood in need of; while another inquired, how it came that he could not sleep?

Two Arabs came, one day, to see them eat. The one was a young nobleman of Sana, who had received a good education; the other a man of some consequence, from the province of Hachan, where few strangers are ever seen, and the greatest simplicity of manners still prevails. When M. Niebuhr invited them to dine with him, the latter earnestly replied, "God preserve me from eating with infidels who believe not in God." When he asked him some particulars concerning his country, he replied, "What is my country to you? Do you want to conquer it?" He was astonished at every thing he saw, their spoons, their plates, their forks. He asked some simple questions which excited laughter. He then went out in a passion, and his companion from Sana had some difficulty to persuade him back. When he came back, he saw whole fowls before our travellers, which surprised that sober Arab not a little, as he imagined that they had eaten too much before. When, at last, he saw Mr. Van Haven about to carve one of these fowls, he stepped forward, and seized him by the arm, saying, with a peevish tone, "What! wilt thou eat that?" He then went out in a rage, and would not return. The young man from Sana apologized for him, and begged them to excuse the simplicity of his countryman.

Our hero and Mr. Baurenfiend sometimes diverted themselves with playing on the violin, which led such as happened to overhear them, to think them musicians. A rich merchant sent for them, to come with their instruments to his house. They refused, because the Arabs look with contempt upon musicians by profession. The merchant, being old, and not able to walk so far, mounted an ass, and came with two

servants supporting him, to their house, in order to gratify his curiosity, by seeing and hearing them. He was very polite, and assured them that he had no aversion to Christians; for, a diversity of religions was tolerated by God, the Creator of all. After some conversation, he expressed a wish to see their violins, and hear them play upon them. They played some solemn tunes, which are more to the taste of the Orientals than gayer music. He seemed to be pleased, and offered each of them half a crown at parting. The Arabs refuse no presents, however small, and he was not a little surprised when our travellers declined accepting his money; especially as he could not conceive what inducements any person could have to learn music, if not to gain by it. This merchant was one of those few who wear their beards dyed red; a custom which seems to be disapproved by the more judicious Arabs. His reason was, that a red beard was handsomer than a white one; but others said, that he had the weakness to think to conceal his age by this silly disguise. He told M. Niebuhr that he was above seventy years of age; but his acquaintance affirmed that he was ninety. They had observed of the Mussulmans in general, however, that they seldom know their own age exactly. They reckon by the most remarkable incidents in their lives, and say, "I was a child when such an event happened, or when such a one was governor of the province or city."

The women of Loheia wear large veils in the street, which cover their countenances to entirely, that only one of their eyes can be discovered, and that but imperfectly. Yet they make no difficulty of unveiling before strangers, as they pass, especially if they happen to think themselves pretty, and are sure that they are not observed by any of their countrymen.

After examining all that seemed worthy of notice in the city, and its neighbourhood, our adventurers became seriously conversant with their political constitution of the other parts of Yemen. It was in vain that they should assign a reason for their curiosity; but their carelessness to deny it, was soon learned by the natives. One who was arrived in the city, but they were not acquainted with him, and he had been some time in the city, they had some common business transactions with them, and they were newly arrived, upon which account they inquired of Mr. Baurenfiend, what he thought of the matter, and after relating there a short time, to conclude their journey to Mokha. He answered, that they were largely disappointed with their entertainment at Loheia, otherwise they would not think of returning so soon; and yet no governor could take more concern to serve them than he. After convincing him that they were actually under a necessity of setting out for Mokha, they prepared for their departure.

When they went to take leave of their friend Emir Fathan, he was indisposed, and they could not see him. But when he heard, that they had determined to set out, he desired that they would come to him very late in the evening. They found him in company with several Arabs. A piece of silk, with twenty crowns, he made a present to their physician; and other crowns he pressed them to accept, in order to pay the hire for their asses and camels. He and his company testified the strongest surprise, when they saw them refuse the money, for instead of refusing, Turkish travellers are ready to demand such gratuities.

They were unwilling to be burthenome to the Arabs, and would therefore accept of nothing from them, without making a recompense. They made the Emir a present of a watch, which, having never before had one of his own, he knew not how to manage. A merchant from Cairo, who was settled at Loheia, promised to wind it up every day. They parted with sincere regret from this good governor.

They hired camels for their baggage, and horses for themselves. In Arabia, Christians are not prohibited the use of horses; but these can rarely be had for hire. The usual mode of travelling here, is upon asses; which in this province are large, strong, spotted, and

and walk with a pace, not the most pleasant to the rider.
Travelling being as little exposed to danger in Yem-
men, as in any other country in the world, they did
not need to wait for the setting out of any caravan.
They therefore left Loheia alone, on the 20th of Feb-
ruary 1793, sending the camels before, and follow-
ing them within a few hours upon their asses.
The territory of Yemen is naturally divided into
two distinct provinces. That part which borders on
the Arabic gulf is a sandy plain, which, as it spreads
backward, rises by a gradual ascent, into hills, and
terminates in a lofty range of mountains. The plain
is called T'ehama. They had to cross it in their way
to Beit-el-Fakih.
In the first day of their journey, they travelled
through a parched and barren tract of country, along
an arm of the sea, which penetrates a considerable
way into the land. They rested in a coffee-house
situate near a village. Mokeya is the name given by
the Arabs to such coffee-houses, which stand in the
open country, and are intended, like inns, for the
accommodation of travellers. They are mere huts,
and are scarcely furnished with a Serir, or long seat
of straw ropes; nor do they afford any refreshment
but Kischeh, a hot infusion of coffee-beans. This
drink is served out in coarse earthen cups; but per-
sons of distinction carry always porcelain cups in their
baggage. Fresh water is distributed gratis. The mas-
ter of the coffee-house lives commonly in some neigh-
bouring village, whence he comes every day to wait
for passengers.
After a journey of six German miles, they arrived
by midnight, at a large city in which a Sub-Dola re-
sides, with a few soldiers. Emir Farhan had given
them a letter to the deputy-governor, with an order
to the inhabitants to supply them with a sheep, which,
however, they did not choose to accept. But they
came afterwards to understand, that the inhabitants
had been obliged to pay a sum of money equivalent
to the value of the sheep, which had been shared be-
tween the Sub-Dola and a servant of the Emir's who
accompanied them upon business of his own. In the
other villages through which they passed, therefore,
they made no difficulty of accepting the sheep which
the Emir had ordered them.
Through the whole country, they found water
scarce and bad. But they met with many large vil-
lages, less distant from one another than they should
have expected in so barren a plain. Menegre is one
of those villages, of which they were led to take par-
ticular notice, by finding in it the first Mansale that
they saw. This is a house in which travellers are re-
ceived and entertained gratis, if they will be content
with such treatment as is usual in the country; they
are all lodged in one common apartment, which is
furnished with a Serir, and are served with Kischeh,
hot millet bread, camels milk and butter. When the
master of this Mansale understood that some Europe-
an guests were arrived, he came to see whether his
servants treated them properly; and was going to kill
a sheep for their entertainment, if they had stayed
longer. He caused wheat bread to be baked for them,
which is in this province very rare; and made them
bring cow-milk, when he saw them nauseate the vil-
lity of the camel's milk. The Arabian servant told
M. Niebuhr that he might be disoblged, if he should
offer any compensation for his kind hospitality; but
the attendant who served them with those things, took
an opportunity, in a place where he could not be seen
by his master, to ask a small gratuity.
At Dabhi, a large village, where is a mosque, the
tomb of a saint, and several houses built of stone, they
stayed a whole day. Near this, they saw a tannery,
and a manufacture of earthen ware, which is prepared
in the open air, and without a furnace. They saw,
likewise, indigo manufactured here; it is sold at a
cheap rate, but is of a bad quality. Much of this dy-
ing stuff is used here; for the women, among the
common people, wear blue shirts and drawers.

From this village, there is a direct road leading to
Beit-el-Fakih. But the tract of country through
which it passes, is extremely arid, and almost unin-
habited, and affords scarcely any water. They there-
fore preferred a longer road, nearer the mountains,
and found reason to be pleased with their choice; for
they met with several small woods, a number of vil-
lages skirted with bushes, and many wells, which were
from an hundred and sixty, to an hundred and seven-
ty feet deep; but happily for both men and beasts, dug
in sloping ground; for, as the water is to be raised by
a cord dragging a leathern bucket, this is more easily
accomplished in a going down hill, than if the ground
were barely level, or an ascent were to be climbed.
They passed two large villages, under the jurisdic-
tion of the governor of Beit-el-Fakih; but in neither
of these did any thing remarkable offer itself to their
observation. But in two places upon this journey,
they saw spots scattered with small villages, bearing
all the same name; from which they were led to think
that some small detached tribes might have settled,
each in a particular district of this province. They
passed also two of those vallies so common in Arabia,
which, when heavy rains fall, are filled with water,
and are then called rivers, although perfectly dry at
other times of the year.
After resting a night in one of those wretched cof-
fee-houses, they arrived, in the morning of the 25th
of February at Beit-el-Fakih, and had their trunks
sent immediately to the custom-house; but they were
not inspected till noon, and then in the presence of
the Dola. They, in the mean time, delivered letters
of recommendation from Macheden of Loheia, to
Ambar Seif, one of the principal merchants in Beit-
el-Fakih. This worthy man received them in a very
obliging manner, hired them a house, saw their effects
carried thither, and invited them to dine with him,
till they could have matters put into order in their
own habitation.
The city of Beit-el-Fakih is situated on a plain,
which, although far from being naturally fertile, is,
however, carefully cultivated. The houses join not
one to another, but are built separate. Many are of
stone; and the mode of building is every day improv-
ing. In the city of Beit-el-Fakih is a citadel, which
is thought of the utmost importance in a country
where armies are without artillery.
The house which our travellers occupied was a
building of stone; but the proprietor had been dis-
lodged by a species of ants, named by the Arabs,
Aid. These ants, which are well known to naturalists,
form covert ways, through which they introduce
themselves into houses, where they destroy equally
cloths and provisions of all kinds. They are not less
troublesome in gardens, where they also form their
covert ways, between the root and the top of trees,
wasting the sap, and devouring the buds and the ex-
tremities of the branches. Their chambers were full
of them. They took the measures which are ordina-
rily employed, to quit themselves of them: destroying
their cells and passages several times successively. The
insect indeed restores these with amazing rapidity, es-
pecially in the dark; but it at length yields. On their
way hither, they had observed a number of bushes
covered with earth, in which was a vast quantity of
galleries formed by those little animals. The shrub
which they had attacked in this manner was always
withered.
The city of Beit-el-Fakih is not of ancient origin.
It has existed only for some centuries; and, like
Loheia, owes its rise to a saint, called Achmed-iba-
Musa, from whom it has derived its name; Beit-el-
Fakih meaning the house or dwelling of the sage.
The tomb of that saint is shewn without the city, up-
on a sandy hill, where a fine mosque has been reared.
At first, some devout persons built themselves cot-
tages round the tomb. The harbour of Ghalefka was
about the same time choaked up; and the inhabitants
of that city, for the convenience of trade, then re-
moved a their effects to the vicinity of this tomb,
and

and settled about it. When it had thus become a considerable city, the lord of the territory built a citadel for its defence, in a place where water had been found. The city is now nearer the tomb: and the vicinity of the tomb is almost deserted.

So modern a city cannot contain many antiquities of an intertelling nature. Yet M. Niebuhr copied here an ancient Kufic inscription, in the presence of many spectators, none of whom suspected him, as the Egyptians had done, of any intention to seek out and pilfer their treasures. They were all very obliging, and especially the Schieche, or learned Arabs, who seemed pleased that strangers should shew a desire to acquire their language. In this city, as well as in Loheia, he obtained much information from a class of Arab literati, who often visited them. These are denominated Fakih, and no where through Arabia do their circumstances appear to correspond to their merit.

The city of Beit-el-Fakih is in a favourable situation for trade; being only half a day's journey from the hills in which the coffee grows, and but a few days journey from the harbours of Loheia, Hodcida, and Mokha, from which this commodity is exported, it naturally becomes the most considerable mart for it. This trade brings hither merchants from Egypt, Syria, Barbary, Persia, Habbesch, India, and often from Europe. Here are also, as in all the other great towns in Arabia, a number of Banians, all of them natives of Diu, who are allowed the free exercise of their religion. Yet they dare not bring their women hither, nor burn their dead: and these prohibitions induce them to return to their native country, as soon as they have accumulated a little fortune.

Beit-el-Fakih is the residence of a Dola, whose jurisdiction extends over a large district. This Dola seemed to take little concern about our travellers, and his indifference left them more at liberty than they had been at Loheia; for, unincumbered with attendants, and unmolested with civilities, they travelled about the country whenever they liked.

Thus enabled to travel in safety through all Tehama, M. Niebuhr first resolved to go by Ghalefka, and perform this expedition in as simple a guise as possible, and without any appearance of splendour or opulence that might prove a temptation to robbers. He hired an afs; and its owner agreed to follow him as his servant, on foot. A turban, a great coat wanting the sleeves, a shirt, linen drawers, and a pair of slippers, were all the dress that he wore. It being the fashion of the country to wear arms in travelling, he carried a sabre, and two pistols hung by his girdle. A piece of an old carpet was his saddle, and served him likewise for a seat, a table, and various other purposes. To cover him at night, he had the linen cloak which the Arabs wrap about their shoulders, to shelter them from the sun and rain. A bucket of water, an article of indispensable necessity to a traveller in these arid regions, hung by his saddle. He

had for some time endeavoured to suit himself to the Arabian manner of living, and now could spare many conveniences to which he had been accustomed in Europe, and could content himself with bad bread, the only article to be obtained in most of the inns.

March the 7th, he set out from Beit-el-Fakih; and, before he had travelled a mile, saw several villages; but, upon all the rest of the way to Ghalefka, which is four miles and a half, he perceived not a single dwelling, nor any mark of human industry, but a few wells. For the two last miles, the way lies through so sandy a tract, that his guide often lost himself; such are the continual changes which the wind produces on the scenery, by demolishing the hillock, carrying the sand about, and forming others. They were even obliged to turn several times out of what they knew to be the true direction, in order to avoid being buried in some of those hillocks which were then forming. Ghalefka is at the same distance from Zebid as from Beit-el-Fakih. It was once a famous city; and the sea-port town of Zebid was then in an equally flourishing condition. That harbour is now filled up, so that no ship, of however small burthen, can enter it: not only has the sea receded, while the banks of coral have been augmented, but a quantity of sand has been here accumulated by the winds, which actually rises into a hill of considerable height. The ruins of a mosque are still to be seen here, which was dedicated to a saint, who, as is said, by his prayers, obtained from Heaven an excellent spring of water, for which the inhabitants believe, that they ought still to be grateful to him. About a score of cottages now hold all the inhabitants of this once flourishing city; and dates, with the milk and flesh of a few sheep, are all the provisions they have. The sea affords them no fish, nor any thing else, but salt, of which every person may have as much as he pleases, upon paying a small fee to the Dola of Beit-el-Fakih's secretary.

In a burying place near this poor village, M. Niebuhr found two stones bearing Kufic inscriptions; one of them was large, and stood on end; the other lay flat upon a tomb, and was but small. The inhabitants could not comprehend for what reason he was so eager to copy the inscriptions from the larger stone; but when he returned next day to do the same for that upon the smaller stone, he found it to have been carried away in the night. He applied to the Hakim or judge of the village, and offered him a trifle if he could procure him another sight of it. The judge led him through many turnings and windings to a poor hut, in which was the tomb of another saint; and there they found the stone that our hero was in search of; by his account of the matter, it had not been hidden by the inhabitants, but the saint had brought it thither himself. Notwithstanding the saint's care of it, the Hakim offered Niebuhr this stone with him to Beit-el-Fakih, if he would be at the expence of having it conveyed.

M. NIEBUHR now left Ghalefka, with his afs and the owner. He arrived the same evening at Hodcida, which is about five German miles distant from Ghalefka.

The harbour of Hodcida is somewhat better than that of Loheia. Yet large vessels cannot enter it. The Dola of Hodcida is accountable only to the

Imam. But his jurisdiction is confined to this city. His revenues consist in part of the duties upon coffee exported. The mansion of the Dola, the custom-house, and the houses of the principal merchants are stone buildings; the rest of the town consists of huts built in the ordinary style. Near the sea, stands a small citadel, which could not prove a very strong defence.

defence. This city has also its patron faint, Sheeh Sddik, who is honoured with due veneration.

At Hodeida, our hero found his friends Van Haven and Cramer, who had come hither to deliver two letters of recommendation, from their friends in Jidda to the Dola, and an eminent merchant in this place. They had been received, lodged, and treated in the kindest manner. But M. Niebuhr not being disposed to lose his time in visits, returned on the 9th of March, to Beit-el-Fakih.

On the road our traveller found a number of coffee-huts, but very few villages. A mile and a half from Hodeida, there is a well of excellent water, which is carried to that city for the use of the inhabitants; the water which they have nearer being very bad. As M. Niebuhr approached Beit-el-Fakih, he passed through some paltry villages; and arrived at his place of destination, on the same day upon which he had set out. The distance between Beit-el-Fakih and Hodeida, is, by his estimation, seven German miles; and his journey he performed in one day, under the most scorching heat and upon an hired ass.

Having found the Arabs very civil, and having met with no disagreeable accident in his first excursion, he was impatient to set out again. Accordingly he departed for Zebid on the 11th of March, to see the remains of that famous city, which was once the capital of Tehama; and to investigate some ancient inscriptions which were said to be concealed at Tahate, a small town in that neighbourhood. An Arab, who was learned, but poor, accompanied him in this expedition, and was glad of the opportunity of visiting an old friend at Zebid, without expence. Our hero was no less pleased to have him for the companion of his journey, as his conversation was very entertaining.

After passing by several coffee-houses, and through some small hamlets, they came to a large village called El-Mahad, standing in a beautiful valley which receives the waters that fall from Mount Reima. In the rainy season, these waters form a river which spreads into several branches, and fertilizes the adjacent lands. A large quantity of indigo grows in this valley. In this neighbourhood, too, there stood anciently a considerable city, called also El-Mahad; but of it no vestige now remains.

Near Zebid are some heaps of stones, which are said to be a part of the ruins of another large and ancient city that was called El-Haud. Our hero arrived early in the morning at Zebid; having travelled in a short time five German miles, which is the computed distance between this town and Beit-el-Fakih.

Zebid is situate near the largest and most fertile valley in all Tehama. It was dry when M. Niebuhr visited it; but, in the rainy season, a large river runs through it, and being, like the Nile, conducted by canals through the neighbouring fields, communicates to them a high degree of fertility. This was once the residence of a sovereign's residence, and the most commercial city in all Tehama. But, since the harbour of Ghalefka was choked up, its trade has been transferred to Beit-el-Fakih and Mokha; and this city now retains nothing but the shadow of its former splendour. Viewed from a distance, it appears to some advantage, by means of the mosques and kubbets, of which it is full. Several of those mosques were erected by different Pachas who reside here, during the short period while this part of Arabia was in the possession of the Ottoman Porte. At Zebid pays dear for its exterior magnificence; its inhabitants are impoverished by the numerous clergy belonging to those foundations, by whom the wealth of this place is almost wholly engrossed. M. Niebuhr was told, as a matter of certainty, that the whole revenue of the territory he considered is divided into five parts, the clergy receive three of these, the Imam one for the taxes, and the inhabitants have only one-fifth remaining for their maintenance. The Turks have left here one

useful monument of their power; an aqueduct, which conveyed water from the hills into the city. But this work has been so long neglected, that only its ruins now remain, and the inhabitants are obliged to content themselves with water from their draw-wells; which is fortunately not bad, and in such plenty as to water many fine gardens that are to be seen in the neighbourhood of the city. Abulfeda ascribes eight gates to Zebid; but of these, only five are now standing, and the river is gradually breaking down a part of them. The walls of the old city are demolished, and the very ruins are sold by poor people who gather out the stones, and sell them for building new houses. The present buildings occupy about one half of the ancient extent of the city.

Zebid is still distinguished for an academy, in which the youth of Tehama, and of a part of Yemen study such sciences as are cultivated among the Mussulmans. This is, besides, the seat of a Dola, a Musti, and a Cadi, of the sect of Schafey; and of two other Cadis of the sect of Zeidi, to which the Imam and the greater part of his subjects profess to belong.

The vainest and most foolishly loquacious man our hero ever saw, he met in an inn. He was a Sheriff, or nobleman of the first rank; but, being poor and beggarly, travelled about the country, living at the expence of the more opulent professors of his religion. Having been in Egypt, Syria, and even Abyssinia, he boasted, that he could speak several foreign languages, although a few proverbs were all that he knew. Our traveller wished to obtain some information from him concerning the countries through which he had travelled; but he could tell nothing but the names of a vast number of Schiechs, Pachas, and Dolas, by all of whom he pretended to have been received with the honours due to a descendant of Mahomet. His son, a boy of ten years, who acted as his servant, never received any other name from him than Sheriff Achmet. The father had hired only one Serir for his son and himself together; whereas every other traveller who is not absolutely mendicant, hires here a separate coach, jult as separate rooms are occupied by different travellers in the inns of Europe. With all those airs of greatness, he often abused his son, and called him, "Dog, son of a dog."

When M. Niebuhr had finished his researches at Zebid, he and his friends set out on the 12th of March, and after a ride of two German miles, reached Tahate, which was once a town of some magnitude, but has now dwindled to a small village. The road leads still through Wadi Zebid, the vale or the bed of the river; in which the fields had a beautiful and rich appearance, wherever they had not been encroached upon and ravaged by the torrents. Much indigo is raised here; our hero counted more than six hundred large vessels, in which this colouring matter is prepared for sale. In this village are also several mosques and houses of prayer, reared over the tombs of faints or opulent persons. Ibn Hassan is the chief of the faints. His tomb is always illuminated by night with lamps; and one of his descendants keeps a Mansafe, or house of hospitable entertainment, in the village.

Niebuhr lodged in a common inn; but the master of the Mansafe came to invite him to his house, and when he found him unwilling to remove, sent him a good supper. Our hero was told, that the masters of Mansafe accept no money; but he of Tahate did not refuse a small gratuity.

Finding nothing remarkable in this village, they set out upon the 13th of March, for Beit-el-Fakih. They saw no houses by the way except the populous village of Murra, situate in the beautiful vale El-Mahad. In this village are many Kubbets, and a large Mansafe, in which thirty or forty people are daily entertained.

On the 14th, accompanied only by the owner of the ass upon which he rode, M. Niebuhr set out for Kahme, where he expected to find some remains of antiquity

antiquity in the ruins of the city Lelue. He passed by some villages; and, nearer the mountains, villages are indeed more numerous. He also crossed a vale, through which runs a river which joins the river of Rema. In the rainy season, the latter holds its course to the sea, and enters it near Schurem.

He went, immediately after his arrival at Kabbme, to search for the antiquities of Lelue. But he found only a large burying-place, filled with pentagonal stones, each eight inches in diameter, and four or five feet long. When he saw those stones, so uniformly of this regular figure, he was at first inclined to think, that they might have received it from the hand of art. But he soon perceived a hill in the neighbourhood wholly composed of pentagonal stones, where those people had found the seemingly artificial ornaments of their burying-place. The rocks of that hill are a pile of vertical columns, of the figure and thickness above-mentioned, rising one over another, as well as spreading for some extent, in a parallel body, and seemingly joined by a sort of flight cement. He saw some other piles of rocks of the same sort, in other places through Arabia.

After examining the few curiosities which Kabbme afforded. our traveller returned to Beit-el-Fakih, purposing soon to set out on some new excursions.

During M. Niebuhr's absence, Mr. Forkal had not been idle upon the hills where the coffee is produced, whither he had gone to prosecute his botanical researches. His description of that part of the country had already induced Messrs. Cramer and Baurenfeind to follow him: M. Niebuhr also resolved to join his comrades, that he might breathe cooler air, and drink better water. The space he had to travel was only half a day's journey; and, in the course of this, he met with nothing remarkable.

He soon came within sight of the small town of Hadie, situate upon one of the foremost eminences. The roads are very bad: a causeway was indeed formed by the Turks; but it has been suffered to fall away, without receiving any repairs. Neither asses nor mules can be used here: the hills are to be climbed by narrow and steep paths; yet, in comparison with the parched plains of Tehama, the scenery seemed charming; as it was covered with gardens and plantations of coffee-trees.

In the neighbourhood of Kabbme, our hero had seen only one small basaltic hill; but here, whole mountains were composed chiefly of those columns. The coffee-trees were all in flower at Bulgofa, and exhaled an exquisitely agreeable perfume. They are planted upon terraces, in the form of an amphitheatre. Most of them are only watered by the rains that fall; but some, indeed, from large reservoirs upon the heights, in which spring-water is collected, in order to be sprinkled upon the terraces; where the trees grow so thick together, that the rays of the sun can hardly enter among their branches.

Stones being more common in this part of the country, than at Tehama, the houses, as well of the villages, as those which are scattered solitarily over the hills, are built of this material. Although not to be compared with the houses in Europe, for commodiousness or elegance, yet they have a good appearance; especially such of them as stand upon the heights, with beautiful gardens and trees, arranged in the form of an amphitheatre, around them.

They passed the night at Bulgofa. Several of the men of the village came to see them; and, after they retired, they had a visit from their hostess, with some young women accompanying her, who were all very desirous to see the Europeans. They seemed less shy than the women in the cities: their faces were unveiled; and they talked freely. As the air is fresher and cooler upon these hills, the women have here a finer and fairer complexion than in the plain.

On the 10th of March, they returned downwards as far as Hadie, a place well known to the Europeans; who come hither from Beit-el-Fakih, to pass some time occasionally in this little town, where the

air is cool, and the water fresh and pure. It is, however, but ill-built, and has nothing else of consequence except its trade in coffee, which the inhabitants of the hills bring down upon certain days in the week. After the duties are paid to the Dola, the coffee is packed up and conveyed upon camels: either to Beit-el-Fakih or directly to Hodeida.

They enjoyed a singular and beautiful prospect from the house of the Sub-Dola at Hadie, and returned in the evening to Beit-el-Fakih, by the same way by which they had gone in their journey up the mountains.

They met with less difficulty in the prosecution of their researches at Beit-el-Fakih, than any where else through Yemen. The inhabitants of that city were no strangers to European manners, and knew that they could not, like them, rest constantly in one place. They were therefore nowise surprised at their excursions, but were fully satisfied when they told them, that the exercise was necessary for their health.

The preparations for their journey were easily made. They hired two asses, and the owner attended them on foot, as their guide, their servant, and occasionally their interpreter. They had already large beards in the Arab fashion; and these, with their long robes, gave them a very oriental appearance. To disguise themselves still more, each of them assumed an Arabic name; and, under these pretences, their real condition was so perfectly concealed, that even the owner of asses thought them Christians of the East; and had no suspicion that they were Europeans. In this garb, and attended by the ass-hirer, they set out on the 26th of March, from Beit-el-Fakih.

They passed through several villages in crossing the plain, and, after a journey of five German miles and a half, reached B. ba, where is a weekly Suk or market. Here they lay the first night.

Next day, after advancing a mile further, they entered upon the mountains. Near the first village, they observed a running stream, the first they saw in Arabia. Till it enters Tehama, this river is called Wadi Zebid. Its channel is very broad; but as no rain had for a long time fallen, the stream covered the breadth of twenty, or four and twenty feet. In this place it runs with a considerable current; but in Tehama it spreads into a shallow lake, and is lost among the sands.

The same day they passed near Mount Sullam, where, from the account given by an Arab who lived in the country, our hero had been led to expect that he should find hieroglyphics or inscriptions, cut upon the rock: but he found only some figures which had been impressed at an idle hour by some shepherd, and were as coarsely executed as those upon Mount Sinai. They lay at Machfa; this is one of the villages in which weekly fairs are held. The houses are still more wretched here than in Tehama. They have no walls, and consist merely of a few poles laid together, and covered with reeds. They could scarcely lodge in one of those huts; so small were they, that a person could not stand straight in the middle; and two persons lying together upon the floor, occupied the whole area of the house. It would not have held a single Serrir. The inhabitants sit and sleep upon the bare ground. The air being colder in this part of the country than in Tehama, the people here put on a bag upon their bodies when they go to sleep, and are warmed by their natural perspiration. In none of the inns, could they find any sort of food but coarse durra bread, made of millet with camel's milk; but the water is every where delicious.

The road by which they travelled is not much frequented by travellers. The ways are very bad and unsafe, and scarce a house appears upon any hand. Within these few years, however, they have become less dangerous than they were before. The lord of Udden has placed some soldiers with a Sub-Dola, at Machfa, who is responsible for the thefts or robberies that happen in his district. This regulation of the police has dispersed the robbers.

Schiech of the family of Aklan, to whom this district appertains. But, in the issue of the war, the Schiech was obliged to acknowledge the sovereign authority of the Ina and now no longer maintains troops.

Proceeding on their way to Tehama, they saw several villages, and crossed some small rivers. They passed the night in a detached coffee-hut: and even the master of it left them by night, and retired to a neighbouring village.

On the 4th of April, they travelled along bad roads, among hills, and crossed several times over the Wadi Suradsji, a considerably large and rapid river, even at that time, although no rain had fallen for a long while. They saw no village near, but several coffee-huts.

Continuing their journey, they passed through several small rivers, which appeared all to empty themselves into one large river. To the south they had a view of a large chain of mountains; but the only habitations that they saw in this hilly region, were a few inns. They came at length to a large village, containing many kubbets, and at no great distance from Hæs, where they arrived this evening.

The city of Hæs, twelve miles distant from Taæs, and situate in the Tehama, is small and ill-built. However, it is the capital of the district, and the seat of a Dola, who occupies a small fortress. A considerable quantity of earthen-ware is manufactured here, especially coarse drinking cups. This district is but of narrow extent, being bounded on one side by Zebid, and on the other, by the territories of the Schiech of Ibn Aklan.

They left Hæs on the 5th of April, and, after passing several villages and coffee-huts, arrived on the same evening at Zebid. They passed without wetting their feet, over the river Suradsji, which they had lately seen so large among the hills. But as they proceeded through the beautiful and cultivated plains which it watered, they perceived both the cause of its diminution, and the effects which it produced.

Their way from Zebid to Beit-el-Fakih was the same already described. They arrived at the latter city on the 6th of April.

Upon leaving the mountains, they felt the heat excessive. They halted to rest themselves at an inn in a village between Hæs and Zebid. There they were refreshed by an agreeable breeze, although all was calm and torrid without; for the walls being built of loose stones, the many chinks among which naturally admitted a current of air. They found this coolness a great refreshment amidst the burning heat which prevailed all around. Our hero imprudently sat down on the ground, without wrapping himself in his large cloak, and being faint, from the heat and fatigues of his journey, he fell asleep. This indiscretion cost him dear; he was in a violent fever before they reached Zebid, which continuing after his return to Beit-el-Fakih, rendered him unable to bear any fatigue.

On their arrival in this city, upon the 6th of April, they found Mr. Van Haven likewise indisposed. He had been attacked with a scurvy, and was weary of the mode of life to which they were confined. They had long wanted wine and brandy; they were disgusted from coffee, as being of a heating quality. Kifeher, although esteemed wholesome, is but an insipid drink; and through all Tehama the water is very bad. Their cook could procure them no such simple dishes of food as those used by the Arabs, a nation distinguished for temperance. Upon this account, they daily ate animal food, although their friends, who knew the climate better, had advised them to abstain from it. Their persisting in this, doubtless, greatly injured their health, and was, in a particular manner hurtful to Mr. Van Haven, who, except to sit down at table, never rose from his sofa.

The first day of Bairam happened this year to be the 14th of April. On this day the Dola proceeded out of the city with a multitude of attendants, to perform prayers in a large enclosed square area, in

the open air. This festival lasts three days, during which the Arabs indulge in festive amusements, and begin no piece of work, nor enter upon any journey.

On the 17th of April, they saw an insurrection at Beit-el-Fakih, of the coolness of temper, and firmness of mind, by which the Arab character is distinguished. The southern end of a house caught fire; and, as the wind blew strong from the south, a great part of the city was soon burnt down. The inhabitants, however, retained their usual tranquillity. No cries nor complaints were heard in the streets, and when addressed with expressions of condolence, upon their misfortune, they would calmly reply, "It is the will of God." Our travellers occupied a house with stone walls, in that part of the town which was spared by the flames; they went upon the roof, and saw the roofs of the other houses crowded with people, who were beholding the conflagration with the utmost indifference. A poor scholar, who used often to visit them, came, after removing his effects to a place of security, to see them, and, with an air of indifference, marked the instant when the flames reached his own house. When such an accident happens, indeed, an Arab does not lose much; as the fire approaches, he removes his goods, and takes refuge, either in a different quarter of the city, or in the open country. He thus loses nothing but his paltry hut, which is rebuilt easily, and at a small expense.

As soon as M. Niebuhr and Mr. Van Haven were sufficiently recovered to bear the fatigues of travelling, it was resolved, that their whole party should leave Beit-el-Fakih. They set out, therefore, on the 20th of April, and took the road to Zebid.

In Tehama, it has been observed, people generally travel by night, rather than in the day. But if they had regulated their journeys in this manner, Mr. Forskal could not have continued to examine and collect plants, nor could M. Niebuhr have surveyed the face of the country. Both, therefore, resolved to proceed forward by day, taking the owner of their asses to attend them, and to leave the rest of their party, with the servants and the baggage, to come up by night.

In consequence of this arrangement, they set out alone next morning, and passed through the plains contiguous to the river Zebid, and by the canals which are supplied from it. This beautiful tract of country is about two miles in breadth. The peasants were busy in cultivating the fields, and raising earthen dykes about them, to retain the water for a certain time, after which it would be conveyed into other fields, to water and fertilize them in like manner. From these fields to Mokha, hardly any villages are to be seen. The whole intervening country is dry, sandy, and covered with that coarse species of grass with which the houses are thatched here. On these sandy plains the heat is excessive: they were overjoyed whenever they could shelter themselves for a little, in any paltry coffee-hut.

On the second and third days of their journey, they saw nothing but coffee-huts, till they, at last, arrived in the large village of Manshid. They were there alarmed with an account of a skirmishing war between two families, in which a man had been killed on the day preceding. Our travellers were assured, that such private quarrels never interrupt the public tranquillity. When an Arab happens to be killed, his family may compromise with the murderer, for a sum of money, or may demand of the magistrate to put him to death; or, if unwilling to receive satisfaction in either of these ways, may declare a resolution of taking vengeance themselves upon the person of the assassin, or upon his relations.

In that same village, a Sub-Dola resides, with a few soldiers from the troops of the Dola of Hæs. Here, as at Zebid, a tax was demanded for each of our travellers' camels. By their agreement with the camel-driver, he was obliged to discharge all demands of this nature; but he contrived to shift this payment, by entering into a secret understanding with the officers

officers who were to receive it. They told M. Niebuhr, that he must either pay it himself, or suffer them to open and inspect his baggage. However, on his threatening to complain to the judge of the place, they desisted from their insolent pretensions. Thus the establishment of customs and custom-house officers, is every where a source of endless villanies and vexations.

They passed through two other villages and several more coffee-huts. They saw, near the road, a salt-work, from which salt is carried to the mountains upon camels. The whole of this way is over fands.

After a very disagreeable journey from Beit-el-Fakih, they entered the city of Mokha on the 23d of April. All who travel by land to Mokha, are obliged to enter by the same gate; and Europeans are under the humiliating necessity of alighting from their asses, and proceeding to their lodgings on foot. They therefore alighted while their baggage was inspected. Those who examined that, asked neither their names nor their passports, but directed them to a Kan, where Turks lodge, and where, as they supposed, they might possibly find some of their countrymen.

At the time of their arrival, there was an English merchant from Bombay in the city. They were unwilling to address themselves to him, lest he might think them vagrants of suspicious character. Besides, they had letters of recommendation from their friends at Jidda, Lohcia, and Beit-el-Fakih, to the Dola, to the English interpreter, a Banian in great credit, and to a merchant of the city, whose name was Seid Salek. Having observed, that the Mussulmans treated those Pagans from India, commonly in a very contemptuous manner, they were in no haste to begin an acquaintance with the Banian, whom they found afterwards to be a very worthy man. They were already acquainted with Seid Salek's son Ismael, who had been their companion in the passage from Jidda to Lohcia, and had made advances to obtain their friendship. This Ismael, besides, had early prepossessed them in his favour, by speaking Dutch tolerably well. They unluckily, therefore, addressed themselves to him in preference to every other person.

These two, the father and son, were accustomed to attach themselves to strangers with dishonest views; and the son had studied some of the languages of Europe, in order that he might be the better able to accomplish his knavish purposes. They had enticed a Dutch vessel from Batavia to Mokha, the master of which falling, without resource, into their hands, was cruelly duped and plundered. By their intrigues, they had kept every other merchant at a distance; so that, with respect to the sale of the cargo, he was absolutely at their mercy. They had hoped to make their gain of our travellers in the same manner; and when they saw their hopes of this frustrated, laboured, out of spite, to do them every ill office in their power.

Our heroes paid their first visit to Ismael. He received them seemingly with great kindness, treated them with punch, and invited a renegade from India, who was settled as a merchant at Mokha, to keep them company. This renegade was a deep drinker, and endeavoured, but without success, to make them drunk. Ismael advised them to resume their European dress, and not to discover their knowledge of Arabic, lest they should be taken for renegadoes. He endeavoured to dissuade them from their intended journey to Sana; telling them, that those highlanders were a savage, inhospitable race, and the Imam treated all strangers who had the misfortune not to be Mussulmans, in the most abusive manner. He was also careful to prepossess them against the people of Mokha, who by his account, entertained inveterate hatred against Europeans; but encouraged them, by offering the powerful protection of his father, to ward off every danger or mortification that they might have to fear. In short, his whole conversation was of such a nature, that M. Niebuhr could not help perceiving from it, that travellers must be grossly im-

posed upon, whenever they trust credulously to the relations they receive from the inhabitants of the country through which they travel. Had they not known Arabic, they might have returned into Europe with very false impressions of every thing in Arabia.

The only piece of service that this man did our Europeans, was, in immediately hiring for them a house that was large enough to lodge them all.

From what happened to them first, after their arrival in this city, they found reason to suspect, that Ismael had secretly instigated the under officers of the customs to harass and oppress them, in order that they might be thus forced to throw themselves into a blind and implicit dependence upon him. Their baggage was carried straight to the custom-house, where was the Dola in person. They begged, that those articles which they needed for immediate use, might first be inspected: but the officers would begin with examining their chests of natural curiosities, which they had sent by sea from Lohcia, and which had been kept here unopened, ever since the arrival of the vessel by which they had been brought. In one of the chests were fishes from the Arabic gulf, preserved in spirits of wine, and enclosed in a small barrel. They begged the officers of the customs not to open the barrel; for that the fishes smelled disagreeably. They, however, not only opened it, but searched it with a pointed instrument of iron, and at length emptied it entirely of the contents. The Arabs, who have a violent aversion to strong liquors, were much prepossessed against them, when they had the smell of the spirituous liquor; and were no less displeased to find the factor of the dead fishes spread through the whole custom-house.

They insisted that they should, at least, let them have their beds. But, without listening to their request, they continued to tofs over and examine their chests, which contained specimens of shells, at the risk of breaking them. The Arabs could not comprehend how a man of sense could collect such trilles, without some interested views: and they accordingly accused them of intending to abuse the Dola, by producing only articles of trifling value, to amuse his people, while they concealed their more precious effects.

At last, appeared a vessel in which Mr. Forskal had preserved some serpents in spirits of wine. At sight of this, the Arabs were terrified. A person, who was servant to the Dola, observed, that those Franks had come hither to poison the Mussulmans, and that it was in order to their success in this, that one of them pretended to be a physician. The Dola, who was a mild old man, and till now did not seem to have conceived any prejudice against them, became suddenly in a passion when this idea was suggested, and swore, that they should not remain a single night in the city. The reader will readily conceive, how the insolence of the people of the custom-house, and of the attending mob, would naturally rise upon this. The custom-house was abruptly shut, and they could obtain none of their goods.

While they were in the custom-house, a servant came to tell them, that their books and other things had been all thrown out of the windows of the house which they had hired, and the door shut against them. They went to see what might be the reason of this outrage, but could find neither Ismael nor his father. One of the citizens, who was a friend of Ismael's, attacked them with abusive language. No person would afford them lodgings; but every one looked upon them as vagrants who would instantly be driven out of the city in disgrace. At length, one of the citizens expressed himself willing to receive them into his house, if he were sure that government would not punish him for it. They led him to the Cadi, who assured him, that he should risk nothing by lodging them. In Turkey, the Cadies are reputed very corrupt and selfish: but in Yemen, our travellers found them persons of great worth and integrity, earnest to do prompt and candid justice. The English

merchant, Mr. Francis Scott, had heard of their difficulties and perplexity; and although they had not yet visited him, he gave them an invitation to dinner, which they accepted with the greatest pleasure. He expressed a warm desire to serve them; and they now perceived, how foolishly they had acted in not applying, at first, to him and his Banian interpreter. However, they durst not break off abruptly with Ismael and his father.

When they could not obtain any of their things from the custom-house, Ismael advised them to offer the Dola a present of fifty ducats; and hinted that he should be the bearer of the present, for that the Dola would not condescend to speak with Christians. They had no intention of making so large a present, still less of intruding him with it. But, after various reflections, they at last resolved to sacrifice those fifty ducats upon the occasion; and it was agreed, that M. Niebuhr should wait upon the Dola with this present, next day. On his way, however, he learned, that the Dola having been exercising his troops, had received a wound in the foot. Upon receiving this information, he returned home; hoping that their physician would be sent for, and that they might thus avoid the expence of the present.

But, as Mr. Cramer was not called by the Dola, and their effects still remained at the custom-house, they understood that a considerable present was expected from them. Mr. Forkal had hitherto been always refused admission by the servants of the Dola, upon pretence, that their master would not treat with them otherwise, than through the medium of Ismael and his father; yet, he now undertook to make a new attempt to obtain an audience. When he had explained the purpose of his visit, he was admitted, and so graciously received, that the Dola kindly chid him for not applying directly to himself at the first. Next day, he in his turn, sent them a present of four lambs, and two small bags of rice; and at the same time gave orders, that their effects should be delivered to them, without being more particularly examined.

The Dola, when he received his wound, had been advised by the principal persons about him, to send for the European physician. But he was afraid, that Mr. Cramer might, in revenge for the ill-treatment which they had suffered, administer to him improper medicines, or might apply heating drugs, which the Arabs think very dangerous. But the Cadi represented to him, that no person had yet complained of our travellers; and that it was nowise strange, that a physician should have dead serpents in his possession, these being used as ingredients in some medical compositions. The Europeans, he further told him, ought not to be despised or slighted for collecting shells or insects, of which the Arabs knew not the use.

These representations, and the alarming state of the wound, which was becoming worse, in the hands of four or five empirics, induced the Dola to send, on the 4th of May, to inquire whether they were still angry with him, or if their physician would undertake to cure him. They were all overjoyed to hear that the prejudices which the governor had conceived against them were so perfectly removed, and Mr. Cramer gladly offered his services. No sooner had their answer been carried to the Dola, than he sent one of his servants with a mule for Mr. Cramer. Europeans, when they pass before the Dola's palace, are usually obliged to alight and walk, if they happen to be mounted: but, to evince to the people the entire reconciliation that had taken place between the Dola and them, Mr. Cramer was permitted to pass through this forbidden ground, and even to enter the court of the palace without dismounting.

They had, after this, frequent opportunities of seeing the Dola, and testifying their friendship to him. Mr. Forkal one day related to him, how they had been insulted and turned out by the owner of their first lodging. The Dola promised him satisfaction, and made the person of whom he complained,

be cast, that very night, into prison. Ismael, enraged to see his friend punished for an act of insolence which he himself had prompted, threatened the Europeans with a mob, by which they might be torn in pieces. Mr. Forkal, although regardless of his threats, waited on the Dola, and entreated him to liberate the prisoner, and only recommend to him, to be more civil to strangers in future.

This change in their situation, rendered Mokha much less unpleasant to them than it had been at first. But disease began now to fall severely upon them, M. Niebuhr had been attacked, soon after his arrival here, with a violent dysentery, from which, however, he recovered, after fifteen days illness. Mr. Van Haven, who had been ill at Beit-el-Fakh, became much worse here. After walking out in the cool of the evening, he was tolerably well through the night; but the heat of the day he was quite unable to bear. At last he ventured to lie for several nights successively, upon the roof of the house, in the open air, and with his face uncovered. On the night of the 24th of May, he caught cold, and was so ill in the morning, that it was necessary for two servants to carry him down into his apartment. His fever was become doubly violent, and he was delirious by the evening. He then sunk into a deep lethargy, and expired in the night.

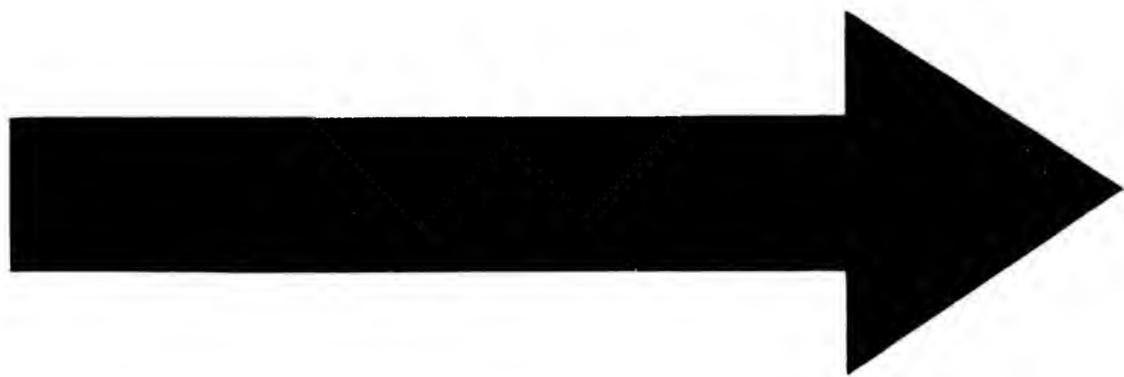

The custom of interring the dead in a coffin, is unknown in Arabia. They had one made, however, for their deceased friend, in order to preserve his remains from any accident. The captain of an English ship lent them six of his sailors to bear the body to the European burying-place. All the English in Mokha attended at the funeral: and the obsequies were performed with more decency, and with less interruption than those of a Consul at Cairo, which were disturbed by the crowding of the people to witness the solemnity, and by the robbery of the audacious Bedouins. On this occasion, the Arabs of Yemen shewed themselves reasonable and humane.

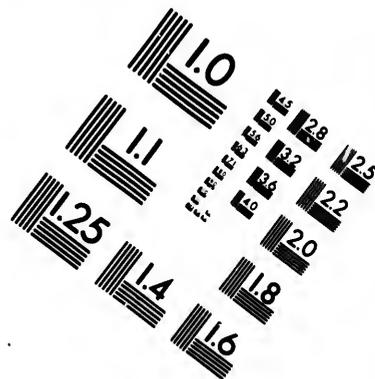

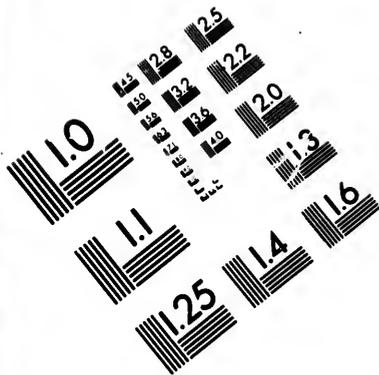

After the death of Mr. Van Haven, they began to think seriously of leaving Mokha, and making a tour into the interior parts of Yemen. They were divided in opinion, with regard to the plan upon which they ought to regulate their subsequent proceedings; some being disposed to remain another year in Arabia, while the rest were desirous of returning immediately to Europe. But they all agreed to set out without further delay, upon their journey to Sana.

M. Niebuhr and Mr. Forkal had made several excursions in a very simple guise, and almost without attendants. But as their whole party were now to travel together, they could not well go without a certain train to accompany them. They could not, however, travel in this style without permission from the Dola, which would not be easily obtained; as it could not be thought, that he would willingly suffer his physician to leave him before his wound was healed. They nevertheless ventured to make the request: but the Dola refused them upon a fair pretext. He told them, that he must first write to Sana, to know whether the Imam would receive them, and that they could not leave Mokha till the Imam had returned an answer.

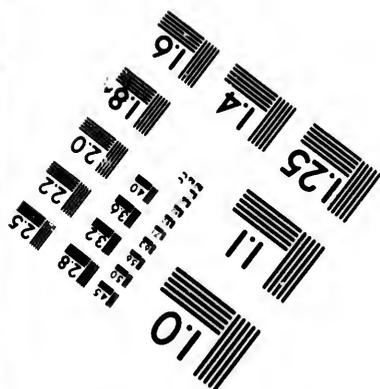

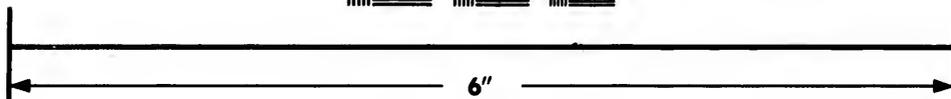

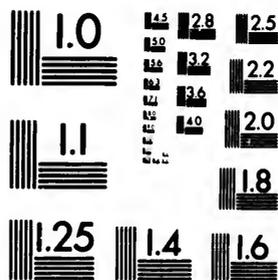

When thus refused permission to proceed to Sana, they begged that they might, at least, be allowed to remove to Taees, in the mean time, for the sake of their health. Even this was refused them. They then proposed to the Dola, to leave their physician behind. But the Arabs feared, that the pain of separation from his friends, might secretly distress Mr. Cramer, so as to render him more negligent of his patient's cure.

When they complained of these restraints to the principal men of the city, they observed, that it was hard to conceive what rendered them so impatient to depart; for that by going to the Highlands, they should only endanger their health more, as those who went thither from the burning sands of Tehama, were commonly attacked with a violent fever immediately upon their arrival.

the place of the residence of the kings of this country; its only remains are the ruins of some mosques. Ismael Mulk having built his tomb at the foot of the rock of Kahre, some of his devout subjects chose to live near their faint; others following their example, Oddena was thus abandoned, and Taes built. So this city, like Laheia, Beit-el-Fakih, and Mokha, owes its rise to a faint.

The Dola who now governed this city had been an officer in the Imam's army, and had risen rapidly to the rank of Nakib, without owing his fortune to his birth, as most of these governors do. His government was very extensive, comprehending both Mount Sabber and the territory of Hodsjerie, in which are a number of Schiechs, whose families have, for these several centuries, possessed small and almost independent lordships. They pay taxes to the Imam, but value themselves much on their nobility of descent, and treat their governors with contempt. Our travellers Dola had already had several differences with those haughty nobles, who refused submission to his authority. He had put one of the mutinous Schiechs in prison, and had detained a female slave whom the Arab was carrying away with him. An order from the Imam, however, obliged him to set both at liberty; but he remained in indignation against those Schiechs in general. He seized the first occasion that offered, and sent out half a dozen soldiers among them, who, according to their master's orders, conducted themselves with great insolence towards those highlanders. The Schiechs could not bear such insults; but made an insurrection, and massacred them all. Since that period, nobody from Taes has ventured to visit the highlands without exposing his life to extreme danger; it was even said, that the Schiechs would never be quiet till the Imam should recall the Dola.

The exuberant fertility of Mount Sabber affords, according to the accounts of the Arabs, plants of every species that is to be found any where else through the world. Mr. Forskal had this mountain daily before his eyes; but, to his infinite mortification, could not obtain permission to botanize upon it. He proposed to bring a Schiech from the mountains at his own expense, under whose protection he might go out upon his herbarizing expeditions without danger. But the Dola put a negative upon all his proposals, and would only suffer him to take a short ramble over Mount Saurek. He set out on the 20th of June, and returned on the 22d, having found the villages in that district deserted, in consequence of the intolerable exactions of the Dola, which had forced the inhabitants to retire and settle elsewhere. In so wretched a country, Mr. Forskal could neither find provisions, nor travel about in safety.

In order to make the most of his stay at Taes, M. Niebuhr wished to make some excursions through the interior country, but durst not attempt them, on account of the prevailing disturbances. He was at last disposed to content himself with copying an inscription in the fortrefs; and Mr. Forskal returned his intention of sending for a Schiech from Mount Sabber. The Dola agreed to their wishes; but at midnight he sent to tell them, that he had received a letter from the Dola of Mokha, requiring them to return immediately to the latter city. They suspected this letter to be a pretence, and refused to comply. Early in the morning, however, camels were sent to carry them away, but they sent them back. With Turks they durst not have done so much.

They could not comprehend what were the Dola's views, unless, perhaps, he might, like the Dola of Mokha, intend to extort some considerable present from them. Into these views they had no disposition to enter, and therefore sought a private audience of him, in hopes of bringing him to reason. Their servant was several times sent back under different pretexts. At last, Mr. Forskal obtained access to the Dola, and begged of him only to permit them to wait till they should receive the Imam's answer,

without mentioning their little schemes. But the governor cut him short, saying, "Since you would not credit my servants, I myself order you to be gone to Mokha to-morrow."

Seeing no means to elude the Dola's orders, they had already packed up their goods, when a favourable change suddenly took place upon their circumstances. A letter was brought them by express from the Dola of Mokha, and in it were three others; one to the Imam, another to his vizier, and a third to the Dola of Taes. He informed them, that the Imam gave them permission to go to Sana, and wished them to carry their curiosities with them. He acquainted the Dola of Taes with their master's orders, and begged him to favour their departure to Sana. Mr. Forskal went instantly with this letter to the governor, but could not obtain access to him, and was obliged to give it to his servant.

They now thought their affairs in a good train, and would even have set out without troubling the Dola further, if they could have obtained camels without his interposition on their behalf. Those who hire these cattle are obliged in a sort of corporation; and travellers are obliged to apply to the head of the company, who has recourse upon the owners of the camels, and makes them furnish, in turn, the number which may be wanted. Unluckily the Dola himself was at the head of this company, and was obliged to furnish camels in his turn. They let him know that they were about to depart. He answered, that camels were ready to convey them back to Mokha, but that the orders respecting their journey to Sana regarded only the Dola of Mokha.

In the perplexity to which they were reduced by this conduct of the Dola's, they knew not what to do. Several instances of the equity and generosity of the Cadi were in the mean time related to them, in which he had brought the governor to reason in cases similar to theirs. They made their complaints therefore to that judge, and shewed him their letters from Mokha. He thought the Dola's conduct very unreasonable, and immediately wrote to him to beware of doing any thing in contradiction to the orders of the Imam. The Dola replied, that he did not hinder their journey to Sana, but, asked them to stay one day; till he should write his letters to court upon the occasion. They offered to stay two or three days. Notwithstanding this, the Dola's servants came next morning, and ordered them in his name, to depart to Mokha. They had again recourse to the Cadi, who being previously informed of all that had happened, had, in the morning, written to the Dola, that he should not act in a harsh or interested manner with them; for they were strangers. The Baskateb told them in the evening, that the Dola was sorry, that his servants had come to them with a message in his name which he had given them no orders to deliver. But upon this head they knew sufficiently what to think.

The Dola of Mokha's servant could not now be of further use to them; they dismissed him therefore with a handsome reward. But as they still wanted a guide who knew the interior parts of Yemen, they begged the Cadi to direct them to such a one; and he politely sent them an Arab, who afterwards accompanied them to Mokha, and with whom they were perfectly satisfied. The Dola shewed likewise a disposition to make amends by kindness for the trouble he had given them, and ordered one of his servants to accompany them on their journey. This man had the address to stipulate before-hand, in the presence of several persons of distinction, for the wages which they were to pay him.

The Cadi, unasked, had the generosity to give our travellers a letter of recommendation to the Imam's vizier, in which he told him, that he should beware of believing any thing that might be related to him to the disadvantage of these Franks. They could have wished to make the judge a present of a watch; his probity and beneficence having inspired them with the highest veneration for his character, and the liveliest gratitude

gratitude for his favour, that he would appear to have intended them.

They could not but be avoided of illness. Their he was fallen serious cases which their given him. Their made him contempt of the city.

His conduct had M. Niebuhr even Mr. Forskal was occasion of the illness to the grave.

From Taes they for the first two days their way, except lages, and a small were falling into ruin and almost desolate late wars for the future.

On the third day storm surprised the of remarking how occasional from the which they passed.

The great inns try from the Tihari These are private travellers with their indifferent. Between every half day's journey burnt bricks. The in Turkey, have been accommodation of but no other sort of butter. The travellers with him.

On the 1st of July upon a paved road try, and after passing madjils, arrived a height of a hill, is contains 800 houf fashion of building a good many small large reservoir, which supplies all the

At a small distance two rivulets, one created into the river southward, forms itself into the sea of these rivers, two country, and the rise here, seem to spot in the mountains. tioning their little schemes. But the governor short, saying; "Since you would not servants, I myself order you to be gone to-morrow."

He means to elude the Dola's orders, they packed up their goods, when a favourable opportunity took place upon their circumstances. They brought them by express from the Dola and in it were three others; one to the other to his vizier, and a third to the Dola. He informed them, that the Imam gave permission to go to Sana, and wished them to be acquainted with them. He acquainted them with their master's orders, and begged for their departure to Sana. Mr. Forkkal wrote with this letter to the governor, but obtained access to him, and was obliged to be a servant.

He thought their affairs in a good train, and have let out without troubling the Dola they could have obtained camels without permission on their behalf. Those who hire are united in a sort of corporation; and are obliged to apply to the head of the company who has recourse upon the owners of the camels makes them furnish, in turn, the number may be wanted. Unluckily the Dola himself was head of this company, and was obliged to be in his turn. They let him know that they were about to depart. He answered, that he was ready to convey them back to Mokha, but they respecting their journey to Sana to the Dola of Mokha.

The complexity to which they were reduced by the orders of the Dola's, they knew not what to do. The necessity of the equity and generosity of the Dola in the mean time related to them, in which they thought the governor to reason in cases similar to them. They made their complaints therefore to the Dola and shewed him their letters from Mokha. The Dola's conduct very unreasonable, he wrote to him to be aware of doing any thing in contradiction to the orders of the Imam. He complied, that he did not hinder their journey, but, asked them to stay one day; till he had written his letters to court upon the occasion, and to stay two or three days. Notwithstanding the Dola's servants came next morning, and in his name, to depart to Mokha. He again recourse to the Cadi, who being informed of all that had happened, had, in writing to the Dola, that he should not be in a more interested manner with them; for the Dola's servants told them in the name of the Dola was sorry, that his servants had not brought them with a message in his name which they had no orders to deliver. But upon this they knew sufficiently what to think.

The Dola's servant could not now be of any use to them; they dismissed him therefore without any reward. But as they still wanted to see the interior parts of Yemen, they desired to direct them to such a one; and he then an Arab, who afterwards accompanied them to Mokha, and with whom they were obliged. The Dola shewed likewise a dislike to amend by kindness for the trouble they had given them, and ordered one of his servants to accompany them on their journey. This man had been stipulate before-hand, in the presence of the Dola, for the wages which they should pay him.

Unasked, had the generosity to give our party a recommendation to the Imam's vizier, which he told him, that he should beware of any thing that might be related to him to the disadvantage of these Franks. They could have made the judge a present of a watch; his beneficence having inspired them with the desire of showing him their gratitude, and the vizier's gratitude

gratitude for his favours. But they were informed that he would accept no such thing, lest he might appear to have interested views in taking part with them.

They could not see the Dola before their departure; he avoided receiving their visit under pretence of illness. Their friends however assured them, that he was fallen seriously ill, in consequence of the uneasiness which their obstinate resistance to his will had given him. Their firmness was indeed said to have made him contemptible in the eyes of the inhabitants of the city.

His conduct had occasioned them no less vexation. M. Niebuhr even blamed the uncalmness with which Mr. Forkkal was at that time agitated, as the first occasion of the illness which soon after hurried him to the grave.

From Taxes they set out on the 28th of June; and for the first two days, found no human habitations on their way, except some paltry coffee-huts, a few villages, and a small town; and most of the villages were falling into ruins. The country is uncultivated, and almost desolate; which seems to be owing to the late wars for the succession to the throne of Taxes.

On the third day they reached Mharra. A violent storm surprised them, and gave them an opportunity of remarking how the torrents, rushing upon such occasions from the hills, produce the gullies, one of which they passed on an arch of solid stone.

The great inns which are scattered over the country from the Tebama thus far, are called Matrach. These are private houses, the masters of which furnish travellers with their meals, which are commonly very indifferent. Between Mharra and Sana, almost at every half day's journey, stands a large Simfira of burnt bricks. These edifices, like the caravanferas in Turkey, have been built by wealthy persons for the accommodation of travellers, and afford safe lodging, but no other sort of food than coffee, rice, bread, and butter. The traveller must bring his other provisions with him.

On the 1st of July, having crossed Mount Mharra upon a paved road, they entered a more fertile country, and after passing several villages and a number of madjils, arrived at Abb. This city stands on the height of a hill, is surrounded by a strong wall, and contains 800 houses, most of which are in a good fashion of building. Its streets are paved, and it has a good many small mosques. Beside one of these is a large reservoir, which receives water by an aqueduct, and supplies all the houses in the city.

At a small distance, between Abb and Djobla are two rivulets, one of which running westward, is increased into the river Zebid; and the other running southward, forms Meidan, a river which disembogues itself into the sea near Aiden. The different courses of these rivers, two of the most considerable in the country, and the circumstance of their taking their rise here, seem to indicate this as the most elevated spot in the mountainous part of the Imam's dominions. The height of Mount Sumara, which they passed on the day following, is another proof of this. They travelled down Mount Abb, along good paved roads, and then crossed a country of a varied surface, having villages, madjils, and houses for the protection of travellers, scattered over it. No remarkable place was to be seen except the city of Muchader, standing on a hill, and the seat of a Dola.

After spending the night in a Simfira, they began to ascend Mount Sumara, a hill much higher than Mharra, by ways which had been rendered accessible to camels by being paved, and carried in a winding direction round those places, which were too steep for direct access. Half way up the hill is the village of Mensil, in which is a superb Simfira built all of hewn stone. They obtained a convenient apartment upon the roof, of which Mr. Forkkal, who was now extremely weak, stood very much in need.

Here they remained during the next day, and would gladly have stayed till their friend had been

somewhat better; but their camel-drivers could not here find food fitting for their cattle. They proposed to them to proceed to Jerim, a city at a small distance, and promised that their sick friend should be borne by men over the rugged roads of Mount Sumara.

They were persuaded, and set forward on the 5th of July. Our hero went before, to enjoy the fresh air; a piece of inexcusable imprudence in places of so keen a temperature. He soon felt himself affected with a severe rheum, vomitings, and excessive thirst, which he could not have quenched on that desert mountain, if he had not fortunately met with a peasant who permitted him to drink out of his pitcher of water. He saw nothing in this part of their journey, which seemed worthy of attention, except a ruinous castle, the property of the family of Hassan, and standing on the very peak of Mount Sumara. In this neighbourhood, are two tribes of wandering Arabs, who are now settled in villages. There are no more Bedouins in the Imam's dominions.

The Arabs could not be persuaded to carry a Christian; and Mr. Forkkal was therefore placed in his bed upon a camel. Although they had proceeded slowly, he was in a deplorable condition, by the time they reached Jerim. They now found, that, although they had accustomed themselves to live like the inhabitants of the country, yet there were certain conveniences which, in case of illness, they could not but want. They lodged in a public inn; but the crowd of spectators whom curiosity brought together, to see the Europeans, becoming extremely troublesome, they hired a more quiet apartment in the city, where they might live undisturbed till their fellow traveller should recover his health. It was impossible to find persons who would carry their sick friend. Their Mahometan servant refused to assist them in removing Mr. Forkkal from the one house to the other; and they were obliged to carry him themselves.

Jerim is but a small town, yet the seat of a Dola, who resides in a castle situate on a rock. The houses are built of stone, and of bricks which have been dried in the sun. At two miles distance from this place, according to the tradition of the Arabs, stood once the famous city Dhafar, very little of the ruins of which now remain. The first magistrate of Jerim, however, told M. Niebuhr, that a large stone is still to be seen there, with an inscription, which neither Jews nor Mahometans can explain. This was probably the situation of the city of Taphar, which ancient historians mention as the seat of the Hamjarines. If any Hamjarine inscription shall ever be discovered, it will probably be among these ruins. The Arabs maintain that Dhafar was the seat of Saad-el-Kammel, a famous hero, king of all Arabia, who lived eighteen hundred years ago.

On the east side of Mount Sumara, they found the climate very different from what it was on the west side. It had rained almost every day of their journey from Taxes to Mensil; and the earth was covered with a charming verdure. At Jerim, on the contrary, no rain had fallen for three months, although distant thunder had been heard almost every day. In this want of rain, the locusts had multiplied prodigiously, and had eaten up almost all the productions of the earth. The inhabitants of Jerim resolved to put up public prayers for rain, on the eighth of July; and for that purpose, repaired in procession to a place without the city, where such solemnities were usually performed. The company who walked in procession, consisted of a number of clergymen in a dress expressive of humility. Two venerable Schichs walked at their head, bearing open caskets full of books. As they proceeded, all sang and repeated short prayers. Hardly was this ceremony over, when, on the very same evening, a storm arose, with hail and a very heavy rain. The rains became afterwards more frequent. Between the tropics they fall at regular periods, on the different sides of the great ranges of hills. In all the markets, locusts were sold at a low price; for so prodigiously numerous were they in a plain

plain near Jerim, that they might be taken by hand-fuls. Our travellers saw a peasant having a sack full of them, which he was going to dry and lay up for winter provisions. Whenever it ceased raining for an hour or two on the other side of Mount Sumara, legions of these insects used to come over to Jerim. They saw the peasants of Menfil pursuing them, in order to preserve their fields from absolute desolation.

In the streets of Jerim, they saw a bridegroom proceeding to the bath in ceremony. Two boys went before, dancing to the music of a timbrel; a crowd followed, consisting of persons of all ages, who shot pistols in the air as they went on; the bridegroom with his friends closed the procession. At night, a number of flambeaux were lighted up, and formed a handsome illumination.

They were one day entertained by two gladiators, who, for a few pieces of small money, exhibited their address in the streets. They wore masks, the first our hero had seen in the East, and were armed with a buckler and a poignard. They did not fight to wound one another: the perfection of their art consisted in their leaping, and in several agile turns of the body.

Being ever unwilling to mingle with crowds, M. Niebuhr had not yet seen any of the markets in Arabia, although these are resorted to as places of amusement by the inhabitants of the country. To divert himself a little, he went to the market at Jerim. A great many people were met in it, who were chiefly peasants that had come to sell their different articles. He saw no shops furnished with goods of any considerable value. Many taylor, shoemakers, blacksmiths, and other artisans, sat along the streets, behind low walls, and wrought at their trades in the open air. He saw also surgeons who drew blood with a common knife, and then dressed the wound with pieces of hartshorn cut off at the root of the horn.

On the first days after their arrival at Jerim, Mr. Forkal's illness seemed to decrease. But it soon after returned with such violence that they despaired of his recovery. On the evening of the tenth of July, he sunk into a deep lethargy, in which state he continued till his death, the next morning.

It being necessary for them to notify the death of their companion to government. Our travellers sent the Dola of Tæz's servant to the Dola and the Cadi of Jerim. The latter politely directed them to an Arab, who could sell them a place, where they might inter their deceased friend. The bargain which they struck with this man did not take effect; for the place being near a canal intended for the watering of the meadows, the possessors of these had threatened their Arab with an action at law, if the water should fail on account of the Christian's body. They soon after obtained a different place for the same price.

The Dola then expressed a wish to confer with some one of their number. He informed M. Niebuhr, that, in quality of governor, he had a right to the personal effects of all Jews and Banians who died within his dominions. Our hero answered that the deceased was neither a Jew nor a Banian, but an European; and that the Dola of Mokha had laid no claim to the effects of one of his companions, who died in that city. The Dola's son then explained to him his father's intentions, who expected to receive at least a considerable present. M. Niebuhr told him that Europeans were accustomed to pay nothing without receiving a written acquittance; and that if he would give them in writing a statement of what he required, they should then see what they could do. After this, the Dola who knew that they were going to Sana, and probably feared that they might complain of him there, left them at peace.

Their greatest difficulty now was to find persons to bear the body to the grave; and this, even although they promised to pay very liberally for the service. At last they prevailed with six men to convey it to the burying-place at midnight. They performed the task, but ran and hid themselves, in the best manner

they could, all the way; so that those people to touch a Christian

They resolved to bury the coffin; but they had done better Arabian mode, and wrapped in cloth. The coffin made the Europeans buried rich with dead. At Sana, they learned it had been taken up by night clothes had been snatched away opened. The Dola obliged them and left them the coffin for the

After the burial of their friend to detain them from continuing the 13th of July, they left Jerim for four miles along rugged barren country, arrived on the 14th. Through this tract of road, whether are in so wretched condition poor huts, and lie on the ground.

As they had lived so long at Damar had previous notice Europeans seldom pass this way, this place being therefore very came out and met them half a mile. As they drew nearer, the crowd increased; and therefore, to avoid being troubled by them, they would hire an empty house. This they did: for the crowd surrounded them, that they could not enter. Cramer being mounted on his horse, but then they exclaimed against the infidels, and began to throw stones. They thought of asking for help, but were told that he had only to be afraid of the mob himself.

He therefore coming to consult their physician, he took no notice of the petulance, and threw stones that they might draw

The tumult soon ceased, and they proceeded. The city of Damar stands in the capital of a province, and is inhabited by a large number of people, in which to the number of 10,000 are commonly employed in the building out walls; its buildings are good, containing no fewer than five thousand Jews live in a detached village, and are permitted to live in the town at night.

In no other city had their physician. As he was unwilling to go out of the city, the sick were brought to him. An inhabitant of this town accompanied them, that he might have an opportunity of consulting their physician by the way.

Near Damar is a mountain of native sulphur. In another part, distant, those fine cornelians are much esteemed in Arabia.

Their European servant falling ill at Damar, to follow them by the way, he complained that he had no lodging by the way. The Arab who accompanied them might die in their houses, and he obliged to take the expence of him.

On the 14th of July they passed with bare and arid hills, within a mile of Damar, is the hot spring. The road becomes very marshy and ill-cultivated. From Suradje to Sana, the villages are with orchards and vineyards. It was taken by a storm of hail, accompanied by thunder; but no madjils were killed.

Next day they had still worse weather, which seemed surprising, to near the mountain of Hodafa, which stands on a steep

they could, all the way; so great is the aversion of those people to touch a Christian.

They resolved to bury their deceased friend in a coffin; but they had done better to have followed the Arabian mode, and wrapped him simply in a fearcloth. The coffin made the people furious, that the Europeans buried their riches with the bodies of their dead. At Sana, they learned that Mr. Forkal's body had been taken up by night, and that the grave-clothes had been snatched away, after the coffin was opened. The Dola obliged the Jews to bury it again, and left them the coffin for their pains.

After the burial of their friend, they had nothing to detain them from continuing their journey. On the 13th of July, they left Jerim, and after proceeding for four miles along rugged roads, and through a barren country, arrived on the same day at Damar. Through this tract of road, the people who sell Kitecher are in so wretched condition, that they live in poor huts, and lie on the ground.

As they had lived so long at Jerim, the inhabitants of Damar had previous notice of their approach. Europeans seldom pass this way; and the people of this place being therefore very curious to see them, came out and met them half a league from the city. As they drew nearer, the crowd became more numerous; and therefore, to avoid being seized and disturbed by them, they would not enter an inn, but hired an empty house. This precaution little availed them: for the crowd surrounded them in such a manner, that they could not enter their lodging. Mr. Cramer being mounted on his mule, forced his way; but then they exclaimed against the insolence of the infidels, and began to throw stones in at their windows. They thought of asking a guard from the Dola, but were told that he had only thirty soldiers in all, and was afraid of the mob himself. At last, the first magistrate coming to consult their physician, advised them to take no notice of the petulance of the students, who threw stones that they might draw them to the windows. The tumult soon ceased, and the mob dispersed.

The city of Damar stands in a fertile plain. It is the capital of a province, and is governed by a Dola, who resides in a large castle. It has a famous university, in which to the number of five hundred students are commonly employed in their studies. It is without walls; its buildings are good; and it is very large, containing no fewer than five thousand houses. The Jews live in a detached village; but the Banians are permitted to live in the town among the Mussulmans. In no other city had their physician better practice.

As he was unwilling to go out on account of the mob, the sick were brought to him in their beds; and an inhabitant of this town accompanied them to Sana, where he might have an opportunity of consulting their physician by the way, and in that city.

Near Damar is a mountain containing a mine of native sulphur. In another hill, somewhat further distant, those fine cornelians are found, which are so much esteemed in Arabia.

Their European servant falling ill, they left him at Damar, to follow them by short journeys. At his arrival, he complained that nobody would give him lodging by the way. The Arabs were afraid that he might die in their houses, and that they might be obliged to take the expence and pains of burying him.

On the 14th of July they crossed a plain encompassed with bare and arid hills. Near the road, and within a mile of Damar, is the small town of Maubab. The road becomes very rugged; and the country appears marshy and ill-cultivated towards Suradje. From Suradje to Sana, the villages are all surrounded with orchards and vineyards. They were here overtaken by a storm of hail, accompanied with peals of thunder; but no madajils were nigh, to shelter our travellers.

Next day they had still worse roads to travel; which were much surprising, to near the capital. They saw a dafsa, which stands on a steep, insulated rock, and

in which is said to be a curious inscription, upon an old wall. This inscription was mentioned to M. Niebuhr at Taces; and he was informed by a Jew at Sana, that the characters resemble neither the Arabic nor the Hebrew. He suspected them to be Hamjanic, and was sorry that it was not in his power to examine them.

After passing through several paltry villages, they at length reached Seijan, a village, which, together with Suradje, belongs to the princes of the blood; they observed in it a good many ruinous houses. As there falls not enough of rain here, large reservoirs have been formed at the foot of the hills, and from these the water is distributed through the country at considerable expence and trouble.

Hoping to enter Sana, on the 16th of July, they put on their Turkish dresses in the morning; their appearance being somewhat better than that of the Arabic garb they had worn in the course of their journey. Along a stone bridge, they passed a small river, the water of which is, not far below, lost among the sand; and they halted near the village of Hadde, where the Imam has an orchard, at a mile's distance from Sana.

On the morning of the 16th of July they had sent their servant forward, with a letter, addressed to Fakih Achmed, the Imam's vizier, announcing to him their arrival. But that nobleman, having already heard of their near approach, had sent one of his principal secretaries to meet them, and bid them welcome. This deputy informed them, that they had been long expected at the court of Sana, and that the Imam had hired an elegant country house for them, in the suburb of Bir-el-Affab.

They learned that the vizier had likewise a villa there. When they arrived near this place, the secretary asked them to alight. They supposed upon this, that they were to be immediately introduced to the vizier; but they only saw their secretary and their mussulman servants proceed on their asses, while they were obliged to march on foot, a long way, before they reached their lodging. This humiliating ceremony was what they had not expected to be subjected to among the Arabs, who value themselves upon their politeness.

In their villa they found very good rooms, but those perfectly naked and unfurnished. They were here as ill accommodated as they had been in Yemen, and more so than they could have been in a caravanera, where they would at least have found food. Here they were obliged to fast till they could have victuals brought from the city. Beside their house, was an orchard, in which the trees appeared to have grown of themselves, without receiving any culture.

Next morning the Imam sent them a present, consisting of five sheep, with wood, rice, lights, and spices. The bearer of this present had at the same time orders to let them know, that the Imam was sorry that he could not see them for these two days yet, he being at present employed in paying off his mercenary troops. This delay they would have regarded with indifference, had they not been at the same time enjoined to keep within doors, till they should obtain their first audience of his highness. They could have wished to make the most of their stay here.

They had however forgotten to warn our travellers, that the etiquette of this court likewise prohibited strangers from receiving visits from the inhabitants of the country till they should first appear there. They had an acquaintance at Sana, a Jew, who had made the voyage from Cairo to Lobeia in their company. This Jew, although belonging to one of the richest and most respectable families of his nation, had entered into their service, for the course of that voyage, either that he might travel in the greater security, or to spare the expence. Accordingly, he no sooner heard of their arrival, than he came to pay them a visit, and, next day brought one of the greatest attologers in his nation to see them. While these men were in their company, the secretary of Vizier Fakih

Achmed happened to come in. The two Jews rose before him, in testimony of respect. But the secretary, angry that they should have presumed to violate the etiquette, drove them out of the house, and ordered their servants to admit no person to visit the Europeans, till they should first have waited on his master.

On the 19th of July, the secretary of the vizier, Fakih Achmed, came to conduct them to an audience of the Imam, in his palace of Bultan-el-Metwokkel. They had expected that they should be introduced privately to an audience of this monarch, or at least in presence only of a few of his principal courtiers. They were surprised therefore to see every thing prepared for an occasion of great ceremony. The court of the palace was so full of horses, officers, and others, that they should scarcely have made their way through the crowd, if the Nakih Gheir Alla, who had been a slave, but was now master of the horse, had not come with a great staff in his hand, to open a passage for them.

The hall of audience was a spacious square chamber having an arched roof. In the middle was a large bafon, with some jets d'eau, rising fourteen feet in height. Behind the bafon, and near the throne, were two large benches, each a foot and an half high; upon the throne was a space covered with silken stuff, on which, as well as on both sides of it, lay large cushions. The Imam sat between the cushions, with his legs crossed in the eastern fashion; his gown was of a bright green colour, and had large sleeves. On each side of his breast was a rich filleting of gold lace, and on his head he wore a great white turban. His sons sat on his right hand, and his brothers on his left. Opposite to them, upon the highest of the two benches, sat the vizier; and our travellers place was on the lower bench. On the two sides of the hall, sat many of the principal men about court.

They were first led up to the Imam, and were permitted to kiss both the back and the palm of his hand, as well as the hem of his robe. It is an extraordinary favour, when the Mahometan princes permit any person to kiss the palm of the hand. There was a solemn silence through the whole hall. As each of us touched the Imam's hand, a herald still proclaimed, "God preserve the Imam!" All who were present repeated those words aloud after him. M. Niebuhr was thinking at the time, how he should pay his compliments in Arabic, and was not a little disturbed by this noisy ceremony; but he had afterwards time to recollect himself.

As the language spoken at the court of Sana, differs greatly from that of Tehama, the only dialect of the Arabic tongue with which they were familiarly acquainted, or could speak tolerably, they had brought their servant whom they had hired in Mokha, to be their interpreter. The vizier who had resided long in Tehama, did the same service for the Imam. Their conversation consequently, could not be either very long, or very interesting. They did not think proper to mention the true reasons of their expedition through Arabia; but told the Imam, that wishing to travel by the shortest way to the Danish colonies in the East-Indies, they had heard so much of the plenty and security which prevailed through the dominions of the Imam, that they had resolved to see them with their own eyes, that they might describe them to their countrymen. The Imam told them, they were welcome into his dominions, and might stay as long as they pleased. After repeating the ceremony of kissing the Imam's hands, and hearing the repeated acclamations of the spectators, they now retired in the same order in which they had come in.

The Imam sent them, after their return home, each a small purse containing ninety-nine Komassis, two and thirty of which make a crown. This piece of civility might perhaps appear no compliment to a traveller's delicacy. But, when it is considered that a stranger, unacquainted with the value of the money of the country, obliged to pay every day for his provisions,

provisions, is in danger of being imposed upon by the money-changers, this care of providing them with small money will appear to have been sufficiently obliging. They therefore accepted the present, although they had resolved not to be in any degree chargeable to the Arabs.

In Turkey no person is admitted to an audience of the Sultan, till after he has visited the vizier. The custom in Yemen is directly contrary. After being honoured with an audience of the Imam in the morning, they were invited to wait on Fakih Achmed in the afternoon, at his country seat, near Bir-el-Affab. They were at the same time desired to bring with them those curiosities which they had shewn to Emir Farhan at Lohcia, and to several Arabs of distinction in other cities.

The vizier received them with great politeness, and expressed himself highly pleased with what they shewed him. He put various questions to them, from which he appeared to possess considerable knowledge, and to have studied the sciences with a degree of care far from common among his countrymen. By means of Turkish, Persian, and Indian merchants, he had acquired tolerably correct notions of geography. The Arabians imagine that Europe lies south from them, because the Franks whom they see, come from India. But the Fakih knew very well the situation of the different states of Europe, with their respective powers and forces, both by sea and land. Nor could more be expected from an Arabian who had never seen a map.

In the narratives of many voyages, they had read, that in the East an inferior might not appear before a superior, without bringing a present in his hand. Besides, they were desirous of returning the marks of politeness which had been shewn them; and of expressing their gratitude for the entertainment they had received.

For these reasons, they resolved to take this opportunity of offering their present to the Imam and the Fakih; they sent to the latter some pieces of mechanism, such as watches, and some other instruments little known among the Arabs. They soon after learned, that this was more than had been expected at their hands, since, not being merchants, they had no favour to ask. All had however been very graciously accepted. The Turks regard the presents of the Europeans as a tribute; but at the court of Sana they appear to be considered in a different light.

The vizier's country-house was not large; it was even entirely open upon one side. A number of fruit trees grew in the garden. In the midst of it was a jet d'eau, similar to that which we had seen in the Imam's hall of audience; the water was put in motion, by being raised in a reservoir by an afs and a man who led him. This jet d'eau was no ornament, but it cooled the air; a thing very agreeable in hot countries. They saw others of the same sort in the gardens of all the principal inhabitants of Sana.

The city of Sana, is situate at the foot of Mount Nikkum, on which are still to be seen the ruins of a castle, which the Arabs suppose to have been built by Shem. Near this mountain stands the castle; a rivulet runs upon the other side; and near it, is the Bultan-el-Metwokkel a spacious garden, which was laid out by Imam Metwokkel, and has been embellished with a fine garden by the reigning Imam. The walls of the city, which are built of bricks, exclude this garden, which is enclosed within a wall of its own. The city, properly so called, is not very extensive; one may walk round it all in an hour. The city-gates are seven. Here are a number of mosques, some of which have been built by Turkish Pachas. Sana has the appearance of being more populous than it actually is; for gardens occupy a part of the space within the walls. In Sana, are only twelve public baths; but many noble palaces, three of the most splendid of which have been built by the reigning imam. The palace of the late Imam El Manzor, with some others, belong to the royal family,

who are very numerous. The Arabian palaces are built in a style of architecture different from ours. The materials are, however, burnt bricks, and sometimes even hewn stones; but the houses of the common people are of bricks which have been dried in the sun. M. Niebuhr saw no glass windows, except in one palace, near the citadel. The rest of the houses have, instead of windows, merely shutters, which are opened in fair weather, and shut when it is foul. In the last case, the house is lighted by a round wicket, fitted with a piece of Muscovy glass. Some of the Arabians, use small panes of stained glass from Venice.

At Sana, and in the other cities of the East, are great Simleras or caravanseras for merchants and travellers. Each different commodity is sold in a separate market. In the market for bread, none but women are to be seen; and their little shops are portable. The several classes of mechanics work in the same manner, in particular quarters in the open street. Writers go about with their desks, and make out briefs, copy-books, and instruct scholars in the art of writing, all at the same time. There is one market, where old clothes are taken in exchange for new.

Wood for the carpenter's purposes is in general extremely dear through all Yemen; and wood for the fire at Sana is no less so. All the hills near the city are bleak and bare, and wood is therefore to be brought hither from the distance of three days journey; and a camel's burthen commonly costs two crowns. This scarcity of wood is particularly supplied by the use of a little pit-coal. Fruits are, however, very plentiful at Sana.

In the castle which stands on a hill, are two palaces. Our hero saw about it some ruins of old buildings, but, notwithstanding the antiquity of the place, no remarkable inscriptions. There is the mint, and a range of prisons for persons of different ranks. The reigning Imam resides in the city; but several princes of the blood-royal live in the castle. M. Niebuhr was conducted to a battery, as the most elevated place about these buildings; and there he met with what he had no expectation of, a German mortar, with this inscription, "*Jörg Selos Gelmick, 1513*". He saw also, upon the same battery, seven iron cannons, partly buried in the sand, and partly set upon broken carriages. These seven small cannons, with six others, near the gates, which are fired to announce the return of the different festivals, are all the artillery of the capital of Yemen.

The suburb of Bir-el-Affab is nearly adjoining to the city upon the east side. The houses of this village are scattered through the gardens, along the bank of a small river. Two leagues northward from Sana is a plain, named Rodda, which is overspread with gardens, and watered by a number of rivulets. This place bears a great resemblance to the neighbourhood of Damascus. But Sana, which some ancient authors compare to Damascus, stands on a rising ground, with nothing like florid vegetation about it. After long rains, indeed, a small rivulet runs through the city; but all the ground is dry through the rest of the year. However, by aqueducts from Mount Nikkum, the town and castle of Sana, are, at all times, supplied with abundance of excellent fresh water.

Jews are not permitted to live in the city of Sana. They live by themselves in a village, named Kaa-el-Ihud, situate near Bir-el-Affab. Their number amounts to two thousand. But in Yemen, they are treated even more contemptuously than in Turkey. Yet, the best artisans in Arabia are Jews; especially potters and goldsmiths, who come to the city, to work in their little shops by day, and in the evening retire to their village. Those Jews carry on a considerable trade.

The Banians in Sana, are reckoned to be about 125. They pay 300 crowns a-month for permission to live in the city; whereas the populous village of Kaa-el-Ihud pays only 125 crowns a-month. The heirs of a deceased Banian are obliged to pay from forty

The Arabian palaces are quite different from ours, built of burnt bricks, and furnished with the houses of the country which have been dried in no glass windows, except in the citadel. The rest of the windows, merely flutters, leather, and shut when it is too hot. Some are of Muscovy glass. Some are of stained glass from

However, by aqueous, the town and castle of Sana are supplied with abundance of

to live in the city of Sana, a village, named Kaa-el-Abbaf. Their number is not great. But in Yemen, they are more numerous than in Turkey. Arabia are Jews; especially those who come to the city, to work and in the evening retire to their own considerable trade. They are reckoned to be about a month for permission as the populous village of Sana, 85 crowns a month. The Jews are obliged to pay from

forty to fifty crowns: and, if the defunct leaves no near relations in Yemen, his whole property devolves to the Imam.

The favourable reception our travellers met with at Sana, which was above their expectations, might have tempted them to stay longer. Many of the principal men about the Imam's court urged them to spend another year in Yemen. But they had lost two of their companions, who could have availed themselves more than they of a continued stay in Arabia. Some instances, too, of the Imam's avarice, which had come to their knowledge, added to what they had experienced in those cases in which they had been embroiled with the Dolas, impressed them with a degree of distrust, and made them fear that their present good treatment might end in a very different manner. They had, besides, found the climate hurtful to their constitutions, and their health was much injured by the changing temperature of the atmosphere. They therefore began to think seriously of sailing for India with the English, that they might save their lives and papers.

They had permission to leave Sana whenever they should think proper; but it was required that they should take a formal leave of the Imam, and show him the curiosities which the vizier had seen; a circumstance which obliged them to defer their journey for some days.

They were sent for to court on the 23d of July, and conducted into the same hall in which the Imam had received them at their former audience. Upon this second occasion, every thing passed very quietly. The Imam sat on the lowest bench beside the throne, upon a chair wrought of reeds. They kissed the hem of his robe, and both sides of his hand. Nobody was present but the vizier, the secretary, by whom they had been conducted into the presence, and six or seven slaves or servants. None of their servants were permitted to accompany them; as the vizier thought them qualified to express themselves in the language of the country. All that they showed the Imam seemed to please him highly; and both he and his minister put many questions to them concerning the manners, trade, and learning of the Europeans. A small chest of medicines, which the Imam had received from an Englishman, was then brought in. Mr. Cramer was asked to explain the virtues of those drugs; and the Imam cauled what he said, concerning their nature, to be taken down in writing.

M. Niebuhr had been indispensed when he came out to wait on the Imam; and, in consequence of standing so long, he felt himself so weak, that he was obliged to ask permission to retire. Before the door he found some of the first officers in the court, sitting on piles of stones along the wall.

The great chamberlain, Gheir Allah, with whom he had often had occasion to speak, immediately made him an offer of his seat, and gathered stones to make himself another. In this company he was again addressed with a number of questions concerning the manners and customs of Europe. Those Arabs (strongly disapproved of their practice of drinking spirituous liquors. But when our hero assured them that the Christians were forbidden to indulge in drunkenness, and that no sensible European drank more wine than was good for his health, they allowed the custom to be rational. They even acknowledged that it was absurd to abstain entirely from the use of a liquor of which they had such abundance, and which, on many occasions, might prove salutary as a remedy.

M. Niebuhr returned into the hall; and, after Mr. Cramer had finished his account of the drugs, and they had answered various other questions, they took their leave with the same ceremonies which they had observed at entering. In the afternoon, they went to take leave of vizier Fakih Achmed, and some other persons of distinction.

They had, indeed, good reasons to induce them to return to Mokha, by the same way by which they had come. It is better frequented; and upon it M. Nie-

buhr would have had an opportunity of copying the inscriptions of which the Arabs had spoken to him: but he had been so often deceived already by stories of pretended antiquities, that to the uncertain hopes which those inscriptions held out to him, he preferred the certain advantage of surveying another part of Yemen, and of seeing the Tehama in the rainy season. Our travellers acquainted the vizier, therefore, that they wished to travel by Mokha to Beit-el-Fakih. He not only approved of their intention, but told them, that the Imam would supply them with camels and asses for their journey.

On the 25th of July, the Imam sent each of them a complete suit of clothes, with a letter to the Dola of Mokha to pay them two hundred crowns as a farewell present. They were at first afraid that this prince might suppose them to have come like the Turks, to draw money from him, or that they had made their presents with interested views. But, after reflecting that they had been obliged to ransom themselves, in a manner, at Mokha, they resolved to accept that letter of credit. When they afterwards presented it to the Dola, he sent them to receive the money from his Saraf, or banker, who paid them by installments, but never without an air of dissatisfaction.

They could hardly think the vizier serious in his offer, when he told them that the Imam would furnish them with beasts of burthen. They were even afraid that this might be a scheme to delay their journey, and would rather have hired camels at their own expence. They thereupon came to an explanation with the secretary, whose answers led them to suspect an interested understanding between him and the Arabian camel-hirer, or post-maler.

They therefore ventured to address the vizier again. He showed surprise at their perplexity; because he had delivered to the secretary a written order, signed by the Imam's own hand, in which he was directed to furnish them with camels and asses for their whole journey, and with a sheep for their provisions. The secretary, on account of their impatience to depart, had not had time to bargain for a share of the profits with the camel-drivers, and was obliged to deliver up the written order, with some pieces of stuff which the Imam had sent them for clothes for their servants. He gave them also notice, that some other presents were intended them, which could not be ready till after a certain number of hours. They set out without them, and the secretary probably kept them to himself.

The dress which M. Niebuhr received from the Imam was exactly like that worn by the Arabs of distinction through Yemen. They wear the shirt over wide drawers of cotton-cloth. The jambea, a sort of crooked cutlafs, hangs by a broad girdle; and a vest with straight sleeves is covered by a flowing gown. The Arabs are strangers to the use of stockings. The only thing they wear on their feet is a sort of half-boots, or slippers. The Turks appear to abuse the generous hospitality with which the Imam treats strangers travelling through his dominions. Poor pilgrims of that nation often come from Jidda, are entertained for months at Sana, and then ask money to defray the expences of their journey home. The Imam even orders a sum of money to be paid them in some of his sea-port towns, that they may return no more to be further chargeable to so hospitable a people.

On the 26th of July, the day of their departure from Sana, they made a short stage along a bad road among bare hills, with few villages interperfed over them. Next day, the road was still worse, lying over rocky mountains. This was the most rugged road they ever saw in all Yemen. The hills were bleak and wild, and the deep valleys among them contained only a few wretched hamlets.

On the 28th of July, they proceeded down steep declivities; but the hills began now to display a small share of verdure; and they here met with several camels, loaded with very bad wood, for Sana. The towns were poor and thinly scattered. In the evening, they were attacked by legions of locusts; but

these were soon driven away by a violent storm of wind, accompanied by heavy rain.

They travelled this day onward to Mofhak, a small town situate on the summit of a precipitous hill. The houses in which travellers lodge, stand at the foot of the hill. They presented the Imam's written order to the Dola of this city, who accordingly furnished them with camels, provender, a good meal for their servants, a sheep for their own supper, and even paid for their lodging. The revenue of Mofhak, and the territory annexed to it, is enjoyed by one of the Imam's sons.

Their next day's journey was upon a still more disagreeable road. Nothing can be worse than the roads between Mofhak and Sehan. Upon the hill they found six large reservoirs, in which rain-water is collected. It becomes putrid, after standing for some time, and is then very disagreeable. In this country the Arabs believe they have most to fear from the worm in the nerves. If it be so, the cause must lay in their drinking that putrid water.

Leaving Sehan on the 30th of July, they continued their journey upon somewhat better roads which winded round the hills. Upon Harras, one of those hills, they came to a defile so narrow that a single camel could hardly pass. On either side are steep rocks; and rain, which had fallen on the preceding day, had broken a gap eight feet deep, precisely in the narrowest part of this road, and made it absolutely impassable. There was no other passage, and all their Arabs were of opinion that they should return straight to Sana, and take the road by Taces; but they were unwilling to turn so far about, and therefore resolved to fill up the gap with stones. Their Arabs laughed to hear them propose an undertaking which they supposed would give them work for several days. But they began to gather stones, and by promises prevailed with them to assist them. Three hours of hard work completed their causeway, and they passed safe over. The Arabs maintained, that, in such a case, the first Dola of Yemen would rather have returned to Sana, than have undertaken what they had accomplished. This gave no favourable impression of the spirit or industry of the nation.

On their way they met with a wandering family, the first of this character they saw in Yemen. They had no tents, but lived under trees with their asses, sheep, dogs, and fowls. Their mode of life is perfectly like that of our European gypsies. They are confined in no place, but go about the villages begging and stealing; and the poor peasants often give them something voluntarily, to remove them from their neighbourhood. A young girl of this company came to ask alms from them: her face was uncovered.

At a small distance from the dangerous pass above-mentioned, they saw the first plantation of coffee trees. They had seen none of these since their excursions in the month of May; but this production does not appear to enrich those by whom it is here cultivated. The villages in the coffee country are declining into a state of wretched poverty: the houses consist of dry walls, covered with reeds, and resemble those of the hills about Beit-el-Fakih and Dsohla. The river Sehan was so swollen that they had difficulty in passing it with their asses.

They spent the night at Samsur, a poor village. In the morning, they found themselves obliged to pass, more than a dozen times in the space of a mile, over the river Sehan, which runs with a meandering course, among rocks, and with a very rapid current. This country being very poor, the roads are not exceedingly safe, and they were therefore obliged to travel slowly, without going before their baggage. They saw here many shrubs of the species which affords the balsam of Mecca; but the inhabitants of the country know not their value, and therefore neglect to cultivate them.

In the coffee-house of Til they met with several pilgrims returning from Mecca. From this inn the country improves. It is covered with verdure: in

the valley are a number of rivulets which discharge themselves into the river Sehan; and a great many villages are scattered over the hills.

They saw a rivulet which loses itself under ground, and appears again at a considerable distance. After leaving the hills, it disappears entirely, and its waters are dispersed over the plains of the Tehama. The arable grounds among these hills are sown only with durra, a sort of coarse millet, of which the poorer people make their bread. The peasants cut out seats in the trees, and sit in these to watch their fields.

The rocks on the confines of the Tehama are basaltic, like those of the coffee-country near Beit-el-Fakih. They came to another rivulet which loses itself in the sands of the Tehama. At last they reached the plain, and arrived at Beit-el-Fakih in the evening of the first of August.

The greater part of this city having been burnt down in the month of April last, they had expected to find it desolate. They were, therefore, greatly surprised to see all the houses, or rather huts, rebuilt. Several edifices of stone, fitted to resist the force of fire, had likewise been raised.

They sent notice to the Dola of their arrival, and desired him to have camels in readiness, on which they might continue their journey. Their Arabian servants would have demanded provisions from him, that they might make merry; and shew the people in what an honourable manner they were received.

Having set out from Beit-el-Fakih on the evening of the 2d of August, they met with two men, on their way to Zebid, who were leading asses loaded chiefly with silver, which had been received by the merchants from Egypt, for coffee, and which they were sending to Mokha, to purchase India goods. This mode of carrying money about, was a proof that in this province there were no fears from robbers.

On the 3d of August, the Dola of Zebid was obliged to furnish our travellers with provisions and camels. They had expected to find the river Zebid considerably swollen; but, near the city, its channel was entirely dry; the waters having been turned off, to overflow a great extent of the adjacent fields which were surrounded by dykes. It should seem that the waters are not suffered to run in the channel of the river, till after they have been plentifully distributed over the country. The peasants construct their dykes in a very simple manner. After plowing up a field, they yoke a plank of wood to two oxen, lead these over the field, till the plank is loaded with earth, empty it upon the line where the dyke is to be drawn, and repeat this till it is formed. They stopped to rest for a few hours at Maufchid, and on the morning of the 5th of August arrived at Mokha.

They had been extremely earnest to return to this city, lest the English ship in which we intended to sail for India, might be gone before our arrival. But, several circumstances happened to detain that vessel some time longer at Mokha; and they soon felt that they had travelled too hastily in that sultry climate. M. Niebuhr fell ill on the 8th of August; Mr. Baurenfeind was confined to his bed, within a few days after; and in a short time, Mr. Cramer likewise, and all their European servants. They fortunately found their friend Mr. Scott still here, who kindly supplied them with European refreshments, which did them more service than they could have received from the use of the best medicines. But all his friendly cares could not remove the lurking distemper which soon afterwards broke out with renewed violence, and deprived our hero of all his remaining fellow travellers.

The city of Mokha stands in a very dry and barren situation: its fortifications are the walls which surround it, some towers on the way to Musfa, which are dignified with the name of castles, and two other castles of the same sort, upon the two arms of the harbour. The greatest of these two castles is called Kalla Tejar, and the smallest Kalla Abdurrah, from the name of two saints, buried in these two places. They are provided with some few

pieces of cannon. The houses of the city are
 built of stone; and some are handsome, in the style
 of those of the suburb of Sana. However, there are
 others, both within and without the walls, no better
 than the huts common through all the Tehama. In
 the environs of this city are abundance of date-trees
 and many agreeable gardens.

The city of Mokha is not ancient, being built about
 four centuries since. Like many other cities in the
 Tehama, this owes its origin to a saint, the celebrated
 Schiech Schödeli. This Schiech acquired at that
 period so great a reputation, that persons eagerly

reorted from the most distant countries to receive
 his instructions. Some of his devout disciples built
 huts round his hermitage, which stood on the sea-side.
 A small village arose on this spot, and was by degrees
 enlarged into a city.

Our Readers will find in Mr. Bruce's Travels, all
 the remaining information which M. Niebuhr gives
 of this City:—we shall therefore proceed with the
 more interesting part of the Work.

 Work—Government, Trade, &c.—Of the Isle Elephanta—The Indian Temple—The Figures, &c.—Death of Mr.
 CRAMER—Departure from Bombay—Arrive at Surat—Description thereof—Conclusion.*

THE vessel belonging to Mr. Scott, with whom
 they were to take their passage for Bombay,
 having been detained for a considerable time at Mok-
 ha, they could not leave the city till the 23d of August
 1763. Though Messrs. Cramer and Baurenfeld were
 at this time very ill, yet they determined not to lose the
 opportunity of leaving Arabia. As to M. Niebuhr,
 his health was so far re-established, that he could safely
 venture upon the voyage to India.

The famous Streight of Babel-Mandel, where the
 Arabian gulf joins the ocean, and where they arrived
 on the second day of their voyage, is about ten Ger-
 man miles in breadth. It is interspersed with small
 isles, of which that nearest Africa is called Perim,
 and forms with the African continent a channel,
 through which ships usually pass, notwithstanding the
 rapid current which prevails in it. In the sea, be-
 tween Arabia and India, there is generally a rapid
 current driving to the east, with so much violence,
 that it is impossible to reckon the rate at which a ship
 runs in passing here. In this sea, they met likewise
 with north winds so cold that they were obliged to put
 on warmer clothes.

In this first part of their voyage, Mr. Cramer's
 health seemed to recover daily; but Mr. Baurenfeld
 grew worse and worse. He sunk into a deep lethar-
 gy, and died on the 29th of August.

Next day after Mr. Baurenfeld, died also their
 servant, Berggreen, a Swede, who had made several
 campaigns in the service of a colonel of hussars.
 This man, who was naturally robust, and had been
 injured to fatigue, had at first laughed at the idea of
 the hardships of a voyage to Arabia; but he sunk un-
 der them at last.

The passage between Arabia and India was formerly
 thought very dangerous. Ships were carried on by
 so rapid a current, that they could neither keep their
 reckoning, nor distinguish the coast during the rainy
 season; several were consequently lost on the low
 coasts of Malabar. These misfortunes have ceased to
 take place, since an observation was made, which has
 been thought new, although Arriao speaks of it as
 being known to the ancients: in the Indian ocean, at
 a certain distance from land, a great many water ser-
 pents, from twelve to thirteen inches in length,
 are to be seen rising above the surface of the
 water. When these serpents are seen, they are an
 indication that the coast is exactly two degrees dis-
 tant.

They saw some of these serpents, for the first time,
 on the evening of the 9th of September; on the 11th
 they landed in the harbour of Bombay; and on the
 13th entered the city.

The Isle of Bombay is two German miles in length,
 by rather more than half a mile in breadth. A nar-
 row channel divides it from another small isle of little
 value, called by the English Old Woman's Island.

Bombay produces nothing but cocones and rice; and
 on the shore a considerable quantity of salt is collect-
 ed. The inhabitants are obliged to bring their pro-
 visions from the continent, or from Sallet, a large
 and fertile island not far from Bombay, and belonging
 to the Mahrautas. The sea-breezes, and the frequent
 rains, cool the atmosphere, and render the climate
 of this island temperate. Its air was formerly un-
 healthy and dangerous, but has become pure since the
 English drained the marshes, in the city and its envi-
 rons. Still, however, many Europeans die suddenly
 here; but they are new-comers, who shorten their
 days by a mode of life unsuitable to the climate; eat-
 ing great quantities of beef and pork, which the
 Indian legislator had wisely forbidden, and drinking
 copiously of the strong wines of Portugal in the hot-
 test season. They likewise persist obstinately in wear-
 ing the European dress, which by its ligatures impedes
 the free circulation of the blood, and by confining
 the limbs, renders the heat more intolerable. The
 Orientals again live to a great age, and are little sub-
 ject to diseases, because they keep the body at ease in
 wide flowing robes, abstain from animal food and
 strong liquors, and eat their principal meal in the
 evening after sunset.

The city of Bombay, situate in the northern part
 of the island, is a quarter of a German mile in length,
 but narrow. It is defended by an indifferent citadel
 towards the sea, and at the middle of the city. On
 the land side, its fortifications are very good. During
 the war the East-India-Company expended no less
 than 600,000 French livres a year, in the construction
 of new works for its defence; and, although these
 works are no longer carried on with the same activity,
 yet the fortifications of Bombay are still continued,
 so that it must be in a short time the most consid-
 erable fortress in India. Beside the town, there are in
 the island some small forts sufficient to protect it from
 any irruption of the Indians.

In this city are several handsome buildings; among
 which are the Director's palace, and a large and ele-
 gant church near it. The houses are not flat roofed
 here, as through the rest of the East, but are covered
 with tiles in the European fashion. The English have
 glass windows. The other inhabitants of the island
 have their windows of small pieces of transparent
 shells framed in wood, which renders the apartments
 very dark. In the East it is the fashion to live during
 the dry season in chambers open on one side. The
 houses of Bombay are in general neither splendid nor
 commodious in any great degree. The harbour is
 spacious, and sheltered from all winds. A valuable
 work, which has been constructed at the Company's
 expence, is two balcons hewn out in the rock, in
 which two ships may be at once careened. A third
 is now preparing. This work, which has been very
 expensive, likewise brings in a considerable annual
 return.

return. Strangers pay very dear for liberty to carcen in these basons.

The toleration which the English grant to all religions has rendered this island very populous. During these hundred years, for which it has been in the possession of the Company, the number of its inhabitants has greatly increased. Of these the Europeans are naturally the least numerous class; and this rather as they do not marry, and their numbers consequently do not multiply. The other inhabitants are Portuguese, or Indian Catholics; Hindoos, the original possessors of the country; Persians from Kerman; Mahometans of different sects; and in the last place some Oriental Christians.

The English have a handsome church at Bombay, but only one English clergyman to perform the services of religion in it; and, if he should die, the congregation would be absolutely deprived of a pastor; for the Company have no chaplains in their ships, and entertain no clergy in their settlements on the coast. Wherefore, when a child is to be baptized, which is not often, as the English rarely marry in India, a Danish missionary is sent for, to administer the sacrament of baptism.

The Catholics, a scanty remainder of the Portuguese, and a great number of Indians, their converts, are much more numerous than the Protestants. They have abundance of priests, as well Europeans as Indians, who attend their studies at Goa. To superintend this herd, the Pope named some years ago a bishop of Bombay, but the governor of the island sent him away, declaring that they needed not Catholic priests of so high a rank. The Catholic churches are decent buildings, and are sumptuously ornamented within. The Jews had once a college and a church in the middle of this island. Their college is at present the country-house of the English governor. And the old church has been converted into a suite of assembly-rooms.

All religions are here indulged in the free exercise of their public worship, not only in their churches, but openly, in festivals and processions, and none takes offence at another. Yet government allows not the Catholic priests to give a loose to their zeal for making proselytes. When any person chooses to become a Catholic, the reasons must be laid before government, and if they are judged valid, he is then allowed to profess his conversion. The priests complain of the difficulty of obtaining this permission. They, however, have considerable success in conversion among the slaves, who, being struck with the pomp of the Romish worship, and proud of wearing the image of a saint upon their breasts, choose rather to frequent the Catholic churches than any others, and persuade their countrymen, as they successively arrive, to follow their example. M. Niebuhr had purchased a young Catholic negro at Bombay, who was also born of Christian parents, and intended to bring him with him into Europe; but, fearing afterwards that the Mussulmans in Persia and Turkey might give him trouble, and pretend that he was carrying away a Mahometan boy in order to make him a Christian, he gave him away before his departure from India.

The English East-India-Company govern their settlements in a mode of administration different from that of the Portuguese and Dutch. These last nations intrust the disposal of all places to the power of a single governor; the Portuguese to the viceroy of Goa; the Dutch, to the governor-general of Batavia. The conquests of the English are, on the contrary, all divided into four independent governments, each of which receives its orders immediately from the Court of Directors at London. The seats of these four governments are, Bombay for the coast of Malabar, Madras for the Coromandel coast, Calcutta for Bengal, and Bencoolen for the island of Sumatra.

Although independent of each other, the several English governors are however obliged to lend one

another mutual aid in extraordinary exigencies. On a late occasion, news being received at Bombay of an insurrection, the council of Bombay, without waiting for orders from the Court of Directors in London, sent troops and artillery to Calcutta. These different establishments are all governed in the same manner. All processs between subjects of the Company are determined by the law of England.

The council or regency of Bombay consist of a governor, with the title of president, and twelve counsellors, who are all merchants, except the commander of the troops, who held lately the rank of major. The Company have of late made some changes upon this arrangement. The president must be a military man; the commander of the troops is a brigadier, and has a voice in the council; and the director of the naval affairs has a place among the twelve counsellors who were formerly all merchants. The other servants of the Company are factors and writers of different ranks. These rise from lower to higher places in the order of seniority,—even to the very first offices, that of president only excepted; who is nominated by the Court of Directors in London. The servants of the Company are sometimes transferred from one department to another.

The president of the council of Bombay is obliged to reside in the island; as are also those counsellors who hold the offices of treasurer and inspector of the Company's stores. The other counsellors are sent out to manage the concerns of the Company's trade in the establishments dependent on the government of Bombay. In M. Niebuhr's time, the directors of the trade at Surat, Tellicherry, Amjengo, and Batta, were members of the council. In three of these places, the Company have forts in which they keep up garrisons of sufficient strength. Since he left that country, the English have conquered Baradich, a great town, north from Surat, which was subject to a Nabob of its own, and was formerly the seat of a Dutch factory. A counsellor from Bombay now resides as director in this city.

Factors are sent to the inferior settlements; such as, in the province of Scindi, the great city of Laha, the seat of the sovereign of the country; Lar Bunder; and Schah Bunder. The Company have likewise factors at Abu Schahr, Cambay, Onor, Calicut, and even in the fort of Victoria. This fort stands on a great river, which holds its course through the interior country, even to as great distance as Puna, the seat of the chief of the Mahrattas. The English acquired this place, with some adjacent villages, from the Mahrattas, in exchange for Geri, a fortress once belonging to the famous Angria, of which they had taken possession. The Company expected, that, by means of this river, they might extend their trade through the country of the Mahrattas. This project having, however failed, they avail themselves of the fort, and purchase butcher's-meat from the Mahometans in the neighbourhood, as the Hindoos about Bombay will not sell their cattle for slaughter.

It is for the benefit of the Company to send its servants successively to different places, before they are advanced to the first employments. Factors thus gain a knowledge of the affairs of all the different settlements subject to the government of which they are afterwards to be counsellors. The Company, however, allow but very moderate salaries to its factors and directors. But they are permitted to trade on their own account in India only from Deleago near the Cape of Good Hope, to China, and northward, as far as Jidda and Batta. By means of this extensive trade chiefly, do the directors acquire that wealth which is the astonishment and envy of their countrymen in Europe. These advantages for the acquisition of wealth in trade, are reserved for the English exclusively. The Company admit strangers into none but the military department of their service, and in it they must enter the lowest rank; but advancement is pretty rapid: for their mode of life cuts off the officers very fast.

C A SICK PERSON (presented to IXORA an Indian City for the recovery of his health.)

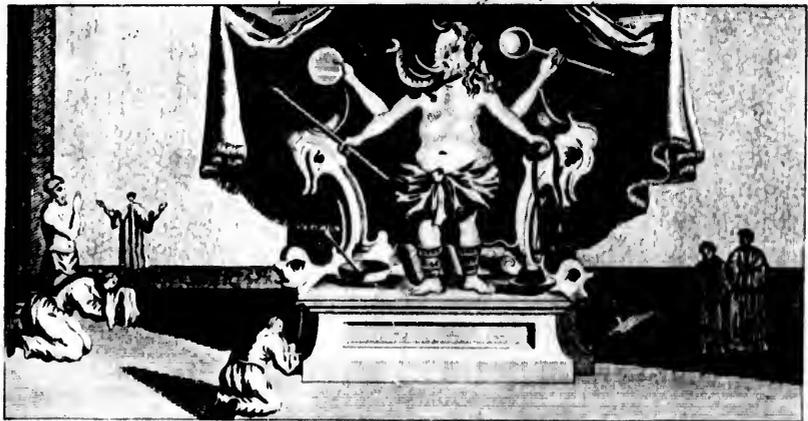

Engraved for PORTLOCK'S, *See* COLLECTION of VOYAGES & TRAVELS.

A very remarkable form under which IXORA is worshipped in the EAST INDIES.

The Idol BRUMA, or BRAMA, another Indian object of Religious adoration.

The Heathen God QUENEVADI, who is called 'Son of Heaven'.

Printed and Sold by B. & C. 1788. No. 1788.

In the government of which Bombay is the centre, the Company maintain seventeen companies of regular troops, each consisting of about an hundred and twenty men, with three companies of artillery. The soldiers are mostly Europeans, except some Topases, or Catholic Indians, dressed in the European fashion. At Bombay there is also a body of three thousand Sepoys, or Indian soldiers, Pagan and Mahometan, who wear their own original dress, and are commanded by their own officers. Each company of this corps has an inferior European officer to teach the Sepoys their exercise; for, when commanded by Europeans, they form good troops. At Surat, the Company have in their pay a small corps of Arabs from the Persian Gulf, who are in such high reputation in India for their courage, that every Rajah desires to have some of them in his service.

The artillery of Bombay is in very good condition, owing to the care of a Swede, whom the English sent out in 1752, and who brought with him a company of gunners whom he had raised in Germany. Bombay was thus furnished with a good number of able workmen, chiefly masons and carpenters. Those Germans likewise engaged many of their countrymen to leave the Dutch, and enter into the English service. The whole coast from Bombay to Basra, is inhabited by people addicted to piracy, such as the Malays, the Sangeries, the Kulis, the Arabs, with other petty nations. The Indians dare not travel from one port to another, otherwise than in caravans, and under the protection of an English vessel, for which they are obliged to pay very dear.

The Company find it not necessary to pay their court in a particular manner to any nation in these latitudes, except the Mahrattas, who are masters of the coast and of the isles about Bombay, and by consequence in some measure masters of the subsistence of this settlement. The marine force of the Mahrattas is not formidable; but they can bring 80,000 cavalry into the field. This residue of the old Indians, retired among the hills, still retain power which renders them formidable to the Moguls. The great Aurengzebe, to keep peace with the Mahrattas, granted them a fourth of the customs paid by several provinces; a revenue which they have found means to enlarge since the rise of the last troubles in Indostan. They ventured to attack the English in a time of peace, and in 1765 took a man of war pertaining to that nation. The Company, instead of revenging this insult, thought it more prudent to settle the affair amicably. The sovereign of the Mahrattas, who is a Bramin, as are also his principal officers, resides at Puna, a great town in the interior country. He farms out his provinces to the Bramins, who again employ under-farmers of their own cast. According to accounts, the government of this nation is good, although arbitrary. Justice is impartially administered; agriculture and manufactures flourish; and the country is very populous. The Mahrattas, although they thus practise justice among themselves, are, however guilty of great barbarities in their frequent incursions into the neighbouring provinces under the government of Mahometans. They pillage and lay waste all before them in the most cruel manner.

All the English ships for India sail to one of the four principal settlements. Those which sail for Bombay are commonly five months in their passage. In one instance, the voyage is known to have been performed in three months and eighteen days. Few of those ships, of which there arrive commonly four in the year, return to Europe immediately after discharging their cargoes. They, for the most part, make first some voyage to a different settlement, as far often as China, by which they gain considerable freights, when the governor favours them so far as to grant them his permission. Each of these ships used formerly to take out 40,000 crowns; but, since the Company have acquired such an extent of territory in India, they have no necessity to lend ready money

from London to their settlements. The principal article with which the ships from India are freighted, is cloth of all sorts, which is sold mostly at Basra, and in Persia. The others are cochineal, iron, guns, arms, copper, ivory, &c. The crew of these ships carry out likewise, each man a parcel of goods on his own account. A great part of the cargoes of these ships is publicly sold, soon after they are unladen. The Indian merchants gather in to the sale; and the goods are disposed of by auction, to the highest bidder. The remainder are carried to the dependent settlements. The ships return to Europe, laden with pepper from Malabar, saltpetre from Scindia, and stuffs from Surat. The crews carry home parcels of perfumes, gums, and spiceries of different sorts, the produce of India.

The small isle Elephanta, situate near Bombay, belongs to the Mahrattas, and is inhabited by an hundred poor Indian families. Its proper name is Cali Pouri. The Europeans call it Elephanta, from the statue of an elephant formed of black stone, which stands in this island, in the open plain, near the shore. This island being of small importance, the Mahrattas take no care of it; and the English are at liberty to visit it without passports, which are requisite, when they go to the isle of Salset.

The Indian temple here is an hundred and twenty feet long, and the same in breadth, without including the measurement of the chapels and the adjacent chambers. Its height within is nearly fifteen feet, although the floor has been greatly raised by the accession of dust, and of the sediment of the water which falls into it in the rainy season. The whole of this vast structure, situate in a hill of considerable height, is cut out in the solid rock. The pillars supporting the roof are also parts of the rock which have been left standing by the architect. They are of an uncommon order; but have an agreeable enough effect. The walls of this temple are ornamented with figures in bas-relief, so prominent, that they are joined to the rock only by the back. Many of these figures are of a colossal size; being some ten, some twelve, and some even fourteen feet high. Neither in design, nor in execution, indeed, can these bas-reliefs be compared with the works of the Grecian sculptors; but they are greatly superior in elegance to the remains of the ancient Egyptian sculpture. They are also finer than the bas-reliefs from the ruins of Persepolis. No doubt, then, but the arts were cultivated by the ancient Indians with better success than is commonly supposed. Probably these figures mark events relative to the mythology and fabulous history of the Indians, for they seem to be representatives of gods and heroes. The modern Indians are so ignorant, that M. Niebuhr could obtain from them no information concerning those antiquities. One man, who pretended to explain the character of one of the largest statues, assured him that it was Kaun, one of their ancient fabulous princes, famous for his cruelties committed upon his sister's children. This statue, which is in other respects well formed, has eight arms; an emblem of power, which the Indians give to their allegorical figures. None of these figures has a beard, and all of them very scanty whiskers. At present, the young Indians wear all whiskers; and such as are advanced in life have commonly the whole beard to grow. The lips of these figures are always thick, and their ears are lengthened out by large pendants; ornaments which they almost all wear. Several of them wear a small cord, in the fashion of a scarf; a mode now prevalent among the Bramins. One woman has but a single breast; from which it should seem, that the story of the Amazons was not unknown to the old Indians. Several figures, as well masculine as feminine, have one arm leaning on the head of a male, or a female dwarf; from which it should seem that these monsters of the human species have always been an object of luxury and magnificence among the tasteless great. Several of these figures have hair on the head, which seems not to be

S3 TRAVELS.

EAST INDIES.

Introduction.

General.

of its native growth, but is perfectly like a wig; so that this covering for the head appears to be of very ancient invention. The female bosom is always perfectly round; from which it seems that the Indian fashion of wearing thin wooden cases upon the breasts is also very ancient. One woman too appears bearing her child in the same attitude which is still in use among the Indians, and which forms those children to stand firmly upon their feet and legs. The head-dress of these female figures is commonly an high-crowned bonnet; also a turban. Some are bare-headed, and have their hair at least well combed, if it is not rather a periwig they wear. Several are naked. The dresses of others is more nearly like that of the moderns. Some of the women wear a cap. In many places the handkerchief, still used through all India, is observable in the hands of the inferior figures. In several parts of these bas-reliefs appears the famous Cobra de Capello, a sort of serpent, which the human figures treat with great familiarity. These serpents are still very common in the isle of Elephanta, the inhabitants of which are not afraid of them, but say that they are friendly to man, and do no harm, unless when intentionally provoked. Certain it is, however, that their bite is mortal.

On each side of this temple is a chapel, nine feet high, consequently lower than the principal building. The walls of these chapels are also covered with bas-relief figures, on a smaller scale than those upon the walls of the temple. Behind the chapels are three chambers, the walls of which display no sculptures; their use our hero could not conjecture. The smallest of the chapels, having no sculptured figure, but that of the god Gonnis, is still in a state of neat preservation, which must be owing to the care of the present inhabitants, who repair thither to perform their devotions. Before the entrance into this chapel, M. Niebuhr found a pile of shapeless stones, newly bedaubed with red paint. He supposed that the modern Indians no longer adore their ancient gods, but have adopted new objects of worship, whom they represent by stones painted red, for want of more artificial statues. In many places through India, indeed, may be seen similar piles of red stones, which are held in high veneration among a people who have now almost entirely lost all knowledge of the fine arts.

The rest of the temple being perfectly neglected, is now the haunt of serpents and beasts of prey. One dares not enter it without first making several discharges of fire arms, to expel those creatures. Even after using this precaution, a Dutchman was once in great danger from swarms of wasps of a peculiar species, which he had roused from their nests with his gun. In the hot season, horned cattle resort to the lower chambers of the temple, to drink of the water which is deposited there during the rains.

There is no way of obtaining any information from the present inhabitants of the island, concerning the period when this temple was built. Those good folks relate with simplicity, that a number of strangers came one night into the island, and reared this edifice before the return of day-light. They seem very fond of the marvellous in India.

On a hill at a small distance, there is said to be another temple; but to it there is no open road: and as the grass was at that time very tall, our hero's guides would not accompany him thither, for fear of serpents and wild animals.

It was their intention to return into Europe through Turkey, and take their passage on board a ship of the Company's which was to sail for Basra the beginning of the next year; but the state of their health would not allow them to take that opportunity. Mr. Cramer, sinking at length under his complaints, died at Bombay, in spite of all medical assistance, February the 10th, 1764.

M. Niebuhr, now the sole survivor of all his party, thought it his duty to attend to his own preservation, and to provide for the safe conveyance of their papers

to Europe, as he feared that these would be lost, if he also should die by the way. Foreseeing that he should have to undergo the same fatigues in passing through Turkey, which he had already encountered in Arabia, and which the weak state of his health was unfit to bear, he resolved to set out straight for London, by the first ship which should sail for Europe. In the mean time, to gratify his curiosity with a sight of Surat, he took the opportunity of going on board an English ship bound on a voyage to that port.

They sailed from Bombay on the 24th of March 1764, and were obliged to stop at Mahim, a small town in the northern part of the isle, where a member of the Council of Bombay constantly resides.

On the 26th of March they arrived in the road of Surat, at the distance of three German miles from the city. They went on shore at Domus, a village distinguished by the residence of some, and by a vast Indian fig-tree, which is held in high veneration. Here they took a Kakkri, the carriage common in the country, which is neither more nor less than a covered cart, drawn by two oxen, which are driven by a peasant seated on the pole. M. Niebuhr had here an instance of the great dryness of this country, for the movement of their light carriage raised a cloud of dust about them. He never suffered so much from the dust, even in caravans of some hundreds of camels, horses, and mules.

The city of Surat stands in a large and fertile plain, on the banks of a considerable river, named Tappi. On the land side, it is encompassed with two brick walls, which divide it into the inner and the outer town. The citadel stands within the inner, on the shore of the Tappi, and is divided by trenches from the town. One may walk round the outer wall in two hours and a half; the space which it encloses is chiefly occupied by gardens, having but a very few houses.

The larger houses are flat-roofed here, as through the rest of the East, with courts before them. The houses of the common people are high-roofed. Although Surat has been long under the dominion of the Mahometan Moguls, yet here is no handsome mosque with towers, as among the Turks and Arabians. The squares of this city are large, and the streets spacious, but not paved; so that the dust is insufferable. Each street has gates of its own, with which it is shut up in times of turbulence; and these are as frequent here as at Cairo.

At Surat provisions are plentiful and cheap; the air, too, is wholesome, notwithstanding the warmth of the climate. One thing unfavourable is, that ships cannot enter the harbour, because the Tappi is full of sand-banks. This river is too low in the dry season; and in the rains swells too suddenly, to such a height as to overflow all the neighbourhood.

Universal toleration and liberty are enjoyed in this city by all religious professions; and its inhabitants are accordingly very numerous. The Europeans residing here estimate the population of the city at a million of souls. But this calculation M. Niebuhr esteems above the truth, by two thirds.

One thing singular in Surat is, that here is no hospital for human beings, but an extensive establishment of this nature for sick or maimed animals. When the Europeans turn out an old horse, or any other domestic animal, to perish as useless, the Indians voluntarily assume the care of it, and place it in this house, which is full of infirm, decrepid cows, sheep, hens, rabbits, pigeons, &c. M. Niebuhr saw in it a great tortoise, which was blind and helpless, and, as he was told, 125 years of age. The charitable Indians keep a physician on purpose for these animals.

The environs of Surat are not without gardens, which are the property either of Europeans, or of natives of the country. The finest of those belonging to Europeans is the property of the Dutch East-India-Company. Its aspect is rich and charming.

To obtain a proper idea of an Indian garden, our hero went to see one which was formed by a late

Nabob, at the expence of 500,000 rupees. This garden was of considerable extent, but had not the usual appearance of regularity in the design, and had in it nothing in the fashion of European gardens, but a few ponds and fountains: the rest was a confused medley of ouidings and small orchards. Among the buildings was one of great dimensions, having baths and saloons, and ornamented with the magnificence of India. The other buildings are harems for the Nabob's wives, entirely separate from each other, so that each lady can hold her little court apart. Every haram has some one good apartment; but all the rest of it consists of very narrow chambers for the slaves. What was most striking in this garden, was the passage from one suite of rooms to another, by paths so narrow, so winding, and so blocked up by doors, as to afford a strong instance of the distrust with which the unfortunate great in despotic countries regard all about them; so that they are never free from anxiety, and are obliged to stand continually on their guard against surprise.

The principal inhabitants of Surat are Mahometans, and mostly strangers, although employed in the service of the government. They are equally zealous in the observance of their law as the Turks and Arabians. Although of the sect of the Sunnites, they tolerate the Shiites, and even permit them to celebrate the festival of Haffein. They make no scruple of drinking wine publicly, or of lending money upon interest.

All people of distinction in Surat, and through the rest of India, speak and write the Persian language. Hence has this language been received at the courts, and the knowledge of it is very useful for the dispatch of business. In trade, corrupt Portuguese is the language used.

The Mussulmans of Surat bring about them a great many Fakirs of their own religion, who are the most insolent beggars in the world. Those Fakirs will often sit down before a house, and continue there till the owner pays the sum they ask, or make a composition with them. As the police interferes not to check these insolent mendicants, people must be content with getting quit of them at any price.

At Surat, our hero had occasion to witness the Mussulman procession at the festival of Bairam. The counsellor from Bombay, who resides in the citadel of Surat, and represents a Nabob, is obliged to announce this ceremony by a discharge of cannons, and to assist at it in person. It is a strange sight, to see an English merchant in the European dress, attended by a party of British soldiers, and with the train of an Indian prince, conduct and regulate a religious festival of the Mahometans. The English director made the Indians sensible of his importance upon this occasion, by refusing to discharge his cannons in the night; a favour requested of him by the Nabob of the city, in order to give the people timely warning of the approach of the festival.

In this procession there was nothing remarkable, except the numbers of kakkris, palanquins, and horses, a few cannons, a great deal of martial music, and the Nabob's soldiers. The governor rode upon an elephant, on the back of which he sat on a sort of throne, raised upon four pillars. This elephant was, like most of the horses and oxen which drew the kakkris, painted red.

Kakkris, the carriages most common through India, are of a very simple construction, run upon two wheels, and are drawn by oxen: the driver sits on a large pole, consisting of several bamboos. It is not in any ornaments about these vehicles, but in the cattle which draw them, that the object of pride and expence to the Indian lies: a pair of white oxen for one of these carriages will cost 600 rupees. These oxen have the points of their horns ornamented with silver; their pace is quick, but less so than that of horses.

The citizens of Surat display their magnificence likewise in their palanquins. This is a sort of couch

suspended from a bamboo, and borne by four men. The traveller reclines in this vehicle, and is shaded from the sun by a curtain. A palanquin completely ornamented with silver, covered with rich stuffs, and suspended upon a handsome bamboo, properly bent, will cost above 200 pounds sterling. The bamboo only of the governor of Bombay's palanquin, exclusive of the other ornaments, cost 125 pounds sterling. The bearers of the palanquins are Italian servants, who wear no clothes, except a small linen cloth about their loins, with close flat bonnets on their heads, as liveries, and are commonly employed in keeping the rooms clean within the houses. The European ladies are at first shocked at the indecency of being carried by naked men, but soon learn to accustom themselves to it. The palanquins of the Mahometan ladies are incommodious wooden boxes, entirely close, and fixed upon a straight pole.

The Hindoos, the aboriginal inhabitants of the country, compose the most considerable part of the population of Surat. They are almost all of the cast of the Banians; and hence their skill and dexterity in matters of calculation and economy often raise them to places of considerable trust, in the collection of the taxes and customs for the Mahometans. These Banians, being born to trade, have engrossed the commerce of India to such a degree, that all foreign nations are obliged to employ them as brokers; in which employment they give better satisfaction than the Jews in Turkey. Europeans have never found reason to repent the intrusting even their whole fortune to the Banians, who continue to give astonishing proofs of their probity and fidelity. Some of them are very rich; but they live all in a style of moderate simplicity, wearing for dress only a plain robe of white cotton.

At Surat there are numbers of Persians, who are skilful merchants, industrious artisans, and good servants. In the same city are also Armenian, Georgians, and Jews; but of none of these any considerable number. The Indian Catholics, commonly called Portuguese, from their speaking the India dialect of the Portuguese language, are numerous here. At Surat, the day is reckoned from sun-set to sun-set, and is divided, not into 24 hours, but into 60 garris. Here are no clocks; the progress of the day is measured by different means. In a conspicuous situation, a man stands to put a cup of copper, pierced with a hole in the bottom, from time to time under water; every time the cup sinks, a garri is counted, and the man announces its lapse by striking the number which it makes upon a plate of metal that sounds like a clock. Each garri consists of 24 of our minutes. In the houses of the great, too, where clocks and watches are not wanting, this old fashion of measuring time is still kept up.

The great trade carried on at Surat, renders this city the store-house of the most precious productions of Indolan. Hither is brought from the interior parts of the empire an immense quantity of goods, which the merchants carry in their ships to the Arabic Gulf, the Persian Gulf, the coast of Malabar, the coast of Coromandel, and even to China. The provinces near this city are full of manufactures of all sorts.

Having already given our Readers a copious Description of this Place in the TRAVELS of Mr. BRUCE (which are of a more modern date) we shall decline any further repetition, for the sake of introducing other novel and interesting Matter.

We shall now proceed with the Travels of the much celebrated and unfortunate M. BRISSET DE WARVILLE, in AMERICA; presuming that his Descriptions of the UNITED STATES of that now Independent Nation, accurately Translated from the French, will be highly acceptable to our numerous Readers.

A NEW, COMPLETE, AND GENUINE

HISTORY of TRAVELS

IN THE

United States of America.

Undertaken and Performed in the Year 1788,

By J. P. BRISSOT DE WARVILLE,

(About Five Years before he was Guillotined in PARIS.)

I N T R O D U C T I O N .

THE author informs us that the object of his travels was not to search for unknown plants or curiosities, but to study men who had just acquired their liberty, and now styled themselves an independent nation. His first object was to examine the effects of liberty on the character of man, of society, and of government; and as this was the most essential point of his observations, for the purpose of attaining a so necessary knowledge, he wrote every evening in a journal what principally struck him in the day. His next rule was to consider the composition of the legislative body, the senate, and executive power, elections, any abuses that may be in them, &c. &c. and to draw forth such conclusions from them as reason might dictate; likewise to remark the principal articles of exportation and importation, the number of ships made use of, and the state of money used in commerce: moreover, as Banks are an important article in the common-wealth, to mark well the proportion observed between the money they contained and the bills they circulated; likewise to note the prevailing system of taxation,—the federal debt of every State, and of individuals,—the federal expences of every State, and their accountability.

Our author further intended to see if report was just respecting the accounts of New-York, which

intimated that the lands were uncultivated, the town surrounded with forests, and that, though fire-wood was cheap, they preferred coals at a high price. Also, to inquire into their mode of rearing cattle; the dispositions and private morals of the inhabitants; of education, public and private; and to make acquaintance, as far as possible, with the ministers of religion, for the purpose of gaining the fullest knowledge of this grand point.

M. de Warville, our author, was one of the deputies to the National Convention; he and his partners, Vergniaux, Genfonne, Duperret, Valaze, Carra, Gardien, Duprat, Sillery, Fauchet, Ducros, Bover-Fonfrede, Lafource, Lestep, Beauvais, Duclatel, Mainville, Lacaze, Lechard, Boileau, Antiboil, and Vigée, having been convicted of a conspiracy against the unity and indivisibility of the republic, and against the liberty and safety of the French nation, were condemned to die at Paris, by the guillotine, November 30, 1793. Valaze stabbed himself in court as soon as sentence was passed; the rest suffered the next day, and the sentence was executed on them all in the space of thirty-seven minutes. The corpse of Valaze was conveyed separately, on a cart, to the place of execution, exhibited at the scaffold, and buried on the same spot.

Engraved for PORTLOCK'S *New* COLLECTION of VOYAGES & TRAVELS.

Celebration of the
CANADIAN'S grand SACRIFICE to QUITCHI MANITOU,
whom they call their great Spirit.

Engraved for PORTLOCK'S, in COLLECTION of VOYAGES & TRAVELS.

(KING of FLORIDA consulting his MAGICIAN previous to his journey to Batta.

the increased demand for sugar, cotton, coffee, &c. in Europe, has augmented in a great degree the demand for slaves in the colonies.

July 30, our hero arrived at Boston, and was highly delighted in wandering up and down that long street, whose simple houses of wood border the magnificent channel, and whose full stores afforded a supply of every desirable production. He enjoyed, while every thing as yet was in its infancy, the activity of the merchants, the artisans, and sailors.

The Bostonians unite simplicity of morals with that politeness and delicacy of manners which render virtue more amiable. They are hospitable to strangers, and obliging to friends; they are tender husbands, fond and almost idolatrous parents, and kind masters. Music, which their teachers formerly proscribed as a diabolic art, begins to make part of their education. In some houses the forte-piano may be heard. This art, it is true, is still in its infancy; but the young novices who exercise it, are so gentle, so compliant, and so modest, that the proud perfection of art gives no pleasure equal to what they afford.

The young women here, enjoy the liberty they do in England, and they do not abuse it. Their frank and tender hearts have nothing to fear from the perfidy of men. Examples of this perfidy are rare; the vows of love are believed; and love always respects them, or shame follows the guilty.

The Bostonian mothers are reserved; their air is however frank, good, and communicative. Entirely devoted to their families, they are occupied in rendering their husbands happy, and in training their children up to virtue.

Heavy penalties, such as the pillory and imprisonment, the law denounces against adultery. This law has scarcely ever been called into execution: it is because families are happy; and because they are happy they are pure.

Neatness without luxury, is a characteristic feature of this purity of manners; and this neatness is seen every where at Boston, in their dresses, in their houses, and in their churches. Nothing is more charming than an inside view of a church on Sunday. The good cloth coat covers the man; calicoes and chintzes dress the women and children, without being spoiled by those gewgaws which whim and caprice have added to them among our women. Powder and pomatum never fully the heads of infants and children: adults, however, invoke the art of the hair-dresser; for this art has already crossed the seas.

All religions are tolerated, and the ministers of different sects live in such harmony, that they supply each other's places when any one is detained from his pulpit.

There are many clubs at Boston. M. de Warville was several times at a particular club held once a week, and was much pleased with their politeness to strangers, and the knowledge displayed in their conversation. There is no coffee-house at Boston, New-York, or Philadelphia. One house in each town, that they call by that name, serves as an exchange.

One of the principal pleasures of the inhabitants of these towns, consists in little parties for the country, among families and friends. The principal expense of the parties, especially after dinner, is tea. In this, as in their whole manner of living, the Americans in general resemble the English. Punch, warm and cold, before dinner; excellent beef, and Spanish and Bordeaux wines, cover their tables, always solidly and abundantly served. Spruce beer, excellent cyder, and Philadelphia porter, precede the wines. This porter is equal to the English: the manufacture of it saves a vast tribute formerly paid to the English industry. Our traveller also found American cheese equal to the best Cheshire of England, or the Rochfort of France. This may with truth be said of that made on a farm on Elizabeth-

Island, belonging to the respectable Governor Bowdoin.

After forcing the English to give up their domination, the Americans determined to rival them in every thing useful. This spirit of emulation shews itself every where: it has erected at Boston an extensive glass manufactory, belonging to M. Breck and others.

Massachusetts wishes to rival, in manufactures, Connecticut and Pennsylvania; she has, like the last a society formed for the encouragement of manufactures and industry. The greatest monuments of the industry of this state, are the three bridges of Charles, Malden, and Essex.

The honour of having given the first college or university to the new world is due to Boston. It is placed on an extensive plain, four miles from Boston, at a place called Cambridge; the origin of this useful institution was in 1636. The imagination could not fix on a place that could better unite all the conditions essential to a seat of education; sufficiently near to Boston, to enjoy all the advantages of a communication with Europe and the rest of the world; and sufficiently distant, not to expose the students to the contagion of licentious manners, common in commercial towns. The air of Cambridge is pure, and the environs charming, offering a vast space for the exercise of the youth. The buildings are large, numerous, and well distributed. But, as the number of the students augments every day, it will be necessary soon to augment the buildings. The library, and the cabinet of philosophy, do honour to the institution. The first contains 23,000 volumes. The regulation of the course of studies here, is nearly the same as that at the university of Oxford.

Every year a solemn feast is celebrated at Cambridge in honour of the Sciences. This feast, which takes place once a year in all the colleges of America, is called the Commencement: it resembles the exercises and distribution of prizes in the European colleges. It is a day of joy for Boston; almost all its inhabitants assemble in Cambridge. The most distinguished of the students display their talents in presence of the public; and these exercises, which are generally on patriotic subjects, are terminated by a feast, where the freest gaiety, and the most cordial fraternity reign together.

It is remarked, that in countries chiefly devoted to commerce, the sciences are not carried to any high degree. This remark applies to Boston. The university certainly contains men of worth and learning; but science is not diffused among the inhabitants of the town. Commerce occupies all their ideas, turns all their heads, and absorbs all their speculations. On this account there are few estimable works, and few authors. Poets, for the same reason, must be more rare than other writers. They speak, however, of an original, but lazy poet, by the name of Allen, whose verses are said to be full of warmth and force. They mention particularly a manuscript poem of his, on the famous battle of Bunker-Hill; but he will not print it. They publish a Magazine here, though the number of Gazettes is very considerable. The multiplicity of Gazettes proves the activity of commerce, and the taste for politics and news; the merit and multiplicity of Literary and Political Magazines are signs of the culture of the sciences.

The Bostonians have no brilliant monuments; but they have neat and commodious churches, good houses, superb bridges, and excellent ships. Their streets are well illuminated at night.

Besides the societies for the encouragement of agriculture and manufactures, they have another, known by the name of the Humane Society. Their object is to recover drowned persons: it is formed after the model of the one at London, as that is copied from the one at Paris. They follow the same methods as in Europe, and have effected many recoveries.

The Medical Society is not less useful. It holds a correspondence with all the country towns; to know

the symptoms of local diseases, propose the proper remedies, and give instruction thereupon to their fellow-citizens.

The alms-house is another very laudable establishment. It is destined to the poor, who, by age and infirmity, are unable to gain their living. It contains at present about one hundred and fifty persons.

The work-house, or house of correction, is not very full, the morals of the people being in general good, and the spirit of industry prevalent.

The profession of the law is one of the most lucrative employments in this state, and they still preserve the expensive forms of the English practice.

The parts adjoining Boston, are charming and well cultivated, adorned with elegant houses and agreeable situations. Among the surrounding eminences may be distinguished Bunker-Hill, to which the super-bridge of Charlestown leads. This town was entirely burnt by the English, in their attack of Bunker-Hill. It is at present rebuilt with elegant houses of wood.

C H A P. II.

Departure from Boston—Remarks on the Taverns, &c.—From Spenser to Brookfield—To Wilbraham—Arrival at Springfield—Description of the Place—Set out for Hartford—Description of that Town—Its Productions, &c. Connecticut—Wethersfield—Newhaven—Of the Women—Middleton—Danger of the Ferry at Stratford—Fairfield—Hartford—New Rochelle—Arrive at New-York—Make for Philadelphia—Land at Paulus Hook—Newark—New Brunswick—Trenton—Bristol—Frankford—Their Arrival at Philadelphia—Journey to Burlington, &c.

OUR travellers set out from Boston at four o'clock in the morning of August the 8th, and passed through the handsome town of Cambridge.

The distance from Boston to New-York is about two hundred and fifty miles. Many persons have united in establishing a kind of diligence, or public stage, which passes regularly for the convenience of travellers. In the summer season, the journey is performed in four days.

The country appears well cultivated as far as Weston, where they breakfasted; thence they passed to Worcester to dinner, forty-eight miles from Boston. This town is elegant and well peopled. They slept the first night at Spenser, a new village in the midst of the woods. The house of the tavern was but half built; however, the part that was finished, was very clean. The chambers were neat, the beds good, the sheets clean, supper passable; cyder, tea, punch, and all for fourteen pence a-head.

They left Spenser at four o'clock in the morning. New carriage, new proprietor. It was a carriage without springs, a kind of waggon. It seemed at first very inconvenient, but by the time they had run thirty miles among the rocks, they were convinced that a carriage with springs would very soon have been overfet and broke.

Though great the fatigue of this route, yet the traveller is amply recompensed by the variety of romantic situations, by the beauty of the prospects which it offers at each step, by the perpetual contrast of savage nature and the efforts of art. Those vast ponds of water, which lose themselves in the woods; those rivulets, that wash the meadow, newly snatched from uncultivated nature; those neat houses, scattered among the forests, and containing swarms of children, joyous and healthy, and well clad; those fields, covered with trunks of trees, whose destruction is committed to the hand of time, and which are covered under the leaves of Indian corn; those oaks, which preserve still the image of their ancient vigor, but which, girdled at the bottom, raise no longer to heaven but dry and naked branches, which the first stroke of wind must bring to the earth:—all these objects, so new to an European, arrest him, absorb him, and plunge him into an agreeable reverie. The depths of the forests, the prodigious size and height of the trees, call to his mind the time when the savages were the only inhabitants of this country. This ancient tree has beheld them; they filled these forests: they have now given place to another generation. The cultivator fears no more their vengeance; his musket, formerly his necessary companion at the plough, now rests suspended in his house. Alone, with his wife and children, in the midst of the forests, he sleeps quietly, he labours in peace, and is happy. Such were the ideas which occupied our hero the greater part of his journey; they sometimes gave place to others, arising from the view of the country.

houses, which are seen at small distances through all the forests of Massachusetts. Neatness embellishes them all. They have frequently but one story and a garret; their walls are papered; tea and coffee appear on their tables; their daughters clothed in calicoes, display the traits of civility, frankness, and decency; virtues which always follow contentment and ease. Almost all these houses are inhabited by men who are both cultivators and artisans; one is a tanner, another a shoemaker, another sells goods; but all are farmers. The country stores are well afforded; one may find in the same shop hats, nails, liquors. It is not supposed that one third of the land of Massachusetts is under cultivation: it is difficult to say when it will all be so, considering the invitations of the western country and the province of Maine. But the uncultured lands are all located, and the proprietors have enclosed them with fences of different sorts. These several kinds of fences are composed of different materials, which announce the different degrees of culture in the country. Some are composed of the light branches of trees; others, of the trunks of trees laid one upon the other; a third sort is made of long pieces of wood, supporting each other by making angles at the end; a fourth kind is made of long pieces of hewn timber, supported at the ends by passing into holes made in an upright poll; a fifth is like the garden fences in England; the last kind is made of stones thrown together to the height of three feet. This last is most durable, and is common in Massachusetts.

From Spenser to Brookfield is fifteen miles. The road is good as far as this last town. A town in the interior of America, designates an extent of eight or ten miles, where are scattered a hundred or two hundred houses. This division into towns is necessary for assembling the inhabitants for elections and other purposes. Without this division, the inhabitants might go sometimes to one assembly, and sometimes to another, which would lead to confusion. Besides, it would render it impossible to know the population of any particular canton; this serves for the basis of many regulations. No people carry their attention in this particular, so far as the Americans. The situation of Brookfield is picturesque. While breakfast was preparing, our travellers read the gazettes and journals, which are distributed through all the country. Their breakfast consisted of coffee, tea, boiled and roasted meat; the whole for ten-pence, New-England currency, for each traveller.

From this place to Wilbraham the road is covered with rocks, and bordered with woods. At this place, a new proprietor, and a new carriage. A small light carriage, well suspended, and drawn by two horses, took place of their heavy waggon. They could not conceive how five of them could fit in this little Parisian chariot, and demanded another. The conductor said he had no other; that there were so few travellers

law is one of the most liberal in the state, and they still preserve the English practice.

Boston, are charming and well furnished; elegant houses and agreeable surrounding eminences may be seen from Bunker-Hill, to which the superb view is town was entirely owing to their attack of Bunker-Hill. The elegant houses of wood,

To Wilbraham—Arrive at Town—Its Productions, &c.—The Ferry at Stratford—Fairfield—Lond at Paulus Hook—New-Jersey—Journey to Burlington, &c.

at small distances through all the states. Neatness embellishes frequently but one story and a papered; tea and coffee appear; their daughters clothed in bits of civility, frankness, and always follow contentment. These houses are inhabited by farmers and artisans; one is a maker, another sells goods. The country stores are well in the same shop hats, nails, and steel that one third of the land is cultivated; it is difficult to find, considering the invitations and the province of Maine. They are all located, and the problem with fences of different kinds of fences are composed of which announce the different demarcation. Some are composed of trees; others, of the trunks of one other; a third sort is made of wood, supporting each other by a post; a fourth kind is made of stone, supported at the ends by an upright post; a fifth is of brick; the last kind is of iron, together to the height of three feet, and is common in

Springfield is fifteen miles. The town is the last town. A town in the state signifies an extent of eight or ten miles; a hundred or two miles division into towns is necessary for elections and other public divisions, the inhabitants assemble, and sometimes lead to confusion. Besides, it is difficult to know the population of a town; this serves for the basis of taxation; people carry their attention to the Americans. The structure is picturesque. While breakfasters read the gazettes and distributed through all the communities of coffee, tea, boiled whole for ten-pence, New-Jersey traveller.

Wilbraham the road is covered with woods. At this place, a new carriage. A small light carriage, and drawn by two horses, a waggon. They could not find a carriage to fit in this little Pennsylvania. The conductor there were so few travellers in

in this part of the road, that he could not afford to run with more than two horses; that most of the travellers from New-York stopped in Connecticut, and most of those from Boston, at Worcester. They were obliged to submit. They started like lightning; and arrived in an hour and a quarter at Springfield, ten miles.

This place, where we dined, resembles an European town; that is, the houses are placed near together. On a hill that overlooks this town, is a magazine of ammunition and arms belonging to the state of Massachusetts. This is the magazine that the rebel Shays endeavoured to take, and was so happily defended by General Shepard. They set out from Springfield, after dinner, for Hartford. They passed in a ferry-boat, the river that washes the environs of Springfield.

Hartford is a considerable rural town; the greater part of the inhabitants live by agriculture; so that ease and abundance universally reign in it. It is considered as one of the most agreeable in Connecticut, on account of its society. The environs of Hartford display a charming cultivated country; neat elegant houses, vast meadows covered with herds of cattle of an enormous size, which furnish the market of New-York, and even Philadelphia. Their sheep resemble ours; but not, like ours, watched by shepherds, and tormented by dogs; hogs of a prodigious size, surrounded with numerous families of pigs, wearing on the neck a triangular piece of wood, invented to hinder them from passing the barriers which enclose the cultivated fields; geese and turkeys in abundance, as well as potatoes and all other vegetables. Productions of every kind are excellent and cheap: the fruits, however, do not partake of this excellent quality, because they are less attended to. Apples serve for making cyder; and great quantities of them are likewise exported. This state owes all its advantages to its situation. It is a fertile plain, enclosed between two mountains, which render difficult its communications by land with the other states. It is washed by the superb river Connecticut, which falls into the sea, and furnishes a safe and easy navigation. Agriculture being the basis of the riches of this state, they are here more equally divided. Connecticut appears like one continued town. On quitting Hartford, you enter Wethersfield, a town not less elegant, very long, consisting of houses well built. It is remarkable for its vast fields uniformly covered with onions; of which great quantities are exported to the West-Indies. It is likewise remarkable for its elegant meeting-house, or church. On Sunday it is said to offer an enchanting spectacle, by the number of young handsome persons who assemble there, and by the agreeable music with which they intermingle the divine service.

Nor is Newhaven inferior to Wethersfield for lovely women. At their balls during the winter, it is not rare to see an hundred charming girls, adorned with those brilliant complexions seldom met with in journeying to the South, and dressed in elegant simplicity. The beauty of complexion is as striking in Connecticut, as its numerous population. Every tavern exhibits neatness, decency, and dignity. The tables are served by a young girl, decent and pretty; by an amiable mother, whose age has not effaced the agreeableness of her features; by men devoid of pride, and yet are not ignoble and base, like the greatest part of our tavern-keepers. On the road one may often meet those fair Connecticut girls, either driving a carriage, or alone on horse-back, galloping boldly; with an elegant hat on the head, a white apron, and a calico gown;—usages which prove at once the early cultivation of their reason, since they are trusted so young to themselves, the safety of the road, and the general innocence of manners. Other proofs of the prosperity of Connecticut, are the number of new houses every where to be seen, and the number of rural manufactories arising on every side.

Previous to their arrival at Middleton, where they were to breakfast, they stopped on the hill which overlooks that town, and the immense valley on which it is built. It is one of the finest and richest prospects in America. Middleton is built like Hartford: broad streets, trees on the sides, and handsome houses. They changed horses and carriages at Durham; and after admiring a number of picturesque situations on the road, they arrived at Newhaven, where they dined. The university here enjoys a great reputation through the continent; the port is much frequented; the society is said to be very agreeable. They were obliged to quit this charming town, to arrive in the evening at Fairfield. They passed the inconvenient ferry at Stratford; afterwards, assailed by a violent storm, they were well enough defended from it by a double curtain of leather which covered the carriage. The driver, though pierced through with the rain, continued his route through the obscurity of a very dark night. They passed the night at Fairfield, a town unhappily celebrated in the last war, being burnt by the English. Most of the houses are rebuilt; but those who have seen this town before the war, regret its ancient state, and the air of ease, and even opulence, that then distinguished it. At Fairfield finished the agreeable part of their journey. From this town to Rye, thirty-three miles, they had to struggle against rocks and precipices. One of these is called Horse-neck; a chain of rocks so steep, that if a horse should slip, the carriage must be thrown into a valley two or three hundred feet. From Horse-neck they passed to New Rochelle, a colony founded the last century by some French emigrants, which appears not to have prospered.

It is thirty-one miles from Rye to New-York. The road is good, even, and gravelly. They stopped at one of the best taverns in America, where they had an excellent dinner, and cheap.

Early on the 25th of August, M. de Warville went from New-York, and had the north river to pass before arriving at the stage. They passed the ferry in an open boat, and landed at Paulus Hook: they reckon two miles for this ferry, for which they pay sixpence, money of New-York.

The carriage is a kind of open waggon, hung with double curtains of leather and woolen, which are raised or let fall at pleasure: it is not well suspended. But the road was so fine, being sand and gravel, that they felt no inconvenience from that circumstance. The horses are good, and go with rapidity. These carriages have four benches, and may contain twelve persons. The light baggage is put under the benches, and the trunks fixed on behind. A traveller who does not choose to take the stage, has a one-horse carriage by himself.

In these stages may be found men of all professions. They succeed each other with rapidity. One who goes but twenty miles, yields his place to one who goes further. The mother and daughter mount the stage to go ten miles to dine; another stage brings them back: at every instant, then, they are making new acquaintances. The frequency of these carriages, the facility of finding places in them, and the low and fixed price, invite the Americans to travel.

The road from New-York to Newark is in part over a marsh: built wholly of wood, with much labour and perseverance in the middle of water, on a soil that trembles under the feet, it proves to what point may be carried the patience of man, who is determined to conquer nature. But though much of these marshes are drained, there remains a large extent of them covered with stagnant waters, which infect the air, and give birth to those musquitoes with which strangers are cruelly tormented, and to an epidemical fever which makes great ravages in summer; a fever known likewise in Virginia and in the Southern States, in parts adjacent to the sea. Our traveller thinks that the upper parts of New-Jersey

Jersey are exempt from this fever, and from musquitoes; but this state is ravaged by a political scourge, more terrible than either; it is paper money. This paper is still in New-Jersey, what the people call a legal tender; that is, they are obliged to receive it at its nominal value, as a legal payment.

From Newark they went to dine at New-Brunswick, and to sleep at Trenton. The road is bad between the two last places, especially after rain; it is a road difficult to be kept in repair. They passed by Prince-Town; this part of New-Jersey is very well cultivated. M. de Crevecoeur has not exaggerated in his description of it. All the towns are well built, whether in wood, stone, or brick. These places are too well known in the military annals of this country, to require a description of them. The taverns are much dearer on this road, than in Massachusetts and Connecticut: our traveller paid at Trenton for a dinner, three shillings and sixpence, money of Pennsylvania.

They passed the ferry from Trenton at seven in the morning. The Delaware, which separates Pennsylvania from New-Jersey is a superb river, navigable for the largest ships. Its navigation is intercepted by the ice during two months in the year. Vessels are not attacked here by those worms, which are so destructive to them in rivers further south. The prospect from the middle of the river is charming: on the right hand, are the mills and manufactories; on the left, two charming little towns, which overlook the water. The borders of this river are still in their wild state. In the forests which cover them are some enormous trees. There are likewise some houses, but they are not equal to those of Massachusetts, in point of simple elegance.

They breakfasted at Bristol, a town opposite to Burlington. It was here that the famous Penn first planted his colony: but it was represented to him, that the river here did not furnish anchoring ground so good and so safe as the place already inhabited by the Swedes, where Philadelphia has since been built. He resolved then, to purchase this place of them, give them other lands in exchange, and to leave Bristol.

Passing the river Shammony, on a new bridge, and then the village of Frankford, they arrived at Philadelphia, by a fine road bordered with the best cultivated fields and elegant houses, which announce the neighbourhood of a great town.

Our traveller's stay here was short, as particular business called him to Burlington, on the borders of the Delaware. This is an elegant little town, more ancient than Philadelphia. Many of the inhabitants are Friends, or Quakers: this was formerly their place of general rendezvous.

Burlington is separated from Bristol only by the river. Here is some commerce, and some men of considerable capital. The children here are all decent and healthy.

M. de Warville visited a bettering house, or house of correction situated in the open country, in one of those parts of the original plan of Philadelphia not yet covered with houses. This hospital is constructed of bricks, and composed of two large buildings: one for men, and the other for women. There is a separation in the court, which is common to them. This institution has several objects: they receive into it, the poor, the sick, orphans, women in travail, and persons attacked with venereal diseases. They likewise confine here, vagabonds, disorderly persons, and girls of scandalous lives. There are particular halls appropriated to each class of poor, and to each species of sickness; and each hall has its superintendent.

Every sick, and every poor person, has his bed well furnished, but without curtains. Every room is lighted by windows placed opposite, which introduce plenty of light. These windows admit a free circulation of air: most of them open over the fields; and as they are not very high, and are without grates, it would be very easy for the prisoners to make their escape; but the idea never enters their heads. This fact proves that the prisoners are happy, and consequently, that the administration is good. The kitchens are well kept. The eating-rooms, which are on the ground floor, are equally clean, and well aired: neatness and good air reign in every part. A large garden at the end of the court furnishes vegetables for the kitchen. Our traveller was surprised to find there, a great number of foreign shrubs and plants. The garden is well cultivated. In the yard they rear a great number of hogs: for in America, the hog as well as the ox, does the honours of the table through the whole year. Blacks are intermingled with the whites, and lodged in the same apartments.

The expences of this hospital amount to about five pence per diem, money of Pennsylvania, for each pensioner.

The hospital for lunatics, which our hero likewise visited, is fine, elegant, and well kept. He was charmed with the cleanliness in the halls of the sick, as well as in the particular chambers. The library is not numerous, but it is well chosen. The hall on the first floor is appropriated to sick men: there were six in it. About the same number of sick women were in a like hall on the second floor. These persons appeared by no means miserable; they seemed to be at home. Our hero went below to see the lunatics; they were about fifteen, male and female. Each one has his cell, with a bed, a table, and a convenient window with grates. Stoves are fixed in the walls, to warm the cell in the winter. There were no mad persons among them: most of the patients are the victims of religious melancholy, or disappointed love. These unhappy persons are treated with the greatest tenderness; they are allowed to walk in the court, and are constantly visited by two physicians.

C H A P. III.

M. DE WARVILLE present at a Meeting of the Agricultural-Society—The Subject—The Public Library—The Market at Philadelphia—The General Assembly—The Falls of the Skunkkill—Spring-Mill—Remarks—He meets two Frenchmen—Account of a Journey to the Ohio—The School for Blacks—Means used to abolish the Slave Trade—Laws, &c.—Description of Philadelphia, &c.

M. DE WARVILLE was present at a meeting of the Agricultural-Society. It is not of long standing, but is numerous, and possesses a considerable fund. If such a society ought to receive encouragement in any country, it is in this. Agriculture is the first pillar of this state; and though there are many good farmers here, yet the great mass of them want information; and this information can only be procured by the union of men well versed in theory and practice. The subject of this meeting was an important one. The papillion, or worm, called the

Hessian fly, had for several years ravaged the wheat in many parts of the United-States. The several farmers present, from their own experience, and that of their neighbours and correspondents, declared that the insect deposited its eggs, not in the ear, but in the stalk; so that they were well convinced, that on threshing the wheat, there could be nothing to fear that the eggs would mix with the grain; and consequently they could not be communicated with the grain.

Among the useful institutions which do honour to Philadelphia,

ring house, or house in country, in one of Philadelphia not yet built is constructed of large buildings; one on. There is a separation to them. Philadelphia, is the public library; it is supported by subscription. The price of entrance into this society is ten pence. Any person has the privilege of borrowing books. Half of the library is generally in the hands of readers.

At the side of this library is a cabinet of natural history. M. de Warville observed nothing curious in it, but an enormous thigh-bone, and some teeth as enormous, found near the Ohio, in a mass of prodigious bones, which nature seems to have thrown together in those ages whose events are covered from the eye of history by an impenetrable veil.

The market at Philadelphia is, without contradiction, one of the finest in the universe. Variety and abundance in the articles, order in the distribution, good faith and tranquillity in the trader, are all here united. Cleanliness is conspicuous here in every thing; even meat, whose aspect is more or less disgusting in other markets, here strikes the eye agreeably. The spectator is not tormented with the sight of little streams of blood, which infect the air, and foul the streets. The women who bring the produce of the country, are dressed with decency; their vegetables and fruits are neatly arranged in handsome, well-made baskets. Every thing is assembled here, the produce of the country, and the works of industry; flesh, fish, fruits, garden-seeds, pottery, iron-ware, shoes, trays, buckets extremely well made, &c. The stranger is never wearied in contemplating this multitude of men and women moving and crossing in every direction, without tumult or injury. The carts and horses which have brought in the supplies, are peaceably arranged in the next street, in the order in which they arrive; when disengaged, they move off in silence: no quarrels among the carmen and the porters.

Two clerks of the police walk in the market. If they suspect a pound of butter of being light, they weigh it; if light, it is seized for the use of the hospital.

The price of bread is from one penny to twopence the pound, beef and mutton from twopence to fourpence, veal from one penny to twopence; hay from twenty to thirty shillings the ton; butter from fourpence to sixpence the pound; wood from sevenpence to eightpence the cord. Vegetables are in abundance, and cheap. Wines of Europe, particularly those of France, are cheaper here than anywhere else. Our hero drank the wine of Provence, said to be made by M. Bergasse, at ninepence the bottle; but the taverns are extremely dear. Articles of luxury are expensive: a hair-dresser costs eightpence a day, or twelve shillings the month. M. de Warville hired a one-horse chaise three days, which cost him three louis d'ors.

M. de Warville was introduced one day to the General Assembly: he saw nothing remarkable in it. It is certainly a fine building, when compared with the other edifices of Philadelphia; but it cannot be put in competition with those public buildings which are called fine in Europe. There were about fifty members present, seated on chairs enclosed by a balustrade. Behind the balustrade, was the gallery for spectators. Our traveller dined about five miles from town, by the falls of the Skunkkill. These falls are formed by a considerable bed of rocks: they are not perceivable when the water of the river is high.

Springmill, where he went to sleep, is a hamlet eight miles up the Skunkkill. The soil is here composed of a great quantity of talc, granite, and a yellow gravel; some places a very black earth. In the neighbourhood are quarries of marble of a middling fineness, of which many chimney-pieces are made.

It is a remark to be made at every step in America, that vegetation is rapid and strong. The peach-tree, for example, grows fast and produces fruit in great quantities. Within one month after the wheat is cut, the field is covered with greens, very high and very thick. The birds are a great discouragement to the culture of the vine in America. Immense clouds of

black-birds may be seen settling on a vineyard, which destroy it very soon.

The pastures and fields in America are enclosed with barriers of wood or fences. These, when made of rails supported by posts as above described, are expensive, especially in the neighbourhood of great towns, where wood is dear. The country here is full of springs; our traveller saw some very fine ones. He was told of one which carries a mill night and day, and serves to water meadows when occasion requires.

M. de Warville had the good fortune to meet a Frenchman here who was travelling in this country, not in pursuit of wealth, but to gain information. He and another arrived at Philadelphia, and passed immediately to Pittsburg. There the winter overtook them, and the Ohio froze over, which rarely happens. They lodged themselves a few miles from Pittsburg, in an open house, where they suffered much from the cold. On the opening of the spring, they descended the Ohio. They landed at Muckinquam, where they saw General Harmer, and some people who were beginning a settlement there.

At some distance below this place, they fell in with a party of savages. One of them was killed, and the other wounded and taken prisoner; he fortunately made his escape, rejoined the Virginian, and found the means of returning to Pittsburg, having lost his money and all his effects. He then returned to Philadelphia, and was now on his way to Europe.

The immense valley washed by the Ohio, appeared to him the most fertile that he had ever seen. The strength and rapidity of vegetation in that country were incredible, the size of the trees enormous, and their variety infinite. The inhabitants were obliged to exhault the first fatness of the land in hemp and tobacco, in order to prepare it for the production of wheat. The crops of Indian corn were prodigious; the cattle acquire an extraordinary size, and keep fat the whole year in the open fields. The facility of producing grain, rearing cattle, making whiskey, beer, and cyder, with a thousand other advantages, attract to this country great numbers of emigrants from other parts of America. A man in that country, works scarcely two hours in a day for the support of himself and family; he passes most of his time in idleness, hunting, or drinking. The women spin, and make clothes for their husbands and families. They have very little money; every thing is done by barter.

M. de Warville visited the school for the blacks, at Philadelphia, and saw, heard, and examined the black children. They read well, repeated from memory, and calculated with rapidity.

The black girls, besides reading, writing, and the principles of religion, are taught spinning, needle-work, &c. and their mistresses assured our author, that they discovered much ingenuity. They have the appearance of decency, attention, and submission.

In 1774, the Congress declared the slavery of the blacks to be incompatible with the basis of republican governments. Different legislatures hastened to consecrate this principle of Congress. Three distinct epochs mark the conduct of the Americans in this business—the prohibition of the importation of slaves—their manumission—and the provision made for their instruction. All the different states are not equally advanced in these three objects.

In the northern and middle states, they have proscribed for ever the importation of slaves; in others, this prohibition is limited to a certain time. In South-Carolina, where it was limited to three years, it has lately been extended to three years more. Georgia is the only state that continues to receive transported slaves. Yet, when General Oglethorpe laid the foundation of this colony, he ordained, that neither rum nor slaves should ever be imported into it. This law, in both its articles, was very soon violated.

A numerous party who still argued the impossibility of cultivating their soil without the hands of slaves,

and the impossibility of augmenting their number without recruiting them in Africa, took such measures as to put it out of the power of the new Congress to prohibit the importation of slaves for twenty years.

Nine States however have proscribed the slave trade, and the blacks, which there abound, are considered as free. There are then nine asylums for those to escape to from Georgia; not to speak of the neighbourhood of the Floridas, where the slaves from Georgia take refuge, in hopes to find better treatment from the Spaniards; and not to speak of those vast forests and inaccessible mountains which make part of the Southern States, and where the persecuted negro may easily find a retreat from slavery. The communications with the back country are so easy, that it is impossible to stop the fugitives; and the expence of reclaiming is disproportioned to their value. And though the free States do not in appearance oppose these reclamations, yet the people there hold slavery in such horror, that the master who runs after his human property, meets little respect, and finds little assistance.

There was never any law in New Hampshire, or Massachusetts, which authorized slavery. There was very little of it in Connecticut; the puritanic austeriety which predominated in that colony, could scarcely reconcile itself with slavery. Agriculture was better performed there by the hands of freemen; and every thing concurred to engage the people to give liberty to the slaves:—so that almost every one has freed them; and the children of such as are not yet free, are to have their liberty at twenty-five years of age.

The case of the blacks in New-York is nearly the same; yet the slaves there are more numerous.

The State of Rhode-Island formerly made a great business of the slave trade. It is now totally and for ever prohibited.

In New-Jersey the bulk of the population is Dutch: people less disposed than any other to part with their property. Yet the Western parts of the State are disposed to free their negroes; but the Eastern part are opposed to it.

The little State of Delaware has followed the example of Pennsylvania in liberating several slaves, and there are some negroes freed in Maryland,—but very few; and scarcely any in Virginia.

The free blacks in the Eastern States, are either hired servants, or they keep little shops, or they cultivate the land. Some of them may be seen on board of coasting vessels. They dare not venture themselves on long voyages, for fear of being transported and sold in the islands. As to their physical character, the blacks are vigorous, of a strong constitution, capable of the most painful labour, and generally active. As servants, they are sober and faithful. Those who keep shops, live moderately, and never augment their allions beyond a certain point.

Of all vegetables containing sugar, the maple, after the sugar-cane, contains the greatest quantity. It grows naturally in the United-States, and may be propagated with great facility. All America seems covered with it, from Canada to Virginia; it becomes more rare at the southward, on the east of the mountains; but it is found in abundance in the back country. Such is the beneficent tree which has, for a long time, recompensed the happy colonist, whose position deprived them of the delicate sugar of our islands. They have till lately contented themselves with bestowing very little labour on the manufacture, only bringing it to a state of common coarse sugar; but since the Quakers have discerned in this production, the means of destroying slavery, they have felt the necessity of carrying it to perfection; and success has crowned their endeavours.

Great difficulties attend the cultivation of the cane. It is a tender plant; it has many enemies, and requires constant care and labour to defend it from numerous accidents; add to these, the painful efforts that the

preparation and manufacture costs to the wretched Africans; and, on comparing these to the advantages of the maple, every one must be convinced, by a new argument, that such pains are often taken to commit unprofitable crimes. The maple is produced by nature; the sap to be extracted, requires no preparatory labour; it runs in February and March, a season unsuitable for other rural operations. Each tree, without injury to itself, gives twelve or fifteen gallons, which will produce at least five pounds of sugar. A man aided by four children, may easily, during four weeks running of the sap, make fifteen hundred pounds of sugar. Several have declared this sugar equal to that of the islands, in grain, colour, and taste: and the cultivators in the State of New-York perceive, in an equal degree, the advantages of this production; they made, in one year, a large quantity of sugar, and brought it to great perfection.

Philadelphia may be considered as the metropolis of the United-States. It is certainly the finest town, and the best built: it is the most wealthy, though not the most luxurious. There are men of information, political and literary knowledge, and several learned societies. Many towns in America are more ancient, but Philadelphia has surpassed her elders.

The Swedes were first established on the spot where this town has been since built. The Swedish church on the banks of the Delaware is more than one hundred years old. It is the oldest church in the town.

At ten o'clock in the evening all is tranquil in the streets; the profound silence which reigns there, is only interrupted by the voice of the watchmen, who are in small numbers, and who form the only patrol. The streets are lighted by lamps, placed like those of London.

On the side of the streets are footways of brick, and gutters constructed of brick or wood. Strong posts are placed to prevent carriages from falling on the footways. All the streets are furnished with public pumps, in great numbers. At the door of each house are placed two benches, where the family sit at evening to take the fresh air, and amuse themselves in looking at the passengers. This is certainly a bad custom, as the evening air is unhealthful, and the exercise is not sufficient to correct this evil, for they never walk here; they supply the want of walking, by riding out into the country. They have few coaches at Philadelphia, but they have several handsome waggons, which are used to carry the family into the country; they are a kind of long carriage, light and open, and may contain twelve persons. They have many chairs and sulkeys, open on all sides; the former may carry two persons, the latter only one. The horses used in these carriages are neither handsome nor strong; but they travel very well.

Philadelphia is built on a regular plan; long and large streets cross each other at right angles; this regularity, which is a real ornament, is at first embarrassing to a stranger; he has much difficulty in finding himself, especially as the streets are not numbered, and the doors not numbered. The shops, which adorn the principal streets, are remarkable for their neatness.

The State-House, where the Legislature assembles, is a handsome building; by its side they are building a magnificent house of justice. The streets are generally from 50 to 60 feet wide. Market-Street is about 100. The wharfs are in general small and niggardly.

Behind the State-House is a public garden; it is the only one that exists in Philadelphia. It is not large; but it is agreeable, and one may breathe in it. It is composed of a number of verdant squares, intersected by alleys.

All the space from Front-Street on the Delaware to Front-Street on the Skunkkill, is already distributed into squares for streets and houses, they build here; but not so briskly as at New-York.

The ladies bestow immense expences on their
toilet and head-dress, and display pretensions too
affected to be pleasing. Adultery is not known here;
there is no instance of a wife, of any sect, who has
failed in her duty. They marry without dowry;
they bring to their husbands only the furniture of
their houses; and they wait the death of their parents,
before they come to the possession of their property.

There is no town on the continent where there is
so much printing done as at Philadelphia. Gazettes
and book-stores are numerous in the town, and paper
mills in the state.

There are several useful institutions in Philadelphia.
One of them is the Dispensary, which distributes medi-
cines gratis to the sick who are not in a situation to
purchase them. There is also the Benevolent Institu-
tion, whose object is to succour, in their own houses,
poor women in child-bed. Another society has for
its object to alleviate the situation of prisoners.

The Philadelphians confine not their attention to
their brethren; they extend it to strangers; they
have formed a society for the assistance of emigrants
who arrive from Germany. A similar one is formed
at New-York, called the Hibernian-Society, for the
succour of emigrants from Ireland. These societies
inform themselves, on the arrival of a ship, of the
situation of the emigrants, and procure them imme-
diate employ.

Here is a company for insurance against fire. The
houses are constructed of wood and brick, and conse-
quently exposed to the ravages of fire.

The climate of Philadelphia is reckoned one of the
most healthful in the world. In dry weather, the
air has a peculiar elasticity, which renders heat or
cold less insupportable than they are in places more
humid. The air never becomes heavy and fatiguing,
but when the rains are not followed by the beneficent
North-Wind. During the three weeks that M. de
Warville passed here (in August and September) he
felt nothing of the languor of body, and depression
of spirits, which he expected; though the heat was
very great, he found it supportable; nearly like that
of Paris, but it caused a greater perspiration.

Variability is the characteristic of the climate of
Pennsylvania. It has changed by the clearing
of lands, and the diminution of waters, which
formerly abounded in this part of America. Many
creeks, and even rivers, have disappeared by degrees;
and this is to be expected in a country where forests
give place to cultivated fields.

However, these changes have produced happy
effects on the health of the people. An old man of
this country observed to our traveller, that the health
of the Pennsylvanians augments in proportion to the
cultivation of the country; that their visages are less
pale than they were thirty or forty years past; that for
some time the number of centenarians has increased,
and that the septuagenaries are very numerous.

There was such an extraordinary drought in 1782,
that the Indian corn did not come to perfection, the
meadows failed, and the soil became so inflammable,
that in some places it caught fire, and the surface was
burnt. In our traveller's time it was excessively rainy.
On the 18th and 19th of August, there fell at
Philadelphia seven inches of water. Wheat suffered
much from the rains this year.

But happily all parts of the country are not subject
to the same variations of the atmosphere; so that a
general scarcity is never known. If the harvest fails
here, at fifty miles distance it abounds.

Among the diseases of the United-States, the con-
sumption doubtless makes the greatest ravages. It
was unknown to the original inhabitants of the coun-
try; it is then the result of European habits of life
transported to this new continent. It is more com-
mon in the towns than in the country; it destroys
more women than men; it is a languid disorder,
which drags, by slow steps, its victim to the tomb;
each day plunges the dagger deeper in his breast, and

renders more visible the incurable wound. Death,
without ceasing, flares him in the face, and throws a
funeral shroud over the remainder of his days. The
world and its pleasures disappear; the ties of friend-
ship are the only ones that are strengthened and en-
deared, and which double the bitterness of his
approaching dissolution. The consumption, in a
word, is a long continued agony, a slow tormenting
death. The physicians of this country attribute it
to different causes; to the excessive use of hot drinks,
such as tea and coffee; to the habit of remaining too
long in bed, and the use of feather-beds, for they
know not the use of mattresses; to the custom of
eating too much meat, and of drinking too much
spirituous liquors. Women are more subject to it
than men; because, independently of the above
causes, they take but little exercise, which is the
only powerful remedy against the stagnation of hu-
mours, the great principle of the marasma: they take
but little the pleasures of walking; a movement
which, varying the spectacle of nature, gives a re-
freshment to the senses, a new spring to the blood,
and a new vigour to the soul. Consumptions, how-
ever, are not so numerous in America as is generally
imagined. This name is ignorantly given to many
other disorders, which reduce the body to the same
meagre state which follows a decay of the lungs.
This appearance deceives, and may easily deceive
the attendants of the sick, who give information to
those who keep the bills of mortality.

Another disease very common here, is the fever
throat; when putrid, it is mortal. It generally
proceeds from excessive heats, cold drinks, and care-
lessness in clothing.

The disease known in Europe by the name of the
Influenza, is likewise common in America: it made
great ravages in 1789. It began in Canada, passed
through New-York, and very soon infected Penn-
sylvania and the Southern States. Its symptoms are
lassitude, feebleness, chills, heats, and the head-ache.
It respects no age or sex, and especially precipitates
to the tomb those who were attacked by the con-
sumption.

The fever and ague may be ranked in the class of
these cruel epidemics; but it is more terrible, as its
returns are annual. It not only visits the marshy
countries and the sea-coast, but it is seen even in the
healthy region of Albany. It is combated by the
Peruvian bark; but the most successful remedy, is a
journey among the mountains, or into the Northern
States. This fever never attacks the black slaves.
This exemption is attributed to a custom they preserve
with obstinacy, of keeping fires always in their
cabins, even in the hottest season. The negroes are
accustomed to consider excessive heat as a guarantee
of health; and one may see a negro, while the la-
bours in the field, in the ardour of a burning sun,
expose her infant to his fires, rather than lay it under
the refreshing shade of a tree.

Among the maladies common in the United-States,
must be reckoned the pleurisy and the peripneumony,
though they are less frequent than formerly. The
small-pox, which formerly made such havoc in the
United-States, is less formidable since the general
practice of inoculation.

There are many physicians at Philadelphia, and
this may be assigned as the cause of so many diseases;
but such an opinion is erroneous. They are said to
be skilful; they are generally strangers to quackery.

The greatest part of these physicians are at the
same time apothecaries. They continue to unite
these two sciences, out of respect to the people, who
wish that the man who orders the medicine should
likewise prepare it. There are, however, other apo-
thecaries, of whom the physicians purchase their drugs.

The practice of this country is the English prac-
tice; that is, they are much in the use of violent
remedies. Lavatives are little in use. Almost all the
physicians of this country are formed at the school
of

of Edinburgh, and this is the cause of their predilection for the English practice.

The prison of Philadelphia is a kind of house of correction. The prisoners are obliged to work; and each enjoys the profit of his own labour. Those who govern the house of correction in New-York, on consenting to take charge of criminals condemned by the law, have obtained leave to substitute to whips and mutilation, their humane method of correction;

and they daily succeed in leading back to industry and reason these deluded men.

By the small number of Pennsylvanians contained in the prison of Philadelphia, one may conclude, that were it not for the strangers, the government of this town, like that of Nanucket, might have a prison with open doors, of which honour and repentance are the only keepers.

C. H. A. P. IV.

M. de Warville and a Party undertake a Journey from Boston to New-York by Providence—Proceed to Newport in a Packet-Boat—Port of Newport and the Place described—Leige—Hell-Gate—Remarks on the Packet-Boat—Description of New-York—Albany—Hudson—Buildings, &c. &c.

ON the 11th of October, M. de Warville and a party set out from Boston at half past seven in the morning, and arrived by six in the evening at Providence. It is forty-nine miles, the road good, the soil stoney, gravelly, and sandy, and, as usual for such a soil, covered with pines. The country bordering the road, appears neither fertile, nor well peopled: the houses are in decay, the children covered with rags. They had, however, good health, and good complexions. The silence which reigns in the other American towns on Sunday, reigns at Providence even on Monday. Every thing here announces the decline of business. Few vessels are to be seen in the port. They were building, however, two distilleries; as if the manufactories of this poison were not already sufficiently numerous in the United-States. Whether it be from prejudice or reality, our author seemed to perceive every where the silence of death, the effect of paper-money. He seemed to see, in every face, the air of a Jew; the result of a traffic founded on fraud and finess. He seemed to see, likewise, in every countenance, the effects of the contempt which the other States bear to this, and the consciousness of meriting that contempt. The paper-money at this time was at a discount of ten for one.

M. de Warville went from Providence to Newport in a packet-boat. This journey might be made by land; but they preferred the water. They arrived in seven hours and a half; and during two hours they had contrary wind. This distance is thirty miles. They never lost sight of land; but it offers nothing picturesque or curious. A few houses, some trees, and a sandy soil, are all that appears to the eye.

The port of Newport is considered as one of the best in the United-States. The bottom is good, the harbour capable of receiving the largest ships, and seems destined by nature to be of great consequence. This place was one of the principal scenes of the last war. The successive arrival of the American, English, and French armies, left here a considerable quantity of money.

Since the peace, every thing is changed. The reign of solitude is only interrupted by groups of idle men, standing with folded arms at the corners of the streets, houses falling to ruin, miserable shops, which present nothing but a few coarse stuffs, or baskets of apples, and other articles of little value; grass growing in the public square, in front of the court of justice; rags stuffed in the windows, or hung upon hideous women and lean unquiet children. Every thing announces misery, the triumph of ill faith, and the influence of a bad government.

Leige and Newport are nevertheless well situated for commerce, and surrounded by lands by no means unfruitful.

M. de Warville was detained at Newport by the south-west winds till the 13th, when they set sail at midnight; the captain not willing to sail sooner, for fear of touching before day on Block-Island. The wind and tide carried them at the rate of nine or ten miles

an hour; and they should have arrived at New-York the next evening, but they were detained at Hell-Gate, a kind of gulf, eight miles from New-York. This is a narrow passage, formed by the approach of Long-Island to York-Island, and rendered horrible by rocks, concealed at high water. The whirlpool of this gulph is little perceived at low water; but it is not surprising that vessels which know it not, should be dashed in pieces. They speak of an English frigate lost there the last war. This Hell-Gate is an obstacle to the navigation of this strait; but it is not rare in summer to run from Newport to New-York, two hundred miles, in twenty hours. On approaching this city, the coasts of these two islands present the most agreeable spectacle. They are adorned with elegant country-houses. Long-Island is celebrated for its high state of cultivation. The price of passage and diet from Providence to New-York is six dollars.

It is more advantageous, and often less expensive to go by land; yet much praise is due to the cleanliness and good order observable in the packet-boats. The one which our hero was in contained fourteen beds, ranged in two rows, one above the other; every one had its little window. The chamber was well aired; well varnished; and two close corners were made in the poop, which served as private places. The provisions were good. There is not a little town on all this coast, but what has these kind of packets going to New-York; such as Newhaven, New-London, &c. They have all the same neatness, the same embellishment, and the same convenience for travellers.

Nothing is more magnificent than the situation of New-York, which stands between two majestic rivers, the north and the east. The former separates it from New-Jersey: it is so profound, that ships of the line anchor in it. Two inconveniencies are, however, experienced in this river; the descent of ice in the winter, and the force of the north-west wind. Ships mount this commodious river as far as Albany, a town situated an hundred and seventy miles from New-York.

Albany will yield very soon, in prosperity, to a town called Hudson, built on a spot where, four years ago, there was only a simple farm-house. At present, it contains an hundred good dwelling houses, a court-house, public fountains, &c. More than fifty ships are owned there, which export the American productions to the islands and to Europe. Two whaling ships are of the number. Their vessels do not winter idly, like those of Albany, in the port. They trade in the West-Indies during this season. Poughkeepsie, on the same river, has doubled its population and its commerce since the war. The inattention of the people of Albany to foreign commerce, may be attributed to the fertility of their lands. Agriculture abounds there, and they like not to hazard themselves to the dangers of the sea, for a fortune which they can draw from the bounty of the soil which surrounds them. The fertility

tility of the uncultivated lands, and the advantages which they offer, attract settlers to this quarter. New settlements are forming here; but slowly, because other states furnish lands, if not as fertile, at least attended with more advantages for agriculture, as they are less exposed to the excessive rigours of the winter.

In this part of America shall be well peopled, the fourth river will offer one of the finest channels for the exportation of its productions. Navigable for more than two hundred miles from the ocean, it communicates with the river Mohawk, with the lakes Oneida, Ontario, Erie, and all that part of Canada. The falls which are found in this route may be easily vanquished by canals, so easy to construct in a country abounding with men and money. This river communicates with Canada in another quarter, by the lakes George and Champlaine. It is this situation which will render New-York the channel of the fur-trade, at least during the existence of this kind of commerce, which supposes the existence of savages, and great quantities of uncultivated lands.

New-York, by the East-River, communicates with Long-Island, and with all the Eastern States. Ships of the line anchor likewise in this river, and near the quay, where they are sheltered from the storms which sometimes rage these coasts. This happy situation of New-York will explain the causes why the English give it the preference over the other parts of America. Being the great market for Connecticut and New-Jersey, it pours in upon those states the productions of the East-Indies, and of Europe. It is difficult to obtain an account of the exportations and importations of this state. The English have a great predilection for this city, and for its productions; thus its port is always covered with English ships. They prefer even its wheat; so that the American merchants bring wheat from Virginia, and sell it for that of New-York.

The presence of Congress with the diplomatic body and the concourse of strangers, contributes much to extend here the ravages of luxury. The inhabitants are far from complaining at it; they prefer the splendour of wealth, and the show of enjoyment, to the simplicity of manners, and the pure pleasures resulting from it. The usage of smoking has not disappeared in this town, with the other customs of their fathers, the Dutch. They smoke cigars, which come from the Spanish islands. They are leaves of tobacco, rolled in form of a tube, of six inches long, which are smoked without the aid of any instrument. The great commerce of this city, and the facility of living here, augments the population of the state with great rapidity. In 1773, they reckoned 148,124 whites; in 1786, the number was 219,996.

If there is a town on the American continent where the English luxury displays its follies, it is New-York. Here one may find the English fashions. In the dress of the women, may be seen the most brilliant silks, gauzes, hats, and borrowed hair. Equipages are rare; but they are elegant. The men have more simplicity in their dress; they disdain gewgaws, but they take their revenge in the luxury of the table.

Luxury forms already, in this town, a class of men very dangerous in society; to wit, bachelors. The expense of women causes matrimony to be dreaded by men.

Tea forms, as in England, the basis of the principal parties of pleasure. Fruits, though more attended

to in this state, are far from possessing the beauty and goodness of those of Europe. I have seen trees, in September, loaded at once with apples and with flowers. The bank of New-York enjoys a good reputation, and is well conducted. It receives and pays without reward, for merchants and others who choose to open an account with it.

There is an abundance of excellent provisions at New-York; vegetables, flesh, and especially fish. It is difficult to unite so many advantages in one place. Provisions are dearer at New-York, than in any other of the northern or middle states. Many things, especially those of luxury, are also dear. A hair-dresser asks twenty shillings per month; washing costs four shillings for a dozen pieces. Board and lodging by the week, is from four to six dollars. The fees of lawyers are out of all proportion; they are, as in England, excessive. Physicians have not the same advantage in this respect as lawyers: the good health generally enjoyed here, renders them little necessary; yet they are sufficiently numerous. Our hero having conversed with some of them, asked what were the diseases most common? They answered, bilious fevers; and that the greatest part of diseases among them, were occasioned by excessive cold, and the want of care; but there are few diseases here, added they. The air is pure; the inhabitants are tolerably temperate; the people in good circumstances, are not sufficiently rich to give themselves up to those debaucheries which kill so many in Europe; and there are no poor, provisions being so cheap.

New-York was in great part consumed by fire in the time of the war. The vestiges of this terrible conflagration disappear; the activity which reigns every where, announces a rising posterity; they enlarge in every quarter, and extend their streets. Elegant buildings, in the English style, take place of those sharp-roofed sloping houses of the Dutch. There are some still standing in the Dutch style; they afford some pleasure to the European observer; they trace to him the origin of this colony, and the manners of those who inhabit it, whilst they call to his mind the ancient Belgic state.

M. de Warville having walked out by the side of the North-River, saw what a rapid change there was in the space of six weeks! The river forced back two hundred feet, and, by a simple mechanism, they have constructed a kind of encaement, composed of large trunks of trees crossing each other at convenient distances, and fastened together by strong beams. They conduct this floating dyke to the place where it is to be fixed, and where there is often forty feet of water. Arrived at its destination, it is sunk with an enormous weight of stones. On all sides, houses are rising, and streets extending; busy workmen building and repairing, are to be seen every where.

They are also erecting a building for Congress. They are likewise repairing the hospital; this building is in a bad condition; not a sick person could be lodged in it at the end of the war; it was a building almost abandoned; now they have ordered it to be repaired, and the reparations are executing with the greatest vigor. This building is vast; it is of brick, and perfectly well situated on the bank of the North River. It enjoys every advantage: air the most salubrious, that may be renewed at pleasure; water in abundance; pleasant and extensive walks for the sick; magnificent and agreeable prospects; out of the town, and yet sufficiently near it.

C H A P. V.

M. DE WARVILLE leaves Boston—Sleeps at Salem—Passes the Bridge of Malden and the Town of Lime—Sewerly—Londonberry—Newberry—Portsmouth—Proceeds to Andover—Importations, Exportations, Manufatures, &c of the United-States—The Western Territory, &c.

M. DE WARVILLE left Boston the second of October, after dinner, with Mr. Barret. They slept at Salem, fifteen miles from Boston; an excellent gravelly road, bordered with woods and meadows. This road passes the fine bridge of Malden, and the town of Linn, remarkable for the manufacture of women's shoes. It is calculated that more than an hundred thousand pairs are annually exported from this town. At Reading, not far from Linn, is a similar manufacture of men's shoes.

In passing to Beverley, they crossed another excellent wooden bridge. It is over a creek near a mile wide. The construction of this bridge, and the celerity with which it was built, give a lively idea of the activity and industry of the inhabitants of Massachusetts. It cost but three thousand pounds; the toll for a horse and carriage is eight-pence; the opening in the middle for the passage of vessels, is of a simpler mechanism than that of Charles-Town. On the road to Beverley, they saw a flourishing manufacture of cotton.

At Londonderry, a town chiefly inhabited by Irish, is a considerable manufacture of linen. They dined at Newberry. This would be one of the best ports in the United-States, were it not for a dangerous bar at the entrance. The business of ship-building has much declined here. In the year 1772 ninety vessels were built here, in 1788 only three. This town stands at the mouth of the fine river Marrimack, abounding in fish of different kinds.

It is about twenty four miles of fine road from Newberry to Portsmouth, the capital of New-Hampshire. There is little appearance of activity in this town. A thin population, many houses in ruins, women and children in rags; every thing announces decline. Yet there are elegant houses and some commerce. Portsmouth is on the Piscataway, a rapid and deep river, which never freezes till four miles above the town. This was formerly one of the greatest markets for ship-timber. Every thing in this town is commerce and ship-building.

They left Portsmouth on Sunday, and came to dine at Mr. Dalton's, five miles from Newberry, on the Marrimack: this is one of the finest situations that can be imagined. It presents an agreeable prospect of seven leagues. This farm is extremely well arranged; our hero saw on it thirty cows, numbers of sheep, &c. and a well furnished garden.

The Americans are not accustomed to grand feasts; they treat strangers as they treat themselves every day, and they live well. They say they are not anxious to starve themselves the week, in order to gormandise on Sunday. From this they proceeded to Andover.

The importations into the United-States have much increased since the peace. Among the principal manufactures and exportations, are ship-building, flour, rice, tobacco, manufactures in woollen, linen, hemp, and cotton; the fisheries, oils, forges, and the different articles in iron and steel; instruments of agriculture, nails, leather, and the numerous objects in which they are employed; paper, palleteboard, parchment, printing, pot-ash, pear-ash, hats of all qualities, ship-timber, and other wood of construction; cabinet-work, cordage, cables, carriages, works in brass, copper, and lead; glass of different kinds; gunpowder, cheese, butter, calicoes, printed linen, indigo, hats, &c. Ship-building is one of the most profitable branches of business in America. They built ships here before the war; but they were not permitted to manufacture the articles necessary to equip them; every article is now made in the country.

Breweries augment every where, and take place of the fatal distilleries. There are no less than fourteen good breweries in Philadelphia. The infant woollen manufactory at Hartford, from September 1788 to September 1789, gave about five thousand yards of cloth, some of which sells at 5 dollars a yard; another at Watertown, in Massachusetts, promises equal success, and engages the farmers to multiply their sheep,

Cotton succeeds equally well. The spinning machines of Arkwright are well known here, and are made in the country.

Pennsylvania, New-Jersey, and Delaware, make annually three hundred and fifty tons of steel, and six hundred tons of nails and nail rods. These articles are already exported from America; as are machines for carding wool and cotton, particularly common cards, which are cheaper than the English, and of a superior quality. In these three states are sixty-three paper mills, which manufacture annually to the amount of 250,000 dollars. The state of Connecticut last year made five thousand reams, which might be worth nine thousand dollars.

The prodigious consumption of all kinds of glass, multiplies the establishment of glass works. The one on the Potowmack employs five hundred persons. They have begun with success at Philadelphia, the printing of calicoes, cotton, and linen. Sugar-Refiners are increasing every where. In Pennsylvania are twenty-one powder mills, which are supposed to produce annually 625 tons of gunpowder. Among the principal articles of exportation are wheat and flour.

In treating of the Western territory our author observes, that at the foot of the Alleghanies, whose summits, however, do not threaten the heavens, like those of the Andes and the Alps, begins an immense plain, intersected with hills of a gentle ascent, and watered every where with streams of all sizes; the soil is from three to seven feet deep, and of an astonishing fertility; it is proper for every kind of culture, and it multiplies cattle almost without the care of man.

It is there that those establishments are formed, whose prosperity attracts so many emigrants; such as Kentucky, Frankland, Cumberland, Holston, Muckingum, and Scioto. The oldest and most flourishing of these is Kentucky, which began in 1775, had eight thousand inhabitants in 1782, fifty thousand in 1787, and seventy thousand in 1790. It will soon be a state.

Cumberland, situated in the neighbourhood of Kentucky, contains 8000 inhabitants, Holston 6000, and Frankland 25,000. It appears that Kentucky will preserve its advantage over the other settlements on the south; its territory is more extensive, its soil more fertile, and its inhabitants more numerous; it is situated on the Ohio, navigable at almost all seasons; this last advantage is equally enjoyed by the two settlements hereafter mentioned. The establishment at the Muckingum was formed in 1782, by a number of emigrants from New-England, belonging to the Ohio-Company. The Muckingum is a river which falls into the Ohio from the West. These people have an excellent soil, and every prospect of success.

From these proprietors is formed another association, whose name is that of the Scioto-Company; a name taken from a river, which after having traversed the two millions of acres which they possess, falls into the Ohio. This settlement would soon rise to a high degree of prosperity, if the proper cautions were taken in the embarkation, and the necessary means employed to solace them, and to prepare them for a kind of life so different from that to which they are accustomed.

The revolution in the American government will, doubtless, be beneficial to the savages; for the government tends essentially to peace. But as a rapid increase of population must necessarily be the consequence of its operations, the savages must either blend with the American, or a thousand causes will speedily annihilate that race of men.

There is nothing to fear, that the danger from the savages will ever arrest the ardour of the Americans for extending their settlements. They all expect that the navigation of the Mississippi becoming free, will soon open to them the markets of the islands, and the Spanish colonies, for the productions with which their

Edwards & Co.

The REJOICINGS of the MEXICANS .at the beginning of the AGE.

their country overflows. But the question to be solved is, whether the Spaniards will open this navigation willingly, or whether the Americans will force it. A kind of negotiation has been carried on, without effect for four years; and it is supposed, that certain states, fearing to lose their inhabitants by emigration to the West, have, in concert with the Spanish minister, opposed it; and that this concert gave rise to a proposition, that Spain should shut up the navigation for twenty-five years, on condition that the Americans should have a free commerce with Spain. Virginia and Maryland, though they had more to fear from this emigration than the other states, were opposed to this proposition, as derogatory to the honour of the United-States; and a majority of Congress adopted the sentiment.

A degree of diffidence, which the inhabitants of the West have shewn relative to the secret designs of Congress, has induced many people to believe, that the union would not exist a long time between the old and new states; and this probability of a rupture they say, is strengthened by some endeavours of the English in Canada, to attach the Western settlers to the English government.

Our author is however induced to believe, that the present union will for ever subsist. A great part of the property of the Western land belongs to

people of the East; the unceasing emigrations serve perpetually to strengthen their connections; and as it is for the interest both of the East and West, to open an extensive commerce with South-America, and to overleap the Mississippi; they must, and will, remain united for the accomplishment of this object.

The Western inhabitants are convinced that this navigation cannot remain a long time closed. They are determined to open it by good will or by force; and it would not be in the power of Congress to moderate their ardour. Men who are masters of the Ohio and the Mississippi, cannot conceive that the insolence of a handful of Spaniards can think of shutting rivers and seas against a hundred thousand free Americans. The slightest quarrel will be sufficient to throw them into a flame; and if ever the Americans shall march towards New Orleans, it will infallibly fall into their hands.

In order to avert the effects of this enterprising character of the free Americans, the Spanish government has adopted the pitiful project of attracting them to a settlement on the west of the Mississippi, and by granting to those who shall establish themselves there, the exclusive right of trading to New Orleans. This colony is the first foundation of the conquest of Louisiana, and of the civilization of Mexico and Peru.

C H A P. VI.

A Journey to Mount Vernon in Virginia—Departure from Philadelphia—Towns of Chester, Wilmington, and Brandywine—Christine-Bridge—Ferry of Susquehannah—Havre de Grace—Baltimore—Alexandria—Brunstown—Bladenbury—George-Town—Arrival at Mount Vernon, the Seat of General Washington—Return to Alexandria—Observations on Maryland and Virginia—Tobacco of Virginia, and the Tobacco Notes—The Valley of Shenadore—Remarks—Conclusion.

ON the 15th of November 1788, M. de Warville set out from Philadelphia for Wilmington, distance twenty-eight miles, and road tolerably good. The town of Chester, fifteen miles from Philadelphia, is a place where strangers like to rest. It stands on a creek, which falls into the Delaware. It enjoys some commerce, and the taverns here are good.

Wilmington, which is a handsome well-built town, is much more considerable; it stands likewise on a creek near the Delaware; the basis of its commerce is the exportation of flour. It is about one mile's distance from the town of Brandywine. This town is famous for its fine mills.

At nine miles from Wilmington, our traveller passed Christine-Bridge, a place of some commerce. From thence to the head of Elk, there are but few plantations; he passed through eight miles of woods, only meeting with a few log-houses, till he arrived at Henderon's tavern, a very good inn, alone in the midst of vast forests. It is twenty-two miles from thence to the ferry of the Susquehannah. The town here is called Havre de Grace, a name given it by a Frenchman who laid the foundation of the town. It is at present an irregular mass of about 150 houses; but there is no doubt, when the entrance of the river shall be rendered navigable, but this will be an interesting situation, and a populous town. From thence to Baltimore are reckoned sixty miles. The road in general is frightful, it is over a clay soil, full of deep ruts, always in the midst of forests, frequently obstructed by trees overfett by the wind, which obliged them to seek a new passage among the woods. Our author cannot conceive why the stage does not often overfett. Both the drivers and their horses discover great skill and dexterity, being accustomed to these roads.

Some vast fields of Indian corn, but bad cultivation, pale faces worn by the fever and ague, naked negroes, and miserable huts, are the most striking images offered to the eye of the traveller in Maryland. They arrived at Baltimore in the night. It contains near two thousand houses, and fourteen thousand

inhabitants. It is irregularly built, and on land but little elevated above the surface of Patapsco-Bay, on the North of which it forms a crescent. The bay is not sufficiently deep to receive the largest ships; they anchor near Fell's-Point, two miles from the centre of the town. There are still stagnant waters in the town; few of the streets are paved; and the great quantities of mud after rain, announce that the air must be unhealthful.

Baltimore was but a village before the war; but during that period, a considerable portion of the commerce of Philadelphia was removed to this place. The greatest ships come as far as here, and can go no further; vast quantities of provisions descend the Susquehannah, and when that river shall be navigable, Baltimore must be a very considerable port.

They left Baltimore for Alexandria at four in the morning; distant about sixty miles, bad roads, a rude waggon, excellent horses, skilful conductors, poor cultivation, miserable huts, and miserable negroes.

M. de Warville saw Brunstown, a new village that the State of Maryland has pointed out for the seat of a college. This edifice is nearly completed; it is on an eminence, and enjoys a good air. They breakfasted in this village, and dined at Bladenbury, sixteen miles from Alexandria. It is situated on a little river, which discharges into the Potowmack, and which admits bateaus of twenty or thirty tons. They could find nothing to drink, but brandy or rum mixed with water. In countries cultivated by slaves, there is no industry and no domestic economy. The people know not the advantage of making beer or cyder on their farms.

George-Town terminates the State of Maryland; it overlooks the Potowmack, has an agreeable situation, and a considerable commerce. Regulations and imposts, inconsiderately laid on commerce by the State of Virginia, have banished to George-Town a considerable part of the commerce of Alexandria.

This place is eight miles below George-Town, on the opposite side of the Potowmack. Alexandria has

has grown from nothing to its present size within these forty years. It is not so considerable as Baltimore, which it ought to surpass. It is almost as irregular and as destitute of pavements. There is here a greater parade of luxury; but it is a miserable luxury; servants with silk stockings in boots, women elegantly dressed, and their heads adorned with feathers. The inhabitants, at the close of the war, imagined that every natural circumstance conspired to render it a great commercial town,—the salubrity of the air, the profundity of the river admitting the largest ships to anchor near the quay, an immense extent of back country, fertile and abounding in provisions. They have therefore built on every side, commodious store-houses and elegant wharfs.

Our traveller made haste to arrive at Mount Vernon, the seat of General Washington, ten miles below Alexandria on the same river. On this route there is a considerable wood, and after having passed over two hills, M. de Warville discovered a country-house of an elegant and majestic simplicity. It is preceded by grassy plats; on one side of the avenue are the stables, on the other a green-house, and houses for a number of negro mechanics. In a spacious back yard are turkeys, geese, and other poultry. This house overlooks the Potowmack, enjoys an extensive prospect, has a vast and elevated portico on the front next the river, and a convenient distribution of the apartments within.

After passing three days in the house of General Washington, who loaded our traveller with kindness, and gave him much information relative to the late war, and the present situation of the United-States, he returned to Alexandria.

The Bay of Chesapeak divides Maryland into two parts, nearly equal. The western division is the most peopled. Numerous bays and navigable-rivers render this state singularly commodious for commerce. Cotton is here cultivated, as in Virginia; but little care is taken to perfect either its culture or its manufacture. There are excellent lands in these two states; but they have very few good meadows, though these might be made in abundance. For want of attention and labour, the inhabitants make but little hay; and what they have is not good. They likewise neglect the cultivation of potatoes, carrots, and turnips, for their cattle, of which their neighbours of the north make great use. Their cattle are left without shelter in winter, and nourished with the tops of Indian corn. Of consequence many of them die with cold and hunger; and those that survive the winter, are miserably meagre.

They have much perfected in this country the English method of inoculation for the small-pox. In the manner practised here, it is very little dangerous. Whoever inoculates in Virginia, is obliged, by law, to give information to his neighbours within the space of two miles.

The population augments every where in these states, notwithstanding the great emigration to the Ohio. The horses of Virginia are, without contradiction, the finest in the country; but they bear double the price of those in the northern states. The practice of races, borrowed from the English by the Virginians, is fallen into disuse. The places renowned for this business are all abandoned.

The towns in Virginia are but small; this may be said even of Richmond with its *capital*. This capital turns the heads of the Virginians; they imagine, that from this, like the old Romans, they shall one day give law to the whole North.

There is a glass manufactory forty miles from Alexandria, which exported last year to the amount of ten thousand pounds in glass; and notwithstanding the general character of indolence in this state, the famous canal of the Potowmack advances with rapidity. Crimes are more frequent in Virginia than in the northern states. Porter, wine, and every article, bear an excessive price here.

Virginia has public magazines, where the tobacco

is deposited. Inspectors are appointed to take charge of these magazines, and inspect the quality of the tobacco; which, if merchantable, is received, and the proprietor is furnished with a note for the quantity by him deposited. This note circulates freely in the state, according to the known value of the tobacco. The price is different, according to the place where it is inspected. The following places are ranked according to the rigidity of the inspection: Hanover-Court, Pittsburg, Richmond, Cabin-Point. When the tobacco is worth sixteen shillings at Richmond, it is worth twenty-one at Hanover-Court. The tobacco travels to one place or the other, according to its quality; and if it is refused at all places, it is exported by contraband to the islands, or consumed in the country. There are two cuttings in a year of this crop; the first only is presented for inspection, the second consumed in the country or smuggled to the islands.

As Virginia produces about eighty thousand hogheads, there circulates in the state about eight hundred thousand pounds in these notes; this is the reason why the Virginians have not need of a great quantity of circulating specie, nor of copper coin. The rapid circulation of this tobacco-money supplies their place.

This scarcity, however, of small money, subjects the people to great inconveniences, and has given rise to a pernicious practice of cutting pieces of silver coin into halves and quarters; a source of many little knaveries. A person cuts a dollar into three pieces, keeps the middle piece, and passes the other two for half dollars. The person who receives these without weighing, loses the difference, and the one who takes them by weight, makes a fraudulent profit by giving them again at their pretended value; and so the cheat goes round.

But notwithstanding this pitiful resource of cutting the silver, society suffers a real injury for want of a plentiful copper coin; it is calculated, that in the towns the small expences of a family are doubled, on account of the impossibility of finding small change. It shews a striking want of order in the government, and increases the misery of the poor. Though tobacco exhausts the land to a prodigious degree, the proprietors take no pains to restore its vigor; they take what the soil will give, and abandon it when it gives no longer. They like better to clear new lands, than to regenerate the old. Yet these abandoned lands would still be fertile, if they were properly manured and cultivated. The Virginians take no tobacco in substance, either in the nose or mouth; some of them smoke, but this practice is not so general among them as in the Carolinas.

The Americans wish for the free commerce of tobacco with France; and they complain much of the monopoly of the farmers-general. If this monopoly were removed, and the tobacco subjected only to a small duty on importation into France, there is no doubt but that the Americans would give the French a share of those immense quantities with which they inundate Europe. They are now carried chiefly to England; where about the tenth part is consumed, and the rest is exported. England pays the whole in her own merchandize.

The high duty paid in England on tobacco, will prevent the Americans from giving the preference to France. It amounts to fifteen pence sterling on the pound. Though England consumes little tobacco, she draws from it a revenue of 600,000 pounds sterling. The state of the finances of that island, will not admit of her diminishing this duty in order to rival France.

The great consumption of tobacco in all countries, and the prohibitive regulations of almost all governments, may engage the Americans to continue this culture; for as they can furnish it at a low price, as they navigate at a small expence, as no people equal them in enterprize and industry, they may undertake to furnish the whole earth.

Spain, for instance, will doubtless become a market for them. A respectable author makes the

appointed to take charge of the quality of the tobacco, and is received, and is noted for the quantity of the note circulates freely in its own value of the tobacco, and to the place where it is placed are ranked accordingly: Hanover-Court, Point. When the tobacco at Richmond, it is worth according to its quality; it is exported by consumption in the country, a year of this crop; the second con- gelled to the islands.

Eighty thousand hogs- the rate about eight hundred notes; this is the reason of a great quantity of copper coin. The rapid money supplies their place, of small money, subjects, and has given rise cutting pieces of silver, a source of many cuts a dollar into three, and passes the other person who receives these difference, and the one makes a fraudulent profit their pretended value; and

tobacco in all countries, ons of almost all govern- ericans to continue this nish it at a low price, as ence, as no people equal lity, they may undertake

doubtless become a mar- table author makes the revenue

revenue which the king draws from this article, amount to twenty millions of livres (£833,333 4 sterling). The greater part of this tobacco is brought from Brazil by the Portuguese, sold to the king at fivepence sterling the pound, and then sold by him at eight shillings and fourpence. At the expiration of the present contract, the same author observes, the Americans will offer a more advantageous one, and it is said they will have the preference.

This high price encourages a considerable contraband in Spain, though interdicted by the pains of death. The law is too rigid to be executed.

The tobacco of the Mississippi and the Ohio will, doubtless, one day furnish the greater part of the consumption of Spain as well as of France. For it is proved, by those who know the secrets of the farm, that the consumption of the latter amounts to more than thirty millions of pounds annually, instead of fifteen, as we have been made to believe.

M. de Warville proposed, on quitting Alexandria, to visit that charming valley, washed by the Shenandoe. From thence he intended to return by the vale of Lancaster, and pay his respects to the virtuous Moravians. But the Revolution in France balked his return, and obliged him to decline the greater part of his intentions.

The Valley of Shenandoe, which lies between the fourth mountain and the north, or endless mountain, is from thirty to forty miles wide; chalky bottom, a fertile soil, and a good air. This situation offers almost all the advantages of the western country, without its inconveniences. It is almost in the centre of the United States, and has nothing to fear from foreign enemies. It lies between two considerable rivers, which fall into the Chelapeak; and though the navigation of these rivers is interrupted for the present, yet there is no doubt, that the progress of the works on the Potowmack, that this inconvenience will soon be removed.

The price of lands here, as elsewhere, varies according to their quality. They purchase at any price, from one to five guineas the acre, land of the same quality as in Pennsylvania from four to twenty guineas.

The average distance of these lands from commercial towns is as follows: fifty miles from Georgetown, about fifty miles from Alexandria, eighty or an hundred from Richmond and from Baltimore. But this part of the country is still more inviting for its future prospects. Of all the rivers that discharge into the Atlantic, the Potowmack offers the most direct communication with the rivers of the West. This circumstance will make it one day the great channel of intercourse for almost all the United-States; and its situation renders it secure against being interrupted by war.

But to realize the advantages which the situation of this country seems to promise, requires a reformation of manners, and the banishment of luxury, which is more considerable here than in Pennsylvania. Idleness and the love of the chase, which are deeply rooted in the soul of the Virginians, and, above all things, slavery must be extirpated; which infallibly produce those great scourges of society, laziness and vice, in one class of men, unindustrious labour and degrading misery in another. The view of this deforming wound of humanity, will discourage foreigners of sensibility from coming to this state; while they have not to dread this disgusting spectacle in Pennsylvania. But it is in a country life in America, that true happiness is to be found by him who is wise enough to make it consist in tranquillity of soul, in the enjoyment of himself, and of nature. What is the fatiguing agitation of our great cities, compared to this delicious calmness? The trees, do not calumniate; they revile not their benefactors; men of the greatest merit cannot always lay this of their fellow-creatures.

Our author in treating of the American trade to the East-Indies, observes that the first motive to it,

was the hope of economizing in the price of East-India goods, which they formerly imported from England, and this economy must be immense, if estimated by the great consumption of tea in America, and the high price it bears in England. In the year 1761, the English American colonies sent to England 85,000l. sterling in Spanish dollars for this single article, and since that time the consumption of it has at least tripled. Another motive which encouraged them to push this commerce, was the hope of being able to supply South-America, the Spanish and other islands, and even the markets of Europe, with the goods of the East; and to obtain every where the preference, by the low price at which they might be afforded. And this project is not without foundation. The nature of things invites the Americans to become the first carriers in the world. They build ships at two-thirds of the expence that they are built at in Europe, and navigate with less seamen, and at less expence. Also, the productions of their country are more favourable to this commerce than those of Europe. They carry ginseng to China; plank, ship-timber, flour, and salted provisions to the Cape of Good Hope, and to the isles of France and Bourbon. They are not, therefore, obliged to export to great a proportion of specie as the Europeans, who have establishments in the East.

Notwithstanding the number of maladies in America, the inhabitants are remarkable for longevity. It is difficult here to obtain regular tables of births and deaths. There are some sects who do not baptize their children, and whose registers are not carefully kept; others who baptize only their adults. Some of the sick have no physicians or surgeons, and their attendants who give the information are not exact. The constant fluctuations occasioned by emigrations and immigrations, still increase the difficulty.

A principal cause of emigration in the back parts of Pennsylvania, is the hope of escaping taxes; yet the land-tax is very light, as it does not exceed a penny in the pound of the estimation; and the estimation is much under the value of the lands. There is much irregularity in the land tax, as likewise in the capitation, or poll tax; but one thing pleased our author much—that bachelors pay more than married men.

No sea is impenetrable to the navigating genius of the Americans. Their flag is every where displayed; they are continually exploring islands, studying their wants, and returning to supply them.

The Americans have already made a considerable commerce on the coast of Nootka-Sound, in furs and peltry. They were there trading in the year 1789, in good intelligence with both parties. In the same year, no less than forty-four vessels were sent from the single town of Bolton to the north-west of America, to India, and to China. They bound not their hopes here: they expect, one day, to open a communication more direct to Nootka-Sound. It is probable that this place is not far from the head waters of the Mississippi; which the Americans will soon navigate to its source, when they shall begin to people Louisiana and the interior of New Mexico.

Having now completed the Travels of M. BRISSOT DE WARVILLE IN AMERICA, and rendered his Observations on the UNITED STATES more candid and impartial than they have hitherto appeared, by expunging all these galling Compliments and unnecessary Allusions with which his own Accounts are interlarded, and rectifying many Errors committed through the hurry of Composition; we shall now proceed with the interesting Narrative of LORD MACARTNEY'S Embassy to China, interspersed with several new and entertaining Anecdotes, and fully descriptive of YONGEN LOONG, the present Emperor— Hoping, that while we preserve our usual Accuracy and Spirit, we shall still retain the preference and attention of our numerous Readers and Subscribers.

A NEW, GENUINE, AND COMPLETE

HISTORY OF

Voyages & Travels:

Undertaken and Performed in the Years 1792 and 1793,

By LORD MACARTNEY and his Suite,

IN CONSEQUENCE OF

His LORDSHIP'S EMBASSY to CHINA.

Containing an INTERESTING NARRATIVE of all the CHINESE CUSTOMS, ENTERTAINMENTS, &c. with ACCURATE OBSERVATIONS of the several Remarkable ISLANDS they passed.

Including many New and Entertaining Anecdotes of TCHIEN LOONG, the present Emperor of CHINA, and interspersed with several other Curious Relations.

CHAPTER I.

LORD Macartney, with his whole suite, went on board the *Lion*, at Spithead, September 21, 1792; and on the 29th of the same month they took their final departure, accompanied by the Hindostan East-Indiaman, and the *Jackall* brig. During the beginning of their voyage nothing particular happened, except that the *Jackall* parted company in a gale of wind, in the Bay of Biscay, and did not rejoin them till after they had left Batavia.

They made land on the 10th of October, and passed the *Desert-Island* and *Porto-Santo*; the next day they cast anchor in *Funchal-Bay*, in the island of *Madreia*.

On Lieutenant Campbell being sent to the governor of the *Madeiras*, to notify the ambassador's arrival, salutes of guns were interchanged between the *Lion* and the garrison. Soon after, the British consul, attended by several English gentlemen and merchants, came to pay their respects to his excellency, and to invite him on shore. This invitation being accepted, the yard-arms were manned; during his lordship's passage from the ship to the shore, salutes were repeated; and at the landing-place, the governor of the *Madeiras*, the British consul, and the principal inhabitants, received the ambassador with every mark of esteem and congratulation. During his stay, he was splendidly entertained by the British consul and the governor on successive days; and before his departure, had the honour of

a visit in return on board the *Lion*, from all the most distinguished persons of the island.

Funchal, a town, is about three miles in length and one in breadth. Its population is very considerable; consisting of Portuguese, mulattoes, negroes, and a few British, who are engaged in the commerce of the place. The natives seem to be courteous in their disposition, and attentive to strangers.

Madreia, an island, is extremely mountainous; but the views are beautifully romantic; and verdure and fertility cover the most unpromising situations.

They took their leave of *Madreia* on the 18th of October, and on the 21st anchored in *Santa-Cruz-Bay*, in the *isle of Teneriffe*. This island, in extent, riches, and population, is the most considerable of those known by the general appellation of the *Canaries*. The town of *Santa-Cruz* is pretty large, well built, and populous, and is defended by two forts, which also command the bay. The *Peak of Teneriffe* is well known to be one of the highest mountains in the world; and it presents a number of objects which the curious inquirer into nature can never cease to contemplate with admiration. It rises in the centre of the island, and its ascent from *Santa-Cruz* may be about twenty miles. Some of the principal gentlemen of the embassy, with attendants, resolved to visit the *Peak*.

They set out on the morning of the 24th, prepared and equipped for the expedition, and furnished with guides;

guides; but after encountering a series of dangers, night coming on, they determined to take up their lodging at the bottom of the Peak, to which they were now advanced, and to renew their journey in the morning. At an early hour they again set out; but were obliged by the innumerable difficulties and dangers they encountered, to relinquish the gratification of reaching the summit. After a fatiguing exertion of two days, they returned to Santa-Cruz, and on the 27th they bid adieu to the Canaries. The Cape de Verd Islands lay next in their route; and Fort-Praya-Bay, in the isle of St. Jago, received them November the 2d.

The town of Praya is chiefly remarkable for the advantage of its port, where outward-bound ships of all nations frequently touch.

On the 18th of November they passed the line; and on the 1st of December came to anchor in Rio-Janeiro-Harbour, in the Brazils; where they found an opportunity of transmitting letters to England by a South-Sea whaler.

December 2, an officer was dispatched to announce the ambassador's arrival to the viceroy. Being then at his country residence, the usual salutes were suspended; however, the deputy-viceroy came in three next morning, to compliment Lord Macartney; but his lordship being much indisposed, was unable to receive him in person, Sir George Staunton and Sir Erasmus Gower, therefore, represented his excellency on this occasion. The day following, the deputy-viceroy, in the name of his principal, congratulated his excellency the ambassador on his arrival, and made a tender of a house for his residence during his stay.

Having accepted this obliging offer, on the 7th at noon his lordship proceeded on shore with the usual formalities, and was received with all possible distinction by the viceroy, attended by his guard and the most distinguished persons of the place. After taking some refreshment at the viceroy's palace, the ambassador, and the principal gentlemen of his suite, were accommodated with carriages to convey them to the house destined for their reception, about two miles distant from the city.

Lord Macartney, with his whole suite, paid a ceremonial visit to the viceroy on the 10th. In the evening his lordship and attendants took a walk in the public garden, the usual amusement, and the scene of the principal entertainment of the inhabitants of the place. This garden is laid out into grass plots and gravel walks, shaded with trees of perpetual verdure, interspersed with lamps. At one end they observed a large structure for music and dancing, which it seems are favourite recreations here at the proper seasons of the year.

On the 11th, the viceroy, in grand procession, returned Lord Macartney's visit. A discharge of artillery announced the moment of his departure from his palace. The ambassador stood ready to receive him on his arrival; and after conducting him to the principal apartment, presented the gentlemen of the embassy, who were all respectfully noticed by the viceroy. An elegant repast concluded the visit. The viceroy's dress was very splendid. It was scarlet cloth embroidered with gold and precious stones. His attendants, in general, wore a livery of green and gold.

Having already described the town of Rio-Janeiro, by some called St. Sebastian, in our former voyages, a repetition here would be unnecessary.

Lord Macartney, being still under indisposition, privately returned on board the *Lion*, on the afternoon of the 15th; and every preparation having been made for renewing their voyage, on the 18th they left the harbour of Rio-Janeiro.

The festival of Christmas overtook them amid the waste of waters; it is scarcely necessary to say that it did not pass unobserved, or its local rites unenjoyed. For some preceding and following days, their voyage was barren of occurrences; however,

on the last day of the old year they reached the island of Triflan de Cunha, a barren and almost inaccessible rock, near the centre of the Southern Ocean. Uninhabited by men, it is the resort of a prodigious variety of marine fowls; and its surrounding seas abound in whales and other tenants of the deep. An officer being sent on shore in the cutter, reported that the beach was favourable, and that fresh water was plenty.

They intended, January 1, 1793, to send out a watering party; and another on natural and philosophical researches. Both schemes were frustrated. A heavy gale came on at midnight, and had not the wind providentially changed, at a moment of imminent danger, their destruction would have been inevitable. During many successive days the weather was generally moderate; and a month passed away without their seeing land.

On the 11th of February, however, they discovered the isle of Amsterdam. They came to an anchor on the East side of this island; and found here five seal hunters from the Isle of France, who had mutually engaged to spend eighteen months on this unpropitious spot; six were already elapsed; and during that period, it seems, they had killed no fewer than 8000 seals. These men, with the utmost civility, conducted them to a hut they had built, and served as their conductors round their usurped domain. They had formed a path, with incredible labour, over a mountain, crowned with a volcano, which throws out a substance resembling salt-petre. In ascending this path, our adventurers found a small spring of boiling-hot water, in which some fish were perfectly dressed in a few minutes. The whole island, which is about eight miles long and six broad, has a volcanic appearance; and produces neither tree nor shrub. Vast quantities of fish were caught here, and salted for use; many species were very delicate, particularly lobsters.

It being a dark night when they departed, they had an opportunity of contemplating one of the most awful spectacles in nature. The flames of the volcano were seen rising from six different openings. Whether this was its usual appearance, or only one of its occasional eruptions, could not be affirmed.

They came in sight of the Trial-Rocks on the 18th. They scarcely rise above the surface of the deep; but the waves dash against them with so much impetuosity, that they run mountains high. This fortunately marks the situation of these formidable rocks, and in reality lessens the danger by magnifying its appearance.

Some short time after, they entered the Straits of Sunda; and on the 6th of March arrived in the Road of Batavia, where they immediately received the salutes of all the English ships, and of one French vessel. Early next morning, the garrison fired a salute, which was returned; and soon after a deputation from the governor-general waited on Lord Macartney, to invite him on shore. His lordship landed on the 8th, it being the anniversary of the birth-day of the Prince of Orange, and a royal salute was fired in honour of the day; afterwards the ambassador went on shore, with the usual ceremonies and attendants. The Royal Batavian Hotel was fixed on for the residence of the suite, and in the afternoon the baggage was safely landed before the door. This hotel is an elegant and spacious structure, and was built at the public expence, for the accommodation of occasional visitors of distinction. The style of living here is expensive; European liquors of every description being at a very high price; but when it is considered that the landlord is obliged to import them from Europe, and pays an annual rent to government of sixty thousand rix-dollars, it may reasonably be supposed, that the profits must be great, to counterbalance his risk and certain outgoings.

The governor-general gave a splendid entertainment to the principal persons in Batavia, at his country

country residence, to which Lord Macartney went by invitation. A ball and supper concluded the fete, and mirth and festivity were prolonged beyond the hours of night.

Batavia, the oriental emporium of the Dutch, is the principal city in the island of Java: it is almost square, surrounded by high walls and gates, and protected by forts, which are well garrisoned. The streets are spacious, and well paved; the buildings in general are uniformly elegant; and through every principal street runs a canal of considerable width, lined on both sides with trees of perennial leaves. In a climate so intolerably hot, this furnishes an agreeable refreshment; but perhaps the quantity of stagnant or slow moving water, thus collected, increases the natural insalubrity of the place. Indeed, so fatal is the climate of Batavia to Europeans, that scarcely one in twenty revisit their native land; and those who escape death there, carry with them emaciated forms and debilitated constitutions to the grave. From the registers of the public hospital, it appears, that the average number of deaths, annually, in that single receptacle of misery, does not amount to much less than five thousand. The population of Batavia, however, is nevertheless very considerable; amounting, at a moderate calculation, to two hundred thousand souls, of whom a majority are Chinese. These chiefly inhabit the suburbs, or Chinese Town, and appear to be an industrious and regular people. They carry on a variety of trades and manufactures; for Europeans think it beneath them to engage in mechanical operations. The Malays are also very numerous in Batavia, and possess all the malignant qualities that so universally adhere to that ferocious race of men. Nothing but constant severity, it is said, can keep them within the bounds of duty. Adapted to the depravity of the people in general, is the nature of the government of Batavia. It is arbitrary in a high degree; and the rigour, with which every species of delinquency is punished, can only find a justification in the ferocious disposition and the bale propensities of the natives.

His lordship soon after his landing, was seized with a fit of the gout, which put a stop to all the festivities intended to fill up the time of their stay. Several gentlemen of his suite also fell ill, in less than a week after their arrival; and to facilitate their recovery, they were ordered on board their respective ships.

During their stay here, a party of them attended the theatre. The play was the tragedy of Mahomet; and the entertainment, Barnaby Rudge. The audience seemed vally amused; but not understanding the language, our heroes could form no idea of the merits of the performance, except from the attitudes and expression of the actors, which seemed to be impressive and correct.

They left Batavia on the 16th, and next morning they made sail, passing the isle of Onroost, which lies in the middle of the bay; and notwithstanding the smallness of its size, contains a populous town, many elegant villas, and several flourishing manufactures. The superior salubrity of the air recommends this and some other surrounding isles, to those whose circumstances qualify them to reside where pleasure or health invites.

As the Jackall brig was now given up for lost, Lord Macartney purchased a French vessel at Batavia to supply her place, and gave her the name of the Clarence. The Clarence, however, had only joined them the day before they received some intelligence of the Jackall by a ship from Olland to Batavia; and this intelligence was confirmed by the brig joining them on the 23d, to the great joy of the whole embassy.

One of their crew named Leighton had gone on shore on the 29th, to wash his linen at Sumatra-Beach, and was found covered with wounds, and murdered by the Malays. To the savage disposition of these people, this event gave an additional, though

melancholy testimony. The last rites were paid to the body of the deceased with the utmost decency and respect; and the feelings of the whole ship's company on the occasion, were the best eulogium on his character and conduct. This day in the afternoon Lord Macartney signified his intention of going on shore, to view the spot where the Honourable Colonel Catheart (who held a similar situation to his lordship some years back) was buried; all that was to be expected from their mission, was of course anticipated by him, but his death put an end to that diplomatic attempt. After passing a variety of islands, they came to anchor in Pulo-Condore-Bay, May 16.

Soon after their arrival, a party of gentlemen, accompanied by one of the Chinese interpreters, went on shore. Some of the natives met them on the beach, with whom they proceeded till they came at a small distance to a village of bamboo huts; one of which was the residence of the chief, whose authority extended over the whole island. Like the rest, his habitation was formed of bamboo, raised on four posts, a few feet from the ground. Here we found several natives of Cochin-China, who wore no other dress but a piece of linen round their waists, and a black turban on their heads. The chief was habited in a loose black gown, and a pair of black silk trousers. He was also decorated with a silver cord thrown over his shoulder, from which a small bag of elegant workmanship was suspended. In common with the rest, he wore a turban, but no shoes. He appeared to be the object of very great adoration.

Adjoining his palace, if so it may be called, stood the temple. Externally, it resembled the other buildings; but the inside was adorned with various military weapons of Europe, particularly some old fire arms, of which they evidently did not know the use, and seemed to consider them only as objects of veneration. The discharge of a musket against a tree, excited the most lively alarm and astonishment. They eagerly examined the place where the ball entered; they even contrived to extract it, when presented it to each other, with the most violent emotion.

A treaty being entered into with the chief for a supply of buffaloes, poultry, and fruit, with which he was to furnish them the next day, our adventurers were regaled with rice and fish. Finding that cocoa nuts would be acceptable, the chief immediately ordered some to be procured for them. The dexterity these people shewed in climbing the trees that produced them, is astonishing. On their return to the ship, they observed caves on the beach very ingeniously constructed.

Pulo-Condore is but thinly peopled. The means of subsistence is difficult; and population of course must be influenced thereby. This island is subject to the king of Cochin-China.

On landing next morning, to receive the stipulated supply of provisions, they found, to their great astonishment, the village deserted, and every moveable carried off. A letter in Chinese characters, left in the hut of the chief, explained the reasons of this sudden and unexpected movement. It seems they were apprehensive of hostilities against them, from the ships coming to anchor in their bay; they earnestly implored the Europeans to spare their humble dwellings, which they intended to re-occupy on their departure; and dwelt on their poverty, which they perhaps concluded was their best protection, and the strongest arguments to allay European rapacity. Thus being obliged to set sail without their expected supply, they left Pulo-Condore on the 18th, and passing several islands of different forms and magnitude, they anchored on the evening of the 26th in Turon-Bay, in Cochin-China.

The ambassador shortly after their arrival received a visit from several mandarins, who came in great state. They were liberally entertained; but at first seemed averse to taste the wines and other liquors which were set before them. This reserve appearing to arise from fear, Lord Macartney set them an example,

example, when they indulged very freely; shewing a particular predilection for cherry and raspberry brandy. These chiefs wore nearly the same kind of dress as those at Pulo-Condore, except that they had a girdle of silver cordage. Their domestics were clad in a fancy dress, resembling tartan; and their legs and feet were wholly bare.

News of their arrival having reached the court, in the evening of the 29th the prime minister of the king of Cochin-China, attended by several mandarins, came, in his majesty's name, to invite the ambassador to dinner. His excellency obligingly accepted the invitation, but postponed the day to June the 4th.

He received in the mean time a present from the king, consisting of a great number of buffaloes, hogs, fowls, ducks, some bags of rice, and some jars of sampsoo, a Chinese liquor, reckoned very delicious.

They visited the town of Fie-Foo, while they lay here. It is nothing but an assemblage of wretched bamboo huts, but it has a good market; and were the industry of the natives equal to the fertility of the soil, this place would be remarkably abundant. They seem, however, to have little knowledge of agriculture: they subsist therefore chiefly on the spontaneous produce of the earth; and make their women a principal branch of their trade. For a certain consideration; they are always ready to consign them to the society of Europeans who touch here, without any apparent sense of impropriety. In one of their excursions to the shore, they saw six elephants performing a variety of unwieldy feats, for the entertainment of the mandarins who had assembled here.

The 4th of June, being his majesty's birth-day, was ushered in with a salute of twenty-one guns; the royal standard of Great-Britain, the St. George's ensign, and the union, were all displayed at their appropriate stations. In honour of this day, Lord Macartney had fixed his landing. Several mandarins waited his arrival on shore; and attended him, under an escort of his own troops, to the residence of the prime minister. A collation was here provided for him, consisting of all the dainties the country afforded; after partaking of which, he returned on board, interchanging mutual civilities with his hosts.

Matters thus far proceeded to the satisfaction of all parties in Cochin-China; but the master of the Lion, who had gone in the cutter to take soundings in the bay, having unreflectingly begun to survey the coast, was immediately seized, with seven men, who accompanied him, and carried prisoners to the capital.

When they first received this disagreeable intelligence, the impression it made is not easily conceived. It was not only the danger to which their countrymen had exposed themselves, that affected the embassy; but as this kingdom is tributary to China, it was feared, that a representation of this inconsiderate conduct, as to them it might appear criminal, would have an injurious effect on all their future proceedings; and that the object so much at heart—to inspire confidence, would be changed into suspicion and alarm. The good offices of the friendly mandarins were instantly and earnestly solicited. One of the interpreters was sent on shore to promote an inquiry and furnish an explanation; and on the 13th, they had the happiness to see the matter and his men return in safety, after an absence of six days. What they suffered during this period of suspense, cannot well be described. Nothing but a respect for the country to which they belonged, and a regard to the mission on which they were employed, could have saved them from certain death. This was not the only unpleasant event that befell them here. They lost a respectable gentleman, the purser of the Lion, who died, after a few days illness, on the 14th, and was interred on shore with all possible solemnity and respect. Over his grave was placed an inscription, cut in wood.

On the 16th of June they left Cochin-China, and the Jackall and Clarence brig, with Sir George Staunton and one of Lord Macartney's secretaries, were dispatched to Macao on the 20th. These gentlemen were charged with letters to the commissioners sent from England to notify the expected embassy. The two gentlemen who were the Chinese interpreters, took this opportunity of proceeding to revisit their relations and friends, from whom they had been long separated.

The intelligence brought by Sir George Staunton, who rejoined them on the 23d, gave very flattering hopes of the success of the embassy. At a time when they were approaching the scene of negotiation, this news was highly gratifying. During their passage up the Yellow-Sea, they passed numerous islands.

On the 21st of July they cast anchor in Jangnanfoe-Bay. Several officers were immediately sent in the cutter to Mettow, to reconnoitre the coast, and to ascertain if there were any practicable means of approaching nearer the capital on shipboard. The cutter returned on the 25th. They gave a very favourable report of the reception they had experienced from the Chinese; but reported, that it was absolutely impracticable to proceed further, on account of shoals and other natural impediments. It was therefore resolved to disembark; and a gentleman, accompanied by an interpreter, sailed in the cutter to Mettow, to make arrangements for this purpose. The mandarins promised to provide large junks for the reception of the suite and baggage, as soon as the wind proved favourable. Some short time after, they received a present of some bullocks and sheep, several hogs, poultry, vegetables, and other productions of the country. A principal mandarin also came on board the Lion, who finally settled the mode and the day of the disembarkation. He was invited to dinner; but not being provided with his usual table appendages, he seemed to feel himself in an unpleasant situation. The Chinese neither use knives nor forks: whether they appeared more ridiculous to him, or he to them, it may be difficult to decide. He expressed the greatest admiration of the ship, and the various arrangements and conveniences he saw on board; but what seemed to delight him most, was his being hoisted into one of their boats in the accommodation chair.

Now the greatest part of the baggage had been put on board the junks sent to receive it, and on the 5th of August, several more came alongside the Lion to take the remainder, and the suite. Before his excellency disembarked, the captain ordered the company to man ship: he was saluted with three cheers from the seamen, and a discharge of guns from the ships.

The junk intended for his lordship's reception, being found inconvenient and filthy, as indeed they were all, he quitted it and went on board the Clarence brig.

For this purpose they occupied no fewer than twenty junks, of about an hundred tons burden; and proceeding slowly, from the various difficulties of the river, the whole fleet anchored opposite the palace of the principal mandarin in Mettow, in the afternoon of the same day. This town, the first which they had seen in China, possessed none of those attractions that arise from the elegance of building, or the beauty of situation. It stands on a swampy spot, frequently overflowed by the sea, which no precaution of the inhabitants is able to prevent; and the houses or huts are wholly constructed of mud, covered with bamboo, without either floors or pavements. The residences of the mandarins, however, which lie at a small distance from the town, are built of stone and wood, three stories high, and are adorned with painting, gilding, and piazzas. They appear to contain a considerable number of apartments; each palace being furnished with projecting wings, which are generally of variously painted wood. Guards of both infantry and cavalry attend each mandarin, and environ his palace with their tents.

One solitary fort, consisting of a square tower, was probably meant for the defence of the place, as its situation commands the entrance of the river; but having neither ordnance or garrison, it serves rather as an ornament than a security. The river here is of considerable breadth, but of small and unequal depth.

Across its entrance runs a bank of land. The surrounding country presents a flat expanse of a rich soil and great fertility. Curiosity, which induced vast numbers to crowd the shores, during the landing of the embassy, gave them a very grand idea of the population of Metow and the environs.

C H A P. II.

Office of Van-Tadge-In, a Mandarin—Junks provided for their Conveyance to Peking, and Provisions—Indifference of the Chinese respecting their Meats—Description of the Junks—They sail for Peking—Description of a Chinese Soldier—Remarks on the Tea-Tree—Tyen-Sing—A Chinese Play—Cho-Tung-Pou—Arrival at the City of Tong-Tcheu—Observations—Death of Mr. Eades, &c.

VAN-TADGE-IN, a mandarin of the first class, being delegated by the emperor, to superintend the progress, and provide for the accommodation of the embassy, during its continuance in China, began the exercise of his functions, by furnishing our heroes with junks which were to convey them to Peking. The important trust with which he was intrusted, proved his country's opinion of his abilities to execute it; and there was every reason to confirm the favourable decision it had passed. This distinguished personage was about the middle size, robust, and finely formed. The darkness of his complexion was relieved by a set of features expressive of intelligence and feeling; and his manners were at once conciliating and correct.

From this mandarin they received, August the 6th, a quantity of beef, bread, and fruit. The beef was well flavoured, but not very fat. The bread, not being baked in the European mode, though made of excellent flour, was less agreeable to their taste. It was in fact little better than dough, being baked without an intermixture of yeast, which the Chinese are either unacquainted with, or reject its use. In shape and size, the loaves resemble a common wastiball, divided in two. They are baked on bars ranged across an iron pan, in which is a certain quantity of water, and placed on an earthen stove. When the water begins to boil, the steam is confined by a shallow tub for a few minutes; and thus the business ends. This curious method of baking, or rather boiling, rendered it necessary for our adventurers to slice and toast the bread before they could relish it.

Towards the afternoon they received a variety of meats, both roast and boiled. The roast meat appeared as if cooked with an oily varnish, and talled accordingly: the boiled was much more agreeable.

They were indeed a little prejudiced against Chinese cookery, from the accounts they had heard of their indifference in regard to animals killed on purpose, or by accident, or dying of disease. It seems all are equally used. The reports that had reached their ears, in this respect, were confirmed by the evidence of their eyes. Some pigs, being infected with an incurable disorder, were thrown overboard; but the frugal Chinese instantly picked them up and dressed them; and while they were enjoying their unenvied feast, appeared to laugh at the English for their fastidious delicacy. Nor is this grossness of appetite confined to those whom want may be supposed to stimulate. The higher ranks, in their domestic economy, appear to be governed by the same motives as their inferiors, and adopt customs which Europeans would despise.

On the 7th the Squadron received orders to return to Chusan-Harbour, and to wait for further orders.

Their junks are built of beech wood and bamboo, flat bottomed, and of various sizes; and nearly a fourth part as broad as they are long. On the first deck of the larger vessels, employed in the navigation of rivers, is a range of apartments, consisting of bed rooms, parlour, and kitchen. The floor from one end of the junk to the other, is full of hatches,

which being lifted up by a brass ring, open a stowage below for immense quantities of stores or goods. The windows are formed of small squares of transparent paper; and the sashes may be taken out on occasion for the admission of air. A coloured curtain on the outside extends the whole length of the junk; and this is either furled or drawn, according to the pleasure or convenience of the passengers. The main deck is laid out into chambers for the use of the crew. A gangway runs on both sides the vessel, so as to render the apartments private. It is astonishing how little water these junks draw. Some of two or three hundred tons may be navigated with safety on the most shoaly rivers. Most of them have only one mast, which, as well as the rudder, is clumsy and inelegant. A very wise precaution is used in the navigation of the rivers of China. No sooner does it become dark, but a lighted lamp is suspended from the mast's head, as the signal of approach. Thus the danger of vessels running foul of each other is prevented. Besides these lamps being formed of transparent paper, inscribed with Chinese characters, serve to announce the name of the junk, or the rank of its passengers. Other lights likewise are distributed round the vessel at night. During the day, signal flags are displayed, which being stamped with letters, answer the purpose of notification, the same as the lamps. These lights and flags have sometimes a grand and novel effect.

The mandarin and his suite occupied five junks, and took the lead of the procession. His excellency the ambassador, and the principal gentlemen, had seven junks for their accommodation. The soldiers, mechanics, and servants, brought up the rear.

On the 8th of August his lordship took leave of the principal mandarin at Metow, and having received a very liberal supply of provisions, tea, sugar, vegetables, and fruit, together with a quantity of wood and charcoal—for mineral coal is not known here, nor did they find it was used in any part of this empire—the embassy proceeded up the river. During this delightful voyage, the mandarin's guards marched by day along the banks of the river, and at night pitched their tents where the junks lay at anchor. Both the fronts of the huts on land, and the vessels on the water, were decorated with lamps, and together formed an attractive sight. The centinels, who kept a regular watch during the night, were furnished with a piece of hollow bamboo, which they strike with a mallet at regular intervals, to signify their vigilance and activity. This custom, the peyings, or soldiers, laid was universally adopted by the Chinese army.

Early the next morning, the gongs gave the signal for sailing. These instruments are made of brass, something resembling the cover of a large culinary vessel; and when struck with a large mallet, covered with leather, produce a sound that may be heard further than the European trumpet, or bell, in the room of which they are substituted.

This day, with the usual supply of provisions, for the first time, they received a jar of the country wine:

bank of sand. The flat expanse of a rich fertility, which induced stores, during the land- in a very grand idea of the environs.

In China, military honours are not unknown. In passing several populous towns where soldiers were quartered, they were drawn up on the banks to receive the ambassador, while crowds of spectators filled every accessible spot of view. The uniform of a Chinese soldier deserves a description. It consists of black nankeen trowsers, over which a kind of cotton stockings are drawn. Their shoes, which are also made of cotton, are extremely clumsy, broad at the toes, and furnished with immoderately thick soles. From the top of their trowsers is suspended a parkie, which contains their money. They have neither shirts nor waistcoats, but only a large black nankeen mantle with loose sleeves, turned up and fringed with red coloured cloth of the same fabric. A broad girdle confines this loose robe, ornamented in front with a kind of plate, said to be a composition of rice; a pipe, and bag for tobacco, hangs from this cincture on one side, and a fan on the other. These appendages, and a supply of tobacco, are allowed by the emperor. They wear their swords on the left side, with the point forwards. A bow is slung under the left arm, and a quiver on their backs generally contains twelve arrows. Many, however, carry fire arms; and though it is impossible for the Chinese to teach Europeans any improvements in the arts of destruction, in the caution they employ to prevent accidents with artillery and muskets, they might give the wisest of us a lesson in the more commendable art of preservation. The soldiers have a tuft of hair on the back of their head, which is plaited down the back, and tied at the extremity with a ribband. The rest they shave. They cover their heads with shallow straw hats, bound under the chin, and decorated with a red plume of camel's hair. According to our ideas, little that looks like military enters into the composition of a Chinese soldier's dress. Their col- ours are commonly of green silk, edged with red, and painted with characters in gold. Of these they employ a great number.

In sailing up the river, they saw numbers of rustic habitations, chiefly constructed of mud, with some few of stone. The country women, with the curios- ity natural to their sex, advanced to see the pro- cection. They seemed to walk with difficulty; having their feet and ancles bound with a red fillet to confine their growth. Their front hair is combed back on the crown of the head, and clubbed, and decorated with artificial flowers and silver pins; the hind hair is then brought up, and secured under the club. Except in regard to the decorations of the head and the ban- dages on their feet, the dress of the Chinese women differs but little from that of the soldiers.

The progress of our adventurers was by no means rapid; but they were every moment attracted by some new objects, which prevented their wish for greater expedition. In the course of one day's sailing, which could not exceed twenty-four miles, they passed such an immense number of junks, and saw such crowds of people, as would almost exceed belief did they attempt calculation. Independent of the moving scene, the river itself, spacious and meandering, was a noble object; and the diversity of its banks, and the views which occasionally opened over a rich and varied country, would have afforded a scope to the most glowing pencil.

On the 10th, for the first time, they saw the plan- tations of the tea-tree. This plant, so injurious to the constitution, and so captivating to the taste, which, from being originally an useless luxury, has now become a necessary in so many countries, has been well described by botanists, and a repetition here would be needless. It may be necessary, however, to observe that it is of a low size, with a narrow leaf, somewhat like myrtle. It was now the season when the tea-tree was in blossom. The blossoms are picked when young, and mixed with the tea, to which they communicate a more agreeable flavour. Plentiful

as tea appears to be in this province, it is not within the reach of the lower classes, for the crew of the junks were glad to receive the tea leaves, which they dried, and then boiled, to procure their favour- ite beverage. Tea is universally used in China without sugar; and as the natives, particularly the lower orders, frequently dry and reboil the leaves for some weeks successively, they unite economy with gratification.

On the 11th in the morning, they approached the city of Tyen-Sing: the banks of the river here pre- sented fields of millet and rice. The number of spectators that met them, both in vessels and by land, exceed all calculation. For nearly two miles they observed a range of salt heaps, disposed in columns, and covered with matting; but whether manufactured on the spot, or for what purpose such a prodigious quantity was collected, they were unable to con- ceive.

Their entrance into the city was attended with the noise and shouts of an innumerable multitude of people. This is a very populous and extensive place. The houses are built of brick, and are in general two stories high, covered with tiles; but the want of regularity offends the eye; and the streets are so uncommonly narrow, that no more than two persons can walk abreast at once.

The ambassador, who was received with military honours, went soon after their arrival, in full form to visit the chief mandarin. His palace is large and lofty, palisadoed in front, gilt and painted in a very fanciful and expensive form. Even the external walls are decorated with paintings; and the roof is coated with a yellow varnish of brilliant effect. Here the ambassador and suite partook of a cold collation, at which all the dainties of the country were col- lected.

A Chinese play was performed in honour of the distinguished visitor. The theatre is a square wooden structure, in the front of the mandarin's palace. The stage is surrounded with galleries, which were deco- rated with ribbands and silken streamers. The repre- sentations consisted of warlike manœuvres, varied by slight of hand deceptions, and a display of personal agility, in which the performers acquitted themselves with admirable adroitness. A band of music, con- sisting of wind instruments, enlivened the scene. The novelty of both pleased the eye, rather than delighted the ear. The female characters were performed by eunuchs: the delicacy of the Chinese would be shocked at the public exhibition of their women.

As soon as the ambassador and attendants returned on board, such an immense number of people accom- panied them, in every kind of conveyance capable of floating, that accidents appeared inevitable. They were witness to one, where part of the deck of an old junk gave way, from the enormous pressure of spectators, whereby several persons perished in the waves.

There was a very liberal supply of provisions sent them before they embarked. Indeed, from the super- abundance, they entertained the crews who navigated the junks; thus conveying the hospitality of the country to the relief of the natives, for which mark of attention they testified a due sense of gratitude.

There was a present made of some parcels of silk by the mandarin Tyen-Sing, to the embassy, and an officer, by the direction of the ambassador, distrib- uted them among his suite; but it not being possible for every one to have an equal share, it was deter- mined, after two pieces were distributed to each of the gentlemen, the remainder should be disposed of by drawing lots, by which means every person had an equal chance, in spite of his station.

For several days the weather was excessively hot, and at an early hour on the morning of the 12th of August they were visited by a most tremendous storm of thunder, lightning, and rain, which is not unusual in this climate.

During several hours this day it was found neces- sary

fary to employ men to tow the junks along. In China, numbers follow this laborious vocation, to which they are called when the wind or tide fails. A rope is fixed to the mast, and another to the head of the junk. These are of a length proportionable to the breadth of the river, and are fixed one at each end, to a stick of about thirty inches long. This is thrown over the head and rests on the breast, forming a kind of harness. Every draughtsman is furnished with a similar apparatus, and when all are ready, the leader gives the signal to advance. The towers all in concert, and proceed with a measured step, which is regulated by a kind of musical tone, constantly repeated. The fatigue these useful drudges undergo would appear excessive to any but the Chinese; they wade through marshy banks, and stalk through muddy soil, with a perseverance that claims at once admiration and pity.

Having received the usual supply of provisions, the next day they set about cooking it themselves; being perfectly disgusted with Chinese stinkiness in regard to their victuals. With respect to rice, however, they deserve the praise of cleanliness. They wash it well in cold water, and drain it through a sieve, then throw it into boiling water, and when pulpy, take it out with a ladle, and put it into another clean vessel, where it is suffered to remain till it becomes quite white and dry. In this form it is used for bread. Indeed, boiled rice, and sometimes millet, with vegetables, fried in oil, constitute the usual food of the lower class. They eat regularly every four hours of the day, and seldom vary their humble repast. Their tables are about a foot high; on them a large vessel of rice is placed, and each person, sitting on the floor, helps himself into a small basin. The vegetables are taken up with a couple of chopsticks, and eaten with the rice. On particular days a more genial diet is used. A weak infusion of tea is the usual beverage.

They sailed by the town of Cho-Tung-Poa on the 15th. It commands a pleasant view, and appears to be of considerable extent.

Shortly after leaving Cho-Tung-Poa they reached a tributary stream, over which were two bridges with two arches of elegant architecture. On a gentle eminence, at no great distance, stood the palace of the mandarin. It was built of stone, two stories high, and exhibited a favourable specimen of Chinese taste and design. The ambassador received military salutes wherever he passed.

As soon as they had moored for the night, the principal mandarin of Tyen-Sing arrived, with a numerous retinue, to pay his respects to the ambassador. A troop of men preceded him, who notified his approach by shouts. Then followed two men carrying large silk umbrellas, to shade the palanquin from the sun, when required; the standard-bearers succeeded; then the foot soldiers; the mandarin in his palanquin came next; and a troop of cavalry brought up the rear. In this style, persons of distinction in China generally travel; and the higher their quality, the more numerous their attendants.

They took a walk in the evening along the banks of the river, which were exceedingly pleasant. The corn was now almost ripe; agriculture appeared in its best form; and copious plenty seemed to countenance and support the immense population they every where observed. On the 16th of August they arrived at the city of Tong-Tchew, where their voyage terminated. This place is distant only twelve miles from Peking. Expectation was now roused, and some degree of anxiety awakened. They found an enclosure here, purposely erected, for the landing of the baggage and presents. Lord Macartney and the conducting mandarin went to inspect it. It occupied nearly the space of an acre.

There was a temple allotted for the residence of the embassy, during its stay at this place; and the whole suite, of every description, received an invi-

tation from the grand mandarin to partake of a public breakfast, which was to be provided here next morning. Accordingly, Lord Macartney and Sir George Staunton set out in two palanquins, and were escorted to the temple by a party of Chinese soldiers. The breakfast was composed of various made dishes, meat, tea, wines, fruit, and confectionary.

There was every exertion made to land the baggage and presents with speed and safety; and such emulation was displayed in this service, that most of it was lodged in the depot before night. Two Chinese officers inspected every case and package at the gate of the enclosure, of which they appeared to take a written account, and passed marks corresponding with their minutes on every separate article. This, as understood, was done with a view of certifying the emperor of all that was brought into his dominions.

The place appropriated for the residence of the embassy, called a temple, though in fact the habitation of a timber merchant, was hired by the Chinese government for this purpose, and is about a mile distant from the city. It is a neat, low building, of one story high; and consists of several courts, which were severally occupied by the soldiers, servants, ambassador, and suite. The soldiers court was next the entrance. Beyond this was the servants quarter, opposite to which is a square building of one room, consecrated to religious worship. In the middle of this stands an altar, supporting three porcelain statues as large as life, and on each side are candlesticks, which are lighted whenever any person is paying his devotion, and regularly at morn and eve. Before the images, stands a pot full of dust, into which a number of long matches are thrust, which are likewise lighted during the celebration of worship. The devotees having finished, the candles and the matches are extinguished, and an attendant on the altar strikes a ball thrice with a mallet. All persons present then kneel before the images, inclining their heads three times, with their hands clasped, which they lift over their heads as they rise. Such is the simple ceremony of the daily worship of the Chinese, invariably observed from the humblest to the highest, from the peasant to the emperor. This worship obtains the appellation of Chin-Chin-Josh, or the service of God. The meanest but has its altar and its image; nor is there a junk without those appendages.

The court appropriated to the use of the ambassador and suite, was handsome and spacious, decorated with lamps, gildings, and other Chinese embellishments. An hundred various dishes were served up at his excellency's table for dinner. A number of Chinese crowded round, and seemed highly diverted with the display of European manners, so opposite to their own. Indeed, Chinese servants were distributed in the different apartments, to be ready at any hour of the day, to supply the embassy with the various beverages of the country. These are chiefly tea, cold or warm.

The city of Tong-Tchew is about six miles in circumference, almost square, surrounded by a high wall, to which an external ditch is added, in the most accessible spots. It has three gates, each well fortified, and may, altogether, be considered as a strong place. The houses are almost universally of wood, of one story high, pretty with exterior decorations in the Chinese style; but most of them are destitute of furniture. The shop is the principal room. Before this are high pillars, supporting an awning, covered with painting and gilding, and decorated with streamers. These streamers indicate the commodities to be sold; and sometimes a wooden figure is superadded, to direct to the spot. In the form and size of the houses and shops there is very little variety; the same plan prevails throughout the city in almost every respect. The streets indeed are of different breadths; but all of them have a pavement on each side for the accommodation of foot passengers.

A CHINESE IDOL called QUANTECONG.
 which they say represents their first Emperor.

Engraved for PORTLOCK'S, *See* COLLECTION of VOYAGES & TRAVELS.

A FESTIVAL annually celebrated in honour of
CONFUCIUS, an eminent CHINESE PHILOSOPHER,
who revived the ancient Mythology of that Empire.

sengers. As a substitute for glass, a thin glazed paper is universally used in China: however, some of the palaces of the higher classes are furnished with silk to admit the light.

This city seems to carry on a very extensive trade. An immense number of junks resort to it. The population is computed at nearly half a million. The summers in this climate are very hot; but the winters are in proportion severe, as appears by ice of vast thickness being preserved to cool the drink during the hot months. In China, ice is esteemed a peculiar luxury.

The shortness of their stay, and the ignorance of the language, rendered it extremely difficult to obtain any correct idea of the nature of the municipal government. It was, however, understood that civil causes were decided by a bench of the lower mandarins, but their judgment was subject to the review of the principal mandarin, and even an appeal lay from him to the viceroy of the province. The ultimate fate of capital offenders depends on the emperor alone; but death is seldom inflicted in China. Persons far advanced in years, confessed they had never seen or known a capital execution take place in their province. The mild manners; the sober virtues, of the Chinese in general, render punishments neither frequent nor severe. An exact police, however, is kept up, and delinquencies are expiated with promptitude and unerring certainty, if detected. Thus the hopes of pardon do not inspire a vitious confidence; and the extreme difficulty of preventing detection, operates as a powerful dissuasive from crime. The Chinese, however, seem to enjoy as much liberty of action as is reconcilable to the well-being of society; and peace and contentment mark their days.

Our adventurers found the curiosity of the people very troublesome during their excursion round the city. They were frequently obliged to seek an asylum in the shops till the gazing multitude had dispersed. The second day after their arrival, the ordnance and stores were examined, and a trial made

of the guns in the presence of the ambassador. It was found they answered perfectly well.

Towards the evening his excellency was visited by the chief mandarin, accompanied by Van-Tadge-In. A band of music performed during his stay, with which the visitors seemed vastly pleased. This day Mr. Eades, one of the mechanics, died by a violent flux. To impress the natives with a favourable idea of the solemnities of their funerals, Lord Macartney was pleased to direct that the deceased should be interred with military honours. In China, coffins are kept ready made. They are chiefly of the same size for all grown persons; are strong and very heavy; in shape somewhat like a flat-bottomed boat. The lid is secured with a cord instead of nails. Having procured one of these receptacles of mortality, they placed the corpse in it with all possible decency. Next morning, orders were issued for the troops to appear with their side-arms, except a serjeant and six privates, who were appointed to fire a volley over the grave; and as there was no clergyman attached to the embassy, an attendant on his lordship was called on to officiate on this mournful occasion. The procession, having been previously marshalled, proceeded slowly to the burying-ground, about a quarter of a mile's distance from the ambassador's residence. An immense concourse of spectators were allured by the novelty of the scene to accompany them. Perhaps the most splendid exhibition would not have procured a larger assembly. The body was committed to the ground with due solemnity, and the procession returned in the same order as it went.

They observed in this country that the graves were very shallow. They have memorials of marble and stone, charged with inscriptions. Some of the monuments here exhibited traces of no ordinary sculpture. This receptacle of dust was of very considerable extent, but without walls. Except in the vicinity of large towns, there are no public burial grounds: in the country, the deceased repose within the precincts where they lived.

PREPARATIONS were made for their departure early on the 21st of August: the soldiers were first marched off, and then the servants, for both of whom covered waggons had been provided. The gentlemen of the suite followed in light carts, and Lord Macartney, Sir George Staunton, and the interpreter, had each a palanquin.

When they had left Tong-Tchew, they entered a fine champaign country, through which they travelled on a road of uncommon breadth and beauty. A foot pavement, about six yards wide, occupied the centre, and on each side several carriages had room to run abreast. Roads of a similar description conduct to the capital from the principal towns of the empire; and these are kept in perfect repair by labourers regularly disposed, and constantly employed.

About seven in the morning they reached the town of Kiyeng-Foo. This is a large and populous place, and exhibits the appearance of commercial opulence.

As it was most probably a matter of general notoriety, when they were to enter Pekin, the concourse of people who filled every accessible spot of view, and even crowded on them, notwithstanding all the exertions of the mandarins, considerably impeded their progress, and exceeded what they had hitherto seen of Chinese population. Yet to their mortification they observed, that their appearance excited rather ridicule than respect; and bursts of laughter accompanied every transient sight of them; on account of their vile carriages.

They stopped nearly an hour at Kiyeng-Foo, and received some refreshments of meats, tea, and fruits. Van-Tadge-In likewise ordered some joau, an unpleasant Chinese wine, to be distributed to the attendants of the embassy. This he did from the benevolent motive of enabling them to resist the calls of appetite till another opportunity offered of gratifying them, which at present could not be ascertained. Of the face of the country between this

town and Pekin, it is impossible to speak; their view was intercepted by the crowds.

On entering the suburbs of the metropolis, they passed beneath several beautiful triumphal arches. The houses in the suburbs are built of wood, two stories high, variously painted in front. The shops make a very respectable appearance. The streets are spacious, and on this occasion they were lined with soldiers, without whose assistance it would have been impossible for the cavalcade to have advanced.

About two in the afternoon they reached the gate of the imperial city of Pekin, or Pit-chin, as pronounced by the natives. The walls enclose a circumference of twelve leagues. In the centre of each angle is a grand gate or entrance, and a lesser one at each corner of the ramparts. They are all of strong stone arch work, and fortified by a tower of seven stories, rising over each. The gates indeed are double: the inner is of the same form as the first, except that it has no tower; and between them are barracks for soldiers. Ordnance and troops are stationed at every gate; and though the olive branch of peace blesses Pekin with almost a perpetual shade, the arts of defence and prudent caution are neither neglected nor unknown. At ten every night the gates are shut, and till dawn of day all communication is suspended between the city and the suburbs. During that space, a special order from the principal mandarin of the city is absolutely necessary to procure ingress or egress. The walls are of great height, and of masonry thickness; the foundation is of stone, but the superstructure is wholly of brick. Outworks and batteries at short intervals increase the strength of the walls, and forts are very frequent; but except at the gates there are neither cannons nor guards.

His imperial majesty generally resides here from October to April; and during that period, soldiers patrol the walls every night. On the most moderate computation, from the fourth gate to the east gate is a space of ten miles. This was their route through Pekin; and every step presented some new object to arrest their attention. The streets are spacious, clean, and commodious, well paved, and well regulated. An exact police is kept up; and as every public functionary, from the highest to the lowest, is attentive to the discharge of his duty, order, neatness, and activity, are every where perceptible. Large bodies of scavengers are employed in separate districts in removing every species of filth; and another class of men sprinkle the streets, to prevent the dust from incommoding passengers, or injuring the gaudy wares and elegant manufactures which every shop presents for sale. In the capital, and indeed in almost every town in China, the pride of architectural elegance and embellishment seems to be chiefly displayed in the shops. The tradesmen wisely lay out the greatest expence in that apartment which brings them in the most profit; hence the shops in general are magnificent, while their domestic accommodations are neither numerous nor great. The houses here are low, but highly embellished in front, with galleries, paintings, and golden characters. Fine pillars are erected at the doors of the shops, supporting a flag, which indicates the name and profession of the master of the house. These flags, with the intermixture of gilding, sculpture, and valuable commodities, which attract the eye every moment, give an idea of splendor, which fancy can scarcely enlarge. The butchers shops appear to be supplied with excellent meat. On entering one of them, to satisfy their curiosity in regard to the pieces of meat, and the mode of cutting it up, which last agrees almost with the European fashion, they observed an earthen stove with a gridiron. The butcher constructing their signs into a want of meat, began cutting off and broiling small slices, which he continued to supply them with till they were satisfied. Perhaps they might consume about a pound; and on producing a string of caecæ, the only coin allowed to

be current in China, he took off one condoron, as the price of his meat. Numbers were leading on beef and mutton in this manner.

The itinerant tradesmen in Pekin, according to the nature of their business, either bear baskets over their shoulders, or carry a kind of pack. Street barbers are very numerous. These carry with them the implements of their trade, together with a chair, a small stove, and a water basin. Their customers sit down in the street, where the operation is performed with dispatch, and a mace is the general compliment to the operator. A pair of large steel tweezers snapped with force, gives the signal that the barber is at hand; and in a country where it is impossible that any person can entirely shave himself, if he complies with the established mode, this must be a lucrative trade. Street auctioneers, apparently possessed of all the low eloquence and the vociferous exertions of that craft, present themselves frequently on a kind of platform. The principal streets being of enormous length, are subdivided by arched gateways, under each of which the name of the partial street is written in gilt characters. These arches continually appearing, serve as central objects for the eye to repose on. The cross streets are terminated by small latticed gates, shut during the night; while the principal ones are incessantly guarded by soldiers, who are armed with swords and whips, to quell any disturbance, or to correct slighter irregularities.

Their chief expence seems to be laid out on the shops, and except in the variety of their embellishments, an uniformity prevails in the height and extent of their houses. Few private buildings are more than one story high, and these are chiefly of wood. The imperial palace, however, the houses of the mandarins, and the pagodas, are distinguished by their superior elevation, as well as their magnificence. Palanquins are the fashionable vehicles of the great, while covered carts, drawn by a horse or a mule, serve for the inferior classes.

The Chinese women frequently present themselves from the galleries in front of their houses, and are very fond of gazing at fights. The females of Pekin in general possess delicate features, the effects of which they heighten by cosmetics. They also apply vermilion to the middle of their lips, which certainly is not an unattractive addition to their beauty. Their eyes are small, but very expressive; and their brilliance is contrasted by a peak of black velvet or silk, set with stones, which depends from the forehead to the insertion of the nose. Their feet appear to be of the natural size. In fact, the women seem to enjoy as much liberty as is consistent with the delicacy of the sex; nor is jealousy, so far as they could judge, a predominant passion among the men. On observing a crowd of women, our heroes addressed them with the word Chou-ou, or beautiful, on which they gathered round them with an air of modest politeness, examined the make and texture of their clothes, and appeared to be vastly entertained. They did not decline a gentle shake of the hand, on one of their party taking leave; nor did the men who were present seem dissatisfied with the attention which was paid to and by them.

They met a funeral procession in their way to the city. The coffin was covered by a rich canopy, with silk curtains, highly ornamented, and hung with escutcheons. It was placed on a large bier, and had a great number of men to support it, who advanced with a slow and solemn step. A band of music followed, playing a kind of dirge; and after them came the friends and relations of the deceased, in dresses of black and white.

Having passed the eastern suburbs, they again entered a rich and beautiful country, and soon arrived at Yeumen-Manyeumen, one of the emperor's palaces, distant about five miles from the city. Here they found rather a frisky and indifferent refreshment; but being much fatigued, the idea of rest was their

took off one condorion. Numbers were leaving in order.

In Peking, according to either bear baskets over their kind of pack. Street porters carry with them together with a chair, fan. Their customers are the general. ion in their way to the red by a rich canopy, ornamented, and hung faced on a large bier, men to support it, who blemish sleep. A band of and of dirge; and after lations of the deceased,

suburbs, they again entry, and soon arrived at the emperor's palace, the city. Here they indifferent refreshment; idea of rest was their most

most acceptable gratification. This palace is low, both in situation and building. They entered it by a common stone gateway, guarded by soldiers; beyond this is a kind of parade, in the centre of which is a small lodge for the accommodation of the mandarins in waiting. The body of the palace is divided into two square courts, equally destitute of elegance and convenience; the windows of the apartments are formed of lattice, covered with glazed and painted paper; and throughout the whole range there was no other furniture than a few ordinary tables and chairs; not a bed or bedstead was any where to be seen. Indeed the natives sleep on a kind of mattresses, and cover themselves with a cushion of stuffed and quilted cotton. They undress only partially, when they retire to rest, and increase the number of their coverings according to the severity of the season. Instead of bedsteads, they use a large wooden bench, raised about two feet from the ground, and bottomed with bamboos or wicker work; on one of these several persons may spread their mattresses. Every thing about this residence evinced that it had been long deserted or neglected; and indeed a more unpromising situation for a royal residence could no where be found. The situation was naturally swampy, and two ponds of stagnant water communicated their mephitic odours to every apartment. Some small grass fields belong to the place; but these too were an exception to the general cultivated appearance of the country. In short, centipedes, scorpions, and musketoes, infested every part of this palace; and for such inhabitants it was solely adapted.

Disagreeable as the internal state of their residence was, they were still cut off from all external communication. Soldiers and mandarins guarded every avenue; and the embassy could be considered in no other light than as prisoners of state. His excellency the ambassador justly conceiving a disgust at a situation so unfavourable to health or accommodation, as well as derogatory to his personal dignity and the honour of his country, made a serious remonstrance on the occasion. His application was at last productive of a change of residence; it was not, however, till the 26th that they were suffered to quit this melancholy dwelling.

Previous to this, several unpleasent altercations took place between the members of the embassy and the soldiers on guard. The former could ill brook the disgraceful restraints laid on them by confinement within the walls of their prison; and the latter pertinaciously opposed every attempt at greater liberty. These contentions were not unrequent, and perhaps were productive of future ill consequences to the interests of the mission.

The pleasure at the prospect of leaving this wretched place was so great, that every necessary preparation was made for the purpose in the shortest possible space of time. Some of the presents and the more delicate articles of art or manufacture were left here, lest they should be injured by frequent removal. The procession set out on its return to Peking with the same accommodations as it came; and the arrangements having been made more perfectly than before, they arrived without any accident or confusion, at the north gate of Peking about one in the afternoon of the 26th of August. This was the counter-gate to what they had entered in their former procession through Peking, and presented new views of streets and buildings.

A pagoda attracted their notice in their progress, being the first they had found an opportunity of observing. It stood in the centre of a beautiful garden; is square, stone built, and gradually diminishes from the bottom till it terminates in a sphere. It rises to the height of seven stories, and has a gallery near the top, encompassed by a rail.

Their return no doubt being unexpected, they passed with facility through the streets, and soon arrived at a princely palace, belonging to the vicroy

of Canton, who it seems was a state prisoner here for some misconduct in office. This palace consists of twelve large and six smaller courts: it is built of a grey coloured brick, of most elegant workmanship, but except two detached edifices, which were occupied by Lord Macartney and the secretary to the embassy, the palace was only one story high, though this was of unusual elevation.

Every thing without and within convinced them they now lodged in a palace: the embellishments were in the first style of Chinese taste; and in regard to the beauty of colours and the brilliant effect of house painting, no nation can enter into competition with this. The glossy effect of japan is every where perceptible, without the invention of varnish; for they were convinced that the beauty produced arose from some ingredients in the original composition. The apartments were very spacious, and hung with the most elegant paper, enriched with gilding. Lord Macartney's residence was singularly superb, and moreover had an elegant private theatre belonging to it; and in a word, all ranks and descriptions were accommodated in a style that gave satisfaction, and deserved acknowledgment. Here, however, the furniture was neither valuable nor in any quantity. Chairs and tables, a few platforms, covered with bamboo matting and carpets, were the only moveables in a palace whose decorations, both external and internal, would not have disgraced the residence of the Emperor himself. Under the floor, in each of the principal apartments, is a stove, with a circular tube, which conveys warm air into every part of the room above. They saw no chimnies in this country, and understood that stoves supplied with charcoal were the universal custom.

Their tables consisted of dishes in the best style of Chinese living; but more particularly stews and hashes than solid joints. In this respect, however, they had no reason to complain; but the same vigilance was employed to keep them within the limits of their residence as ever; and on no pretence could they pass the gates, or even scale the walls, which were constantly guarded by a military force.

Notwithstanding they wished that their continuance in this place, might be of no long duration, as it was impossible to make any progress in the grand object of their mission till they had an interview with the emperor, yet every arrangement was made to add to the dignity of the embassy, or promote its convenience. Having settled this business, they waited with anxious expectation the return of a mandarin, who had been dispatched to learn his Imperial majesty's pleasure, whether they should proceed to Tartary, where he was then resident, or wait till the period of his usual return to Peking.

Early on the 28th of August, the conducting mandarin came to acquaint the ambassador that it was his Imperial majesty's pleasure to receive him in Tartary: thereupon a new arrangement took place. The principal gentlemen belonging to the embassy were selected to accompany his excellency into Tartary; several of the scientific gentlemen, mechanics, and sick, were to remain in charge of the baggage and presents. The guards, musicians, and servants, received orders to hold themselves in readiness, with only indispensable necessaries; and even the gentlemen of the suite were to be as little incumbered as possible. They were to carry with them only the uniform of the embassy, and a common suit of clothes: the musicians and servants were to be dressed out in a suit of slate liveries, which, on being unpacked, it was evident that this was not their first appearance in public; several of the dresses bearing the names of their former wearers, and from some circumstances that they discovered, had been made up for the servants of some former ambassador. With these habiliments, such as they were, every man fitted himself out in the best manner he could. The ambassador and Sir George Staunton were to travel in an old chaise belonging to the latter, which

on being unpacked, had none of that gaudy appearance which distinguished the works of art in this country; and some of them did not hesitate to express their disapprobation of its external appearance. Such of the suite as preferred riding on horseback were to be accommodated on givings in their names; and carts were to be provided for the rest. The baggage and presents which were to accompany them having been previously sent off, the ambassador's carriage was to be driven by a corporal of infantry, who fortunately had once been a postillion, and a light horseman, who was to act as his assistant. A man who has learned two trades is frequently useful to himself and to others: this humble corporal was the only man who could have headed the ambassador. He and his assistant were permitted to exercise the horses in the chaise for a short time through the streets of Peking, under a guard of mandarins and soldiers; and such crowds assembled to see this extraordinary spectacle, that authority was absolutely necessary to restrain the consequent molestations.

Early on the 2d of September, a number of horses having been already brought to the palace, and the riders having made a selection, they began their march, but meeting with frequent interruption, it was some time before they could pass the city gate. This being effected, they soon drove through the suburbs, and entered a rich and beautiful country by a road of great width, but without any central pavement. After travelling about six miles they reached the village of Chin-Giho, where they were allowed the morning refreshments.

In their route they passed a great number of populous villages; and took up their first night's lodging at one of the Emperor's palaces, named Nanhighiee. They were now furnished every day with the best accommodations, and received an allowance of samchoo and Chinese wine; the former is a spirit distilled from rice and millet, and may deserve the appellation of Chinese gin.

The distance from Peking to Jehol, whither they were bound, is one hundred and sixty miles, which was divided into seven days' journeys, that they might have the advantage of sleeping in an imperial residence every night. This flattering mark of distinction is the highest it seems that can be paid; and is never conferred even on the first mandarins. The palace where they passed the first night had but little to demand attention, either in its external appearance or its internal decorations. It was environed by a spacious garden; but to this they were denied access.

About four the next morning they resumed their journey, and took their first refreshment at the town of Wheazon, a place of some consequence. From thence they proceeded through dusty roads, beneath a burning sun, till they reached the palace of Chang-Chin, where they halted for the night. This is a spacious structure, covering a great extent of ground, and is adorned with gardens and plantations. The surrounding country is enclosed; and in point of fertility is equal to any they had seen: it fed immense herds of cattle. The sheep here are small, but very fat; they have a thick short tail weighing several pounds.

The next morning as they proceeded on their journey, the distant country assumed a mountainous aspect; fertility was sensibly diminished, and the villages became more thin. About noon they saw the city of Caungchumfoa. It seems to be a large place, and is walled in the manner of Peking. The palace of Caungchumfoa received them at a early hour of the afternoon, after the most fatiguing and disagreeable journey they had hitherto experienced.

This palace has little to distinguish it from those they had already occupied, and the treatment which the ambassador and his attendants received, corresponded in every respect with what they had undergone before, in their journey to and from Peking. It is almost unnecessary to say, that however unfavourable appearances might be, most of them gladly

accepted of whatever was prepared for their refreshment; and it will be doubted by none, that nothing gave them greater satisfaction than when their conductor informed them that they might retire to the different apartments allotted for their repose.

Early the next morning they were summoned together, and soon after departed. The roads now became indifferent, and the country displayed a mountainous appearance.

At a small distance from Waung-Chanyeng, they passed a prodigious arch, which united two hills, with a parapet of masonry strength on both sides. The further hill is crowned with a fort, whose ramparts stretch to a very great distance. Beneath this fort is a ponderous arch-way conducting down the hill, so steep as to render travelling dangerous. In a romantic valley at the bottom, appears the town of Waung-Chanyeng: it is irregularly built, about a mile in length, and displays a considerable share of commerce and opulence. At the extremity of this town a temporary triumphal arch was erected in the honour of the embassy, finely ornamented with silk streamers. Here the ambassador received a salute from some guns, and passed between a double line of soldiers, who displayed a martial appearance and military parade beyond what they had hitherto witnessed in China. They were regularly drawn up in companies; and each regiment was distinguished by a different dress. They all wore a kind of coat of mail; and had their head and shoulders covered with steel helmets. Their armour was matchlocks, sabres, spears, lances, and bows and arrows, together with some weapons of which they knew not the appropriate name. Almost every division varied in its armour as well as its dress.

Now they approached one of the wonders of the world, the wall that separates China from Tartary, the most stupendous work every produced by man. In the vicinity are cantonments for an army of considerable magnitude; at the extremity of which is a masonry gateway of stone, defended by three iron doors, which guard the pass between countries formerly distinct. This wall, the pride of human labour, is supposed to be upwards of twelve hundred miles in length; its height varies according to the circumflances of the surface. Where one of them contrived to get to the top, it was upwards of thirty feet high, and about twenty-four broad. The foundation is laid on large square stones; the superstructure is brick; the centre is a kind of mortar, covered with flag stones. A parapet of no ordinary strength runs on each side of an embattled wall.

The country on the other side assumed a new appearance; even the climate was changed. Instead of cultivated champain, the abodes of wealth, and the bustle of commerce, they now encountered barren wastes, where art has not yet displayed her magic powers.

About seven miles from the great wall they came to a mountain, which exhibited an additional proof of the indefatigable labours of the Chinese in works of public utility. A road, thirty feet wide, is cut through the solid rock; and to lessen the declivity, it is sunk no less than an hundred feet from the summit of the mountain. Yet still the ascent has a tremendous appearance; and without this vast labour, it could not have been surmounted by man. At a moderate distance, on the other side of this steep mountain, stands the palace of Chaung-Shanuve. It consists, like the rest, of a number of courts, surrounded by a high wall. In the palaces, at least in this country, picturesque beauty is either unknown or disregarded. No distant prospects glad the eye nature, though frequently enchanting, is excluded from the sight. Here a considerable number of the emperor's ladies are lodged, guarded by eunuchs. Their apartments of course were distinct; but several of them were seen peeping over the partition that separated their apartments from the embassy. feraglio. This place is surrounded with extensive gardens: the road from Chang-Shanuve was every where broken and mountainous. Yet sterile as it now appeared, this evidently did not proceed from any want of activity from the natives. Every spot capable of cultivation was covered with corn; and in one place they saw several patches of tillage where the declivity seemed to be wholly inaccessible. This excited their admiration; but judge their surprize when they observed a peasant labouring on one of them, where they at first could not conceive how he was capable of standing. This poor man, whose hut was erected at the bottom of the precipice, let himself down from its top by a cord tied round his middle; depending on the strength of this, he laboured for his daily fare, amid continual danger: a proof at once of Chinese industry and fortune.

They arrived before noon at the palace of Callachottung, where they spent the remainder of the day. This palace stands between two lofty hills; it appears of more modern erection, but in style and form resembles those they had already seen.

As they were now near the termination of their journey, the ambassador gave orders to practise the procession and ceremonies with which they were to appear before the imperial court. His excellency was pleased to approve of the rehearsal; during the performance of which the band played the favourite march, known by the appellation of the Duke of York's.

September 7, they continued their route over a hilly country, where the air was piercingly cold. They passed several well-peopled villages, but neither the country nor the people were the same as on the other side of the Chinese wall.

They reached the palace of Callachotshangfu early in the afternoon: in extent and form it was equal to any they had lately seen; but they found it tenanted only by squirrels which bounded round the courts and inhabited the rooms.

September 8, they arrived at one of the emperor's pagodas, where they found an abundant supply of provisions. Here they made a short stay to equip themselves for their progress.

They arrived next at the village of Quoangcho, within a mile of Jehol, the imperial residence. Here they were marshalled, and proceeded amid an immense concourse of spectators, with all the parade that circumstances would allow. The military made a most respectable show; and the gentlemen of the suite, it may be reasonably supposed, were not forgetful of their dignity, and strove to support it by every external display; but the generality were a motley group, without even the advantage of a tolerable uniformity in dress or appearance. The whole certainly could not convey any extraordinary ideas of the splendour or power of the country from which they came. The novelty of the scene might possibly amuse the Chinese, but its grandeur could make no impression. As their progress was slow, they did not reach Jehol until ten in the morning, and drew up before the palace provided for the reception of the embassy. The British military formed a line for the ambassador as he passed; but not a mandarin was in waiting to receive him: and they took possession of the palace without the welcome of an address. Indeed it was reported that the grand choulai, or minister of state, would meet the ambassador, and escort him into Jehol; and after their arrival, they were kept for some hours in anxious expectation of receiving this honour; but at last dinner being served up, all their hopes of seeing him that day terminated.

They now occupied a palace situated on the declivity of a hill. The entrance was by a wooden gateway, which conducs to a large court. Each side of this court has a long gallery, supported by wooden pillars, and roofed with black glossy tiles. That on the left was converted into a kitchen, the other served for the soldiers to exercise in. At the upper end

was another gallery of more elegance, from which a door opens into a further court, the principal apartments of which were appropriated for the use of the ambassador and Sir George Staunton, the rest for the military gentlemen attached to them: a third court was occupied by the gentlemen of the suite, the musicians, servants, and mechanics. The whole fabric is surrounded by a high wall; but owing to the declivity of the situation, the view was not entirely obstructed. They had plenty within the walls, but no one had liberty of egress.

On the second day after their arrival, the ambassador received a visit from a mandarin, with a numerous retinue. He remained nearly an hour in conference with his excellency and Sir George Staunton. During his stay, his attendants amused themselves in examining the dress of the English servants; and on rubbing the lace on their clothes with a stone, to ascertain its quality, failed when they found it less valuable than brilliant. What passed at this conference could not be generally known; but a spirit of conjecture was conjured up among the attendants on the embassy, and the prefaces they formed were by no means auspicious.

This day, instead of that profusion which had hitherto crowned their board, the lower classes in the embassy found scarcely enough at dinner to satisfy one half of them. They had, however, been previously instructed, though for what reason cannot be said, that if their provisions should be defective in quantity or in quality, they were to intimate the grievance to his excellency alone, and leave them untouched. According to these instructions the meat was left untouched; but his excellency having remonstrated to the mandarin by means of his interpreter, in a few minutes every table was served with hot dishes, in the usual variety and profusion. Why this entertainment, which must have been nearly ready, was thus withheld, and so speedily produced, served as an enigma to exercise their ingenuity, but which they could never solve.

On the succeeding day, the presents brought from Peking were unpacked; they consisted of a great number of pieces of coarse cloth, principally black and blue, two telescopes, two air-guns, two richly mounted fowling-pieces, two pair of saddle pistols, two boxes of Irish tabbinets, two large boxes of British carpeting, and two most elegant saddles with furniture complete. Centinels were placed to guard these specimens of British art and manufacture, till the imperial pleasure respecting them should be known, which was afterwards notified by the attendant mandarin.

September 12, a mandarin of the first order, came to acquaint the ambassador, that his imperial majesty would give him an audience on the 14th. This intelligence diffused hope and spirits through the whole embassy, and orders were immediately issued that the suite should be ready on the morning of the day appointed, to accompany his excellency to the imperial palace. The attendants were to appear in their best liveries; and the soldiers and servants, after having escorted the ambassador, were to return immediately to their quarters; his excellency informing them, that he had reason to hope the restrictions imposed on them, which were so irksome to all, would, by his endeavours, be in a few days removed.

Lord Macartney was splendidly dressed, in mulberry colour velvet, with his diamond star and ribbon, and over the whole he wore the full habit of the order of the Bath. Sir George Staunton was in a full court dress, over which he wore the gown and hood of a doctor of laws, with the academical cap. As the morning was very dark, a considerable confusion arose in the intended order of the cavalcade: about five o'clock the ambassador alighted from his palanquin, amid an immense number of the populace. Sir George and Mr. Staunton supported his train.

As it was day-light when they returned, they had a view of the city. It is large and populous, but very

irregularly built; the houses are low, and chiefly of wood: except in the quarter contiguous to the imperial palace, none of the streets are paved. The principal support of this place seems to be derived from the emperor's partiality for it. No river connects it with remote situations; the splendid expence of a court, however, renders it rich and busy. The surrounding country, though not comparable to China, is in the best state of Tartary cultivation.

As their visit was a meer matter of form and presentation, his excellency was not detained long: he returned before noon. The emperor, it is said, received the credentials with all the dignity of form. He appeared to be vastly struck with the manners and abilities of Mr. Staunton, to whom he presented, with his own hands, a beautiful fan, and some embroidered purses.

Some short time after the ambassador's return, a number of valuable presents were received from court, consisting of velvets, silks, and purses, and some of the finest tea of the country, made up into solid cakes of about five pounds each. Except such as were addressed for their Britannic majesties, these presents were proportionably divided among the gentlemen of the suite.

On the 15th, the ambassador, attended only by his suite, paid a second visit to the emperor, in order, as they understood, to attempt to open the wished-for negotiation. On this occasion, he stopped several hours. The interpreter gave a very favourable report of the aspect of the negotiation, as far as it had advanced; and their hopes for its success seemed to derive some confirmation from a second cargo of presents, consisting of silks as before, Chinese lamps, and valuable porcelain; to these were added a number of calibash boxes of the most exquisite fabric. A distribution was made as before; and this evening was spent in mirth and festivity, arising from the most sanguine hopes of success.

On the 16th, several mandarins visited the ambassador, and invited him and the whole embassy to attend the anniversary of the emperor's birth-day at court, on the morrow. Accordingly, his excellency set out very early in the morning, and the whole cavalcade reached the Imperial palace about four o'clock.

The emperor's palace commands an elevated situation and extensive views: it contains a numerous range of courts, none of which, however, appear very magnificent, though some of them are highly decorated with painting and gilding. The gardens surround it for several miles; these are bounded by a wall thirty feet high. In the front of the palace is a fine lawn, with a lake in the centre. On the emperor's approach, the mandarins in waiting prostrated themselves, or it would have been impossible to have distinguished his palanquin from one of theirs. No external pomp or badge of dignity, marked his dress or equipage. It is a favourite maxim of his government to check superfluous expence, and to encourage frugality and industry in every department of his government. Actuated by the same wise and patriotic principle, he has forbid any public rejoicings on his birth-day, in this less flourishing part of his empire; but such unfeigned homage is paid to his dignified and amiable character, that except in his immediate presence, and under his personal view, all ranks and descriptions of men, throughout his extensive dominions, give a loose to joy on this auspicious day. He had now completed the 85th year of his age, and the 57th of his reign. In the palanquin they could only observe his countenance, which was animated, and little expressive of his advanced years; his eyes were dark and piercing; and his whole air bore the impression of the conscious dignity of virtue rather than of state and parentage.

Their return was followed by a repetition of the same kind of presents, varied in pattern and colour. A profusion of fruits and confectionary accompanied those expressions of imperial munificence. In the

confectionary art, the Chinese seem capable of giving a lesson to the most eminent in that line among the Europeans.

On the 18th, the ambassador went in a more private manner to have an audience of leave, as the court was soon to return to Peking. At the same time, he transacted certain official business, but the emperor declined entering into any written treaty with Great-Britain, or indeed with any nation, as being contrary to ancient usage; though, at the same time, he expressed the highest respect for the British nation and the king: he was strongly disposed to give them a preference in all commercial concerns; yet he would not sacrifice the interests of his own people to any foreign connections, and would only continue his avowed partiality for the English, while he found they conducted themselves in their commercial intercourse in such a manner as to deserve it. Furthermore, to evince his high personal regard for the king of Great-Britain, he delivered to the ambassador with his own hand, a box of great value, containing the miniatures of all the preceding emperors, with a short character of each in verse, written by themselves, accompanied with an address to the following purport:

"Deliver this casket to the king your master, and tell him from me, that small as the present may appear, it is the most valuable I have to bestow, or my empire can furnish. It has been transmitted to me through a long line of ancestors; and I had reserved it as the last token of affection I had to bequeath to my son and heir, as a tablet of the virtues of his progenitors, which I should hope he had only to peruse to be induced to imitate; and to make it, as they had done, the grand object of his life to exalt the imperial honour, and advance the happiness of his people."

His excellency, after dinner, returned with his whole suite and attendants, to see a play performed in the Imperial palace, on a temporary stage. The dramatic entertainments consisted of mock battles, vaulting, tumbling, rope-dancing, and other gymnastic amusements, which would have done no discredit to any performers. A variety of deceptions concluded the theatrical fete. One of which was the exhibition of a large bowl, in every possible position; which was immediately placed on the stage bottom upwards, and on being lifted up again, discovered a large rabbit, which escaped from the performer by taking refuge among the audience. The spectators in general, including many Europeans, were totally at a loss to account for this deception; but to others it was no novelty, having frequently seen the same trick exhibited by the jugglers of Europe. Other similar tricks, very dextrously performed, amused them by their novelty and apparent difficulty. The theatre, being well filled with persons of distinction, made a splendid appearance.

On the 19th, pipes and tobacco, sufficient to supply every individual belonging to the embassy, were received; and several mandarins came to pay their respects to the ambassador. In these visits they observed how little regard is paid to external appearance in China. The mandarins never varied their habits; and even the court-dresses here differ very little from the ordinary habiliments. It may be said to consist of a loose robe, falling half way down the leg, and drawn round the neck with ribband. Over the breast is a piece of embroidery, about five inches square, finished in gold, or silk of various colours, with an exact counterpart on the back; which badges denote the rank of the wearer. The sash, which at other times is usually worn round the waist, is dispensed with at court.

His excellency, on their approaching the coast of China, had communicated the general orders by which the conduct of the embassy was to be regulated: these seemed to be dictated by good sense, and a regard to the successful prosecution of the grand objects in view. His lordship's observations and injunctions, however, delivered at the same time,

time, did not seem to accord with the spirit of liberty
and personal security, which accompanies an English-
man wherever he is placed; and it is to be feared
they gave no very favourable idea of the British
character to those on whom it was wished to impress
the highest. Hitherto they had not been attempted
to be carried into execution; and it was generally
believed, that a person of some rank in the embassy
never approved of their tenor; but now it was
intimated, that all the servants of the ambassador
were to consider themselves as under martial law,
and that they would be punished according to its
regulations, in any case of disobedience or neglect.
It is true that the experiment was never made in
regard to the civil servants of the embassy; but the
alarm which this information gave was felt with
secret indignation.

There was among these orders an express injunc-
tion, forbidding any traffic with the natives. This,
it was believed, was punctually observed, as far as
gain was concerned; but a private in the infantry,
composing part of the ambassador's guard, having
been reported to have procured a small quantity of
samchoo by the assistance of a Chinese soldier, he
was immediately confined; and being brought to a
court-martial, of which a corporal was president, he
was sentenced to receive sixty lashes. This sentence
being approved by the commanding officer, the Bri-
tish soldiers were drawn up in form, in the outer

court of the palace where they resided, and the poor
culprit being fastened to one of the pillars of the
great portico, without any mitigation, received the
punishment. The abhorrence excited in the breasts
of the Chinese, at a conduct which appeared cruel to
them, was demonstrably proved by their words and
looks; they expressed their astonishment, that a
people professing the mildest, the most benevolent
religion on earth, as they wished to have it believed,
could be guilty of such flagrant inattention to its mer-
ciful dictates. The commander of the Lion went a
step further towards alienating the affections of the
Chinese from our heroes. When that ship lay at
Chusan, a native brought a bottle of samchoo on
board, intending to exchange it for some European
article. His design being discovered, the captain
ordered him to be seized and punished with twelve
lashes, in the presence of numbers of his country-
men; though a complaint preferred to a mandarin
would have obtained the satisfaction necessary, and
saved the appearance of despotism. Indeed, the mild
manners of the Chinese revolt at the public exhibition
of punishments: they are at a loss to reconcile Euro-
pean behaviour with European professions. Their
faith and practice, in almost every instance, appear to
them to be opposite; in short, their prejudices, in-
stead of decreasing on better acquaintance, were,
through fresh circumstances, hourly increasing.

C H A P. IV.

Departure from Jehol—Account of two extraordinary Rocks—Loss of an Artillery-Man—Consequent Apprehensions—Arrival at Pekin—An Hospital established for the Sick—Imperial Palace in Pekin—The Emperor visits the Palace of Teenen-Maryeumen—Description of kim—Mutual Presents—A sudden Order from the Emperor—Conjectures respecting their unexpected Mandate—The abrupt Departure from Pekin—Leave the Channel of the River and enter an expensive Canal—Remarks—A lofty Pagoda—Anchor—Arrive at Kord-Chuang—Anchor at Lee-Yangod—Pass the City Kanngbo—Yellow River—Chin-Fong—Kiangsou, &c. &c.—An unexpected Meander—A Brick-Kiln—Description of the Chinese Horses, &c.—Voyage the Yellow and Green Rivers—Anchor at Van-on-Chean.

AFTER a state imprisonment of fourteen days (for the liberty they had been encouraged to expect was never granted) they left Jehol September 21, and proceeded to Pekin.

There are two extraordinary rocks in the vicinity of Jehol. One is an immense pillar of stone, about an hundred feet high, small at the base, and gradually spreading towards the top, from several parts of which issue streams of the purest water. This lofty object is situated on the pinnacle of a mountain, which adds to its sublime effect. The upper part of this rock is rather flat, and appears to be clothed with verdure and shrubs; but it is totally inaccessible. Some convulsion of nature must certainly have placed it here; and it is impossible to view it from the valley below without the strongest emotions of wonder and fear. The Chinese give it the name of Panfuihaung; and justly esteem it as one of the first natural curiosities of their country. The other is rather a cluster of rocks, whose greatest height is nearly two hundred feet: these stand likewise on the summit of a mountain; and from one point of view, appear one solid mass.

Shortly after they left Jehol, they passed the emperor's pagoda, where they saw the tributary king of Cochin - China's ambassador and suite, advancing with the annual acknowledgment. They slept at the Imperial palace of Callachotung, where they lost an artillery-man of the bloody flux; of which alarming malady several others among the military were ill. The attendant mandarin expressed great apprehension, lest the emperor should hear of this circumstance, and an alarm of contagious disorders be given him.

They received intelligence the next morning that the emperor had left Jehol, and that it would be necessary to advance two stages this day in order that

the palaces might be at liberty to accommodate his majesty's attendants.

As they pursued the same route they had done before, their journey to Pekin was now destitute of novelty. They arrived there on the afternoon of the 26th, and took up their residence in the palace which had been appropriated for their use before they set out for Jehol. The arrangements which had been made, during the ambassador's absence, seemed to meet his entire approbation; and as their stay here, at this period, was likely to be of some continuance, every preparation and provision was made for the domestic comfort of the establishment, and the splendour of the embassy. The state canopy was erected in the principal room of the ambassador's apartments. It was made of flowered crimson silk, and fringed with gold: the back displayed the arms of Great-Britain; under its cover five chairs of state were placed; the centre one being elevated above the rest for the ambassador. At the other end of the apartment were hung whole length portraits of their Britanic majesties. The whole formed an appearance for an audience-chamber, equal to the consequence of the country represented.

On the 28th, the arrival of the emperor was announced by a grand discharge of artillery, and the next day his excellency was visited by several mandarins.

About this time sickness prevailed so much among the soldiers, attached to the embassy, that it was found expedient to establish an hospital in some vacant buildings within the precincts of the palace in which they resided, for their reception and more speedy recovery.

October the 1st, a mandarin requested, in the name of the emperor, that the ordnance presents might

be sent to the palace of Yeumen-Manyeumen, where the Chinese themselves were to prove and examine them. The chariots and other presents were also removed to the same place; and on the 2d, the ambassador received a formal invitation to wait on the emperor on the morrow. His excellency went in a private manner, and transacted business with the officers of state. The conference lasted for two hours.

The imperial palace in Peking stands in the middle of the city, and is surrounded by a very high wall. It is said to occupy a circumference of about seven miles, containing gardens both for pleasure and utility, replenished with all that is rare in art or nature. The entrance is by a strong stone arched way; the range of buildings fronting it is three stories high, and much embellished with galleries, gilding, and painting; the roof is covered with shining tiles, of a yellow colour; the walls are variously painted and decorated. A large body of soldiers guard the gate; and several mandarins of the first class are in constant waiting.

His excellency now settled the order and disposition of the tables for the different departments of the household; and every thing seemed to indicate a residence of some permanency at Peking.

On the 5th, the emperor visited the palace of Yeumen-Manyeumen, to inspect the presents which were lodged there; and was pleased to order several ingots of silver to be distributed to every person attending. The English artificers, who were the immediate objects of his generosity, and had a complete view of him, described his majesty as being about five feet ten inches high, of a slender form, but well proportioned; and that his countenance presented a regularity of features, free from the decrepitude of age. His deportment was attractively affable; and the dignity of the prince was only displayed in the superior manners of the man. He was habited in a robe of yellow silk, and a cap of black velvet, surmounted with a red ball, and adorned with a peacock's feather. He wore silk boots, embroidered with gold, and a blue silk sash. The opinion his majesty formed of the presents could only be collected from their being generally received. Two camera obscuras were, however, returned, as being suited only to the amusement of children. The interpreter, explained to the mandarins the nature and use of a variety of articles.

This day presents were received from the emperor for their Britannic majesties. The ambassador and suite had likewise their proportion.

On the 6th, about noon, the ambassador again went to visit the emperor; but on his arrival at court he fainted away, and being conveyed home, continued indisposed during the day. In the meanwhile, Sir George Staunton and Colonel Benson distributed to each of the soldiers and servants, some pieces of silk, others of dongarce (a kind of nankeen) and a junk of silver of considerable weight, as a present from his imperial majesty.

It was now reported, that they were soon to quit Peking. It occasioned a considerable share of speculation, though it obtained less credit than afterwards appeared to be due. This report, which at first met with only a faint belief in general, was confirmed by an order from the ambassador, to prepare for their departure on Wednesday. Their surprise and concern may easily be conceived. After a variety of fatigues, they consoled themselves that they should now have enjoyed some repose; but all personal considerations were absorbed in public affairs, in which the humblest individual felt an interest. The grand objects of the embassy were evidently unaccomplished; and in their attachment to the good of their country, its honour, its advantage, they forgot every other care. A little respite was therefore requested, till the baggage was packed up and arranged. The attendant mandarin made the requisition: an order arrived from the grand choulai to suspend their de-

parture till Friday; but judge their astonishment, when this was countermanded by the emperor himself, and they were expressly ordered to depart on the day first intimated.

It was reported by the Chinese, that as the business on the part of the emperor was already completed, he was surprised the English ambassador was not anxious to return to his own country. It was also said that his majesty was alarmed at the number of their sick, lest any contagion should be communicated to his subjects. Nor were there persons wanting who ascribed his determination to an aversion contracted against them, from the skill and ingenuity they evinced in those engines of destruction, the brass mortars, which were tried in his presence. It was said he depreciated the spirit of a people, who, contrary to the vital avowed principles of their religion, had made such a proficiency in arts which seemed to contradict them all.

In this state of affairs, Lord Macartney sent the carriage of ceremony, as a present to the grand choulai, which was refused; and after they had left Peking they found it returned on their way. The confusion arising from this sudden and unexpected event, rendered it impossible to arrange the baggage with any order. They huddled it together in the best manner that circumstances would permit. Some articles, which could not be packed up, or were now useless, were given to the mandarins; the natives took care to purloin a share, and Lord Macartney's servants had the canopy of state. They set out on the road that leads to Tong-Tehew at a very early hour on the morning of the 9th, and reached that town in the evening. Even the thoughts of being on the return to their country failed to relieve the gloom of disappointment; and to increase their unpleasant sensations, they met with neglect and humble accommodations, compared to what they had experienced before. They were lodged here in temporary sheds, hung with straw matting.

On the 10th, while proceeding to the side of the river, they found the junks intended for their reception. The baggage was put on board with all possible expedition, but not without a degree of confusion beyond what they had yet known. The ambassador and his suite occupied seven junks; the attendant mandarin and his party followed in separate vessels. Soon after the embarkation was performed, dinner was served up; and at an early hour, after a most fatiguing day, they retired to rest.

They left the channel of the river on the 15th, and entered a canal of infinite labour and expence. The sides are masonry throughout its extent; and at certain distances locks, in the form of a crescent, are erected, which confining the water to a narrow passage in the middle of the canal, occasions a moderate fall of about three feet. The motion of the junks is accelerated in passing these locks, and continues to some distance; and to prevent vessels receiving damage from striking against the walls of the lock, men are always ready to let down large leathern pads, which effectually break the shock. In the course of this day, they passed a number of these locks, whose construction and effects, they found invariably the same.

They sailed for some days through a country rich in agriculture and population. They observed plantations of the shrub which produces the Imperial and gunpowder tea: in size and figure it resembles the gooseberry-bush. Imperial tea is the produce of the first blossoms; gunpowder tea is a collection of the successive blossoms, as they appear.

Not only the exterior marks of respect had been withdrawn from the embassy by the Chinese, but they even found their provisions deficient, both in quantity and quality. A representation to the mandarin procured immediate redress in this particular; and it was further reported, that the same benevolent character had exerted himself with effect to do away some very unfavourable impressions, with which a

their astonishment, by the emperor himself, ordered to depart on

fe, that as the business was already completed, the ambassador was not to return to his country. It was allowed that the number of persons who could be communicated here persons wanting in to an aversion of the skill and ingenuity of destruction, the brass his presence. It was of a people, who, conspires of their religion, in arts which seemed to

and Macartney sent the present to the grand and after they had left on their way. The sudden and unexpected to arrange the baggage led it together in the would permit. Some packed up, or were no mandarins; the natives and Lord Macartney's are. They set out on a very early day, and reached the thoughts of being failed to relieve the id to increase their un- with neglect and humble what they had experienced here in temporary

marks of respect had been y by the Chinese, but rations deficient, both in presentation to the mand- edress in this particular; that the same benevolent If with effect to do away pfections, with which a

Tartar mandarin had prejudiced the emperor against the English, by representing them as divested of every amiable quality, and addicted to every vice. They passed numerous plantations of tobacco; a plant cultivated here in the greatest variety, and to the greatest extent, of any country in the world. Indeed smoking being the universal practice from infancy to old age, the quantity of tobacco consumed in China must exceed all moderate calculation. Several considerable cities appeared at a small distance from the canal; the garrisons from which advanced to the banks, to give the usual salute. Also several corn-mills, worked by water, and apparently on the same construction as in Europe, arrested their attention in their progress.

On the 23d, a lofty pagoda, of eight stories, opened to their view. Next day they saw the Chinese post pass along the road on the margin of the canal. The letters are enclosed in a large bamboo basket, hooped with cane; it is then locked, and the key is given into the custody of one of the soldiers, who delivers it to the post-messenger. The basket is then strapped on the courier's shoulders, and being decorated with a number of little bells at the bottom, they make a loud jingling when shaken by the motion of the horse, and announce the approach of the post. Five light-horsemen escort the courier; and as the fleetest horses are selected, and changed at every stage, the mails in China are conveyed with extraordinary expedition.

On the 24th, in the evening, the junks anchored in the heart of a large city, through which the canal passes. A continual succession of bridges connects the banks. These are guarded by soldiers, who suffer no vessel to pass till a mandarin has inspected it. The fleet here received a salute of three guns; and a numerous body of soldiers lined the banks.

They arrived soon at Kord-Cheeaung, a city of equal magnitude with the last; in the centre of which they saw a pagoda of ten stories, each surrounded by a gallery. After passing several large cities in the course of this day's voyage, they anchored for the night at Lee-Yaungoa, which was illuminated in honour of the ambassador.

On the 26th, they passed the city of Kaunghoo, and found such an amazing number of junks lying there as impeded their passage for some time. The canal winds through this place, and its banks slope down to the water in a very beautiful form. Every spot in their passage gave testimony to the existence of art, and the effects of industry.

On the 29th, they observed the peasants ploughing. They worked with oxen; and though their ploughs were of a very clumsy form, the labour seemed to be neatly and properly executed. On the 2d of November they reached a city of great extent and trade. Several canals meet here; and on the south side of it is a bay, communicating with the Yellow River, in which the noblest fleets of Europe might ride. The hills in the vicinity are beautifully green; their summits are crowned with pagodas; while villas and gardens adorn the lower slopes. Passing through the bay, in which various opposite currents meet, they soon entered a large river, and found themselves again embosomed in a rich and delightful country. Town opened on their enchanted senses after town; and no words can convey an adequate idea of the picturesque scenery that surrounded them.

They arrived about the hour of dinner, at a town of unusual magnitude and beauty, through which the river flowed for the space of three miles. The houses were uniformly of brick, varied with a bluish coloured stone, and generally rise to two stories high. Here they received the military honours so often mentioned; and indeed it may in general be observed, that there was neither town nor village through which they passed, that had not its mandarin, and its proportionate number of guards and troops, not only in China, but also in the remote and less populous regions of Tartary.

Soon after, the country assumed a swampy appearance; the natural consequence of so many rivers, canals, and lakes, which intersect it, and promote its commercial intercourse. The weather was cold and the mornings frosty. The climate unquestionably is affected by the large bodies of water which every where abound in this part of the country. They now understood that it was the Yellow River on which they were sailing, probably so called from some communications with the Yellow Sea. They passed several lakes.

On the 3d, they saw a number of fishing-boats employed in their vocations, and procured from them a small fish, about the size of a sprat, but in flavour and form resembling the haddock. On the opposite side of this lake they discovered the city of Chun-Foong; it is built of a dark-coloured stone, roofed with tiles of the same hue. This place appears to be about eight miles in circumference; and from the dress and manners of its inhabitants, they could easily determine was both commercial and polite.

On the 4th, they passed two other large lakes; and soon after reached the town of Kiangfou, which is large and walled. A mandarin and his guards appeared, to give the customary salutes; and at each end of the line of troops, a temporary arch was erected, with a platform reaching down to the river, very elegantly adorned, to afford a landing to the ambassador, should he happen to be disposed to stop. At a small distance, tents were pitched, in the centre of which was the mandarin's pavilion, where a collation was ready for the entertainment of his excellency and the mandarins in their fleet. But the order of the voyage prevented them from accepting this tribute of hospitality and politeness.

They came to another large town beyond this, of superior beauty, where they stopped to receive a supply of provisions, and to be furnished with towers for the junks. Here they were gratified with the sight of a number of fine women, whose complexions were uncommonly fair.

They passed a town in the afternoon, which could not be less than nine miles in circuit: the walls are of immense height, and seem to be ancient. Several hundreds of junks were moored along its wharfs. They entered a lake on the 5th, sprinkled with a variety of beautiful islands: the most considerable of them contains the palace of a mandarin, with most beautiful summer-houses, plantations, and gardens; a lofty rock rose amid the trees, and supported on its top a stately pagoda. They soon entered another river, whose banks became highly picturesque, on which, and the adjoining heights, they saw a variety of villas, with gilt pyramids rising from the roofs, in the Gothic style. They stopped at the city of Mee-you-Mee-aung to take in the customary supply of provisions. Nature seems to have formed this place for the purposes of navigation; and rural beauty to have fixed her residence in its vicinity. Falling down the river, an unexpected meander brought them back again upon the city, and astonished them with its extent and the variety of new prospects that presented themselves. The mandarin's palace was a splendid object. It was uniformly built; the wings were two stories high, and the centre three. The country continued to improve in landscape beauty; the hills were verdant to their tops, and covered with cattle and sheep. In their progress they observed a brick-kiln. The materials of which these valuable articles in building were composed, seemed to be a mixture of sand and river mud; the kiln was of a pyramid form. In the evening several pagodas were illuminated in honour of the ambassador.

On the 6th of November, they entered a town of a most dismal hue. It was wholly erected of black bricks; and as the houses were more lofty than those generally seen in this country, its peculiar character made the stronger impression. In a short time after they reached the mandarin's palace; a stone building of singular architecture. This officer had erected a

temporary stage to communicate between his residence and the river, the roof of which was covered with silk of every dye; and from it a number of lamps were fancifully suspended. All this was done for the accommodation, and in honour of the ambassador, if he or the attendant mandarins should be disposed to land; but the circumstances of their voyage did not allow them to partake of this respectful hospitality. In the afternoon, the banks of the river rose with such a bold elevation as to intercept their view of the country.

On account of a complaint against some of the captains of the junks, for embezzlement of provisions, the grand mandarin instituted an inquiry after the fleet came to anchor this evening; and being convinced of the truth of the charge, condemned the culprits to be bamboozed, which sentence was put into execution immediately.

They passed another town, the houses of which were covered with plaster, and painted black. At the entrance and the extremity of this place, which is very large, they sailed under a noble arch. As it was intended to forward the heavy baggage from Hoang-Tchew to Chufan, in order to its being conveyed by sea to Canton, arrangements were made for this purpose. A party of the gentlemen of the embassy, and the servants, were to accompany it; the ambassador and the remainder were to proceed over land, with only the absolute necessities of apparel and travelling.

The grand mandarin visited every junk on the 9th, the owners of which he briefly examined; and then ordered them to suffer the punishment of the bamboo. Their crime was kept a secret.

The next day having passed several plantations of tallow-trees, they arrived at Hoang-Tchew, when the junks were all fastened together, and every person belonging to the suite was forbid to land. Indeed a body of Chinese soldiers pitched their tents opposite to them, as if to awe them into compliance. During the time they lay here, no circumstance happened worthy of being recorded. The mandarin of Hoang-Tchew had accompanied them from Pekin, and being superior to Yan-Tadge-In, of course assumed the supreme direction during this part of their voyage. Here he was to remain. The heavy baggage, which was to be sent to Chufan, being separated from the light articles they were to carry with them to Canton, Colonel Benfon, Captain Mackintosh, and party, set off to join the Hindostan at Chufan, on the fifth day after their arrival; and the same day also they left Hoang-Tchew.

November 14, his excellency, accompanied by his retinue, proceeded for the Green River, where they were again to embark in smaller junks. On passing the city gates, the embassy received the customary salute. Between the two rivers the distance could not be less than seven miles; and the whole space was covered by the city and suburbs, and lined with soldiers, who secured them from the pressure of an innumerable multitude of people. The streets are narrow, but well paved; the houses two and three stories high; and the magnificence of the shops was beyond any thing they had hitherto seen. In commerce and population, Hoang-Tchew is a very considerable city.

They reached the Green River at noon, where the ambassador was received with military honours. The troops were armed with helmets, and made a splendid appearance with their accompaniments. A triumphal arch, with a platform descending to the ambassador's junk, had been erected for the occasion. Their embarkation was attended by myriads of people. Some were mounted on buffaloes, which animal carried several at a time on its back, and appeared very docile.

Their voyage was continued between ranges of mountains, presenting the most romantic scenery. The vallies were covered with tallow and mulberry-trees. The former is called the latchoo, and is

remarkably beautiful, having scarlet leaves edged with yellow, and purplish blossoms. The river on which they now sailed, was, at a medium, about three feet deep. The water has a green cast, and the bottom is gravelly.

The city of Zanguoa made a most brilliant appearance on the evening of the 15th, with its illuminations. The effect was increased by numerous bodies of soldiers ranged along the banks of the river, with paper lanterns.

On the 16th, the features of the country through which they sailed, were still mountainous and picturesque; and the forts and salutes became so frequent that they grew absolutely tiresome. Indeed, so much military honour was paid to the embassy, that the salutes could only be compared to a train of wild-fire laid from Pekin to Canton, and continually exploding as they proceeded.

November the 18th, the country changed to a fine champaign, in which numerous villages rose, amid plantations of tallow and mulberry-trees. This day they passed a group of water-mills, all turned by a small cut from the river, flowing in a circular direction. These appeared to be on the European construction; and as they underflood, were employed in threshing rice. The following day the banks of the river resumed the usual appearance; and long ranges of mountains rose into the horizon.

On the 20th they reached a large and beautiful town, where they were again to disembark. The scenery here might have advantageously employed the warmest pencil. The river formed a central object, on one side was the town, with its appropriate circumstances, and a military encampment in front, with all its gaudy ensigns; on the other side lofty perpendicular hills bounded the view in the most sublime style. As soon as they disembarked, they proceeded next day by land, and soon reached the city of Chanfoiyeng, where the ambassador was received with due distinction. Leaving this, they passed another walled city and several villages; and arrived at the city of Yoosau early in the afternoon, where they drank refreshments of tea at the palace of the mandarin; and having stowed the baggage on board another fleet of junks provided for their accommodation, they all embarked, and were anxious to proceed on their voyage.

November the 24th, they found themselves before the city of Mammenoa. The river now winded away between enormous masses of stone, without any continuity or connection; exhibiting the appearance of some volcanic eruption. Some of these huge stones had been excavated into dwellings; and every interstice between them was occupied by hortulan productions. This stupendous scenery continued for several miles; it was grand, perhaps unique, in itself; and where it admitted of views into the more distant country, it produced a most delightful picture. In the afternoon they reached the city of Hoa-Quo, where, much to their satisfaction, they found larger junks ready to receive them. The mandarin of the place politely sent a variety of fruits and confectionary for the use of every junk. For two days the weather had been very rainy; it now became more moderate. The country through which they passed was rich and fertile; a few red rocks occasionally broke the level of the scene.

On the 26th, in the morning, the fog was so thick as to obscure the country. About noon it dispersed; and the eye ranged over a level extent of rice fields, intersected with villas and gardens. Their provisions had for some time been very indifferent; not from neglect, but the nature of the country. In proportion as they fared worse their Chinese junk-men fared better; who received not only their superfluity, but sometimes almost the whole.

On the 27th they reached a village entirely built of mud, with inhabitants as wretched in appearance as their habitations were mean. For this sight they were unable to account. The river had now assumed a formidable

a formidable breadth; and as the wind was high, the
waves and surf resembled those of the sea. They
passed numbers of fishing boats, which served to vary
the navigation of the stream.

On the 28th, the city of Tyaung-Shi-Sennau ap-
peared in view. They passed it in the afternoon, and
for extent and the advantages of situation, it unques-
tionably deserves to be reckoned one of the first in
China. Not less than a thousand junks lay at anchor
before it: it is built near the conflux of several rivers,
and enjoys a most extensive commerce. The grand
mandarin paid a visit on board his excellency's junk,
and made a variety of presents, in silk, porcelain,
and tea.

On the 29th they reached another village, built
with blue bricks, and covered with tiles of the same
colour. Pagodas and the palaces of mandarins were
now become familiar objects. Next day they passed
a city lying amid beautiful meadows and orchards,
about two miles distance from the river. Beyond
this the prospect became as delightful as fancy can
conceive. Mountains rose into the horizon, forests
waved on the slopes, and flocks and herds covered
the vales. The river was now expanded to a great
breadth, and as the wind blew fresh, the junks some-
times appeared in danger of being overft. At this
time the fields were covered with frost.

December the 1st, they sailed by the town of
Saunt-Yo-Tawn, where several superb pagodas rose
above the surrounding groves. Numerous timber-
yards occupied the banks of the river; and a large
quantity of timber was immersed in the stream,
which, as they were told, were in a state of prepa-
ration for the building of junks, the principal business
of the place. The cities of Loo-Diehan, Morriun-
Dew, and Chie-a-Foo, which they now approached,
all lie contiguous to each other. Art and nature
have united their efforts to increase the beauty of this
charming vicinity. At a distance they observed vast
columns of smoke, which rose, as they were inform-
ed, from a porcelain manufactory. In the evening
they reached the city of Chinga-Foo. Here illumina-
tions, the firing of rockets, and of artillery, took
place in honour of the ambassador. They received
also a present of fruit and confectionary from the
mandarin of this city.

December 2, they passed the city of Fie-Cho-Jeu-
nau, embosomed in plantations. From its apparent
population, and the number of junks employed in its
commerce, it was evidently to be ranked in the first

class of Chinese towns. On the 3d they were grati-
fied with the view of some beautiful ruins. The ori-
ginal destination of the edifice they could not certainly
discover; but from the remains still visible, they
concluded it must have been a work of no common
magnificence. In this part of the empire, situation
seems to be duly appreciated. The villas of the
mandarins, the pagodas, and even some of the pri-
vate dwellings, are erected with a palpable regard to
the circumstances of the place, and the beauty of the
scenery. They observed numbers of fishermen em-
ployed in their vocation with rods and lines. In
lakes and large rivers, the same kind of bait is fre-
quently used as at sea: nets too are in very common
use. In some places bamboo canes, supporting a
curtain of strong gauze, are placed across the
streams; and then the fish being allured to the spot
by baits, are caught in nets with great success. On
inquiry, they found that the rights of fishery, as in
Europe, are private property. In those rivers they
navigated, a kind of whiting and trout were the most
plentiful. These are sold to the crews of the junks,
and the demand for them is very great.

Early in the afternoon they anchored before the
city of Vang-on-Chean; where the ambassador re-
ceived a visit from the mandarin. This place occu-
pies a considerable space: on one side it is bounded
by the river, on the other by a range of high moun-
tains. A succession of towns and villages enlivened
our voyage during the succeeding day. The features
of the country became craggy and elevated into hills;
but fertility, in every possible situation, shewed the
labour of diligent cultivation.

On the 5th, the river became very shoally, and
they anchored before dark to avoid the dangers of
such a navigation. This day they passed the city of
Joo-Jennan, situated at the bottom of a lofty moun-
tain. Here they found that the river on which they
had sailed communicated with another of equal mag-
nitude. The position of a city, at the conflux of
two large rivers, readily points out its convenience
for trade. Leaving this place, the stream was divi-
ded into two streams by a beautiful islet, in which the
mandarin had an elegant seat, probably for his occa-
sional retirement. In the evening, the city of Kaung-
Joo-Foo presented the most brilliant nocturnal illu-
mination they had hitherto seen; and this complimen-
tary attention was heightened by a present of fruits
and confectionary from the mandarin of the
place.

C H A P. V.

They continue their Passage—Observe a Number of Machines—Their Utility—Village of Sbaiboo—Pagoda of Tau-ay—Town of Wan-Ting-Tau—Observations—Arrive at Naung-Aun-Foo—Journey over Land—Pass several Villages—Dine at Lee-Con-Au—City of Naung-Chin-On—Mandarin's Palace—Embark—Sepulchral Monuments—Larger Junks prepared—A Mountain of immense perpendicular Height—Extraordinary Illuminations—The Mountain of Koan-Yeng-Naun—City of Shizing-Ta-Heng—Of Ting-Tau-Yun—One of the Junks in Danger of being burned—Village of Onz-Chooa—Several other Towns, &c.—Arrival at Canton, the Termination of their Voyage—Remarks—Anchor at Spithead—Conclusion, &c.

IN their passage down the river on the 6th of De-
cember, they observed a number of machines
with which the Chinese water their grounds. They
consist of a wheel of bamboo, turned by a stream,
which throwing the water into large reservoirs, it is
from thence distributed by sluices into a thousand
channels. The beautiful village of Shai-Boo, situ-
ated on a bold elevation, above the river, was the
principal object in the landscape, till the attention
was called away by the pagoda of Tau-Ay; the upper
part of which being in ruins, gave it a more pictu-
resque and impressive appearance, and well accorded
with the character of the little burial-place at its foot.

In this day's voyage the town of Whan-Ting-Tau
was the only place of any importance they passed:

villages were numerous; and some huts again made
their appearance, of the humblest construction.

The 8th was the most remarkable day they had yet
experienced. During their whole progress they saw
neither city, town, nor village. A few farm-houses
were, however, dispersed over the face of the coun-
try: the banks of the river were lofty, and formed
of a perpendicular barrier of red earth, streaked
with horizontal veins of stone, in a direction perfect-
ly retilinear. The natural curiosity continued for
several miles. The shallowness of the river obliged
them again to shift the baggage into junks of lesser bur-
den; and in the course of the evening they found
themselves in the vicinity of some town or village,
from the number of paper lanterns they saw exhibited
by

by the soldiers, and the complimentary salute they paid them. The weather had for some days been temperate; but the face of the country was no longer the same. Barren mountains, separated by plains that seemed to defy the labour of man to produce fertility, now presented themselves on all hands. Some dwarf-trees, however, among which the camphire is said to predominate, broke the abruptness of the slopes; and here and there a village or a pagoda animated the scene. In this place they observed several sepulchral monuments, with excavations in the rocks beneath, as receptacles for the dead. The most elevated spots, the most abrupt precipices, they generally observed, were appropriated for the repose of the dead. Whether this choice was determined with a regard to notoriety, or from any superstitious opinion that the body might be placed as near as possible to that heaven where spirits wing their flight, they could obtain no satisfactory information. The amiable virtues, however, of the Chinese, were rendered more conspicuous by the feeling regard they uniformly appear to shew to the remains of those they have once collected.

They arrived at the city of Naung-Aum-Foo on the 9th. Here the embassy was to make a day's march over land; and accordingly they disembarked. The landing-place was adorned with a triumphal arch, highly decorated with silken streamers, and connected by a platform, with a circular court, surrounded by a screen of silk. In this place a number of horses were collected, with the choice of one of which every person in the suite was indulged, for the journey of the day. The ambassador, with two or three gentlemen of his suite, were to proceed as usual in palanquins. The horses being selected, the cavalcade commenced their progress; and perhaps such an exhibition of equestrian exercise and grotesque dress, never before amused a Chinese populace. The horses were spirited, many of the riders were new to this mode of travelling. The cries of fear, and the shouts of ridicule, were every where heard; and scarcely could they attend to the passing scene; so much were they engaged by the peculiarities of their own situation.

Naung-Aum-Foo, through which they passed, is a large walled city; and though the river here does not admit large junks, from the very great number of smaller ones which lined its shores, they concluded it had no inconsiderable pretensions to traffic.

They arrived at noon at the foot of a lofty mountain, where they were obliged to dismount. Having gained the ascent, they passed several villages; and dined at the town of Lee-Cou-Au, where the road was lined with soldiers in armour, to salute the ambassador as he passed. They arrived at the gates of Naung-Chin-Oa, just as the sun had sunk beneath the horizon. This city stands in a plain, encircled on three sides by hills, and on the fourth by the river, on which they were to continue their voyage. The houses are chiefly built of wood, in general two stories high; and the streets are narrow, but well paved. In exterior appearance and decoration, it preserves the general character of Chinese towns. Soldiers lined the streets, to facilitate their passage to the mandarin's palace, a very noble building, consisting of several courts. A splendid entertainment was provided for the whole suite; and such a profusion of lights decorated the principal apartments as are never displayed in Europe on any occasion. Indeed, illumination constitutes the grand appropriate feature of Chinese magnificence.

They began embarking in the morning of the 11th of December, on board small junks, corresponding with the depth of the river; and before noon they resumed their voyage; sailing under a wooden bridge of seven arches, with stone pillars, strongly guarded by soldiers at each end. From this point, the city appears in a very advantageous view. Beyond the bridge the river divided into two branches, taking almost opposite directions. The town of Chang-Fang

was the only place of note they passed in this day's voyage. The face of the country had few lively features; and its artificial circumstances increased the gloom. Sepulchral monuments were the chief objects which they saw in the course of next day. The only novelty was floating rafts, with several bamboo huts, well tenanted, which they passed near the village of Ty-Ang-Koa.

They reached the city of Shaw-Choo on the 13th, where the houses, adjoining the river, appear to be so flatterly supported, as to threaten constant ruin to their inhabitants and the passengers. At the extremity of this city the fleet anchored; and here the ambassador experienced the elegant attention of the mandarin in a very superior degree.

Now junks of larger dimensions were prepared to receive the embassy; and next day they passed through a country sometimes varied with patches of cultivated ground, though mountainous sterility was still the predominant feature. Towards evening they found the hills gradually approaching the river, till at last they seemed to close, and admit only its course. This gloomy scene continued for some time, as if to heighten the contrast that was to open. They now reached a mountain of immense perpendicular height, the upper part of which appears to project over the stream. Its contour is bare rock and shaggy foliage; and this extends for nearly two miles. Its termination, like its commencement, is abrupt. At the extreme point, a pyramidal rock appears to rise above the edge of the precipice; and this is separated by an interjaacent plain from another enormous rock, of the same character, though of a different form. Another range of hills commenced after they had left these stupendous objects, and continued to exclude their view of the country; but no sooner were they come to the end of this chain, than a burst of illumination, carried over mountains and valleys for several miles, wrapt the senses in ecstacy and astonishment; this line of undulating light was so various and so brilliant, that no words can do justice to its sublime effects. Immense bonfires on the summits reddened the clouds; while spiral streams of fire serpented up the ascents, or sunk into the declivities below. The number of lanterns or torches employed on this occasion must have astonished by their immensity, as well as by their effects; and they can only say, that such a magnificent spectacle was never before displayed to European eyes. Discharges of artillery were repeated at intervals; and night was lost in the artificial blaze.

December 15, the grand mandarin ordered the fleet to stop to indulge the embassy with a leisure view of the mountain of Koan-Yeng-Naum, one of the natural curiosities of China. It has a perpendicular ascent from the water, terminating in a peak; and from the face towards the river, such enormous masses project, as menace every moment to fill up the channel of the stream. But art has heightened the curious circumstances of this extraordinary mountain. It contains several caverns: one of them is about forty feet above the level of the water. To this there is access by a flight of steps, guarded by a rail. On reaching the top of the flight, they enter a room of good dimensions, excavated from the rock, in which stands an image sacred to Chinese devotions. An artificial stair-case conducs to two other superior apartments; and the whole is fitted up by the mandarin to whom the mountain belongs, in a style of rude magnificence, corresponding to the character of the place.

Having proceeded through a country presenting many sublime features, they reached the city of Shizing-Ta-Heng about noon. This place enjoys every local advantage that can contribute to render it picturesque in a high degree. Lofty banks for a considerable space shut out their view of the land; and where a casual opening gave a wider prospect, it was not marked with any new features. Similar objects occurred—varied only by shape, or discriminated by

light and shadow. The evening was cheered with an illumination of the distant hills. The coup d'œil was extremely grand, but inferior to what they had witnessed before.

On the 16th, steep rocks, in various grotesque forms, sometimes tinted with foliage, sometimes the traces of laborious toil, were the prevailing character of the landscape. They reached the city of T'ing-Yan-Yeun. It is well fortified, of great extent and population. The number of junks which lay before it, indicated an enlarged commerce. Triumphal arches decorated the beach; and several regiments of soldiers paid the military honours as they passed. From this city the river takes a direct course for some miles, amid fertile and highly cultivated meadows. The mountains fall into the back ground.

This day one of the junks was in imminent danger of being consumed by a spark falling unobserved from a tobacco-pipe. Indeed, where smoking is so generally used, it is a matter of astonishment that accidents are not more frequent and fatal.

They passed the extensive village of Ouz-Chouaa on the 17th, where a number of manufactories appear to be established. The country now returned its fertility and beauty; and provisions became both plentiful and excellent. In the evening they reached Sangs-We-Yenno, where the ambassador received every honour that the most elegant attention on the part of the mandarin could pay, or his excellency expect. This is a large and commercial city: the illuminations displayed here were peculiarly grand. On the following morning they passed a series of very large and populous towns, so closely connected, that they seemed for some hours to be sailing through one city of immense extent. The salutes were almost incessant as they proceeded; and every place poured thousands of its inhabitants, though at a very early hour, to obtain a transient view of an European embassy. They now approached the city of Tain-T'yn-Tau, a place of the first importance and the most extensive trade. The suburbs lie on both sides the river for several miles; and as far as our heroes could judge in extent, population, and commerce, this city is only inferior to Peking or Canton. Thousands of junks covered the river for a vast space; and scarcely had they overcome the difficulties and impediments of this crowded navigation, before they found themselves approaching to Canton, the termination of their voyage.

Their arrival here being notified, several mandarins waited on his excellency; and these were soon followed by the gentlemen of the English factory, and Colonel Beulon. This officer brought with him the public dispatches for the ambassador, and a packet of private letters from their friends in England.

They were moved on the succeeding day into larger junks. The magnificence of the river at this place baffles description. Its surface was almost covered with vessels, engaged in trade, or attracted by curiosity. The banks were lined with soldiers, and covered with elegant houses; and a succession of forts thundred out salutes with almost incessant rapidity. They reached the English factory about one in the afternoon, and both it and the Dutch factory paid his excellency the usual salute, hoisting at the same time the standard of their respective countries. A temporary residence for the ambassador and suite had been provided by the East-India-Company's supercargoes; and in point of accommodation and domestic arrangement, they found it superior to the first palaces in which they had lodged, during their long peregrination in China.

Canton is walled, strongly fortified, and garrisoned with numerous troops. The streets are generally narrow, but well paved; and the houses, which are constructed of wood and stone, seldom rise above one story high. The viceroy's palace is exactly on the model of that in which they resided at Peking. Triumphal arches are numerous and splendid; and

these are the only public buildings in the place. The population has been estimated at a million of souls; the suburbs cannot contain less than half that number. The river at Canton is noble and deep; the water, however, is not wholesome for strangers, till its sediment has been allowed to subside. In this respect the natives give themselves no concern. The suburbs of Canton, in which, indeed, properly speaking, all the European commerce is carried on, are very extensive, and every where exhibit commercial opulence; but they have no pretensions to grandeur or elegance.

The viceroy of Canton only once visited the ambassador during his stay. Large presents of sugar-candy, porcelain, and nankeen, were distributed to the whole embassy. For several days, during the time of dinner, the ambassador was entertained with Chinese plays, performed on a stage erected before the windows of his apartments.

On the first day of the new year 1791, his excellency and suite were splendidly entertained by the gentlemen of the British factory. The band of music which had accompanied the embassy, on the request of the factory, were permitted to enter into its service; and in a country where amusements are so few and confined, it could not fail to be a valuable acquisition.

January the 8th, the ambassador proceeded to Whampoa to join the ships. At the same time a deputation of the retinue was dispatched to Macao, to make preparations for his excellency's reception at that place. We have already given our readers full descriptions of these places.

Whampoa, beyond which European ships are never permitted to pass, is an elegant and populous village, about eighteen miles below Canton. The river, near this place, is defended by a sand-bank, which prevents the passage of large ships, except at high water, and two necks of land, projecting from the Strait of Bocca Tigris. Van-Fudge-In took his farewell leave of the ambassador here.

On the 14th, Lord Macartney landed at Macao; and took up his residence with Mr. Drummond, one of the supercargoes of the East-India-Company. Here the gentlemen of the several European factories have their houses; as they are not permitted to remain at Canton longer than is absolutely necessary for the purpose of trade.

The long intercourse which has subsisted between Europeans and the Chinese in Macao, has not altered the established customs and habits of the latter. The Chinese never deviate from the usages of their country, which may be considered as invariable.

March the 8th, Lord Macartney and retinue embarked for Europe, amid the salutes of forts and ships; and being joined by a large homeward-bound fleet of Indiamen, on the 17th proceeded to sea.

There was nothing of particular consequence which happened during their voyage. They arrived at St. Helena on the 19th of June, and remained there till the 1st of July.

On the 3d of September they were seriously alarmed by running foul of a large fleet off Portland-Roads, which proved to be the Grand Fleet, commanded by Earl Howe. Two or three of the Indiamen received some damage; but except in this instance, their voyage was free from accident, and barren of interrelling occurrence.

After an absence of little less than two years from their native land, they anchored in the afternoon of this day safe at Spithead.

Having now accomplished the Narrative of this remarkable Embassy to CHINA, we shall, for the completion of our arduous Task, present our Readers in the next place with a genuine Description of a Tour through GERMANY, SWITZERLAND, and ITALY, including all the Particulars of our most eminent Travellers, and being more full and descriptive than any hitherto published.

A NEW, COMPLETE, AND ENTERTAINING
HISTORY of TRAVELS

THROUGH
Germany, Switzerland, Italy, Genoa,
Venice, Rome, &c.

Undertaken and Performed chiefly in the Years 1791 and 1792.

Composed from the respectable Journals of

LADY WALLACE, DR. MOORE, C. ESTE, ESQ.

And several other eminent Travellers and Persons of Distinction, who have lately visited the Continent.

Containing an accurate Description of the MANNERS, LITERATURE, RELIGION, &c. of the several Countries herein explored, and a Variety of Anecdotes and Remarks NEVER BEFORE UNITED.

Collected, Arranged, and Re-Written by

WILLIAM HENRY PORTLOCK, ESQ.

CHAPTER I.

OUR travellers undertook their journey June 6 1791, with a view of improving their taste and gratifying curiosity. Having passed the Dover road they admired the well wooded scenery of Kent; after which Captain Radcliffe's vessel conveyed them, in about twelve hours, to Boulogne, where they staid only for the examination of their baggage, and then proceeded to St. Omer's, a town which still retains a gloomy appearance, though the mists of Jesuitism are dispersed. They looked into the church and convent of St. Bertin. The monks were then in daily expectation of the order of dismissal from their spacious and handsome buildings: the courts and gardens likewise exhibited the rude appearance of neglect.

From St. Omer's they proceeded by Cassel to Lille. The rich land through which their road was directed, was covered with full crops of various vegetation. The fields of tobacco, the straight roads, and the rows of willows and poplars fantastically stripped to the top, reminded them that they were in Flanders; and they remarked that the people appeared well clothed and comfortably fed and lodged.

They visited Ghent on Whitunday, and on their departure thence travelled through a country more open but less luxuriant in its productions. The road was covered with crowds of men and women returning from a pilgrimage to the Lady of Hall, whose miracles then established a great reputation.

They all had a kind of paper flag in their hats, like those worn by the representatives of fools on our stage, and each person carried one or two small children's trumpets suspended at the side.

Brussels has been generally considered as a most agreeable place of residence. Those who have introduction to the higher ranks certainly experience every enjoyment there that lively and elegant society can furnish. It requires some prudence, however, to keep safe from the dissipation and taste for high play which prevails. The public buildings are well known. The church of St. Gudule contains much to interest travellers.

They left Brussels on the 17th, and proceeded by Tilemont and St. Tron to Liege. The country towards Brussels exhibits gentle declivities, prettily covered with woods and villages, with their church spires rising among the trees. As they approached Liege it appeared gradually to impoverish.

Liege, though a very ugly town, is finely situated on the Meuse. The narrow streets are crowded with manufacturers of fire-arms and of other articles, who get rich amidst their dirt. They dined, the second day, at Chaufontaine, a beautiful spot in the centre of well-clothed hills. The views in the neighbourhood, particularly that over an adjacent valley, are charming. In the evening they drove through an agreeable country, occasionally contrasted by barren heath, to Spa, having passed through a part of the petty territories, or manastery, of the prince of Stolvet,

velot, an ecclesiastic, with whom his subjects profess themselves satisfied. As they approached Spa they admired, by moonlight, its fine hills richly covered with trees. They took up their abode at the Hotel du Loup, a little discouraged, however, by that emblem of a voracious landlord. This place is yet very thin of company; the rooms are but little frequented: the gamblers can with difficulty draw a circle round their tables; they look very anxiously at strangers. The few French women who are here dance with great elegance: but play is the whole pleasure and business of the place; men, women and children are all caught by the phrenzy. They who repair here for health counteract the effect of their morning ride and salutary draughts of water, by late hours and ruffled passions. The fountains which issue out from amidst these stony hills are, certainly, very efficacious in many cases. Englishmen, returning from an Italian tour, visit them with great benefit; but one is apt to fancy, that when ladies, who are impatient to get their debits discharged by presenting their husbands with an heir, seek to promote parturition by bathing their feet in the waters of Sauvenier, they ascribe more virtues to them than they possess, though certainly they brace relaxed habits speedily.

They left Spa on the 26th, and quitting the territory of Liege, at Vervier, they travelled through a country, of which, the rich enclosed pastures and extensive views reminded them of Somersetshire. The latter part of their drive, at ten o'clock at night, was through a forest, where their lamps hardly afforded light enough to save them from being overtaken by the deep ruts of a heavy sandy soil.

When they arrived at Aix-la-Chapelle, they might have slept in their carriage, if their courier had not procured them lodgings at a private house; for, the king of Sweden being then there, not a room was disengaged at the inns, even for Englishmen, for whom room is always made, if possible.

This ancient town, which Charlemagne made the seat of empire on this side the Alps, and which continued so to be till the time of Charles the fifth, affords but few circumstances to interest the attention. The cabinet (a quatre portes) remains a monument of a silly dispute for national precedence. The dome of the cathedral, in which many emperors have been crowned, is supported by large pillars, brought from Constantinople.

From Aix-la-Chapelle they were conveyed slowly, by Juliers to Dusseldorf, by horses. The small, well-planted enclosures reminded them of England; they are not adorned, however, by the frequent neat houses which enliven our prospects. Dusseldorf derives an air of dignity from its palace and great church, though these buildings are not particularly distinguished for their style of architecture. The palace has the appearance of a deserted residence, and a solitary guard or two suggested the idea of departed magnificence. This place and its environs are not unpleasant. The river Dussel, from which the town takes its name, falls into the Rhine here, and flows with that river, in a respectable channel, through a cheerful country. The society of the neighbourhood is described as polished; but with French politeness has been introduced somewhat of French dissipation, among the higher ranks, who mix not with their inferiors. The style of living is not expensive. There is no tax, but a small land-tax, imposed by the three orders of the districts of Berg and Juliers, who assemble here to tax themselves.

The country between Cologne and Dusseldorf is flat. At Benrah, a few miles from Dusseldorf, they saw an elegant chateau of the elector, which, however, contains nothing remarkable, and is situated in gardens stiff and formal as art could make them. Cologne is finely situated for trade, which once flourished here. It was one of the Hanse-Towns, and a free city, and formerly contained 30,000 men,

and stood a siege of the whole empire. It is now badly governed: its corporation is rich; its trade and population are decayed; its streets and buildings are dirty and unimproved. The few Protestants who are here are not tolerated in their worship, but go to a church at Mulheim, six miles further in the palatinate: these, however, are the chief promoters of trade. The Romanists exhibit their dark cathedral, and numberless monasteries: live in poverty to support an overgrown ministry, not respectable for character; and tell their superstitious and childish stories of St. Ursula and her eleven thousand virgins, and of coach-horses that ran up into the garret of a man to punish his incredulity, with such trumpery tales as prove, that some of the inhabitants of Cologne are not wiser in their popular creed, than they were ten centuries ago.

Bonn is a fine town: the palace there has no uniformity of design: the chief facade is at one end: the gardens are gay, and decorated with espalier orange trees, and a variety of fine plants: the terraces in front commands, very beautifully, the bold sweeps of the Rhine, which, with the gradual declivities covered with castles and towers, and the lofty spiral tops of distant mountains, form a wonderful scene.

About four miles beyond Bonn they quitted the road, in order to visit a mineral spring not far distant, which is called Newth. It is situated amidst some beautiful hills, one of which are the picturesque ruins of an old castle. A good inn is established there; and the adjacent grounds are laid out, by the elector, with every attention due to nature. The water, which resembles that of Spa, though it is not so strong, is said to be very efficacious in similar cases.

From hence they drove through a most enchanting country by the side of the Rhine, between mountains perpetually varying and richly clothed.

The houses and frequent towns, delightfully situated, reflect a cheerful light from their white fronts and slated tops; and the patches of corn, intermixed with the vineyards, spread a glad appearance of plenty around them. A fine spiral hill crowned with a rocky, castle-like building, forms a noble object for many miles. The whole ride to Andernach is one of the most beautiful in Europe: it runs along a road which was made, as an inscription informed them, under the emperors Marcus Aurelius and Lucius Verus, in 162, and repaired and widened by Theodore, elector of Bavaria, in 1768. Here our travellers slept.

Andernach was one of the seven ports which Julian built after the destruction of the barbarians. From this town to Coblenz, the country is inferior only to that which they had passed the preceding day. The position of the city on the Rhine, at the mouth of the Moselle, is remarkably fine. The new part of the town is well built; the new palace is handsome, but the situation is by no means to be compared with that of the old one, which stood at the foot of the noble fortrefs of Eltrencherstein, facing the Moselle, which here pours its yellow stream into the Rhine, but is very inferior to the Thames. Of the Rhine one can never profess sufficient admiration; it has every beauty that poetical description hath attributed to it.

One wishes, it is true, to see more vessels on the Rhine; but its navigation is impeded by heavy and injudicious taxation. The current is likewise extremely rapid, and vessels ascend with the greatest difficulty; but large rafts of timber float down and give a peculiar character to the river.

Instead of proceeding by Mayence to Frankfort, they unfortunately took the road by Montabaur, Limbourg, and Konigstein, and were jumbled over a continuation of rocky stones, to the imminent hazard of dislocating their bones and breaking their carriage.

They were obliged to sleep at Konigstein at a wretched inn, which, however, they exchanged next morning

morning for the red-house at Franckfort, one of the best in Europe. However, Franckfort affords little gaiety to the stranger except at a coronation, or during the time of the fair, when the mornings are enlivened by the bustle of business, and the evenings pass merrily in the relaxations of success and in the spirit of occasional indulgence. The chief street in the town is spacious; the buildings such as wealthy merchants should inhabit: but some of the houses are distinguished by painting and tallels embellishments. The town is well governed by its two burgomasters and knights. The adjacent dependencies, situated in a star plan, are marked out by four towers all visible at once. The town is said to contain thirty thousand inhabitants, Romanists, Lutherans, Calvinists, and Jews, all of which have now their places of public worship. The Lutheran spirit, however, prevails in the magistrature. The Romanists are not allowed to partake of the government, or to have a public procession of the host; and the Calvinists were, till lately, obliged to have their churches at Bochenheim, in Hanau. The Jews are rich, but are compelled, by an uncles and illiberal policy, to reside in a separate part of the town: in that oppressive spirit likewise with which they are every where marked out, they are obliged to fetch water to extinguish every fire that happens at Franckfort. The trade of this town, and indeed of Germany in general, is supposed to decrease, since the export of German commodities, through Franckfort, scarce amounts to a tenth of the imports from France, Holland, Italy, and other countries. The revenues, from custom and excise, and contribution levies, amount to above 30,000*l.* per annum.

Those who have introduction to the merchants of this town, may converse with men of enlarged and liberal minds. The great resort of strangers has introduced a frankness of manners; and the traveller easily finds persons as willing, as they are well qualified, to communicate information. He may amuse himself also at the cabinet literaire, which is well supplied with books and foreign papers. The people at present have no public amusement, but that of repairing to a kind of vaux-hall wood, down the Maine, where they divert themselves with more good-humour than elegance, particularly drinking, and dancing what they call the *walze*.

The Maine is not beautiful near Franckfort. The houses on its banks are too close to each other, and have no lawns or gardens descending to the river: they are built of wood or stone, and are slated; but bear no more marks of taste in architecture than those at Dulwich. The ramparts, as those of many other towns in Germany, are generally planted with lines, which finely scent the air: they afford pleasant walks to the inhabitants.

Our travellers visited Hesse-Cassel, which is about one hundred miles from Franckfort. They passed through some of the territories of the Landgrave of Hesse-Darmstadt, and arrived the first day at Marburg, formerly an Imperial town, but now subject to the prince of Hesse-Cassel.

It has but a mean appearance; it is irregular and built on a small eminence: the castle, which overtops it, is fast verging to ruin: it commands a view of a country somewhat wild and romantic: the surrounding hills are well varied and well wooded. The university here, though so near to Gottingen, flourishes. They look in vain, however, for college edifices, amidst the poor buildings of the town. Marburg derives no ornament from the river Lohne, on which it is situated. The waters of this stream, however, though not brilliant, furnish the largest cray-fish ever seen; and it is remarkable, that they continue black after they are boiled.

From Marburg to Cassel, the distance is about sixty miles, through a country well diversified. They noticed, amidst variety of vegetation, the beech and oak as very fine, and the weeping birch as remarkably elegant. The houses, scattered here

and there through the country, are built in a handsome style, with eaves and differently coloured beams, like those in Cheshire.

Cassel is a most beautiful town: it somewhat resembles Bath. They took up their abode in the circus: the public buildings are handsome, and have a classical appearance; the manege is light and elegant; the pavilion is built in a good style of architecture, and pleasantly situated in gardens perfumed and richly decorated with orange-trees; and enlivened by the cheerful notes of canary-birds, which fly wild and unconfined about them. The museum, which was built by the last landgrave, Frederick the second, to whom the town is indebted for many of its public ornaments, is a noble building: the library, a magnificent room, about five hundred feet long, and forty feet broad. The museum contains a valuable collection of antique gems and ornaments, stuffed beasts, statues, busts, cork models of buildings of Rome, &c. &c.

While they were at Cassel, they of course drove to see the Wäfen-Stein, where the present and preceding electors have expended very large sums, in covering a hill with castles, cascades, temples, woods, gardens, &c. The grounds are disposed with great taste; and an English park, with a few deer, is introduced to great advantage between the woods. The two buildings, in which the landgrave and his favorite counsellors reside, are elegant. With the Chinese village they found no fault; it is whimsical and pretty: but they were there on also an apartment designed as a representation of Tartarus; the windows of which were inflated with stained glass, and which is filled with classical figures of Orpheus and Euridice, Pluto and Proserpine, Tantalus, and Ixion; the Danaides, Prometheus, Hercules, Cerberus, and other mythological personages, who may as well cease to exist except in poetical description.

They left Franckfort the day after their return from Cassel. The country improved in beauty as they approached Mayence, July 6, which is about twenty miles from Franckfort.

Mayence, or Mentz is finely situated on the confluence of the Maine and Rhine. The adjacent country is covered with vineyards, among which, not far distant, is the pleasant village of Hockheim, where the famous hock wine is produced, of which the Augulines of Mayence and Franckfort have the exclusive possession. Mayence, with its cathedral and palace, presents a grand appearance to the traveller, who approaches it by the road. They entered it by the bridge of boats, which extends about seven hundred and sixty-six feet across the Rhine. This river, however, is near fourteen hundred feet broad, where it receives the Maine, not far from the town.

The palace of Martinsburg, is a Gothic building of the fifteenth century. It contains several magnificent and well furnished apartments, which command a view of the Rhine, and the Rhindgau, but which exhibit but few pictures. The cathedral cannot be admired for its architecture, though the tower would be rather grand, if one could divest it of some trifling appendages, added by way of ornament. The foundations of the building were laid by Archbishop Conrade, in the twelfth century.

There are ten collegiate churches at Mayence, five convents for men and four for women, which are certainly sufficient in proportion to the number of inhabitants, which amount to thirty thousand. The nobility pique themselves much on the purity of their descent. The chapter preserves, in some measure, its freedom of election. It enjoys a revenue of near 300,000 guilders. The provost's house indicates the affluence of his situation: it is furnished with great splendour, and with more luxury of taste, some think, than becomes an ecclesiastic. The clergy, however, have established a good reputation here, by the propriety of their general conduct: and the late and present elector have laboured

laboured very assiduously for their reformation, and have suppressed some monasteries, applying the buildings and revenues to good purposes. The education of the people has been also attended to; and the reading of the scriptures not discouraged. The nobility here live in great state. The narrow streets hardly allow a passage for the old dignified carriages.

In the summer the higher ranks quit Mayence for their small wooden houses, which are thrown picnically together, something in the Tunbridge-Wells style, about two or three miles from the town. Strangers, and particularly the English, are well received at Mayence, and obtain, without difficulty, admission to elegant society.

Leaving Mayence, they drove by Oppenheim to Worms, by the side of the Rhine, which spreads itself between banks fringed with verdure to the edge of the water: its sweeps are finely broken by islands. The neighbouring hills, however, are less rich than those they had seen before.

Manheim is a very beautiful town; it is fortified after Cohorn's manner: its streets are spacious and regular. The elector's palace is situated at the junction of the Rhine and Neckar: it has little exterior beauty of architecture, though it has the appearance of a palace. As the town has but little trade it suffers much from the absence of the court. The electress, as she is called, resides at Okerheim, which is a few miles only from Manheim: the elector, being of the Romish faith, prefers Munich, as he there resides among his catholics; for here, though some of the higher ranks profess the religion of the court, the bulk of the people has embraced the reformed principles; and the Calvinists have the largest portion of ecclesiastical property. The people at Manheim say, that the elector's confessor teaches him, that it is more meritorious to make heretics miserable than professors of the true faith: they seem, indeed, to have imbibed the democratical spirit; but it shews itself in too low and daring insolence to conciliate the higher ranks to its party. Political subjects, however, begin to be discussed, and the discussion will lead to the discovery of some subjects for discontent. The place swarms with refugee French; the Table D'Hotes resound with their noisy politics, upon which conversation is in vain prohibited.

Manheim itself contains near twenty-five thousand inhabitants, including a garrison of five thousand men. The situation of the town, which was built in opposition to Heidelberg, was injudiciously chosen: the water is very bad and unwholesome; and less advantage is derived from the neighbourhood of the Rhine than might have been expected: it is not even supplied with fish from it, the stream being too wide and too rapid for nets; and it is proverbially remarked at Manheim, that unless the land be deluged and damaged by inundations, the river is of no value.

After leaving Manheim, they stopped a few miles from the town to look at the elector's palace and gardens at Schweflingen: the palace is seldom thought worth the trouble of a visit; the gardens are large, and adorned with canals, orangeries, statues, fountains, hercæus, amorous neptunes, cupids riding on swans, flags, spouting water, &c. &c. very handsome to be sure; but considering that the elector seldom resides in this country, and has so many palaces, it is hardly worth while to spend 40,000 guilders every year to keep them up.

Instead of taking the Heidelberg road from hence, which would not have led them to deviate much from their route, they drove over a sandy country, through woods of fir, about thirty miles to Waghenfel; and had, for the first time, reason to complain of a German inn, Waghenfel being but a small village; they left it, however, early next morning, and drove over rich tobacco lands, and through delightful woods, to Carlruhe, the chief residence of the margrave of Baden, whose beautiful territories run

along the Rhine to the borders of Switzerland, though separated by some intervening districts. This is a very neat town and contrived in a remarkable manner, since all the streets are terminated with a front view of the palace; and constitute, at it were, the radii of an half circle. The palace of Carlruhe contains little deserving notice. Strangers, and particularly Englishmen, who stay any time at Carlruhe, are usually invited to partake of the hospitality and cheerful pleasures of this court: they are received with much affability.

At Rastade, fifteen miles from Carlruhe, they looked at another palace, where they saw nothing remarkable, except a cabinet of Turkish arms taken from the Turks about a century since, by an ancestor of the late margrave; and the room in which the treaty of Rastade was concluded, in 1714, by Villars and Eugene. From the top of this palace, which commands an extensive prospect, they discerned, at about ten leagues distance, the spires of Stralburg.

In their drive to Bune, which is about twelve miles distant from Rastade, they could not but remark, how much the character of this country must be changed: for though the hills are topped with ruined castles and broken walls, which add great beauty to the picturesque scenery of the country, where well wooded, pasture, and arable land, are delightfully intermixed, not a modern house, of appearance beyond a cottage, is to be seen. The people seem but thinly feathered: the women are here and in other parts of Germany the chief labourers; they appear to have great strength, and brawny limbs; they wear a very large straw hat, that is both parasol and parapluie; and exhibit under short petticoats, legs thick as any in Scotland, and as little adorned with shoes and stockings.

The country from Bune to Freiburg, in Brisgaw, which is about sixty miles further, is finely cultivated: the rising grounds are occasionally covered with vineyards; and the valley of Rinsing, which slopes from a fine chain of hills into rich meadows and pastures, is animated with cattle. They passed through some Imperial towns which profess the Romish faith; and others which are chiefly Lutheran.

Freiburg was formerly the residence of the bishops of Balle, who quitted it in 1551, when the canton of Balle joined in the Helvetic union. The cathedral is light and elegant, though disfigured by painting in the German taste.

After leaving Freiburg they discovered the snowy tops of the Swiss mountains. They remarked in yesterday's and this day's journey that many of the trees were dead, and found that they were destroyed by the severity of the winter preceding the last. The women of the country, between Freiburg and Balle, wear their hair bound fancifully enough with ribbon, though some prefer a small hat crimped up like a shrivelled mulhroom, which is very ugly.

They arrived, after a ride of about forty miles, at Balle, by six o'clock in the evening, or rather seven o'clock, reckoning by the clocks of Balle, which, for some reason not well remembered, are always an hour advanced. They took up their abode at les Trois Rois, as they style the three eastern sages. Their rooms overhung the Rhine, which ran rapid under their windows.

Balle has been filled with emigrants from France. It has no streets or buildings remarkable for beauty; a modern house or two, indeed, exhibit a style of architecture superior to the plain character of the rest of the town. The cathedral is chiefly remarkable for containing the tombs of Erasmus, and Gertrude, wife of the emperor Rhodolph the first: the ramparts are pleasant. Our travellers think the inhabitants of the town amount to about sixteen or seventeen thousand. The town appears, indeed, thin of inhabitants: the numbers decrease because the burghership is very rarely conferred on strangers. The manners of the people are plain and simple: there is no parade of equipage, no theatre, no bulle of business,

no throngs of idlers. The university at Balle does not flourish. The library here contains some antiques and some natural curiosities, with some fine pictures and drawings of Holbein, which are highly preserved, and shew the progressive improvement of his pencil: some of them were painted when he was in his sixteenth year.

They rode one evening to see the famous garden

at Arlesheim: it is composed of some pleasant walks, which ascend in a natural, easy manner through woods, on the side of a hill, and which open upon some fine points of view over Alsatia and the adjacent country. There are some well-contrived grottoes in the grounds; in one of which is a bold representation of a Resurrection, which is so contrived as to produce a great effect.

HAVING hired horses for their carriage, and bidets to ride, they left Balle July the 12th, and rode about six leagues by the side of the Rhine, to Stein, a village delightfully situated on that river. It is at the foot of some hills which command a delicious prospect. They ascended to the summit of one, which is distinguished by a projecting rock, and had a magnificent view of some hills richly clad, and of the river winding through a beautiful valley. At the first entrance into Switzerland they were struck with the greatness of the materials which nature has to work on.

The next day was appropriated to mark the rich volume of vapour rolling along the top of the hills, which gradually dispersed after a sultry morning, descending occasionally in light showers, between which the sun enlightened an enchanting country: they rode through woods of oaks, and spiry firs, by the foot of well planted hills. The Rhine has, indeed, more of the green than of the silver cast.

The majority of the towns through which they passed, after leaving Balle, belong to the emperor, whose territories skirt the frontiers of Switzerland: they stopped at Lauffenburg, which is about six miles from Stein, to look at its old castle, and a fall of the Rhine, which, pent up here in a narrow channel, throws itself precipitously over rocks, when it meets with resistance and foams in violent eddies with a boiling surface.

At no great distance from hence they stopped at Havenstein, and ascended a steep hill to examine the ruins of a castle which formerly belonged to the counts of Freiburg, and which was thrown down by an earthquake in 1456. As it is on the frontiers of Soleure and Balle, it was doubtless formerly a place of some importance. From its broken walls they had a pleasing view of the Rhine, and some neighbouring hills.

Having continued their ride by the banks of the Rhine, at the foot of sloping hills on which the vines climbed up, as it were, to meet the sun, they passed by Coblentz, a town of which the name, as well as that of Coblentz at the junction of the Rhine and Moselle, is descriptive of its situation, being derived from Confluentia, for here the Aar and another river bring their waters to increase the broad and rapid stream of the Rhine.

The road from Balle to Schaffhausen is more intertelling than travellers have in general reported. The cottages on the hills are certainly picturesque; they resemble those which may be seen in the neighbouring parts of Germany, being built of dark fir with projecting roofs. The dress of the men has an antique cast, they wear a kind of puffed Spanish breeches.

Our travellers dined at Lauchingen, which belongs to prince Schwartzenburg, and is on the verge of the Black Forest, which is the largest forest in Germany, and said to be sixty days journey in extent.

They arrived late at Schaffhausen, having deviated from their road to see the ruins of a very fine castle, situated on a lofty hill about two miles from Lauchingen; from whence they had a view of a vast circumference of country, of fields and mountains covered with snow.

Schaffhausen, the capital of the smallest canton in Switzerland, exhibits an appearance of republican equality. The houses are plain and somewhat dirty: there is no contrast of disproportionate splendour; no palace to excite the envy of the neighbouring buildings; on the other hand, there is no edifice for the stranger to admire; no monument for national vanity or taste to point out. The free states of antiquity, long before the private citizen was well lodged, erected public edifices with emulation of ornament; and republics, as well as monarchies, had magnificent baths, theatres, and temples. The genius of Switzerland is different: the Swifs are not rich; they are fond of simplicity, and consider, with a jealous eye, whatever indicates the approach of luxury and foreign taste. The fortrefs, and the curious bridge by Uric Grabenman, of Tuffen, were the only public works that attracted attention.

The first object, after their arrival at Schaffhausen, was to see the fall of the Rhine, whether they drove as soon as the weather, then rainy, would permit. Descriptions of such scenes are always faint: something, however, may be attempted. The whole river, after rippling and foaming over several feathered breakers, runs, by different channels, against some beautiful rocks which rise several feet from the water, covered with shrubby wood: beat back from these it rushes round, and by three grand openings precipitates its fall, in accumulated masses, for fifty or sixty feet perpendicular, raging and foaming with wonderful violence, and throwing up a thick dust and shower of spray. In the view from the front, as the banks approach in the perspective, the river appears almost surrounded by a fine amphitheatre of hills richly covered with trees. After viewing it at the bottom of the descent, and looking up at its arched fall, and after contemplating its broad and magnificent front from the beach, they crossed over in a little boat to the castle of Janssen, in which a bailiff, from Zurich, resides. From the room there, which overhangs the cataract, they saw the river, under different circumstances, spreading into great variety of surface before its fall: in some parts gliding smooth and transparent over polished and rounded swellings of rocks, in others, broken, snawy, and unequal, till it rushes headlong down its deep descent. They wished to contemplate this amazing fall in every point of view, and therefore descended to the planks and beach beneath it, and were covered by its spray and stunned by its noise.

They wished to have proceeded to the Benedictine convent, on the banks of the Rhine, but the evening began to close, and their minds were filled

The present prince, however, has conciliated the people by his conduct.

They arrived at Glarus on the 26th. The guide whom they hired at St. Gall, who was a ragged cheerful fellow, conducted them through a wild and romantic country to Gaisfe, their road winding round the edges of hills, the sides and the bases of which were covered with lofty and alpiring firs.

Gaisfe is a village of Rhodes Exterior, which is the Protestant division of the county of Appenzel. The neighbouring hills are naked of trees, but covered with wooden houses, roofed with polished fir, cut like shingles, which are remarkably neat. These houses belong chiefly to the millin manufacturers, who enjoy competence and liberty on their healthy mountains. Each house is surrounded by its little territory; and every lad, in spite of the natural poverty of the soil, is animated with population.

The village of Gaisfe is as much resorted to as Aberystwyth in Wales, for the benefit of drinking the goat's whey, which is brought every morning from a neighbouring mountain, and which is considered as very efficacious in purifying the blood. It is supposed to derive its medicinal qualities from some very salutary herbs on which the goats browse. The place is much frequented about the time of Easter.

After dinner they walked about two miles to the brow of a hill, from which they had a grand rude prospect of some frowning mountains, at the bottom of which the Rhine winds foggily through a black valley. On their return they were led, by people who had never witnessed the strength of a London porter, to see a blacksmith, who drew from his furnace, wit'out assistance, a stone, weighing 112 pounds, to a distance of several feet. As they could procure but four horses at St. Gall, their guide was under the necessity of walking, and he carried their portmanteau with great cheerfulness, rather than suffer it to load one of the horses. In these hilly countries the pediculation may beat the Turkman; they outged their servant, however, occasionally to rest on his horse and exchange gait.

In the evening they proceeded through fine well-carved passages to Appenzel, which is a city little town for the metropolis of a canton, and affords but miserable accommodation: it is situated in a hollow bottom beneath some shaggy mountains. They disliked their mill man, and forsook it for a worse, being obliged to stop in a room where some were in bed, and a party playing at questions and commands, and singing, in a lye, however, which their guide, who was very salubrious, treated with great contempt; they could by no means persuade him to join in their mirth, but he diverted our travellers with many lively tales on their amusements, which he lyled calfsk and cow. The gradations of concert are curious. The supercilious pride of their guide would have been probably softened, if the women, who joined in the party had been more pleasing.

They were much struck with the difference, which they beheld, between the two divisions of this country. In the Protestant part they admired cleanliness, industry, and comfort. In the Roman-Catholic, they saw dirt, indolence, and poverty. The people about Appenzel have much of the roughness of a republican spirit.

They left Appenzel early next morning without regret, and rode through narrow paths by the side of the river Suler, a shallow stream which ripples over a stony bed. They looked at the Wullen bath, where they tasted the strong goat's milk, which is esteemed almost equally with that of Gaisfe, and saw some invalids established in hot baths. The mineral waters, which flow from all the neighbouring hills, are used with success in nervous and gouty cases. From this place they toiled up an enormous mountain, to an hermitage, the object of the devotion from their road. One of our travellers more brave than the rest, who successively declined the enterprise, though

they ascended high enough to enjoy a fine view of the lake of Constance, and to see an hermit who has lived there in penitential restrictions for eighty years, pulled by a narrow projecting edge of the rock, holding by a rope, which some friendly attention had fixed in the side, to the hermitage, where he tolled the bell to announce his arrival. Having examined the chapel, which has an altar with tumpetry decorations, dawkings, and inscriptions, he looked into some dark caverns and excavations, in which the peasants, who reside on the top of the mountain, keep their milk. He afterwards passed through an opening of the rock, from one of the caverns, and crawled up the steep rocky side of the mountain. Having at length, with great labour, attained the brow, as he hastened to the summit he saw a thick mill surround the whole circle, and shut up the grand and extensive prospect, of which he had leave caught a glimpse.

The mill continued impenetrably thick while he stayed. He was soon surrounded by some mountaineers, of whose jargon he could understand nothing but that they wanted money, which he thought it prudent to give them. After examining a great cleft in the mountain, which contained a large quantity of snow that has probably remained there for many years, he began to descend; the fearless boy who conducted him, went on with the confidence and activity of a mountain goat, by a route different from that by which they had ascended: our traveller relying on his knowledge, followed him some yards, though under the necessity of descending on his side, and of holding by bars of rock, sensible of infallible death if he should once lose his hold. They soon arrived at a steep ridge of snow, hanging over a perpendicular precipice, which the boy was preparing to pass; he could see nothing, however, by which he could possibly keep himself from falling, and therefore mistled, very vehemently, on the boy's reason, though it was with some difficulty that he could communicate his orders to his German companions by signs and gesticulations; they again, however, mounted with much toil, and the boy at last conducted him by a less tremendous, though very precipitous path. They passed through a wood of firs; and while he was clinging, with apprehension, to the friendly roots and rocks, in a descent often perpendicular, the boy was rambling on all sides for wood lawberries, with which he refreshed our traveller, who, after some hours, arrived safe and joined his companions, who had been much alarmed on his account.

They set off again in the evening with an additional guide, who was judged necessary: he had the behaviour of an honest man, a character to which the men of Appenzel are not always entitled. They travelled about 8 or 9 miles of the stiel road, without any exception, that was ever passed: it lay chiefly through woods; the worst parts of the worst roads seemed to have been compiled together. They had stones at once sharp and slippery, mud and clay, steep ascents and headlong descents, uneven flairs formed by trunks of fir placed laterally, often broken or sunk irregularly, and gaping with muddy crevices. Thanks, however, to their cautious and experienced horses, they arrived safe, and before dark, at Oberried, a small Roman-Catholic village in the Rhodental. The last part of their ride was by the side of the Rhine, which runs through the valley that they overtook the day before in their walk from Gaisfe. The valley is little adorned by vegetation, but it is enlivened by small cottages encircled by fields. They seemed to excite much attention in the village; the children followed them in crowds.

They left Oberried the next morning, and rode about twelve miles to Weidenburg, through a broad willow valley, sometimes by the side of the Rhine, which, as they mount towards its source, flows in a contracted and stony bed. The hills, near which they rode, are covered with fine pasture, bounded towards the summit with firs. Above the firs they

see the barren rock often tipped with snow. The
short grafs of the Swiss mountains affords as fine feed
for cattle as the celebrated pasturage of Mount Libanus,
or the Calltravan hills. The lower parts, how-
ever, of the mountain are now deprived of the
ornament of cattle, which is driven in the summer
to feed on the summit.

They passed through the village of Sennwald and
that of Salitz, where baron John Philip was mur-
dered by his nephew George Ulric, in 1596.

Werdenburg is pleasantly situated amidst well
clothed hills: at the foot of Schloburg there is a
castle of a bailiff of the canton of Glarus. They
began to remark some strong symptoms of poverty
in this part of Switzerland. From Werdenburg they
had a most beautiful ride of four or five leagues, to
Ragatz, passing through Sargans, a small village on
the Rhine, near which, most romantically situated on
a rock, stands the bailiff's castle, which was formerly
the residence of the counts of Werdenburg Sargans,
and has more of the dignity and style of an ancient
castle than any yet seen in Switzerland. Opposite
to Sargans, on the German side of the river, is another
castle, which commands a narrow defile leading into
the Meyenfeld. The mountains on each side of the
Rhine are beautifully covered with trees and houses
at an immense height. They slept at Ragatz, which
is situated on the Tamina, a river which frequently
overflows the country when swelled by dissolved
snows, or hurried beyond its banks by sudden tor-
rents.

The next morning they proceeded to walk to
Pfeiffer; they toiled up a steep hill: the day was
excessively hot. One of our adventurers having
arrived at the top, walked into the convent, and
entered into conversation with one of the monks,
who introduced him to the superior; he invited him
to dine with him, which our hero did, in his apart-
ment, with one of the monks and some gentlemen
from Zurich. The superior is a titular prince of the
empire, intelligent and well bred. As our traveller
did not understand German, their conversation was
carried on in Latin, in which they mutually regretted
the difference of accent. After coffee, and a good
concert, in which several of the monks performed,
our hero took leave of his hospitable friends,
having had no time to see the library. Willing to
join his fellow-travellers he proceeded to the baths of
Pfeiffer, which is about a league from the convent.
He descended by the brink of a tremendous chasm,
and down a perpendicular passage cut into flairs, to
the baths, where his friends had dined in company
with some monks of the convent of Pfeiffer and Di-
fendis, who furnished them with introductory letters
to the different convents which they projected to
visit. These letters were written in Latin, and with
a conciseness not inelegant.

They were tempted here to visit the source of the
hot water which supplies the baths; and having pro-
cured a conductor, began the dangerous journey.
After entering a frightful cleft of the rock, which
admitted a feeble light to direct them, they walked
about half a mile on boards attached to the side of
the rock, often sloping and slippery, and sometimes
placed so distant from the side, that they had no
support from it. Below them, about fifty feet, at
the bottom of a deep rocky channel, roared a rapid
river burling through a very narrow passage. If
their feet had slipped they were inevitably lost.
When they arrived at the end they saw ~~but~~ to
repay them for the risk which they had incurred;
a gush of water, of about thirty degrees of heat,
issuing from the rock. They were soon fatigued, and
returned from the dripping rock as expeditiously as
the danger would admit. They staid to look at the
company, some of whom had a more respectable ap-
pearance than any persons whom they had yet seen:
they were variously engaged; some were at the Ro-
mish chapel, some bathing, and others dining or
playing at billiards; the amusements of a Romish

Sunday. As these people supped at the primitive
hour of six, our travellers were persuaded to stay, and
afterwards returned to Ragatz by a different but
equally beautiful walk, though their Swiss servant,
who is ever attentive, had contrived to bring horses,
in case they should choose to ride.

Having, from apprehension of want of time,
relinquished their projected scheme of visiting the
sources of the Rhine, and given up, with regret,
the prospect of the Grisons, any further than the peep
which they obtained from Pfeiffer, they set off very
early next morning, and rode twelve miles in the
shadow of some beautiful hills very richly adorned,
and sprinkled with a variety of the most picturesque
houses and villages, to Wallenfadt, on the approach
to which, the lake of Wallenfadt opened most eleg-
antly between the hills.

The village of Wallenfadt is situated at the eastern
end of the lake, in the bailliage of Sargans, at the
foot of the Seven-headed Mountain, the rocky tops
of which are called the Seven Princes. The lake
has decreased and retired from the village. After
walking to a curious spring not far from the village,
they intended, in the evening, to go by water to
Wesen, but suddenly a storm was introduced by a
violent wind, which, in a few minutes, transformed
the smooth mirror-like lake, which had just before
reflected the bright rays of the sun, into an outrageous
sea, on which it would have been very dangerous to
embark. The inn-keeper at Wallenfadt having
made our travellers a most exorbitant charge, had
the insolence, on their remonstrating with him, to set
them at defiance, though he could not but admit that
the charge was extravagantly high. It was vain to
dispute, for as he himself was the advover of the
town, there was no one to whom they could apply for
redress. They therefore paid the unjust extortion,
and ordered their horses; but their host, who had
been offended by their complaints of his injustice,
had seduced their guide to refuse to accompany them
any further by land, unless they would submit to an
additional charge of twelve livres for this day, under
pretence of bad roads. As they had consented to
take this man further, at his own particular request,
and had hitherto found him a civil honest fellow,
they were as much surpris'd as provoked at this; and
their good Swifs was so hurt at the treatment which
they experienced, that he vented his feelings in tears.
Resolved not to consent to this unreasonable demand,
they paid the man for the days that he had travelled
with them, and set off, determined to walk from the
inhospitable house. The storm, however, coming
on violently with thunder, lightning, and heavy rain,
compelled them to take shelter under the hange-
work of the bridge, close to the village. In the
mean time their guide repented of his conduct, came
to them, confessed his fault, and earnestly, with tears
of repentance, entreated to proceed with them: to
which, after much sollicitation, they consented. The
evening and the scheme brightened, and they again
set off; the guide amused them on their way with
exclamations against his own ingratitude, and the
rascally arts of their landlord.

They travelled slowly, between two or three leagues,
to a small village on the lake, called Mullhorn,
having pass'd over a somewhat dangerous road, with
frequent ascents and descents, at the edge of holes
and precipices, sometimes creeping along a shelving
bank close to the lake, meeting occasionally the mules
of the Milanese and other Italian merchants, which,
with their projecting baggage and unaccommodating
manners, produced disagreeable rencontres on nar-
row banks. These merchants bring coffee, choco-
late, sugars, and spices, to exchange for the muffins
of St. Gall, Zurich, &c.

The lake of Wallenfadt assumes somewhat of a
solemn cast from the black and gloomy mountains
which overshadow its surface. Those to the north
are lofty and steep, and descend rapidly, often to the
brink of the water. In some parts narrow slips of

fields skirt the edge, and occasional platforms project into the lake, with houses accessible only from the water. The southern side, along which they passed, is enlivened by pastures, woody walks, and cottages with gardens. The lake is not broad; it opens into a variety of striking points of view: it is subject to very sudden changes, and is, in many places, rendered dangerous by lurking rocks; they paddled upon it in the evening, and admired "its dark billowy bays." A kind of diurnal monsoon prevails on this lake; the wind generally blows from east to west from the break of day: for some hours, and afterwards from west to east till sun-set.

Next morning they went by water from Mullhorn to Wefen; it rained hard during their voyage, and they covered themselves with the sail. When the watermen foresee a squall, which their long wooden boats are ill calculated to encounter, they put in, as they did once or twice, and shelter themselves under cavities of the rock.

Some beautiful waterfalls glide from the mountains, which rise on each side of this lake, often falling in a fine silvery stream. Wefen is elegantly situated at the bottom of the lake, near where the Linth, or Linmat, which joins the lake of Zurich with that of Wallesell-dt, falls into the latter. The chief lakes in Switzerland are so connected together that they facilitate the communication between different parts, and afford opportunities for inland intercourse, very important in a country distant from the sea, and of which the rivers can be of no use to navigation unless they should be hereafter employed to supply canals. The Swiss manufactures are chiefly exported by land, as well those which go to Franckfort and Leipzick, as those which are conveyed to France and Italy.

Wefen is in the bailiage of Galler, which belongs to the canton of Schwetz and Glarus; it was formerly fortified: from thence they walked about two miles to Mollis, where the brave Glaronnois, who were killed at the battle of Nafels, were buried. Nafels is not far distant; they saw it as they passed from Wefen. The Glaronnois fought for liberty from advantageous posts on their mountains, and lost but fifty-five out of three hundred and eighty men, contending against thirteen thousand or fifteen thousand Austrians, of whom they killed one hundred and eighty-three nobles and gentlemen, and two thousand five hundred soldiers. The battle happened in 1388, and is commemorated by a procession, on the first Thursday in April in every year. Here their horses, which had been sent round from Mullhorn, joined them. Their guide arrived still trembling; and they were informed by him and the servants, that as they were leading the horses over the mountains, by a very horrible road, his horse slipped and fell from a dreadful height; the guide, who had not presence of mind to loose the bridle, jumping with it: they must then have fallen into the lake had they not been stopped by trees. It providentially happened that neither man nor horse were hurt. Admitting that the man's fears exaggerated the distance, it is certain, from the servant's evidence, that they must have fallen at least forty feet.

Having mounted their horses, they proceeded about a league further to Glarus, passing by the side of the Linth, admiring the wild character of the country and the grand rocky mountains that faced them. Glarus, which at a distance seems important, when seen in conjunction with another town, called Schwanden, dwindles as they approach, to its own dimensions; and though it makes a better appearance than Appenzel, is but a paltry place as the metropolis of a canton. It is inhabited by persons of both communions, who use the church in common. The Romanists of the canton in general do not amount to above an eighth part of the number of the Protestants.

As, after visiting Pantenbruck, they meant to return to Glarus, they set off the evening of the

same day, and rode through a wild romantic valley to Linthal, three leagues further. The Linth flows with a full whitened stream, which derives its force and colour from melted snow. The valley flourished with the vegetation of Summer, while the mountains were clad in the horrors of Winter. The canton of Glarus is composed of three of these valleys, separated by mountains from each other: they are cultivated to their utmost fertility, but cannot support their inhabitants, who wander as soldiers, or in search of employment into commercial countries. The government of the canton is democratical; and both sects are admitted to the direction of affairs, with some preference, as to duration, in favour of Protestants. Four or five thousand assemble once a year, at Glarus, for tumultuary elections and Babylonian eloquence; and both communions assemble separately for their respective affairs. They arrived late at Linthal, having passed through several villages, and crossed many fir bridges, and were obliged to call up the inn keeper, who is of the council. He gave them some good trout, which are always to be found at most of the Swiss inns; and some indifferently beds, with pully eddy down coverlets. They first noticed here a watchman; and found, on inquiry, that watchmen are employed, in most parts of Switzerland, to give an alarm in case of fire, which, in these wooden villages, would produce rapid destruction.

They rode, next morning, three or four miles further, between wild mountains which closely approach each other, from which descended some very beautiful cataracts; they admired one especially towards the end of the valley, which fell very elegantly, shooting its white foam like an inverted icy-rocket; when seen from the side, it appeared frequently to strike again and bound from the rocky furrow which it had made. The mountains from which the torrents pour have often large lakes at their summits, which furnish admirable fish.

The chamoises are pursued by the huntsmen, from rock to rock, particularly on the Freyberg mountains, near the foot of which they slept. They go in flocks, polling one as a sentinel, who lisses when he hears "the approach of hostile foot." The people, who have sometimes seen their picturesque forms suspended as it were from the side of the mountains, describe them as hanging by the horns from the rock. The cottages, which are of a dark walnut colour, have projecting roofs which hang over to protect them from the snow: their appearance accords well with the scenery of the country; and when seen at a distant height on the mountains has a very peculiar effect. Stones are placed on the roofs to save them from being carried away by the storms of the Winter. Winter, amidst these mountains, must be awful: their lofty summits exclude the sun, except for a few hours, in the longest days of Summer.

They left their horses at the end of the dark shadowy valley, and went on foot, through a forest, about a mile, by a very steep ascent, to Pantenbruck, which is a narrow bridge that overhangs a fearful chasm, at the bottom of which the Linth rushes impetuously. The source of this river is about three or four leagues further in the mountains that form the rude barrier and boundaries of this canton, separating it from Uri, and the Grey League, a division of the Grisons. The valleys of Switzerland often run parallel, and, by crossing the mountains, a short passage may be obtained from one to the other. As they had seen Pfeiffer, the chasm and rush of water here did not alarm them so much as it may have done other travellers; but the surrounding scenery struck them by its grand and rude character. After dining at Linthal, on boiled goat's flesh, nearly as good as mutton to hungry appetites, they returned to Glarus in the evening.

C H A P. III.

Departure from Glarus—Dine at Oberbilten—An agreeable Ride—Einsidlin and its Abbey—Reach L'Epée—The rapid Linmat—Zurich—Proceed to Albis—Zug—Continue their Walk—Conducted by a Peasant to Schweitz—Walk to Brunnen—William Tell's Chapel—Steig—Walk through Ursfield to Wasen—the Devil's Bridge—Urfesen—Further Rambles—Dine at Altdorf—Two Female Companions admitted into their Boat—Land at Lucerne—Remarks—Ceremony of two Girls taking the Veil—Proceed to Baden—Schinznach—Arau Solcure Klendbenk—Arrive at Berne—Description of the Town.

OUR travellers left Glarus on the 28th of July, and having passed through Næfels, and other small villages, dined at Oberbilten, which is nine miles from Glarus, at the sign of St. Fridolin, who is the patron saint of the district. They had an agreeable ride of six leagues, in the evening, partly by the side of the lake of Zurich, of which they had a fine view from a mountain, before they reached Einsidlin, looking down upon Rapperschwyl, the hill of Ufнау, &c. The effects of the devotion of the neighbourhood were visible before they arrived at the abbey of Notre Dame des Hermites, particularly in an handsome church at Lachen.

Einsidlin has an important appearance as approached by a wide plain, situated between lofty mountains, whose distant summits are covered with snow. The town is built on the river Sihl, in the canton of Schweitz. The abbey was rebuilt in 1725: the church is a sumptuous edifice; the walls are hung, at the first entrance, with votive tablets, made for deliverances by sea and land, attributed to the miraculous assistance of the virgin: they are painted with more piety than skill.

After dinner they were shewn the sacerdotal vestments elaborately worked and adorned, and the riches and relics of this establishment, by a very assiduous and complimentary conductor. In the evening they set off. All the surrounding country is covered with chapels, sanctuaries, and hermitages, at which pilgrims respectfully stop. They rode by the side of the lake, which, though it has not the bold and magnificent breadth of that of Constance, is enlivened on each side by a continued succession of neat and cheerful villages with white houses. As they were now about to part with their guide, who had accompanied them from St. Gall, and behaved well since they left Wallentadt, he expressed great regret at being obliged to leave them. They got to L'Epée in good time, where they found their servants and carriage safe.

The rapid Linmat is a beautiful clear river. Zurich is charmingly situated on this river, where it runs from the lake. The town has no streets that are regular or well built: the suburbs, towards the lake, are improved by some modern buildings; the environs are very beautiful, and the banks of the lake and the Linmat are covered with houses, many of which are the country seats of the gentlemen of Zurich; these derive their chief beauty from their situation, having nothing that corresponds with the European pleasure-gardens. Though the town has no buildings distinguished for their beauty of architecture, it has every edifice of importance to the welfare of the people. The town-house is large and commodious; the granary is well conducted, and, in times of scarcity, alleviates the public distress: the arsenal seems well provided with arms: Les Orphelins, a charitable institution for the children of the citizens, and which contains from eighty to one hundred, who are educated, and, at fifteen, are apprenticed to different trades, is well supported. The Swiss have neither the inclination or the power to expend money in superfluous edifices. Their houses are furnished with simplicity, and very little ornament; their carriages are for convenience, and chiefly open; their possessors are not permitted to use them in town; their servants seldom wear livery; and there is but little appearance of those refinements, which are too often the indication of

corruption of manners. The dress of the higher ranks is extremely plain: black is the full dress; and the men, who are in any department of government, wear swords. The dress of the women is unbecoming; on Sundays they wear black in the morning, and colours in the evening; the hair is dressed in the French and English fashion, but with a loose and ill-shaped negligence, appearing what is vulgarly called blowzy; their shapes are not advantageously displayed, nor do they exhibit any of that flowing and graceful drapery which gives to the lengthened and picturesque forms of Reynolds and Bunbury, the elegance of the Grecian figure: their squat and unfeminine monsters of shoes seem manufactured for downright walking, not to bend with supple pliancy in the dance, or to draw attention in the succession of the well directed steps. The strangers who resort here begin to sap a little the simplicity of manners which prevails, by the introduction of foreign luxuries; they intermix indeed, but seldom, with the natives in convivial intercourse.

The ministry is supported with suitable maintenance at Zurich, and the people seem to profit at least by its moral instructions, being celebrated for their integrity and worth. The library is open, upon very liberal terms, to the public.

August 2, they left Zurich, and strolled about eight miles through a charming variety of hill and dale, to Albis, where they slept at a tolerable house. The next morning a misty rain deprived them of their prospect from the hill, on which they slept. It did not prevent them, however, from renewing their walk, through a fertile country, to Zug. They found fruit-trees and fountains the whole way. Zug is situated on the lake of that name. In the evening they continued by the side of the lake, for about three leagues, under fine beach woods which adorn its banks, and in which they heard the frequent sound of the woodman's axe, without any sorrowful reflections that the trees were to be indiscriminately felled to pay the debts of the gambler or the spendthrift. The cultivated fields which border on the lake, and the well-wooded promontories which project into the water and form beautiful bays, finely embellish the scenery. The houses are but few; some vineyards occasionally descend to the edge of the water, and are trained sometimes to twine over roofs of wood which overhang the paths.

They stopped for a short time at a small village in the canton of Schweitz; at the bottom of this there is a capuchin convent, of which, the houses are fantastically painted, some of them with sketches of the Dance of Death. They then continued their walk among the echoing caverns of a sequestered valley, and by the side of another lake till they were overtaken by darkness, and wandered for some hours without the glimmering of a single star to direct their weary steps in security. Towards midnight they met a peasant returning home, whom they persuaded to conduct them to Schweitz, where they at length rested, as well as if they had arrived with a chaise and four and half a dozen attendants.

On leaving next morning this metropolis of the canton, which has nothing remarkable in its appearance but a handsome church, they walked about a league, to Brunnen, a village situated on the lake des Quatre Villes Forelales. Here they engaged a boat to convey them to Fluelen, which is three Stunden, or three hours row from Brunnen.

The lake of the four cantons here is not very broad; it is enclosed with lofty steep rocks, on some of which are houses and chapels, built like the religious edifices of ancient times, on high places, and beautifully surrounded with groves of wood.

They stopped to look at William Tell's chapel, which is painted with some sketches of the history of that hero and patriot, and landing at Fluelen, which is the little port and repository of the Italian merchandize, they walked a short mile to Atdorf, the capital of Uri, situated in the valley of the Reufs. It is almost surrounded by dark steep mountains covered with gloomy trees, which throw a solemn shade over the town. The firs of Mount Bänberg, which rise immediately above it, shelter the houses from injury from the snow or falling rocks. The whole neighbourhood has a serious character. There are many churches and chapels on all sides; one of the latter is erected on the spot where William Tell is said to have been born. The town has no better appearance than a market town in England: the Maison de Ville, if it may be dignified by that appellation, is daubed with some historical paintings, relative to the exploits of William Tell, who is said to have shot the apple from his son's head in this town.

After dinner they continued their walk about nine miles, to Steig, through the valley of Reufs, along which the snow-muddied river runs shallow in a rapid and rocky channel. The rivers in Switzerland, like those in Scotland, are not often fit for navigation; they feed the lakes, however, and might feed canals. The valley, through which they passed, is enclosed by fine dark mountains, overpread with solemn firs.

The valleys in Switzerland are very romantic; in the midst of which flows the river Pencens, swelled by other streams that fall into and increase its current. The rocks here are overhadowed, and often almost concealed by the mantling shrubs and herbs that spread their foliage around them; and amidst these burst out frequent fountains, from which cool and pleasant waters flow. The valley of the firs excels, however, those of Switzerland, in the number and variety of musical birds. In Switzerland no birds are to be seen, except sometimes a fine eagle soaring above the tops of the loftiest mountains; for as every one has a gun, the feathered race is shewn no quarter, each man seeking for objects on which to exercise his skill.

August 5, they walked three leagues through Ursfeld, to Wafen, where the valley of Meyen opens, through which the Meyen pours its impetuous waters to join the Reufs. As they advanced through this beautiful and extraordinary valley, the mountains often advanced near each other: they were covered with remarkably straight and flatly firs, which seemed to rise out of the bare rocks. Some of them were cut down and laid by the side of precipices as a security to the traveller, who would else reel with giddiness, as he passed along the narrow edge of the path. The Meyen abounds with crystal, of which the poor children offer bits to passengers for sale.

After leaving Wafen they began to ascend the barren valley of Schoellenen. The scenery became more rude and rocky; the firs disappeared, and they saw only some scanty grass fringing the edges of the rocks. The valley was strewn with huge fragments of broken granite rock, which often dilapidated and falls, with a thundering noise, from the mountains. After ascending about a league and a half they passed the Devil's Bridge, which overhangs a chasm that would appear tremendous, to those who had not seen that of Pfeiffers, or Pautenbruck. Just above it rises a torrent of foaming water: near this place, opposite to a little chapel and between two torrents, they saw men half way down the mountain, on a rock apparently perpendicular, on which they were turning some scanty grass. They should have conceived it impossible for goats to stand on the steep slippery side.

Every spot which has an inch of soil on these mountains, is cultivated with laborious industry. Animated by freedom and independence, the people draw out fertility from the rock: and happy in their well-earned competence, they would fight, as they have often fought, for their barren and scanty possessions, with as firm and invincible a courage as if they contended for the rich plains of Italy. After having crossed the Reufs, at the Devil's Bridge, they passed through Underloch, a passage of two hundred and twenty feet in length, cut through a granite rock in 1707. This opens into the valley of Urseren, which spreads into wide pastures, in which Urseren appears cheerfully with its back ground of firs. It is watered by two streams. Urseren is a small common-wealth under the protection of Uri, and well secured by its enclosing mountains. They dined in this valley, at Hospital, which is about four leagues from Wafen. The whole way, indeed, since they left Zurich, they had great reason to be satisfied with the small inns, in which they experienced better accommodations than these mountainous and sequestered villages might be expected to supply; and though they paid but as foot passengers, were treated with such attention and kindness, as a display of riches would not elsewhere procure. The manners of the people are simple and friendly, and their reception and treatment that of liberal hospitality, not of mercenary contrivance.

They were now within three leagues of St. Gothard, and feeling themselves but little fatigued, they mounted, by no very violent ascent, through wild and desolate scenes of naked rock, by the side of the Reufs, till they reached its source in a lake, in the large crater at the summit, at which they arrived about eight o'clock, as the night, encompassed by a thick fog, was rolling towards them.

The next morning, after a good night's rest, in beds which were not had though they had no curtains, and were in rooms of which the bare walls had no ornament but a few prints of the Virgin. They descended, in about two hours, to Hospital, and in the evening continued their walk to Steig, over loose stones, which sorely battered their feet in the descent, but which could not prevent them from again admiring the shivered rocks with firs opening from the clefts; the torrents which freshened the air of an hot evening, and the paths which wind under noble rocks and firs. They crossed the river several times, as it afforded a narrow way, on either side, between its channel and the base of the mountains.

They slept again at Steig, and dined next day at Atdorf, and afterwards took a boat at Fluelen, for Lucerne, admitting two women who petitioned for a passage. After again admiring the hills that border on this beautiful lake, they turned a point opposite Brunnen, and entered into a part which they had not yet passed. The lake here has no very great breadth: the banks furnish very rich parkish scenes. The beach woods hang over the lake; and when they stopped for refreshment under the caves, the goats came down to their boats. One of their female companions, whom they had admitted, recited prayers and hymns during the whole passage, except when they checked her pious effusions by some excellent ham; or when her voice was overpowered by the louder strains of one of their watermen, who sung to them the feats of William Tell, in some traditional songs, which had a local propriety, as the borders of the lake were occasionally adorned with monuments erected in honour of his exploits. They landed at Lucerne about seven in the evening. The town is finely situated at the north-western end of the lake, and commands a delightful view.

The hangework of the bridge at Lucerne, which is built over the Reufs, is painted with historical representations. The town has little but its situation to recommend it to the eye. They went to the Jesuit's college. The library was removed at the suppression of the Order: the building is large, and now inhab-

ited by a few professors. On leaving Lucerne they
loitered, slowly, in a hot evening, till they were
overtaken, before their arrival at Sins, the place of
their destination, by a violent storm of the heaviest
rain, accompanied with thunder and lightning. Every
flash which threw its beautiful horrors across the dark
night that soon encompassed the woods in which they
strayed, reminded them of the inconsiderate delay
with which they had lingered in their delightful walk.

The next day, the gloomy circumstances of the
preceding night were forgotten, in the cheerfulness
of a glorious sun, which, when they had proceeded
four leagues further, to Albis, appeared to spread its
dazzling splendour over the lake of Zurich, and en-
livened them with its rays, as they returned in the
evening to that town, where they staid only one
day, when they went, in company with several per-
sons, down the Limmat, to a convent about two
leagues from the town, to be present at the ceremony
of two girls taking the veil: one of them appeared to
be about eighteen and had a pretty face, with an
expression somewhat fullen; the other was about
twenty-four, her countenance meek, and expressive
of gentle serfiousness by a melancholy smile. The
ceremony was extremely interesting; the solemnity of
the scene, the presence of the parents, the grave and
venerable appearance of the abbot, the prostration of
the women, the tearing of the chaplets, the cutting off
the hair, and the change of diels suggested many
affecting considerations.

They left Zurich on the 11th, and drove about
four leagues to Baden. The baths of Baden, which
were anciently celebrated under the name of Ther-
me Helveticae, are about a mile from the town, and
at this season much resorted to.

They proceeded the same evening three leagues,
to Schintznach, admiring the Reufs, which runs
through a fine valley, and of which the banks are
adorned with some vineyards. In their course they
crossed the Limmat: this neighbourhood abounds
with rivers. After their arrival at Schintznach they
strolled to the Aar, and walked up, through a steep
beech wood, to the castle of Hapsburg, which was
erected in the eleventh century, within the ancient
boundaries of Vindonissa, and is famous, as the root
of the family of Austria, for having furnished Ger-
many with the Emperor Rhodolph, of Hapsburg;
elected by the intercess of the archbishop of Mayen-
ce in 1273. The precincts of the castle were not
large: from its proud eminence it commands a spa-
cious view of a fine range of country, through which
the Aar winds its course, between lofty mountains.

Their next stage was to Aarau, which is about three
leagues from Schintznach; they drove through a
country, which has but few of the bold features that
usually characterize Switzerland. They stopt at
Aarau to transact some business. The postillion who
conducted them, wished to loiter, as he was paid by
the day. Travellers, with these conductors, are
compelled to listen to exaggerated accounts of bad
roads and difficulties.

In spite, however, of murmurs, they proceeded
through Ensfingen, and the old town of Wiedlisbach,

to Soleure. The country through which they passed,
was beautifully varied with hills well sprinkled with
boulders and trees: they remarked a castle belonging
to an advoyer of Berne, which was particularly to be
admired. They saw, at some distance, the rude
mountains of Jura, of which the snowy tops were
brightened by the rays of a descending sun. They
supped at the crown inn.

The town of Soleure, or Soleturme, is very an-
cient, as may be collected from a stumpy inscription,
under a dial plate in the chief street.

The great church here is said to have cost 80,000l.
besides an additional expence occasioned by an altera-
tion in the plan after the foundations were laid.
This was a liberal exertion for Switzerland. The de-
sign and style of architecture are superior to those of
any building in this country. The women in this town
wear a straw hat, which is very simple and well adap-
ted to the climate. The whole place has an appear-
ance of neatness and comfort, which resembles the
air of a Protestant.

After leaving Soleure, they dined at Hindelbank,
which is about four leagues from Soleure, and about
a league out of the straight road to Berne. Having left
Hindelbank, they arrived at Berne August 13; it is
a pleasant ride of about two hours.

Berne is a very handsome town: the streets are spa-
cious; the piazzas, with their low arched fronts, give
it a peculiar character; the store houses would appear
to more advantage if the arcades were more lofty;
the walk, likewise, would in that case be equally shel-
tered from sun or rain, and there would be a much
freer circulation of air: the town is kept neat, but it
is by felons, chained with a collar and hook over
their heads: the terraces, particularly that behind
the cathedral which overlooks the Aar, afford very
agreeable walks, where the Berne ladies, who are
very pretty, exhibit their charms better displayed by
dresses than those of any Swiss women which they have
yet seen.

The men being generally engaged in the offices of
government, or in foreign service, there is not much
pernicious dissipation here. Gaming is effectually
expressed, for every member of the council takes an
oath to inform against any whom he shall see engaged
in high play. It is vain also to attempt seduction, for
the seducer is compelled to marry the woman whom
he has vitiated—to take, as his companion through
life, the woman whom he has degraded. Public
brothels, under certain regulations, are allowed.

The public buildings at Berne are handsome,
though they do not shew any great departure from the
simplicity of the country, which consults utility rather
than ornament in its buildings, even where the
dawnings of taste most appear. The Hotel de Ville,
at which the council and senate assemble, is an old
building wherein are some convenient rooms and his-
torical pictures. The new room, for the library,
shews but little advancement in skill of architecture:
it is ill contrived, and fitted up with but little taste or
respect to the convenience of readers; it is rich in
manuscripts.

tion of Turin.

ON the evening of the 15th, they proceeded to Friburg, a town about sixteen miles distant from Berne, remarkably situated on the river Sane, amidst the scenery of craggy rude mountains: it is filled with Romish churches profusely loaded with ornaments, and with convents that contain large libraries. The women are very pretty; their complexions are delicate, and their countenances, which seem all moulded in similar forms, are very interesting.

Leaving Friburg on the 16th, they travelled about six leagues further, through a charming circular valley, richly covered with groves, to Bull, a small town of one street. On quitting this, they saw the village of Gruyeres, so famous for the cheese which is exported to all countries; and thence proceeding through a fine pasture country, they slept at Chatel St. Denys, where a bailiff resides in a castle, the construction of the thick walls of which reduced the ancient counts of Gruyeres to indigence.

The next morning a short ride by the lake of Geneva, which opened beautifully, conducted them to Vevay, just in time to see a septennial celebration of the Fête des Vignerons, which seems to have been a very early, and perhaps, an heathen institution. A procession, composed of the representatives of Ceres, Bacchus, Flora, and Pomona, with their respective attendants, and with appendages of corn, grapes, flowers, and fruit, carried in profuse display, paraded merrily round the town. These jovial deities were personated by people selected for their figure or beauty. Silenus, rolling from side to side between his supporters, was not forgotten. The characters were dressed with suitable ornaments, and the procession was continued with singing and much gaiety for four or five hours; after which the gods and goddesses repaired under some fine trees that ran close to the lake in the town, to partake of the plenty which they assembled to celebrate. A humorous fellow who was employed to harangue them, in a burlesque discourse, amused the company much, by his coarse but sprightly sallies. There was much good-humour and no disturbance.

One of our travellers walked to Clarence, which is towards the extremity of the lake, about a league and a half from Vevay. They ascended to the castle of Chatillard, which is very beautifully situated on an eminence, and commands a glorious view of the lake, the mouth of the Rhine, and the distant rocks of Meillerie. It is surrounded by delightful vineyards planted in an artificial soil brought to those hills, and supported by some walls lest it should be carried away by the torrents that often rush from the summits of the mountains.

There are many rooms half-furnished in the castle, which at present belongs to a bailiff; and in an upper room, where criminals are examined, there are some instruments of torture, which are still suffered by the government of Berne to be in the hands of individual magistrates. In the evening they had a ball, at which the waltz and country dances kept them up till three or four in the morning.

The women in Switzerland sometimes wear long tails of braided hair. After marriage these braids are twisted round the head, and fastened at the top with a small silver bodkin, or sword.

They left Vevay on the 19th, and proceeded by the side of the lake to its extremity; and through Aigle, a small gloomy town in a charming country, to Bex, which is about six leagues from Vevay. After dining there, at the Table D'Hôte, with some intelligent travellers, they rode about half a league to examine the famous salt-works at Bevioux. The water is conveyed to them by pipes from the source at Fondemont, which is about a league further, whither they afterwards went; and having procured guides, lights, and dresses fit for the journey, they entered the souterrains by a narrow passage cut through the rock, and walked about four hundred feet to the chief source, which issues in a very incon-

siderable but perennial stream; this is received into a grand excavation that serves as a reservoir for the water, and is about one hundred feet in length. The country about Bex and Fondemont is to be admired for its finely wooded hills.

The next morning they drove about three leagues to Martigny, having entered the Villais at St. Maurice, by a romantic pass over a Roman bridge; and having stopped to contemplate the beautiful cascade, called Pisse-Vache, which falls from a great height with much elegance. It first arches with a fine bold curve; it afterwards shoots into many spiral forms which have somewhat of a dark cloudy hue, and then terminates its fall in a graceful foamy spray.

Near Martigny they noticed the ruin of the old castle, where formerly the bishops lived; they now, however, reside at Sion. They were at Martigny obliged to leave their carriages; and having procured horses and mules, they rode about three leagues over stony roads and rude hills to Trient, which is situated in the Vallais, in a bottom, surrounded by tremendous mountains covered with snow. Here they dined at a wretched inn, and afterwards having rode about half a league further, they began to ascend the Col de Balme. They toiled over stony paths by a very steep ascent, their mules labouring above them, for it was impossible to ride; and they trembled as they hung over them in parallel roads, which they often did, from the winding of the path. They were three or four hours before they had surmounted their difficulties and reached the summit; when they began to descend in paths less precipitous, indeed, but down slippery hills, and covered with a thick brouillard.

Our travellers wondered to see the cattle descending from neighbouring mountains, down paths that appeared to them at some distance absolutely perpendicular; and from one of which, a tall Englishman not long before fell giddy. The descents are, indeed, so rapid, as to be dangerous to persons and cattle most accustomed to them; and accidents so often occur, that on the brows of the mountains are often erected wooden crosses, in honour of prostrating saints, or to deprecate the wrath of the evil Genii, whom the superstition of the people imagines to be always contriving mischief against them. From the top of the hill they had a fine view of the vale of Chamouny and his snow-tipped mountains, particularly that of Mont Blanc, which, according to Sir George Shueborough's account, is 15,662 feet above the level of the sea; and, according to that of Mr. De Luc, 15,304, and which is, therefore the highest mountain in the old world, exceeding that of Caucasus, or any mountain in Asia or Africa.

They did not reach the bottom of the hill till darkness made them rejoice at their safe arrival; they had still, however, near three leagues to ride, by the side of the river Arve, and to pass over many dangerous bridges every now and then, which were thrown across beds of torrents; or to ford the Arve, where its windings in the valley required it. They arrived, however, soon after ten o'clock, at the inn called Balance, and found the refreshment which they much wanted.

On the 21st, as soon as their guides had been to mafs, they procured mules and ascended for about an hour over the steep and rugged paths of Montanvert, when they were obliged to dismount, and toiled for about two hours more along the road of the Crystal hunters, stopping indeed frequently to repose and refresh themselves with the wild strawberries and milk, which the peasants' children brought them, and to contemplate the rude scenery of the mountains and the vale of Chamouny, through which the shoaly river Arve ripples along. They at length arrived at the summit, and had a view of the magnificent glaciers which are encircled by vast and savage rocks rising in gigantic and fantastic forms, sometimes terminating in sharp needle points. The glaciers appeared to them like waves of ice topped with snow; they extend many miles in length and one in breadth. They descended

of the magnificent glaciers
ft and savage rocks rising in
s, sometimes terminating in
glaciers appeared to them
with snow; they extend many
breadth. They descended to

to the glaciers, looked into the tremendous blue clefts
in the ice, and heard stones roar for a considerable
time after they threw them in. They afterwards de-
scended to Chamouny, by a steeper path over loose
stones, where their poles, and sometimes their friend-
ly and officious guides supported them; they reached,
in about an hour and a half, and contempla-
ted with great astonishment and pleasure the source
of the Arveron, which issues from the glacier
of Argentiére, called la Mer de Glace, rolling under
a magnificent vaulted arch formed by projecting ice,
undermined into a tremendous cavern; within this is
a smaller circle, or arch, divided from the other by
an immense fissure, which will probably fall ere long,
together with the piece of rock that rests upon it.
The children mount, fearless, upon the upper arch,
though our travellers could hardly behold them with-
out apprehension. Their mules met them here, and
they returned to Chamouny, and in the evening rode
to the glaciers of Bosson, to which the ascent is less
difficult as they rode within a quarter of a mile of
them. The ice here assumes a pyramidal form,
appearing like sugar loaves, or inverted basket salt,
in gigantic representation.

The next day they returned to Martigny by the
Tête Noire. The road, which is composed of an
irregular stair-case of pavement, winds round fearful
precipices. The barren rocks, the romantic entrance
of the vallais, and the rich expanse of a woody valley
and hills, decorated with cottages and pastures; the
beautiful cascade of Argentiére, and other falls of
water, together with the dark firs which crowned the
summit of the Tête Noire, formed a succession of
very striking and magnificent scenes, displayed with
infinite variety of light and shade, and diversified
with every combination of form.

As they arrived at Trient they saw the opposite hill
covered with a long ascending train of people, pre-
ceded by priests and religious orders, in their proper
dresses, who had come here from Martigny to supplic-
ate for rain, and were returning slowly, in solemn
procession.

At Martigny they again remarked the number of
Cretins and goitered persons who suffer from the
stagnant air of this enclosed valley, and the noxious
vapours which arise from its marshy land. They
slept this night at Bex, and returned the next day to
Vevay, having only stopped to look at the fortrefs of
Chilon, which projects into the lake.

They left Vevay again on the 24th, and dined at
Moudon, which is about six leagues from Vevay, one
of the most ancient towns in Switzerland.

At Payerne, four leagues further, they saw the
camp now removed from Berne. The country,
through which they this day passed, is parkish: its
gentle well-wooded slopes of pasture, and occasional
corn fields, are very pleasing. They slept at Aven-
che, which is situated near the lake of Morat. They
looked here at some remains of Mosaic pavement
near the castle, of which the design representing Bac-
chanals, was, as far as they could judge from what is
left, very handsome. On leaving Avenche the next
day, they skirted the side of the lake of Morat, of
which the banks are flat, and less adorned than those
of the lakes which they had before seen.

Passing through Morat, Guimenc, and Berne,
they proceeded to Thun, which is near forty miles
from Avenche. As they approached Thun they
admired the magnificent mountains, with their gla-
ciers, and the noble well cultivated valley through
which the Aar flows. This, which is rather a large
town situated at the head of the lake of Thun, is of
the Reformed religion.

The next morning they embarked in a covered
boat, and in about three hours and a half passed this
very beautiful lake of Thun. They landed at the
end of the lake, and walked about three leagues to
Lauterbrunnenn, passing through a romantic valley,
between lofty mountains richly covered with trees
and dotted with houses. The view of the Jungfrau-

Horn, tipped with snow, appeared to equal that of
Mont Blanc.

They took up their abode in a small village, and
the next morning were rowed back to Thun by three
persons, the usual number, one of whom was a wo-
man. They slept at Berne and dined the next day at
Arbourg.

The country about Arbourg is adorned with great
variety of oak and beech; its dark hills are finely
clothed. They reached Bienne in the evening, time
enough to walk to a cascade situated amidst "low
browed rocks" and romantic hills.

Bienne, which stands at the bottom of Jura moun-
tains, has no distinguishing buildings to characterise
it. There is a remarkable spring which supplies
above eighty fountains in the town; the water is per-
nicious to the teeth, as appears to be the case of many
other springs in Switzerland. Its bad qualities are
said to be derived from the rock through which it
flows. Fountains are the chief ornaments of the
Swiss towns: there is generally one in each, sur-
rounded by a broad basin, at which the women assem-
ble with tubs, to wash their vegetables. Bienne is
under the sovereignty of the bishop of Basle, whose
reduced power is, however, chiefly nominal and
ceremonious.

As the day was unfavourable for the water, they
drove about three leagues on the road to Basle, along
the edge of a steep valley beautifully shaded with
beech, oak, and fir, which intermingle their various
hues. After stopping at a small house for dinner,
they walked about a league to Pierre Pertruis, a sin-
gular rock, which appears to have been perforated
for a road, as it should seem from an inscription,
which, however, is of disputable interpretation by
the Romans. It separates Val St. Irmier from the
district of the old Rauraci, and is part of the chain of
rocks branching from Mount Jura. After supper
they engaged a boat to convey them to the island of St.
Pierre.

This island is about two miles in circumference.
The small spot is enlivened with a charming variety
of woods, vineyards, orchards, and meadows, ter-
minated on one side by a noble terrace which looks
over the neighbouring land that borders on the lake,
of which the banks are rich and pleasing.

In the evening having crossed over to their car-
riages at Neuville, they drove about four leagues to
Neuchatel, which is sweetly situated on the lake of
that name. They were much pleased with this agree-
able town and its neat appearance.

They afterwards made a little excursion to Locle,
where the watch trade goes on briskly. The country
about Locle, which rises into gentle eminences, for-
merly covered with forests, is now adorned with neat
white houses, which indicate a diffusion of wealth and
the dawnings of taste. They slept at la Chaux de
Fond, which is on the edge of Franche Comte. Af-
ter having seen some new modes of life in this expe-
dition, they returned to Neuchatel, through cheerful
villages, by a different road, which they left Septem-
ber 3, and arrived in the evening at Yverduin, eight
leagues from Neuchatel, having skirted the lake, and
driven through a country where rude and elegant
scenery were beautifully contrasted, and well culti-
vated hills, vineyards, and meadows, with distant
mountains and glaciers, furnished fresh objects of
admiration every instant.

Yverduin lies in rather a flat situation, at the south-
east end of the lake. It is mostly to be admired for
its walk, which is enclosed by two branches of the
river Thièle. The printing-house is famous.

Their first stage next morning was to Orbe, which
is proudly seated on an eminence, and is distinguished
for its antiquity. The castle and the tower, which
are not among the most ancient buildings of the town,
add to its strength.

On leaving Orbe they deviated from their road to
see the castle of Barthelemi, which commands a mag-
nificent view, and arrived at Laufannc in the even-
ing.

ing. This is an irregular town, with few buildings that deserve notice.

Having quitted Laufanne, they passed through Merges and Rollo, and many other pleasing towns, to the ancient town of Nyon, situated on the lake along which they again travelled in the evening.

They drove through Coppat, a barony in the bailiage of Nyon, and passed through the paltry French town of Verfoy, or Verfoi, which is called Choiseul's Folly, because built by that minister in fruitless opposition to Geneva.

The first evening of their arrival at Geneva they experienced the inconvenience which results from the early closing of the gates; for having taken up their abode within the town, and strolled out for a walk towards the lake, they found the gates shut, by inexorable sentinels, before their return, and in vain petitioned for admission. They could have no communication with their servants, and were obliged to sleep at Secheron's.

The city of Geneva is remarkably situated at the west end of the lake, where the beautiful Rhone issues from it in two rapid currents of a transparent green colour. The streets are not broad, and derive no embellishment from the lofty wooden arcades which shelter them from the sun. They are cheerful, however, and thronged with a busy active people. The houses which face the lake, and those which overlook the parks, are very handsome; the fairs are good, the walks pleasant, and much resorted to.

The environs of Geneva are very beautiful: the walks of the lake, with the view of the lake, the mole, the glaciers, and Mount Blanc, always afford pleasure. It is very populous; the Lutheran religion is tolerated here, and strangers may be admitted to the rights of burghers.

Our travellers were furnished here with phaetons and open carriages of every kind, as well as in England. They drove one day to Fernay, where they saw nothing worthy of mentioning.

The inhabitants of Geneva have a general kind of information, which excites surprise in strangers; though, on further acquaintance, it is often discovered to be superficial enough. They are almost all educated at a public academy, which is well regulated and supported at the public expence. Here they imbibe a taste for literature, which every citizen is enabled to keep up, by a permission to borrow books at the public library opened to them for that purpose once a week. Literary societies, though controlled by government, still assemble. The theatre, which always contributes, in some degree, to the cultivation of letters and the polite arts, is tolerably supported. The higher women at Geneva have much improved in the elegance of their manners by associating with foreigners. The constitution of Geneva is still unsettled, and the liberties of the people undefined.

They left Geneva on the 15th, and proceeded by Cartouge and Luifelles, through a country, of which the thin soil seemed withered by the sun to dust, to Frangy, a small village, where they slept. The next day they continued their journey, by Douer and Remilly, to Aix-les-Bains, where they stopped to look at the handsome baths, in which the gnawing pains of the rheumatic are soothed, and the relaxed nerves of the paralytic are braced. The remains of a Roman arch are here to be seen. From thence they had a pleasant ride to Chamberry, a town which seems hewn out of the quarry of surrounding mountains. Its narrow streets are crowded with an industrious people. Having procured a bulletin here, they determined to deviate from their road, on a visit to the Grande Chartreuse; and, after dinner, travelled amidst hills, of which the forests gradually disappeared, till they reached the rude and naked rocks of Echelles, and descended to the town by the wonderful road called la Grotte, which was cut through the solid stone by Charles Emanuel, in 1670: a work stupendous indeed, and, as the inscrip-

tion in the side informs us, "unattempted by the Romans and despaired of by others."

Echelles, the ruins of its castle, and the adjacent plain, are seen to great advantage from the hill by which they descended. On entering the town its importance vanished; and the river, which separates Savoy from Dauphiny, allots to each country a few houses that neither side can envy or despise. The next morning, having procured some saddle-horses and a guide, they passed the bridge, and applied to the mayor of the French district for a passport, without which, they understood, that the advocates for freedom would not suffer them to return. The magistrate was a good grocer, and granted their request without any intolence of office.

Having rode about three leagues, they entered the first enclosure of the territory of the Chartreuse, and passed through a deep cold valley, hidden by steep hills from all but the meridian sun. They mounted to the convent by a gradual ascent. The narrow road is conducted by the edge of a deep chasm, down which it is fearful to look: while from above it is overhung by well wooded mountains, that tower to a tremendous height. They sometimes rolled large stones down the precipitous descent, which, by the force that they acquired, broke branches from the trees, and sometimes almost carried away the firs, with a hollow echoing sound, till they reached the bottom. The thick woods, which arise almost perpendicularly to the summit of the mountain, abound in bears, wolves, flags, roebucks, goats, &c. which are often seen. They arrived at the convent about ten o'clock: it is situated towards the end of the valley, near the foot of a spiral rock, on which is placed the cross of St. Bruno. The external architecture is simple: they were not struck with the magnificence of its extent till they entered. The convent has been despoiled of a great part of its revenues and territory. There is now a small party of soldiers lodged there to preserve it from popular injuries, whose appearance accords but ill with the religious quiet of the place. Our travellers having given their passport to the serjeant, were well received by the coadjutor, who conducted them to the room appointed for the reception of the English; for in this extensive range there is a distinct apartment appropriate to each of the principal nations of Europe. After the first attention they were left to amuse themselves with the room till dinner was got ready, when they were served with fish and eggs. After dinner they were shown some of the apartments and cells of the monks, each of which had his little garden and library.

Our travellers now returned to Echelles, and returned the same night to Chamberry, which they left the next morning: their first stage was to Mommelian, a small town on the banks of the river Here, with a castle that stood a siege of fifteen months against Lewis XIII. of France, and at last foiled his endeavours: adjacent to which is an eminence, on which the Marquis de Bellegarde has a castle, called le Chateau des Marches. From thence they proceeded by Mal-Taverne to Aiguebelle, through a country very picturesque; the vineyards mantling up the hills between barren rocks, and the castles and towers, which were scattered on the summits of the mountains, gave a peculiar character to the scenery. Their next stage was to Eriepre. In their route they passed a mountain in which there are iron-mines and a foundry; and they thence continued by the side of the river Arehe, now a scanty stream flowing sluggishly over oozy banks, but which, sometimes, rushes with violence, when swelled by melted snow or accumulated torrents. The country began to assume a more rude appearance, and the projecting roofs of Chanon or Chambre, where they again changed horses, reminded them of the winter snow. The valleys here are pent up and enclosed with mountains: the snow falls in great abundance, and the confined air is rendered very unwholesome by

Public procession of the FLAGELLANTS, of Spain, Italy, France, &c.

by the vapours which hover over the muddy bed and banks of this river.

They changed horses at St. Jean de Maurienne, which is the largest town in Savoy after Chamberry, and slept at St. Michel. They rose early the next morning and travelled five posts, through St. André, Villarrodin, and Bramant, to Lannebourg, through rude and stupendous scenes: through a chaos of rocks, at the foot of mountains, and on the edge of precipices, winding and ascending by narrow roads.

At Lannebourg they mounted post-horses, which they who come by the post are obliged to take, and ascended mount Cenis by a very stony and precipitous path, in which they met with many mules laden with rice and silk. They got to the top in about an hour, without much fatigue to the horses, and galloped over the plain, which extends two leagues.

They stopped to change horses at the post-house, called Santa-Croce, which separates Piedmont from Savoy. Opposite to this house is a fine lake famous for its trout. The lake freezes in the winter, but the fish subsist by air, which is supplied from springs, or enters at the place from whence the river Doria issues, that forms the cascade, and flows, in conjunction with the Po, to Turin.

Elevated as they were on mount Cenis, they saw the top of Notre Dame de la Neige still higher, and understood, that from the summit of a mountain not far distant from their passage, there is an extensive prospect of the plains of Lombardy almost to Milan. Having reached the southern side of the mountain, they began to descend towards Italy by steep winding stairs of rock, where the horses went very carefully and safely; but the path was sometimes so narrow, the precipices so tremendous, and the stones so loose and uneven, that they chose to walk, and could on foot more confidently admire the falling torrent, the steep stony declivities of the hill, the scattered houses, and the rich opening valley. After about five hours expedition from Lannebourg, they arrived, with great satisfaction, at Novalezza, a wretched lane of dirty miserable houses, and then thronged with carriages. They passed the fort of Brunette, which commands the whole passage through the valley, being finely situated on a rock levelled with great labour and expence of powder.

At Sufa, the ancient Segesium, a small town, but one of the gates of Italy, is a strong castle, built in a very commanding situation, on a rock. The town consists of one broad street. In the garden adjoining to the ruins of a castle, erected in the time of Augustus, is a triumphal arch, which, though much defaced and dilapidated, deserves to be seen by a traveller eager for antiquities, on his entrance to Italy.

From Sufa they proceeded to Zaconiero, passing by the fine castle of St. George, which had the character of what they conceived to be Italian grandeur; and soon afterwards they admired the proud convent of St. Michel, placed on the summit of a stupendous rock. Dismantled castles were often to be seen, of which the fine ruins gave effect to the country, that, in other respects, resembled Savoy. As they proceeded, the valley widened, but was still shut in by mountains; and as the banks of the swift flowing Doria are, in many places, muddy and stagnant, cretins abound in the neighbouring villages. Their hideous squat figures, and distorted broad countenance, are shocking to behold. The towns through which they passed are narrow, poor, and dirty. They drove through St. Ambroise, a large town, and Rivoli, where is a castle belonging to the king, of which the exterior is not handsome, but the situation fine. As they approached Turin, the country flattened into an open plain: they travelled through fine rows of elm. The town was concealed till they advanced to its gates; but the hills behind and round it are covered beautifully with white palaces and buildings of different kinds.

Turin is a small but very regular and handsome city. The chief places, and some of the streets, are spacious, with arcades and piazza shops. The opera house is large and commodiously arranged, though somewhat dark: its decorations display but little taste. The king's opera house is very handsome; it is only opened for a serious opera in Lent.

There is a tapestry manufacture at Turin, of which the execution is better than the design or colouring. Some works of tolerable sculpture are also produced there.

C H A P. V.

Departure from Turin—Progress of their Journey—Description of Novi—Arrive at Genoa—Description thereof—An Excursion to Poggi, &c.—Journey to Milan—Curious Remarks—Journey to Bologna—To Florence—To Sienna—To Rome—Descriptions of the respective Places.

SEPTEMBER 29 they left Turin, and proceeded through an insipid country, five posts, to Asti, a deserted town, which retains but little of its ancient population and importance. Its chief trade is in wine and cattle. There are fifteen convents there.

After dinner, they drove in the evening three posts and a half, to Alexandria, a town full of soldiers and monks, with an handsome theatre, where operas were then rehearsing. They slept the next night at Novi, which is two posts from Alexandria.

Novi is a small free town under the direction of a governor, appointed every two years by Genoa. There is an appearance of industry in the town. Its district is small, a few miles only in circumference; but it is not precisely defined, and the people have occasional disputes with the inhabitants of Tortona. Novi stands in a flat plain, encircled in the horizon by the Alps and Apennines. St. Bernard and Mount Cenis stand high above the rest. There are no buildings worth noticing in the town.

Leaving Novi the next morning, they passed the proud fortress of Garvy, which stands on a fine eminence, in an immense excavation, amidst a sea of hills, some of which are beautifully covered with chestnut trees.

89.

After passing through Voltaggio, and ascending the Bochetta, they obtained a grand view of the Mediterranean, and descended by a fine winding road through Campo Marrone to Genoa.

Their first view of Genoa, encircling the bay, and extending its walls for twelve miles round the ridgy and sun-browned brow of the mountains, was very grand. They arrived by a fine road through the valley of Polcevera, and saw the doge walk in procession to the church of St. Dominic.

The number of magnificent palaces at Genoa is prodigious. In the splendid apartments of these palaces, which are at the upper part of the house, the possessors do not reside: and some of the nobility have four or five, and even more, palaces kept chiefly for ostentation. They are filled with costly furniture. Parts of these palaces are often let.

The crowd of poor objects at Genoa is dreadful. They are fed not only by private charities but by public support.

The franc port at Genoa deserves to be noticed, as a commodious depository and well regulated office for the customs. Ten per cent. is paid for all imported goods for home consumption; the export duties are low. The chief articles sent out are silks,

9 Z

velvets,

velvets, damasks, orſevera ſculpture, artificial flowers, oil, oranges, and citrons. The port is large: it is encloded by two moles; on each of which is a pharos, to direct veſſels to the ſpacious mouth of the harbour, where they are ſafe from injury, except when haraſſed by the ſouth-eaſt wind, called Libeccio, which rolls on a great ſwell of ſea.

Our travellers made an excursion to Poggi, which is about ſix miles from Genoa: the ſuburbs through which they drove, are decorated with gay buildings, marble palaces, terraced gardens, orangeries, fountains, colonades, painted walls, ſtatues, ornamental works, &c. At Poggi they ſaw the large palace of the prince Doria: the orangeries there are very fine; and the terraces command a beautiful ſea view; notwithstanding which, they are ſprinkled with tricheries of water-works, and jets d'eau. The groves and woods are natural and pleaſing; and the pines, with their umbrella tops, are ſingular. In the garden, there is a rural theatre artificially formed by trees.

The women of Genoa have pretty features, but are extremely pale; a kind of ſickly languor gives a ſoft expreſſion to their countenance and fine blue eyes. The painted linen veil which they wear, called mezzaro, is not unbecoming, though it reſembles a flowered gown thrown over the head and hooded. The Italian women, in general, are very uninformed. The ſociety of Genoa is not among the beſt of Italy. The court is without women, and the nobility have not the elegance of high birth. The rich nobles are œconomists in general, though they ſometimes entertain a ſtranger with ſumptuous oſtentation. They intermix chiefly at the theatres, which are tolerably ſupported. A ſtranger may aſſociate here to much advantage, with the merchants of the factory.

No ſtate in Europe ſeems, in ſome reſpects, to be ſo ill governed as Genoa; the laws are defective, and, ſuch as they are, are ſeldom put in force. The magiſtrates of the criminal rota are foreigners; they accept their office from mercenary motives, and are notoriously corrupt. When they have amſſed riches enough to prefer ſecurity to further gains, they retire from public detellation to their private reflections. The nobility purchaſe popularity, and the continuance of their privileges, by proteſting and obtaining pardon for turbulent men, and thoſe whoſe uncontrolled paſſions lead them to crimes. Redreſs for injuries, cannot be had againſt power; and individuals execute their own vengeance. Hence aſſaſinations are frequent; and a ruſſian, who can make intereſt with a noble, or command 150 or 200 livres to bribe the officers of juſtice, is ſure to eſcape. Not leſs than one hundred and fifty aſſaſinations are committed, upon an average, every year at Genoa, chiefly among the lower ranks, at the ſuggeſtions of jealousy or the sudden impuſe of revenge, notwithstanding a patrolle parades the ſtreets, and ſome ſbirri, who are not diſtinguiſhed by their dreſs.

They left Genoa on the 8th of October, and returned to Novi, whence, taking the Milan road, they paſſed through a flat uninterreſting country, in which the eye ranged in vain for trees or fertile fields, to Tortona, once Dertona, and in the decline of the empire Attilia, now a ſmall town, two poſts from Novi, which bears ſome inferior reſemblance to Alexandria. It has a fortrefs with about forty ſavoyards.

From Tortona to Voghera, which is a poſt and a half, they paſſed through rows of willows that bound paſture land. They ſlept at Voghera, the Tria of antiquity, ſituated near the river Staſera, called alſo, formerly, the Tria, a town full of ſoldiers and eccleſiaſtics, and doomed to ſupport, at preſent, three troops of cavalry, about 400 infantry, and eleven or twelve monaſteries.

They left Voghera the next morning, and drove two poſts and a half, through a flat burnt-up country, thinly ſprinkled with mulberry trees, by Caſſe Tiſina, to Pavia, having croſſed the Po by a bridge

of boats, where it has a reſpectable breadth, and alſo the Gravalola.

Pavia, once the feat of the kings of Lombardy, has the appearance of a deſerted town. It contains many open places like fields; not a third of what is encloded by the walls, is now inhabited. There are eight colleges.

In going from Pavia to Milan, they viſited the Carthuſian convent, which is one of the moſt magnificent in Italy. The church is eminently beautiful and richly adorned with variegated marbles. The chapels, which are curiouſly checkered and inlaid with marbles, exhibit at every altar fine pictures. The library has been tranſported to Padua.

Milan is not a handſome town, and it has few prominent beauties. Among the buildings moſt diſtinguiſhed for architecture, is the cathedral, of which the exterior is ſtill nearly as unfiniſhed as in the time of Addiſon: it is a vaſt edifice; and religion took here no vulgar flight. The nave and long drawn aiſles are very fine; the outside is crowded with ſculptured figures. The tower commands a magnificent view of the Alps and Appennines, of the city of Milan, and of the extenſive plains of Lombardy.

Among the remarkable churches at Milan, ſtrangers are uſually ſhewn that of St. Scabbian, from a deſign of Pelegrini; that of St. Maria Pedone, that of St. Francheſco, and eſpecially that of St. Ambroſe, built on the ſpot where the father is ſaid to have diſcovered the bodies of the martyrs, St. Gervafius and St. Protafius. It bears great marks of antiquity; contains the braſen ſerpent, or one very like it, erected by Moſes in the Wilderneſs. Beneath a cupola in it, with relief figures of the 9th century, ſupported by four porphyry pillars, is a table, of which the pallium is of ſolid gold inlaid with precious ſtones, under which were depoſited the aſhes of St. Ambroſe. Our travellers noticed here a ſarcophagus, ſuppoſed to be a work of the fourth century. The iron crown was formerly given in this church to the emperors. All theſe valuables are encloded by the gates, which St. Ambroſe is repreſented to have cloſed with Chriſtian zeal, in the face of the emperor Theodoſius, on account of the maſſacre which he had committed at Theſſalonica.

The church of St. Laurence here is built on the foundation of ſome Roman baths, or, as ſome ſay, on the ruins of the temple of Hercules. It retains the form of the heathen temple, but is conſtructed with ſuch evident marks of the dark ages, that the old columns are inverted, the capital being where the baſe ſhould be. The church of Thiele, which is ſuppoſed to be erected on the ruins of the pantheon of Minerva, is in the ſame neighbourhood; and not very far diſtant is the fine Doric colonade, which is uſually repreſented as the work of Maximilian. On Mount Olivet is a convent, beautifully adorned with marble. The altar is very handſome.

The cemetery, in the neighbourhood of Milan, deſerves particular notice; it is a building formerly erected for the reception of the bodies of perſons who died in the hoſpital, and, poſſibly, for the general uſe of the city: it conſiſts of a circular colonade, which contains no indication of a ſepulchre, no epitaph, no moral hint, but here and there a ſuſpended tablet with injunctons to pray for the ſoul of the deſunct.

The Foppone at Milan, which was formerly a lazaretto for perſons afflicted with peſtilential diſorders, is now converted into a lazaretto for cattle. Epidemic diſorders are leſs frequent than they formerly were.

Literature is but little cultivated at Milan, though it boaſts of having produced Valerius Maximus, Cardan, and other great men, and though the Ambroſian library, founded by Cardinal Frederic Borromeo, affords fine field for reſearch. Trials are conducted in ſecret, and the laws are not very judiciously enforced.

seventeen miles from Milan,

Milan, through a flat country, to a village called La Corde, and, after dinner, about fourteen miles further, to Sesto, a small village, where they slept at an indifferent inn; and the next morning hiring a boat and four men, and ascending the river Tefino, entered on the Lago Maggiore, which opened most beautifully upon them in a broad expanse, of which the banks, particularly that of the Sardinian territory, were adorned with some palaces, as those of Casa Visconti and Casa Otolino, and the castle of Angiera. The lake was uncommonly full, in consequence of great rains. They landed at Arona, a small place of great trade, and walked up to the enormous bronze statue of Cardinal Borromeo, adjoining to which is an academy for Catechumen ecclesiastics; the number of students now amounts to about seventy-two. Having reembarked, as they continued their voyage, they admired the hills which rose gentle, and prettily adorned from the water, and the distant mountains, particularly, cloud-capped St. Bernard; the woods of chestnuts, the olives, and the vines hanging gracefully over poles and wooden roofs erected for them. They dined in their boat, in sight of Isola Bella, where the lake expands nobly near seven miles in breadth.

Isola Bella, which is about fifteen miles from Sesto, is a small clump of terraces, lined with orangeries, that rise, one above the other, with a formality little correspondent to the bold scope which the surrounding scenes display. They rowed from Isola Madre, a beautiful little spot, about six miles, to Laverno. Here they found their carriage, and drove about fourteen miles, to Varese.

On leaving Varese next morning, they drove through a very pleasant country diversified by hills richly covered with oak and chestnut trees, to Como, charmingly situated at the southern end of the lake.

The lake of Como, which was anciently called the Larius, appears from the town to be a small body of water, as the opposite hills, through which are openings towards its great expanse, seem to approach so near as to enclose a small part of it. The banks, as seen from Como, are beautifully studded with villas, among which the new erected palace of Count Odiskalki is remarkable. The scenery of the lake, and its environs, is enchanting. The houses are near enough for the cheerfulness of neighbourhood, without the inconvenience of proximity.

The town of Como is surrounded by a wall, and contains a garrison of about sixty men. The cathedral is large; its circular window and fretted Gothic work are very beautiful: the interior is large, but darkened rather by a gloomy superstitious, than by a dim religious light.

October 24, they drove by Magnano, over a level plain to Lodi, about two posts and three quarters. The rich meadows about Lodi are well watered by sluices; and some of them are mowed four times in the year. The Lodi cheese is the best of the Parmesan; a great quantity of it is sent to England. The town appears neat, and indicates the prosperity of increasing wealth. From Lodi they went by Zorliscana, three posts, to Placentia, having crossed the Po, before their arrival, on a moving bridge of boats. The country in the neighbourhood of the Po, which is part of what was anciently the most flourishing side of Italy, and which still retains its reputation for fertility, appears now squalid and miserable, in consequence of the late overflowing of that river, which spread desolation wherever it went.

Placentia is a very handsome town, though its present appearance reminds the traveller of its decay: it swarms with beggars, the cause and appendage of idleness and poverty. The cathedral is worth visiting, for the view of the adjacent country and the Po from the tower.

They visited the Augustins, of which the church is large, without grandeur: 14,000 sequins have been lately expended upon it, by a society rich amidst

general poverty. The façade is handsome. In the sacristy of this church is a very beautiful representation, finely carved in wood, of the scene at Calvary. The palace at Placentia is still unfinished.

At Placentia they wished to have proceeded by a voliturier, as they could have travelled at much less expence; but were told, that they must go off by the post, as they arrived by it, unless they chose to stay three days at Placentia; such, it seems, is the regulation.

The next morning they continued their journey through well planted enclosures, by Furenzole, Borgo S. Domingo, and Cappel Guelpho, to Parma, five posts. The vines entwined, and hanging in luxuriant festoons from tree to tree, from elms, alders, and maples, were extremely beautiful. They regretted being so late in the year, as the vegetation of summer, less embrowned by autumnal tints, and enriched with clusters of grapes, must be very beautiful. They crossed the Taro, where the fragments of a bridge still remain, that many years since was destroyed by its violence.

Parma does not impress the stranger at its entrance: there is neither magnificence nor much appearance of trade. It contains between 40,000 and 50,000 inhabitants.

The first object of our travellers attention was the celebrated theatre, so admirably constructed, which has the classical appearance of a Roman work: it was built, in 1618, of wood; is capable of containing 12,000 or 14,000 persons: it is so well contrived, that sound is equally distributed over every part. Upon some occasions it has been converted into a naumachia: and water was formerly admitted from the river Parma, for the display of naval engagements. This theatre is now almost falling to ruin.

Notwithstanding the people of Parma have so beautiful a model for a theatre, the modern building, where theatrical representations are made, is a hideous house, built like the hulk of a great ship: the pit sunk into a subterraneous hole, and the higher boxes projecting over the lower, as if they were about to tumble down.

In a small palace in the garden, built on the site of the Farnese residence, they saw the remains of a gallery, and a room painted with the last efforts of Augustin Caracci's pencil.

The cathedral of Parma is large and gloomy; it contains some good pictures. The church of S. Baptiste has the appearance of very great antiquity: its statues and hieroglyphical figures deserve much attention. The baptistery is so large, that it seems to have been constructed for plenary immersion.

They left Parma on the 28th, and travelled through a country of well cultivated meadows and fields, adorned with elms and other trees. The trees serve but as stems for vines to cluster round: if they draw away somewhat of the nourishment of the soil, they still serve for fire-wood, and save the expence of poles.

They passed through Reggio, two posts from Parma, where, notwithstanding the prince, like the emperor, has suppressed some religious establishments, are some churches and a cathedral, which a traveller should stop to admire. Two posts more conveyed them through Rubiera, formerly a well fortified and important town, to Modena. They passed the Secchia in a boat, though a bridge is almost finished and ready to be opened: this bridge and another have been lately built at the expence of the duke. It is free to the Modenese; but strangers are required to pay a toll. He has made also a new road, the old Emilian way which ran between Parma and Modena being destroyed.

Modena is a very elegant town; its streets are regular and remarkably neat: the winding arcades which are seen in some of them have a good effect; but the painted houses, which have the appearance of stage scenes, deserve no praise. Some of the buildings

buildings are handsome. The town is not large; it may contain about 20,000 men. The soil in the neighbourhood of Modena presents remarkable vestiges of a deluge, in the abundance of marine productions. Sea weeds, shells, branches and trunks of trees, are often dug up; and sometimes the remains of the devallations of probably later times, as the pavement of streets; &c.

They arrived at Bologna, which is but three posts from Modena, on the 30th, having passed the Isola Triumvirata in the way. Modena contains about 90,000 inhabitants: it is governed by a senate, consisting nominally of forty, but by a politic addition of ten, to facilitate the influence of the pope, actually composed of fifty, under the direction of a Gonfaloniere, as supreme magistrate, who is changed by election every two months. The pope's vicergerent exercises by intrigue more authority than he is constitutionally invested with by the state. He is allowed, indeed, to preside at the judicature of criminal causes. The present legate has resided there five years, which is a longer time than the legates usually continue. The pope derives a great advantage from his government, restricted as it is by the privileges of the state.

The streets of Bologna are narrow, and darkened by arcades: they are washed by a branch of the Reni, which turns the mills employed in the manufacture of silks, damasks, satins, velvets, and tafetas, of this town. The people are certainly distinguished for their ingenuity and industry. They excel particularly in making walnut-tree work, artificial flowers, &c.

The Bolognese are no niggards of the wealth which they procure from trade. Their public buildings and churches are numerous and grand; among the latter that of St. Petronius, which contains the meridian line of Casini, that from June to January marks the point of mid-day, is the largest. La Madonna di St. Luca, which is finely situated on an eminence without the town, is ascended to by a grand arcade of three miles in length, open by pillars to the south.

The estates of Bologna are equally divided between all the children; hence nobility has been sometimes impoverished, but trade, perhaps, promoted. The nobility, however, still maintain sufficient splendor.

The university of Bologna still retains some of its ancient reputation, as the chief school of civil jurisprudence cultivated in conjunction with the elegant parts of literature.

The immediate environs of Bologna are beautifully diversified and pleasant. They want only the spreading fulness of a river to wind between their hills. The streams that flow through the valley are shrunk to creeping rills, which, with difficulty, make their way over rough beds; such are most of the Italian rivers that our travellers met with: stony channels in the hot weather, and torrents in the cold; in the winter conferring no ornament, in the summer spreading devallation.

They left Bologna on the 3d of November, and though obliged to take six horses to their chaise, could not, in this hilly country, get further than Feligare, four posts from Bologna. On quitting the fertile valley in which Bologna stands, they entered on the Appennines, and continued to ascend and descend hills but little adorned the whole way; from one of them they had a distant glimpse of the gulph of Ancona.

On quitting Feligare next morning, they had a view of a little volcano in the neighbourhood of the Douane, where they distributed some bribes not to have their baggage disturbed on entering Tuscany. The volcano, as it is called, appeared at some distance to be composed only of a flame of small circumference, affording a kind of glow-worm light which required the contrast of darkness to produce any effect. The flame is a haromcter to the neighbourhood; it increases on the approach of bad wea-

ther; and when fiercest, portends a storm. Some years hence this volcano may be dangerous to the neighbourhood: it is now an object only of curiosity.

The next day they toiled again, for four posts, over Appennines and Alps, sometimes assisted by oxen. At Monte Carli they passed a small neglected house, which is called a chateau of the duke: it is not remarkable for beauty or position.

Having quitted the mountains, the last of which is adorned with some fine cypress trees, they got, towards evening, a noble view of the vale of Arno of Florence, spreading wide its white houses, suburbs, and villas, through a charming well varied country, of which the hills and the valleys were covered with dusky-leaved olives and vineyards.

Florence well deserves the praises which it has received. Trade and the fine arts seem to flourish there in union. The streets and quays that border on the Arno are delightful. The bridges, particularly the Ponte della Trinita, with the statues of the seasons, and that with the cycloidal arches by Annanati, are very handsome. The houses have a noble appearance; and the ornaments of sculpture scattered about the town give it a classical air. In every part of the city are works and buildings erected for its embellishment, by the Medici family.

The gallery at Florence deserves particular notice. The first entrance to it opens the perspective of a corridor, lengthened to the sight by its narrowness, and lined on each side with pictures, statues, and busts. A walk through rows of emperors, and emperesses, conducts one to its tribunes and detached rooms, every one of which contains beautiful and interesting works of antiquity.

The churches here, which amount to near one hundred and fifty, besides the chapels of eighty-seven convents, contain some fine works by the best masters, and, in general, they are beautifully adorned with marble, drawn partly from some fine quarries which are found in the neighbourhood.

The duomo, or cathedral, has a magnificent exterior of variously coloured marbles emblematically representative of the splendid outside of the Romish faith; while the coarse and neglected interior suggests the idea of correspondance not so favourable to the inside of the thing to which it is compared. The tower, as it often happens in Italy, is set apart from the rest of the building. The gates of the baptistery, which are of bronze, sculptured with parts of sacred history from the New Testament, are said to have been praised by Michael Angelo, as fit to be the gates of heaven.

In the cloister belonging to the beautiful church of the annunciation, is the celebrated fresco of la Madonna del Sacco, by Andrea del Sarti, who was buried in the church. It is to be lamented that the work will expire with a fate accelerated by its exposure to the air. The chapel of St. Lorenzo, beautifully decorated as it is with Sicilian jasper and curiously inlaid and variegated marbles, still remains an unfinished monument of the Medicean family. The family is extinct in its chief line; and the mausoleum is not completed; seven dukes have been buried in it. The tombs of Galilæo and of Michael Angelo are to be seen in the church of Santa Croce, as is that of Brunelleschi in the duomo or church of S. Maria del Fiore, on which this architect boldly raised the first cupola, or dome, that appeared in Europe.

The present generation of Florentines is not distinguished by the number of its philosophers, poets, or artists. The people have the reputation of being friendly and benevolent; and, perhaps, they are less corrupt than in other parts of Italy. It is certainly, however, a delightful city, and strangers who settle in Italy, will, perhaps, do well to prefer it to any place. Its situation in the vale of Arno, and on the banks of the river, is extremely beautiful. The surrounding hills are charming. It is impossible to live at Rome or Naples during the summer months, while

the

the air of Florence is refreshed by temperate breezes
from the mountains and the sea, even in the hottest
season. In the winter it is somewhat cold, being
exposed to the Tramontane winds, particularly since
the Appenines have been stripped of their firs.
Provisions and fruit are abundant and cheap, and the
contiguity of the sea affords opportunity of receiving
from or sending to England whatever may be neces-
sary, as also a facility of repairing to the coast for
health or pleasure. Its being the residence of an
ambassador facilitates introduction to society; and
the Cassino is opened, without difficulty, to strangers,
who may associate with the nobility of both sexes
that assemble here for cards and conversation, and
occasionally for dinner parties.

The style of visiting is not costly: very few enter-
tainments are given at private houses, except those
at which the whole expence may be lemonade and
ice, and sometimes tea. The chief intercourse is in
morning visits, or at public places. The dinner is
selfish and negligent all over Italy. At Florence the
women appear every evening at the opera or the
theatre, where they have annual boxes: two of them
are seldom seen together. A lady, attended by a ca-
valiere servente, or sometimes by two of this species
of animal (the second being a kind of inferior deputy
cecilbeo) is visited by other gentlemen, and sometimes
by some of the chief performers in her box. He who
aspires to the honour of being invited in the service
of a lady, may undergo the pleasing duty of attending
her every morning, and escorting her, in a carriage, or
on horseback, in the woods and walks that border on
the Arno. Attended by these guardians of their virtue,
the women visit every place or person to whom whim
may lead them, and call on single men at lodgings
or hotels without scruple. Every woman almost in
Italy is openly neglected by the man who has solemn-
ly plighted his vows to her, and attended by those
who are privileged to possess the opportunities of
seduction.

The Florentine nobles live in magnificent houses,
but they still sell wine by the bottle: some of them
have a better education than the nobility of Italy in
general receive, and in their mansions may be seen
the indications of literature and taste.

At the Ranucini palace our travellers were shewn a
very fine and spirited drawing, on a sacred subject, by
Mengs, the Raphael of modern times, which was
executed by that painter under the conviction of
approaching death, when his expiring genius roused
itself to execute a last monument to his fame.

At the Riccardi palace also they had a fine library
to admire, rich in manuscripts, and books printed in
the 15th century, as well as a saloon with a ceiling
painted by Luca Jordano, and in other palaces
many and beautiful pictures.

Here also is a species of amusement similar but in-
ferior to that of Sadler's Wells. One evening while
our travellers were there, a man descended by a rope,
on which he reeled by a board fixed to his breast, from
the ceiling to the stage, with great applause.

Having left Florence, they travelled three posts,
by Prato, through a flat country of vineyards to
Pistoia, a dull deserted town, containing little to
arrest the hasty traveller but some pictures, in an old
style, in one of the churches. From thence they
proceeded, three posts and a half, through a country
well planted with vineyards and separated into small
enclosures.

Lucca is the metropolis of a small republic, con-
taining about one hundred and twenty thousand peo-
ple, in a district of, perhaps, thirty miles in circum-
ference. The town has no very cheerful appearance,
for the houses are all lofty and shut up with grated
windows, and the streets are somewhat narrow; it is
enlivened, however, by the busy activity of the peo-
ple, who are still as distinguished for industry as they
were in the time of Strabo. The soil of the country
is remarkably fertile and well repays the labour of the
tenants. It formerly furnished supplies to the Ro-

mish armies. Its olives, and other productions, now
afford a revenue of 400,000 crowns. The govern-
ment is aristocratical.

This place lays claim, indeed, to an antiquity little
short of that of Rome, though, according to some
accounts, it was peopled by a Roman colony. It
was esteemed the chief town in Cisalpine Gaul.
Some vestiges of the splendour of Lucca, in former
ages, are still to be seen. An ossuarium and a cine-
rarium were discovered in 1692, by which it appear-
ed, that the people were formerly buried and burnt
within the walls of the town, contrary to a law of the
twelve tables, which the independent spirit of the
people disregarded, as well as to all salutary regu-
lations. The remains of its magnificent amphithe-
atre, into which whole forests and oceans were occa-
sionally introduced, and which was alternately filled
with the bealls of Asia and Africa, and with the
fleets and monsters of the deep, are now converted
into the walls of a prison still to reverberate with the
sounds of guilt and misery. The materials of this
amphitheatre have been employed in the erection of
churches, in honour of that religion which suppressed
the barbarous spectacles therein exhibited.

Lucca is said to have been converted to Christianity
by St. Paulino, a disciple of St. Peter, of whom ma-
ny miraculous stories are related, and who is supposed
to watch, with the affection of a patron, over the
interests and security of the city, where he is rever-
enced as one of the seventy disciples, and the first
martyr of Tuscany. The doctrines and principles of
the Romish church took deep root at Lucca. The
historians of the city are anxious to vindicate the
pretensions of St. Anthony, a priest of Lucca, to the
honour of having first instituted the eremitic life in
Italy, in the fourth century, by retiring himself to
Mount Pisano, now called San Pantaleone, in the
territory of Lucca.

There is somewhat of the strict spirit of republican
equality to be met with at Lucca. No titles are
borne by the higher ranks, except in the case of a few
individuals who have foreign distinctions. Sump-
tuary laws are observed even by the women, who
wear black the whole year, except during the Car-
nival, when they change their colours every day.

A ride of two posts, from Lucca, brought our
travellers through a low wet country to Pisa, which
is a remarkably fine stately city. The quays are
broad and handsome, and the Arno dilating towards
its mouth has a nobler expanse here than at Florence.
The streets built on each side of the river have a
grand appearance. Florence and Paris derive their
ornament from buildings circumstanced in a similar
manner. Wren designed that London should have
taken the same advantage of its river, and if his plan
had been adopted strangers would have heard but
little of the views from the Pont-Neuf, or of the
perspective of the canals in the Dutch towns. The
two sides of Pisa are connected by three bridges, one
of which is very handsome. The Arno, however,
is but shallow, and navigable even in the winter only
by small vessels, which are towed by boys, who run
along a wall which forms part of the embankment of
the river. The town has lost much of its ancient
population and importance; and instead of the one
hundred and fifty thousand inhabitants of which it
once boasted, among which were one hundred citi-
zens, each of which fitted out a galley at his own
expence, and maintained it during a war, it does
not now contain above twenty thousand. The court,
however, often resides here, particularly during the
winter, as the air is milder than at Florence.

The Pisa guide, if a traveller can procure it, will
give him an ample account of the botanical garden
and the observatory, of a cathedral with pillars from
the temple of Ephesus, and gates, some from Jeru-
salem, some elaborated by John of Bologna; of a
baptistery, remarkable for its font and pulpit, and of
a leaning tower, of which it is not yet determined,
whether the inclined position be designed or acci-
dental.

dental. He will also remark the curious customs, sham battles on the bridge, annual ceremonies, &c. &c. It may be worth while, however, to notice the campo santo, a cemetery of very peculiar description: it is built upon the reputed dimensions of the ark, being five hundred and fifty palms in length and one hundred and sixty in breadth. The earth in its enclosure is said to have been brought from Palestine, and to have the power of pulverising bodies, deposited in it, in the space of twenty-four hours. The walls are painted in fresco with fantastic and extravagant representations of death, in different forms, and of angels employed in the pious office of taking souls out of the mouths of just persons, or of contending with devils for friars and godly persons, with other such edifying conceits: but the most important objects of observation in it, are two old inscriptions which illustrate the customs of antiquity. They describe the honours voted by the Pisan colony to Lucius, and Caius Cæsar, the sons of Augustus. To Lucius is decreed a black ox and a black sheep, adorned with blue fillets: it is directed that the sacrifices should be burnt, and that urns of milk, honey, and oil should be poured upon them. Caius, who died of wounds sustained for the republic, is to be lamented by a general mourning, with a suspension of all business and amusement: and the 21st of February is noted as an inauspicious day, in which no sacrifices, supplications, and espousals can be made, and no games, but those of funeral rites, can be celebrated. In this cemetery is a monument, recently set up, in honour of Algarotti.

The country between Pisa and Leghorn, but two posts distant from each other, is well wooded. Leghorn is a small town. The appearance of trade is not great. English goods, useful and ornamental, of every kind are exposed in the shops, some of which are very handsome, in the style of those in London, and contain a great variety of articles. The streets and coffee-houses are crowded with people of all nations, with Jews and Turks, and all the throng of the mercantile tribe, whose daily buzz soon wears the stranger that loiters but for observation and amusement.

The post, the custom-houses, and particularly the lazaretto where quarantine is performed with security to the town and convenience to the individual, are well appointed and directed. It is a pleasing and no uncommon circumstance for persons, eager for the society of their relations, to enter the lazaretto and live in temporary seclusion, and at the risk of suffering, from infection, with the objects of their regard.

Not very far from the lazaretto is a burial-ground: disease and death are near neighbours. This spot is especially interesting to the English traveller, as appropriated to the reception of his countrymen. There are several handsome monuments, but the inscriptions are not often classical, and sometimes favour of mercantile spirit.

The evening amusements at Leghorn are confined, at this time of the year, to the theatre, and dramatic representations are in general exhibited by Neapolitan children (pygmean actors) whose premature powers, and artificial accomplishments surprise and disgust the spectator.

Having left Leghorn, they slept the first night at Pisa, and the next day arrived at Sienna, after they had passed through a country which, by its vegetation and scenery, reminded them of England, till they came again to hills covered with olives. Their road lay through Farnachetti, Castel del Bosco, Scala, Certaldo, Poggio Bonzi, and Castiglione, in all eight posts.

Sienna is somewhat of a solitary town, situated in a very beautiful country. The English often choose it for a residence. In the time of Dante its polite inhabitants enjoyed the reputation of speaking the Italian language in great purity, and they have retained the reputation ever since. Hence it is resort-

ed to as a school, in which are studied the graces of the Italian tongue. Society is obtained here with little difficulty. The ladies, however, are said to be dangerous, and to abuse the freedom which they enjoy, more, perhaps, than the women of any town in Italy; and no where, in good truth, are they over-much restrained. The cathedral in this town is elaborately enriched with marble sculptured pillars, and mosaic pavement, by Dominico Bucalumi; and the curious pulpit of diaphanous alabaster is worked with sacred subjects by Giovanni di Pisa. After admiring in this cathedral Bernini's statues, our travellers were shewn, in the Sacristie, twenty-nine volumes of illuminated vellum with the church service, executed together with twenty-nine more volumes now in Spain, by a Benedictine monk: a beautiful and elaborate work of the cloister.

Having left Sienna, they slept the first night at Radicefani, in a solitary house, which stood in the centre of bleak hills not far from Chiusi, the ancient Clusium, the capital of Perusia. The next morning, having descended from our rocky unadorned hills, by or near the old Via Cassia, to a small wretched village called Ponte Centino, they entered the pope's territories, which were instantly characterised by the appearance of idleness and dirt. At San Lorenzo, their next stage, they had a fine view of the expanded lake of Bolsena, and soon arrived at the town of Bolsena.

Travelling from thence they entered the Bosco Helerno, the ancient Lucus Volturnensium, where some of the pope's guards demanded money for protecting them against the unauthorized banditti who formerly pillaged travellers in this notorious wood. Their route, as they continued their journey under oaks scarce yet discoloured by the tints of autumn, conducted them through Montefalconi to Viterbo, a large town, of which the inhabitants support twenty-four convents. The air of the neighbourhood is impregnated with sulphurous particles, which ascend from a small lake, formed at no great distance by the waters which issue from a boiling spring.

They set off very early next morning, and hurried through some now unrecorded towns, about six posts, to Rome. The postillions drove, the last miles, with uncommon rapidity.

They had no sooner alighted at Pio's, in the Piazza di Spagna, than they procured a guide and hastened through some dirty streets, and over the bridge of St. Angelo, to St. Peter's. They arrived at Rome in the evening of December 5, and contented themselves for the present with a hasty view of St. Peter's, of the corso crowded with ecclesiastics, of the large and incumbered palaces of the nephews of popes and cardinals, of the churches and public buildings of this distinguished city, and then returned to their lodgings, where their rooms were thronged with valets, trachelmen, antiquarians, &c. &c.

It is vain to look for any features of Pagan or Christian Rome separately: they are strangely blended and incorporated together. It is sometimes difficult to ascertain the works of ancient and modern times, and almost impossible to discriminate between the characters of ancient and modern superstition. Houses of recent date exhibit the detached and sculptured fragments of Roman buildings. Christian churches are erected on the foundations, and constructed with the materials of heathen temples. The statues of the apostles are supported by the columns of the emperors: and the remains of the purple, designed for the reception of the vilest slaves, are lost in the labyrinth of the catacombs, now honoured as the sepulchre of the primitive martyrs.

The church of St. Theodore stands on the ruin of a temple erected in honour of the infant founders of Rome, on the spot where they were fabulously reported to have been nursed. The church of St. Cosmo and St. Damian unfolds the gates of a temple, dedicated to the same reputed founders of the city. That of Santa Maria, sopra Minerva, bespeaks its

own origin; and without going out of Rome to find the walls of the temple of Bacchus in the church of St. Urbino, we need only observe, that the Pantheon dedicated by Agrippa to Jove and other deities, was consecrated by Pope Boniface the fourth, to the Virgin and holy martyrs, and by Gregory the fourth to all the faints. The Corinthian brass, despoiled from the portico of this temple, was converted into the canopy, supported by its wreathed columns, at the Papal altar of St. Peter's; and the church of St. Paul is decorated with marble pillars, drawn from the mausoleum of Hadrian.

The temper of the Romans ever aspiring, still often exhibits its force in the degenerate race of the present day, in which may be noticed a commanding presence, an expressive countenance, an imposing air, a genius and a vigour which need but encouragement and direction to break through the fetters which restrict their exertion. If we would advert to the magnificence of the ancient city, as discernible in monuments still extant, we must consider, with astonishment, the grand, though half dilapidated fabric of Colosseum; the extent and accommodations of the Imperial baths, spread out like provinces with walks, porticos, and museums, enriched with every variety of decoration; the temples of the city and its obelisks, its triumphal arches and well compacted roads, carried over rivers and mountains to the extremities of the remotest provinces; its aqueducts, its catacombs, its tombs, and its palaces.

The remaining monuments, erected in the flourishing times of the republic, are inconsiderable when compared with those of its declining fate. The Tiber still divides the city, and of the Sublician or Æmilian bridge only some piers are now left; of the capitol the site alone is known; its immobile faxum has disappeared; of the temple, where Numa Pompilius had his intercourse with Ægeria, and derived sanctions for his salutary laws, nothing remains but a dripping grotto with a broken statue: of the great work of the Cloaca Maxima but one arch of a sewer is to be seen.

As soon as an acquaintance with the works of Greece and of other countries produced a taste for the arts, the emulation of the candidates for popular favour, and the rivalry and munificence of Imperial patronage, filled the city with buildings of useful or ostentatious character. The quarries of Egypt were imported, and the marbles of Asia were worked up to Grecian designs. Unfortunately it happened, that the temples erected in the earlier periods, and the edifices built near them in later times, were so crowded together, that they must have lost half their effect.

For some time Rome was bounded by its seven hills and raised up its works on a confined scale. When its dominion increased, a predilection for the feat of empire still remained; and the arts, though generally introduced, were cramped in their exertions. The necessity of fortifying a city, of which the inhabitants were engaged in continual wars with the neighbouring powers, required that the streets should be narrow, as more easy to be defended, and as occupying a less space. Established plans are not readily altered; and the central part of Rome, for many ages, must have been restricted to its original dimensions, which were extremely confined, as one may judge from the ancient plan of Rome discovered on a pavement in the church of St. Cosmo and St. Damian; from the dimensions of the ancient forum; and from the breadth of the via sacra, a principal street of Rome, in which its religious processions were displayed, and in which Horace and other speculative loiterers strolled, Rome did not dilate into its open spaces till established prosperity excited confidence in the security of the capital.

Notwithstanding a sufficiency of Rome remains, to enable the traveller to trace the progress of its architecture from its perfection, in the time of Augustus, to its decay in the time of Constantine. No one

who views the remains of the marble city of the former emperor, but must heartily wish to have seen Rome in its splendour. In beholding the arch of the latter emperor loaded with the ornaments of a happier period, the decay of the arts must be much lamented.

The intelligent traveller, who dwells with improving meditation on the changes which the city has sustained, and on the moral causes that have effected them, feels considerable satisfaction in this wonderful place, and finds every object pregnant with instruction. The Colosseum, striking as a beautiful ruin, does not sufficiently arrest the attention, unless the spectator recollects not only the savage purposes to which it was generally applied, but that the altars, raised within its circumference, are consecrated to faints martyred there for a religion now triumphant. The temple of Peace becomes more interesting, if it is also recollected that in it were lodged the spoils brought from Jerusalem; that it was afterwards burnt, like the temple of which it received the treasures, and that its riches flowed in a molten stream through the streets of Rome. The arch of Titus will exhibit proofs of the accomplishment of the Hebrew prophecies, to him who considers the sculptured representations of the sacrificial vessels, the tables of the shew bread and of the law, and of the candlestick with the seven branches. Our piety will be awakened to instructive reflections, on remembering that Titus entered through this arch to close the gates of the temple of Peace, in auspicious testimony of an established concord emblematical of that peace which Christianity, abolishing the Jewish polity, should finally produce. The inscription on the arch of Constantine becomes really curious to the reader, who, in the expression of the emperor's having saved the republic "by an impulse of the divinity and the greatness of his own mind," discovers an allusion to the dream which historians represent to have preceded the victory over Maxentius: and in traversing the vast tract which was covered by the palace of Nero, it is satisfactory to recollect, with Orosius, that a building polluted by crimes, and from which Christianity was cruelly persecuted, was marked out as a monument of destruction by divine vengeance.

The church has had its periods of taste in the arts, and its periods of decay. Its temples, where the graceful dome is suspended, where the breathing statue and the living picture are shewn, are too often incumbered with rich materials and elaborate ornaments; its virgins dressed out in trumpery, and its altars covered with tinsel.

There is but little encouragement given to modern artists either by the pope or the Roman nobility, who are content with exhibiting the treasures of hereditary possession; and they, whose ancestors rewarded the labours of Michael Angelo, now scarce afford to pay an artist to copy portraits; and when they do, they chiefly encourage foreigners.

Our travellers made an excursion to Tivoli, to which they drove, over eight miles dreary waste of the Campania, a country once described, by Varro, as an orchard, and excelling all lands in fertility. The parts of it which are now thinly inhabited, are labourled by persons who repair to it for a season from Viterbo, Perugia, and other parts of Italy: the Roman territories being depopulated by castration, celibacy, and bad government. The few tenants of the district prefer the pure air of the mountains to that of the plains, rendered unwholesome by the noxious vapours which ascend from stagnant waters and a volcanic soil. The country about Rome is of a very volcanic nature. The scenery of Tivoli; the fine ruins of the villa of Mæcenas, of which the arches still display a great range of front covered now with vineyards; the cascades, some of which rush headlong from the rains to swell the Arno; the hills covered with olives, and the elegance and projecting swell of the Sybil's temple, hanging over the grotto of Neptune, both amuse and delight the mind.

The

They were conducted to the villa Estense, near the town where Hippolito of Este, cardinal of Ferrara, whom Ariosto dedicated his Orlando Furioso to, built up his tasteless and elaborate structure, gardens, terraces, grottos, and other artificial works in face of the bold and uncontrolled beauties of the neighbouring country.

Afterwards they visited, with less pleasure, Fiescati, where the modern Romans, as well as those of ancient times, pass a few of those weeks when it is most unhealthy to remain at Rome. The villas are lately, the gardens large and adorned with water-works, hydraulic organs, busts, statues, &c.

Departure from Rome—Veletri—Terracina—Fundi—Mola di Gaeta—From Capua to Naples—The Beauties of the Bay—Amusements, &c.—Departure from Naples—From Rome—Various Towns—Venice—Padua—Verona—Augsbourg, &c.—Arrival at Brussels—Conclusion.

HAVING left Rome they drove over other parts of the deserted Campania, rendered interesting by the extensive ruins of an aqueduct, and by the vestiges of a few buildings, and bounded on one side by the slopes of Fiescati prettily covered with houses. As they approached Veletri the country improved in cultivation. There was the appearance of vineyards, olive-trees, &c.

Veletri is by some supposed to have been the birth-place of Augustus. It was, certainly, sometimes the seat of the residence of the emperors; and the ruins of Otho's palace are still to be seen in the neighbourhood. As it is not above twenty or twenty-five miles from Rome, it was near enough to partake of the vicissitudes of the capital. It now contains about fifteen thousand inhabitants. It affords but indifferent accommodations to travellers.

The next morning after having passed through a country slightly variegated with cultivation, they entered on the Pontine marshes, and proceeded rapidly over a line road above seas, as extended and dreary as those of Lincolnshire, about six posts and a half to Terracina, of which the fine spiral rock, formerly called *Rea*, and a sea view opened, beautifully. It is a small town with a church built on the lofty summit, where stood, in ancient days, on the white rocks of Anxur, a temple of Jupiter. The neighbourhood of Terracina exhibits a beautiful display of the productions of the Italian climate.

Having entered the Neapolitan dominions, as they approached Fundi they were struck with the sight of an orchard of orange trees, the first that they had seen; for though these trees abound towards Nice, and in some sheltered and more mild spots of Italy, they are confined in the parts which they have hitherto visited. Those which they saw near Fundi were about the size of a large apple tree; they are clumpy, but somewhat too round and regular to produce a picturesque effect, notwithstanding the beauty of the golden fruit contrasted with the green of its leaves. There are very fine cork trees in the neighbourhood, which retain their beautiful sable green leaves, resembling those of the ilex during the winter months.

The inhabitants of Fundi have had a had character from the highest antiquity. Mola di Gaeta is a small fishing town, beautifully situated at the head of a delightful bay. The whole neighbourhood swarms with inhabitants, whom industry might clothe better, but who seem to prefer dirt and poverty with indolence, to wealth and happiness with labour.

From Mola di Gaeta, they had a charming ride the next morning, along a fine terrace covered with myrtles and olives, to Carigliano, where they passed the river Carigliano, the silent Liris of antiquity, and the boundary of ancient Latium, near which are the remains of an aqueduct that belonged to Minturnæ, and the plains where the Romans fought with the Tarentines, aided by Phyrus. The drive from thence, by St. Agade and Francolisi, to Capua, is less adorned by vegetation; it is, however, populous and fertile.

From Capua they had two posts to Naples, where they arrived as the evening closed, and drove down

the throng of the Strada di Toledo, lighted with candles at the stalls, placed on each side, as occasional shops of provisions, which, together with the lamps at the madonnas, and the flambeaux of a string of carriages, produced a gay effect of illumination.

They took up their abode at the hotel de Venice. The next morning, though the 29th of December, they breakfasted upon the platform of some leads which hang over the border of this beautiful bay, admitting, under a summer's sun, Vespasian, from the conical top of which issued a cloudy column of smoke; and around them the white and cheerful buildings that encircle the bay, the island of Capri, and the shore of Portici. Finding their lodging, however, inconvenient, they moved to Labotte's, a situation equally beautiful.

The beauties of the bay at Naples are numberless. The Tauro Farnese is a striking and admirable piece of sculpture, in which, on a single block of white marble, are represented Amphion and Zethus in the act of tying their step-mother to the horns of a wild bull in order to throw her therewith into the sea. His magnificent work, it is to be feared, may suffer from its exposure to the weather.

The port and the pier at Naples, are likewise very beautiful; but the general distribution of the city is not striking. The Neapolitan style of architecture is bad; some of the churches are grandiose, and extremely rich in ornaments; the pictures which they contain do not engage attention after those at Rome. It is the custom, on arrival at Naples, as it is also at Spa and other places, to send round cards to the principal strangers; an attention which, though it does not establish an acquaintance, facilitates intercourse.

There is an assemblage of foreigners from all parts, who meet at the houses of the different ambassadors; and also at the academy, for admission to which, it is necessary to be furnished with tickets by the ambassadors, and to be provided with a full dress. At this academy is a good concert, and cards, and princes and princesses in crowds. The Neapolitan nobles do not stand high in their general character. Extremely uneducated, and holding literature in contempt, the men have little but their good humour to recommend them. Their evenings are generally spent at cards, or at an insipid opera; and they have not those common sources of information, which, in other countries, are opened in newspapers and dramatic entertainments.

The public amusements at Naples are various and splendid. The opera-house, its decorations and performers are in a superior style. The inferior theatres are tolerably supported, but little frequented.

The English are often invited to be spectators of the hunting-matches, at which his majesty slaughters hundreds of boars, which being preserved in his woods, and fattened on the husks of grapes, on mottles, truffles, and chestnuts, furnish admirable food, and of a flavour infinitely superior to that of any pork. Some of these boars are preserved in the crater of the extinguished volcano at Allrume, which is six miles in circumference, and of which the lava

is covered with woods, as was that of Vesuvius before the eruption in 1631. It is no uncommon circumstance for his majesty's party to butcher many hundreds of these boars in a few days. Naples is filled with pork, and the stalls in every street are covered with its brawny rolls. The king is a favourite with his people: but his dominions are badly governed: they abound with people insufficiently employed. No measures are adopted to suppress their crimes by a rigorous administration of justice: and as poverty is very general, notwithstanding the fertility of the country, it is unsafe to travel in Calabria, or, indeed, any where but in the public roads. At Naples the use of the *filletto* has been as common as in the other parts of Italy.

Naples and its environs are not only superior to Rome and its vicinity in the beauties of nature, but almost rival them, in the opinion of the general traveller, in point of local interest, and in antiquities, at least as to their present appearance. On every side of this delightful city there is much to awaken the recollection of former times: if we proceed through the wonderful passage of Paullippo, and skirt the shores of Baizæ, we trace the vestiges of Roman temples, the ruins of villas of Pompey, Cæsar, Cicero, Lucullus, Lentulus, and many other distinguished men, now covered in part by the transparent waves of the bay. In the neighbourhood are the still more ancient ruins of Cumæ: the cave, where the virgin Sybil uttered her oracles; the fragments of the temple dedicated to Apollo by Dædalus; the arch of Aqua Felice, a portal of Cumæ, and part of a well constructed aqueduct. Near these are the scenes of Virgil's Elysium with all its distinctive scenery and circumstances; the remains of Nero's temple, ventilated by the ingenious tyrant as if with design to prolong the sufferings of the wretched objects of his vengeance; the coliseum, and the piscina mirabilis, a reservoir which was constructed to hold supplies of water sufficient for the fleets at Misenum, or the luxuries of Baizæ. Not far from these are the Campi Plegrei, the Leucogaia enclosed by projecting brows of hills which has continued to smoke from the time of Strabo, scalded to whiteness by the corroding vapour; and the mole, or the reputed remains of Caligula's mad attempt. The whole circumference to the horizon is marked with classical and distinguished objects; and we may contemplate at the same time, with different but interesting sensations, the town of Puzzuoli, decayed since the age of Cicero from a second Rome, in which St. Paul preached, on his arrival from Rhegium, to a small fishing town, and the islands where Julia and the wife and sister of Commodus were banished, and where Tiberius rioted in beastly sensuality.

If the places or ruins yet alluded to are not to be put in competition with the vestiges of antiquity on the Roman territory, let the traveller drive in a different direction to Pompeii, over plains laid desolate by Lava, to the site of a town more than once destroyed by the eruptions of the mountain, as appears from the foundations and various laminae on which they were laid. Nothing can be more interesting than the remains of a place preserved ages after those of contemporary cities, by the very destruction which threatened prematurely to annihilate its every trace.

At the first slight descent at the entrance, may be seen the soldier's quarters, with the names of some ancient Romans, inscribed above seventeen centuries ago, on the walls; the platform and proscenium of two theatres; some rooms of a private house, with a human skull that once was animated with the features of Roman genius; the impression of a foot sunk in yielding lava; the perfect form of the temple of Isis, built of stuccoed brick; its columns, its altars; the cænabulum of the priests, in which the bones of some fish were found; the slaughter-house with the bill existing ring to which the generous and struggling victim was tied, and the canal by which the blood was conducted away.

90.

If ascending by the Appian way, the traveller proceeds across the vineyard to a suburb of the town, he may behold two narrow streets, each about ten feet wide entirely cleared; he will have a perspective view of both at the same time diverging obliquely from a fountain at a sharp angle. He will see the rows of houses on each side unroofed, indeed, and with walls disjunctured, and presenting the appearance of buildings half destroyed and cleared away after a The pavement, the narrow trottoir, and channels worn by the wheels, still perfect. The houses, excepting one distinguished by its colonade and double stair-case, are very small, and generally built with a portico enclosing a court, into which fountains were usually introduced. The apartments, particularly those of the furgos house, where there are chirographical instruments and manuscript rolls, as also those supposed to have belonged to the vestals, are painted with figures, many of which have been removed, but a few still remain and look beautiful, when their colours are freshened by water thrown upon them. In some rooms are the remains of Mosaic pavement. The walls of the sepulchre at the outside of the city, are sculptured with ancient masks.

Some ruins in the neighbourhood exhibit a specimen of an ancient villa with the whole plan of the house, its out-houses, and its garden, which is about, perhaps, half an acre, and divided into compartments, in one of which was a pond. The walls of the rooms retain some delicate painting. The cellars still contain Amphoræ, with wine, incrusted by ashes to a solid substance. In the cellars of this villa the skeletons of some unhappy sufferers were found, who had fled there for shelter from the shower of ashes which buried the district.

At Herculaneum the remains of a theatre still may be seen, with its seats, its orchestra, and several departments, all much more below the surface of the ground than are the ruins of Pompeii.

In one museum at Portici is collected almost all the furniture, useful and ornamental, of a Roman house. The lectisternia, the sideboard, the culinary utensils, and even the eatables are preserved. The weights and scales and steelyards are scarce excelled by modern improvements. The caldaria with heaters first suggested the idea of tea-urns. The implements of agriculture, which resemble those used in our own time, prove that the necessity always operates by the most simple contrivances and suggests nearly the same means. The tops, and different representations of ancient amusements, prove the antiquity of many games. The toilet and its furniture unfold the decorations of female taste. The chirographical instruments, here are not sufficient in number to illustrate much of the state of surgery at the time when they were used. Among the musical instruments is an uncommon trumpet, which is supposed to be the ancient clangor tubarum.

Naples is visited not merely for the remains of antiquity; nature no where exhibits more wonderful and extraordinary features. Vesuvius, since our travellers were in its neighbourhood, only rolled out a volume of smoke, sometimes lightly and gracefully discharged, sometimes with heavy and lowering ebullition clinging to the sides. During their stay here they never once saw the conflagration of a flame, though the mountain has been often thought to threaten. Having mounted on mules at Portici, with impatience to visit the Crater, they rode about four miles, to the lava at the base, part of which is covered with chestnuts, and vineyards, from which the Lacryma Christi and Muscadell are made. Quitting their mules at the convent, they toiled over a continuation of large and caked ashes of lava, and above them ascended by loose and yielding sand, often treading on latent fire, of which they were sensible from the burning heat which scorched their feet and turned the colour of their shoes; and the excesses of which were avoided only by the skill of the guides, who carefully tried and examined the

10 B

appear

NAPLES.

appearances of the lava, lest it should burst into a sudden flame. When, after much fatigue, though without being obliged to run over the incrustation of the lava, they reached the verge of the crater, and drank their friends health in some English porter. The perpendicular height is every year increased. It is eleven thousand fathoms above the surface of the sea; and the crater gradually converges towards the top. As they looked into it, when the wind blew in the opposite direction, they saw the white sloping sides of ashes, and a projecting tower, as it were, ready to fall into the chasm. The mountain groaned under their feet, and threw up threatening volumes of smoke glowing with a tinge of fire, and, sometimes, almost bursting into a flame. As they crept down, some of the guides endeavoured to work on their minds, and to engage them to promise additional rewards if they conducted them safely. These guides deem themselves secure as they are guarded by charms, some of them being marked with a cross of St. Anthony, the patron of Italy, a guardian against fire.

The weather at Naples is sometimes dreadfully oppressive: at other times remarkably fine. Every nobleman in Calabria has a wooden house to resort to in case of an alarm of an earthquake. One might fear also without great imputation of timidity, the effects of subterranean fires, a burst of which, in 1538, dried a lake not far from Naples, and threw up, in one night, a mountain three miles in circumference and one hundred feet high. But these are rare calamities, and the vegetation is wonderful. Italy formerly produced eighty sorts of wine, more than two thirds of which were the production of the soil: and our travellers had green peas in January.

The palace at Caserta is still, what its name imports, a dreary house, in a flat country, in the plain of ancient Capua. It contains views of all the Italian ports, by Hacket, and some spacious rooms, some of which are finished and furnished with splendid decorations. The stair-case, and chapel, and theatre, are very handsome. The gardens are stiff and disposed with childish ornaments. The town, and houses of the nobility are wretched.

Having left Naples they arrived again at Rome February 1, and departed from thence February 15, driving through a flat desolate country, about four posts, by Civita Castellana, to Borgetto, where the appearance of population began to improve. They crossed the Tiber at Ponte Felice, and travelling over a more varied country passed Otricoli, situated amidst romantic scenes, and thence mounted, by a doubtful ascent, to Narni, which is eight or nine posts from Rome, and surrounded by tremendous cliffs and rocks, of which the moonlight did not suffer them fully to discern the beauty. Though it was late, they did not stop to see if it corresponded with its former character, for elegant accommodations, or to examine the birth-place of Tacitus, or the reputed bridge of Augustus, and the Æolian hills of Cæsis in the neighbourhood, but fatiated with antiquities proceeded on to Terni.

The next morning they walked through a beautiful and well wooded country, by a gradual ascent, about four miles, to the Cascata della Marniore, to which there is a road which was cut through the rock to facilitate the passage of the emperor Joseph when he visited the cascade, so well known and so deserving of admiration.

From Terni to Stretura they admired the hills richly covered with evergreens and the valleys, which, in the time of Pliny, were mowed four times a year, and still retain their reputation for fertility. These beauties, however, gradually disappeared as they approached Spoleto, and ascended the Somma, one of the Appenines. They slept at Spoleto, a town famous for having repulsed the troops of Hannibal, flushed with their victory at Trasimene, from a gate which still exists, and is, besides, rendered worthy of attention by a fine aqueduct.

The next day they drove through a cheerful olive country, by le Vene to Foligno, through the vale of Umbria, along which the Clitumnus freshens the air.

The people still believe that the breed of white cattle, which pasture on the banks of this river, and spread themselves, indeed, over all Italy, derive their whiteness from its waters. Foligno is a large well situated town, famous in the records of modern history, for its confessionary. On the night which had preceded the day of their arrival, it experienced a slight concussion, an expiring throe of the earthquake which produced such considerable effects in October last, and which has so frequently continued its movements, since that time, that the observance of the carnival there has been interdicted.

The ascent of an high mountain, scattered over with poor villages, brought our travellers to Serravalle. The country improved as they approached Ponte le Trave, and its scenery changed again to the wildness of Savoy, as they drew near to Valcimara. They slept at Tolentino. The land of this neighbourhood is highly capable of benefiting by the industry of its inhabitants, who, after having sufficiently laboured on it, repair to the environs of Rome to cultivate the plains of Campania. The town affords a small opera-house. The next day a ride through a pleasing country, swelling into gentle declivities, led them, by Macerata and Sambuchetto, to Loreto. They were here permitted, as strangers, to be present, in the evening, at a private theatre. The public opera-house was suppressed about twelve years ago, upon the pope's observing that it faced the church.

The next day they had two stages through a populous and prosperous country to Ancona. They were pleased with the improving neatness of the town, which has flourished since it was declared a free port by Clement XII. The mole, the port, the triumphal arch of Trajan, the cheerfulness of commerce, and the indications of successful industry, render the town very interesting. In the evening they were present at a masked ball, which, however, was not more enlivened by character than those are in England. It commenced with a lottery, the effects of which, though they may intoxicate a few, must produce a general depression of spirits little favourable to the spirit of the entertainment.

Their next day's route lay by Cafe Brugiate and Senigaglia, the last of which is a large and flourishing town, and has a cathedral embellished by the present pope, of whose munificent piety there are many proofs in Italy. Passing thence through a flat country, by Marotto and Fano, they arrived in the evening and slept at Pesaro, the ancient town of which was swallowed up, a little before the battle of Actium, by an opening of the earth: it is now a distinguished place of resort for Italian merchants.

The next morning they renewed their journey, and drove over a dreary flat, by Catholica, to Rimini, a handsome but irregular town, decorated with the ornament of a fine old arch. Passing thence through Savignano they arrived at Casena, a Bologna in miniature, just at the conclusion of a tournament, which is annually kept up there. Continuing their course afterwards through Faenza, they slept at Faenza, where, at the opera, they were regaled with the sight of female dancers.

The succeeding day brought them by Imola and St. Nicholo, to Bologna. Having visited this city before, they staid but one day, and on the following morning travelled by a very bad road to St. Georgio, and thence by a still worse to Cento, a small neat town.

The roads the next day, for a post and a half, to St. George, and afterwards for the same distance, to Ferrara, were so execrably bad, that they were obliged to have eight oxen to their chaise, and eight horses to that of their friends, with whom they had joined party, and notwithstanding this, they were detained for nine hours in a deep clay and stiff mud,

through

through which, the persevering efforts of the poor animals could, with difficulty, drag the straining carriages, before they could accomplish the two posts and a half.

Ferrara has the appearance of decay. It retains, as vestiges of its former grandeur, the palace of the princes of the house of Este, built in a bad style of architecture; an ancient cathedral, a strong citadel, and spacious streets. Ariollo's monument is shewn at the Benedictine convent.

Our travellers felt at Ferrara, very seriously, the effects of a transition from the mild air of Naples to the severity of a northern latitude, and regretted that they had occasion to quit the southern parts of Italy so early in the year.

On leaving Ferrara, they proceeded four miles by land, to Ponte di Lago, where they embarked in a very commodious vessel large enough to receive both their carriages, and floated down the stream of the Po, which has here a noble breadth. They dined, and slept on board in some tolerable beds that their courier made up; and next morning they entered the Taglio, and were towed along the canal by the side of dreary Lagune, spread out half water and half mud. They left the carriages at Fusina, and entering the open Lagune had a fine view of Venice.

They glided through rows of handsome palaces lining each side of the great canal, and were landed at Petrillo's door, near the Rialto, of which, the beautiful arch is blest with the effect of shops and houses built upon it.

The Venetians, to whom they had letters, treated them with much attention, and an hospitality more liberal than that of Rome or Naples. They give splendid entertainments, though their private tables are served with great economy. They live in handsome palaces, many of them built from the designs of Palladio and other famous architects.

Of the gaiety and splendour of the carnival they saw but little. The rage for its extravagance seems to have expired in the feeble efforts of a few grotesque figures and some insipid masks. The baout is, however, convenient, and serves as an apology for the want of dress. One of our travellers was in it at the phil-harmonic society, a casino or assembly, of which, only the first ranks are members, and where a full dress is usually worn. The theatres at Venice are abundantly crowded, and during the carnival, especially, well supplied.

The Venetian society is really pleasant. The women, who are pretty, though they have bad figures, are devoutly inclined to the tender passion. Our travellers were invited to exceeding good private concerts: seven public theatres are open every night in this joyous city; and the Furor Dramaticus has run so high that another is just built.

The Doge has only the exterior of royalty, and few privileges but that of divesting himself of his official dignities, and sometimes appearing as a private man in the evening. He has a revenue of about 20000. and nominates the dean and canons of St. Mark. His sons and brothers, however, are disqualified, by their affinity to him, from holding any civil office, or from being employed in any public department, domestic or foreign; and he is not allowed himself, to form a connection with any foreign prince without the consent of council. He is subjected to the troublesome and scrutinizing authority of the inquisition, who have the keys of his palace and can search it at pleasure, being accountable for their conduct only to the council of ten. Every member of the state, indeed, it is well known, is amenable before these vigilant and jealous magistrates, to whose tremendous power the government is supposed to be indebted for its security; and may be conducted out of a palace, to a prison over the Ponte di Sospiri, or thrown into the Canal Orphano, without any regular trial or known sentence.

Titles of nobility have been sold at Venice upon great emergencies; but the nobles gradually decreas-

into a small aristocracy: all are employed in some department of state. The podestas, who have the civil presidencies of towns; and the captains, who have the military power, are not allowed salaries sufficient for the state which they maintain, and make up the deficiency by oppression and corrupt administration. The execution, however, of criminal justice is, generally, equitable, though strict; and the people are kept in good order, and not extravagantly taxed. The commerce of the country, however decayed from its former extent, still flourishes. Its glass manufactories are famous; but the plate glass is not by any means so large as that of France, nor so good as that of England.

The arsenal still exhibits a grand display of naval stores, and affords employment for its three thousand men, which is above double the number usually employed at Plymouth. The men receive from a paul and a half to eight pauls per day. The oylers within the arsenal, which fatten on the bitumen and exudation of the wood in the docks and canals here, are in high and deserved estimation, for their size and quality, with the Venetian epicures.

The nobles of Venice are, perhaps, more intelligent than those of any other parts of Italy, being early called out to the exertion of their talents in public departments. The lower classes of the people are, however, but little intrusted even on the most important subjects. The clergy being on the world of all establishments, that of election, is necessarily degraded in its character. Persons of respectable family, and liberal talents, shrink from a profession where subsistence must be obtained by a popular canvass, and authority depends on the caprice of the parish which is to be directed. The higher ranks are, indeed, virtually restrained from taking up the profession, since a noble, who enters into the sacred function, forfeits his hereditary vote in the council. If he obtains a cardinal's cap his whole kindred must withdraw from all interference with public affairs: and should he even attain the pre-eminent dignity of patriarch, he will have no power or jurisdiction even over the church of St. Mark,—ecclesiastics being suspiciously excluded from all authority.

They left Venice March 27, in a borchetta, and taking in their carriages at Fusina, were towed by horses along the Brenta to Padua, where they arrived in the evening. This river is confined by banks somewhat formal.

The post, which they resumed at Padua, conveyed them two stages over a bad road, and through a flat country to Vicenza. As they were travelling northwards they shivered, on observing that the distant mountains, towards which they advanced, were covered with snow.

Verona, which is about three posts and a half from Vicenza, contains many things worthy of attention.

The next morning, they saw the country gradually impoverish, as they approached Volarni. From thence to Beri, the beautiful river Adige accompanied them, washing, in its gentle course, the brown and pelished base of some picturesque rocks which re-echoed every found that disturbed the tranquil solitude of the country. At Beri they tasted an excellent white wine made in the neighbourhood, called Vino Santo, in strong expression of the estimation in which it is held. At Borghetto, before their arrival at Ala, they quitted the Venetian territories, and were allowed to import all their property unmolested, except their money, into the Tyrol; the first entrance to which, as they approached Roveredo, opened to them a rude country covered with heaps of rocks, wilder and more fantastic in their forms than those of Savoy, and intermingled with tracts cultivated and populous.

A road through an open valley, bounded by bold hills, conducted them through Befeno to Trent. They proceeded the next day by Brenner and Steinach and Schonberg to Innsbruck, where they sometimes walked a stage, faster than the horses would

drag the carriages. They were struck with the grand scenery of the country.

Inpruck is finely situated on the Inn. They passed the river the succeeding morning, and toiled the whole day up steep hills, or cautiously descended down frozen roads. They travelled the last stage, to Reita, by the pale light of the moon, which magnified the appearance of the mountains and reflected its beams on dark forests of fir, rising in beautiful contrast above extended walks of snow. At the edge of these forests their servant saw two prowling wolves, in spite of which, however, and in spite of many a fearful precipice, they arrived, about midnight, at a good inn at Reita.

At Reita they understood that the nearest road would lead them through Bavaria, but a passport could not be obtained without delay; they therefore continued their course over the plains of Suabia, diversified with fine plantations of fir and parkish scenery; and after a tedious lingering drive, arrived long after midnight, at Augbourg.

Augbourg has the spacious streets and bold character of a town that once flourished considerably. Its buildings are of a better character than those of contemporary cities; and the simple front of the town-house has been very much and very justly admired.

No remarkable town intervened to detain them between Augbourg and Ulm, which are distant four posts and a half from each other. They continued their journey by Weferfeuten, Geßlingen, Gappingen, and Blockingen, five posts to Stuttgart, the capital of the duke of Wirtemberg's dominions, which are bounded by the Alps and the Black Forest, and contains about twenty thousand inhabitants.

They left the town next day and pursued their course over a trackless road, to Mannheim, which is but a few miles from Heidelberg. Having visited Bingen, they proceeded by Lauterthal to Simerio, where they slept.

Early the next morning they reached Treves, slept that day at Gravenmaker, and the next day by dinner at Luxembourg; they then drove by Steinfort to Atorny, where they slept.

The next day they were shaken over very bad roads by Malmaison to Flamfoul, and thence through dreary and almost unpeopled wilds, on which, however, much cattle is bred; by Grinshelm to Marche, where they slept, and the next day proceeded over level uninteresting plains to Namur. They arrived at Brussels March 27, and thence proceeded with all speed to England.

DIRECTIONS TO THE BINDER.

The Work to be placed according to the Order of Publication, viz. The preceding Part, including the most Important Modern VOYAGES to various Parts of the Globe, printed in a Set of Alphabets, distinguished by Stars; and the latter Part containing other Voyages of Importance, and the most recent TRAVELS to different Parts of the World, printed in a second Set of Alphabets without Stars.

N. B. The STAR'D Figures imply those Pages (as for ex. 234) which precede the Voyages and Travels of COOK, DRAKE, ANSON, BYRON, WALLIS, CAVARAT, MULGRAVE, BAUCS, HONORS, PATTERSON, NISIBUNI, BRUNOT, LA MACARTNEY, LADY WALLACE, &c.

No. FRONTISPIECE to face the TITLE-PAGE. 1

1 A new whole Sheet general Chart of the World. 29
