The Value Added Content of Canada's Exports A Brief Analysis

Introduction

The purpose of this paper is to demonstrate the usefulness to policy makers of the data obtained in the appended study. The results are equally applicable to an examination of the success of Canada's trade policy, or to an examination of a specific bilateral relationship. Rather than attempt to be comprehensive this paper is intended solely to highlight the major patterns of Canadian exports. Any more specific inquiry is best answered through an examination of the study itself.

The World

During the ten year period from 1971 to 1980 Canada's exports increased from a value of over \$17 billion to one of over \$74 billion. The crude growth rate inferred from this change must, however, be adjusted to account for the fact that inflation and currency fluctuations distort any such longitudinal study. Subtracting for these distortions lowers the increase to 146%. While this figure is substantially lower than the first estimate it still shows a healthy rate of growth over the ten year period. This represents a real annual growth rate of over 10%. Nonetheless, it seems that Canada's export growth rate has not been as great as that of many of the other developed nations. Closer examination of the situation yields additional cause for concern. While in current dollars the last three years have seen the decade's largest percentage increases in exports, with annual increases exceeding 20%, in constant dollars one finds the pattern reversed. constant dollars there is less than a 2% difference between export levels in 1978, 1979, and 1980 and there is a net decrease from 1979 to 1980. This indicates that the volume of exports has not increased. Thus, while Canada is benefitting by the increases in the prices of the goods we export, there is some cause for concern in the stalled level of exports evident over the last 3 years.

Having examined the total value and volume figures it is worth focussing upon the mix of goods which Canada exports. For the purposes of this paper, the categories referred to in the study as crude, fabricated, and processed, will be referred to as unprocessed (or raw), semi-processed, and processed.

In 1980, 28.2% of Canada's exports were in raw form, 40.6% were semi-processed, and 31.2% were processed. In comparison with 1971 (27.1% raw, 34.7% semi-processed,

38.2% processed) one sees a contraction of the percentage of goods exported in processed form, and an almost equal expansion of the percentage of goods exported in semi-processed form. It should be borne in mind, however, that a decrease in percentage does not always indicate a decrease in the absolute volume of exports. In this case, all three categories expanded by more than 250% over the decade, but because the rate of growth of the processed exports was smaller than that of the other exports, processed goods came to make up a smaller share of Canada's total exports.

Since inflation has become a significant force it is essential to separate its effects from those attributable strictly to an increase in the volume of goods exported. Inflation can be viewed as the sum of price increases. It is necessary, therefore, to deflate the three categories of exports at different rates, each of which reflect price increases in the particular category. Examining the difference produced by using constant dollars to eliminate the effects of inflation, is startling. In current dollars one notes that raw materials constituted a greater proportion of our total exports in 1980 than in 1971. This seems to show that Canada's attempts to increase the value added content of our exports, and decrease our raw material exports, have failed. Constant dollars present a contrasting picture. Not only has there been a decline over the last decade in the proportion of Canada's exports shipped in raw form, from 27.1% to 18.5% there has been an actual decrease in the value (in constant dollars) of raw exports, from \$4.72 billion to \$4.70 billion (see Appendix G). In addition, one notes that unlike the results using current dollars, those using constant dollars show no rise after the oil crisis. Thus, one can see that the rise was attributable not to the increased level of raw exports relative to processed ones, but to the high increases in the price level of raw exports relative to those of processed goods.

There are indications that the Canadian export picture is improving and will continue to do so. Even in constant dollars total exports have increased by approximately 50% over the decade. Most of this change is accounted for by increases in the constant value of processed goods. Processed goods accounted for almost 50% of total exports in the late seventies. This increase from less than 40% in 1971 indicates that Canada has managed to alter the pattern of our exports to favour those with higher degrees of processing. In summary, the value of Canada's exports has increased dramatically in all stages of fabrication, but increased raw materials prices seem to have compensated for

the decreasing volume of their export in increasing their proportion of total exports. This fact merits consideration in any deliberations concerning the value added content of Canada's exports, for it indicates that success in further processing exports can be overshadowed by the increase in the price of Canada's raw materials. This in turn calls into question the notion of "success" in increasing value added content.

Country Groupings

The EEC:

The EEC is Canada's second most important export destination after the USA. In 1980 Canada shipped \$9.6 billion worth of goods to the EEC, accounting for 12.9% of our total exports. While export levels to the EEC were fairly constant through the mid-70's, they almost doubled over the last three years of the decade. Nonetheless, exports to the EEC as a percentage of total Canadian exports have been declining throughout the decade. Although this was reversed in 1980, the change can largely be attributed to the significant drop in the US share.

In examining the makeup of Canadian exports to the EEC in 1980, it becomes evident that the percentage of exports shipped in processed form is quite low, the percentage shipped in raw form is quite high, and the percentage shipped in semi-processed form is also quite high. same time, while over 14% of Canada's total exports in the raw and semi-processed categories are sent to the EEC, only 6.8% of Canada's processed exports are destined for the EEC Nonetheless, the EEC accounts for a greater percent of Canadian exports in all categories, including raw materials, than does Japan, the second most important nation This is especially true of in terms of Canadian exports. semi-processed goods in which the EEC shows particular strength. Over 50% of the EEC's Canadian imports are purchased in semi-processed form.

The static 1980 situation does not, however, yield insight into the dynamics of a rapidly changing situation. Although the static picture is one favouring Canada's least processed exports, tracing trade patterns back over the decade reveals significant progress. In 1971 exports of raw goods accounted for over 45% of the EEC's imports from Canada, and these accounted for 24.3% of Canada's total raw material exports. In 1980 the corresponding figures had dropped to 31.9% and 14.6% respectively. There was a simultaneous improvement in our exports of processed goods. The

EEC increased the percentage of Canadian imports which it purchased in processed form from 11.4% to 16.4%, and this accounted for a 50% increase in the percent of total Canadian processed exports which were shipped to the EEC. Although semi-processed goods also became a larger component of total EEC imports, the EEC's share of total Canadian semi-processed exports declined. Thus, while improvement in the value added content of exports to the EEC occurred over the decade, even the 306.5% increase in the level of processed exports was not sufficient to greatly improve the EEC's overall position.

The Newly Industrialized Countries (NICs) and ASEAN nations:

The NICs have become increasingly important markets for Canada over the last decade. The NICs import more Canadian goods than Japan, with imports totalling \$5.7 billion in 1980. The NICs perform even more impressively in the processed category. Not only do they import more Canadian processed goods than Japan, they even import slightly more than the EEC. Furthermore, the pattern of NIC imports is one of strong steady growth. Somewhat surprisingly, however, the NIC's imports are not biased towards processed goods. The NICs import a lower percentage of their imports in processed form, and a higher percentage in raw form, than does the USA. Thus, although the NICs are an increasingly important market for Canadian exports, it is not correct to assume that because they are developing countries they will import processed goods, and our value added problem will solve itself. The evidence is that Canada will have to carefuly monitor our exports to the NICs in an attempt to take the greatest advantage of developing opportunities.

The ASEAN countries have been noted to be greatly expanding, and could therefore be considered promising potential markets. This is most evident in the area of semi-processed goods in which imports from Canada have grown by almost 1800% over the last decade. They presently import 1.6% of Canada's semi-processed exports which would, were they a country, make them our 9th most valuable importer of semi-processed goods. The ASEAN nations import 62.0% of their Canadian goods in semi-processed form and 25.3% in processed form. Although their processed imports constitute only one quarter of their total imports, the value of the ASEAN nations' processed imports would be sufficient to rank them 9th as a Canadian export market. In raw material imports they would rank 21st. The strength of the ASEAN nations in the processed and semi-processed categories would be sufficient to rank them 12th overall. Thus, although

only one ASEAN nation appears in the list of Canada's top twenty five export markets for goods in any stage of fabrication, collectively they constitute a valuable export market. Moreover, the growth rate of their import levels signals great potential which should be examined and, if possible, taken advantage of.

Countries

The United States:

The United States is Canada's largest export market for products in all stages of fabrication. The United States purchases more than 10 times the amount of Canadian goods as does our second largest single trading partner (Japan). Even with the slump in exports in 1980 (which resulted from problems with the automotive sector), the US absorbed \$46.8 billion worth of exports, or 63.1% of Canada's total exports. Over the last decade total exports to the USA have increased by 291%. Discounting for inflation one finds that the real increase is a more modest 39%. Nonetheless, it is important to recognize that while increasing sales from \$1 million to \$4 million represents a 400% increase, it is much more difficult to increase an \$11 billion sales level by a four fold margin. Consequently, a 39% level of real growth, in the case of the US, can still be seen as adequate if not outstanding.

In examining our trade with the U.S. one can detect the same pattern as was noted in world trade. When performing calculations using current dollar figures, the proportion of U.S. imports in the raw and semi-processed categories is seen to increase, while the proportion in the processed category is seen to fall from 48.7% to 37.8%. When considering constant dollars, however, the reverse appears to be true. Processed imports increase to 55.8% of total imports, semi-processed imports remain constant and raw imports gradually decline to 8.8% of total imports. Whichever figures one accepts, it is clear that the United States provides one of the best profiles in value added terms of any importer of Canadian goods (see Appendices B, D, E & F). None of Canada's nine other top ten export destinations imports more than 30% of its goods in processed form, and other than W. Germany none even imports more than 20%. In addition, none of them imports a lower percentage of its total exports in raw form. In value added terms the U.S. does significantly better than any of Canada's other major trading partners.

Another point worth noting is that Canada's dependence on the USA market increases as the degree of

processing of our exports increases. Thus, the U.S.A. imports 48% of Canada's exports of raw materials, 63% of our semi-processed exports, and 76% of our processed exports. Looked at positively, this indicates that Canada has managed to increase the value of her processed exports to the country that has been most receptive to them. Examined negatively this trend describes a sizeable dependency. Nevertheless, Canada has begun to diversify her markets in all stages of fabrication but that of unprocessed goods, and it can be argued that while raw exports are a sign of our reliance on the US market, they are also a sign of American reliance on Canadian sources.

Japan:

Japan is the nation which imports the second highest value of Canadian goods. In 1980 Japan imported \$4.4 billion worth of Canadian products, which amounted to 5.9% of Canada's total exports. Of our major trading partners Japan has shown the most growth in all categories over the previous decade. In that period Japan surpassed the U.K. as Canada's second most important single export market. While Japan was our fastest growing major market it continued to purchase largely unprocessed goods, and practically ignored processed Canadian exports.

Japan presents a pattern of trade which is diametrically opposed to that of the USA. As the degree of processing of Canadian exports increases, the percentage of the total which Japan imports decreases. In 1980 Japan imported 12.6% of Canada's unprocessed exports, 5.4% of Canada's semi-processed exports, and 0.5% of Canada's processed exports. Even in terms of Japanese imports alone, processed goods were unimportant. Japan imported 60.2% of her Canadian imports in raw form, 37.2% in semi-processed form, and 2.6% in processed form (see Appendix B). Thus, the Japanese case illustrates a failure of the Canadian value added efforts. Although one would expect Japan to import a great deal of raw materials, the degree to which the Japanese market is closed to Canadian processed goods, and therefore to which our policy has failed in our relations with Japan, is surprising.

European countries:

The UK and W. Germany are Canada's third and fourth most important export markets. Although the tendency is to believe the fifth to be France, both the USSR and the Netherlands are more important to Canada. The Netherlands imports approximately 45% more Canadian goods than does France although this difference can be partially accounted

for by transshipments through ports in the Netherlands. W. Germany imports 29% of its Canadian goods in processed form and as such is the only European nation, important as an export market, which imports a high percent of Canadian products in their final form. Ireland does import over 50% of its goods in processed form but this amounts to only 0.3% of Canada's total output. Italy, at the other extreme, imported only 9% of its Canadian goods in processed form but that amounted to 0.4% of our shipments. In addition, the percent of Italian imports in processed form has risen steadily through the decade from a low of 5.8% in 1971. unexpectedly, the USSR has the worst record of any European nation in terms of the Canadian value added content of its imports. The USSR imports 87.3% of its Canadian imports in raw form making it the third largest importer of unprocessed Canadian products. The USSR accounts for less than 1.0% of Canadian goods with any degree of processing. France lies between the two extremes importing the bulk of her imports, in semi-processed form (58.6%). Relative to other nations, France's most important imports are also semi-processed, and are of sufficient volume to make her our 6th largest market for semi-processed exports. One can see from these few comparisons alone that there is a wide disparity between the positions of the various countries in Europe. performance of some markets, such as the Netherlands and Belgium, is somewhat surprising when compared to those of larger, more traditional trading partners such as France and Italy. Whatever the reason for this situation, it seems clear that policymakers should make a greater effort to examine the siutation in countries of specific interest to them, rather than accept generalized notions that may, with the passing of time, have become quite inaccurate.

Other Countries

Australia:

Although Australia's importance, relative to other Canadian export markets, has declined over the previous decade, it continues to be a more important market than generally recognized. Australia is Canada's twelfth largest overall market and its importance increases with the degree of processing put into Canadian exports. Australia is our 5th largest market for processed goods, 9th largest for semi-processed goods, but only 19th for unprocessed goods. This translates into 14.9% of Australian imports being unprocessed, 46% being semi-processed, and 39.1% being This breakdown will be remembered to be slightly processed. better than that of the USA. Thus, in value added terms, Australia is one of Canada's most valuable markets. It should, however, be noted that because of the concentration of Canadian trade elsewhere, total exports to Australia (our 12th largest market) equal only 0.895% of our total

exports. The situation is even more glaring in the area of processed goods in which importing just over 1.0% of our processed exports qualified Australia as our 5th largest market. This result is useful in considering the potential effectiveness of Canada's attempt to exploit the "Third Option".

Venezuela, Mexico, S. Korea and Brazil:

Venezuela and Mexico present export profiles which mirror the general notion of what a NIC's profile looks like. Exports to Venezuela are highly concentrated in the processed category (75.5% of exports to Venezuela) in which it is second only to the U.S.A. in importance as an export market. Venezuela's importance drops off sharply in the other stages (16th in semi-processed, 56th in raw materials) but her strength in processed imports makes her our 13th most important market overall. Venezuela's most impressive attribute is her rate of growth. Over the past decade her processed imports have increased by 568% (unadjusted). Nonetheless, even as Canada's second most important market for processed goods, she only accounts for just over 2% of Canada's exports. This indicates that although Canada's exports are concentrated in the USA, the 24% left over is fairly well distributed among the remaining nations. Mexico presents roughly the same pattern as Venezuela although Mexico's performance is somewhat less impressive in the area of processed goods, and more impressive in the other two areas. The growth of trade with Mexico has not been nearly as great as that with Venezuela, although it has increased very impressively over the last two years.

S. Korea is atypical in that its most valuable area, as a market, is that of semi-processed goods. Fifty eight percent of Korea's Canadian imports are semi-processed, and these make it our 10th most important market for goods in that stage of fabrication. Only 14.9% of S. Korea's Canadian imports are in processed form. Consequently it begins to be evident, that the generalization that most NIC imports are processed, is not universally The example of Brazil reinforces this applicable. Brazil's imports are heavily concentrated in conclusion. the area of raw materials (57.1%). Brazil is Canada's 7th most valuable market for raw materials, 12th for semi-processed goods, and 15th for processed goods. 11.8% of Brazil's total imports were in processed form, and the growth rate of these imports was less than half that of the phenominal 1666% increase demonstrated in the unprocessed category over the last decade. The examples of Venezuela, Mexico, S. Korea, and Brazil demonstrate that in the area of exports NICs are often less alike than is assumed, and that policy makers would do well to examine the individual characteristics of the trade patterns they are considering.

Saudi Arabia and China:

Saudi Arabia and China present examples of nations whose imports are concentrated almost entirely in one stage of fabrication. China is Canada's fifth largest export market for raw materials, and Saudi Arabia is our sixth largest market for processed goods. China accounts for less than .04% of Canada's processed exports and Saudi Arabia accounts for less than .04% of our raw exports. The major difference between the two patterns is that China shows over 2000% growth* in her weakest areas (processed and semi-processed imports), while Saudi Arabia shows the greatest growth in its area of greatest strength, that of processed goods.

Conclusion

We seem to have increased the value added content of our exports significantly over the past decade. change is somewhat hidden by the fact that inflation has been far greater in the price of those export products with the least value added to them. In addition, one notes a wide divergence between the performance of our exports in various otherwise similar countries. Consequently, trade with certain NICs more closely resembles that with certain EEC nations than that with other NICs. While our trade patterns with the U.S.A., the Netherlands, W. Germany, Venezuela, and Mexico are good in terms of value addition, those with Japan, Italy, China, and Brazil have been less impressive. If our value-added efforts are to be improved it remains to examine our export markets individually and to identify those requiring the greatest effort in the future. It should always be borne in mind, however, that all our efforts will continue to be affected by differential rates of price increases.

Another policy on which these results cast an interesting light is that of the "Third Option". The United States is responsible for 76% of Canada's processed exports. Venezuela, Canada's second ranking export market for processed goods, imports approximately 2% (see Appendix A). Thus, although our reliance on the US market has decreased slightly over the decade, it is still enormous. As has previously been mentioned this is increasingly true as the degree of processing of our exports increases. The USA helps our value added policy by providing a market for

^{*} Beginning from a very low base

processed goods which is difficult to find elsewhere. However, our gains in terms of value addition, are losses in terms of finding a "Third Option". The tension between these two goals should be considered in examining the data presented in the appended study.

Canada's Major Markets Ranked by Their Percentage Share of Exports

The Percentage of Canadian Exports in Processed and Raw Forms: Constant Versus Current Dollars

Appendix G

The Value Added Content of Canada's Exports

Explanation of the Study

PURPOSE: To study the value added content of Canada's exports during the ten year period beginning in 1971 and ending in 1980.

METHOD: Exports to each country studied are divided into three stages of fabrication. The stages in order of increasing fabrication are: crude, fabricated and processed. Individual exports are assigned to each category according to Statistics Canada's breakdown which can be found in the "1980 Convertibility Index of the Canadian Export Commodity Classification" prepared by the External Trade Division of Statistics Canada.

All functions performed on Canada's export data are performed for each of the stages of fabrication and for total exports, by country and country grouping.

FUNCTIONS:

Value (\$,000) - Value in thousands of Canadian dollars

Change over last - The change in value over the average of the three previous years.

Percent Change - The Percent change of the "% of total" from the figure for the previous year.

Percent Change - The Percent change of the "% of World total" from the figure for the previous year.

Change 69/70/71 - The percent change from the average of the first three years to the average of the last three. This is intended to give a figure representing the change over the decade.

The three year averages are an attempt to discount for the effects of an anomalous year. The final figure is always somewhat high as it includes the effects of inflation.

Value (constant \$,000)

The value in constant dollars is found by deflating current dollar values. Thus, while the value of raw materials exported to the world went up (in current dollars) over the decade, its value in constant dollars declined. Constant dollars allow a more accurate comparison between various yearly values. It should be noted that different deflators are used both for different countries and for different stages of fabrication in an effort to accurately reflect different rates of inflation.

THE COUNTRIES INCLUDED: USA, Argentina, Brazil, Mexico, Venezuela, UK, France, FRG, Netherlands, Italy, Belgium, Poland, USSR, Romania, Yugoslavia, Nigeria, Zimbabwe, Algeria, Saudi Arabia, India, Australia, Japan, S. Korea, China, Hong Kong, Indonesia, Malaysia, Philippines, Singapore, Thailand.

THE COUNTRY GROUPINGS:
