The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

The copy filmed here has been reproduced thanks to the generosity of:

National Library of Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol  $\rightarrow$  (meaning "CONTINUED"), or the symbol  $\nabla$  (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

Bibliothèque nationale du Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole  $\rightarrow$  signifie "A SUIVRE", le symbole  $\nabla$  signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

### WEATHER GUIDE.

The following Table (the result of many years' actual observation) is ascribed to Dr. Herschel. It is constructed upon a due consideration of the attraction of the Sun and Moon in their several positions respecting the Earth, and serves to show what kind of weather will most probably follow the entrance of the Moon into any of her quarters:—

Moon.	Time of Change.	In Summer.	In Winter.
If New Moon, First Quarter, Full Moon, or Last Quarter, happens	Between midnight & 2 A. M. }	Fair.	Hard Frost unless wind be S. or W.
	“ 2 and 4 A. M. }	Cold with showers.	Snow and stormy.
	“ 4 “ 6 “ }	Rain.	Stormy and rainy.
	“ 6 “ 8 “ }	Wind and rain.	Stormy.
	“ 8 “ 10 “ }	Variable.	Rain if wind W. Snow if E.
	“ 10 “ 12 “ }	Showery.	Cold and high wind.
	At 12 Noon, and to 2 P. M. }	Very rainy.	Snow or rain.
	Between 2 and 4 P. M. }	Variable.	Fair and mild.
	“ 4 “ 6 “ }	Fair.	Fair.
	“ 6 “ 8 “ }	Fair if wind be N. W. { Rainy if S. or S. W. }	Frosty if wind N or N E. Snow if S or S W
“ 8 “ 10 “ }	Ditto. Ditto.	Ditto. Ditto.	
“ 10 “ midnight. }	Fair.	Fair and frosty.	

The nearer midnight any of the Moon's changes occur, the finer will be the weather during the succeeding week; the nearer noon any of those changes happen, the more foul and wet will be the weather that will follow.

The Astronomical day is reckoned from Noon to Noon through the 24 hours. Thus July 21, 9h. is 9h. A. of July 21st, and July 21st, 15h. is 3h. M. of July 22.

The Sun's Declination and Equation of Time are given for Noon at Halifax, Apparent Time, *i.e.* when the True Sun is on the meridian.

The Moon's Southing is given in Astronomical Time for the Meridian Passage at Halifax; and her declination when on that meridian.

Both the rising and setting of the Moon are given for every day in the year.

THE TIDES.

The Tides in the Calendar given for the Ports mentioned, are the tides that occur during the day. In the Tide Table (page 53) will be found constants for finding the time of High Water at each of the places mentioned in the Table.

The Times of High Water given in the Calendar have been corrected for the varying distance of the Moon from the Earth, and also for her angular distance from the Sun. They can now be depended on as accurate to at least the same degree as the Admiralty Tide Tables.

It will sometimes be found that when a constant is added to the time of High Water at Halifax, the sum exceeds 12 hours; in this case subtract 12 hours from the sum, and the remainder will be the time of High Water at the required port on the following afternoon or morning, according as the Tide at Halifax was a morning or afternoon Tide.

EXAMPLE.

High Water at Halifax, Jan. 5th 11h. 17m. M.	Jan. 7, 11h. 0m M.
Boston Light, U. S., add 3h. 22m.	3h. 22m.
<hr/>	<hr/>
15h. 17m.	14h. 22m.
Subtract 12h. 0m.	12h.
<hr/>	<hr/>

High Water at Boston, Jan. 5th, 3h. 17m. A. Jan. 6, 2h. 22m. A.

It will sometimes be found that a constant to be subtracted is greater than the Time of High Water at Halifax; in this case add 12 hours to the time at Halifax, subtract the constant, and the remainder will be the time of High Water at the required Port for the previous Morning or Afternoon, according as the tide at Halifax was an Afternoon or Morning Tide.

EXAMPLE.

High Water at Halifax, Jan. 6th, 0h. 8m. A.	Jan. 9, 0h. 24m. A.
Add 12h.	12h.
<hr/>	<hr/>
12h. 8m.	12h. 24m.
Cape Sable Isld, S. side, Subtract 1h. 19m.	1h. 19m.

JANUARY.—Our FARMER'S CALENDAR is intended as a monthly guide or reminder of field work and indoor operations, as well as of farm matters in general, that require attention during the progress of the year. A fact known to every farmer is that no two seasons are the exact counterparts of each other, and the farmer or gardener or fruitgrower will be most successful whose crops are selected, and operations carried on, in view of such variations. Crops that ripen well one season may not do so well on the same farm the next. Some crops thrive best in a moist cool season, others in one with prolonged hot weather, some do best when they have an early start in the spring season, whilst others require a long genial autumn to form their fullest yield. Thus, of our more important crops, Indian

Corn, Potatoes, Tomatoes, Squashes, and others of Southern origin, do best in a hot season, while oats, grass, turnips, cabbages and such like northern crops, make most growth in comparatively cool weather. The occasional loss of the hay crop from drought, as was experienced in Cape Breton during the preceding season (1892) shows that it is of the greatest importance for a farmer not only to make a judicious choice of crops suitable to the climate, and to the soils and exposures of his fields, but also to have sufficient variety in his crops, so that whether the season should prove a hot and dry one, or cold and moist, or of a medium or average character, he may fairly expect a profitable return. This is the leisure time when plans for cropping can be made. Let it be remembered that a moderately cool wet season will give a good crop of hay, whilst a hot dry one will ensure

scarcity of this important fodder. To meet such a calamity a sufficient breadth should always be sown or planted of potatoes, mangles, Indian Corn or other crops that are capable of taking the place of hay and which succeed best in a warm dry season.

FEBRUARY is the most trying month for cattle; we cannot too strongly impress the necessity of care in their feeding, watering, and general treatment, at this season of the year. Barns may be faulty, and the cold severely felt, and yet this is one of the least evils in Nova Scotia, for horned cattle require plenty of fresh air, and winter and spring rates of mortality in cows in the country barns is very low compared to that of the apparently comfortable, substantial wind tight stables of the City of Halifax. The root cellar may be troublesome to get at, and the

animal may miss an occasional meal; the wells may be frozen, and the way to the watering places may be so slippery that the cattle cannot reach them without discomfort or danger. In order to overcome these and many other difficulties that appear in February, it is a good rule to give extra time and attention to the stock. In feeding grain and meal always mix them into cut hay, moistened. Cut hay does not digest any more rapidly than uncut, but it enables the meal or crushed grain fed with it to be more perfectly digested. In districts where an Agricultural Society does not already exist this is a good time to organize: farmers have leisure to attend a meeting, and take steps for organization. Notification has to be made to the Office of Agriculture, so that the new society may be sanctioned by the Governor-in-Council, before the end of June in order to qualify for the grant for the current year.

MARCH.—The Nova Scotia climate is singularly adapted for the growth of Garden Vegetables and root crops,—yet one of the most lamentable wants on our Nova Scotia farm is the kitchen garden. Instead of finding on every farm a well furnished kitchen garden, filled with vegetables and small fruits, sufficient to provide for the family wants during the year, such an inexpensive luxury is the exception rather than the rule. There is no reason why every farmer's family should not be provided to a large extent with supplies from the garden, such as early salads in spring time, rhubarb for pies, early green peas, early turnips, lettuce, radishes, cucumbers, early cauliflowers and cabbages, early beans, gooseberries, currants, strawberries, raspberries, (not the watery wild kinds that grow about the fences, but the luscious-fruited European varieties,) winter radishes, turnips, beets, parsnips, artichokes, seasoning herbs, melons, squashes, and

dozens of other delicacies and substantial articles of food that cost nothing but foresight and some agreeable labor. The nature of our climate necessitates the use of hot-beds for raising seedling plants of those crops that require a long season to mature. A hot bed is made by piling on successive layers of well-chopped horse dung, obtained from a stable where oats are freely fed. The manure may be raised to a height of two to three feet above the surface of the soil. On top spread four or five inches of very fine and rich soil mixed with sand: this should have been prepared in the fall, and kept dry under cover all winter,—otherwise it is likely now to be in a hard frozen mass. The glass sashes are then to be put on and kept close till the hot-bed heats; the steam and heat will start the seeds of weeds, which may be allowed to grow. Air is then given, and when the heat modifies, weed and rake the surface; sow your spring seeds—cauliflowers, cab-

The seeds will bear a good deal of heat before they emerge from the soil, but, as soon as the first leaves begin to appear, the frame must be aired daily, taking care to avoid draughts and exposure to bright sunshine; a newspaper laid over the seed bed forms a convenient shade.

APRIL.—One of the most important operations of the year is spring ploughing, the preliminary to planting and seeding. The operation belongs especially to the month of April, commencing sooner in dry, light soils and warm situations, later where the opposite prevail. Every farmer should be ready to avail himself of the early opportu nities presented by the varying years. In 1889 ploughing commenced at the very beginning of April; in 1890 its commencement was delayed till near

the end of the month; in 1891 the earliest ploughing was done in Digby and Yarmouth counties on 10th April. During the winter of 1891-92, frost did not sink so deeply as usual into the ground and fields were ready for the plough in South Queen's County as early as 25th March, 1892. It is not wise to plough till the soil is comparatively dry, and little is gained by early sowing until the ground is warm. This was conspicuously shown by the experience of last year. Although the season was very suitable for early work, it was found that much early sown seed rotted in the ground or came away slowly, owing to lack of warmth. In fields seeded down with timothy last fall, it will now be time to sow clover,—a mixture of red and alsyke is the best for hay. Where early potatoes are required, the seed should be kept in a warm place so as to start the eyes, and, whenever the ground is dry enough, they may be planted. This advice if not heeded will lead to potatoes coming up scantily, many rotting in the ground. If farmers, instead of planting inert seed potatoes, taken out of a cold cellar, would first allow the

eyes to start, there would be fewer complaints of the seed perishing in the soil. Peas and broad beans may be sown at the very beginning of the month; onions, parsnips and carrots as soon as the ground is fit to be worked sufficiently to give them the more delicate seed-bed they require. Beets and mangel wurzel are usually sown at the end of the month or early in May, but are apt to be weedy if sown too early. All gooseberry and currant bushes should be dressed, apple and pear trees gone over, and, generally, the whole kitchen garden and orchard thoroughly cared for.

MAY.—If the season is not an unusually early one, some ploughing will still have to be done; let it be done at once; if manure has to be taken out for crops, don't

wait for a more convenient season ; if the weather is not all that is desired, proceed nevertheless with your work, vary it to suit the state of the soil and atmosphere. Men cannot fight successfully against the operations of nature, but they can very often turn them to advantage by consideration and forethought. What has to be sown and planted this month? *Everything*, except what has either already been committed to the soil, or is too tender to withstand the coldness or the probable frosts. Such exceptional crops are bush-beans, pole-beans, corn, tomatoes, cucumbers, squash ; it is only in warm, sandy soils that such things can safely be put out before the end of the month. Turnips also should not be sown in May except the small garden patch of early whites for household use. One of the principal marketable crops in Nova Scotia is the potato. It has been found advantageous of late years to plant as early as possible ; as soon, therefore as the ground is in fit condition, commit the potato to it : see, however, that the eyes of the

seed have started into growth otherwise it will be apt to rot in the cold seed bed. Neglect of this point which has been urged again, and again in the Farmer's Calendar of this Almanac has caused the loss of countless thousands of dollars to our farmers. See Crop Reports for August 1892, copies of which may be obtained at the Office of Agriculture. In light lands the manure (old and well rotted) may be ploughed in before planting. In heavy soils, put the manure in the drills, so that the warmth of the air may counteract the deadening effect of the cold wet clods. Superphosphate and other artificial fertilizers may also be used.

JUNE.—Planting and sowing will still continue, and much of such work has, in unfavorable seasons, to be accomplished in June. Corn for ensilage should now be sown. But, while spring operations have to be continued and finished this month, there are others appertaining more especially to the summer that have to be attended to. Garden crops will require hoeing and weeding; potatoes also, when sufficiently advanced. It should not be forgotten that we have not only to sow and cultivate, but to protect our crops, if we would gather a profitable harvest. In localities subject to late spring frosts, it is easy to protect early crops by

throwing some spruce or other brush over them on cold nights. A method much used in France, and which may easily be adopted in this country, is to burn brush to windward so as to cover the field in a cloud of smoke. Attention has often been called to such simple and costless devices, and yet year after year, we hear of the loss of early crops; it is said "by frost," we should say "by neglect." The Colorado or potato beetle now challenges attention. Paris green and London purple are undoubtedly efficacious, but they are homicides as well as insecticides, and every precaution should be observed in their use by farmers, and in their sale by apothecaries and store-keepers. The poison is best applied in mixture of ground plaster. Hellebore is also effective, and less dangerous, but too expensive where large fields have to be poisoned. As soon as the currant and gooseberry bushes have pushed out their first leaves and early blossoms, it will be found advantageous to give them a sprinkling of white hellebore powder in the morning, before the dew is off. This will destroy the first crop of currant worms, and thus preserve the bushes and the fruit crop for the season. The objection to the use of white hellebore on currant bushes (if used early enough in the season) is by no means so strong as to the employment of arsenical poisons as the white hellebore

being organic, decays, and is thus speedily rendered innocuous, by exposure to rain and air. Summer bedding plants are set out in the flower garden as early this month as the weather will allow; verbenas may be put out very early, and they thrive rather better in the moist cool weather of early June than later, when the soil is apt to be baked by the sun. Stocks are also very hardy. Balsams, Phloxes, Petanias, Geraniums, Heliotropes, and other tender things need not be put out so early, as they will make no progress in cool weather, and the slightest approach to frost will kill them for the season.

JULY.—This month is especially devoted to the cultivation of the various field crops. Cultivation, in this restricted sense, means the hoeing of crops, stirring by cultivators and harrows, and such like implements between or over

the drills, hilling up and moulding. The objects of these operations are to destroy weeds, to keep the soil open, and thus to promote the decomposition of the manure, enable the soil to retain moisture, allow free access of air to it, bring it well over and around the roots and stems, and, by these several means, to promote vigorous growth. We are apt to have a good many rainy days, in July, and, as most of the hoeing work has to be compressed between planting time and haying time, haying has occasionally to be begun before potato hoeing is completed; this occurs on many of the best regulated farms. In ordinary seasons it is sure to occur on a farm where foresight is not shewn, hence the miserable root crops we so often see. Let our farming readers then be careful to forecast the weather probabilities in light of the July work to be done on the growing crops, and thus avoid the disastrous loss that comes from neglect. The sowing of turnips is usually recommended for the month of June, but as the

The difference of 12 minutes in the decrease of length of morning and evening is caused by the sun's being 6 minutes slower than the clock on the 1st, and agreeing with it at the end of the month.

ground has to be remarkably fine for this crop, and as turnips are often put in to fill up land that was originally intended for the earlier sown roots, it frequently happens that turnips have to be sown in July. In fact, if turnips are sown early in June, they are apt to run to seed instead of forming bulbs. Some even prefer to sow their Swedes early this month, so as to avoid the "fly," and the soft turnips for immediate feeding need not necessarily be sown till the end of July, although, if they get warm genial weather to start with they do much better earlier. Late sowing, while it is apt to give a small yield, ensures excellent quality, and freedom from fibre, so that turnips intended for table use in winter should never be sown early. The ground should have undergone a thorough pulverization. Light sandy soil is the best for turnips. They start better after the ground is warm, but the bulbs swell most rapidly during the cold dewy

nights in Autumn. The soil cannot be worked too deep or made too fine for turnips. Town manures are valuable for this crop, and crushed bones have been applied with best effects, either when covered in the drills in the manner of ordinary dung, or, preferably, when sown by machine along with the seeds, so as to be in immediate contact with the latter. In many parts of the province, particularly Yarmouth, Shelburne, Queens, Digby and Annapolis, the important operation of hay harvesting will have commenced this month, and on upland will probably be well advanced, or even finished before the end of the month. All other work has to give way to this. If the weather is warm and dull, do not hurry the hay into the barn; put it up in large well-built cocks, so as to allow it to sweat or ripen before being put into the mow. Where mows are large this is particularly necessary.

The time of sunrise added to the time of sunset is equal to 12 hours, only when the time by the sun and the clock is the same, as it is, nearly, at the beginning of this month.

THE LONDON DRUG STORE, 147 HOLLIS STREET.

AUGUST.—In the eastern counties, and on dyke and intervalle lands, much hay has often to be taken in during the month of August. Hay making is the most important operation of the Nova Scotia farmer, half of all his land under crop of every kind being occupied with grass destined to be made into hay. More than half a million acres have to be mown every season. Where suitable implements and appliances are used there is now no difficulty in securing the crop. After haying there will be work in top-dressing the hay fields, and in the garden and orchard. Where the trees are in grass they will benefit by a rich top-dressing around their roots. Look after the ripening fruit, destroy the caterpillars, if any still remain; pick the early August apples, and send them into a local market or to the picnic. When the rain comes beds of strawberries may be made up. See

that the ground is well drained and enriched with old manure. Mushrooms now appear in horse pastures, house flies become troublesome, and the swallows congregate in flocks and leave us.

SEPTEMBER.—Grain has to be harvested in September. Indian corn will have to be cut and put into the siloes. The ensilage forms an excellent supplement to the hay and roots, but ensilage is still used to only a very small extent. Later in the month, potatoes of the earlier kinds, and earlier planted, will be ready to be taken up, but while the weather remains warm they should be well-aired before being put into the cellar, and only in small quantities at a time. The most experienced farmers usually wait for cold weather before taking up their full crop. The farmer's year is a complete cycle, and before one year's annual harvest is taken in, it is useful to be preparing for the next. In fact, it is already time, by the beginning of September, to sow Winter Rye, which is a favorite crop with

OCTOBER.—The apple crop is yearly acquiring increased importance in Nova Scotia, and our apple orchards are annually extending. But there is still plenty of room, and no farmer who has suitable land, and is willing to take the necessary care, can make a better permanent investment than by planting an orchard. The best market varieties, at least those that appear at the present to be most in favor among our fruit growers in the counties of Kings and Annapolis, where orcharding

Greening, Abston Pippin, Northern Spy, Vandevere, Golden Russet, Nonpareil and Baldwin. Cherry County is at present our cherry county, and Cape Breton has profitable plum orchards, but these fruits may be grown all over the Province. Now that the season's work is well nigh over, the young man on the farm may repair to the School of Agriculture and Provincial Farm, Truro, where instruction is given in the art of agriculture and the sciences bearing upon it. A post card of enquiry to Prof. Smith, the Provincial Lecturer on Agriculture, will bring full particulars as to the operation and arrangements of the School and Farm, and the terms upon which pupils are admitted. No fees are charged, and students are paid for their work on the farm. Students are not boarded on the farm, but can obtain comfortable board and lodging in Truro at very reasonable rates.

NOVEMBER.—To insure the improvement of cattle, every society keeps or ought to keep, a sufficient number of male animals for the use of members. For beef cattle the Short Horn Durham, Polled Angus, Galloway and Hereford are used. For milk alone, or the cheese factory, Ayrshires are to be preferred. Devons make the best working oxen, are quick, active, and easily fed, and soon fatten in the wild pastures for leaf. For domestic cows, and butter making, Guernseys or Jerseys are the most suitable. The Jerseys have been great favorites, and their increase will promote the manufacture of butter, but it threatens to lessen our capacity for beef production. Holsteins are also increasing, but less rapidly, in a few localities; they are large, healthy cattle, combining beef producing with milking qualities—the yield of milk being often very large. Fall ploughing will be the

principal field work this month. After ploughing do not forget to go carefully over the water furrows to make way for the exit of the rain and melting snows that are sure to flood your fields before seed time. A well ploughed, well drained field may be sown in spring as soon as the frost is gone, while one that is irregularly ploughed or has no water furrows, may long remain a puddle, defying every attempt to improve its condition, until the season has so far advanced as to reduce very much the prospect of a crop. The best part of what is too often left to be "Spring work," can be done in the month of November. At the same time care should be taken not to open up gravelly banks or hilly land, subject to be scoured by the Fall and Spring rains, or melting snows. Every season brings loud complaints of the winter-killing of grass in the hay fields. It may possibly be of use to some farmers to say that the winter-killing is merely another name for neglect. If a hay field not on a dead level is drained simply by running water furrows with

DECEMBER.—Agricultural improvement is encouraged and promoted in various ways by the Provincial Legislature. Grants are given to aid County Exhibitions, and once in three years to enable a Provincial Exhibition to be held. There is also a system of Agricultural Societies throughout the Province, with a membership of about six thousand farmers; each society is entitled to draw from the Provincial Treasury an annual grant in aid to promote its operations. Directions to Mariners with Reference to Canadian Storm Warnings, issued for Quebec and the Maritime Provinces.

I.—Cone, hoisted with the apex downwards, indicates "moderate gale is expected," probably at first from an easterly direction.

II.—Cone, with apex pointing upwards, indicates "moderate gale is expected," probably at first from a westerly direction.

III.—Drum, with Cone underneath, the apex pointing downwards, indicates fresh to heavy gale is expected, probably at first from a easterly direction.

IV.—Drum, with Cone above, the apex pointing upwards, indicates fresh to heavy gale is expected, probably at first from a westerly direction.

The Cone, when hoisted by itself, indicates that it is expected that the wind will obtain a velocity of 30 miles an hour, but will not exceed 40 miles; and it is not intended that an ordinary well found vessel should stay in port, but simply as a warning to mariners that strong winds are expected from the quarter indicated.

The Drum will always be hoisted when the velocity of the wind is expected to exceed 40 miles an hour.

The night signal, corresponding to Nos. 1 and 3, is two white lanterns hanging perpendicular.

The night signal, corresponding to Nos. 2 and 4, is two white lanterns hanging horizontally.

NOTES.—Mariners will be able to obtain further information from Drum Agents or by consulting the daily probabilities. Mariners should always bear in mind that the storm signals are merely cautionary, and do not necessarily mean that a storm will occur at the place where the signal is displayed, but that one is expected either there or within such a distance that vessels leaving port would be liable to be caught in it.

The storm warnings issued for Nova Scotia, are received from the Central Office, Toronto, Ont.

# SYDNEY COAL.

This celebrated Coal, mined by the **General Mining Association, Ltd.**, of London, G. "**Sydney Coal**" stands far ahead of all **Nova Scotian and Cape Breton Coals** in its reputation for **House Use**. It is also an excellent **Steam Coal**.
