HARVIE'S
Prince Edward Island
ALMANACK;
 FOR
1868.

BEING BISSEXTILE OR LEAP YEAR, AND THE LATTER PART
 OF THE THIRTY-FIRST AND THE BEGINNING OF THE
 THIRTY-SECOND YEAR OF THE REIGN OF HER
 MAJESTY QUEEN VICTORIA.

CALCULATED FOR CHARLOTTETOWN,

Lat. 43° 13' 55" North, Long. 63° 7' 23" West, from Greenwich.

CHARLOTTETOWN, P. E. ISLAND.

PUBLISHED AND SOLD BY HENRY A. HARVIE, QUEEN STREET.

Printed at the Book and Job Office of W. H. BREMNER, Kent Street.

PRINCIPAL ARTICLES OF THE CALENDAR FOR 1868.

CHRONOLOGICAL CYCLES.

Golden Number 7, Epact 6 Dominical Letters E. D.
 The year 5629 of the Jewish Era commences September 17th.
 The year 1285 of the Hegira or Mahomedan Era commences April 24

EXPLANATIONS AND NOTES.

The GOLDEN NUMBER is the year of the Metonic or Lunar Cycle of 19 years; after which, all the phenomena of Eclipses and Moon Changes commence to recur in the same order as before.

Its present use is to find Easter; its place in the Calendar being against the day of Paschal, full moon: that is, the full moon on or next after the 21st March. Easter Day is always the Sunday following, for example, at the end of 19 years, Full Moon will again fall on the 8th of April, there will be two Solar Eclipses and no Lunar Eclipse, as is the case in the present year.

The EPACT is the moon's age on the first day of the year. It is found for each successive year by adding 11 to the previous Epact. When 29 is reached it is called 0.

The DOMINICAL or SUNDAY LETTER is useful for determining on what day of the week any day of the year falls. The Letter marking Sunday changes each year in backward rotation. Leap year has two letters, the first, during January and February; and the other, to the end of the year. Knowing the Sunday Letter, all that is necessary to remember, is the Letter that stands opposite the first day of each month. This is clearly retained by means of the following couplet:

<i>At</i>	<i>Dover</i>	<i>Dwells</i>	<i>George</i>	<i>Brown</i>	<i>Esquire</i>
JAN.	FEB.	MARCH	APRIL	MAY	JUNE
<i>Good</i>	<i>Christian</i>	<i>Folk</i>	<i>And</i>	<i>David</i>	<i>Fryer</i>
JULY	AUGUST	SEPT.	OCTOBER.	NOV.	DEC.

Counting on the fingers from the month's Letter to the Sunday Letter fixes the first Sunday of the month, from which any other day is easily reckoned.

ECLIPSES.

There will be no eclipse of the moon this year. Two eclipses of the sun, but neither visible in P. E. Island. I. An annular eclipse of the sun, commencing 22d February 23h. 17m., ending 23d February, 5h. 24m. 5s., Greenwich mean time. Not visible

further north to Rouen, Hamburg, Lima, Casco, Perseus, eclipse of the sun 19h. 14m. 2s., visible at Dardenelles to the east as far south as Abyssinia, Hydruntum.

There will be some of which will place in the Calendar star Aldebaran. At the junction of the star half an hour each reappearance.

There will be a 4th, commencing which mean time.

MERCURY. In conjunction it is very difficult to see rays. The elongation, west of sunset, or east of west.

VENUS. Revolving never appears alternately to the west will be retrograde and direct or motion of the planet is direct or retrograde or retrograde inferior planets.

MARS. The motion being in conjunction He will not be visible in March. He will not be visible till the beginning of the year.

JUPITER. Retrograde He is to be seen from the Sun on the 10th of March; star. His range in the year is $36^{\circ} 26'$.

SATURN. Retrograde at the end of the year.

3

further north than a line including Honduras, Cuba, Jamaica, Rouen, Hamburg, Tilsit. Line of centrality, 60 miles south of Lima, Casco, Pernambuco, Liberia, and Lake Tchad. II. A total eclipse of the sun, commencing 17th August, 14h. 34m. 7s., ending 19h. 14m. 2s., visible as a partial eclipse, to South Asia, from the Dardenelles to the Yellow Sea; also to the eastern half of Africa, as far south as Madagascar; the line of totality passing through Abyssinia, Hydrabad, Malacca, Borneo, and Torres Straits.

There will be several occultations of planets by the moon, some of which, being visible at Charlottetown, are noted in their place in the Calendar; as also some of the well-known bright star Aldebaran. The time given being local mean time of conjunction of the star with the moon's centre, an allowance of about half an hour each side will have to be made for immersion and reappearance.

There will be a Transit of Mercury over the sun's disc, Nov. 4th, commencing 17h. 24m. 39s., and ending 21h. 2m. 57s., Greenwich mean time. Invisible on this side of the Atlantic.

PLANETS.

MERCURY. In consequence of this planet's proximity to the Sun, it is very difficult to be seen, being mostly under the Sun's rays. The most favorable time is when it is at its greatest elongation, when it may be found near the Sun shortly after sunset, or before sunrise, according as the planet is to the east or west of the Sun.

VENUS. Revolving in an orbit within that of the earth, Venus never appears more than 45° or 46° from the Sun. Moving alternately to the east and west among the Stars her motion will be retrograde or westwards from June 24 to August 7, and direct or eastward during the year. As the apparent motion of the Earth, as seen from the Venus or Mercury, is direct or retrograde, according as their motion is direct or retrograde to us, so also the apparent motion of the superior planets is sometimes retrograde as seen from the earth.

MARS. The motion of Mars will be direct throughout the year, being in conjunction with the Sun on the first of January. He will not be visible till he appears as a Morning Star in March. He will not be seen to rise in the east before midnight till the beginning of November.

JUPITER. Retrograde from the 3d August to the end of the year. He is to be seen to the south-west at sunset. His distance from the Sun decreasing till the time of conjunction on the 10th of March; after which he will reappear as a morning star. His range of motion through the heavens during the year is $36^{\circ} 26'$ in the constellation Pisces.

SATURN. Retrograde from March 14 to August 2, and direct to the end of the year. His range of motion is about $6^{\circ} 45'$ in

the constellation Scorpio. At the beginning of the year he is a morning star, rising about 5, a. m., and will not be seen to rise before midnight till near the end of March. During the months of October, November, and December, he is under the Sun's rays, and ill placed for observations. The north side of the ring is towards the earth throughout the year, and is open to its fullest extent on the 17th May.

URANUS. Retrograde till March 16. Direct till October 22; then retrograde to the end of the year: the range of his motion being about 93° in Gemini.

NEPTUNE. Retrograde from July 19 to the end of the year. Extent of motion 5° in the constellation Pisces.

ALMANAC.

5

The time of Sunrise and Sunset is given to the nearest minute mean time, but may be brought to apparent time by applying the equation of time as directed.

The time of High Water is given for once in the 24 hours, but the time of any intervening tide may be found by adding to the time of preceding High Water, half the difference between it and the succeeding. For example,—to find the morning tide on the 21st June;

June 21—11h. 52m. p. m.

June 20—10h. 50m p. m.

2 | 1h. 2m.

31m.

June 21—11h. 21m.

The time of High Water for the following places will be found by subtracting from Charlottetown time as under:

Pinette, Bedeque, Pictou, Tatmagouche	0h. 45m.
Murray Harbor	1h. 39m.
Indian Rocks, Wood Islands	2h. 5m.
Cardigan River	2h. 5m.
St. Peters	2h. 15m.
Malpeque	4h. 45m.
Cascumpeque	5h. 5m.
North Cape	6h. 35m.

At the head of each month, besides the changes of the Moon, is given the Perigee or Moon's nearest approach to the earth; also, the Lunar Equinoctials—days when atmospheric disturbance may be expected.

* denotes the day and hour when the moon crosses the line, N. and S. the time when she attains her greatest North or South declination.

When these days fall close upon the day of a Moons change, or Perigee, this disturbing influence is proportionably increased, and these cases are marked ** or ***, according as two or three of these influences combine. Where *** occur a gale may be expected with considerable certainty.

In addition to these days, the effect of a storm generated near the tropics, may be propagated so as to arrive in about two or three days—it having been ascertained that these circular storms travel at the rate of about sixteen miles an hour.

THE NEW STYLE in Catholic countries, by order of Pope Gregory XIII., was adopted in 1582, commanding to reckon the 5th of October as the 15th, thus omitting 10 days. Protestant countries adopted this rule in 1752, calling the 3rd of September the 14th, omitting 11 nominal days. Russia still adheres to the old style, the difference from the new being now 12 days. Up to 1752, the year was held to begin in England with the 24 of March; 1751 did so, but 1752 began January 1, by Act of Parliament, agreeably to the Gregorian or Roman Catholic Calendar, which is the true time, with only an error of one day in about 3,000 years.

PICKLES.—Pickles ought to be stored in a dry place, and the vessels most approved of for keeping them in are widemouthed glass bottles, or strong stone-ware jars, having cords or bungs, which must be fitted in with linen, and covered with bladder or leather; and for taking the pickles out and re- turning them to the jar, a small wooden spoon is kept. The strongest vinegar used for pickling; that of cider more particularly recommended, but sugar vinegar will generally be found sufficiently strong. It is essential to the excellence and beauty of pickles, that they be always covered with vinegar.

QUEEN OF PUDDINGS.—One pint of nice fine bread crumbs, one quart of milk, one cup of sugar, the yolks of four eggs beaten, the grated rind of a lemon, a piece of butter the size of an egg. Bake until done, but not watery. Whip the whites of the eggs stiff, beat in a teacupful of sugar in which has been strained the juice of the lemon, spread over the pudding a layer of jelly, pour the whites of the eggs over this; replace in the oven; bake lightly. To be eaten cold, with cream, if preferred. Decidedly the best of all puddings—something new.

SCOTCH-CAKES.—Three-quarters of a pound of flour, three ounces of butter, three ounces of lump-sugar, sal ammoniac about the size of a hazel-nut; warm the butter in a little milk, and mix the whole into a stiff paste. Cut into rounds, and bake in a cool oven.

A SIMPLE MODE OF PICKLING ONIONS.—Take off the outside skin and top and tail them, then put them into the bottles, and add sufficient vinegar to cover them. Put also a few mustard-seeds into each bottle, a blade of mace, and a capsicum. It is said that a spoonful of salad oil to each bottle will keep the onions white.

COLD WATER SPONGE CAKE.—One and a half cups sugar and 3 eggs beaten together, then add 1 cup of flour, and beat; then half cup cold water, then one cup of flour, 1 teaspoon cream of tartar; put in dry, one and a half teaspoons soda, beaten in the last thing; add flavoring and bake in a moderately hot oven.

W. H. BREMNER, Printer & Bookbinder, Kent Street.

To PICKLE BEET-ROOT.—This vegetable makes an excellent pickle, and from the Brightness of its color, has a very pretty effect in a glass pickle-dish or jar. Wash the beet perfectly; do not cut off any of the fibrous roots, as this would allow the juice to escape, and thus the coloring would be lost. Put it into sufficient water to boil it, and when the skin will come off it will be sufficiently cooked, and may be taken out and laid upon a cloth to cool. Having rubbed off the skin, cut the beet into thick slices, put it into a jar, and pour over it cold vinegar, prepared as follows: Boil a quart of vinegar with an ounce of whole black pepper, and an equal weight of dry ginger, and let it stand until quite cold. The jar should be kept closely corked.

To PICKLE MUSHROOMS.—Clean them with salt and water, then put them into a saucepan with a little salt; keep them over the fire until the heat draws the liquor from them, adding a blade of mace, and distilled vinegar sufficient to cover them.

TO TAKE INK OUT OF LINEN.—Dip the spotted part in pure melted tallow; then wash out the tallow and the ink will come out with it. This is said to be unfailling.

A cheap method of preserving Cucumber Plants from the small fly or bug—Break off the stalks of onions which have been set out in the spring and stick down five or six of them in each hill of cucumbers, and the bug will immediately leave them. It would be well after a few days to renew them; but one application has frequently been found to be completely effectual.

W. H. BREMNER, Printer & Bookbinder, Kent Street.

IMITATION PRESERVED GINGER.—Well scrape and split in halves young, yellow carrots, and cut them into the shape of the races or cloves of West Indian ginger, as we see it preserved. Parboil them, taking care that they do not break or loose their shape; drain them thoroughly, and let them lie on the back of a sieve all night. Next day weigh them and put them into a stew-pan with their own weight of "syrup of ginger." let them simmer very gently over a low fire for four hours. Fill your preserve-pots, taking care fairly to apportion both vegetables and syrup. Tie them down with bladder, and let them stand on the hob for three days. This preserve is an excellent substitute for the real West Indian importation, which is reckoned so great a delicacy, and is also so expensive. It improves by keeping.

TOMATO CHOW CHOW.—Eight sliced Tomatoes—green, one doz. onions, mix with salt and stand over night, then add one ounce of pepper, one of allspice, one of whole cloves, quarter of a pound of mustard seed, one lb. sugar, one tablespoonful of ground mustard, cover this with vinegar and cook half an hour.

To Pickle Nasturtiums.—These should be gathered quite young, and a portion of the buds, when very small, should be mixed with them. Prepare a pickle by dissolving one ounce and a half of salt in a quart of pale vinegar, and throw in the berries as they become fit, from day to day. They are used instead of capers for sauce, and by some persons are preferred to them. When purchased for pickling, put them at once into a jar, and cover them well with the vinegar.

TO WASH NEW FLANNEL.—Cut the Soap small, and boil it in a little water. Have two tubs with water as hot as the hands can bear, previously blue the water well, to keep the color of the flannel, and put some of the boiled soap into one tub to make a lather; then wash the flannel without squeezing it. Put it into the other tub, and wring it in a large towel. Shake it then out, and, after drying it, smooth it with a cool iron.

GERMAN CREAM BISCUIT.—Take four ounces of butter, six ounces of powdered loaf-sugar, seven ounces of flour, one tablespoonful of fresh cream and one egg. Make the above into a dough, beating it well; then roll it out very thin, cutting it into square pieces two inches long and one broad. Bake it in a quick oven, and when done they should be a light yellow brown.

Small Tea Cakes—Put a quarter of a pound of butter into a pound of flour, mix a quarter of a pound of sifted lump sugar, and wet it with water: when made up, divide it into two equal pieces; put one ounce of corraway seeds to one piece, by way of having two sorts; then rub the paste out very thin and cut it out with a small round cutter; butter a baking sheet, and dust it over with flour; lay them regularly on baking sheets, and bake them in a slow oven; they should be of a light brown. They should be kept in a dry place, either in a covered glass or pan. Small cakes of all description should be kept this way.

into a pound of flour, set it with water; when the juice of corroway seeds the pasty out very thin sheet, and dust it and bake them in a slow oven kept in a dry place, description should be

TO TAKE MILDEW FROM CLOTHES.—Mix soft-soap with powdered starch, half as much salt, and the juice of a lemon; lay it on the part with a wash; let it lay on the grass, day and night, till the stain comes out. Iron-stains may be removed by the salt of lemons. Many stains may be removed by dipping the linen in sour buttermilk, and then drying it in a hot sun; wash it in cold water; repeat this three or four times. Stains, caused by grease, may be removed by tying some pearlsh up in the stained part; steep some soap in cold, soft water, and boil the linen till the stain is gone.

SOAP PUDDING.—Add five tablespoonfuls flour, three eggs, a little salt and a quart of boiling milk; stir it ten minutes—then pour it into a tin and put a cup of white sugar over it while hot—to be eaten cold.

How to Cook a Ham.—We dine occasionally at the table of Mrs. P.—and until we tasted it there, we did not know what a ham was capable of. Being so nice to remain a family secret, we asked the receipt for the benefit of our readers. Boil a ham for three hours, remove the receipt for the benefit of our readers. Boil a ham for three hours, remove the skin, and trim it nicely, and then rub into the fat a pound of powdered sugar, or as much as will take up. The ham is then placed in a dripping pan, in which is put a pint of sherry, or other good wine, and put into the oven, and baked very slowly for two hours. During the baking it is frequently basted with the wine. This, and we are confident you will say that you have never before eaten ham in its greatest perfection.

Lemon Cheese-Cakes.—Rasp the rind of a large lemon with four ounces of fine sugar, then crush and mix it with the yolks of three eggs, and half the quantity of whites, well whisked; beat these together thoroughly; add to them four tablespoonfuls of cream, a quarter of a pound of oiled butter, the strained juice of the lemon, which must be stirred quickly in by degrees, and a little orange-flower brandy. Line some patty-pans with thin puff-paste, half fill them with the mixture, and bake them thirty minutes in a moderate oven.

Preserve Puffs.—Roll out puff-paste very thinly, cut it into round pieces, and lay jam on each; fold over the paste, wet the edges with egg, and close them; lay them on a baking sheet, ice them, and bake about a quarter of an hour.

Celery Preserve.—Cut the blanched part of the celery in pieces, and boil it in water with a large quantity of ginger until it is quite tender, then throw it into cold water and allow it to remain for an hour. Put it over a slow fire in good syrup, with some pieces of ginger, and let it remain simmering for an hour. Cool it again, and in the meantime thicken the syrup by further evaporation. Put the celery in again, and repeat the same process. After a third simmering in this way, taking care to keep the syrup thick, put the celery into pots, and cover with a syrup.

Boiled Meat Potato Pudding.—Boil a sufficient quantity of pared mealy potatoes till they are ready to crumble in pieces: drain, pick out every speck of lump, and mash them as smooth as possible. Make them into a thickish batter, with an egg or two, and milk; placing a layer of steaks or chops, well seasoned with salt and pepper, at the bottom of a baking dish, cover with a layer of batter, and so alternately till the dish is full, taking care to have batter at the top. Butter the dish, to prevent sticking or burning. This pudding, when properly baked, will be of a fine brown colour

Minced Mutton.—This is a very useful preparation of "cold mutton," and will be found excellent for a change. Cut slices off a cold roasted leg of mutton, and mince it very fine; brown some flour in butter, and moisten with some gravy; add salt and pepper to taste, and let it simmer about ten or fifteen minutes, to take off the raw taste of the flour; add another lot of butter and some parsley chopped fine, then add the minced meat, and let it simmer slowly, but not to boil. or the meat will be hard.

Potatoe Bread.—Boil six pounds of potatoes, work them with four ounces of butter, and as much milk as will cause them to pass through a cullender; add a pint of good yeast and the same quantity of warm water, mix it with the potatoes, and pour the whole on ten pounds of flour: add salt as usual. Knead it well; and, if necessary, add more milk and warm water; then let stand before the fire about an hour, to rise. Bake as for common bread.

To make Yeast with Pease.—Take a tea-cup or wine-glass full of split or minced pease, pour on them a pint of boiling water, and set the whole in a vessel four and twenty hours on the hearth, or in any other warm place; the water will be a good yeast, and have a froth on its top next morning. Any quantity may be made in this proportion. This recipe must prove high-serviceable where yeast cannot be obtained.

of "cold mutton," and
a cold roasted leg
a butter, and moisten
let it simmer about
our; add another lot
minced meat, and let
ward.

To Bleach a Straw Bonnet.—First scrub the bonnet well with yellow soap and a brush dipped in clean water; after this, put into a box a saucer containing burning sulphur; it must remain there a short time, and as soon as it is removed, the bonnet must be placed in the box and well covered up, that the sulphuric atmosphere may whiten it; next dissolve a little oxalic acid in boiling water. Wash all over the bonnet with a small paint-brush; put into a pail of cold water, and let it remain half an hour; then hang it out dry; it must afterwards be stiffened with gelatine, dried again, and then pressed into shape.

Pilled Onions.—Have th

Pickled Onions.—Have the onions gathered when quite dry and ripe, and with the fingers, take off the thin outside skin; then with a knife remove one more skin, when the onion will look quite clear. Have ready some very dry bottles or jars, and as fast as the onions are peeled, put them in. Pour over sufficient cold vinegar to cover them, add two teaspoonfuls of allspice, and two teaspoonfuls of black pepper, taking care that each jar has its share of the latter ingredients. Tie down with bladder, and put them in a dry place, and in a fortnight they will be fit for use. This is a most simple receipt and very delicious, the onions being nice and crisp. They should be eaten within six or eight months after being done, as the onions are liable to become soft.

Oyster Patties.—Line some small patty-pans with fine puff-paste, rolled thin, and, to preserve their form when baked, put a bit of bread into each, lay on the covers, pinch and trim the edges, and send the patties to a brisk oven. Plump and beard from two to three dozen of small oysters; mix very smoothly a tea-spoonful of flour with one ounce of butter, put them into a clean saucepan, shake them round over a gentle fire, and let them simmer for two or three minutes; throw in a little salt, pounded mace, and cayenne

then add, by slow degrees, two or three spoonfulls of rich cream; give these a boil, and pour in the strained liquor of the oysters; next, lay in the fish, and keep at the point of boiling for a couple of minutes. Raise the covers from the patties, take out the bread, and fill them with the oysters and their sauce, and replace the covers. We have found it an improvement to stew the heads of fish with a strip or two of lemon-peel, in a little good veal stock for a quarter of an hour, then to strain and add it to the sauce. The oysters, unless very small, should be once or twice divided.

A Cheap Family Pudding.—One pound of flour, one pound of suet chopped fine, three-quarters of a pound of molasses or sugar, one pound each of carrots and potatoes well boiled and mashed together, half a pound of raisins, three-quarters of a pound of bread crumbs; spice, flavoring, and peel optional. Mix the whole together with a little water; it must not be too stiff and certainly not too moist. Rub a basin well with dripping, and boil for eight hours.

American Black Pudding.—Half a pint of molasses, half a pint of water, two teaspoonfuls of saleratus, one teacup of raisins, rolled in flour; or, a teacupful of plums, cherries, or currants, dried with sugar. Put into a mould, crock, or pail, large enough to leave one half for swelling. If boiled in an open crock, tie a thick cloth over the top. Boil steadily three hours.

To make a Date or Prune Pudding.—Take a quart of milk, beat six eggs, half the whites in half a pint of the milk, and four spoonfuls of flour with a little salt, and two of beaten ginger; then by degrees mix in all the milk and a pound of dates, tie it in a cloth, and boil it an hour, melt butter and pour over it. Damsons are very nice instead of the dates or prunes.

Simple but Delightful Fruit Cake.—One cup of butter (with salt washed out), three and a half cups of light brown sugar; beat these ingredients to a cream. Put the yolks of three eggs into the mixture, and beat all together. One cup of sweet milk, sift four cups of flour, in which mix one teaspoonful of cream of tartar, and half a teaspoonful of soda. Take some of this flour, and rub it into one pound of clean dry currants, and add them to the mixture; then gradually stir in all the flour, one quarter of a nutmeg, and the grated rind of one lemon. Then add the beaten whites of the eggs. Pour into a pan lined and covered with white paper, and bake in a moderate oven.

THE ENDING AND BEGINNING OF THE YEAR.

Ring out, wild bells, to the wild sky;
The flying clouds, the frosty light;
The year is dying, in the night
Ring out, wild bells, and let him die.
Ring out the old, ring in the new;
Ring, happy bells, across the snow;
The year is going—let him go—
Ring out the false, ring in the true.
Ring out the grief that saps the mind
For those that here we see no more;
Ring out the feuds of rich and poor,
Ring in redress to all mankind.
Ring out false pride in place and blood,
The faithless coldness and the spite;
Ring in the love of truth and right,
Ring in the common love of good.
Ring out old shapes of foul disease;
Ring out the narrow lust of gold;
Ring out the thousand wars of old,
Ring in the thousand years of peace.

GARDENERS' CALENDAR FOR 1868.

The few remarks that are intended to be made under the above title will, it is hoped, benefit those who are already in the possession of gardens, and encourage those who are not to provide themselves where it is possible with pieces of ground to make them, as well as to encourage the sons and daughters of farmers to add the productions of the garden to those of the field.

JANUARY.

Although nothing can be done in the open air in this month, something may be done in the house. In the first place, let the seed box or basket be looked over, and the kinds and quantities of seeds that will be requisite for the ensuing season, be provided for, or at least bespoke. It would save both time and money if clubs were formed for the purchase of seeds, roots, and plants. Each member might give a list to the secretary, and the aggregate amount of the different kinds provided through the medium of one of the usual importers, or send direct to some eminent seedsman, in Britain or the United States, with directions to have them forwarded by the steam vessels, so as to be in full time for the spring. Some such, as melon, cucumber, lettuce—of sorts, cauliflower, early cabbage, celery, tomatoes, and capsicum seeds, for the purpose of forcing in the hotbed, might be forwarded from Halifax by the iceboat. It would be well to lay in, during the winter months, a good supply of pea sticks. If the people who came into Charlottetown with wood were to gather the loppings of the trees, and bring them to town, they would get a fair price for them. The writer, however, prefers sawn laths—three feet ones, for the smaller and earlier kinds, and four feet ones for others; then, when put in lattice wire, are more sightly, and confine the plants as effectually as rods,—still for some, such as Knight's tall marrows, six feet rods will be absolutely necessary. Bean Poles can be had of the Indians in the Spring. Prepare all kind of sticks—some long—for the purpose of supporting plants and flowers when necessary; some short, for labels. If you keep a horse or cow, try by all means to keep the manure under cover. Bed your animals well with straw, shavings, or sawdust. It will be of much benefit to the poor animals. During the cold of winter, greatly increase your stock of manure. By having the manure under cover, you preserve the most nutritive parts of it, which are dissipated or lost by the action of frosts, and sun and rain; besides, you have it ready for your early hotbeds. This leads to the remark that if any person wishes to raise cucumbers, melons, capsicums, and tomatoes, so as to have them early, and to ensure success, let him provide a building of rough boards, sufficiently tight to keep out the snows of winter; and with a window in the roof, and another on the south side. The dimen-

sions may be such as square, or fourteen feet would contain one from two; the hotbed, as these, in the next month of early plants, to be air. Glass houses, so multiply in Charlottetown within the reach of early old shop or house-pense: they may be sent to another location necessary for forcing. See the Guide to the florist.

Cucumber—Early F packet; Melon—Christ Beechwood is much early, and the last 25 cents per packet,) Lettuce—Early Curled Silks—Early Davis, Hork or Early Enfield; hotbed frames and

Nothing can be done in the hotbed will be wanting. We may as well give the hotbed provided with a cover about the middle or end of the latter end of March. If you wish to start early—choose a site on the east or south side of the house or building on the north side. If the ground is frozen, it is best made of

Making the Bed.—Manure should be thrown over a hotbed, making it into a conical shape, and remain three or four days, and let so be covered again, and let so be covered, this in our climate may vary, in our climate may vary, depending on whether in the hotbed or eighteen inches deep, a stake at each corner, and towards the outer frame, the better. Proceed to dig up two and a half, to three feet deep with the fork, but by no means dry, add a little water. Let it stand and exhaust

sions may be such as suits the purse of the maker; but eight feet square, or fourteen by eight feet, would be a good size: the first two; the hotbed, as herein after directed, might be made inside these, in the next month, and would greatly facilitate the raising of early plants, to be transferred to other beds, or into the open air. Glass houses, such as it is pleasant to see, are beginning to multiply in Charlottetown—are better still, but they are not within the reach of everybody's means; while the others, by getting old shop or house windows, may be erected at no great expense: they may be so constructed as to take to pieces, and carried to another locality, if necessary. A list of the seeds necessary for forcing is subjoined; it is taken from Hovey's illustrated Guide to the flower and vegetable garden, 1867:

Cucumber—Early Frame, Early White Spine, (cost 5 cents per packet; Melon—Christiana, earliest kind; Green Citron, (the Beechwood is much esteemed in England—the two first are 5 cents, and the last 25 cents, per packet;) Capsicum; Squash; (5 cents per packet,) Lettuce—Early Green Paris, Cos, Early Dennis Ball, Early Curled Silesia, Early Drumhead or Malta; Cauliflowers—Early Davis, Hovey's Early American; Cabbage—Early York or Early Enfield; Tomato—Large Smooth Red. If you have hotbed frames and glasses, lose no time in ordering them.

FEBRUARY.

Nothing can be done in the open ground this month, but as a hotbed will be wanting, either in this or the subsequent month, we may as well give the necessary directions for making one. If provided with a covering as before stated, it may be made about the middle or end of this month. If to be made in the open air, the latter end of March or the beginning of April will be sufficiently early—choose a warm position, fully exposed to the sun, facing the east or south—the latter the best—and sheltered by a fence or building on the west or north. The ground being hard where, it is best made on the surface.

Making the Bed.—Manure fresh from the stable is best. This should be thrown over and thoroughly shaken up with the fork, making it into a conical heap. In this state it should be allowed to remain three or four days. Some then cause it to be turned over again, and let so be three or four days more; it is needless to say, this in our climate must be done under cover. Lay out the ground whether in the house before alluded to, or in the open air, about or eighteen inches larger than the frame, on all sides. Put down a stake at each corner, and if you enclose the place with boards on the outer frame, made for the purpose; it will be so much the better. Proceed to build up the head to the height of two and a half, to three feet,—making it rather firm, by striking with the fork, but by no means tramping upon it. If the manure is dry, add a little water. Put on the frame with the lights closed, and let it stand and exhaust the violent heat. In a day or two, if

pots only are to be used, add three or four inches of light rich sandy loam, spreading it evenly over the bed, if the seeds are to be sown in the soil of the bed three or four more inches of soil will be sufficient. If you have manure sufficient to make another hot-bed three weeks or a month later, by all means use pots, and these being ready and sown with the various seeds, plunge them into the soil, and with proper care the seeds will soon rise above the soil. Shade the bed during the day, and cover with mats or other materials at night. A thermometer placed in the bed will be the safest guide to the inexperienced: it should not rise above 85° in the day, nor sink below 60° at night. If, as is commonly the case with us, the bed is intended for the double purpose of raising melons or cucumbers, and forcing cauliflowers, lettuce, early cabbages, and flowers, plant the cucumber or melon seeds in the middle of each of the lights, four five or six seeds at about four inches from each other; if all come up, they can be thinned out—leaving only three under each light, or six plants in a two light frame. This is important, for most people are fond of leaving a much larger number, thinking thereby to save a larger supply of fruit. This is however a great mistake: the smaller number of plants will produce fruit of a far finer quality, and in greater abundance, than when the bed is over crowded. You may sow a few cauliflower, lettuce, early york cabbage, and celery seeds round the sides of the bed, but at the distance of nine or ten inches from the cucumber or melon plants. It is best to sow the flower seeds in small pots, placed at the extreme edges of the bed, close to the frame, so that they may be bedded out when the spring is somewhat advanced. Directions for this will be given under the titles of the different months. The proceeding instructions are intended for those who have money or the requisite convenience at hand. There is a class, and by far the most numerous, who must make use of less costly materials. Where horse dung is not to be had, that of cows will answer, if the cows have been bedded in straw; if not, straw should be added. In the Horticultural Gardens in Halifax, tanner's bark is used, mixed with horse dung. A layer of tanner's bark forms an excellent base for every hot bed, as it keeps the manure from the cold earth in the first place, and assists the fermentation in the second.

Farmers Gardens. It is a common excuse with agriculturists that they have not the time to spare from their other occupations for the cultivation of a garden—as if the products of the garden were of little or no value. This is a great mistake, as shall be shown. We would agree with them if the whole were to be cultivated by spade labor and hand weeding; but there is no necessity for that. Let there be a piece of ground not less than one acre, and not more than three, be enclosed in the usual manner. Lay off ten feet all round, and make a walk of four feet. The soil should be plowed and subsoiled and planted with potatoes the first season, to incorporate the soils. A sufficient number of apple and pear trees, should be provided, either at once, or in instalments—sufficient to plant the whole of the border thus

off, with trees at twenty feet apart. If the farmer cannot afford to plant the whole, let him begin with ten trees. Let him not however stick them into a hole, and tramp them in, and care no more about them, but place a small stake where the tree is to be planted, and then, with a piece of string two feet in length, with a loop at each end of it, and putting one round the stake, insert a small stick into the other, and trace a circle, which will thus be four feet in diameter. Dig the earth and clay within this circle to the depth of eighteen inches at the least; two or three feet would be better. Mix the surface soil intimately with the clay, adding manure or rich earth of every kind. When this has been done, and the earth levelled, make an excavation about six inches deep and sufficiently wide to take in all the roots of the tree to be planted. Take the tree and cut off the top root if there be any; place the tree in the centre of the hole, and carefully with the hand spread the roots evenly on the ground; cover with the soil from the excavation to the depth of six inches, and tread the earth in. Have ready one or two buckets of water, pour by degrees on the roots, gently shaking the tree during the operation, so that the earth may get between the fibres of the roots, and prevent any access of air to the roots. Have ready four stakes, from two and a half to three inches thick, and drive them down at equal distances, about six inches from the stem of the tree. Take a hay band and fasten by means of the stakes, place the tree in an upright position firmly, so that its roots will not be effected by the wind—it being of the utmost importance that the root should be kept for the season in a perfectly quiescent state, in order to enable it to thrust out new radicles. The future progress of the tree and the goodness of the fruit pays the farmer for his trouble. The middle of the garden may then be manured, plowed, harrowed and sown in the usual mode, with carrots, parsnips, beets, turnips, and mangle wortzel—drilled in and kept clean with the horse hoe. A part will be reserved for cabbages; these when planted will need to be at first hand hoed, but afterwards treated like the rest. It should have been previously stated, that the ground of the borders between the apple and pear trees can be planted at leisure, with red, white, and black currants, and gooseberries. A very small portion of the garden nearest the house may be cultivated by the girls and boys; and lettuces, parsley, summer savory, and other sweet herbs, a bed of mint, and cabbage plants may with no great trouble, and productive of great comfort, be raised.

MARCH.

If you are well provided with the materials for making a hotbed, and for keeping it from the effects of the cold days and nights, you may begin to make it during the first fortnight of this month. If but slenderly provided, defer it to the last week in this or the first in the succeeding month. Look over your tools. It will be well if you make a rough plan of your garden, and settle where you intend to sow or plant; and be careful not to sow or plant

the same things in the place where they were sown or planted the year before, in other words to have a rotation of crops, with the exception of onions, which appear to thrive best when kept in the same bed, if plentifully supplied with nutriment. This will be a good time to send for seeds and bulbs of plants. As you may wish to plant an asparagus bed, your best plan would be to send during this month to Boston, or where else they can be procured for plants two years old, which may be had for about two dollars the hundred; they will come into partial cutting the next season after they are planted. *Mode of making the bed.*—Be particular to select for the bed warm rich soil. Trench it at least eighteen inches deep, working in six inches or more depth of well rotted manure. After the surface has been made completely even with the rake, make drills four inches deep lengthwise, at the distance of one foot apart; plant the roots one foot apart in the rows, and cover to the depth of two or three inches. Keep the beds well weeded during the summer. In the fall cover the bed well with rotted manure, which fork on lightly in the ensuing spring, taking care not to disturb the roots. In the spring after the frost has left the ground sow the bed with refuse salt, or water it with old pickle or seawater; by following these directions you will have an asparagus bed which will last your lifetime and that of your children.

There is a species of spinach called by some Mercury by others Good Henry or perpetual spinach. A bed of this ought to be in every garden in a climate like ours. It is propagated by seed or plants. Choose a spot in your garden well sheltered and open to the east or south. If to raise by seed prepare the bed as directed for asparagus, and sow the seed two or three at a time, at intervals of a foot apart. When they have grown to the length of two or three inches, thin them out leaving only one at every foot distance. Keep the bed clean of weeds and in a year or two you need never want for one of the wholesomest spring greens. Or procure the seed in summer, and select a piece of good rich ground, and sow the seed in rows ten inches apart; tread the seed well in mark the rows by sticks at either end so that you may weed between them let the plants remain in the bed until the following spring, when they may be planted like asparagus a foot apart. It will appear the first thing in spring, often coming up under the snow. There are several persons in Charlottetown, who have beds of this excellent vegetable, who would have pleasure in giving seed, which is very abundant.

Nothing has hitherto been said about trees or shrubs, either for fruit or ornament. We have some leisure at our disposal, which we shall use for the purpose of giving some directions concerning each. *Fruit Trees and Bushes.* Unless you have a large piece of ground at your disposal, it is not advisable to plant many fruit trees; but where you do plant, do it well. Apples are not advisable in a moderate sized garden. A dwarf pear or two, the like number of cherries, a green gage—with some others the egg plant, or the orleans,—will probably be sufficient. As to the mode

of planting them; There are now seen are peculiarly fitted present in P. E. Is suited to our soil a provinces are loud propagated by cut when the plants are soil." As to the mode

of planting them; directions have been already given. *Currants.* There are now several sorts of this fine and easily raised fruit, and are peculiarly fitted for a small garden as are the majority at present in P. E. Island. 1st the Black currant. This is especially suited to our soil and climate, and strangers from the neighboring provinces are loud in their praise of the fruit grown here. It is propagated by cuttings. Miller says, "The fruit is always best when the plants are placed in an open situation, and in light loamy soil." It is liable to be attacked by a species of caterpillar. To cure this on Currants and gooseberries, it is recommended to sprinkle the bushes with tobacco water. The stalks of the tobacco plant can be had from the tobacconists. 2nd. Red and White currants. The best sorts are the Large Red, Long Clustered Red, and White Dutch. They may be advantageously trained against a fence or side of a house. The White raspberry is a desirable addition, and is easily cultivated. The shoots of last year, technically called canes, can be easily procured from any old garden where the plant is cultivated. They should be planted in rows three feet apart, and four feet between each row.

APRIL.

The weather is now becoming milder, and spring may be said to have commenced. Your first thing to be done is to make your hotbed; if it has not been done in the preceeding month. Directions have already been given for making and planting it. All that can be now said, is that if you intend to have cauliflowers, tomatoes, or capsicums, or early plants of any sort they must be forced in this month. Plant out cabbage stumps or swede turnips for early greens. Put in as early as the ground will allow. Broad or Winsor beans, a row of early peas, early Daniel O'Rourke Hovey's extra early, or Carters first crop. Sow a small bed of lettuce for early planting—large India white Paris cos, or green Paris cos, though in this case as in many others, you must be guided by the sorts you find in the seed shops. Parsnips and onions cannot be sown too early. For both, the ground should be dug deeply—18 inches at least. Sow parsnips in drills a foot apart. You can hardly make the ground too rich for onions; wood ashes and soot are both good. The seed should be sown in drills, ten inches asunder; thinned out, when three inches high, to four inches between each plant. Sow radish broad cast for early crop. Many people mix lettuce seed with it, pulling the radish, and allowing the lettuce to stand. Sow a small bed of celery, also of parsley. Remember these directions are given on the supposition of an early spring, should it turn out otherwise, they must be observed as early as possible in the succeeding month.

MAY.

If not done before rake off the covering from the asparagus bed and rhubarb, and fork both slightly, ever taking care not to hurt the crowns of the roots. Sow early turnips—early white dutch,

or early stone; these may be sown broad cast, but carrots should be sown in drills as directed for parsnips and onions. Plant early ash leaved or governors white potatoes in drills, two feet apart and one between the sets. A row of peas during the early part of this month. Shalots should be planted as early as possible this month, in drills a foot apart and six inches asunder. The potatoe onion likewise, in drills eighteen inches apart, and a foot between each bulb. Sow Early York, Drumhead, Early Enfield and Savoy cabbage seed. If the bed be covered with old pea rods or spray of any kind, it will materially help to keep off the fly. Should this destructive insect prove likely to be troublesome, water the bed, and dust the plants lightly with dry soot.

The ladies must now look to their flower gardens, prune the rose bushes, and dig between the perennials.

Should the weather prove adverse, many things which we advised doing in the previous month must be done in this. The weeds are already beginning to spring; they must be kept down by either hand-weeding or hoeing; for the latter we recommend the Polish hoe: it is a species of short stub scythe, set on a long handle; can be had at all the American tool shops. As during this and the early part of the next month is the time for transplanting, a few directions will be of use. In putting out cabbages, cauliflowers, and broccoli, the best plan is to plant them at the least two feet apart; then put in lettuce plants between each; by this method you are certain not to have your larger plants over-crowded, and as the lettuce comes to maturity first it can be cut out, leaving room for the other to grow. Get a good piece of ground ready for your sweet herbs; let it be moderately rich, well mixed, and raked fine. Sow either in the latter end of this, or the beginning of next month—in drills about 9 or 10 inches apart, and thin out to 5 or 6 in the drill—thyme, summer savory, and sweet marjoram.

In some sheltered place, but open to the sun, sow sage seed; thin out as directed above, and transplant, if you like, ten inches apart. Sage is a perennial plant, and, if protected, will keep throughout the winter. A bed of mint may be now made: get roots from some old garden; plant it in rows a foot apart; keep free of weeds the first season, and if the soil be rich the plants will have so occupied the ground as to need nothing further. Many people are fond of English sorrel; it is easily raised, and makes a good border. Sow mustard and cress in drills; be not sparing of the seed, and let the ground be rich. You should make two more sowings during the month, if you are fond of the articles. Sow radishes again—get mixed seed. Peas must be sown for a general crop the latter end of the month; the quantity must depend both upon the size of your garden, and the number of your family; the sorts we would recommend are—Early Charlton, Champion of England, Large White Marrowfat, Dwarf do., Blue Imperial. Plant Indian Corn. Early bush beans. Sow carrots; for winter, use Early French Horn and Long Orange.

JUNE.

Keep down weeds. Sow Early Turnip beet in the first of this month, and a little later the Blood Red. If sown earlier, the plant is, though biennial, apt to seed, and the roots to get woody. Trenches for celery may be made and planted when convenient. The usual way of managing celery is to dig a trench a foot or so deep; the earth from the top is returned into the trench to the depth of six inches; in it the plants are placed, at the distance of six, eight, or ten inches. They should be covered with a board to keep the heat of the sun from the plants till they have struck. The boards may then be removed, and the plants left to themselves. We will give directions for earthing up by and by. Continue to transplant lettuce and cabbage plants. Capsicum plants ought now to be put out. Make a bed of good rich soil, in size according to the number of plants you may have, so that they may be put at the distance of at the least a foot apart. Water frequently at first, and afterwards more sparingly. The tomato is becoming one of the necessities of vegetable diet. It does not require a very rich ground: on the contrary, a rather poor soil suits it best, as it gets most of its nourishment from the air, and bears more abundantly when the vegetation is not so rampant as it inclines to be in a good soil. They thrive best planted next a wall or the side of a building to which they may be trained. If in the open ground, sticks or trellices must be provided. Barrel hoops, supported by sticks, at from 8 to 10 inches apart, to the height of 5 or 6 feet, is a very profitable, as well as pretty, way of supporting them. Put a few squash seeds among your Indian corn. Early Yellow Bush, scalloped for summer use, and Hubbard, for winter, will be found sufficient. Early in this month, if not done in the latter part of the former month all kinds of annual flower seeds are to be sown. The generality may be in small patches, and thinned out when above ground. Some perennials, such as carnations, stocks and wall flowers, must be planted out singly, and for the purpose of raising plants, a small portion of the kitchen garden may be appropriated. They are sown in the usual way, in drills 8 or 9 inches apart, and thinned out to about 2 to 6 inches.—Directions will be given in one of the subsequent months as to the mode of preserving them through the winter. The following are the most common:—pinks, carnations, sweet williams, hollyhocks, primroses, polyanthus, snap dragon, wall-flower, pyrethrum, auricula.

The half-hardy annuals, such as German Aster, Zinnia, balsams, canary-bird flower, and a number of others, easily procured at the seed shops, must be forced under glass, or raised in the house, and transplanted into the flower border during this month. To give directions as to raising each and all of the flower tribe would take up more space, and occupy more time than can be at present afforded.

JULY.

You must be very busy in this and the succeeding month in weeding, for the weeds will get the better of the plants. Hoe potatoes, corn, cabbage and cauliflowers. Thin out carrots, parsnips, beets, onions, turnips, as directed. Plant bush and French beans in rows; also pole beans or runners in hills, or if you like better, in rows, and if you fix the poles lattice wise, the beans will run equally well on them, and will resist the force of the wind better. Some of your peas will want rods or laths.

Look well to your cucumbers and melons, if you have any, and prune carefully, by shortening the vines, and cutting out where too thick.

Have ready some forked sticks, to keep the shoots separate, and prevent their matting by means of their tendrils. Try, however, before you do so, to get practical information from some skilled gardener. Have an eye to tomatoes; tie them to sticks, trellices or hoops. This plant stands a great deal of pruning, and is the better for it. Do not be sparing of water, mornings or evenings, but not in the middle of the day, if the sun be bright. Plant celery in trenches for winter use. As it grows, earth it up, taking care not to cover the centre of the plant. Choose dry weather for this operation.

AUGUST.

You are still to be reminded of the necessity of hoeing, weeding and watering; as much, or more wanted in this month as in the preceding ones. Earth up celery. Take the glasses off the hot-beds. If very partial to green peas, you may try a row of the very early kinds. If planted this month, may yield a crop in the latter end of September. Your garden ought now to be repaying you for your labor. If you intend to raise the strawberry in perfection, begin to make your bed. Choose an open compartment; dig eighteen inches deep at the least, and as much deeper as you please; put in plenty of good compost, and mix well; let it lie until October, turning the weeds down with the fork or spade. On the ground in which you have raised your early potatoes, you may sow radish—mixed,—they will come in just as your lettuces are giving out. Some of your early peas will now have begun to wither; pull up your sticks and laths, and lay them carefully aside—they will both come into use again.

SEPTEMBER.

There is little else to be done in this month, save having the pleasure and comfort of gathering and enjoying the products of the garden. Keep cleaning up as often as may be requisite. Many things will require weeding, and, above all, watering. Look to your cauliflowers, where you find them heading, or, more properly, flowering; break or pinch the larger leaves, so that they may fall over and shade the head or flower from the intense rays of the sun—this will serve to keep them white and tender. Dig some

der, Kent Street.

roots of parsley, and plant them in a box. If your cellar be deep, and lighted with a double window, you may have parsley during the winter.

In the latter part of this month, or the beginning of the next, pull your onions and house them, in a cool place, free from frost. The shalots may be taken in earlier. They themselves give notice when to gather them, by their leaves turning yellow.

OCTOBER.

Continue to earth up your celery. There are some who do not earth at all; they enclose the plants when grown in a frame of boards, and, as the plants increase in size, fill in with dry seaweed or other substances that will exclude the light, and not impair the growth of the plant. Some people are fond of endive when blanched in the same way as celery; and the common dandelion, if covered with a stone, or a board, will in the spring of the year whiten or blanch, so as to become a very agreeable, as well as very wholesome, salad. Take up carrots, and place them in the cellar; put them in boxes or barrels—this will keep them dry, and prevent their sprouting, which would greatly injure them;—they should be looked to during the winter months and kept dry. Beets should also be lifted and treated much in the same way.

The early part of this month is the best for planting your strawberry bed, prepared as before directed. Get from Boston or New York plants of the best species for the climate; those which suit the State of Maine will answer well here. Plant them in rows a foot or more apart, and the same distance in the rows; in the next month cover them with pea rods or any light haulm, or, what is better, spruce boughs; when the spring has melted the snow; remove the covering; press them carefully into the earth, and keep them free of weeds; keep cutting the runners until the plant has ceased to bear fruit.

NOVEMBER.

The out-door operations of the gardener have pretty nearly come to an end. Having taken up your cabbages, put them into a place free from intense frosts, but sufficiently cold to prevent them from growing. On the other hand, those cauliflowers which have not flowered, should be placed in a cellar sufficiently warm to encourage their growth, but not so damp and close as to rot the plants; the roots should be covered with damp, not wet, earth. You will, by this means, have cauliflowers in January and February.

Trench up all the vacant places in the garden, so that the land may be the more ready for the crop in the spring.

DECEMBER.

Gather up your tools, repair if necessary, and take care of them until wanted. All that remains is to apologize for any errors or omissions that may be found in the foregoing pages. Should the

writer be alive and well next year he trusts to make it more perfect. There is no part of these northern colonies where the raising of fruits and vegetables can be accomplished with greater certainty of success than in Prince Edward Island, if but common care and attention be given to their care and management.

There ought to be here, as in most parts of America, Horticultural and Pomological Societies. These, by instituting shows and giving prizes for the best specimens of fruits, vegetables and flowers, would enable us in a little while to compete with any of the surrounding colonies.

Any one who examined the fruit table at the late Exhibition in the Drill Shed, could not but be convinced that the Island is capable of raising fruit of the finest quality—why then are we dependent upon foreigners? It is to be hoped that by individual exertion, coupled with some slight aid from the Government, that a change for the better may be effected in this department of industrial exertion.

MAYOR'S COURT.—This Court, established for the purpose of adjudicating in cases of Small Debts, is composed of His Worship the Mayor, with two Councillors; or, in the Mayor's absence, three Councillors. Its sittings are held at the City Hall, on the first Wednesday in each month, with power to adjourn to the following day. The last day of issuing summonses for the monthly sittings, is the Monday week previous to the first said Wednesday. The Act gives jurisdiction to the extent of £20 in cases of debt and trover, and to £5 in slander, detinue and replevin.

THE QUEEN AND ROYAL FAMILY.

THE QUEEN.—Victoria, of the United Kingdom of Great Britain and Ireland, &c. Queen, Defender of the Faith. Her Majesty was born at Kensington Palace, May 24, 1819; succeeded to the throne June 20, 1837, on the death of her uncle King William IV; was crowned June 28, 1838; and married Feb. 10, 1840, to his Royal Highness, Prince Albert. Her Majesty is the only child of his late Royal Highness Edward, Duke of Kent, son of George III. The children of Her Majesty are:

Her Royal Highness Victoria-Adelaide-Mary-Louisa, **PRINCESS ROYAL OF ENGLAND and PRUSSIA**, born Nov 21, 1840; and married to his Royal Highness William of Prussia, Jan 25, 1858, and has issue two sons and a daughter.

His Royal Highness Albert Edward, **PRINCE OF WALES**, born Nov. 9, 1841; married, March 10, 1863, Alexandra of Denmark (**Princess of Wales**) born Dec. 1, 1844, and has issue two sons, Prince Albert-Victor, born Jan. 8, 1864, and George-Frederick-Ernest-Albert, born June 3, 1865.

Her Royal Highness Alice-Maud-Mary, born April 25, 1843; married to H. R. H. Prince Frederick Louis of Hesse, July 1, 1862, and has issue two daughters and a son.

His Royal Highness Alfred-Ernest-Albert, born August 6, 1844.

Her Royal Highness Helena-Augusta-Victoria, born May 25, 1846; married to his Royal Highness Prince Frederick Christian Charles Augusta of Schleswig-Holstein-Sonderburg-Augustenburg, July 5, 1866.

Her Royal Highness Louisa-Carolina-Alberta, born March 18, 1848.

His Royal Highness Arthur-William-Patrick-Albert, born May 1, 1850.

His Royal Highness Leopold-George-Duncan-Albert, born April 7, 1853.

Her Royal Highness Beatrice-Mary-Victoria-Feodore, born April 14, 1867.

George-Frederick-William-Charles, K. G., **DUKE OF CAMBRIDGE**, cousin to Her Majesty, born March 26, 1819.

Augusta-Wilhemina-Louisa, **DUCHESS OF CAMBRIDGE**, niece of the Landgrave of Hesse and aunt to her Majesty, born July 25, 1795; married, in 1818, the late Duke of Cambridge.

George-Frederick-Alexander-Charles-Earnest-Augustus, K. G., **DUKE OF CUMBERLAND**, cousin to her Majesty, born March, 1819; married Princess Frederica of Mecklenburg-Strelitz, and has issue a son and two daughters.
