The copy filmed here has been reproduced thanks to the generosity of:

National Library of Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol → (meaning "CONTINUED"), or the symbol ▽ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

Bibliothèque nationale du Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole → signifie "A SUIVRE", le symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

KEY

TO THE

ATIONAL ARITHMETIC;

CONTAINING

ull Solutions to nearly all the Problems,

DESIGNED FOR THE

E OF TEACHERS AND PRIVATE STUDENTS.

BY JOHN HERBERT SANGSTER, M.A., M.D.,
MATHEMATICAL MASTER AND LECTURER IN CHEMISTRY AND NATURAL PHILOSOPHY IN THE NORMAL SCHOOL FOR ONTARIO.

THIRD EDITION—CAREFULLY REVISED.

Montreal:
PRINTED AND PUBLISHED BY JOHN LOVELL,
AND FOR SALE AT THE BOOKSTORES.
1870.

PREFACE.

It was the original intention of the Author to give, in the Key, merely a series of brief hints upon the Solutions of the more difficult Problems. He was led to modify this plan, and to issue the work in its present form, chiefly from the consideration that as there are in the country many young persons who, from various causes, are unable to avail themselves of the advice and assistance of a teacher, it would be a great boon to these to have access to a book to which they might refer with the certainty of having every doubt removed as to the correctness of their work and methods of solution. He offers the work to his fellow-teachers with the hope that they will accord it the same favorable reception that they have so kindly given to the National Arithmetic.

$$\frac{11}{13} + \frac{10}{13} + \frac{9}{13} = \frac{30}{13} = 2\frac{4}{13}.$$

(2)

$$\frac{1}{12} + \frac{6}{12} + \frac{7}{12} + \frac{9}{12} + \frac{11}{12} + \frac{5}{12} = \frac{39}{12} = 3\frac{3}{12} = 3\frac{1}{4}.$$

(3)

$$4\frac{3}{7} + 11\frac{1}{7} + 16\frac{2}{7} + 21\frac{3}{7} + 19\frac{5}{7} = 4 + 11 + 16 + 21 + 19 + (\frac{3}{7} + \frac{1}{7} + \frac{2}{7} + \frac{3}{7} + \frac{5}{7}) = 71 + \frac{14}{7} = 73.$$

(4)

$$16\frac{3}{23} + 11\frac{17}{23} + 18\frac{4}{23} + 17\frac{19}{23} + 112\frac{23}{23} = 16 + 11 + 18 + 17 + 112 + (\frac{31}{23} + \frac{17}{23} + \frac{4}{23} + \frac{19}{23} + \frac{23}{23}) = 174 + \frac{83}{23} = 174 + 3\frac{14}{23} = 177\frac{14}{23}$$

(5)

$$4\frac{1}{4} + 1\frac{1}{3} + \frac{7}{11} = 4 + 1 + (\frac{1}{4} + \frac{1}{3} + \frac{7}{11}) = 5 + (\frac{33}{132} + \frac{44}{132} + \frac{84}{132}) = 5 + \frac{161}{132} = 6\frac{29}{132}.$$

(6)

$$\frac{1}{2} + \frac{2}{3} + \frac{3}{4} + \frac{4}{5} + \frac{5}{6} + \frac{6}{7} + \frac{7}{8} + \frac{8}{9}.$$

These fractions reduced to their least common denominator become $\frac{12600}{25220} + \frac{16800}{25220} + \frac{18900}{25220} + \frac{20160}{25220} + \frac{21000}{25220} + \frac{21600}{25220} + \frac{22050}{25220} + \frac{22410}{25220} = \frac{155521}{25220} = 6\frac{23121}{25220}$.

(7)

$\frac{3}{4} + \frac{5}{6} + \frac{4}{5}$ when reduced to their least common denominator become $\frac{45}{60} + \frac{50}{60} + \frac{48}{60} = \frac{143}{60} = 2\frac{23}{60}$.

(8)

$\frac{4}{5} + \frac{5}{6} + \frac{6}{7} + \frac{3}{4} + \frac{8}{11}$.

These fractions when reduced to their least common denominator become $\frac{7392}{9240} + \frac{7700}{9240} + \frac{7920}{9240} + \frac{6930}{9240} + \frac{6720}{9240} = \frac{36962}{9240} = 3\frac{6477}{9240}$.

(9)

$\frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \frac{1}{7}$.

These fractions when reduced to their least common denominator become $\frac{210}{420} + \frac{140}{420} + \frac{105}{420} + \frac{84}{420} + \frac{70}{420} + \frac{60}{420} = \frac{668}{420} = \frac{293}{140} = 1\frac{83}{140}$.

(10)

$16\frac{3}{11} + 47\frac{2}{9} + 21\frac{17}{33} + \frac{7}{18} + 19\frac{1}{2} = 16 + 47 + 21 + 19 \times (\frac{3}{11} + \frac{2}{9} + \frac{17}{33} + \frac{7}{18} + \frac{1}{2})$.

$16 + 47 + 21 + 19 = 103$.

$\frac{3}{11} + \frac{2}{9} + \frac{17}{33} + \frac{7}{18} + \frac{1}{2} = \frac{486}{1782} + \frac{396}{1782} + \frac{918}{1782} + \frac{693}{1782} + \frac{891}{1782} = \frac{3384}{1782} = \frac{376}{198} = \frac{188}{99} = 1\frac{89}{99}$.

$103 + 1\frac{89}{99} = 104\frac{89}{99}$.

(11)

$17\frac{1}{2} + 43\frac{3}{7} + 168\frac{4}{5} + 207\frac{8}{21} + 506\frac{125}{126} = 17 + 43 + 168 + 207 + 506 + (\frac{1}{2} + \frac{3}{7} + \frac{4}{5} + \frac{8}{21} + \frac{125}{126})$.

$17 + 43 + 168 + 207 + 506 = 941$.

$\frac{1}{2} + \frac{3}{7} + \frac{4}{5} + \frac{8}{21} + \frac{125}{126} = \frac{63}{126} + \frac{54}{126} + \frac{100}{126} + \frac{48}{126} + \frac{125}{126} = \frac{348}{126} = \frac{174}{63} = 2\frac{48}{63}$.

$941 + 2\frac{48}{63} = 943\frac{48}{63}$

(12)

$6\frac{3}{4} + 11\frac{4}{7} + \frac{9}{56} + 16\frac{7}{16} + \frac{1}{2} + \frac{5}{21} + 17\frac{11}{12} = 6 + 11 + 16 + 17 + (\frac{3}{4} + \frac{4}{7} + \frac{9}{56} + \frac{7}{16} + \frac{1}{2} + \frac{5}{21} + \frac{11}{12})$.

$6 + 11 + 16 + 17 = 50$.

$\frac{3}{4} + \frac{4}{7} + \frac{9}{56} + \frac{7}{16} + \frac{1}{2} + \frac{5}{21} + \frac{11}{12} = \frac{252}{336} + \frac{192}{336} + \frac{54}{336} + \frac{147}{336} + \frac{168}{336} + \frac{80}{336} + \frac{308}{336} = \frac{1201}{336} = 3\frac{193}{336}$.

$50 + 3\frac{193}{336} = 53\frac{193}{336}$.

(13)

$\frac{1}{2} + \frac{2}{3} + \frac{7}{5} + 68\frac{1}{4} = 68 + (\frac{1}{2} + \frac{2}{3} + \frac{7}{5} + \frac{1}{4})$.
$\frac{1}{2} + \frac{2}{3} + \frac{7}{5} + \frac{1}{4} = \frac{30}{60} + \frac{40}{60} + \frac{42}{60} + \frac{15}{60} = \frac{127}{60} = 1\frac{67}{60}$.
$68 + 1\frac{67}{60} = 69\frac{67}{60}$.

(14)

$173\frac{3}{8} + 85\frac{5}{7} + 91\frac{11}{13} = 173 + 8 + 91 + (\frac{3}{8} + \frac{5}{7} + \frac{11}{13})$.
$173 + 8 + 91 = 272$.
$\frac{3}{8} + \frac{5}{7} + \frac{11}{13} = \frac{273}{728} + \frac{520}{728} + \frac{616}{728} = \frac{1409}{728} = 1\frac{681}{728}$.
$272 + 1\frac{681}{728} = 273\frac{681}{728}$.

(15)

$1\frac{15}{16} + 2\frac{23}{24} + 3\frac{24}{25} + 4\frac{29}{30} = 1 + 2 + 3 + 4 + (\frac{15}{16} + \frac{23}{24} + \frac{24}{25} + \frac{29}{30})$.
$1 + 2 + 3 + 4 = 10$.
$\frac{15}{16} + \frac{23}{24} + \frac{24}{25} + \frac{29}{30} = \frac{6750}{7200} + \frac{6900}{7200} + \frac{6912}{7200} + \frac{6960}{7200} = \frac{27522}{7200} = \frac{1529}{400} = 3\frac{329}{400}$.
$10 + 3\frac{329}{400} = 13\frac{329}{400}$.

(16)

(17)

$7 + 11\frac{1}{2} + 18 + 26\frac{3}{7} + 79\frac{4}{11} = 7 + 11 + 18 + 26 + 79 + (\frac{1}{2} + \frac{3}{7} + \frac{4}{11})$.
$7 + 11 + 18 + 26 + 79 = 141$.
$\frac{1}{2} + \frac{3}{7} + \frac{4}{11} = \frac{77}{154} + \frac{66}{154} + \frac{56}{154} = \frac{199}{154} = 1\frac{45}{154}$.
$141 + 1\frac{45}{154} = 142\frac{45}{154}$.

$\frac{5}{8} + \frac{1}{6} + \frac{33}{48} = \frac{30}{48} + \frac{8}{48} + \frac{33}{48} = \frac{71}{48} = 1\frac{23}{48}$. $28 + 1\frac{23}{48} = 29\frac{23}{48}$.

$10\frac{1}{12} + 6\frac{5}{16} + 15\frac{41}{640} + 1\frac{8}{9} = 10 + 6 + 15 + 1 + (\frac{1}{12} + \frac{5}{16} + \frac{41}{640} + \frac{8}{9}) = 32 + (\frac{1}{12} + \frac{5}{16} + \frac{41}{640} + \frac{8}{9})$.

$\frac{1}{12} + \frac{5}{16} + \frac{41}{640} + \frac{8}{9} = \frac{840}{10080} + \frac{9450}{10080} + \frac{661}{10080} + \frac{8960}{10080} = \frac{28133}{10080} = \frac{4021}{1440} = 2\frac{1138}{1440}$.

$\frac{3}{5}$ of the longer $= \frac{3}{4}$ of the shorter; therefore $\frac{1}{5}$ of the longer $= \frac{1}{2}$ of $\frac{3}{4} = \frac{3}{8}$ of the shorter.

Hence the longer $= \frac{3}{8} \times 3 = \frac{9}{8}$ of the shorter.

The whole tree = longer + shorter $= \frac{9}{8} + \frac{8}{8}$ of shorter $= \frac{17}{8}$ of the shorter.

If 136 ft. $= \frac{17}{8}$ of the shorter, $\frac{1}{17}$ of 136 $= 8 = \frac{1}{8}$ of the shorter.

Hence shorter $= 8 \times 8 = 64$ ft.; and longer $= 136 - 64 = 72$ ft.

$1\frac{7}{11}$, $\frac{4}{5}$, $\frac{2}{7}$, $\frac{5}{33}$, $\frac{11}{14}$, $1\frac{7}{10}$, $\frac{1}{2}$.

The least common multiple of 11, 5, 7, 33, 14, 10 and 2 is 2310.

The multiplier for both terms of the first fraction is $\frac{2310}{11} = 210$; for the second, $\frac{2310}{5} = 462$; for the third, $\frac{2310}{7} = 330$; for the fourth, $\frac{2310}{33} = 70$; for the fifth, $\frac{2310}{14} = 165$; for the sixth, $\frac{2310}{10} = 231$; for the seventh, $\frac{2310}{2} = 1155$.

Multiplying by these numbers, we obtain $\frac{1470}{2310}$, $\frac{1848}{2310}$, $\frac{2970}{2310}$, $\frac{560}{2310}$, $\frac{1815}{2310}$, $\frac{1617}{2310}$, and $\frac{1155}{2310}$ for the required fractions.

Then $P = \frac{A}{1+rt} = \frac{1342{\cdot}50}{1{\cdot}022\frac{12}{24}} = \$1313{\cdot}266.$

(6)

Here $A = \$2400$, $r = {\cdot}05$, and $t = \frac{236}{365}$ year. Whence $1 + rt = 1{\cdot}03\frac{17}{73}$.

Then $P = \frac{A}{1+rt} = \frac{2400}{1{\cdot}03\frac{17}{73}} = \$2324{\cdot}84.$

$\$3024 - \$2873{\cdot}9536 = \$150{\cdot}0464$ = Discount required.

(14)

Here in first case $A = \$440$, $r = {\cdot}08$, and $t = 1{\cdot}25$. Whence $1 + rt = 1{\cdot}1$.

\$0·87½ = buying price.

\$0·32½ = gain per bushel
\$0·32½ × 2138 = \$694·85.

(3)

$0·37½ × 1178·1=$441·7875 = ad valorem duty.
$1178·10+$441·7875+$20·33=$1646·2175=whole cost.
$1646·2175—$1625=$21·2175 loss.

EXERCISE 120—Page 276.

(1)

Here for every $1 I expend I wish to receive $1·30, and hence the selling price will be $3·25 × 1·30 = $4·22½.

(2)

Here for every $1 I expend I wish to receive $1·05, and hence the selling price will be $1·05 × 13420 = $14091.

(3)

Here for every $1 I expend I desire to receive $1·15, and hence the selling price will be $1·15×·11 = $0·1265 = 12$\frac{13}{20}$ cents.

(4)

Here for every $1 I expend I wish to receive $1·23, and hence the selling price will be $1·23 × 15·25 = $18·75¾.

(5)

Here for every $1 I expend I am willing to receive $0·89, and hence the selling price will be $0·89×7880=$7022·10.

EXERCISE 121—Page 277.

(1)

Here the whole gain is $\$0\cdot87\frac{1}{2} - \$0\cdot60 = \$0\cdot27\frac{1}{2}$.

That is, $\$0\cdot60$ gains $\$0\cdot27\frac{1}{2}$, and therefore 1 cent gains $\frac{27\frac{1}{2}}{60} = \frac{55}{120} = \frac{11}{24}$ of a cent.

And hence, the gain per cent $= \frac{11}{24} \times 100 = \frac{1100}{24} = 45\frac{5}{6}$ per cent.

(2)

Here the loss on each lb. is 2 cents.

That is, every 13 cents invested gives a loss of 2 cents.

Therefore every cent invested loses $\frac{1}{13}$ of $2 = \frac{2}{13}$ cents.

And hence, the loss per cent $= \frac{2}{13} \times 100 = \frac{200}{13} = 15\frac{5}{13}$ per c.

(3)

Here the gain on each barrel is $\$1\cdot60$.

That is, every $\$6\cdot20$ invested gives a gain of $\$1\cdot60$.

Therefore every $\$1$ invested gains $\frac{1}{620}$ of $160 = \frac{8}{31}$ of a $.

And hence, the gain per cent $= \frac{8}{31} \times \frac{100}{1} = 25\cdot8 = 25\frac{4}{5}$ p. c.

(4)

Here the gain on each yard is 35 cents.

That is, every $\$2\cdot75$ invested gives a gain of 35 cents.

Therefore every $\$1$ invested gains $\frac{1}{275}$ of $35 = \frac{35}{275} = \frac{7}{55}$ of a dollar.

And hence the gain per cent $= \frac{7}{55} \times 100 = \frac{700}{55} = 12\frac{8}{11}$ p. c.

(5)

Here the gain on every bushel is 9 cents.

That is, every 47 cents invested gives a gain of 9 cents.

Therefore every cent invested gains $\frac{1}{47}$ of $9 = \frac{9}{47}$ cents.

And hence the gain per cent $= \frac{9}{47} \times 100 = \frac{900}{47} = 19\frac{7}{47}$ p. c.

(6)

Here the loss on each lb. is $1\frac{1}{2}$ cents.
That is every 12 cents invested gives a loss of $1\frac{1}{2}$ cents.
Therefore every cent invested loses $\frac{1}{12}$ of $1\frac{1}{2} = \frac{1}{8}$ of a cent.
And hence, the loss per cent $= \frac{1}{8} \times 100 = \frac{100}{8} = 12\frac{1}{2}$ p. c.

(7)

Here the whole gain is $\$127 - \$93 = \$34$.
That is, \$93 gain \$34, and therefore \$1 gains $\frac{34}{93}$ of a dollar.
Hence, gain per cent $= \$\frac{34}{93} \times 100 = \frac{3400}{93} = 36\frac{52}{93}$ per cent.

(8)

Here the loss is $\$6742{\cdot}50 - \$6000 = \$742{\cdot}50$.
That is, \$6742·50 loses \$742·50, and therefore \$1 loses $\frac{1}{6742{\cdot}50}$ of $742{\cdot}50 = \frac{100}{899}$ of a dollar.
Hence loss per cent $= \$\frac{100}{899} \times 100 = \frac{10000}{899} = 11\frac{111}{899}$ per cent.

(9)

Here $\$5700 + \$275 + \$1987{\cdot}32 = \$7962{\cdot}32 =$ whole sum expended.
Whole gain $= \$8750 - \$7962{\cdot}32 = \$787{\cdot}68$.
That is, \$7962·32 gains \$787·68, and therefore \$1 gains $\frac{1}{796232}$ of $787{\cdot}68 = \frac{9846}{9952900}$ of a \$.
Hence gain per cent $= \$\frac{9846}{9952900} \times 100 = \frac{984600}{9952900} = 9{\cdot}89$ or nearly 10 per cent.

(10)

$\$4{\cdot}25 \times 723 = \$3072{\cdot}75 =$ price of 723 yds. @ \$4·25.
$\$3072{\cdot}75 \times {\cdot}07 = \$215{\cdot}0925 =$ amount for Insurance.
$\$3072{\cdot}75 \times {\cdot}22 = \$676{\cdot}005 =$ amount for ad valorem duty.
Then whole cost $= \$3072{\cdot}75 + \$215{\cdot}0925 + \$23{\cdot}70 + \$2{\cdot}70 + \$3{\cdot}16 + \$676{\cdot}005 = \$3993{\cdot}4075$.
Whole gain $= \$5270 - \$3993{\cdot}4075 = \$1276{\cdot}5925$.
That is, \$3993·4075 gains \$1276·5925 ∴ \$1 gains $\frac{1}{3993{\cdot}4075}$ of $\$1276{\cdot}5925 = \frac{A.\ 0837}{1697305}$ of a \$.
Hence gain per cent $= \$\frac{A.\ 0837}{1697305} \times 100 = 31{\cdot}96749$ or nearly 32 per cent.

EXERCISE 122—Page 278.

(1)

Loss on \$1 is 4 cents, or for every \$1 paid I receive \$0·96.
Hence cost = \$24·60 ÷ 0·96 = \$25·625.

(2)

Loss on \$1 is 10 cents, or for every \$1 paid he receives \$0.90.
Hence cost = \$2360 ÷ ·90 = \$2622·22.

(3)

Gain on \$1 is 11 cents, or for every \$1 paid he receives \$1·11.
Hence cost = \$7400 ÷ 1·11 = \$6666·666.

(4)

Gain on \$1 is 17 cents, or for every \$1 paid he receives \$1·17.

$$\text{\$117 : \$100 :: \$3789·40 : } \frac{3789\cdot40\times100}{117} = \text{\$3238·803.}$$

Loss on \$1 is 13 cents, or for every \$1 paid I receive \$0·87.

$$\text{\$87 : \$100 :: \$2740 : } \frac{2740\times100}{87} = \text{\$3149·425.}$$

EXERCISE 123—Page 279.

(1)

\$2 gains 50 cents.

$$\text{Hence \$0·50 : \$0·10 :: \$2·00 : } \frac{2\cdot00\times10}{50} = \text{40 cents.}$$

(2)

$$\$2\cdot00 : \$2\cdot80 :: \$2\cdot50 : \frac{2\cdot50 \times 2.80}{2\cdot00} = \$3\cdot50.$$

(3)

8 cents gain 5 cents in 9 months.

Hence 9 mo's : 6 mo's :: 5 cents : $\frac{5 \times 6}{9} = 3\frac{1}{3}$ = gain for 6 mo's.

8 cts. : 12 cts. :: $3\frac{1}{3}$: $\frac{3\frac{1}{3} \times 12}{8} = 5$ cts. gain on 12 cts. for 6 mo's.

Therefore $12 + 5 = 17$ cents = his selling price.

(4)

70 yds. of cloth at $\$1\cdot85 = \$1\cdot85 \times 70 = \$129\cdot50$.

$\$129\cdot50 \div \$\cdot60 = 215\frac{5}{6}$.

(5)

(1)

By Case I we find that 17 quarts @ 31 cents, 6 @ 16 cents, 6 @ 19 cents, and 6 @ 23 cents will make a mixture worth 25 cents per quart.

Therefore 17 qts. : 87 qts. :: 6 qts. : $\frac{6 \times 87}{17} = 30\frac{12}{17}$ quarts @ 16 cents, and as there are 6 lbs. at each of the other prices, the same statement may be used, and the answer is therefore $30\frac{12}{17}$ quarts @ each price.

(2)

To produce a mixture worth 75 cents per bushel, we require 45 bushels @ 80 cents, 5 @ 37 cents, and 5 @ 68 cents.

(7)

After the first has wound off her portion, there will remain $\frac{3}{4}$ of the thread.

Then the whole ball : part remaining :: cube of diameter of whole ball : cube of diameter of part remaining.

That is, $1 : \frac{3}{4} :: 3^3 : x^3$, and hence $x = 3 \times \sqrt[3]{\frac{3}{4}} = 3 \times \sqrt[3]{.75}$ $= .90856 \times 3 = 2.72568 =$ diameter of the ball after the first has wound off her portion.

Similarly after the second has wound off her portion, there will remain $\frac{1}{2}$ of the ball, and after the third has taken her portion, $\frac{1}{4}$ of the ball.

Hence $1 : \frac{1}{2} :: 3^3 : x^3$, whence $x = 3 \times \sqrt[3]{\frac{1}{2}} = 3 \times \sqrt[3]{.5} =$ $3 \times .79370 = 2.38110 =$ diameter after the second has taken her portion.

$1 : \frac{1}{4} :: 3^3 : x^3$, whence $x = 3 \times \sqrt[3]{\frac{1}{4}} = 3 \times \sqrt[3]{.25} = 3 \times$ $.62996 = 1.88988 =$ diameter after the third has taken her portion.

$14000 = 7 \times 2 \times 1000$ ∴ log. 14000 = (log. 7) + (log. 2) + (log. 1000).

Log. 7 = 0·845098
Log. 2 = 0·301030
Log. 1000 = 3

Sum, = 4·146128 = log. 14000

$4{\cdot}9 = 7^2 \div 10$ ∴ log. 4·9 = (log. 7) × 2 — (log. 10).

Log. 7 = 0·845098 × 2 = 1·690196
Log. 10 = 1

Difference = ·690196 = log. 4·9

$\cdot 00196 = 49 \times 4 \div 100000 = 7^2 \times 2^2 \div 100000$
∴ log ·00196 = (log. 7) × 2 + (log. 2) × 2 — (log. 100000).

Log. 7 = 0·845098 × 2 = 1.690196
Log. 2 = 0.301030 × 2 = 0.602060

Log. of 100000 = 5 and 2·292256 — 5 = $\bar{3}$·292256 = log of .00196.

Since 5 = 10 ÷ 2, the logarithm of 5 = log. 10 — log. 2 = 1 — 0·301030 = 0· 698970.

$1750 = 5^2 \times 7 \times 10$ ∴ log. 1750 = (log. 5) × 2 + (log. 7) + (log. 10)

Log. 5 = 0·698970 × 2 = 1·397940
Log. 7 = ·845098

∴ log. of 1428·571428 = sum = 3·154902

·00000112 = $2^4 \times 7 \div 100000000$ ∴ log. ·00000112 =

Log. 7 = 0·845098 × 2 = 1·690196

And series is 2, 11, 20, 29, 38, 47, 56, 65, 74, 83, 92.

1st term = 4096; 2nd = $4096 \times \frac{1}{2} = 2048$; 3rd = $2048 \times \frac{1}{2} = 1024$; 4th = $1024 \times \frac{1}{2} = 512$; 5th = $512 \times \frac{1}{2} = 256$, and so on.

EXERCISE 160.—Page 347

(1)

Assume 4 to be the number of men.

Then $2 \times 4 = 8$ = number of women.

And $8 \times 3 = 24$ = number of children.

6d. × 4 = 24d. = amount received by the men.
4d. × 8 = 32d. = " " " women.
2d. × 24 = 48d. = " " " children.

Sum, = 104d., but it should, by question, = 78d.

Then $104 : 78 :: 4 : \frac{78 \times 4}{104} = 3$ = number of men.

$3 \times 2 = 6$ = number of women, and $6 \times 3 = 18$ = number of children.

(2)

Assume £8 to be the price of the harness.

Then £8 × 2 = 16 = price of horse.

And £8 + £16 = £24 × 2 = 48 = " chaise.

Sum, = £72, but it should by question = £60.

Then £72 : £60 :: £8 : $\frac{8 \times 60}{72}$ = £6 13 4 = price of harness.

£6 13 4 × 2 = 13 6 8 = " horse.

£6 13 4 + £13 6 8 = £20 × 2 = 40 0 0 = " chaise.

(3)

Assume 20 as C's age.

Then $20 \times 3 = 60 =$ B's age.

And $60 \times 2 = 120 =$ A's age.

Sum $= 200$, but by question it should $= 140$.

Then $200 : 140 :: 20 : \frac{20 \times 140}{200} = 14 =$ C's age.

$14 \times 3 = 42 =$ B's age, and $42 \times 2 = 84 =$ A's age.

(4)

Assume 100.

One fourth of $100 = 25$ and remainder $= 100 - 25 = 75$.

One fifth of $75 = 15$ and remainder $= 75 - 15 = 60$, but it should by the question $= 72$.

Then $60 : 72 :: 100 : \frac{100 \times 72}{60} = 120$.

(5)

A can do the work in 7 days ∴ he will do $\frac{1}{7}$ of it in 1 day.

B " " 5 " ∴ " $\frac{1}{5}$ " "

C " " 6 " ∴ " $\frac{1}{6}$ " "

Then all working together will do $\frac{1}{7} + \frac{1}{5} + \frac{1}{6} = \frac{107}{210}$ in 1 day.

Therefore to do the whole work it will take them $\frac{1}{\frac{107}{210}} = \frac{210}{107} =$

$1\frac{103}{107}$ days.

(6)*

A and B working together can do it in 10 days ∴ they will do $\frac{1}{10}$ of it in 1 day.

A can do it in 15 days ∴ he will do $\frac{1}{15}$ of it in 1 day.

Therefore $\frac{1}{10} - \frac{1}{15} = \frac{1}{30} =$ amount done by B in 1 day.

Then if he does $\frac{1}{30}$ in 1 day, it will take him 30 days to do the whole.

---

*The mode of working these questions by position is so simple that they cannot trouble any one; it has therefore been thought advisable to work them by simple analysis.

(7)*

The first pipe empties the whole of it in 1 hour.
The second pipe empties $\frac{1}{2}$ of it in 1 hour.
The third pipe empties $\frac{1}{3}$ of it in 1 hour.

Then all these pipes running together will empty $1 + \frac{1}{2} + \frac{1}{3} = \frac{11}{6}$ in 1 hour.

Therefore to empty the cistern it will take $1 \div \frac{11}{6} = \frac{6}{11}$ hours.

(8)

Assume 84
One third of 84 = 28
One sixth of 84 = 14
One seventh of 84 = 12

Sum = 54, but by question it should = 27.

Then $54 : 27 :: 84 : \frac{84 \times 27}{54} = 42.$

(9)

All 5 mills working together will grind $7 + 5 + 4 + 3 + 1 = 20$ bushels in 1 hour.

Therefore to grind 500 bushels it will take them $500 \div 20 = 25$ hours.

(10)*

One pipe fills $\frac{1}{12}$ of the cistern in 1 hour, and the other empties $\frac{1}{18}$ of it in 1 hour.

Then $\frac{1}{12} - \frac{1}{18} = \frac{1}{36}$ = part of the cistern filled in 1 hour when both are left open.

And if $\frac{1}{36}$ of it is filled in 1 hour, the whole will be filled in $\frac{1}{\frac{1}{36}} = 36$ hours.

* See note on page 227.

NOTE.—For reason why we multiply by the 4th powers of the assumed numbers and then take the 4th root of the quotient, see Arith. page 353, Example 11.

It may, however, perhaps be clearer from the following illustration:

Let x = the number required.

$$\text{Then } \frac{x}{2} \times \frac{x}{4} \times \frac{x}{5} \times \frac{x}{6} = \frac{x^4}{240} = 6998\tfrac{2}{3}$$

Formula II. $a = \frac{2A}{t\{2 + (t-1)r\}} = \frac{2 \times 2080}{16\{2 + (16-1) \cdot 04\}}$

$= \frac{4160}{16 \times \{2 + (15 \times \cdot 04)\}} = \frac{4160}{16 \times 2 \cdot 6} = \frac{4160}{41 \cdot 6} = \frac{41600}{416}$

$= \$100 =$ 1 payment or rent for half a year, hence yearly rent $= \$100 \times 2 = \$200$.

EXERCISE 164.—Page 366.

(1)

Here $r = \cdot 04$, and $v = \$3000$.
Then $a = vr = 3000 \times \cdot 04 = \$120$.

(2)

Here $a = 563$, and $v = 11260$

Then $r = \frac{a}{v} = \frac{563}{11260} = \frac{1}{20} = \cdot 05$, and hence rate per cent. $= 5$.

(3)

Here $a = 75$, $r = \cdot 05$, and $s = 14$.

Then $v = \dfrac{a}{r(1+r)^s} = \dfrac{75}{\cdot 05 \times (1\cdot 05)^{14}}$

$\log. v = \log. 75 - \{(\log. 1\cdot 05 \times 14) + \log. \cdot 05\}$

$= 1\cdot 875061 - (0\cdot 021189 \times 14 + \log. \cdot 05)$

$= 1\cdot 875061 - (0\cdot 296646 + \bar{2}\cdot 698970.)$

$= 2\cdot 879445.$

$\therefore v =$ nat. number corresponding to the logarithm 2·879445, which is \$757·608.

(4)

Here $a =$ \$90, $r = \cdot 04$, $t = 12$, $s = 7$, and $\therefore s + t = 19$.

Formula VIII. $v = \dfrac{a}{r}\left\{\dfrac{1}{(1+r)^t} - \dfrac{1}{(1+r)^{s+t}}\right\}$

$= \dfrac{90}{\cdot 04}\left\{\dfrac{1}{(1\cdot 04)^{12}} - \dfrac{1}{(1\cdot 04)^{19}}\right\} = \dfrac{9000}{4}\left\{\dfrac{1}{1\cdot 60101} - \dfrac{1}{2\cdot 10682}\right\}$

$= 2250 \times (\cdot 624605 - \cdot 474649) = 2250 \times \cdot 149956$

$=$ \$337·401.

(5)

Here $a = 1500$, and $r = \cdot 05$.

Formula IX. $v = \dfrac{a}{r} = \dfrac{1500}{\cdot 05} = \dfrac{150000}{5} =$ \$30000

$= 20 \times 1500$ or 20 years' purchase.

(6)

Here $a = 22$, $v = 308\cdot 64166$, and $r = \cdot 04$.

Then Formula VII. $t = \dfrac{\log. a - \log. (a - vr)}{\log. (1+r)}$

$= \dfrac{\log. 22 - \log. (22 - 308\cdot 6416 \times \cdot 04)}{\log. (1\cdot 04)}$

$= \dfrac{1\cdot 342423 - \log. (9\cdot 65425)}{0\cdot 017033} = \dfrac{1\cdot 342423 - 0\cdot 984707}{0\cdot 017033}$

$= \dfrac{0\cdot 357716}{0\cdot 017033} = \dfrac{357716}{17033} = 21 +$

(7)

Here $a = 154$, $t = 19$, and $r = \cdot 05$.

Formula V. $v = \frac{a}{r}\left\{1 - \frac{1}{(1+r)^t}\right\}$

$$= \frac{154}{\cdot 05} \times \left\{1 - \frac{1}{(1\cdot 05)^{19}}\right\} = \frac{15400}{5} \times \left\{1 - \frac{1}{2\cdot 5269}\right\}$$

$$= 3080 \times (1 - \cdot 39574) = 3080 \times \cdot 60426 = \$1861\cdot 12 +$$

(8)

Here $A = 600$, $t = 40$, and $r = \cdot 0375$.

Formula II. $a = \frac{Ar}{(1+r)^t - 1} = \frac{600 \times \cdot 0375}{(1\cdot 0375)^{40} - 1}$

$$= \frac{22\cdot 5}{4\cdot 36034 - 1} = \frac{22\cdot 5}{3\cdot 36034} = \frac{2250000}{336034}$$

$$= £6\cdot 6957 = £6\ 13s.\ 10\tfrac{1}{4}d +.$$

(9)

Here $a = 8$, $A = 187\cdot 315625$, and $r = \cdot 03$.

Formula IV. $t = \frac{\log.(Ar + a) - \log. a}{\log.(1 + r)}$

$$= \frac{\log.(187\cdot 315625 \times \cdot 03 + 8) - \log 8}{\log. 1\cdot 03}$$

$$= \frac{\log(5\cdot 61946875 + 8) - \log 8}{\log 1\cdot 03}$$

$$= \frac{\log. 13\cdot 61946875 - \log. 8}{\log 1\cdot 03} = \frac{1\cdot 134160 - 0\cdot 903090}{0\cdot 012837}$$

$$= \frac{0\cdot 231070}{0\cdot 012837} = \frac{231070}{12837} = 18.$$

(10)

Here $a = 74$, $r = \cdot 04$, and $t = 30$

Formula I. $A = a\left\{\frac{(1+r)^t - 1)}{r}\right\} = \frac{74 \times \{(1\cdot 04)^{30} - 1\}}{\cdot 04}$

$$= \frac{74}{\cdot 04} \times (3\cdot 24332 - 1) = \frac{7400}{4} \times 2\cdot 24332 = \$4150\cdot 142$$

By Table, page 362. Amount of \$1 for 30 years, at 4 per cent. $= \$56\cdot 08494$

Then $\$56\cdot 08494 \times 74 = \$4150\cdot 28$.

EXAMINATION PROBLEMS.

FIRST SERIES.

(2)

$7580 × ·19 = $1440·20, and $7580 — $1440·20 = $6139·80.

D is to have one third as much as A, B, and C together, therefore he will have one-fourth of the whole. ¼ of $6139·80 = $1534·95 = D's share.

$6139·80 — $1534·95 = $4604·85 = amount to be divided among A, B, and C.

B is to have $90·90 more than C.

A is to have $111·11 + $90·90 = 202·01 " " "

$292·91

$4604·85 — $292·91 = $4311·94 = three times C's share.

$4311·94 ÷ 3 = $1437·31⅓ = C's share.

$1437·31⅓ + $90·90 = $1528·21⅓ = B's share.

$1528·21⅓ + $111·11 = $1639·32⅓ = A's share.

(3)

A and B working together can do the work in 96 hours, therefore in one hour they will do $\frac{1}{96}$ of it.

A by himself can do the work in 192 hours; therefore in 1 hour he can do $\frac{1}{192}$ of it. $\frac{1}{96} - \frac{1}{192} = \frac{1}{192}$ = part B can do in one hour. Therefore he will require as many hours to finish it as $\frac{1}{192}$ is contained times in the whole, i. e. $1 \div \frac{1}{192} = 192$ hours. Then 192 ÷ 14 = 13⅝ days.

(4)

£179 14s. 8¾d. = $718·94$\frac{7}{8}$ = $718·94583.

$718·94583 ÷ ·00000048 = $71894583333·3 ÷ 48 = $1497803819·4444.

$\frac{1}{6}+\frac{1}{12}+\frac{1}{7}+5$ years $=\frac{11}{28}$ of life time $+5$ years $=$ age at birth of son.

$\frac{28}{28} - (\frac{11}{28}+5) = \frac{17}{28}$ of his life time $- 5$ years $=$ time he lived after birth of son.

$\frac{17}{28}$ of father's life time $- 5$ years $- 4$ years $=$ age of son $= \frac{1}{2}$ father's age.

$\frac{17}{28}$ of father's life time $- 9$ years $= \frac{1}{2}$ father's age.

$\therefore$ 9 years is the difference between $\frac{17}{28}$ and $\frac{14}{28}$ of father's age.

$\therefore$ 9 years is equal to $\frac{3}{28}$ of father's age.

If 9 years is $\frac{3}{28}$ of his age, $\frac{1}{28}$ will be the $\frac{1}{3}$ of 9 which is 3 years.

If $\frac{1}{28}$ is 3 years, $\frac{28}{28}$ or the whole age will be $3 \times 28 = 84$ years.

Or by Position.

Assume 42 for father's age at death, the son's age $= 21$.

$\frac{1}{6}+\frac{1}{12}+\frac{1}{7}+5 = \frac{11}{28}+5$; $\frac{11}{28}$ of $42 = 16\frac{1}{2}$ and $16\frac{1}{2}+5 = 21\frac{1}{2}$ $=$ age of father when son was born.

$\therefore$ he lived after birth of his son $42 - 21\frac{1}{2} = 20\frac{1}{2}$ years.

(Continued on next page.)

(36 continued.)

By the question he lived $21 + 4 = 25$ years.
The error $25 - 20\frac{1}{2} = -4\frac{1}{2}$.

Assume 98 for father's age, then son's age $= \frac{1}{2}$ of $98 = 49$.
$\frac{1}{6} + 1\frac{1}{2} + \frac{1}{7} + 5 = \frac{11}{21} + 5$; $\frac{11}{21}$ of $98 = 38\frac{1}{2}$, and $38\frac{1}{2} + 5 = 43\frac{1}{2}$
= age of father at birth of son.

∴ he lived after birth of his son $98 - 43\frac{1}{2} = 54\frac{1}{2}$ years.
But by the question he lived $49 + 4$ years $= 53$ years.
Then $53 - 54\frac{1}{2} = +1\frac{1}{2}$ = error.

23 per cent. of \$4200 = $\frac{23}{100}$ of 4200 = \$966·00, and \$4200 — \$966·00 = \$3234·00. E has half as much as A, B, C, and D together; therefore E has *one-third* of \$3234·00, which is \$1078·00.

Deducting E's share, \$1078, from \$3234, the whole sum to be divided, there remains \$2156 to be divided among A, B, C and D. Now D gets a certain amount; C gets \$42·11 more than D; B gets \$61·34 (42·11 + 19·23) more than D; and A gets \$78·44 (61·34 + 17·10) more than D. Together they get, then, *four times* D's share, together with \$42·11 + \$61·34 + \$78·44, or, in other words, four times D's share, together with \$181·89.

That is, four times D's share, together with \$181·89 is equal to \$2156.

Hence \$2156·00 — \$181·89 = \$1974·11 = four times D's share. Then \$1974·11 ÷ 4 = \$493·5275 = D's share.

Each child gets 1 child's share, ∴ 17 children get 17 shares.

Each woman gets *three* times a child's share, ∴ 4 women get 12 shares.

Each man gets *six* times a child's share, ∴ 3 men get 18 shares.

And together they get 47 times a child's share.

Therefore $\$7200 \div 47 = \$153{\cdot}19\frac{7}{47}$ = a child's share.

$\$153{\cdot}19\frac{7}{47} \times 3 = \$459{\cdot}57\frac{21}{47}$.

Suppose the *hour* hand moves over 4 minutes, then since the minute hand moves 12 times as fast, it will have travelled over 48 minutes. But in order to overtake the hour hand, the minute hand must traverse the entire circle, 60 minutes, plus the 4 minutes we have supposed the hour hand to have moved forward, *i. e.* 64 minutes. Then 48 should equal 64, for we should find the same number by each process; $48 - 64 = -16$ error.

Suppose hour hand moves over 6 minutes, the minute hand moves over $6 \times 12 = 72$ minutes. But minute hand moves over $60 + 6 = 66$ minutes.

10 apples + 8 pears cost 44 pence ∴ 2 apples + 1⅗ pears cost 8⅘ pence.
Subtract, and 2⅓ − 1⅗ pears cost 11d. − 8⅘d.
That is, $\frac{11}{15}$ of a pear costs 2$\frac{1}{5}$d.
If $\frac{11}{15}$ cost $\frac{1}{5}$d., $\frac{1}{15}$ will cost $\frac{1}{11}$ of $\frac{1}{5}$d., which is $\frac{1}{55}$d.
If $\frac{1}{15}$ cost $\frac{1}{55}$d, $\frac{15}{15}$ will cost $\frac{15}{55}$d.= 3d.
6 apples + 7 pears cost 33 pence, and 7 pears cost 21d. ∴ 6 apples cost 12d. and 1 apple costs 2d.

$$\text{Log.}\,(r+1) = (\log. A - \log. P) \div t$$

Part of ball remaining after 1st has taken off her share = $\frac{4}{5}$

Then whole ball : remainder:: cube of diameter of whole : cube of diameter of remainder

$1 : \frac{4}{5} :: 5^3 : x^3$ hence $x = \sqrt[3]{\frac{4}{5} \times 125} = \sqrt[3]{\frac{4}{5}125} = \sqrt[3]{93{\cdot}75} = 4{\cdot}542$

∴ Part taken off by 1st = 5 in. — 4·542 in. = 0·458 in.

After 2nd had taken off her portion $\frac{1}{2}$ of the ball remained.

$1 : \frac{1}{2} :: 5^3 : x^3$, hence $x = \sqrt[3]{\frac{1}{2} \times 125} = \sqrt[3]{\frac{1}{2}125} = \sqrt[3]{62{\cdot}5} = 3{\cdot}968$ in.

∴ Part taken off by 2nd = 4·542 — 3·968 = 0·574 in.

After 3rd had taken off her share there remained $\frac{1}{4}$ of the ball.

$1 : \frac{1}{4} :: 5^3 : x^3$, hence $x = \sqrt[3]{\frac{1}{4} \times 125} = \sqrt[3]{31{\cdot}25} = 3{\cdot}149$ in.

∴ Part taken off by 3rd = 3·968 — 3·149 = 0·819 inches

Remainder = 3·149 = part taken off by 4th.

\$1 × $920\frac{1}{5}$ = \$920·20 = payment of 1st person.

165 acres — $77\frac{14}{47}$ acres = $87\frac{33}{47}$ acres = acres cleared by company of 25 men.

1st company contains 3 more men than 2nd company and receives \$86 more.

Therefore \$86 pays 3 men. Hence each man gets \$86 ÷ 3 = \$28·66⅔.

Each man clears $3\frac{24}{47}$ acres, and receives \$28·66⅔ for it; therefore cost of 1 acre = \$28·66⅔ ÷ $3\frac{24}{47}$ = \$$8\frac{82}{495}$.

$182 is $\frac{91}{100}$ of buying price $\therefore$ $\$182 \div 91 = \$2 = \frac{1}{100}$ of buying price $\therefore$ buying price $= \$2 \times 100 = \$200$.

To realize a profit of 7 per cent., he must receive $1·07 for every $1 the goods cost; but they cost him $200, therefore he must sell for $\$1{\cdot}07 \times 200 = \$214$.

Simple Interest $t = \frac{n-1}{r} = \frac{11\frac{1}{2}-1}{.06} = \frac{10{\cdot}5}{.06} = \frac{1050}{6}$ $= 175$ years.

Compound Interest $t = \frac{\log. n}{\log. (1+r)} = \frac{\log. 11\frac{1}{2}}{\log. 1.06} = \frac{1.060698}{0.025306}$

$= \frac{1060698}{25306} = 41.914$ years.

$$= \frac{\cancel{217}}{\cancel{22}} \times \frac{\cancel{1760}^{\cancel{16}}}{1} \times \frac{32}{\cancel{35}} = 217 \times 16 \times 32 = 111104 \text{ metres.}$$

f means + 2 extremes = 9 terms.

Formula XIII, p. 340. $r = \left(\frac{l}{a}\right)^{\frac{1}{n-1}} = \left(\frac{19683}{3}\right)^{\frac{1}{8}} = \left(6561\right)^{\frac{1}{8}} = 3$

Hence means are 9, 27, 81, 243, 729, 2187, and 6561.

(130)

Formula XXI, p. 344. $s = \frac{a}{1-r} = \frac{7}{1-\frac{1}{4}} = \frac{7}{\frac{3}{4}} = \frac{28}{3} = 9\frac{1}{3}$.

(131)

Part remaining after 1st has received his share = $\frac{3}{4}$.

$1 : \frac{3}{4} :: 60^2 : x^2$; whence $x = \sqrt{3600 \times \frac{3}{4}} = \sqrt{900 \times 3}$

$= 30\sqrt{3} = 1{\cdot}732 \times 30 = 51{\cdot}96$ inches.

Hence 1st ground off $60 - 51{\cdot}96 = 8{\cdot}04$ inches.

Part remaining after 2nd had taken off his share = $\frac{1}{2}$.

$1 : \frac{1}{2} :: 60^2 : x^2$; whence $x = \sqrt{3600 \times \frac{1}{2}} = 30\sqrt{2}$

$= 1{\cdot}4142 \times 30 = 42{\cdot}426$.

Hence 2nd ground off $51{\cdot}96 - 42{\cdot}426 = 9{\cdot}534$ inches.

Part remaining after the 3rd had taken off his share = $\frac{1}{4}$.

$1 : \frac{1}{4} :: 60^2 : x^2$; whence $x = \sqrt{3600 \times \frac{1}{4}} = \sqrt{900} = 30$ inches.

Hence 3rd ground off $42{\cdot}426 - 30$ inches = $12{\cdot}426$ inches, and the 4th ground off remaining 30 inches.

By Formula III, page 354, $r = \sqrt[t]{\frac{A}{P}} - 1$ $\therefore$ $r + 1 = \sqrt[t]{\frac{A}{P}}$

$\therefore$ Log. $(1 + r)$ = (log. A — log. P) $\div$ t

= (log. 1679·40 — log. 700·90) $\div$ 5

= (3·225154 — 2·845656) $\div$ 5.

= 0·379498 $\div$ 5 = 0·075899.

$\therefore$ $1 + r$ = nat. num. corresponding to the logarithm 0·075899 which is 1·19, $\therefore$ r = ·19 = rate per unit, and hence rate per cent. = 19.

(135)

Having paid 10 per cent. he had 90 per cent. remaining.

$\frac{90}{100}$ or $\frac{9}{10}$ of his salary = \$1250, $\therefore$ $\frac{1}{10} = \frac{1250}{9} = \$138\frac{8}{9}$.

If $\$138\frac{8}{9} = \frac{1}{10}$, the whole = $\$138\frac{8}{9} \times 10 = \$1388{\cdot}888$.

$+ \frac{220}{420} = 161 + \frac{527}{420} = 161 + 1\frac{107}{420} = 162\frac{107}{420} = 162\frac{29}{140}$.

By Table on p. 362, the amount of \$1 for 34 payments at 3 per cent. = \$57·73018.

\$57·73018 × 260 = \$15009·84.

By Formula I, page 361, $A = \frac{a\left\{(1+r)^t - 1\right\}}{r}$

$= \frac{a}{r}\left\{(1+r)^t - 1\right\} = \frac{260}{\cdot 03}\left\{(1\cdot 03)^{34} - 1\right\}$

$= \frac{26000}{3} \times (2\cdot 731855 - 1) = \frac{26000 \times 1\cdot 731855}{3} = \$15009\cdot 41$

By Formula IX, p. 333, $d = \frac{l-a}{n-1} = \frac{79-2}{6-1} = \frac{77}{5} = 15\frac{2}{5}$.

Hence the series is 2, $17\frac{2}{5}$, $32\frac{4}{5}$, $48\frac{1}{5}$, $63\frac{3}{5}$, and 79.

Formula I, p. 333. $l = a + (n-1)d = 3 + (9-1) \times 4$
$= 3 + (8 \times 4) = 3 + 32 = 35$.

Formula VI, p. 333. $s = \left\{ 2a + (n-1)d \right\} \frac{n}{2}$

$= \left\{ 2 \times 3 + (207-1) \times 4 \right\} \frac{207}{2} = \left\{ 6 + (206 \times 4) \right\} \frac{207}{2}$

$= (6 + 824) \times \frac{207}{2} = \frac{830 \times 207}{2} = 85905$.

(144)

B travels 4 miles per day faster than A, and will therefore gain the circumference of the island in $\frac{7}{4}^3 = 18\frac{1}{4}$ days.

C travels 10 miles per day faster than A, and will therefore gain the whole circumference of the island in $\frac{7}{10}^3 = 7\frac{3}{10}$ days.

Now B cannot be with A except at the end of $18\frac{1}{4}$ days or twice $18\frac{1}{4}$ days, or three times $18\frac{1}{4}$ days, or some other multiple of $18\frac{1}{4}$ days.

Similarly C cannot be with A except at the end of $7\frac{3}{10}$ days, or of some other multiple of $7\frac{3}{10}$ days.

Therefore C and B will both be with A for the first time after the lapse of a number of days expressed by the least common multiple of $18\frac{1}{4}$ and $7\frac{3}{10}$.

The greatest common factor of $18\frac{1}{4}$ and $7\frac{3}{10}$ is $3\frac{1}{20}^3$.

Hence the l. c. m. of $7\frac{3}{10}$ and $18\frac{1}{4}$ is $\frac{7\frac{3}{10} \times 18\frac{1}{4}}{3\frac{1}{20}^3} = 36\frac{1}{2}$ = number of days when A, B, and C will first be together.

2nd Step: Again fill the 3-gallon cask out of the 8-gallon cask.

3rd Step: Fill up the 5-gallon cask out of the 3-gallon cask. This will leave one gallon in the latter.

4th Step: Empty the 5-gallon cask into the 8-gallon cask.

5th Step: Pour the one gallon out of the 3-gallon cask into the 5-gallon cask.

6th Step: Fill the 3-gallon cask out of the 8-gallon cask, and empty it into the 5-gallon cask.

15. Weigh out 7 lbs. as often as possible and there will remain 2 lbs.; add two four pounds and one seven pounds to this, and the sum will be 17 lbs., the share of one.
Weigh 7 lbs. as often as possible out of the remaining 34 lbs. and there will remain 6 lbs., to which add 7 lbs. and 4 lbs., and the sum will be 17 lbs., the share of the second. The remaining 17 lbs. will be the share of the third.

16. The hurdles are, in the first case, placed 12 on a side and one on each end, and then they inclose a space represented by 12 squares whose area is, by the question, 40 square yards. If two hurdles be taken away there will remain 24, and if these be placed in the form of a square, each side containing 6 hurdles, they will enclose a space represented by 36 squares of the same size as the former. Hence they now inclose three times as much space as before, *i. e.* three times 40 square yards, or 120 square yards.

RULE FOR FILLING MAGIC SQUARES OF ODD NUMBER OF CELLS.

Begin in centre cell of top horizontal row by placing 1 in it; ascend diagonally to the right, and where this carries us beyond the square, transport the next number to the cell at the remote end of the vertical or horizontal band to which it belongs. When in ascending we come to a cell already filled, we place the number in the cell next below the cell last filled. The following is a square of 7 cells in a side filled after this method:

23. This problem admits of the following two solutions:

1ST SOLUTION.

Persons.	Full bottles.	Hf.-full bottles.	Empty bottles.
1st	2	3	2
2nd	2	3	2
3rd	3	1	3
	7	7	7

Each person has 3½ bottles of wine and 7 bottles.

2ND SOLUTION.

1st	3	1	3
2nd	3	1	3
3rd	1	5	1
	7	7	7

Each person, as before, has 7 bottles and 3½ bottles of wine.

24. There were in all 8 bottles of wine, of which each drank $\frac{1}{3}$, which is $2\frac{2}{3}$. The third person, therefore, drank $\frac{1}{3}$ of a bottle belonging to him who had but 3 bottles, and $\frac{7}{3}$ of a bottle belonging to him who owned the 5 bottles. Hence the latter should have *seven* times as much of the money as the former, or, in other words, the latter gets 7 shillings, and the former 1 shilling.

25. This problem is merely to find some number between 50 and 100 which is exactly divisible by 2 and by 3, but which divided by 5 leaves a remainder 3.

The only numbers between 50 and 100 that are divisible by both 2 and 3, are 54, 60, 66, 72, 78, 84, 90, and 96, and by inspection the only one of these which gives a remainder 3 when divided by 5 is 78; therefore the basket contained 78 eggs.

26. *Ans.* 1 lb., 3 lbs., 9 lbs., and 27 lbs.

For 1 lb. = 1 lb.; 2 lbs. = 3 lbs. — 1 lb., i. e. 3 lbs. in one scale and 1 lb. in the other; 3 lbs. = 3 lbs.; 4 lbs. = 3 lbs. + 1 lb.; 5 lbs. = 9 lbs. — (3 lbs. + 1 lb.); 6 lbs. = 9 lbs. — 3 lbs.; 7 lbs. = 9 lbs. + 1 lb. — 3 lbs.; 8 lbs. = 9 lbs. — 1 lb.; 9 lbs. = 9 lbs.; 10 lbs. = 9 + 1 lb.; 11 lbs. = 9 lbs. + 3 lbs. — 1 lb.; 12 lbs. = 9 lbs. + 3 lbs.; 13 lbs. = 9 lbs. + 3 lbs. + 1 lb.; 14 lbs. = 27 lbs. — (9 lbs. + 3 lbs. + 1 lb.); 15 lbs. = 27 lbs. — (9 lbs. + 3 lbs.); 16 lbs. = 27 lbs. + 1 lb. — (9 lbs. + 3 lbs.); 17 lbs. = 27 lbs. — (9 lbs. + 1 lb.); 18 lbs. = 27 lbs. — 9 lbs.; &c., &c.

27. In order to fill seven out of the eight points, it is merely requisite to remember that the second counter must be carried to the point from which the first *started*, the third to the point from which the second started, &c.

Thus if the first counter is carried from 1 to 4 and there deposited, the second must be taken from 6 to 1 and there deposited; the third from 3 to 6; the fourth from 8 to 3, the fifth from 5 to 8; the sixth from 2 to 5; and the seventh either from 7 to 2 or from 2 to 7.

28. The mouth fills the reservoir in 6 hours, therefore it fills $\frac{1}{6}$ in 1 hour; the right eye fills it in 38 hours, therefore it fills

$\frac{1}{72}$ in 1 hour; the left eye fills it in 72 hours, therefore it fills $\frac{1}{72}$ in 1 hour; the foot fills it in 96 hours, therefore it fills $\frac{1}{96}$ in 1 hour. Hence together they fill $\frac{1}{8} + \frac{1}{72} + \frac{1}{72} + \frac{1}{96} = \frac{61}{288}$ in 1 hour, and to fill the reservoir they require $1 \div \frac{61}{288} = \frac{288}{61} = 4$ hours 43 min. $16\frac{44}{61}$ sec.

29. The person who thinks of the numbers must proceed as follows: He must multiply the 1st by 2 and add 5 to the product; he must next multiply this sum by 5 and add the second number to the product; he must next multiply this result by 10 and add the third number to the product; lastly, he must subtract 250 and name the remainder.

The three digits of the remainder will be the three numbers thought of, and will be in the order in which they were thought of.

The reason is obvious: let a = 1st, b = 2nd, and c = 3rd number thought of.

$a \times 2 + 5 = 2a + 5$.

$(2a + 5) \times 5 + b = 10a + b + 25$.

$(10a + b + 25) \times 10 + c = 100a + 10b + c + 250$.

$(100a + 10b + c + 250) - 250 = 100a + 10b + c$ = a in hundreds' place, b in tens' place, and c in units' place.

30. Since each man possesses 63 square rods of land more than his son, we must form three pairs of numbers, such that the difference of their squares shall be 63.

The difference of the squares of two numbers is equal to their sum multiplied by their difference, and hence 63 must be divided into two factors in three distinct ways, thus:

$63 = 63 \times 1 = 21 \times 3 = 9 \times 7$.

If sum = 63 and difference = 1, the numbers are 32 and 31.

If sum = 21 and difference = 3, the numbers are 12 and 9.

If sum = 9 and difference = 7, the numbers are 8 and 1.

Hence the squares of Jones, Brown, and Smith, are respectively 32 rods, 12 rods, and 8 rods on the side, and the son's squares are respectively 31, 9, and 1 yards on the side.

Jones' piece was 23 rods longer on each side than Tom's, and since the difference between 32 and 9 is 23, we may conclude that Jones' square was 32 rods to the side, and Tom's 9 rods on a side.

Brown's piece was 11 rods longer on a side than Harry's, and since if the above numbers 12 and 1 have 11 for their difference, we may conclude that Brown's piece was 12 rods on a side, and Harry's piece 1 rod.

Hence Tom was Brown's son, Harry was Smith's son, and Ned was Jones' son

31. The mode of arranging the crew may be remembered by attention to the vowels in the following line:

Populeam virgam mater regina ferebat.

The vowels refer to the crew as follows, $a = 1$, $e = 2$, $i = 3$, $o = 4$, and $u = 5$.

We begin with 4 whites because the first vowel is o, next $u = 5$ blacks, next $e = 2$ whites, next $a = 1$ black, next $i = 3$ whites, next $a = 1$ black, next $a = 1$ white, next $e = 2$ blacks, next $e = 2$ whites, next $i = 3$ blacks, &c., as follows, o standing for a white and + for a black.

oooo++++++oo+ooo+o++oc+++o++oo+

32. You select the multiplier or the multiplicand, such that the sum of its digits shall be exactly divisible by nine. Hence upon the principle of the proof by casting out the nines, the product has the sum of its digits exactly divisible by nine. By subtracting the sum of the digits of the remainder from the next higher multiple of 9 you determine the digit crossed out.

Thus suppose you select 117, and he takes for multiplicand 21613. Then $21613 \times 117 = 2528721$. Now, suppose he crosses out the 7; upon reading you the remaining digits 252821, you find that their sum $= 20$, which taken from 27 the next higher multiple of 9 leaves 7 the digit he crossed out.

If he crosses out a 0 or a 9, you cannot determine which, but in all other cases you can tell the exact figure.

33. You write the second, fourth, sixth, &c. lines in such a manner as to make the sum of the first pair, the sum of the second pair, &c. an exact number of 9's. Then having settled the number of pairs, you get the answer by multiplying by that number a row of 9's containing as many digits as there are to be figures in the line.

Thus suppose you agree to write 5 lines each, and that each line is to contain 5 digits, or not more than 5 digits. Then $99999 \times 5 = 499995$ will be the answer. This is shown as follows :

Suppose he writes 41113 You write 58886	= 99999		
Suppose he writes 61451 You write 38548	= 99999		
Suppose he writes 6500 You write 93499	= 99999	= 99999 × 5.	
Suppose he writes 1 You write 99998	= 99999		
Suppose he writes 99999 You write 00000	= 99999		
Sum = 499995			

THE END.
