The number of varieties of the vine is as great in Portugal as in other countries, and their names are of Portuguese origin; but these names are various for the same variety in different parts of the country, while the same name is used in various places for different varieties. At *Pezo*, the best red wine is produced from a small red late grape, growing on a vine whose leaves are deeply indented and very rough. A great number of varieties are mingled together, as for instance at *Camego*, where sixty-seven varieties grow together; a method which certainly possesses some advantages, but also great disadvantages. The distance at which the vines are planted is very various.

One of the most important steps is to prune the vine. The high vines in *Minho* which produce the white wines, are only cut every other year and sometimes seldomer; whereas the others are cut every year; in cold situations in autumn, and in the warm in January and February. The manner of doing this is various, and depends much on the skill of the gardener. A short time before and after they are in bloom, or if they bear too many grapes, the superfluous branches are lopped off. In some parts the leaves are also taken off to expose the grapes to the sun.

In Upper Douro, the branches are carefully bound up to one or more stakes, which is done

just before and after the birds come out; otherwise the branches are only twined round the stem, and fastened or tied to it.

Another very necessary annual labour is hoeing, partly to loosen the earth, and partly to destroy weeds. This is done in spring before the leaves come out; at which time the labourers are seen in crowds in the vineyards, and repeated short time before the blossoms appear. During the first three years a furrow is dug round the vine in autumn, a short time before the fall of leaf. This is done in order to cut the roots and afford sufficient moisture; for which reason, in cold moist places, the furrows are filled immediately, but in warmer situations much later.

In Upper Douro and other mountainous parts the vines are manured as soon as they are ten or twelve years old. Combustible materials, such as old faggot-wood, dry plants, &c. together with argillaceous earth, are spread, after which the whole heap is fired from below, and the ash used as manure.

The vines are propagated by means of cutting from the roots or by layers, which consists in laying a branch in a furrow, leaving out only two eyes. The young vines that arise from the cuttings are used for planting new vineyards. But the method is generally used only for supplying vacant places, new vineyards being planted with slips without roots, which, when cut off, are covered half with earth, and half with loose branches. These are planted from vintage-time to the end of January.

The vintage in Upper Douro commences when the grapes begin to shrivel. In these parts it is difficult and expensive to convey the grapes to the press, the whole district consisting of steep hills and narrow valleys. This process is performed by treading, and a great number of men are employed at vintage-time, but the population of Upper Douro being insufficient, a great number of *Gallegos* come to assist them. To each vine are reckoned from eight to twenty pipes. The proper port-wine is left seventy-two hours standing on the hulls, if intended for exportation, but only four-and-twenty if for home consumption. In only six districts is white wine produced, which, however, is inferior to the former, but in some other parts of Douro, which properly produce no port wine, good white wine is made.

ndy is added, forming even in wine of the
quality a twelfth part. There is no proper
wine free from it, nor is this addition by
means an adulteration of the wine-merchant,
originally added. Those who dislike this
tasted taste must drink the wine of the coun-
made for home consumption, which is often
excellent; and might probably by a delicate
be preferred to all that is exported. It
contains at least a much smaller quantity of
ndy. The taste of the English, and their
ndness for drinking to excess, is evidently the

I will here describe the port-wine trade from a paper
the 3d. vol. of the *Memorias Economicas*. It principally
ards the progress of the monopoly of the company of
per Douro, and in more than one point abounds with in-
teresting information. I shall neither give an extract nor a
elation of this treatise, but shall only avail myself of the
it contains.

In 1681 the Upper Douro was as yet but little cultivated,
very poor. At that time the English as well as other
European nations loved sweet wines, to which but few parts
this district are adapted. Lisbon then exported it in con-
siderable quantities, nor did the exportation of port-wine
cease immediately after the treaty of Methuen in 1703.

Soon the taste for red-wine began constantly to increase,
the English who now settled in the country in great
numbers encouraged the cultivation of the vine in order to
the wine cheaper; which succeeded so well, that from
1735, a pipe of the best wine was sold for only ten
crus.

At this even the members of the English factory
were discontented, and fearing so cheap a price might injure
the trade held a meeting; but a shrewd merchant, named
Pancorvo, prevented any increase of price, and persuaded
them rather to direct their attention to a Spanish merchant,

Colonel Pancorvo, and put him down. Pancorvo being
a cunning man, determined to open a direct trade with
the northern ports, and therefore offered a higher price;
his money failing, he could not go through with his
speculation, and became a bankrupt. The English then
altered the wine terribly, mixing it with the sour wines
of Beira and Minho, coloured it, and in short at length de-
stroyed its reputation.

In 1736, the company of Upper Douro was established
by an order of the cabinet, which still continues in force,
and has produced much good to the country, though its re-
gulations and conduct are faulty. It consists of a provisor
chief inspector, twelve deputies, six counsellors, and a
secretary. These nominate a kind of tribunal, consisting of

desembargador juiz conservador, a desembargador fiscal,
with subordinate attendants, a notary, a meirinho, a
provisor, scribes, administrators, &c. an intricate and
complex constitution, which annually costs a hundred thou-
sand crusades. This company depends immediately on the
king, and is not under the jurisdiction of any other tribunal;

which reason they ventured on many arbitrary acts,
they were resolved to keep up the reputation of the wine,
and that the price should be fixed. Their funds at first
consisted of one million two hundred thousand crusades,

cause of adding so great a quantity of very
strong brandy: but now almost all Portuguese
wines have at least some brandy added before
they ferment. It is said to be impossible to
preserve the wine without this addition; which
may indeed be true, as there are no wine cellars
in Portugal, the wine being kept in warehouses
above ground, where it is left to ferment.

The wines grown here are as soon as possible
sent to Oporto, where they remain in the maga-
zine three years before they are exported*.

SECTION

which, however, were not destined merely for the purchase
of wine, but to make loans to the peasants at three per cent.
These however have very seldom taken place, evasions
having also been used to avoid them.

The company have not indeed a complete monopoly of
the wine of Upper Douro. The members are bound to take
wine from each grower at a fixed price. But if the grower
prefers selling and transporting his wine elsewhere into the
country he may. This however must be done through the
intervention of the company, who receive six per cent. It
is evident these regulations necessarily give them a very con-
siderable monopoly; but the restraint went still farther: a
list was made of the produce of each vineyard for the last
preceding five years, and no one was permitted to sell a
larger quantity, either to the company or to any one else.

Thus all increase of this species of agriculture is entirely
stopped, and what is still worse, the company employ va-
rious evasions not to take all the wine grown, nor at the
prices fixed.

The district of Upper Douro was divided into such parts
as were to produce factory or export wine, and wine for
home consumption. The division itself is not properly
made; for there are districts which bear bad export wine,
and others, where a wine is produced, which far excels
most of the wines destined for exportation. The port wine
for home consumption, which we drank in good houses,
was so excellent, that I at first thought this was the name of
the best port wine, and was much astonished when I learnt
the contrary, and tasted the common bad home consumption
wine. Every possible precaution is now taken to prevent
the adulteration of the export-wines with the other wines.

It was at first prohibited to send out of their districts the
grapes for the export-wine, under penalty, which disabled
the poor farmers, who could not now carry their grapes to
the press, from selling any factory-wine. But even this
did not prevent frauds of this kind, which were often con-
trived with great art.

The care the company bestowed on the goodness of the
wine, went too far. In 1557 munnuring with dung was
prohibited, because it tended to produce a large quantity,
but of bad quality. Orders were also given to cut down
every elder tree within five leagues round Upper Douro, to
prevent colouring the wine with their berries. In 1771 this
order was extended to the provinces of Beira, Trás-os-
montes, and Minho; but no attention was paid to the
phytolacca decandria, (Pokeweed or American night shade),
which is grown in large quantities in Beira for colouring
wines.

SECTION XII.

Journey to Estrella—Description of that Range of Mountains—Return from the Serra de Estrella to Lisbon—Portuguese Justice.

THE summer was already far advanced, the heat which was very great threatened soon to make the fields naked and dry, and we were obliged to hasten toward the Serra de Estrella, the highest range of mountains in Portugal. We therefore crossed the Douro by a ferry at Pezo Regua, and on the other side immediately climbed the heights of the mountain. We continued rising as far as Lamego, an old city on the small river Balsamao. This is a considerable place containing about five thousand inhabitants, and appears quite opulent. It consists of two parishes, has four monasteries, and is the seat of a bishop and a corregedor. Lamego is celebrated in history for the constitution which bears its name and forms the basis of the monarchy. It is asserted that the Lacobriga of Strabo was situated near it. The land lies very high, and near the town is barren, but considerable eminences surround it. This adds to the charms of the declivity of the mountain toward the Douro,

wine, as I myself have often seen. At length in 1773 orders were given to root up every vine that bore white grapes and replace them with red, because the former give more, but worse wine. This measure was altogether prejudicial; for the difference between the prices of good and bad wine being very trifling, little attention was paid to the choice of the cuttings, those which gave a greater quantity being preferred to the better varieties. The wine-growers also suffered by it considerably, a new-planted stock not bearing its proportion of fruit till five years old. The company itself falsify the wine, since they export as much factory-wine as they receive, though it loses a ninth part of its quantity in the warehouses, where it is kept.

The company have the monopoly of all the factory-wine exported to foreign parts, but is almost entirely sent to England. In 1780, the wise plan was first put in force, of freightships loaded with port-wine directly to Petersburg. This has been repeated from time to time, but the number is still insignificant. Portugal might certainly find a considerable market for her wines in all the northern states, and men would soon drink larger quantities of that excellent wine, which so far excels the common sour French wine, were it not spoiled by that quantity of brandy, which none but the English can like. Perhaps, however it was this brandied Portuguese wine which first corrupted the taste of the English, who were almost entirely confined to this kind of wine. Six per cent for commission and shipping, and sixteen per cent profit are allowed this company.

which is one of the finest vine-mountains, and produces excellent wine, of which the inhabitants of the town make their principal beverage. In some parts the road is excellent, and planted with trees. The slate of the Douro ceases on the heights round the town; after this all is granite which is not without metallic veins, and on the eminences near the town brings with it plumbago.

In these parts we met with the elm-leaf sumach-tree, both wild and cultivated, of which probably the former had run wild. It is cultivated here and there in Traz-os-montes, and especially in Upper Douro. Its cultivation requires but little care, and it is very easily increased. Its young rough branches are used for tanning fine leather, and near nine hundred thousand pounds weight are annually exported from Oporto to England and the northern ports.

Beyond Lamego to the southward, we climbed still farther up this high range of mountains which here accompanies the Douro, but soon

The company have farther possessed, from their erection, the monopoly of wine in the town of Oporto and the country three leagues round it, which distance extended in 1760 to four leagues, in order as was given to prevent all adulteration of wine. This at first excited a tumult, which was suppressed by force, and the ringleaders of which were severely punished. The company still possess the village, and every tavern bears the name *Companhia do alto Douro*.

At length, in 1772, the company acquired the privilege of exclusively furnishing with wine the taverns in the districts of Pezo da Regua, Penaguiao, Mezaio-frio, Barqueiros, Teixeira, Touraes, and Subroso de Folhadella, like under a pretext of preventing adulteration; whereas it is evident, that the real object was to increase the profits of the company.

Such is the history of an institution in which the interest of the founder Pombal very clearly prevails. His exertions to benefit the country are every where apparent, but where the measures he adopted were precipitate and despotic. Absolute governments generally run from one extreme to the other. Some expedient was necessary to improve the wine-trade of Portugal, or at least partly to wrest it from the hands of foreigners, which the erection of the company of Upper Douro has undoubtedly done; but was it therefore necessary to exceed the proper bounds of coercion so despotic a hand?

branches to the southward. As it has no narrow deep valleys, and the declivities are not very steep, a man of slight observation might estimate the height of the mountain at much less than the truth. The soil is naked, being only covered with grass or short heath, and somewhat rocky. In the valleys we also found oaks and chestnut-trees, though not in great quantities. The vine is particularly cultivated here, which is a sign of a mountainous bad soil and a cold climate; it had already been harvested in the beginning of August. The villages between Lamego and Crasto, which is four miles farther, are extremely miserable, and the peasants appear very poor. Crasto is a large nunnery, with a small market-town, which lies somewhat lower. From Crasto to Viseu the country becomes constantly lower and more cheerful. Near Crasto we passed the Vouga, which flows from the north to San Pedro de Sul (where are some celebrated and much-frequented warm baths) and of which length forms the harbour of Aveiro. We passed through chestnut woods and over mountains covered with high heath to a large village called Calde, where the country is better cultivated and the peasants appear opulent. The mountains now grew quite flat, and at length formed a plain, on which is the city of Viseu; but though every thing here appeared cheerful, we perceived we were on a considerable height, compared with the coast and level of the country. To the south-east the Serra de Estrella appeared very distinctly. Viseu is nine leagues from Lamego, being a considerable place, and containing nine hundred houses, three parishes, and three religious houses; but consists of narrow dirty streets, and mostly bad houses. It is a very old city, and historians are very uncertain of its origin: but a city stood here in the time of the ancient Rome, as appears by some remains of Roman antiquity, especially two old towers. At present it is the see of a bishop and corregedor; and it is principally celebrated on account of the great Portuguese fair, which is here annually held*. The plains round Viseu are adorned

ed with small chestnut and oak-woods, but also present many heaths. The soil is granite sand. Not far from Viseu begin the fore-runners of the Serra de Estrella. We passed over low mountains and through pine-woods to Mengualde, a large village two leagues from Viseu. The higher we ascended, the more lively, more cultivated and pleasanter the country appeared. The village of Mengualde surprised us by the number of new-built neat houses, of which we soon perceived the cause: for we came exactly at the time of an annual fair which is very considerable, and at which a great traffic, particularly in cattle, is carried on. The roads are full of passengers, by which this otherwise populous country was rendered still more gay and lively. This cheerful appearance of the country continued as far as Coutances, another village; after which we climbed rough mountains, down which flows the Mondego, till at length, at the village of Penhações, two leagues from Mengualde, we descended to the fine plain which skirts the mountains on this side.

This plain is one of the pleasantest spots in Portugal. It is properly a wide flat valley, inclosed on one side by the forerunners of Estrella, and on the other by that range itself, which on this side appears a high, but gently declining and naked mountain; its forerunners lose themselves in hills. The plain is extremely well cultivated, containing fields of maize and rye, vineyards, and small woods of pine and chestnut-trees. A number of villages also surround it, which, like all the villages after passing Mengualde, were adorned with very neat houses and orchards. The fruit of this Serra is also the best and most celebrated in the kingdom. We were much struck with the beauty of this country, of which we had never read, and had heard but little. On the first plain of this serra, a league from Penhações, is a very small town (or villa) called Cea, where many persons of easy fortune reside, as is the case in many small places in Portugal. At the extremity of this place, near the declivity toward the plain, on an open and beau-

tiful spot, who are nearer to Viseu than to any sea-port, take their merchandize from thence. As we were travelling near Thomar, at a considerable distance from Viseu, we met with many loaded carts going to this fair, but as soon as it is over Viseu is again a very dead place.

This fair which is mentioned in no book of geographical or statistical work, is certainly of importance, since the proprietors of estates at considerable distances, frequently very far from the middle of Portugal, here provide themselves with objects of luxury. Many jewels are also here bought and sold; and the merchants from the middle of the country,

tiful spot, is the fine house, or rather castle, of Dom Luis Bernardo Pinto de Mendonça, the windows of which command a fine and extensive prospect. Here the spectator looks down on the charming plain that surrounds Cea, and beyond the forerunners of the Serra discovers the plain of Viseu, which city he distinctly sees, as also the mountain-chain of Val de Besteiros, which rise in front, while to the left he perceives the Serra de Bussaco, and the country of Coimbra.

From Cea, we immediately climbed up to the first plain of the Serra de Estrella. These mountains are covered with pines toward their base, but soon become very bare, and nothing is seen but a short grass then entirely parched up. When we had passed this first plain, we came to a valley, in which is the village of Sabugueiro, undoubtedly the best place to stop at in order to examine the range of mountains. The inhabitants of Estrella are not in this country reputed polite; which in comparison with the rest of the nation is perhaps true. A mountain stream, the Rio de Alva, flows near the village through a valley, which in many parts is extremely deep and rocky. A part of the mountain around has a gentle declivity, which is covered with grass.

The Serra de Estrella, which is the Mons Herminius of the ancients, is indisputably the most extensive and highest range of mountains in Portugal; for in winter it is covered with snow frequently during four months and longer, and rises from a mountain plain which itself is considerably high; it lies north-east and south-west. The northern part is lower, the mountains rising there gently and being less rocky, for which reason it is called *Serra Mansa*, the gentle mountains; but the southern parts which is the highest, and in many parts very steep and rocky, is called *Serra Brava*, the wild mountains. Here all is granite without exception. Although many large and small rivers take their rise in these mountains, as for instance the Mondego, the Vouga, the Zézere, yet it does not give rise to those innumerable brooks, which render the mountains of Gerez so charming. There are many populous small towns on this range of mountains, of which the principal are Covilhão and Momteigas. Below much rye and fruit are grown, but the upper part of the mountain consists of pasture, especially for sheep, which range

about like those of Spain, descending in September to the plains of Alentejo, and returning hither in May. Their wool which is excellent and next to that of Spain, the best in Europe, is exported to England in large quantities. In the villages round the Serra de Estrella an excellent sheep-cheese is made, which is sent all over the country; but is every where very scarce. The royal family annually send some as a rarity to the court of Spain, and it greatly excels the sheep-cheese of Alentejo. At Covilhão are woollen manufactories in a thriving state, but the Portuguese cloth is bad, thick, and heavy for which reason the rich constantly wear the cloth from England.

To go from Sabugueiro to the highest summit of the mountain, we first ascended a declivity very steep, where the road is easy, and winds between cists, heaths, and rocks. We now arrived at the ridge of the mountain, where the underwood changed to a fine grass, and we pursued with great ease our road, which rose slowly the southward together with the mountain. High masses of rock soon began to appear among which we suddenly perceive the fine lake, called Lagoa Redonda, or the Round Lake. These lakes, so near the summit, are charms to the mountains. The Lagoa Redonda is the smallest of them, but its completely round form, the high rocks that surround it at a small distance, and the clear transparency of its water render it extremely pleasant. Still pursuing the ridge of the mountains, which is very pleasant, we sometimes discovered a group of trees adorned with rare and beautiful hanging plants, sometimes a large plain or soft declivity covered with beautiful flowers springing up from the soft greenward. The broad ridge of the mountain suddenly grew narrow, on the east side appeared a deep and steep valley, to which a path led, dangerous to those who are subject to be giddy, and near it a stupendous mass of rocks broken on sides, and only connected with the ridge of the mountain, by a narrow tongue of land. This highly striking and uncommonly fine mass received the significant name of *Cantharus*, the pitcher; because water streams down everywhere between the rocks.

At length the ridge of the mountain leads to the highest summit, called Malhaço de Serra,

ascending in Serra de Estrella, and returning to the rocky sides that surround the mountain which is excellent everywhere excepting to the north-east. Here we found the remains of a pyramid erected by the engineers sent round the country by the government to construct a map of Portugal. The inhabitants of Estrella had destroyed it immediately after its erection, and the first anxious inquiry of every one we met on the mountain was to ask what was its object. The prospect from this eminence is uncommonly extensive, including almost the whole province of Beira and Trasmadura, and to the east are distinctly seen the Spanish mountains called Sierra de Gata, not inferior perhaps in height to that of Estrella.

Turning from the summit, and leaving the characters to the right and to the east, we passed rough rocks to the beautiful Lagoa Escura, a dark lake, which is so enclosed between high rocks, that we could not pass round it. The lake is deep and cold, and the water receives its dark shade from the reflection of the rocks of the sky. From this lake we passed, by an extremely difficult road, over fractured masses of rocks heaped upon each other to the small or great lake, called Lagoa Longa*, or Comprida. It is, however, the least beautiful of the very long, occupying the middle of a valley of considerable length. It is of unequal breadth, often very narrow, and has marshy banks. Hence it is the least striking, especially as it is situated in rather a broad valley. The whole of the south-west declivity of this range of mountains is very rough, wild, and composed of high heaped-up rocks, which render it difficult to ascend; nor does it begin to be easier till less rocky till farther on toward Sabugueiro, the northern part of the serra. We estimate the elevation of this mountain at six thousand feet above the level of the sea, and even that perhaps exceeds the fact. The mountains of Spain and Portugal describe the eye extremely through their broken and wild appearance, which give them an air of character.

The Serra de Estrella is a branch of the high range of mountains that divide the two Castiles, forming the Guadarrama, the Sierra del Pico,

and the Sierra de Gata. This chain of mountains itself sends out branches to Coimbra and Lousa, which then indeed only run off in great mountain-plains as far as Cabo de Roca. It lies in the direction of most of the ranges of mountains of this peninsula, from N E to S W.

From Sabugueiro we descended to a market-town, called San Romao, at the foot of the Serra de Estrella, and a league both from Cea and Sabugueiro. At first we found corn-fields, then young plantations of oaks, and near San Romao a well cultivated soil, and which are very rare in Portugal, potatoe-fields: in many parts water had been dug for with great labour. But when we left the mountain, appeared a dry and little cultivated hilly country covered with heaths. A long league from San Romao is a small village, called Caragoga, in which is an inn. Here the serra presents its highest, wildest, steepest side, and its majestic appearance seems to place it in the class of Alpine mountains.

A fine road continues to Ponte de Murcella, which is said to form a part of the great Spanish road through Coimbra and Almeida. This road, however, obliged us to make a great circuit toward the west, as far as the neighbourhood of Coimbra, to get to Thomar.

We passed arid hills of granite-sand, meanwhile the villages were large, and the soil round them well cultivated; to the left stretched out the continuations of the Serra de Estrella, and at first the Serra de Goes which is considerably high.

From Caragoga to a large village called Gallizes is a distance of two leagues, thence to Venda do Vallo, a miserable inn, two leagues, to the village of Moite one league, to the village of Sovereira Formosa one league, and a league more to Ponte de Murcella, at which place we were but four leagues from Coimbra.

At Venda do Vallo the granite ceases, changing to a sandstone slate, containing veins of quartz and iron-ore. Not far from hence, at Arganil, the bishop of Coimbra has caused plumbago to be dug for.

The inns on this road are in part good. At Ponte de Murcella, a village consisting of only a few houses on the Rio de Alva, is an excellent inn. As soon as we had passed the Alva over a large bridge, we crossed the range of mountains

* So the inhabitants call it though this word is not Portuguese, in which language *comprida* signifies long.

that goes from the Serra de Estrella to Coimbra, called Serra de Agor, or hawk-mountain, which is moderately high, and consists of sand-stone. The valley between this first and second chain that follows is very well cultivated, and contains many villages, as Poveres, Ponte-velha, and one particularly large called Foz de Arouce. Here Guinea-corn is cultivated. Arid sand-mountains again close this pleasant tract of country to the southward. Beyond the village of Corvo, the mountains approach and crowd together from all sides, and close before the market-town of Espinhal considerable limestone mountains arise. To the right the high Lousã appears in sight, forming the highest range of limestone mountains in Portugal. These mountains supply Lisbon with ice, which is there preserved in ice-houses. We now again entered the province of Estremadura.

From Ponte de Marcella to Espinhal is a distance of six leagues. As far as Venda dos Moinhos the road runs along a valley between high mountains, and at Venda da Maria, two leagues from Espinhal, the valleys open, the hills become lower, and are alternated with limestone and sandstone. We passed through a market-town called Cabaços, four leagues from Espinhal, and four leagues from Thomar, in a pleasant country.

This town is situated on a plain which is almost every where enclosed by hills on the river Nabaô.

Here the hills again consist partly of sandstone and partly of lime-stone. The plain is almost entirely covered with olive trees, which give it at a distance a monotonous appearance, though on a nearer approach it is much enlivened by the gardens on the banks of the river. On the whole, however, the country is very arid. Thomar was formerly more considerable, but now consists of two parishes, contains four monasteries, and the number of inhabitants is said to be from four to five thousand. It is the seat of a corregedor. The streets are tolerably regular, well paved, and have a gay and cheerful ap-

* The order of Christ was established in 1310 by Dom Diniz after the suppression of the order of knights templars, whose estates they received. It possesses no less than twenty-one towns and villages and four hundred and fifty-four commanderies. The king and the queen are constant grand-masters, an office to which a revenue of forty thousand cruzados is attached.

pearance, but most of the houses are small. The hills is a remarkable edifice, the chief monastery of the order of Christ. Here we saw many vestiges of a high antiquity extending beyond the time of Dom Manoel. In this edifice several tribunals are held, and the president is always the head of the order of Christ, and a member of the council of state*.

The road to Santarem leads at first over an cultivated sand hill; we then came to an extremely well-cultivated and extensive plain shaded with olive trees, which accompanied the Tagus for a considerable distance, and afforded a prospect, which, after having long seen nothing but hills and mountains, was uncommonly pleasing. The soil of this plain is very fertile, consisting of a fat mould mixed with sand, and therefore light; hence it is hoed with hoes which have moveable mould-board and no point, but an edge two inches broad. On this plain is a market-town, called Golegam, which appeared very flourishing, and where we observed a number of new-built houses. Very low hills, somewhat interrupt the plain at Ponte de Almonda, but soon began again still more beautiful than before. Here it is almost entirely covered with vineyards enclosed within tall black poplars, as we already discovered, at a considerable distance. Santarem situated on a mountain between olive trees and summer-houses. The wine grown here is sent to Lisbon in great quantities.

The city of Santarem, which is eight leagues from Thomar, is divided into the upper and lower town, the former being situated on a mountain, the latter on the banks of the Tagus. Most of the rich, the corregedor, the judges reside in the former, the low town being reckoned unwholesome, and accordingly consists of small houses. The upper town still preserves here and there some remains of walls, and has an old citadel. The population amounts to about eight thousand†.

The Tagus was here so shallow, that we could without inconvenience wade through it in late

† Of its former greatness and brilliancy, its division into thirteen parishes, and its containing fourteen religious houses are proofs, and it is well-known that since 1417 it has diminished. It then held the 5th place on the list of the cortes, many assemblies of which have been held there.

es, but in winter the contrary prevails; and, great number of sand-banks interrupt its navigation on it, and the tide extends only up Albalade, which is a league farther down, where goods going to and fro from Lisbon usually loaded and unloaded. All the hills consist of ratchil, of quartz, sandstone, &c. I cannot but here relate an incident which happened to us because it gives an idea of the administration of justice in Portugal. At Thomar count of Hoffmannsegg wished to embark Lisbon. In this plan I found no attractions, proposed to accompany a young Spaniard, count's secretary, and the servants, by land. Here we met with a difficulty; for we had only one passport, in which the count and myself were mentioned, together with his suite*. We therefore went to the corregedor's, but he being he had entrusted his business to another person, who made no objection, saying the count might proceed with the portaria, to which he added a declaration why the count travelled alone without attendants, giving as at the same time a passport, in which he stated that he had expected the portaria, of which he briefly added the contents. With this passport we went to Santarem, where two officers of justice, (*escrivaes*) immediately appeared, a class of men who throughout the country bear a very bad character, and demanded our passports. They refused the declaration of the corregedor of Thomar, as every foreigner ought to have a pass from the in-
stant or a secretary of state. Both these men went to and fro, spoke secretly together, then came back to us, and, in short, I observed they wanted some money, which however I feared to give them, lest I should thereby render myself suspected. At length they examined our pockets, and unfortunately found in mine a pointed knife, which being prohibited in Portugal, they threatened me with imprisonment. All this, however, was not serious; they suffered us to eat our supper in peace, and did not come till ten o'clock to fetch us to the juiz de fora. This gentleman, having a large company with him, suf-

fered us to wait a long time in his antichamber, whither he at length came, merely heard the *escrivaes*, who said. "Here are foreigners who have no regular passport," and laconically replied, "To prison." I requested him to read our papers, but he replied, "My orders are given—to prison." Thither the young Spaniard and myself were taken amidst the sport of the *escrivaes*, but no one troubled himself about our servants and baggage. At first we were put into a decent room: but the *escrivaes* spoke a few words softly to the jailer, who then obliged us to go down some steps into another chamber. This was a shocking place; a horrid stench attacked us, for the privy was situated there, and I soon perceived with horror, that we were in the same room with criminals. Even now when I reflect on this wretched moment, I can scarcely restrain my feelings; and it particularly vexed me to be told, that it was contrary to good manners to wear my hat. At length I sent to the jailer to know if we could have another room by paying for it. This was all that was wanted; and we were now shown into a good room, our servants were permitted to attend us, and the jailer allowed us to go into his apartment. I was also permitted to send messengers to Thomar and Lisbon.

At first people seemed disposed to let us remain in prison. Among the prisoners were a number of Spanish merchants, who had remained there several weeks from the same cause as ourselves, and had only been once examined since their first imprisonment. A poor Italian, who was ill, chiefly attracted my pity. He had been brought here because his passport did not agree with the last orders, his money was spent, the poor man was forgotten, and saw no means of liberation. A son of a citizen of Santarem said to us, with a dejected countenance. "You are fortunate, for you know the cause of your imprisonment, which I do not of mine; and I shall, perhaps, be sent for a soldier."

Meanwhile we soon procured our liberty. I asked the young Spaniard to draw up a petition in Spanish, as I thought he would express himself better in that language; I then translated it

It was not a mere passport, but a portaria, or order from the queen, signed by a secretary of state, to all magistrates and officers, to aid us in all things relative to our persons and researches into natural history, which was particularly specified. Such a portaria is in that country much
VOL. II, No. XCVI.

more comprehensive than a mere passport; and the judges were bound in case of need to provide for our lodging and conveyance.

† Notaries.

into Portuguese, and asked a notary, who was one of the prisoners, to instruct me in the proper form. With this we applied to the juiz de fora, who referred us to the corregedor, and the latter demanded information of the two escrivaos who had taken us prisoners. The jailer now came to us, saying that the two escrivaos were very poor, that an unfavourable report from them would at least lengthen the affair, and, making the worst of the pointed knife, advised me to give them money. We therefore purchased a favourable report with a couple of crusades, upon which the corregedor liberated us; so that we remained only about eighteen hours in prison.

We had already met an incident which may also afford some insight into the administration of justice in this country. We arrived one morning at Cezimbra, where a notary appeared as usual, read the portaria, and took leave of us very politely. Toward evening the count and myself on our return from a walk to Calheriz, had separated a little way from the town, the better to examine the country, as we could not here lose our way; but the count had scarcely entered the town when some officers of justice met him, and demanded his passport. He assured them he had it at the inn, whither they might conduct him and see it; but all he could say availed nothing, and he was taken to prison; where indeed he was placed in a decent apartment, but exposed to the curiosity of a multitude of spectators. Here he was examined even to his shirt, and two pistols being found in his girdle, he was declared a very suspicious person, though the portaria permitted him to carry all kinds of arms; nor till he was thrown into prison was a message dispatched to me to send the portaria. I did so, not doubting the count would immediately return; but with the utmost astonishment I heard the answer of the alcade, that the juiz de fora being absent he could not decide upon this affair. Fortunately we had spoken with the juiz de fora, who was a good kind of man, at Calheriz, whither a servant was sent in the night with the portaria. Meanwhile I was informed, that if the servant did not return next morning, I must also go to prison. He returned at three

o'clock, and brought positive orders immediately to liberate the count; but the officers of justice would not suffer him to go without paying their fees, which the count gave them, declaring he despised these men too much to trouble himself any further about them. The alcade would also have kept the pistols, till the count declared that he would immediately send a messenger to Lisbon with an account of the whole transaction.

The road from Santarem to Lisbon passes first between the river and hills, which latter soon ascends; these are very sandy, and, being covered with heath and pine-woods, forming a striking contrast to the charming banks of the river. On these hills is Cortacha, two leagues from Santarem, a very large village, market-town, with many new and neat houses situated, notwithstanding the badness of the soil, in a well cultivated country. The sandy hills terminate toward Azambuja, a small town containing from seven to eight hundred houses on a fine and well cultivated plain on the bank of the river. Two leagues farther, still pursuing the river-bank, we came to a market-town called Castanheiro, where is a good inn. Here we saw nothing but corn-fields, olive-trees and gardens. Only half a league farther is Vilafranca, containing about eight hundred houses, and situated on the river, where it forms a considerable landing place. Half a league beyond Vilafranca is Alhandra, containing four or five hundred houses. Here we left the river for a while, and ascended cultivated hills covered with olive-trees, to Alveroa, consisting of about four hundred houses situated two leagues from Lisbon. From hence we followed the river to Povungue, a small market-town containing two hundred houses. At the parts where the river overflows its banks much salt is made. At the village of Saccarem we passed a small river that falls into the Tagus on a bridge of boats. From this place we were accompanied by a continual succession of walls of quintas with houses interspersed to Lisbon, where the traveller may pass through several streets without knowing he is in the capital. I do not know a city whose vicinity is announced at so great a distance.

* These examples shew how much precaution is necessary to protect a traveller from Portuguese justice; and that the alcaides and escrivaos are a class of men among whom are

many rogues. They are indeed generally complained of and the juizes and the corregedores are every where accused of great partiality to persons of rank.

SECTION XIII.

Journey to Algrace—Road through the Province of Alemtejo—Serra de Monchique—Cape St. Vincent's—Lagos—Villanova—Loule—Preparation of Thread from Albes.

At the beginning of September 1798 we returned from the above extensive excursion through the northern provinces to Lisbon, where we continued till the beginning of February 1799. We then set forward again, crossing the river to Alentejo, from which place, to Agua de Moura, an extremely wretched village, we passed over continual heaths, and during the whole distance, which is five leagues, only saw one single house. Agua de Moura is situated on a brook, which however supplies the means of some cultivation. The country now becomes more hilly, as far as Alentejo, two leagues from this place, and we saw a number of cork-trees; more indeed than I remember to have seen in any other part of Portugal.

Palma is a considerable estate of the Conde de Alentejo, who resides there some months in the year. The house is indifferent, nearly resembling the dwellings of the possessors of estates in Mecklenburg. The conde has another building near the house, in which are rooms and beds for travellers of decent appearance, whom he receives every night, the inns being at a great distance from this place. The possessions of the conde are extensive, and must be extensive, as they enable the proprietor to keep large herds of cattle on the heaths. Round the conde's residence are some peasants' houses, but rural economy seems in a very backward state here, for neither the use of manure nor plants for fodder are known.

From Palma we passed over sand-hills covered with heath and cork-trees to Val de Reis, a large very old and ruinous gothic-built house of the conde de Val Reis, with a small village. The valley was cultivated like that of Palma.

The battle of Ourique was the commencement of the Portuguese monarchy. Portugal, as far as it had then been conquered from the Moors, had been conferred on Afonso Henriques, in consequence of his marriage with Isabella, daughter of the king of Castile. His son Dom Afonso Henriques (or the son of Henriques), carried on successively against his mother, the Countess, and the king, and, on the 25th of July 1139, here gained a victory with two thousand men over five Moorish kings, who

From hence the road passes over heath-hills to the river of Porta de Lama, the banks of which are likewise cultivated. Then follow hills of granite-breccia, with traces of sand slate, instead of mere sand. Beyond these hills follows another valley watered by the Xarama, which here unites with the Sado, and forms the navigable river Sado. In this valley is the village of Porto del Rey, near which is a very bad inn, where all travellers are usually obliged to sleep in one room. We travelled constantly through wastes covered with heath and cistus; only on high and dry situations appear the wild olive-tree, the kermes-oak (*quercus coccifera*), and the cistus *Monspelienensis*, which last begins in this place to be very common. Through the valleys, almost all of which lie east and west, a river generally flows, the banks of which are cultivated. All these rivers take their rise in Upper Alemtejo and fall into the Sado. In winter they swell astonishingly; we still saw the traces of their ravages, and of their fertilization, and found it difficult to pass some of them, as we met with very few bridges. They frequently render travelling in these parts wholly impracticable in winter. Messejana is a market-town, which still has its old walls like some places in Spain, especially in old Castile. The level of the country here rises, and is covered with corn fields, which continue to Pomoyas, a market-town a league farther. Here we came to the celebrated field of battle called Campo de Ourique, a hilly and ill-cultivated country.

Leaving the town of Ourique to our left, we entered on a road that leads to Garvão, a village situated in a very pleasant valley. The moun-

according to history were at the head of an army of two hundred thousand men. He now retained the title of king, which he had assumed before the battle, and called himself Dom Afonso the first. He was proclaimed king on the field of battle; but the real dignity and constitution were not settled till about six years after at Lamego, where an assembly of prelates, nobility, and commons was called by the king for that purpose, and the independence of Portugal on Spain confirmed.

tains

tains rise from thence to Amoreiras and San Martinho, two small villages, (though laid down in the maps as one,) on the declivity of a rather high chain of mountains, lying E. and W. before Serra de Monchique. We also saw round Martinho some very well-cultivated spots, and even fields sown with flax. On the summit of these mountains, we beheld the whole range of Serra de Monchique before us in its direction from E. to W. being considerably high, but not so full of peaks as the mountains of Cintra and Gerez. The indented ridge of these mountains divides Algarvia from Alemtejo.

A large but ill-cultivated valley follows the mountains of San Martinho. At length we continued our way between low hills, after which we climbed the spurs of the Serra de Monchique. This range consists of mountains thickly crowded together with short interruptions, formed of slate and sand-stone. The road winds along over these mountains, and is far from bad. The nearer we came to the highest part of the Serra de Monchique, which is called Serra de Foia, the deeper and narrower are the valleys; so that we saw nothing but an interminable desert without houses, men, or traces of cultivation. Leaving the summit of the mountain to the right; after travelling four long leagues through this desert, we arrived at the charming town of Monchique. Monchique is a considerable villa situated partly on the declivity of the mountain, where it is dispersed in a picturesque manner. By only ascending a little above the town the spectator may behold the whole coast of Algarvia with its bays and rivers lying before him like a map. On the summit of the Serra de Foia, he will see not only the whole of Algarvia, but also a great part of Alemtejo.

Round Monchique every thing is granite, as also on the Serra de Foia which entirely consists of it. On the north side only does the slate rise to a considerable height. The Serra de Foia is unquestionably the highest range of mountains on this side the Tagus, exceeding that of the mountains of Cintra, and being perhaps but a little lower or even a little higher than the Serra de Marão. The next mountains on this side the Tagus, in point of height, are those of Mertola. The warm baths of Monchique are situated a little to the southward of the town, the road to them lying over a mountain, which however

may be avoided by going round it. They are on the south declivity of this mountain. There are four stone bathing-rooms, each prepared for one or at most two persons; the water is let in and out at pleasure by cocks. They are quite dark being without windows, and the patient descends into them down several steps. The water, like that of Gerez, has neither taste nor smell, and does the heat exceed 24° of Reaumur, which is very inconsiderable. The springs take their origin from a greyish granite, of which the whole mountain consists. The season for bathing is in spring.

At length we descended from these desert mountains, which now opened and embraced broad valleys. Being desirous of seeing Cape St. Vincent we quitted the road to Lagos, taking that to the right, and proceeding to the village of Bem Safrim. The plain had here quite an Algarvian appearance, and was covered with a number of plants very rarely or never found in other parts of Portugal. Between the slate mountains we had left on our right, and the limestone mountains on our left, we passed through the villages of Bem Safrim, Indes, and Raposeira, to Villa do Bispo, eight leagues from Monchique, as the nearest place to the Cape. The villages here have a singular appearance. They are large, stragglingly built on eminences and the churches, which are small and neat, are situated at a distance from them. Such is Villa do Bispo.

Here we saw basalt in single mountains, so rounded as at Lisbon by limestone mountains, but the basalt was blacker, more compact and sonorous, than round Lisbon. Basalt is a rare stone in this pyrenean peninsula; I know of no other traces in Spain except the specimen in the museum at Madrid, which was said to be found in Catalonia. The only parts of Portugal where it is found are those round Lisbon and Cape Vincent.

Of Algarvia I must here, for the sake of greater perspicuity, give a very brief and cursory account. This narrow tract of land is separated from Alemtejo by a broken chain of mountains consisting of sandstone and an argillaceous slate; granite only appears on the Serra de Foia. These sandstone mountains are arid and barren. They begin here beyond Villa do Bispo close to the sea-shore on low hills, and continue as far as the Guadiana. Here follows a chain of other

limestone mountains, low, but rather the former uncultivated loose stones other plants commence on mountain is a strip of cultivation which most are situated

Toward Cape Sagres the plain grows flatter, the desert plain is naked and ready to travel over covered with every where feet high, the Rocca, which At the utmost a monastery very near that something them. On by a creek from Sagres, the commandant and the unwilling to Without the When the g Lisbon, the from a creek

At Sagres are taken, under the rock in great quantities (quarries), Spain, especially and of which from thence

To leave long portions of the plain and right to Lagos cultivated at Lagos declivity toward with corn-trees in re-

limestone mountains, on the whole somewhat low, but rather steep, and only separated from the former by narrow vallies. These are also uncultivated, being covered with a quantity of loose stones, thickets of kermes-oak, and some other plants. Cape St. Vincent forms their commencement, and they end at Tavira. This mountain is at length succeeded by that narrow strip of cultivated land extending to the sea, on which most of the towns and villages of Algarvia are situated.

Toward Cape St. Vincent the hills constantly grow flatter, and that promontory itself is a desert plain, consisting of a grey limestone, so naked and rough near the point, that it is difficult to travel over it. In other parts it is merely covered with sand. Toward the sea the rock is every where fractured, and about fifty to eighty feet high, being of equal height with Cabo de Rocca, which it in general somewhat resembles. At the utmost extremity in this desert country is a monastery of Capuchins. Ships can approach very near the rock, and the monks assured us that sometimes in fine weather they speak with them. On another point of the rock, separated by a creek from the extreme end, is the small fort of Sagres, within which nothing is seen but the commandant's dwelling, the soldiers' barracks, and the works, which the commandant seemed unwilling to shew us, and even forbid our seeing. Without the fort are only a couple of houses. When the great earthquake of 1755 destroyed Lisbon, the sea here also swelled, and pouring from a creek over the land laid the country waste.

At Sagres a great quantity of fish and muscels are taken, and small fishing-smacks lie at anchor under the rock in the creek. Near Sagres grows in great quantities the esparto-grass (*stipa tenacissima*), a very useful vegetable, of which in Spain, especially in La Mancha, cords are made, and of which considerable quantities are sent from thence into Portugal for the same purpose.

To leave the Cape we were obliged to return a long portion of our former way through Raposeira and Budes, after which we turned to the right to Lagos; here we traversed the stony uncultivated limestone mountains, and afterwards at Lagos descended that finely-cultivated declivity toward the sea. It was entirely covered with corn-fields, in which were a number of fig-trees in regular ranks, only here and there in-

terspersed with olive and almond-trees. The figs serve for the ordinary support of the people, whose breakfast consists of bread, figs, and wine; their dinner concludes with figs, and their supper is the same as their breakfast, as we had already an opportunity to observe at Villa do Bispo.

The city of Lagos, five small leagues from Cape St. Vincent, is properly the chief town of Algarvia, though no longer the residence of the governor of that province. It is situated on a declivity close to the sea, on the west side of a large bay; but it is only of a moderate size, containing about eight hundred and fifty houses, three monasteries, and two parishes. It is surrounded by high old walls, which have only fallen in one place; and without the town is a small suburb. Many parts of this town have continued vacant since the earthquake of 1755, when it suffered much. Lagos has a corregedor, a governador, or commandant, and a garrison. The castle of Penhaõ commands the bay, which, when the wind is north or west, affords excellent anchorage even for a large fleet, though less favourable with an east wind, and not at all when it is south. Here lord St. Vincent cast anchor after he had gained his great victory over the Spaniards. A small part of the bay forms a harbour, which however only small vessels can enter. Another arm of the sea extends inland, but is only navigable for small boats, and over it is a stone bridge. The sea-coast is here flat and sandy, and continues so along the south coast of Portugal throughout the whole of Algarvia, whereas the whole western coast is always more or less rocky.

In the neighbourhood of Lagos, Cape St. Vincent, and other parts of this coast, a quantity of tunny-fish is taken and salted in May and June; but it is not so commonly eaten fresh, on account of its fat.

From Lagos to Villanova de Pertimaõ is a distance of two leagues, the road being circuitous in consequence of the creeks and small rivers, which at flood are full of water. Here we crossed the range of uncultivated lime-stone mountains. Toward Villanova the country becomes flat, is very well cultivated, and shaded with high olive and fig-trees, which here, as at Lagos, grow in corn-fields. The town consists of about five hundred, mostly small, houses, is surrounded by a high wall, beyond

which is a small suburb, and is garrisoned by two companies. The river of Villanova flows close to the walls, is here considerably broad (next to the Guadiana, which is the largest in Algarvia) and discharges itself half a league from thence between high downs into the sea. Two considerable forts, St. John on the east side and St. Catherine on the west, cover the entrance. We only saw one ship in the harbour, of which the bar is dangerous and the sand-banks shifting. This harbour can therefore be but of little importance.

We passed the river in a boat, and pursued our way to Lagoa across a flat, pleasant, and extremely-well cultivated country. Lagoa is a market-town situated on a small lake, from which it derives its name, two leagues from Villanova. The soil is here somewhat sandy, and we saw pine-woods. Some writers erroneously place here the ancient Lacobriga.

From hence to Loule, a distance of six leagues, the road varies in the manner it usually does in Algarvia. At one time we crossed flat and well-cultivated tracts, where large high olive-trees, spreading fig-trees, and the charming carob-tree*, in the corn-fields, afford a pleasant shade; and at another time we climbed rough stony limestone mountains, without any traces of cultivation.

Loule contains about one thousand six hundred houses, and is situated in a broad valley surrounded by mountains of the limestone chain, which here attain to a considerable height. The Cabeça da Camara south-west of Loule, is one of the highest. The town is surrounded with high walls, garrisoned by two companies, and the commandant (governador) is a major. Here are three monasteries and a convent for poor ladies of family.

SECTION XIV.

Faro—Cultivation of the Fig Tree—Tavira—Remarks on Algarvia—Villa Real—Account of the Fishery there—Return from Algarvia through Alentejo by Mertola, Serpa, and Évora.

FROM Loule to Faro is a distance of only two leagues. At first the road passes through a pleasant valley along a brook between limestone mountains, where large and beautiful carob-trees grow in the fields. Toward Faro the country becomes flat and sandy, being covered with heaths and cisti; but in the neighbourhood of the town the numerous gardens enliven the country, which is otherwise unfruitful.

The city of Faro is situated on a plain, being a league from the sea, and on the bank of the river Da Quarteira. The town is quite open, being built with considerable regularity, and tolerably broad streets; but chiefly consists of small houses. It is the see of a bishop, a governor, a brigadier, and a corregedor, contains

two parishes, three monasteries, and one thousand two hundred houses. There is a handsome square, with some considerable buildings, situated on the narrow river, and on one side is a small citadel. Large ships cannot come up to the town, these being obliged to unload in the road or lower down the river, which after many windings forms the narrow entrance of the harbour, a league and a half below the town to the south-east, where it is covered by the fort of San Lourenço de Olhaõ on the east side of the river. Another narrow arm of the river, or rather of the sea, forms an island, on which is the sandy cape of Santa Maria. The country toward the sea is marshy, and overgrown with marine plants; on the opposite side it is flat and sandy, and at a

* The high and beautiful carob-tree grows in great numbers toward Loule, is a great ornament to this province, of which it is a native, and we found many bushes of it on the barren limestone hills. I consider this as the most beautiful of European trees; it attains to a considerable height, always forms a large wide shady vertex, and its beautiful feathered evergreen foliage, with small roundish leaves,

gives it a charming appearance. The many pods that hang down from it have to us Germans a singular effect. It is also a useful tree; the wood is hard and red, the ripe fruit is very commonly used as fodder for cattle, and especially as mast for swine, though inferior to that of the evergreen-oak. It is also eaten by men, but chiefly for amusement, and to excite an appetite.

of six leagues, usually does in flat and well-cultivated olive-trees, forming carob-pleasant shade; rough stony traces of culti-

y pods that hang lar effect. It is ed, the ripe fruit e, and especially f the ever-green, for amusement,

distance

distance appear the mountains of San Miguel, which are rather high and steep, but well cultivated toward the base.

Faro still retains the greater part of the trade of Algarvia, and as long as lord St. Vincent blockaded Cadiz, much traffic was carried on between this place and the fleet.

The road from Faro to Tavira, which is four leagues farther, continues always near the sea, and is uncommonly pleasant: only a few small spots near Faro are sandy, and a few limestone hills uncultivated. Elsewhere, especially in the neighbourhood of Tavira, the whole soil is exceedingly well cultivated, and adorned between the corn-fields alternately with olive, carob, and almond trees.

Tavira is a neat city containing one thousand four hundred houses, four monasteries, some neat and clean streets and considerable houses, of which the principal is the governor's palace. Old walls divide the city from the suburbs; the river Sequa, over which is a handsome stone bridge, flows through the middle of it, and small vessels come up as far as the bridge. The surrounding country is one of the pleasantest in Portugal; hills of the chain of lime-stone mountains crowd close round the town, which they enclose as it were with a wood of high shady trees, in whose bosom it seems to repose.

The road ascended the river, and was very pleasant, winding amid these charming hills, and in the upper part of the valley bordered by thickets of oleander and Spanish reed. The tide comes a league above Tavira. The mouth of the river is a league to the south-east of Tavira. The entrance of the harbour is narrow, shallow, and unsafe, owing to shifting sand-banks, and the quantity of shipping is much less considerable than that of Faro. This entrance is defended by a small fort. Between Tavira and the sea are many salt-marshes. The fishery, particularly that of Sardines and Tunny, is considerable, the former of which we had an opportunity of seeing.

Tavira is the chief town of the small kingdom of Algarvia, where the governor of that province resides together with a provedor. The place of

* The most important produce exported from hence consists of figs, which the country people bring to town to the warehouses of the merchants who deal in that article. They are there thrown down in a heap in a building prepared for that purpose, where a syrup flows from them, which is used with advantage for making brandy. They are then

governor of Algarvia is one of the highest in Portugal. All the other governors of the province are under him; and as most towns have garrisons, and are or should be fortified towns, the government is military. This small kingdom (Algarvia) according to the last enumeration of the governor, the Conde de Val de Reis, in 1780, contained ninety-three thousand four hundred and seventy-two inhabitants, of which six thousand five hundred and twenty-one were husbandmen, and five thousand five hundred and seventy-five labourers. It lies close to the sea, and is well-cultivated; but this cultivation generally extends scarcely two leagues inland, after which follow desert hills. Here are more wells than in other parts, probably the remains of Moorish industry; that people having continued longer in this than in the other provinces. Oil is produced in great quantities, being considered as the best in Portugal, and exported. The wine of this province is white, contrary to the general custom of the country, but is good, and supplies a part of Alemitejo. Figs constitute the principal produce of Algarvia, but almonds are grown in considerable quantities, especially round Tavira, and are exported. The common people live principally on fish, and are very poor. The inhabitants of Algarvia are less refined and less polite than the rest of the Portuguese, but their shrewdness and sharpness of wit are celebrated throughout the country. They are also considered as the best mariners in Portugal; hence great numbers of them emigrate, and most of the boat-men at Lisbon are from this province. The inns are uncommonly bad, the whole house even at Tavira consisting of a small quadrangular room upon the ground, without windows or floors, with a stable in the neighbourhood.

From Tavira we went to Villa Real, a town built by Pombal, four small leagues from thence. In the neighbourhood of Tavira the country continues very pleasant, but round Villa Real is sandy and naked. This town is situated at the mouth of the Guadiana, which is here a broad and fine stream. It is built with perfect re-

spread to dry in the sun, in an open situation, where they are left a few days, in proportion to the heat of the weather; after which they are pressed into small baskets made of the leaves of the fan-palm, each containing twenty-eight pounds and sent off.

gularity,

gularity, the streets in which are the handsomest houses being on the bank of the river, and the smaller houses at a greater distance. All the houses are perfectly alike and well planned, and behind each is a square court with a back-door exactly similar to that in front. In each street, except those leading to the river, the houses are built alternately four with the front, and four with the back-door to the street. The pavement is extremely good, and in the middle of the town is a handsome square, in which the town-house stands. In short, nothing is wanting but inhabitants; for a deadly stillness reigns throughout the streets, a human figure is rarely seen looking out of the handsome houses, and without a company of soldiers the place would be quite empty. The greatest poverty every where appears. The country round the town is extremely sandy, the soil often consisting entirely of quick-sand; the downs are planted with fig-trees. This place is supplied with every thing, even its daily bread, from Ayamonte, which thus generously nourishes a town intended to effect its destruction; for such was the view of its founder.

On the opposite side majestically rises, proudly looking down on the hither side of the river, the elevated Spanish bank, and on its declivity the large Spanish town of Ayamonte with a number of handsome towers. A greater neatness and cleanliness instantly distinguish the towns of Spain from those of Portugal. Ayamonte was once the seat of great Moorish kings. In former times the tournaments of Ayamonte were much celebrated, and in Spanish poetry and romances the high sounding name and example of the Guadiana often occur. Not far from thence and nearer the sea is a well-built and neat market-town, called Figuerita, peopled by Catalonians whom Pombal drove away, and now flourishing by the emigrations of the Portuguese. It was easy to go over to Ayamonte with a passport from the juiz de fora at Villa-Real, the Spaniards at this time generally not being strict, which if they had been, the inhabitants of this place must have starved. By this channel much contraband trade was carried on with Portugal, especially in silk and fine cotton manufactures.

The situation of Villa-Real and the fishery on this coast are interesting subjects. A league from Villa-Real is Monte Gordo, now consisting only of a few huts, from which, however, the

whole coast and the fishery take their name. Previous to the year 1711, the fishery was unknown in this part of the country. An inhabitant of Castromarim, named Antonio Gomez, first fished here for sardines in 1711 and 1712; he was followed by some Catalonians, who first built a few huts, and were joined by degrees by other Catalonians and Andalusians. These began to use better nets, and brought the fish to Ayamonte, where they were salted. At first the fishermen paid no duty at Castromarim, but afterwards they came to an agreement with the farmers of the customs, to whom the increase of the fishery was very beneficial, according to which they only paid about five or six per cent, whereas in other parts of the kingdom the regular tax amounted to thirty per cent. The fishery now increased very much, and in 1750 there were twelve large fishing-smacks belonging to Castromarim, and fifty to Ayamonte, San Lucas and the Catalonians; and in 1774, the number of the whole amounted to a hundred, fifteen of which belonged to Castromarim. The streets of huts extended a league from the mouth of the Guadiana to the old town of Cacela, and though many of the fishermen only remained here during the season, viz. from the 24th of August to the 25th of December, yet many others had settled there. It is true, the Spaniards enjoyed the chief advantage of this trade, but many Portuguese still derived the support from it; and, although this object might require the attention of the government, it did not follow that the whole fishery should be destroyed, rather than concede a small advantage to their neighbours.

Pombal took up this business hastily, and with despotic force, so that within five months Villa-Real de san Antonio was built by his orders, and every thing that concerned the fishery and the fish trade transferred thither, and the huts at Monte Gordo burnt. Many of the soldiers in the troops at Tavira, who were present at the expedition, assured us they were exposed to the greatest danger from the rage of these fishermen. The foreigners were driven away, and lost together with their huts all their little property. This measure was exactly in character with the maxims of Pombal.

To all the inhabitants of Villa Real ten per cent of the duty on the fish caught was abated for some years, viz. from thirty to twenty per

cent (which between five nothing was un-

cent. (which however properly only amounted to between five or six per cent); on salted sardines nothing was in general paid, and nothing on exportation; but on the importation of foreign Galician sardines a heavy tax was laid. To prevent contraband trade, and enforce the payment of the duties, the minister employed much severity, and no mariner or fisherman was permitted to quit Algarvia without a passport from the chief inspector of the customs of the southern provinces or his delegate. To procure plenty of salt the minister ordered salt-pans to be dug at Castromarim, and the salt to be sold for nine hundred rees per bushel. Eight companies were now formed, each of which were to have six great fishing smacks with other small-craft. These companies were obliged to sell a thousand sardines for three hundred rees, if no other purchaser offered; for though Pombal was an enemy to monopolies, he constantly gave them birth. Most of the members of these companies engaged in them to flatter the minister, were ignorant of the business, did not usually reside at Villa Real, and were obliged to rely on their agents. A competition soon arose between these companies, who employed the same means to ruin one another, and the heavy duty imposed by Spain on foreign salt fish completed their destruction.

When Pombal fell, the losses, which the members of these companies had suffered, ceased. In 1777, from forty-eight fishing smacks the number had diminished to ten; but from this time to 1782, the fishery again somewhat increased, in consequence of the duty in Spain being taken off. It again immediately sunk on the duties in Spain being raised; but as on fish not salted no duty was now levied in Spain, they were all brought to Figuerita, where they were salted. In 1783, no less than eight hundred Portuguese fishermen emigrated thither, and in 1790, of three thousand fishermen at Ayamonte and San Lucar de Barrameda, two thousand five hundred were Portuguese.

From Villa Real to Castromarim it is usual to go by water up the Guadiana and a branch of that river on which it is situated; for by land it is necessary to make a great circuit of two leagues round another arm of the Guadiana, whereas this passage is performed in a quarter of an hour. The bank of the Guadiana on the Portuguese side is marshy, and some salt is made. Castromarim is a market-town surrounding a hill, on

VOL. II. NO. XCVII.

which is an old ruinous castle not now fortified. Near Castromarim immediately rise mountains of the chain that divides Algarvia from Alemtejo, growing higher as they approach the north.

Here and there we saw cultivated spots, and passed through some villages before we entered Alemtejo. These mountains are the fore-runners of the Serra de Caldeirão, but the range of mountains which properly bears this name lies between Faro and Ourique.

We now entered Alemtejo and came to the village of Espiritu Santo, seven leagues from Castromarim. Two leagues from thence Mertola is situated on the peak of a steep mountain, by the foot of which the broad and fine stream of the Guadiana flows through a deep valley. The prospect is extremely wild and dreary, every where consisting of naked steep mountains, among which the river flows, and a small town enclosed within high walls, with neither field nor gardens, except a single quinta near the town on another mountain. From the bank of the Guadiana the approach to the town is by a very steep ascent. A brook falls to the southward of it into the Guadiana, and though so narrow that a man might jump over it, must be passed in a ferry. The Guadiana often swells very much, the mountains are covered with its sand to a considerable height, and even up to the town itself. On removing to a small distance from the valley of the Guadiana, we found here and there well-cultivated and even fruitful spots, which produce excellent wheat. Mertola has a governor who holds the rank of major, a *juiz de fora*, about three thousand inhabitants, and belongs to the corregimento of Ourique. An excellent road leads from hence to Beja, but is not entirely finished. The road from Lisbon into Algarvia passes through Beja to Mertola, where travellers embark on the Guadiana for Castromarim, which renders Mertola a lively place, the road by land being inconvenient.

We crossed the Guadiana to go to Serpa, a town seven leagues from Mertola on the opposite side of the river. A more extensive desert does not perhaps exist in Portugal; at first we only saw a couple of houses and some fields, then another house half way, but every where else till within a league of Serpa only hills and mountains; nor did we meet any man in this desert. At a distance to the eastward we saw many chains of mountains which join the Sierra Morena.

To the left of the road is the Salto de Lobo,

5 I

where

where the Guadiana forces its way between narrow rocks. This name, which signifies the wolf's-leap,¹ reminded us of the horse-leap in the Hartz mountains in Germany, but the Bude is an inconsiderable brook compared to the Guadiana.

About a league before we arrived at Serpa, the prospect changed. The cistus gave place to pastures and fine woods of ever-green oaks, and close to Serpa are fruitful corn fields. Serpa is an open cheerful place, much more populous than Mertola, contains four thousand inhabitants, and shows considerable signs of thriving.

We again passed the Guadiana a league from Serpa, where it winds among mountains which are lower and more gentle than round Mertola. At Serpa we came to the great granite plain, which extends from thence beyond Beja and Evora as far as Montemor o novo, forming the best and most fruitful part of Alemtejo. The city of Beja is situated on a gentle hill in a fertile country rich in corn. It is a very old place surrounded with walls and gates, is the see of a bishop, a corregedor, and a governor.

Vidigueira, which is five long leagues from Serpa, is a small market-town, in an extremely charming country. On one side is the fertile plain, on the other immediately beyond and close to the town rise mountains, the valleys of which are adorned with quintas and orange-gardens, and a large gothic church on the fore-ground improves the gaiety of the scene. Every thing has a tranquil cheerful appearance, and the traveller is richly compensated for the deserts of Alemtejo. Here are about two thousand inhabitants.

Beyond the mountains the high fertile granite-plain continues, and to the left appears the Serra de Viana, consisting of low mountains in which were formerly silver mines. To the right is the Serra de Ossa, a fertile and, on one side, well-cultivated range of mountains, with a rich monastery of Paulists. Between this Serra and Evora we saw Evoramonte on a high hill. We perceived Evora at a great distance, as it is situated on an eminence. The nearer we approached this town, the worse was the cultivation.

Evora is the chief town of Alemtejo, and the see of an archbishop, a corregedor, a provedor, a juiz, &c. It is indeed surrounded by walls, which however are fallen down in many parts,

but in other respects it is quite open. Coimbra, Oporto, and Evora, are the only towns throughout Portugal, where the passports of travellers are not demanded immediately on their arrival, while there no attention is paid to them. The town consists of narrow crooked streets full of angles, with high gothic buildings and a number of old gothic churches, by which it is much distinguished from most other towns in this kingdom, where the houses are indeed small and low. The monastery of Franciscans particularly deserves notice. The cathedral church is situated in the highest part of the town, and has twenty-five prebends, each with an income of five thousand crusades. Adjacent to it is the archbishop's house, and not far from that the shambles, an old Roman building, whose well-preserved corinthian columns are now connected by a plastered wall. On the north side the aqueduct enters the town, and is commonly called the aqueduct of Sertorius, having been begun by him; though it is well known to have been built by John III.

Evora was once an university, and still enjoys that privilege, but, since the time of Pombal, has fallen to decay. It was formerly a very celebrated place. Evora is an old town, but has much dwindled since the fifteenth century, and now contains at most twelve thousand inhabitants, of which the enormous proportion of twenty-three religious houses may be the cause. Its ancient name was Eboria in the time of the Romans. Julius Caesar constituted it a municipium and named it Liberalitas Julia. The Moors conquered it from the Goths in the year 715, but in 1166 it was taken from them by Gerald surnamed the Intrepid (Geraldo Sempavor.) This man got into the town in the day-time, and in the evening went upon the wall where he cut off the heads of two centinels, then descended to the gate, and let in some troops stationed near it.

On the north side of Evora the hills rise, being round the town adorned with gardens, and on their summits with ever-green oaks. The road from hence to Montemor o Novo, which is five leagues distant, passes over granite-hills partly covered with corn-fields and partly with fine woods of ever-green oaks and pastures, which give great variety to the prospect. From Montemor we returned to Lisbon.

TRAVELS

THROUGH

GERMANY, SWITZERLAND, ITALY, AND SICILY.

BY

FREDERIC LEOPOLD COUNT STOLBERG.

SECTION I.

Journey to Düsseldorf—Description of the Picture Gallery at Düsseldorf—Flouts on the Rhine described—Valley of Elberfelde and its Prosperity—Cavern of Leuchtenburg—Monks of La Trappe—Pempelfort.

WE set sail, with a favourable wind, on the Elbe, and, in one hour, from Altona we reached Haaburgh. Of Westphalia and Lower Saxony there is not much to remark. Many thanks are due to the regency of Hannover, for the culture bestowed upon these deserts. In the parts under this government we saw the half barren waste covered with beautiful fields of rye, good potatoe grounds, nay, even wheat, peas, and barley; where the indolence of the inhabitants would scarcely have produced rye and buck wheat.

Near Bomte, where the Osnabrug domains begin, the prospect brightens. Between the towns of Bointe and Osnabrug, we saw the majestic oak, which has continued to be the subject of astonishment for centuries.

On the 6th of July, 1791, we remained at Osnabrug, and the next day proceeded to Münster; where we remained two days and a half, which we spent chiefly in the company of the Princess Gallitzin and the Baron of Fürstenberg*.

We left Münster early on the 10th, and the following morning arrived at Mühlheim on the Ruhr. Here, for the first time, during a journey of two and forty miles, we had a truly beautiful prospect. On each side of the valley, through

which the meandering Ruhr pursues its course, we saw the bold projecting rocks, clothed with hanging woods: beyond them the mountains rose, covered with forests, and interspersed with plains of different elevations, all bedecked with rich and variegated fertility. We arrived at Pempelfort at two in the afternoon.

The famous picture gallery at Düsseldorf deserves particular notice; but as I am not a connoisseur, I cannot admire a picture that speaks to the eye only, and not to the heart. The most inimitable deceptions, whether of painting or poetry, if they place no living image before me, to me are equally uninteresting.

The Diogenes, seeking an honest man in the thronged market-place with a lantern at noon-day, displays great invention. Rubens has given to the face of the philosopher the expression of bitter, but half-concealed irony. The crowd, different in sex and age, cannot conceive his meaning, and laugh at his folly. The malicious painter has introduced his own wife; yet certainly he did not mean seriously to characterize her as a fool. What various marks of folly has he communicated to the multitude! How perfectly does the philosopher appear the only man among them! The very spirit of Diogenes seems to have inspired the painter. He had certainly retired

* Germany acknowledges the merit of this statesman. He secured the rights of the peasantry, inspired the monks with industry and patriotism, gave order to the war department, awakened a general thirst for knowledge, and

with unwearyed perseverance laboured to gratify the noble craving. It was he that promoted the pure and benevolent love of science through the schools and seminaries, from the highest to the lowest degree.

within.

within himself, and, deep in contemplation, had studied each countenance, before his magic pencil could so truly delineate this ample heritage of full grown folly. His action is necessarily confined to the moment; yet he artfully leads the fancy through many successive generations. Oh Rubens, hadst thou been present when Diderot, standing to view the picture, imagined himself the hero, and exclaimed to his guide, *C'est Diderot en Hollande!* i. e. *It is Diderot in Holland!* thou wouldst have immortalized the self-sufficient mien of the man on thy canvas! Diogenes would not have put out his lantern in his presence, but probably would have assumed an air of more keen and bitter satire.

Had Rubens read Milton's *Paradise Lost*, the painter would have soared beyond himself on the wings of the poet, would have added dignity to his Fallen Angels, and would more emphatically have imparted to them their inherent malignity. The victorious angel, in pursuit of Satan as he descends, bearing the flaming sword, and invested with the power of the Almighty, is not unworthy the Michael of Milton. This picture will ever remain the work of a great genius. Sir Joshua Reynolds tore himself from it with regret, and exclaimed, "Other pictures are excellently painted: here alone colours are made to speak."

The most famous picture in this great collection is the *St. John in the Wilderness*: by some ascribed to Raphael; by others to Andrea Sarpi. The noble figure of the youth, above censure, or rather inimitably beautiful and dignified, irresistibly attracts and fixes the attention; and, when at last you have left it, you are again and again brought back*.

The *Assumption of the Virgin*, by Guido, is one of the greatest ornaments of the gallery. Devotion, rapture, divine benignity, inspire and dignify the matron; and, in all their lustre, seem to bear her to her native heaven, which opens for her reception.

I did not see the *Holy Family of Raphael*; it was not in the gallery, but was sent to be engraved.

* The history of this painting is singular. One of the keepers of the gallery was retouching a damaged Landscape, in water colours, which was not without merit. That which he had supposed to be mere canvas he discovered to be coated with oil-colours. Curiosity induced him to pro-

Rubens had certainly read Dante with attention. The noble and inventive genius of the poet inspired him, when he painted his *Day of Judgement*. Yet he is unequal to Dante, in picturing both the good and evil spirits. The rage of the one, and the rapture of the other, are more exquisitely described by the Florentine. The figure of the Judge of the world is beneath criticism. The figure of the saint in the foreground is noble: but how many thanks are due to the painter, for the cheerful countenance he has bestowed on the rising negro? The idea of skeletons half clothed with flesh, and struggling into existence, is worthy of Dante or of Milton. They are well contrasted with the already risen; and appear like the sappy buds of the ash in spring, swelling into life.

Not only the falling deception of the burning lamps, and the glimmering matches on the ground, but the animated characters of the Wise and Foolish Virgins, by Schalken, rank this picture among the best in the gallery.

The *Adoration of the Shepherds*, by Rubens, is very fine. On one side, in the clouds, an angel is seen, with his hands folded on his breast; an angel such as Raphael might have painted.

The *Mary of Medicis*, by Rubens, drew our attention. In these noble, ardent, gentle, poetical traits, the physiognomist would discover the rank which a *Mary de Medicis* would hold in society.

Christ among the Doctors in the Temple, by Vander Werf, appears to me as worthy of the subject as a picture can be. Youth, beauty, benignity, grace, and wisdom, beam in the gold-like boy. Sages, such as you might imagine Gamaliel and Nicodemus to have been are listening to his discourse.

No collection contains so many of the works of Rubens as this: but I am told his best productions are to be found in the towns of Brabant. The gallery is poor in pictures by the Italian masters; and not to be compared with those of Dresden. It is likewise deficient in Landscapes.

The Düsseldorf academy is furnished with many excellent casts, from antique statues.

ceed; and a most beautiful body began to be visible. He saw the hand of a master, washed away the water colours, and restored in full perfection the great work, that had long remained buried in darkness.

likewise rich in engravings; and, were it not, the numerous drawings, by Raphael, which it possesses, give it a value which few collections can equal.

A timber float having been announced, we went to Düsseldorf to see it; for which purpose we hired a boat, and rowed up the Rhine. The way of the oars was seen from afar, and we presently discovered a swimming village; for such is the appearance of the wooden huts that are built on the float. Four of these floats go every summer from Andernach to Holland. Each is about a thousand feet long, and a hundred and thirty wide. The number of floatmen four hundred and fifty. The rapidity of the stream, and the bulk and unwieldiness of the float make the navigation dangerous. The passage, if good, will be from six to seven days; but, if the water be low, and the wind violent and adverse, may be as many weeks. Several anchors are carried, and the float lies at anchor every night. The strong motion of the float drags them at anchor, but this motion slackens, and the float at last remains stationary. The worth of the wood which the float is composed is estimated at five hundred thousand florins. The toll it pays is six. At Düsseldorf it amounts to a hundred and sixteen pistoles: at Kaiserswerth, eighty pistoles; and the Prussian tolls are still more there. The daily maintenance of the floatmen estimated at upward of a hundred rix dollars. The pay of each man, for the whole voyage, is five rix dollars. Having arrived at their place of destination, they form themselves into parties, of seven each, club their pay, and then lot for the whole, and the losers are obliged to give their way home. The good cheer of the floatmen during the voyage delights and well rewards them for their labour. We saw fat oxen on the float, and were informed that one was slaughtered daily. The cabin of the master is as spacious as that of the captain of an eighty gun ship. The wood of the float is chiefly for the use of flooring and carpenters.

We next went to Elberfelde, which town lies in a small valley on the Wupper, which empties itself into the Rhine. The peculiar quality of the waters of the Wupper maintains four populous towns; the principal trade of which is fishing. The valley is about two leagues long, and the high hills on each side are covered with the beech and the ash, and skirted with corn fields, meadows, pastures, and gardens, in various and rich fertility. The four towns which the Wupper waters are Rittershausen, Wupperfelde, Gemark (or Barmen), and Elberfelde. Barmen is a colony of Elberfelde; of which it is the rival, both in industry and prosperity. The whole appearance of this valley delights the eye, and makes a deep and lasting impression upon the heart. Its various buildings, its swarming inhabitants, its meandering stream, now deep and silent, now rapid and shallow, its bold projecting rocks, hollow beneath, and loaded above with thick woods that shade the horizon, the honest, prosperous, and happy appearance of its people, some dwelling in neat towns, others in scattered houses that ornament the vicinity; these objects, individually and collectively, give unspeakable pleasure. Here indeed abundance every where reigns.

On our return from Elberfelde we went to Metman, a town four leagues from Pempelfort. Passing through corn fields that had been reaped, we entered a beech wood, and suddenly beheld an uncommonly wild mass of rocks that fixed our attention. Proceeding through a wide opening, we went into a cavern, into which light had two entrances, that were unperceived by us. We suddenly came to a deep precipice, with high rocks in our front; and they, like the cavity in which we stood, were loaded with trees, their sides were adorned with shrubs and ivy, and at their feet flowed the rapid Düssel. This cavern is called the Leuchtenburg. We returned through a narrow passage, which brought us to a projecting cliff, where, that we might the better look into the abyss beneath, we laid ourselves down, and each held the other in turn. This cliff is called Rabenstein (or Ravenstone.) From this we passed into a small grotto, called the Engels Kammer, or Angel's Chamber, and saw a black gulf on the other side, which people have named the Teufels Kammer, or Devil's Chamber.

Half a league from this there is a monastery of the religious order of La Trappe; of which there was only one in Germany, one in France, and one in Italy founded. The monks of this order renounce the use of speech; the prelate only, under certain restrictions, is allowed to infringe this rule. We saw the prelate, but he

shewed no inclination to admit us into the monastery. Government has appointed a spiritual commission to reform the rules of this monastery; but a veil of secrecy guards their proceedings.

Pempelfort is separated by a spacious electoral garden from Düsseldorf. Here the house of our friend Jacobi is roomy and well contrived; built for the convenience of a sage, who wishes

neither to be incommoded by want of space, nor incumbered by magnificence. He has laid out his garden in the English manner, but with a degree of taste peculiar to himself. Trees, some single, others in clusters, ornament the green lawn; through which the Düssel meanders, and forms a cascade.

SECTION II.

Duchy of Berg—Mühlheim—Cologne—Picture of the Crucifixion of St. Peter, by Rubens—Rheinmagen—Ems—Nassau—Schwalbach—Wisdaden—Mentz—Frankfort, and the Jews—Darmstadt—The Bergstrasse—Heidelberg—Bruchsal—Karlsruh.

WE had only a short half day's journey from Pempelfort to Cologne, our road lying through a fruitful and well cultivated valley. The duchy of Berg appears to me to owe its prosperity to the constitution it enjoys under the government of the elector (now king) of Bavaria, and to the industry of its inhabitants, more than even to the goodness of its soil; which, from excellent cultivation is so productive. That land must be light which one horse can plough. The horses and cattle in this country are large and well fed.

At Mühlheim we crossed the Rhine, and soon arrived at Cologne. This ancient city is built in the old style, with high houses and narrow streets. The gothic cathedral is beautiful, and would have been one of the largest in Europe, had the immense work, which was interrupted before finished, been completed. Its grandeur is still considerable; and the unfinished part gives a picturesque appearance of gothic ruins.

In St. Peter's Church we saw a noble picture of St. Peter on the Cross, by Rubens, which the painter presented to his native city. It is said that this apostle, from humility, wished to be crucified with his head downwards; and this furnished the great painter with an opportunity of displaying his genius in what may be called the terribly beautiful. The blood, hurried toward the head, distends the veins; and, as the body is not outstretched, it is bent and foreshortened: in the execution of which Rubens has displayed his whole power. The mouth of the sufferer opens in such agony, and with so much

truth, that it has a wonderful appearance of reality. Various executioners are employed around him; one of whom, with a friendly ferocity, is driving a nail through his foot, while a Roman soldier holds him fast, with a placid diligence. The soldier's countenance would be our speak our favour, were it not for the calm manner in which he attends to his horrible office. None but a Roman soldier could have hardened his countenance to such an iron serenity.

From Cologne to Bonn the road is delightful but after we had passed the latter, nature assumed her highest charms. We now plainly saw the seven hills, the summits of which, on the other side of Düsseldorf, had gradually seemed to approach. The fertile plains through which we passed abounded with vineyards and orchards. Again our road brought us to the high banks of the Rhine, beyond which were still more lofty heights, terminating in the rocky summits of the seven hills. On some of the heights are seen the ruins of old castles: in other parts the daring hand of nature projects the overhanging fearful cliff, that seems to brave the shock of time. The last of the seven hills, which is called Drachenstein (Dragonstone), appears to be the largest.

Between Rheinmagen and Andernach we beheld the majestic course of the Rhine. Before us lay the ancient town of Andernach, with its gothic wall and towers. As we determined to lay all night at Andernach we approached the shore, took a boat, and were rowed between high hills that were clothed with hanging vineyards.

We saw white insects in swarms fluttering in the evening air, and in swarms saw them end their short lives in the stream. We passed Neuwied, sailing between rows of tall poplar; and the wind being against us, we traversed the river, from shore to shore, till we came to Andernach.

Half a league from Coblenz we passed the palace of Schönborunst, where the fugitive brothers of the king of France then resided. Coblenz is at present full of French emigrants; for they crowd the streets in parties, and hurry to and fro, some in carriages, some on horseback, and some on foot; so that their numbers seem endless. The cross of St. Louis is at every button hole.

The small town of Ems, famous for its mineral waters, lies in a deep narrow vale, that is watered by the Lahn, in the road between Coblenz and Nassau. Along this river, and between the mountains, lies the road to Nassau, which is situated in a fertile valley and surrounded by rocks. On one of the hills stand the ancient ruins of the castle of Nassau, from whence that famous house derived its title.

Schwaibach and Wisbaden, both celebrated for their mineral waters, are seated among these mountains, which are interspersed with fruitful plains. There is a beautiful prospect about a league from Wisbaden, from which a long course of the Rhine, the entire city of Mentz, and the pleasant islands that surround it, are seen. Mentz is two full leagues from Wisbaden.

We entered the ancient and beautiful city of Mentz over a wide bridge of boats. Though so much nearer its source, the Rhine is more spacious here than at Düsseldorf. The palace called La Favorite, with its vast garden, stands on the shore where once the old Carthusian monastery stood; as well as two nunneries, which have been demolished. The revenues of these foundations are paid to the university. The elector purchased the deserted monastery from the university, which possesses about four millions of florins. At Mentz we became acquainted with Count Von Stadion, a young canon of great talents. All the parts round Mentz, which abound in corn, fruit, and wine, probably are more indebted for these productions to the industry of the inhabitants than to the goodness of the soil, which is light and sandy.

The parts round Frankfort appear to be in the

same predicament. They are embellished and fructified by the Main, to the beneficent waters of which they are wholly indebted. A part of Frankfort is well built, especially the principal street, which is called the Zeile. The Jews, who are numerous, are confined to live in one street, which is very long, narrow, and irregular. Their houses are separated, in back and front, from the rest of the citizens by a high wall, built far above the first floor. Every evening, about ten or eleven o'clock, both ends of this street are shut up, and no Jew, without particular permission, is suffered to quit this prison, during the time of divine service among the Christians.

The road between Frankfort and Darmstadt is very sandy. At Darmstadt we visited the celebrated English garden; and on the 8th of August passed the Bergstrasse, (a noble chain of mountains) that extends from Darmstadt to Heidelberg, which is one of the most pleasant and remarkable roads in Germany. It is seven miles long, and grew more beautiful as we approached Heidelberg. To our left lay the lofty uninterrupted chain of mountains. Opposite to these the Melibokus rears its head, on the top of which the late landgrave built a white watch tower. We had seen this tower some miles before we came to Mentz. It may be seen from Pirmacenz on the frontiers of Lorrain. The ruins of old castles, built in the feudal ages, are seen on the other mountains. The wine in these parts is called Bergsträsser (Franconian.) It is cooling, and resembles the small kind of Rhenish, or the wine of Saxony.

Heidelberg lies behind a hill, round which we travelled, and had a view of the Neckar, with the town built on its banks. Heidelberg is situated in a small valley, and part of it is built on the declivity of a hill, with the old castle much above it, though far from the top. The old counts Palatine and electors, cut in stone after the ancient German manner, are placed in deep niches between the windows. A deep moat, planted with trees, surrounds the castle; but a large part of one of the vast round towers is fallen, and lies in ruins on the side of the moat.

We continued our journey on the following morning through Bruchsal and Durlach, and arrived at Karlsruhe in the afternoon. Bruchsal is a well built town, where the bishop of Spire resides in a beautiful palace, and where there is
a salt

a salt work. About a league from Durlach a small brook, rushing from the top of a hill, divides the circle of the Rhine from the circle of Swabia.

Karlsruh is regularly built. The town contains about a third part of a large circle; the

centre of which is the palace. The streets are at equal distances, and terminate in the right line walks that lead to the garden, and the wood; forming, with these walks, the half of a circle, and having the appearance of a spider's web.

SECTION III.

Reach Pforzheim—Stutgard, and Description of its Academy—Esslingen—Gisslingen—Ulm—Biderach—Ravensburg—Tettnang—Lindau, and its Bridge—Lake of Constance—Mörsburg—Lakes of Constance, Zell, and Ueberlingen—Abbey of Reichenau and Relics there—John Huss and Jerome of Prague—City of Constance.

FROM Karlsruh the road led us back to Durlach, and afterwards, through delightful meadows, to Pforzheim. The people were busy about their second hay harvest. In these fruitful parts, the grass is mowed three times each season. Pforzheim lies on the Ens, in a very pleasant valley. In the territory of Baden the fertility of the earth and the industry of the inhabitants seem to vie with each other.

Württemberg does not appear to be so fruitful, though equally well cultivated; neither are the roads there so charming as in Baden.

The military academy at Stutgard, was invested with the privileges of an university by the emperor Joseph II. In the upper class the sciences that appertain to the former faculties are taught. The number of tutors is one hundred and forty-three: instruction is amply communicated; and very few seminaries are equal to this, either in scholastic or military science. Day scholars included, the number of students is about five hundred; of which nearly three hundred board in the house. They are well maintained, well fed, and well clothed. Their uniform is blue with black trimmings. They are daily obliged to bathe in the garden in summer: and in winter in a capacious house bath. Each scholar has a small plat of ground to himself. The collection in natural history is a good one; and, if the students desire it, they have able masters to instruct them, not only in the

sciences but in the arts: several good painters and engravers have been educated here.

The roads of Württemberg on the way to Ulm are excellent. The districts beside the Neckar, are as fertile as they are delightful. The small town of Esslingen lies on this river; which waters a beautiful valley that abounds in pastures, fruit trees, and fruitful fields.

Among the hills Hohenstaufen rises in circular beauty, which may remind the German patriot of its noble antiquity. This was the cradle of our kings and emperors, from the Swabian line: a line equally renowned in history for its genius, its courage, and its misfortunes.

From the valley near Gisslingen the road constantly ascends as far as Ulm. How much higher must the source of the Danube be than that of the Rhine! When a few leagues from Ulm the Glaciers of Switzerland may be perceived; indeed they may frequently be seen to the distance of forty leagues. The count acquaints us that he saw the Glaciers from the same parts, and likewise from the tower of the cathedral. This cathedral, as well for its size as for the height of its gothic towers, is one of the largest in Germany. From these towers the course of the Danube may be traced to a great distance. This river, though so far from the ocean, has a character for greatness, which shews it to be the first river in Europe*.

From Ulm, proceeding along the Danube, its ready for the extinguishing of fire. There are four hundred and one steps to the top of the steeple. It is one of the largest and best places in Germany; and the town house is a handsome edifice. The trade of the inhabitants is principally

its junction with the Iller takes place. Right before the town of Biderach a lovely valley draws attention; and at some leagues distant from Ravensburg the high tops of the mountains of Switzerland appear.

Leaving the vineyard heights, that surround the valley which lies to the right of Ravensburg, and the other side of the lake of Constance the hills of Bregenz are seen, beyond which lay the much higher summits of the distant Glaciers. Proceeding through Tetnang, and, travelling through forests and meadows, the prospect becomes more extensive. Here the lake of Constance may be seen, as it were, approaching the mountains of Bregenz, and likewise those of Tyrol, Appenzel, and Glaris, crowned with eternal snow. No person can form any idea of the beauty of the prospect, who has not seen the large lakes of Switzerland, with their surrounding mountains. Approaching the charming lake, at length appears the long beautiful bridge, which is three hundred and fifty paces over, and which unites the well built town of Lindau with Terra Firma.

Constance is the largest lake in Germany, and indubitably one of the most beautiful in Europe. Mörsburg, which is situated beside the lake ten leagues from Lindau, is the seat of the bishop of Constance.

From Mörsburg it is a pleasant passage over the lake to Constance; but, as the wind was unfavourable (says Count Stolberg,) we were three very pleasant hours on our passage. The lake is about seventeen leagues long, and from three to five broad; and the clear green transparency of its waters, with the changeable aspect of its shores, give a combination of charms to its prospects which are seldom seen. The mild, fertile, and gently rising shores of Swabia are adorned with three imperial towns, Lindau, Buchhorn, and Ueberlingen, beside the little

especially in linen, fustians, hardware, and wool. This town is thirty-six miles W. of Augsburg, forty-seven S. E. of Stuttgart, sixty-three N. of Munich, and two hundred and seventy-five W. of Vienna.

* The Tyrol is a hundred and fifty miles long, and a hundred and twenty broad. It produces as much corn and wine as the inhabitants have occasion for. Here are rich mines of gold, silver, and copper, and it contains twenty-eight cities and large towns, two bishoprics, forty-eight convents, twelve hundred and thirty churches, three hundred and fifty-five castles, and one hundred and twenty thousand inhabitants, who never change the fashion of their

town of Mörsburg, with various villages, hamlets, abbeys, and monasteries.

The Tyrol mountains lie in a circle to the south east, in the form of a half moon; scarcely leaving room, on a small slip of land, for the little town of Bregenz: on both sides of which their feet advance into the lake, and their summits rise to the clouds*.

The populous shores of Switzerland are steeper and grander than those of Swabia. Behind them tower three successive rows of mountains, opposite to each other, as if in order of battle; and, by their various directions, divide the cantons of Switzerland and the county of Tyrol from each other. The artillery of heaven reposes, with awful threats, upon their cloudy summits. Between them lies the Rheintal, (*i. e.* Rhine valley,) through which the most beautiful river in Germany takes its course, and pours its waters into the lake; whence, more voluminous, they again pursue their way. The Alpstein, a rocky mountain of the canton of Appenzel, rises in all its terrors, here and there covered with snow, and often emerging from among the vagrant clouds, but seldom entirely visible. More distant, and still more lofty, more daring, and more steep, are the mountains of the canton of Glaris. If, while the Alpsteindelights, yet terrifies the imagination, a person would here repose, superior promontories again attract his attention; and these do but conceal the still higher Glaciers, which cannot be seen from the lake†.

The north-west side of the lake of Constance is divided into two parts by a broad slip of land. They are called the lakes of Zell and of Ueberlingen, after the little town of Ratafz Zell (or Zell) and Ueberlingen; though they are part of the principal lake, except that the lake of Zell communicates only with the lake of Constance by the course of the Rhine. Each of these small lakes is adorned with an island.

garments, and by a very industrious set of people, but extremely obstinate. It is bounded on the north by Bavaria; on the east by Carinthia and the archbishopric of Salzburg; on the south by part of the territory of Venice, and Trentino; and on the west by Switzerland and the country of the Grisons.

† Count Stolberg was so enraptured with the lake of Constance, that he was inclined to prefer it to all the lakes of Switzerland; for, sixteen years before, he travelled on foot over the thirteen cantons, the country of the Grisons, &c. and visited all the principal lakes of this noble country to the number of four and twenty.

The Switzerland shore, is only half a quarter of a league from Thor; and two leagues on the lake of Zell, is the small island called Reichenau. Here is a rich, benedictine abbey, under the government of the bishop of Constance. This place is of great antiquity, and boasts of the relics it possesses; among which is an emerald, an ell long, about half as broad, and twenty-nine pounds weight! The monks say it was a present from Charlemagne. Whether this pretended emerald be a piece of green glass, of vitrification, or of spar, says the count, I leave the naturalist to determine; the precious jewel was valued by the monk at three millions, yet he did not forget to detail the poverty of the monastery.

Opposite to the island is Arenenberg, on the Switzerland side, in the district of Thurgau; which belongs to the eight old cantons. This hill is not high, but pleasant from its beech woods, its rivulet and charming prospect.

The council house here has, among other curiosities, the arm chair in which the emperor Sigismund and Pope Martin V. of the family of Colonna sat. Here the people shew the place where in 1415, John Huss, and two years afterward his friend Jerome of Prague, who was at

first more timid, but who became no less courageous, were burnt. Here in a house are the effigies of John Huss, carved in stone, with the date of the year 1415. Perhaps he lived in this house, when the emperor granted him a passport to conduct him safely to Constance.

Constance, or Kostnitz, is one of the oldest cities in Germany. It was a free imperial city, was in alliance with the dukes of Austria, was often obliged to take part with the confederates, and was again brought back to its former alliances under the emperor Maximilian. John Huss and Jerome of Prague were burned here, although a hundred years afterwards, it was one of the first to declare in favour of the doctrines of Luther. It has, however, lost part of its former grandeur*.

The island of Meinau, which is a full league from this place, lies between the lake of Constance Proper and the lake of Ueberlingen. It is six hundred paces from the shore, and seems to rise like a little hill out of the water. This small island contains all that man could wish; and the desire of living here, apart from the world and its turmoils, might be excited in a very lively degree.

SECTION IV.

Schaffhausen—The Fall of the Rhine—Eglisau—Zürich; its Government, Rank, and Military Force—Population—Orphan House—Cathedral—Arsenal—Societies and Customs of Zürich.

ABOUT a league from Schaffhausen the Rhine passes through a valley among woody shores, after having refreshed itself in the lake of Constance. The top of a hill, in the forest over this stream, divides the German empire (there no longer German) from Switzerland half a league from Schaffhausen. No longer German!

The Rhine near Schaffhausen is very beautiful, and flows over beds of rocks. In former times there certainly were warehouses here, for merchandize brought down the stream, from Bun-

den, Lindau, Constance, and other parts. The goods were unloaded here, because of its vicinity to the fall of the Rhine. From these the town took its name. In the Switzerland, Swabian, and Austrian dialects the word Schaffen signifies to buy and sell.

The fall of the Rhine is an object so grand and magnificent, that no description can do it justice. Here the broad stream, among bold cliffs, overgrown with trees, collects its waters in a prodigious mass; which, though disturbed, here and there rises in circles of translucence

* Constance is an exceedingly old place; it is supposed to have been the Vitodurum or Gannodurum of the ancients. It was taken by Attila, and afterwards possessed by the old French kings; and in their records it is called Villa regia Dagoberti regis. It is at present a well-built

place, is populous, and has a considerable trade. Its fortifications are strong, and its public buildings very magnificent. Here is likewise an university, which was translated from Friburg in 1677. It is thirty-five miles N. E. of Zürich, and sixty-two from Ulm.

green; and, with thundering din and raging impetuosity, dividing itself into three unequal cataracts, dashes headlong against the rock below, that daringly resists the ungovernable fury of the torrent! Daring and dignified, yet not unchastised; as the deep cavities in its bed, and its perforated sides, too plainly shew. On the lowest of these high shores, to the right of the waterfall, in the territory of Schaffhausen, stands a thread mill. Opposite to this, in the district of the canton of Zürich, on a very high rock, is built the castle of Lausen. A stranger is first taken beside the thread mill, where he is suddenly surprised, and his astonishment pleasingly yet terribly excited. He is then led, by a small winding path round the foot of the hill, to a circular basin of the stream; and, being there placed opposite to the waterfall, he learns that the cataract, at which he has been amazed, is formed only by the shores and a rock that projects out of the stream, which constitutes about a fifth part of the waterfall. Here he perceives the whole stream compressed between its rocky shores and three insulated cliffs. He is then taken into a small boat, passes the cataract on the dancing waves, and is landed on the side of Zürich. Here, below the castle of Lausen, is a scaffolding built over the waterfall. He is obliged to wait a short time till a small door is opened, the key of which is kept in the castle, standing immediately over the stream, and listening to its thunder. He then looks down upon the terrific gulph. The imagination, overpowered, is dreadfully persuaded that it shall be hurried into the deep. No possible idea can be formed of the force of the water, or of the relentless violence with which it rushes. The poet Lenz standing here, struck his thigh, and exclaimed, "*Hier ist eine Wasserhölle! i. e.*" "Here is a water hell." After a fall thus rapid the water is projected back to a great height, forming a cloud, white and dense as the smoke of a forge which conceals all beyond it. Every bush on the rocky shores is dripping: when the sun shines the colours of the rainbow play in the froth and the rising vapours.

The town of Schaffhausen was first admitted into the league of the confederates in 1501; before which it was an imperial town, whose burghers had ever been bold and ardent in the

cause of freedom. Its constitution is a mixture of aristocracy and democracy*.

Eglisau is a municipal town of the canton of Zürich, and is situated in a small valley on both sides of the Rhine, which, winding among narrow rocks, pursues its rapid course in a right line, rolling its waves among leafy hills, till it again takes a curve, and again concealed by the rocks is lost to the eye. The little town of Eglisau is uncommonly pleasant; its houses denote the active benevolence of freedom. The whole taxation of the citizens, an inconsiderable rent excepted, consists in the tythes of their corn and wine. These tythes effectually amount to a tenth of the produce, and are collected in kind, for the maintenance of the clergy, and the municipal officers. They originated in the church tythes, which were abolished at the reformation, when the magistracy took upon itself the support of the schools and clergy. The same beneficent marks of prosperity which distinguish the town are visible in the country. The people, well fed, well clothed, laborious and cheerful, live in roomy, clean, and airy houses. Their fields have the appearance of gardens; by which they are the more strikingly contrasted with the wild beauties of surrounding nature.

Zürich is a charming place, situated at the side of a lake. Some public roads were made several years ago for the advantage as well as for the convenience of the inhabitants. Zürich is wealthy by the wisdom of its economy. It expends great sums for the benefit of the country. Its buildings and public institutions are becoming the dignity of a free town. Patriotic simplicity ornaments the regulated welfare of the happy burgher. In theory, the government of the town is that which the ancients called aristocratic, but which the moderns continually confound with democracy. The burghers have equal rights, and the officers of administration are chosen by their fellow citizens from among such as are supposed to be most capable. The government of the canton is an oligarchy, which the moderns unjustly call aristocracy, for the country people are excluded from all share in the administration. The municipality consists of thirteen companies, one only of which is noble. Twelve men are chosen from each company, and constitute the great council; these again choose

* Schaffhausen is twenty-two miles N. by E. of Zürich, and thirty-nine E. of Basil.

the little council, which is composed of fifty men, who are added to and complete the great council. The small council is most respected, and may be considered as a more select body. To the half of the small council the administration of affairs is committed, and in six months the other half comes into office; so that in half a year the first burgomaster yields to the second. The election is annual; but the custom is to reelect the same members. The commission of some crime only can exclude a member of the great council; but each member of the great council has a right, when any one of the little council has been guilty of a misdemeanor, to propose another. The proposition having been made, the votes are collected, and he who has a majority is chosen. Such is the confidence which these people place in their council, and on which the calm of the city depends; for, as they trust all the administration to the little council, it was wise to subject the powerful members thus annually to the superintendence of the great. Alliances, war, and peace, depend upon the collective voice of the citizens; but they cannot assemble without first having been summoned by the burgomaster. People that are truly free do not feel the necessity of interfering upon all occasions. They know that the mind of the mechanic is deficient in the knowledge necessary for the administration of public affairs. This discretion, confirmed by the happy experience of undisturbed felicity, originates in the custom which continues the members of the great council in office for life; though, for form's sake, they are annually chosen. This annual choice is no more than a solemn ratification. Actions for debt are determined by the municipal court. The ecclesiastical court consists of laymen and divines. Every other kind of suit, between burgher and burgher, comes before the little council; with an appeal, however, lying to the great. In dignity Zürich is the first canton, though Berne is much more powerful. To Zürich, as to the canton that has the right of convoking, all foreign affairs must come. It annually issues mandates to assemble the deputies from the other cantons at Frauenfeld, which is the chief town of the bailiwick of Thurgau. They meet in the middle of July, and continue to sit six weeks. The burgomaster of Zürich has the precedence, and opens the assembly. This venerable assembly decide on all the important

affairs of the thirteen confederated cantons. Here all internal differences are assiduously appeased. Here all the complaints against landmen (high bailiffs) or governors are heard and determined. Foreigners likewise have a right to appeal to this assembly; yet it is very difficult, and almost impossible, for a foreigner to become a burgher of any canton. At Zürich the first year of every century a foreigner is made a burgher; but his descendants cannot be of the council till the century following.

The church tythes, which consist of the tenth of the annual produce of the harvest and the vintage, constitute the only tax which is levied on the farmer. The state collects these tythes, and maintains the clergy. It likewise often assists those communities that erect churches, though communities are expected to erect and maintain them at their own expence. Ten thousand florins were lately paid to a community from the treasury of the republic.

The obligation which the country people are under, to sell their wrought manufactures to the burghers of Zürich, is more oppressive than this inconsiderable tax. This restraint affects the wholesale more than the retail trader; for the latter could only furnish the shops at home, but the others might supply foreign dealers.

The state possesses certain domains, the farming of which increases its revenue. The burghers are obliged to pay five per cent. for all goods manufactured in the town: an easy tax, which generally falls upon strangers who trade with the place. The trifling revenues are more than sufficient in a country where the public officers receive no salaries; where no soldiers are maintained; and where, notwithstanding, forty thousand men, trained and armed, can, in twenty-four hours, be brought into the field; which is about a fifth part of the army of the whole confederacy.

The youth are trained to arms. All the males are exercised every Sunday in the afternoon, and no one dare marry till he can produce accoutrements and arms that have been proved. Those who serve in foreign countries are so many experienced warriors for Switzerland. In the democratic cantons, beside the pay of the soldier, each father of a family receives a crown a year from France: this is not paid in the aristocratic cantons.

f the canton of Schweitz

Schweitz, in a menacing manner, wished to raise their pay with France; which being remonstrated against by the high bailiff, he was accused of corruption and heavily fined. The canton sent threateningly to its citizens to return from France, and France, justly holding itself no longer bound by its former engagements, the people of this canton found themselves glad to send their youth to France again on less advantageous terms.

In the aristocratic as well as in the democratic cantons of Switzerland, far from an army of mercenaries, they have no standing army; and where, in the democratic cantons, each citizen is armed, there the rights of the people are sufficiently secured against the innovations of government.

The territories of Zürich extend, on both sides of the lake of that name, about four leagues and half. House after house, village after village, continually meet the eye. The population of the shores of the lake, not including Zürich, is estimated at twenty-two thousand.

As well here, on the lake, as in the interior part of the country, the culture of their fields, gardens, and vineyards is attended to with extraordinary care, though most of the inhabitants around the lake are manufacturers. The beauty of their churches, their neat and roomy houses, the good condition of their cattle, and, above all, their own cheerful and friendly countenances, denote their happiness. Some of them live by fishing, which, as well as hunting, is free throughout Switzerland; but those who reside near the lake depend most on their trade with Zürich and with their neighbours in the canton of Schweitz; which supplies the canton of Zürich with corn that is purchased in Swabia. The grain of Zürich is insufficient for its own consumption: its population, the mountains ex-

cepted, being estimated at between four and five thousand souls to the geographical square mile.

The Orphan House is a large and noble building. It stands in the finest quarter of the town, open on all sides, and on high ground near the Limmat. The children live in roomy and lofty chambers, and consist both of orphans and the children of poor old persons still living. The number is not fixed, but varies according to circumstances: none but the children of burghers are accepted. They are instructed in the christian religion, reading, writing, arithmetic, drawing, geography, and the history of their own country. Health blooms on their cheeks, good humour and satisfaction beam in their eyes. Indeed, so much care is taken of their health, that, though they admit children of a year old, and though life at this period is so precarious, only two children have died in four years. The present number of the children is ninety-two; and the numbers of the boys and girls are nearly equal.

The cathedral of Zürich was built by Charlemagne; whose effigy, well cut in stone, is placed over the door.

The people of Zürich have an old custom, which they have probably derived from the wisdom of their ancestors. If married people, in spite of remonstrance, persist in a desire to separate, they are confined for some weeks in a chamber of the council house, in which there is nothing but a small bed, a stool, and a table. Their food is served on one dish, with one plate, one knife, one fork, and one spoon. Change of place, privation, and the sociality that arises from the necessity of mutually aiding each other, have frequently, before the time of probation has expired, so reconciled them to each other, that they have renounced all thoughts of parting, and have lived peaceably together till death.

SECTION V.

Town and Country of Zug—Account of Lucerne—Anecdotes of William Tell—Remarkable Inscriptions—Town and Lake of Sempach—Canton of Berne—Thun—Valley of Hasli—Numerous Waterfalls—Herdsman of the Alps—Valley of Grindelwald.

LEAVING Zürich, with the lake on the left, and the forest of Siehl and the Jütlyberg on the right, a steep road leads to the Albis, which

joins the Jütly. On this hill drivers usually stop to give their horses breath. On the top of it is a place called the high watch, which is one of the

5 M

heights

Vol. II. No. XCVIII.

heights from which fire signals are given: a practice common in Switzerland, on any extraordinary occasion; by which the confederates are warned. No sooner is one fire seen than the next is lighted; and in a few hours all the watch heights in Switzerland are in a blaze: so that, within four and twenty hours, all the levies of the confederates are under arms. From the top of the Albis the descent is sudden and steep; and forms, with the opposite hill, which is covered with pine trees, a beautiful but narrow valley. From this place may be seen, though at the distance of five or six leagues*, the Rigi, the first hill of the nearest Alps†, or the Alps proper, lying near Küsmacht in the canton of Schweitz.

The town of Zug gives name to the seventh and least of the cantons. It is distinguished from the other democratic cantons by having a town; for the inhabitants of the others, from their love of freedom, and after the manner of the ancient Germans, do not choose to live in towns surrounded by walls. The people of Schweitz, Uri, Unterwald, Glaris, and Appenzel, have no towns.

The administration of public affairs, in the canton of Zug, is partial. There is a general assembly of the town; and likewise the individual general assembly of the three villages, Baar, Egeri, and Mentzing. In these four general assemblies, which are democratic, all foreign affairs, of war, peace, and alliance, are determined. Those resolutions in which the villages are agreed are likewise binding to the town; but should the assemblies divide, two and two, the opinion in favour of which the town declares prevails.

The Ammann, who is not here, as in the other small cantons, called Landammann, is chosen in the town; not by the assembly, but by forty counsellors. To this council the town sends thirteen deputies, and each of the three villages nine. It is a standing rule, that the Amman must be a native of the town, or of one of the villages. If of the town, he holds his office three years; if from a village, only two years. The council of forty likewise appoint the high bailiffs, who govern those villages that have no share in

the public administration of affairs. The subjects of the state, except some small taxes to the high bailiff, pay only the church tythes.

The people of Zug are held to be the most restless of Switzerland. Their general assemblies are often tempestuous, though seldom stained with the blood of their citizens. The town is built under a mountain, and on the north-east side of a lake; both bearing the same name. The lake is four leagues long, and one broad. Its situation, between the Alps and other high mountains, is inexpressibly beautiful. The wind of the canton of Zug is very acid, while that of Zürich is both mild and powerful.

The canton of Lucerne is uncommonly productive. The fertility of the soil, the mildness of the climate, the gentle breezes from the hills, and the frequent morning mists, maintain the verdure a great length of time. Every where are beheld fruitful valleys, clothed with luxuriant herbage, and various flowers.

The people of Zug and Lucerne are very handsome, both in face and form. Freedom and openness of manners characterize this noble and beautiful people; who, among their mountainous friends, dignified, and unaffected, exercise the virtue, which the Romans and Greeks supposed was only to be found in cities, and which the ancients called urbanity, but which the moderns, having apishly imitated, have from courts called courtesy. The unenslaved shepherds are free in their advances, because they cannot suspect where there is nothing to fear. They approach with a grace; for, as they want for nothing they ask for nothing. They love, and are beloved by strangers.

No town in Switzerland is so charmingly situated as Lucerne. Lovely hills, mingled with groves of pine and other trees, overlook the town and the neighbouring shore of the lake of the four Walstädte. The Reuss pours its waters into the lake with its accustomed impetuosity. It is navigable; and, by means of the Aar, maintains a trade between Baden and Switzerland; passing to the Rhine; and might open a more valuable intercourse with Holland. From this situation, which is much more convenient than

* It must be observed, that Count Stolberg makes use of the German mode of measurement. A German mile is from six to eight English miles.

† In the ancient and generally received phraseology of

Europe, those mountains which are eternally covered with snow are called the Alps; but not so in the dialect of Switzerland, where every hill has that appellation, on the tops of which even flocks and herds may feed.

that of Zürich, and from those advantages which were denied Geneva by its jealous neighbours, Lucerne might be the first commercial town of Switzerland; but, like most of the catholic cantons, Lucerne is deficient in industry.

The town of Schweitz lies between its two rocks called the Haken: it is the chief place of the canton of the same name. Some leagues along the lake the land forms a cape, at the point of which there was a prodigious rock, which fell into the lake, and where, at some distance from the land, it now stands erect like a watch tower.

Altorf is the chief place of the canton of Uri, where the general assembly meet on the first Sunday in May. The canton of Uri is divided into ten confederacies; from each of which six of their burghers are chosen, as counsellors. These sixty counsellors, as in the other democratic cantons, enjoy their office for life. Once in two years two Landammänner are elected; each of which has his year of administration. To the one in office is added a deputy, called a Statthalter. The general assembly enacts, alters, and repeals laws, forms alliances, and makes war and peace. This constitution is common to all the democratic cantons.

The people of Uri have two colleges*, the members of which are counsellors; and two courts of justice, civil and criminal. An appeal lies to the general council; but, in this case, a citizen is added to each counsellor. The general assembly takes no cognizance of legal proceedings.

Each youth of Uri enjoys the right of citizenship at fourteen. The number of armed citizens is above three thousand; but this is not the whole amount of men able to bear arms. The fruitful valley of Liniver, which lies beyond the Gothard, and is inhabited by Italians, is subject to Uri. Three other Italian districts, Riviera, Pollenz, and Bellenz, are subject to Uri, Schweitz, and Unterwald; as likewise are Meynthal, Mendris, Lugano, and Locarno, to the eleven other can-

tons. Appenzel only has no part in these districts.

The democratic burghers, who are all country people, pay scarcely any taxes: the same may be said of the inhabitants of the small cantons, and of the country of the Grisons and Valais.

The people of the valley of Liniver, near the Gothard, from which the Reuss runs down a precipice under the Devil's Bridge, are so far dependant on Uri, that the inhabitants have an appeal from their own court to the canton. Yet they have their small general assemblies, though all that relates to foreign affairs must be subject to revisal at Uri.

Bürgli is half a league from Altorf in the valley of Schacher. Here lived William Tell; but gratitude and reverence changed his cottage into a chapel, where mass is solemnly said, and from which the people go in procession. Like the two other chapels of Tell, it is adorned with images, from holy writ and the history of Switzerland. Under each image is a verse. The following lines are over the entrance:

Alhier, auf dem platz dieser Kapell,
Hat vormals gewohnt der Wilhelm Tell;
Der treue retter des vaterlands;
Der theure wrheber des freien stands!
Deme zum dank, Gott aber zur ehr,
Ward diese Kapelle gesetzt her:
Und selbe dem schutz befohlen an
Sanct Wilhelm Röschli, und Sebastian †.

On each side likewise are the following:

Sind wir gerecht, einig, und gut,
So steht die Freiheit sicher gnug ‡.

Dankbar gedenket an jene zeit
Da ihr seid worden gefreite leut§.

In the chapel, over the altar, the dial plate of a clock is painted, with a hand, which is significant of concord, pointing to the hour one; under which are these lines.

Die freiheit wird sein von langer daur
Wenn allzeit Eins zeigt diese uhr ||.

The constitution of Lucerne, relatively to the town, is more an aristocracy, or rather an

* It must, however, be observed, that these institutions are political, not academical.

† On the place where this chapel stands formerly lived William Tell; the true saviour of his country, the honoured author of its freedom. In thankfulness to him, and in honour to God, this chapel was built. It is dedicated to Saint William of Röschli, and Saint Sebastian.

‡ Let us be just, united, and virtuous, and our freedom will be secure.

§ Thankfully, and for ever, remember the day that made you free.

|| Freedom will endure so long as it shall be one o'clock by this dial.

oligarchy, than that of Zürich, where each burgher has an equal share in the government. The great council in Lucerne consists of a hundred persons. From these thirty-six men, who must be patricians, are chosen for the little council. There is an appeal from the little council to the collective council. The members of both councils hold their places for life; and it may be said, from the practice of filling up vacancies, that, in the little council, these places are in a certain manner hereditary. The chief magistrates are the two Schultheisse, or mayors, one of whom always sits at the helm of the state. They are chosen for life, and one presides this year, another the next. War, peace, alliance, and new taxes, cannot be incurred without the consent of the assembled citizens.

The peasants are very happy: they pay nothing but tythes in kind, and half a florin annually from every head of a family to the high bailiff. The country people enjoy a free trade, and, in this respect, are not, like those of Zürich, dependent on the town.

This is the most powerful of the catholic cantons, and can bring twenty thousand armed men into the field. The revenue of the state does not consist of above seventy-four thousand florins; of which there is an annual surplus, which is employed for the general good.

On the shore of the lake of Sempach stands the old town of that name; where, in 1386, the famous battle of Sempach was won, by three hundred confederates, against Leopold duke of Austria, and the flower of his army. Arnold von Winkelried, of Unterwald, here broke the phalanx of the Austrian army; opposing himself to their spears, and, by seizing as many as he could grasp, made an opening for his troops: thus willingly devoting himself to death, that he might secure the victory to his fellow warriors.

Sempach, though dependent on Lucerne, enjoys privileges so great that it may well value itself on its freedom. In ancient times it belonged to the counts of Lenzburg, then to those of Kyburg, and afterwards to the counts of Habsburg.

In 1383 it allied itself with Zürich, Berne, Basle, Soleure, and St. Gall. After the battle of Sempach it appertained to Lucerne. It has its own magistrates, an extensive jurisdiction, and considerable privileges. From three of its citizens, chosen by the town itself, the council itself elects its Schultheiss.

The lake of Sempach is two leagues long, and half a league broad; where there is a considerable fishery, the revenue of which is collected by one of the council of Lucerne for the state.

The canton of Berne is limited by the cantons of Lucerne and Soleure. A good soil, industry well directed, and freedom enjoyed, under a government wise, mild, and limited by fixed laws, raise the people of Berne to a degree of visible prosperity. An acre of meadow land is frequently sold for a thousand rix dollars.

The houses of the country people of Berne are remarkably roomy and neat; and they themselves are well clothed, well fed, cheerful, and strong. Their cattle are large, in good condition, and sleek. The men are well formed; indeed the beauty of both sexes is remarkable.

The town of Thun is built at the end of the lake of Thun, at the mouth of the Aar: its situation is charming. The lake of Thun is about five leagues long and one broad: in many places the depth of its water is a hundred and twenty fathoms. On the left shore are three cascades springing from rocks; viz. the Stampfbach, the Jungfraubrunnen, and the Beatusbach. The last flows out of a cavern on the Beatusberg. The Breitklavenberg on the right, and the Hardeberg on the left, limit the lake, affording only a passage to the Aar, which, a league from this place, flows out of the lake of Brienz, coursing through both the lakes. The Great Eiger, the Little Eiger, and the Jungfrau rise covered with everlasting snow, and higher still the Schreckenhorn, whose rocky summit appears continually covered, during the summer, with two shining snow balls. This summit is always inaccessible, and, in the fame of its height, contends with Mont Blanc in Savoy. The shores of the lake are covered with numerous villages. On the right side the southern mountains rise over the little village of Leissingen; and, for the space of six weeks in winter, conceal it from the sun.

The lake of Brienz is three leagues long, and not quite so broad as the lake of Thun. Verdant mountains surround it on all sides, some of which gently rise, till at a certain height they become steep; some set their bold rocky feet in the green waves, while the summits of others exhibit immense cliffs. Here are many fine waterfalls, the most beautiful of which is the Giesbach.

It passes from a cliff in the rock among gorges, and, after twelve different descents, rushes into the lake. Brienz is a large village, the houses of which, after the general manner of the uplands in the canton of Berne, are built with the trunks of pines stripped of their bark and laid one above the other, and roofed with shingles. These roofs are almost flat, and others of them, like the cabins in the Alps; stones are laid to prevent the wind from carrying them away. The village church is built on a small separate rock. It is three leagues from Brienz to the valley of Hasli; which is sometimes called Ober Hasli, (Upper Hasli,) though there is no Unter Hasli, (Lower Hasli,) in existence. Here are several waterfalls. In this valley stands the village of Meyringen, shut in by high rocks, and secluded, as it were, from the whole world. There are five outlets or roads between these rocks: one leading to Brienz, another over the mountain leading to Lucerne, a third over the Engelberg to Unterwald, a fourth over the Grindelberg to Valais, and the fifth over the Schedeck to Grindelwald. According to tradition the inhabitants of the valley of Hasli, which is about seven leagues in length, came originally from Sweden. In 1333 the inhabitants shook off the yoke of John baron of Weissenburg, and, with a grant of great privileges, submitted to the canton of Berne. They appoint their own council, the members of which are called *Gerichtssasse*; and from one of three burgesses, chosen by themselves, the government of Berne appoints their *Landammann*; who exercises the power of a high bailiff, and remains in office six years, but is obliged to give an account of his administration twice a year to the high bailiff of Interlaken. Meyringen is the chief place of the valley. Here are seen several water-falls, viz. the Alpbach, the Dorfbach, the Müllimbach, and the Reichenbach*.

As the traveller approaches the upper region of the mountain the pines begin to be few. The enormous rocks extend to the Wetterhorn, at the

* The Reichenbach is one of the most beautiful waterfalls in Switzerland. A lofty current tumbles through the rocky cliffs in broad sheets, and with a thundering din, while the green mountain, far and wide, is covered with

foot of which stands the Rosenlauer glacier. The last height is very difficult to climb; and the road downward to the Grindelwald is steep and not without danger; there being sometimes precipices, sometimes falling beds of flat slate, and at others short slippery grass.

The lowest glacier stands half a league from the parsonage house, but the difficulty of ascending it is great, it being through a defile almost impassable, from cliffs, flints, and snow. Here "Jacobi," says Count Stolberg, "discovered a spacious hall of ice, which I entered with him; but the clergyman" (of the place, who accompanied the count as his guide) "entreated us to leave it, and persisted in departing from a place where, two days before, there had been none of the ice which we beheld." The people of the Alps are all of them persuaded, that the glaciers continue seven years to increase, and seven years to diminish. The pastor, who has lived here these eight years, has observed it continually decrease. The rock which stands at the foot of this glacier is called the Fischerhorn. The white Lutschina rises out of the glacier, and the black Lutschina from a higher glacier at Scheideck. Their waters mingle in the valley of Grindelwald.

From this place it is four leagues in descent to the valley of Grindelwald, and beside the Lutschina into the valley of Lutschina, from which the road leads to the still deeper vale of Lauterbrunn. The verdant valley through which the Lutschina runs is narrow and very populous.

The Staubbach, near the village of Lauterbrunn, is a waterfall, which rushes down a wild rocky declivity, nine hundred feet high, which is overgrown with brushwood. Here the full stream rolls tempestuously. As it falls the pillar of water disperses into a fine rain, which does not descend perpendicularly, but yields a little to the wind. It then meets with a projecting scaffold of rock, and a part runs down its side in single streams, while another part dashes below in clouds, and covers the green turf with its spray.

Its spray. It will take a traveller nearly an hour to reach a bridge which is thrown over the rocky gulph. Here, from above, he beholds the Reichenbach rush, and sees it foam below.

SECTION VI.

Historical Sketches of Berne—Government and Constitution of Berne—General Prosperity of the Canton—Arsenal—Hospitals—Orphan-House—Cathedral—Air—Granaries.

BERNE was founded in the year 1191, by Berthold V. duke of Zähringen. The dukes of Zähringen were statthalters of the German empire, in a part of Swabia and Switzerland. The character of the times impelled the little nobles and free burghers to seek a secure refuge against the enterprizes of the great nobles and their restless fief holders. This town was particularly esteemed a place of safety and of rendezvous for the small nobility. It was built on a spot which nature had fortified; the Aar flowing on three of its sides. Berthold gave the town new laws and privileges, which were confirmed by the emperor in 1218; so that it was, even then, a free imperial town. At the death of Berthold it retained its own government, being neglected by the unstable power of the empire.

The territory of Berne was divided into four parishes. The nobles ruled the little state, and with their wealth and blood frequently defended its possessions, freedom, and security. The burghers gradually became warlike: their short wars did not hinder them from cultivating their land and collecting its produce, though they were exercised in arms, and thus rendered habitually courageous. The youth of Berne frequently, and perhaps too easily, provoked to the field, inflamed by their increasing love of war, took castle after castle. Enemy after enemy was attacked, and the laws of war annexed the conquered districts to the state. Small communities sought the protection of Berne; which strengthened itself as much by its prudence as by its fortune in war; making alliances with inferior states against the mighty fief holders, who, in the middle ages, were the common foe of growing cities.

Soleure was always the true friend of Berne. Freiburg, although its sister, was always its rival, and frequently its declared enemy. It allied itself against Berne with the jealous counts of Kyburg, Gröyeres, Arberg, Nidau, and Neufchatel. The allies, between twenty and thirty thousand strong, encamped before the

little town of Laupen, which, with its district Berne had purchased, and had first erected as bailiwick. Rudolphus of Erlach, who had served the counts of Nidau, but had deserted them to fight for his country, was the leader of the little army of Berne; which, with the aid sent by Schweitz, Uri, Unterwalden, and other allies, amounted only to five thousand men. The proud counts and their arrogant cavaliers despised the feeble foe; but the prodigious spears, wielded by the nervous arms of the small army, unhorsed the mailed knights. The allies against Berne left three thousand dead on the field. A new victory gained over Freiburg, by which it was in imminent danger, increased the courage of Berne.

Lucerne and Zürich had entered into an alliance with the three first cantons, and these allies having taken Glaris and Zug by force of arms, communicated to their inhabitants the full rights of liberty; when, in 1353, Berne was received into the confederacy, where it then assumed the second rank, which it has ever since maintained.

While the confederates were acquiring new fame against Austria, at Sempach and Näfels, the people of Berne attacked the counts of Kyburg, who sided with Austria, in Thun and Burgdorf; both of which places were ceded to them at the peace. They likewise conquered the counties of Nidau and Buren. By various means, partly by the bestowing the rights of citizenship, and partly by the conquest of feudal knights and barons, they possessed themselves of the upland valleys of the Alps. These new conquests greatly increased the power of Berne.

When Frederic duke of Austria fell under the ban of the empire for supporting Pope John XXIII. against Martin IV. the people of Berne, instigated by the emperor Sigismund, attacked Aargau, and obliged Zosingen, Aarau, Brugg, and Lensburg, with their appendages to surrender; and these now form one of the most fertile districts in their possession. allies likewise conquered the country of Baden: and Sigismund, glad to weaken his enemy, for a sum of money, confirmed them in the possession of these territories.

The canton of Berne, by a series of successes and purchases, at different times greatly increased their territories and power. It must, however, be admitted, that the canton of Berne, in ancient times, took advantage of the counts their neighbours; and, in modern, of the people of Savoy; to increase their territories: but for many years it has been animated by a different spirit. It is now honoured by all the powers of Europe, and beloved by all the cantons; and it will be difficult to furnish an example, from the history of mankind, where more moderation and love of justice have been seen, than they have shewn to their allies of every description.

With respect to the government of Berne, the most ancient chronicles of the republic shew that, in former times, the whole municipality was occasionally assembled; but such an assembly does not prove any stated or active power. In simple ages men were not so lightly fearful of subtle conclusions. An original paper, so early as 1294, mentions the two hundred. The council of two hundred formerly actually consisted of that round number; but it was gradually increased, till it was sometimes above three hundred. A law therefore was made, which limited the number to two hundred and ninety-nine. No candidates were to be elected till there were eighty vacancies; but here too corruption crept in. Young men who aspired to this honour found old counsellors, who had no longer any hopes of enjoying the office of high bailiff, whom they secretly pensioned to resign their places, in order to make the eighty vacancies, that they might be elected. Hence the law now is, that the vacancies of living counsellors must not be numbered: there must be eighty counsellors dead before there can be any new election. Each candidate must be twenty-nine years of age, dating eight days after baptism. Hence, in families who hope their descendants may be counsellors, they have the males christened immediately after birth. Elections generally happen once in nine or ten years; and any young man who is at this time a minor, if it be but for a few days, must wait till the next election.

Every burgher of Berne has the right of being

elected to the highest dignities; but few have the hope; for the little council, which consists of twenty-seven members, and the sixteen, who are annually chosen from the great council, propose the members of this great council; so that they continually circulate among the powerful families. In the collective great council, of which the small council is a committee, all power centres, but in different bodies. The executive power is entrusted to the little council, the legislative to the great. The little council assembles every day, Sunday excepted: it first examines every matter, which is afterwards laid before the great council. All current affairs are in its disposal; as likewise are most of the church benefices, and the inferior of the lay employments. It pronounces sentence in criminal causes, except over the burghers of Berne.

The members of the little council are elected in a very complex manner. On the death of any one member, the remaining twenty-six assemble: twenty-six small balls are put in a box, three of which are gold. The members each draw a ball. Those who draw the three golden balls nominate three electors from their own body. Seven other electors are chosen by the great council. These ten electors nominate a number of candidates, not more than ten, nor less than six. The collective council then give their votes. Those who have most votes in their favour draw four balls, two of which are gold, and two are silver: one of those who have drawn the golden balls is elected, by the plurality of votes of the collective council.

The little council consists of two advoyers, two treasurers, two bannerets, seven counsellors, and two secret counsellors. The two advoyers preside in the collective council and in the little council. They are elected by the collective council. They hold their office for life; though the collective council has the right to remove them. The reigning advoyer has the seal of the republic lying before him: he never gives his vote till it is demanded; nor has he any vote, till the numbers being equal, it becomes necessary for him to decide. The two treasurers and the four bannerets constitute a college, or committee, of finance. The bannerets are only a year in office; the treasurers may be continued for six years. Each banneret is likewise a high bailiff.

The bailiwicks are divided into four classes, according

according to their importance and revenues, and are frequently very lucrative. No man can be high bailiff of the first class above once, twice of the second class, and three times of the third and fourth, and the latter must be at intervals. The high bailiff continues in office six years, and each annually lays his accounts before the committee of finance. Their power is very great. To them is the police, the execution of the orders of the council, the disposal of the public money, and the corn granary, the appeals from the small courts, and the power of pronouncing sentence, when complainants bring their causes before them, entrusted.

The revenues of the state are not large; yet sufficient for a republic, the rulers of which have most of them no salary, and the rest very little, and which maintains no standing army. These revenues consist in some domains, the tithes, a certain small ground rent, the sixth part of the allodial fines of the fiefs in the Pays de Vaud, the tenths of those inheritances in this same country which do not descend to the next heir, certain trifling tolls, and the monopoly of salt. Of this monopoly no one complains; for it is sold cheaper by the government than it could be afforded by the trader.

The people are regularly trained to arms, and annually mustered. They are divided into twenty-one regiments of foot, each two thousand strong, and four companies of jagers, or light horse, and eighteen of dragoons. Beside these the persons who hold estates that confer titles of nobility raise several companies of horse. No soldier, whether of horse or foot, dare marry till he has first provided himself with uniform, arms, and accoutrements. This is the dress of the bridegroom. The dragoon must provide himself with a horse; but this is no great difficulty, since, as a farmer, he must keep many horses.

The arsenal is well stored: it contains above a thousand cannon, many mortars, muskets for sixty thousand men, and sufficient arms for the cavalry. There are three companies of cannoneers, and one of bombardiers for the artillery. The arsenal is likewise remarkable, to a traveller, for its ancient Swiss and Burgundian armour. The prodigious two handed swords and long spears are dreadfully cumbersome. The banners of Burgundy, and the ropes with which the Swiss were to have been bound, are preserved and exhibited

in a truly republican spirit. There is also the wooden image of William Tell in the act of shooting the apple from the head of his son. The building, however, is a bad one, and does not correspond to the greatness of its destination.

The hospitals are both of them beautiful: one is called the Insel, (or Island,) because of its detached situation. The sick of all nations are here carefully nursed and dressed in roomy apartments; from which there is a full prospect of the great chain of distant glaciers. Equally remarkable is the other great hospital, which much rather resembles the palace of a prince than the abode of the poor: yet not the least convenience is sacrificed to magnificence. The front gives the impression of greatness, which idea is much increased by the motto, "CHRISTO IN PAUPERIS;" i. e. "To Christ in the Poor." The court is a verdant lawn, planted with trees and numerous flowers, and a fountain is in the centre. Fifty persons, some of them poor, others sick, are here supported: beside which others are lodged and maintained at a small expence. There is likewise in this hospital a separate part for poor travellers: in the evening they are supplied with bread, wine, and a bed; in the morning they receive a breakfast, which is usually bread and wine, and a small supply of money.

In what is called the Orphan House, which is not intended for orphans only, but for other children of the burghers, forty boys, for the small annual sum of thirty rix dollars, are fed, clothed, and instructed in the christian religion, reading, writing, arithmetic, German, French, Latin, Greek, history, geography, mathematics, singing, and drawing.

The Cathedral is one of the finest and largest I have seen, says Count Stolberg. Before it is a spacious walk of trees on a bold and elevated terrace, which commands a prospect of the whole town, of the windings of the Aar, and especially of the great chain of glaciers. The money for building this cathedral, like as for building St. Peter's at Rome, was collected through all Europe: for which purpose the pope granted his indulgences.

The Granaries are well built, and are an ornament to the town; and the use to which the government puts them is deserving of praise. Corn is collected here in great quantities, not, as

Geneva, to oblige the baker to purchase there, to prevent the price being excessive. Berne often furnished neighbouring states with corn, and some few years since it generously assisted Geneva to its own loss.

The air of Berne is so healthy that the register for centuries proves, that one man in three attains the age of seventy. This sanity of the air is ascribed to its high situation, the neighbourhood of the glaciers, and the curvings of the rapid Aar.

SECTION VII.

lake of Bieler—Peter's Island—Vallangin, and Neufchatel—Chaux de Fond—Grandson—Yverdon—Meillerie—Vevay—Lausanne, its Government and Public Buildings.

THE lake of Bieler is thus called after the town and republic of Biel, which is situated on the east shore: it is four leagues long, and one broad, and is surrounded by the canton of Berne, the principality of Neufchatel, and the bishopric of Basle. This lake has its peculiar beauties. Among hills that gently rise from the shore, the meadows, pasture land, corn fields, vineyards, and woods, intermingled with unceasing variety. Numerous small towns, villages, and hamlets, above the population of this distinguished country.

In the middle of the lake the Peter's Island rises; its verdant shores crowned with trees, and in the west declining with hanging vineyards. This island belongs to the rich hospital in Berne: the purveyor of the hospital inhabits the house, under the shore, in which Jean Jacques Rousseau, for a short time, resided. In his chamber every corner and plank was scribbled over by travellers, in all languages.

The county of Vallangin and the principality of Neufchatel, united, are ten leagues in length, and five in their greatest breadth. They are supposed to contain forty thousand inhabitants. In 1707 their race of princes became extinct, and the inhabitants chose Frederic I. King of Prussia, for their prince, as heir to the house of Chalons, after having stipulated for their reciprocal rights. The representative of the king swore to leave their rights, liberties, and customs, written and unwritten, unmolested; and the representatives of the country, in return, took the oath of allegiance.

This little country has great difference of climate; the south part, toward the lake, enjoys a very mild air, and wine, with every kind of grain, and fruit, are produced here; but the sea-

sons of the north, on the contrary, including a part of Mount Jura, are rude, and the lands with difficulty produce oats and barley.

The Chaux de Fond is a valley about two leagues long, is divided into eleven parts, and, exclusive of the villages, is every where scattered over with houses. Here, under the wing of freedom, inhabit industry, order, art, and prosperity. Here the inhabitants are maintained by their manufactures and the excellence of their pastures. The number of these inhabitants is about three thousand, four hundred of whom are watch-makers. Each part of the watch is made by its particular workman; which increases the accuracy of the work and the dexterity of the artist, and lowers the price of the watch. From ten to sixteen thousand watches and many clocks are annually made here. Sixteen hundred women are supposed to be employed in the lace manufactory.

The town and bailiwick of Grandson belong in common to Berne and Freiburg. In 1476 the town was taken by Charles the Bold, duke of Burgundy, who, contrary to his pledged faith, hanged a part of the garrison and drowned the rest; but soon afterward he was defeated by the Swiss, at the same place, and lost his camp, his baggage, and his artillery. This battle was the harbinger of the victory of Murten, by which he was humbled; and of the battle of Nancy, where the restless warrior lost his life.

Yverdon is among the oldest towns in Switzerland. It is one of the four towns of the Pays de Vaud which are called *Les quatre bonnes Villes*, i. e. The four good Towns: these are Moudon, Yverdon, Morges, and Nyon. They have considerable municipal rights, with a little and a great council, consisting of thirty-six persons,

the president of whom is a banneret. There is an old castle in Yverdon, with four towers, which was built in the twelfth century by Conrad, duke of Zähringen. In this town there is a society that collects voluntary alms for all the poor, to prevent begging, and keep the country free from the dirt, disorder, and immorality of mendicants. The town is built at the south end of the lake of Neufchatel, in a charming situation.

Meillerie in Savoy, famed for its rocks, is a little village, pressed as it were between the waters of the lake and the rising mountain. The rocks, which are a part of the mountain, are perpendicular to the lake, and leave but a small space between the cliff and the edge of the lake. The inhabitants of Meillerie have neither corn fields nor vineyards. Before and over their houses are numerous tall poles, loaded with grapes as excellent as those of the Pays de Vaud; but they are not in sufficient quantities for the making of wine, and are therefore eaten. Few of the inhabitants are wealthy enough to keep a cow: they chiefly live on the produce of their walnut trees, the oil of which is expressed from the nut; and on their chesnuts, which they barter for corn. Their principal food is chesnuts, fish, and potatoes.

Vevay is an old town. In the itinerary of the Emperor Antonine it is mentioned by the name of Viviscum; and the Germans still call it Vivis. It is the next town in rank, of the Pays de Vaud, to Lausanne, and is even more pleasant than the latter, by its situation and the mildness of its climate. Like the other towns of the Pays de Vaud, it has a great and a little council, with many privileges. It contains one church, which

is very handsome; the square towers of which may be seen at a great distance. The town well built, and inhabited by wealthy citizens. About the distance of a cannon shot to the east another little town is built, called La Tour de Peyl, which appears to make but one with Vevay.

Lausanne is the largest town of the Pays de Vaud, and is built on a rising height, a short half league from the lake of Geneva. The houses are handsome, but the ground upon which they are built is so unequal that three horses are generally obliged to be harnessed abreast to draw a coach up their steep streets. In the times of the Romans it was called *Lausonium* or *Lausannum*, but it is supposed to have been built lower at that time, and nearer to the lake. Lausanne enjoyed great privileges while under the jurisdiction of its bishops, but they have much been extended under the government of Berne. Lausanne elects its own burgomaster, five bannerets, the little council, the council of sixty, and the great council of two hundred. The town holds its own upper and lower courts of justice. The government of Berne has reserved nothing for itself, except the rights of sovereignty, of arming soldiers, coining money, and that best of rights the right of forgiving. The cathedral is very beautiful, though built in the gothic style. Facing the church there is a walk planted with trees, from which there is a beautiful prospect toward the lake. The hospital is large and magnificent. In this country the benevolence of the inhabitants is greater than the necessities of the poor. This fine building is almost tenantless.

SECTION VIII.

Geneva, and brief History thereof—Government, and State of Manners—Population and Extent.

THE city of Geneva, with its small territory, lies between the confines of Switzerland, Savoy, and France, and is built on the beautiful lake which takes its name. The Rhone flows through the city, where it forms an island which is covered with houses.

Geneva was converted to christianity in the

third or fourth century; but was afterwards more than once shaken and overrun by the northern invaders. Some of the kings of Burgundy chose it for their residence: it next fell under the jurisdiction of the kings of France. Charles the Magnificent granted the town considerable privileges. It afterwards became a part of the kingdom of Arles.

Arles, and after that of Burgundy. The Burgundian race having become extinct, Geneva was incorporated, by Conrad II. with the German empire, in 1032. Its bishops gradually became more potent, and accumulated their claims, which its ambitious counts disputed with them. The people at length acknowledged the bishops as their sovereigns; but the people possessed considerable privileges. They annually chose a syndic, and a treasurer; and these appointed a council. The people were consulted in the imposing of taxes and in forming alliances. Neither the bishop nor the magistrate could undertake any thing of importance unless they were assembled; and each, at coming into offices, made a solemn oath before the syndic, by which he promised to leave the privileges of the city undiminished. About the middle of the fifteenth century the number of the council, under which the presidency of the syndics held the administration of public affairs, was fixed at five and twenty, and a superior council of fifty was instituted, which, in certain cases, was to be associated with the former. This was the origin of the great council of two hundred. In 1526 Berne and Freiburg renewed their alliance (which had been interrupted) with Geneva; and from this period it may be truly estimated to have become a free state. In 1535 the council of two hundred admitted and countenanced the doctrines of the reformers, and Freiburg renounced its alliance. The following year Calvin came to Geneva. This man, whose thoughts were as ardent as they were profound, communicated order both to church and state. By his advice, in 1559, the academy was founded; a seminary which has produced great men in every science. After great and violent contentions for many years, Geneva was acknowledged as a free and independent republic by the king of Sardinia, in 1754, and the boundaries of Geneva and Savoy were accurately determined. The state now paid off the remainder of its debts, and it appeared to have attained that chief of blessings, peace at home and with all the world. The fire, however, though smothered was not extinguished. A partial enjoyment of the blessings that result from freedom occasioned, as usual, dissatisfaction, in a city in which there was an equality of rights, but a great inequality of wealth. In 1762 the democrats excited new commotions, in

consequence of the decision of the council, on two of the works of Jean Jacques Rousseau, viz. his "Emilius" and his "Social Contract." These works were both forbidden, the former from religious, the latter from political motives. The council knew that Rousseau had fled from Paris to Geneva by reason of the trouble he was likely to receive on account of these writings. From Geneva he went to the mountains of Neufchatel, and held a correspondence with his friends in Geneva; who presented a remonstrance against the decision. They demanded that the affair should be examined by the council general; that is, by the assembled citizens. The council, on the contrary, maintained that their demand was unconstitutional. The partisans of Rousseau were called Remonstrants; the friends of the council, the Negatives. M. Tronchin defended the Negatives in "Lettres écrites de la Campagne;" which was answered by Rousseau in his "Lettres écrites de la Montagne;" by which the party of the Remonstrants was still more inflamed. In 1765 the citizens rejected all the counsellors who were named as candidates for the election of new syndics, and the election did not take place. The magistrates demanded aid of their three allies, France, Berne, and Zürich. These powers sent plenipotentiaries, and twenty-four commissioners were chosen from among the citizens. They decided in favour of the council; which so provoked the citizens, that, in a general council, they rejected the decision of the mediators. The court of France sent troops on the confines of Geneva, and prohibited all trade with the Remonstrants. The ambassadors from the interfering states published a proclamation for the restoration of order, under the title of *Pro-noncé*. To this the citizens paid little attention, held the menaces of the foreign plenipotentiaries in contempt, defied their magistrates, and obliged the government so to compromise these disputes as to give the power into the hands of the popular party. This compromise was effected on the 11th of March, 1768. Some years afterwards open war broke out between the Remonstrants and the Negatives; the Remonstrants twice flew to arms, and in the spring of 1782 several of the members of both councils who were suspected by them were imprisoned; and, aided by the natives, they seized on the gates and the ramparts. While in this state of commotion, France, Sardinia, and Berne,

Berne, sent their troops into the city, and a new conciliatory plan was devised, which was accepted by the little council, the great council, and the council general, on the 4th of November, that year, which promised permanency, by the guarantee of the interfering powers. In 1789 fresh disturbances broke out; the government called in the regiment from its barracks, but the burghers found means to avoid the soldiers, and still continued their tumults: the regiment, after it had been twenty-six hours under arms in the middle of winter, abandoned its posts; and the burghers having now become masters, a new convention was made, by which the people regained the right of election, and obtained the establishment of a city militia. The true constitution was thus once more restored, and the burghers would have remained tranquil had not their imaginations been disturbed by the French revolution. Some of the burghers ardently desired that Geneva might become incorporated with France. The inhabitants were excited to arms, and were joined by the inhabitants of the country of Gex, which belongs to France. The insurgents had almost gained possession of the city, but were however prevented. Accommodation once more took place, by the confirmation and extension of the privileges of the people.

The government of Geneva, being now firmly settled to the mutual satisfaction of all parties, exercises its functions with justice and impartiality, for the benefit of the republic: and their civil code is laconic, unambiguous, and simple; and where this code is insufficient the Roman code is consulted. This little state, which probably contains more knowledge and wealth than comparatively any other in Europe, is less troubled with lawsuits than any other.

At present they only enumerate five advocates who really practise, and seven attorneys. Whoever would have a perfect idea of the justice administered in this city must read the excellent work entitled, "Etat civil de Genève, par François André Naville, Citoyen de Genève."

The manners of the people here are likewise comparatively pure. The young men are well informed: the education of the women is no less carefully attended to; and they are as celebrated for their real merit as for their charming manners. At Geneva it is almost become proverbial to say, "Happy the children who have a woman to instruct them."

There is an excellent law of the republic which deserves notice. If a son does not pay his father's debts, which the law cannot oblige him to do, he is excluded from the enjoyment of every public office. The same prohibition extends to all who have not paid their own debts.

The corn chamber is an useful institution. Its duty is to take care that a certain quantity of corn shall be always in the granary; and the state has the exclusive privilege of selling corn to the bakers: it sometimes gains; but it is much oftener a considerable loser. This regulation is necessary in a city whose small territory is insufficient for its own consumption; and those who imagine that this privilege ever degenerates into a monopoly, in Geneva, are neither acquainted with the people nor their government.

The number of the people, according to the accounts delivered in, anno 1790, was twenty-six thousand one hundred and forty within the walls, and nine thousand without; amounting in all to thirty-five thousand one hundred and forty souls. The whole territory of the republic consists of three square leagues and seven hundred cells, allowing twenty leagues to a degree.

are poor but joyous, and did not belie their character: loud mirth, yet not riotous, rang through the valley, and brightened in their faces. Buyers and sellers appeared with their wares, and seemed satisfied with their bargains, and with each other. The horned cattle, which this air was for the purpose of vending, are a large breed, though not so fine as those of Switzerland. The goats are extremely beautiful, the ewes very large, sleek, and all of them black. Chamberry, the chief town of the duchy, contains about thirteen thousand inhabitants. Notwithstanding that many of the nobility winter here the town is ill built; but its fruitful neighbourhood, and the orchards which shade the valleys, make it very pleasant. The industry with which the fields of Savoy are cultivated is wonderfully contrasted with the uncleanness of their inns.

The little town of Lanchurg stands at the foot of Mount Cenis, in a wild situation, built with materials dug from the rock, and roofed with slate; which, that the wind might not carry away, is overlaid with stones. In ascending the mountain, the road is steep and very uneven, being all of large stones. The descent from Mount Cenis is one uninterrupted zig-zag. Steep as the mountain is on the side of Savoy, it is still much steeper and much higher on that of Piedmont. The Sennar, a rivulet which takes its rise in the lake on the mountain, dashes down among the rocks, and forms an uncommonly beautiful cascade. It then rushes through a high valley, and separates Savoy from Piedmont. At Susa it falls into the Dora, which is mingled with the Po at Turin. Here the charms of Savoy take a kind of solemn farewell of the traveller; being separated from Piedmont by rocks of a strange appearance, and thundering cataracts. The road, for some leagues, is over steep and stony path, full of short turnings, leaving high rocks on one side, and on the other deep precipices.

At Susa the valley becomes narrow, and forms the celebrated pass of that name; which is strengthened by the fortress of Brunette, commanding two vallies, and standing opposite to the fortress of Briançon, on the confines of France.

Between the little towns of St. Ambrosio and Rivoli the vallies widen, and many ruins of an-

cient castles are seen among the mountains. The parts around are fertile and pleasant. Rivoli is overlooked by a royal castle, built on a hill.

Turin is only two leagues distant from Rivoli. The road is in a straight line, uncommonly spacious, with a ditch on each side, that is planted with a row of large elms.

The extensive plains of Lombardy, the fertility of which have been famous for these thousand years, begin on this side Rivoli. It was to these plains that Hannibal pointed, as a recompense to his army, for the labours of their march, and as the seat of future victory, for which the hero was the guarantee. They extend over Piedmont, Milan, Mantua, and the Venetian territory, as far as the Adriatic. The lands are excellent, and mulberry trees are frequently planted among the corn. At some distance high hills are seen, which are clothed with vineyards and fruit trees.

The Piedmontese are justly accused of a propensity to drunkenness, and of being scandalously rapacious, which induces them to commit murder in cold blood. It is strange, that, in so active a government as that of Sardinia, no decisive regulations should have taken place, sufficient to redress this evil. How conspicuous does this make the character of nations! Among the inhabitants of Savoy, under the same government, the traveller is in perfect security; while on the plains of Piedmont, and in the very neighbourhood of the metropolis, a man may be murdered at an inn, or on the high road.

Turin is one of the most beautiful and most ancient cities of Europe. From history we learn that Taurasia was the chief city of the Ligurians, and the first which Hannibal took after his passage over the Alps. Some centuries afterward, under the reigns of the Cæsars, the Romans sent a colony to this place; and gave it the name of Augusta Taurinorum. The situation of Turin is uncommonly beautiful, and, as most travellers have remarked, very much resembles that of Dresden. Immediately facing the gate, which takes its name from the Po, there is a bridge over the river, that neither corresponds with the beauty of the city nor the dignity of the stream. The Po Street, which leads to this gate, is handsomely built. The plan of Turin is a noble one. The streets are in right lines, and the gates and the houses are built in a good style and taste; though

though the streets, in proportion to the height of the houses, the Po Street and the New Street excepted, are not sufficiently spacious. In the Po street there are handsome and lofty arcades on both sides of the way. The outside of the castle is not very promising; but the apartments are very magnificent. In the picture gallery are several fine paintings.

Between the castle and the principal church the chapel of the holy handkerchief is built; which relic the city believes itself to possess. The chapel is entirely of black marble. The capitals of the pillars, and the large silver candlesticks, by which alone the building is lighted, are gilded. The entrance inspires holy solemnity. The supposed genuine handkerchief, which is considerably large, is only publicly exhibited at the beginning of a new reign, at the marriage of the prince royal, or when any person of great rank arrives at Turin and makes the request. Here is a chalice of extraordinary value, set with jewels, said to be the richest in Italy: it is made in a good taste.

The celebrated palace of the duke of Savoy, the façade of which is built with pillars of the Corinthian order, stands near the castle, than which it is a much finer building. Next to this the palace of the prince of Carignan is the handsomest.

The arsenal, which is still to be enlarged, is a fine and uncommonly capacious building, including five courts. The halls are supported by heavy pillars, similar to those of gothic churches. Round each of these pillars a thousand muskets are ranged in an ornamental manner. Pyramids are erected between them, on which horse pistols are piled with great elegance. In the midst of these halls is one of a large size and circular form, the walls and pillars of which are ornamented with trophies of ancient armour, ranged in military pomp. The arsenal contains arms for a hundred and twenty thousand men. The cylindrical ramrod for artillery is not yet in use: the ramrods here are all of iron. In an adjoining chamber are a considerable number of small light arms, which from being very wide at the muzzle are called tromboni, as resembling a trumpet. The king has forbidden the use of

* The church was built in 1706, in consequence of a vow to the holy virgin, made by Victor Amadeus II. when the French was besieging Turin, to induce her to assist him

them, they being destructive and easy of carrying and are therefore well adapted for the banditti for which reason they have been all bought up. They are capable of being loaded either with balls or with cartridge shot, with which, by scattering, they make dreadful havoc. There is a cannon foundry, and likewise a chemical laboratory, annexed to the arsenal.

On the banks of the river, near the city, is the beautiful royal castle of Valentin, which the king granted to his chamberlain in chief, as a summer residence. The garden annexed to it applied to botanical studies.

Sluices are carried through the streets, to cleanse them, by means of a canal, which receives its waters from the Dora. These sluices flow through drains into the Po, in consequence of which the city is always clean. There are many large squares here, among which that of St. Charles is the most spacious and beautiful: the buildings are handsome, and it has extensive arcades on each side.

Two short leagues from Turin is the height at which the church called La Superba is built, and is one of the most beautiful places of Italy. This height overlooks the plains of all Piedmont as far as the utmost limits of the Alps and Apennines*.

There is a large building annexed to the church which is inhabited by twelve canons, who are provided for as a part of the establishment. The whole has a striking appearance of grandeur and magnificence. The church is in the form of Grecian cross, that is, a cross the length and breadth of which are equal. It is ornamented with a cupola, on the sides of which two minaret towers are built. The royal sepulchral vault is under the church; in which the coffins are grand and richly ornamented. A singular custom here established, that the king who died last is to be buried in one particular grave, out of which his predecessor is to be removed. The canons have an excellent library, which is particularly rich in the writings of the fathers, and is well provided with classics and the works of modern authors. From the top of the cupola is seen one of the sublimest spectacles in nature: the plains of Piedmont, the meanders of the Po, the

to raise the siege. This help was sent him in the person of the great Eugene, who led the imperial forces, and in the person of the prince of Anhalt, who commanded the Prussians.

whole shining circle of the snow-covered Alps, and after these a range of the Apennines.

La Veneria is the principal country palace of the kings, and is situated about two leagues and half from Turin. The royal family always remains here fifty days in the spring of the year. The church is beautiful: the palace contains handsome apartments, and the garden is very large, but entirely laid out in the French taste.

Turin is very populous: the streets are full of people, though the court, the greatest part of the nobility, and many students and professional men, to the number of three thousand, are absent.

In winter the number of inhabitants is estimated at nearly one hundred thousand.

Alessandria is a tolerable town in the Piedmont district of Milan, which in 1703 was ceded at the treaty of Turin by Austria to Savoy. It was built toward the end of the twelfth century by the citizens of Milan, Cremona, and Placenza, as a place of refuge against the emperor Frederic I. The town Alessandria in 1178 was named after Pope Alexander III. The town has a considerable trade, particular in cotton, silk, and the merchandize of the east.

SECTION X.

Historical Sketches of Genoa—Struggles for Freedom—Its Contentions—Territories—Manufactures—Population—Palaces—Hospital—Pavia, its City and University—City of Milan, Cathedral, Ambrosian Library—Lodi—Placenza—Parma—Reggio and Modena—The Bucket—Bologna—Population and Institutions of Bologna—Particulars concerning the People and City of Bologna.

THE city of Genoa is of very high antiquity, and of very doubtful origin. The Italians call it Genova. It was early allied to the Romans, and, in the second Punic war, was destroyed by Mago, the brother of Hannibal. An ancient inscription proves that it afterwards became a Roman municipal city. When the Ostrogoths overran the Roman empire this city fell under their jurisdiction, but was again recovered by Belisarius. It was afterward laid waste by the Saracens and Lombards. Charlemagne was the last who took it; and he restored it to its ancient freedom. His son Pepin gave it to Adhegar, a Frenchman, with the title of Count; but the Genoese shook of the yoke in the eleventh century, and appointed consuls. Even in these times the city was surrounded with walls, and divided into six parts, with a tribune over each division. Quarrela soon took place among the citizens, who chose a foreigner to be their Podesta, or chief magistrate; but, weary of this, they appointed a governor, and afterward elected a Doge from the nobility and the citizens. They were induced, however, by new disturbances, to put themselves under the power of Charles VI. of France. In 1409 they broke the chains with which they had fettered themselves, put the French garrison to death, and subjected them-

selves to the marquis of Montferrat. In four years afterward they recovered their liberties, and once more elected a doge: but they soon became tributary to the duke of Milan; and again in 1436 regained their freedom. In 1458 they once more subjected themselves to the French; and in three years the people asserted their former rights, and re-instituted the doge. They once more offered themselves to Lewis XI. who replied that, if Genoa were his he would consign it to the devil. After this the city was torn by intestine divisions, by the factions of the Guelphs and Ghibelins, and by the contests between the families of Adorno and Fregoso. The emperor of Germany, the kings of France, and the dukes of Milan governed it in turns; and it was on the brink of destruction when the naval hero, Andrea Doria, one of the greatest men Italy ever produced, snatched it from the arms of France, and once more restored it to its freedom. It was in his own choice to have been the monarch of his country; but he nobly declined the sovereign rule. In 1684 it was bombarded by the French, and obtained peace only on the most humiliating conditions.

It was our intention to have followed Count Stolberg in his excellent account of the constitution of Genoa; but as that republic no longer

longer exists, it being united with the French empire; as mentioned in the note, we forbear to touch upon it, since it has undergone such alterations as to the wisdom of Napoleon seemed meet*.

The territories of Genoa contain ninety German square miles, allowing fifteen miles to a degree; and its population is estimated at four hundred thousand souls. The country is mountainous and sterile, the people laborious and hardy. Their grain is insufficient for their own consumption; but this is amply compensated by their vineyards and their orchards of excellent fruits. The silk manufactory is so extensive that the raw silk produced in their own territory is an insufficient supply: they are therefore obliged to purchase more from the Two Sicilies and Piedmont. The oil produced at the presses of St. Remo is acknowledged to be the best in Europe.

From the multitude and beauty of its palaces the city deserves, and has obtained the epithet of *La Superba*, or the magnificent. The streets, which are kept clean with remarkable care, are many of them uncommonly narrow; and as the town is exceedingly populous, the throng is very inconvenient. The houses are from five to six stories high, and some of them even seven and eight. The palaces are forty-four in number, most of which are built in a noble style. Its situation, on the shore of the Mediterranean, is certainly one of the grandest and most beautiful in the world. The number of its inhabitants is supposed to be eighty thousand.

The red palace of Brignole is a fine building, well furnished with excellent paintings; among which Christ driving the Money Changers and Sellers of Doves out of the Temple, and Christ with the Tribute Money, are beautiful

* Under pretence that the Genoese were incapable of protecting themselves from the depredations of the Barbary powers, a treaty was concluded October 20th, 1804, between the republic of Genoa and Salicetti, the French minister, upon the part and in the name of his government. By this treaty Napoleon acquired possession of all the naval means and resources of the republic. The arrangements, however, made by the treaty were of a temporary nature; for several circumstances seem to point out that Napoleon had determined to annex Genoa to the French empire. The particular geographical situation of the Genoese territories seems to have been a primary motive to this measure. That republic, extending along the gulph to which it has given name, was interposed between Piedmont and the Mediterranean; and as this latter country had been united to

and expressive. The palace of the doge is grand but not to be compared with the palaces of many private persons. The pillars are daubed over with paint, and the marble is concealed. The whole building appears rather to pretend to grandeur than to possess it. Fronting the staircase in the court are marble busts of Andrea and John Andrea Doria, which are ill executed.

The great hospital has been built by the grandees of Genoa. Its marble pillars, its handsome staircase and avenue, and the greatness of the whole excite admiration. The sick of every nation and of every faith are here admitted, and the number of them in winter frequently amounts to sixteen hundred. The hospital is ornamented with about seventy statues of persons who have made donations; and the kind of rank which these statues maintain among each other is remarkable. Those who have bestowed fifty thousand livres of Genoa have each a marble bust; those of a hundred thousand have a whole length statue; and those who have given a greater sum are seated.

From Genoa the Count took the road to Pavia, which was called Ticinum by the Romans. When it was the seat of the Lombard kings, it was probable that, in proportion to the times, it was a more considerable city than it is at present. The number of its inhabitants is computed at about thirty thousand. Pavia is noted for its university, which was founded by Charlemagne. The divines of this university are famous for their rectitude, their zeal, and their talents. The number of students amounts to about twelve hundred. There are six different colleges, in which students are instructed gratis. The collegians are distinguished by the colour of their robe and by an embroidered ornament, which they wear upon

France, the incorporation of Genoa became necessary to complete the arrangement. As a mark of policy, it has been suggested, but with what truth we pretend not to vouch, it was determined, that the proposal should originate with the senate and the people of Genoa; and that Napoleon should seem to accede to the general wishes and entreaties of the republic. Accordingly the senate, after due deliberation, resolved that an address should be presented to Napoleon, praying that he would allow the republic of Genoa to be permanently united to the French empire. To the address he listened with attention and with favour; and afterwards addressed the doge and the deputies in a speech, in which he enlarged upon the importance and the necessity of this union to the republic of Genoa. The annexation of Genoa to France took place in the spring of 1805.

the right shoulder. The revenue is annually twenty-four thousand and it possesses a very fine bay. The air, which is not healthy throughout the year, is particularly unhealthy in the summer.

The whole country between Milan and Genoa is one entire flat. Milan is a city which was founded by the Gauls, three hundred years before the birth of Christ. The chief place of the Insubri; and Polybius, was of a considerable city. In the time of Trajan it was numbered among the cities of the Romans, and in it that at that time, flourished. Milan was the seat of many of the emperors after the fall of the empire. About the middle of the fifth century it was laid waste by Attila. It was recovered by Belisarius. It again fell into the hands of the barbarians in 539. After Charlemagne drove the Lombards out of Milan, it recovered its prosperity, under Frederick I. and insulated the emperor on an ass, and, placing her head toward the tail, leading her through the city. Frederic marched against them, and the city was obliged to capitulate, and the emperor took an indignant and revenge for the insults that had been offered to his wife. The inhabitants, with their hands behind their backs, were obliged to march, with their teeth, from under the emperor's feet, and the city was laid in ruins. The city was rebuilt, and soon recovered its former importance. The city is supposed to have contained four hundred and forty thousand in 1790 the people of Austrian Milan amounted to one million three hundred thousand.

The cathedral was built by Giovanni Visconti: it is exceedingly large. St. Peter's at Rome, and St. Paul's at London, are esteemed the largest in Europe. The interior is very grand, and the architecture like many others, disguised by the taste of the French. The treasury of the church is valued at: the silver, gold, pearls,

* The emperor totally demolished the city excepted; he gave orders that it should be rebuilt.
VOL. II. NO. XCIX.

the right shoulder. The revenue of the university is annually twenty-four thousand Dutch ducats; and it possesses a very fine botanical garden. The air, which is not healthy throughout Milan, is particularly unhealthy in Pavia, especially in summer.

The whole country between Pavia and Milan is one entire flat. Milan is a very ancient city, which was founded by the Gauls about four hundred years before the birth of Christ. It was the chief place of the Insubri; and, in the time of Polybius, was of a considerable size. In the age of Trajan it was numbered among the municipal cities of the Romans, and in it the sciences, even at that time, flourished. Milan became the seat of many of the emperors after the division of the empire. About the middle of the fifth century it was laid waste by Attila. It was again recovered by Belisarius. It again fell into the hands of the barbarians in 539. After Charlemagne had driven the Lombards out of Milan, the city recovered its prosperity, under the archbishops. The inhabitants rebelled against the emperor Frederic I. and insulted the empress, by tying her on an ass, and, placing her with her face toward the tail, leading her through the city. Frederic marched against them with an army, the city was obliged to capitulate, and the enraged emperor took an indignant and terrible revenge for the insults that had been committed on his wife. The inhabitants, with their hands tied behind their backs, were obliged each to take a fig, with their teeth, from under the tail of an ass, and the city was laid in ruins*. In 1171 the city was rebuilt, and soon recovered its former importance. The city is supposed to contain a hundred and forty thousand inhabitants. In 1790 the people of Austrian Milan and Mantua amounted to one million three hundred and ten thousand.

The cathedral was built by Giovanni Galeazzo Visconti: it is exceedingly large; and, after St. Peter's at Rome, and St. Paul's at London, is esteemed the largest in Europe. The aspect as you enter is very grand, and the church is not, like many others, disfigured by false ornaments. The treasury of the church is of inestimable value: the silver, gold, pearls, and precious

* The emperor totally demolished the city, three churches only excepted; he gave orders that it should be burnt to

stones which it contains, are supposed to render it the richest in Italy, that of Loretto excepted.

The library of St. Ambrosio was founded by Charles Frederic Borromeo, archbishop of Milan, and nephew to the great Carlo Borromeo. The number of books is very great. Here are above fourteen thousand manuscripts, and about forty thousand volumes of authors in print. The manuscripts, which constitute the richest part, are kept in an apartment by themselves; and among them is a Latin version of Josephus, which is said to be thirteen hundred years old. The books are kept in a spacious gallery, which has windows only on the top at both sides, and which is yet very light. By this method much room is gained. The library is open four hours every day, for the use of the public. It is likewise decorated with many noble pictures. In a hall of the library plaster casts are kept of the principal statues of the ancients.

The seminary, the Helvetian college, the large hospital, the archiepiscopal palace, and the duke's palace are worthy the attention of travellers.

Lodi is not the ancient Laus Pompeia, which owed its foundation to the Gauls, and to which the father of Pompey led a Roman colony, for that town was destroyed by the people of Milan in the twelfth century. When Frederic Barbarossa had razed Milan to the ground he built the present Lodi on the Adda, with a fortress upon a height, which in itself is scarcely visible, though the most commanding in these level plains. The town is well built. Büsching tells us that, in 1773, it contained above sixteen thousand inhabitants. It is situated about half a mile from the ancient town, which is now called Lodi Vecchia. It is at Lodi and in the neighbouring country, which is called after it, that the celebrated cheese is made, which has unjustly obtained the name of Parmesan. The country between Milan and Lodi is every where one continued level. The horned cattle are generally of a dark red colour; the sheep are large, entirely white, and with hanging ears; the swine are all black.

The town of Placentia (now Piacenza) was founded and a colony sent to it, in the year 569 of the Roman era, under the consulship of P.

the ground, likewise that it should be ploughed up, and the land be sowed with salt.

Cornelius Scipio and Tiberius Sempronius Longus. It was burnt during the second Punic war by the Carthaginians, and rebuilt by the Romans. In the time of Cicero it was a municipal city. Placenza, as a city, is not so beautiful as its situation would promise, when viewed from the Milan side of the Po: it rather appears in a state of decay.

The country of the duchies of Parma and Placenza is not quite so flat as that of Milan. The fertile lands appeared to be well cultivated. The roads, however, are never safe by night. The city of Parma is very ancient: it was founded by the Etrurians, and was afterwards in the possession of the Gauls. A Roman colony was sent to this place a hundred and eighty-four years before the birth of Christ. Parma was the native place of Cassius, the brother-in-law and friend of the great Marcus Brutus, and the first who joined him in the conspiracy. This city contains about forty thousand inhabitants.

Reggio was founded by the Romans in the year of Rome 565. The father of Marcus Brutus was murdered here, because of the hatred borne him by the father of Pompey. The town is not well built, but contains about seventeen thousand inhabitants. It is the chief place of the duchy of Reggio which is united to the duchy of Modena. The whole country between Parma and Modena is well cultivated. The fields are separated from each other by rows of large trees, round each of which a vine plant clings.

Modena is a handsome city. The chief streets are spacious and in a right line. The houses are beautiful, and so flat roofed that the roofs cannot be perceived from the streets. Lofty arcades projecting from the houses give the town a noble appearance, and afford the foot passenger a dry as well as a shady walk. The population of the city is about twenty thousand, and of the two duchies of Modena and Reggio taken together three hundred thousand. In the cathedral the bucket is kept which the people of Modena took from the people of Bologna, and carried with them as a proof of their victory.

Not far from the city of Modena there was formerly a ferry over the Panaro; at present there is a magnificent bridge. The Panaro separates the territories of Modena from those of Bologna. From Modena to Bologna both sides of the road are planted with large mulberry trees.

The fields are separated from each other in right lines by elm trees. The land is fruitful; and, immediately round Bologna, we met with many well cultivated kitchen gardens. In this mild climate the vegetables of summer and of autumn are seen in great plenty ripening at the same time. The city of Bologna is pleasantly situated on the river Rene. It is a very ancient place. In the times of the original Etrurian inhabitants its name was Felsina, and it was the chief place of the Etrurian confederacy. Theodosius the younger founded the university that is here. Bologna coins its own money, on which the word *Libertas* is impressed. The city of Bologna is supposed to contain seventy thousand inhabitants; and, next to Rome, is the principal of the states of the church.

The grand institution for the encouragement of the sciences and the fine arts, which was founded in 1712, is an enormous building, which contains above forty apartments, with many halls under them, and a provision for the support of the arts and sciences, rich beyond all that I have ever seen, says the Count. The cabinet of natural history is not only amply provided with the wealth of nature, in every division of her three kingdoms, but the specimens are peculiarly fine, especially the fossils.

The library contains above a hundred and twenty thousand volumes, not including the numerous and valuable manuscripts, which fill an entire apartment. Besides which those apartments that are dedicated to study are furnished with a library for each science. The hall of anatomy is large, and well supplied with all parts of the human body, which are admirably imitated in wax. The large and valuable collection of philosophical instruments which belonged to the late lord Cowper was purchased in 1790 by some private citizens of Bologna, and presented to the institution.

Next to Rome there is no city in the world so rich in excellent paintings as Bologna. Here we find noble specimens of all the great artists of Europe; and the master pieces of those painters who formed themselves in this school. Of about two hundred and fifty churches, there are few which do not contain some of the works of these great artists, and many are full of them.

There are two small square towers in the city, which are named after the noblemen at whose expense

they were built, Asine. The height of the first is thirty-six feet, and that of the second a hundred and thirty feet, so obliquely that the top is perpendicular. The people esteem this a wonderful effort, though probably it is nothing more than the sinking of the ground.

Florence; its Picture Gallery—Benevolent Societies—Pisa; its Cathedral and Library—of Santa Maria Maggiore—of Modern Rome—Descriptive

THE city of Florence, which its freedom was one of the first in Europe, does not now contain more than four thousand inhabitants. Its situation is beautiful; and its four large squares have a grand appearance; but it is not so well built as its streets are narrow and crooked. The picture gallery contains pictures of the most famous masters, but they are not their best performances. The cabinet of medals contains the finest productions of the ancients. The hall abounds with statues of monarchs, emperors and empresses, the figures of the Medici, an Apollo, the Roman gods, wrestlers, and the dancing figure of Alexander dying is of the most beautiful. The museum of the Grand Duke contains a noble and remarkable collection of the kingdoms of nature. The anatomical figures, in wax, are executed with great skill and deception. Here are a vast number of birds, which are equal to those in all their natural attitudes. The cabinet is admirably rich in insects and minerals. The new palace of the grand duke, the Palazzo Pitti, from its former appearance without, and now it is most remarkable for its interior pictures.

erence they were built, Asinelli and Garisendi. The height of the first is three hundred and seventy-six feet, and that of the town of Garisendi a hundred and thirty. The latter stands so obliquely that the top is nine feet from the perpendicular. The people of Bologna esteem this a wonderful effort of architecture, though probably it is nothing more than a consequence of the sinking of the ground.

Here, as in many parts of Italy, the men wear cloaks; and the women, as in Modena, have them of black sattin. At a distance from several of the gates arcades are built, as walks. The young gentlemen exhibit themselves frequently in this city as so many Phaëtons, in their high carriages; in which they drive standing, and have servants behind.

SECTION XI.

Florence; its Picture Gallery, Statues, Museum, Palaces, Paintings, Churches, Library, and Benevolent Societies—Pisa; its mild Air, Tower, Cathedral, Houses, and Exchange—Sienna; its Cathedral and Library—Rome—Thermae of Dioclesian—Fontana del Aqua Felice—Church of Santa Maria Maggiore—Triumphal Arches of Constantine and Titus—Manners of the People of Modern Rome—Description of St. Peter's Church.

THE city of Florence, which in the time of its freedom was one of the most populous in Europe, does not now contain more than seventy-four thousand inhabitants. Its site on the Arno is beautiful; and its four large bridges give it a grand appearance; but it is not well built: the streets are narrow and crooked. The Florentine gallery contains pictures of the greatest masters, but they are not their best performances. It is better provided with ancient statues; for it contains the finest productions of antiquity. The hall abounds with statues of many of the ancient emperors and empresses, the famous Venus de Medici, an Apollo, the Roman slave, the wrestlers, and the dancing fauns. A colossal head of Alexander dying is of the highest beauty. The museum of the Grand Duke is a very ample and remarkable collection from the three kingdoms of nature. The anatomical preparations, in wax, are executed with great powers of deception. Here are a vast number of specimens of birds, which are equally well preserved, and in all their natural attitudes. It is likewise admirably rich in insects and shells; and their mineralogical collection is exceedingly ample. The new palace of the grand duke, called the Palazzo Pitti, from its former possessor, is noble in appearance without, and magnificent within. It is most remarkable for its fine collection of pictures.

The church of St. Lawrence is famous for be-

ing the burying place of the family of the Medici. There is a fine library belonging to this church, the books of which are all chained to the tables, but may be reached with convenience. The number of books does not appear to be considerable, but it contains some choice manuscripts.

Here is a noble institution, which does honour to Florence, and which originated in the age of liberty. A community, which is called La Societa della Misericordia, which consists of all ranks of people, make it their duty to afford aid to the poor and helpless of the city. After enquiring into the diseases of the sick, they either take them to an excellent hospital or into their own houses. Any person, meeting with an extraordinary misfortune, may depend upon receiving succour from this community. When the society assemble, or when any sudden accident calls a number of them together, they appear in masks: partly from prudence, to conceal themselves, and partly not to put the poorer members of the society to the blush, by the difference of dress in the more wealthy. They afford their aid, when necessary, unasked. When a distressed person meets with any accident, though he have never belonged to the society, he is made welcome. Similar societies, which are called *confraternita*, are common in the towns of Italy.

Pisa is well deserving of notice, and is remarkable for the fine air it enjoys. The road is pleasant,

sant, and sometimes leads by the banks of the Arno. The land is cultivated with extreme care, and planted with numerous olive and mulberry trees. Pisa must have been built some centuries before the destruction of Troy. It became one of the principal cities of the Etrurians: On the decline of the Roman empire, it obtained its freedom; which contributed, with its situation on the Arno, to raise it to a high degree of power and rule. The people of Pisa took the islands of Sardinia and Corsica from the Saracens, the town of Palermo in Sicily, and likewise of Carthago. It greatly aided the crusaders, and themselves raised the siege of Alexandria in Egypt. Afterwards its liberties received a most deadly wound in the war it waged with Genoa. In this war Pisa lost twelve thousand men, forty-nine galleys, its haven, Porto Pisano, and the navigation of the Arno. From this time the commerce of Pisa greatly declined. After the last struggle to recover its liberty, Pisa declined so fast, that from a hundred and fifty thousand, its inhabitants were reduced to about fifteen thousand.

The famous tower of Pisa, which is swayed fifteen feet from its centre, has a noble appearance: it is the belfry of the cathedral. In this church is the famous Campo Santo, which consists of a spacious corridore within a court, the figure of which is an oblong square.

The houses of the city are ancient; the streets, however, are wide; and, on one quay, there are some noble palaces. The exchange consists of very handsome high arcades, built with stone, which on festival days are illuminated.

Sienna lies high among the Apennines, between hills that are planted with olive trees. This town is indebted for its cool summers to the height of its situation; but its winters are often severe; at least they are thought so by the Italians. Its circumference is computed to be a German mile, yet the number of its inhabitants is only seventeen thousand. It formerly contained a hundred thousand people. The cathedral is an excellent gothic building, of white and red marble. The front is perfectly gothic, and covered with numerous carved images. The pavement within the church is of great beauty: it represents stories from holy writ, in mosaic work; and is covered with boards, which are removed when strangers come to visit the church. Here is what is called the library; but in which the only books now

remaining are about thirty large folio volumes of church music, which have belonged to the cathedral more than three hundred years. They are decorated with finely illuminated figures, painted by a monk.

The entrance into the city of Rome is through La Porta del Popola, and is very grand. This gate is likewise called Porta Flaminia; for here the Flaminian way began.

The Thermæ of Dioclesian are in this city. The word Thermæ may be easily misunderstood; it may be supposed to mean nothing more than warm baths; but the baths were properly not more than accessory. The chief purpose of what was called the Thermæ was to form a place for the exercise both of body and mind. The plan and its execution exceed all expression. Here in one row of buildings, all in harmony with each other, there were four half circular halls; which were intended, two for philosophers, one for poets, and another for orators. A Greek and Latin Library, a building for boys to play a ball in, the warm baths, three spacious open places, one for wrestlers, one for the casting of the discus, the third for throwing the lance, and a large bath for swimmers. At the two corners were two round temples. One of these temples, which constituted but a small part of the whole, is now become the church of the Bernardines. The whole wall is ancient. The place which was destined for the wrestlers is now become a Carthusian church, built in the form of a Greek cross. The large bath for swimmers is dried up, and is now the garden of the Carthusians. The Bernardine cloister, many large granaries of the Pope, and a great laundry, take up the remainder of the place which was formerly set apart for these buildings.

Near these Thermæ is the beautiful Fontana del Aqua Felice; so called after Sixtus the Fifth, whose proper name was Felix. This pope restored the ancient aqueducts, and likewise the fountain of Aqua Julia, that was erected by Agrippa.

The church of Santa Maria Maggiore was built in the middle of the fourth century, during the pontificate of Pope Liberius, on the ruins of the temple of Juno Lucina. Within it was entirely of the form of the ancient basilica, or court of justice; a form which was chosen by the Christians for two reasons: first, because of their

their dislike to the Pagan temples; and, secondly, because the form of the basilic best corresponded with the church service, and the liturgy of those times.

Not far from the Colosseum are the ruins of a temple, which was dedicated to Phœbus and Diana. It rested on two semi rotunda, the back parts of which touch each other.

The triumphal arch of Constantine is in good preservation; and, for the most part, it is embellished with statues and bassi relievi of ancient times. Over the triumphal arch there is the figure of the hero, as a conqueror, in bronze, in a chariot with four horses.

The triumphal arch of Titus is much celebrated. Here are seen the river Jordan, one of the seven-branched candlesticks of the temple, and a table with the shew-bread, carried in triumph. In the hollow of the arch above is the apotheosis of Titus. The Jews to this day do not pass through the arch, but on one side.

On the right of the triumphal arch of Titus are the ruins of the Temple of Peace, which appears to be the largest of those that were erected by the Romans.

The education of the daughters of the nobility in modern Rome is wretched. Indeed, from the bad education of the women, domestic virtues, and with them the domestic happiness of the higher ranks, are injured; and the poison of these vices sheds itself among their inferiors; whose passions, without this concomitant, are violent to excess. It is dreadful to hear, that, in Rome, the population of which is estimated at a hundred and sixty-eight thousand persons, there are annually about five hundred people murdered. I do not believe, says Count Stolberg, that, in all Germany, fifty men perish by murder within the same period. The people of Rome cannot be justly accused of robbery. A stranger is no where safer, but is more frequently plundered in most of the great cities of Europe. The Roman stabs his enemy, but does not rob. Anger is his stimulus; and this anger frequently lingers for months, and sometimes for years, till it finds an opportunity for revenge. The passions of the people of Rome are frequently roused, by playing at *mora*, though the law

severely prohibits this game; and, if they are disappointed at the moment of their revenge, they wait for a future occasion. Jealousy is another common cause of murder: it being with them an imaginary duty to revenge the seducer of their wife, their daughter, or their sister, on the seducer. The catholic religion, ill understood, encourages the practice: the people being persuaded, that, by the performance of trifling ceremonies, and inflicting of penance, they can wash away the guilt of blood.

All the assiduity of the present Pope* is not sufficient to reform the police; the faults of which originate in the constitution of Rome. Many churches afford a sanctuary to the pursued culprit. Foreign ambassadors likewise yield protection; which extends not only to their palaces, but to whole quarters of the city, into which the officers of justice dare not pursue offenders. The ambassadors, it is true, are obliged to maintain a guard; but who is ignorant of the mischief arising from complicated jurisdiction? Many cardinals seek to derive honour by affording protection to pursued criminals. Could we find all these abuses collected in any other great city, many men would be murdered, though not so many as in Rome; but robbery would be dreadfully increased, which is here unknown.

A sense of the ancient grandeur of Rome is not yet quite lost to the people. When the Queen of Naples was last here, and at the theatre, she was received with great applause. Self-forbearance induced her to make signs to the people to cease their loud clapping, and their shouts of welcome. The people took this very ill; and, the next day, a person of my acquaintance, says the Count, heard one orange woman say to another, "Did you hear how the foreign queen despised our people last night? She must surely have forgotten that many queens, before now, have been brought in chains to Rome."

To enter into a particular description of the various antiquities, remains of amphitheatres, &c. within the city of Rome, would naturally lead us into a detail of ancient history, which our limits would not admit; we shall therefore conclude our account of this celebrated city with a

* This account was written by Count Stolberg on the 1st of January, 1792; and these matters still continue the

same. What effect the government of the new king of Italy may have upon these practices we presume not to say.

description of St. Peter's church, which we are the rather inclined to, because of its magnificence, and because the Count seems to have passed it over, almost in silence, from other authentic documents.

The far-famed church of St. Peter is situated on the west side of the river in Trastevere, and is greatly admired, both for its dimensions and its architecture. That the reader may have a good idea of the building, we need only to mention, that St. Paul's Cathedral at London is built after the same model. The length of the outside of St. Peter's, including the portico, is seven hundred and twenty-two English feet. The length within, not taking the portico, or the thickness of the walls, is five hundred and ninety-four feet. The breadth of it from the north side of the cross to the south side, or from the north to the south door, on the outside, is four hundred and ninety feet. The breadth, from the north to the south door within is four hundred and thirty-eight feet. The breadth of the body of the church is eighty-six feet eight inches. The height of the body of the church is an hundred and forty-four feet. The outward circumference of the dome or cupola is six hundred and twenty feet. The circumference of the dome within is four hundred and forty-nine feet ten inches. The breadth of the front of the church is four hundred feet. The height from the pavement to the top of the cross which is over the ball is four hundred and thirty two feet. The circumference of the ball is twenty-four feet six inches. The height of the statues which are on the cornice of the front is eighteen feet. The body of the church, as well as the cupola, is sustained by large square pillars, like those in St. Paul's, but have the advantage of being incrustated or overlaid with marble, as well as the walls, which is however so tarnished by the smoke of the lamps and candles that the plain stone in St. Paul's looks full as well. The great altar is directly under the cupola, being a kind of pavilion supported by four wreathed brazen pillars, adorned with foliage, and strewed with bees, which are the arms of Pope Urban VIII. Over every column of the altar is an angel, brass gilt, seventeen feet high, with the figures of children playing and walking on the cornice, the height of the whole being ninety feet; and about the altar are an

hundred silver lamps perpetually burning. The inside of the cupola is ornamented with mosaic work, representing Paradise, the Eternal Father, and many other figures; and in the corners below are the four Evangelists of the same kind of work, admirably well executed. On the inside of the four square pillars which support the cupola are erected gigantic statues of St. Veronica, St. Helena, St. Longinus, and St. Andrew; and under the pedestal of each statue is an altar, with a beautiful picture of each saint. These statues and pictures are placed here in regard to certain relics which are kept in the vestries belonging to these altars or chapels, as they are called; as, first, the handkerchief, which, according to tradition, St. Veronica lent our Saviour as he was carrying his cross to Mount Calvary, and still retains the print of his face. 2. A piece of the real cross of Christ. 3. The top of the lance wherewith Longinus pierced our Saviour's side, sent as a present by Bajazet, emperor of the Turks, to Pope Innocent VIII. And, 4. The Head of St. Andrew. Under the high altar there is a stair case which leads to the chapel where, it is said, part of St. Peter's body is kept, and to the other holy places in the vaults of this church. An old wooden chair, supposed to be St. Peter's, enclosed in brass, and supported by four doctors of the Roman church, whose Colossean statues are of brass gilt, is not one of the least ornaments of St. Peter's; the chair, with all its furniture, having cost seven thousand five hundred and fifty Roman crowns. The riches and beauty of the chapels and altars round the walls of this church can never be expressed: the gilding, carving, embossed work, statues of brass of marble, are all disposed by so wise and happy a contrivance, that the abundance does not cause the least confusion. Among other admirable pieces, the Dead Christ, of alabaster, by Michael Angelo, is said to be a stupendous work; the two wreathed pillars of alabaster brought from Jerusalem by Helen, the mother of Constantine, and erected at a side altar, are much admired; the altar-piece representing St. Michael, in mosaic work, shews such a vivacity of colours and exact proportions of all the parts and lineaments of the body, that it passes for a wonder of its kind; the Martyrdom of St. Sebastian, the Visitation of the Blessed

Virginia

Virgin, the Crucifixion of St. Peter, the fall of
Simon Magus; and a thousand other historical
pieces, are exquisite performances. There are
also a great number of tombs of popes, cardinals,
and other persons of distinction; particularly
those of the emperor Otho II. Charlotte, queen
of Jerusalem; and of Adrian IV. the only English
pope. The tomb of St. Peter serves for an altar
to say mass on. The tombs of Urban VIII.
Paul III. Alexander III. the countess Matilda,
who gave her estate to the church, are works of
a finished beauty and magnificence: nor does the
tomb of Christina, queen of Sweden, who volun-
tarily abandoned the glories of a crown for a re-
ligious retirement, fall short of the rest. The
inside of St. Peter's is adorned with above a hun-
dred columns of the finest, and for the most
part, antique marble, with some of brass. Here
are also an infinite number of excellent paintings,
the master-pieces of the most celebrated pencils;
with several other curiosities of art and nature,
which can never be too much admired or applau-
ded for their magnificence. The sacristy of this
church, and that of the Pope's, contain also a
vast variety of sacred utensils in gold and silver
enriched with precious stones, as crosses, shrines,
chalices, pontifical tiara's, mitres, priestly habits,
and ornaments that are inestimable. If we look
upon the building only, exclusive of its rich
materials and furniture, the church of St. Paul
in London, is very little inferior to that of St.
Peter. Some think St. Paul's is to be preferred
to it, since the latter is not encumbered with
chapels on the sides, as that of St. Peter's is,
which greatly obscure the prospect of the

building. That spacious court in the front of
St. Peter's indeed, surrounded by a piazza of
two hundred and eighty-six fine marble columns,
adorned with a prodigious number of statues,
gives it some advantage over that of St. Paul's.
Here are two fine fountains playing in the middle
of the area, which are no small addition to the
beauty of it: from whence is an ascent to a lofty
portico before the church by twenty-four steps,
and from this porch the church is entered by five
doors, one of which, called the Porta Sancta, is
opened only in the Jubilee year. The porch in
the front is eighty-five feet high, and supported
by pillars three fathoms in circumference, the
vaulted roof gilded and beautified with stucco
work, and on the architrave is the following in-
scription: "In honorem principis Apostolorum
Paulus Quintus Burghesius Romanus, Summus
Pontifex Anno 1612." Over the porch are the
statues of our Saviour and the twelve apostles,
and in a balcony here the popes are crowned, in
the view of all the people. The two principal
doors of the church are above forty feet high
and covered with brass, on which are represented
our Saviour, the Virgin Mary, the crucifixion
of St. Peter, the decollation of St. Paul, the
coronation of the emperor Sigismund by Eu-
genius IV. and the re-union of the Greek and
Roman churches. The building of this church
was began by Pope Julius II. from a plan laid
down by the famous architect Bramante Lazari,
and continued by Michael Angelo, under the
pontificate of Paul III. nor was it finished till
the time of Pope Paul V. so that it was an hun-
dred years in completing.

Borghese.*

ABOUT half a league from Porta Maggiore,
(formerly called Prænestina, also Labicana,)
on the east side of the city, there is an ancient
round half fallen building; which appears to have
been erected about the second or third century
after the birth of Christ, and to have been called
(but for what reason does not appear) Torre

degli Schiavi; i. e. the Tower of Slaves. This
structure is a sepulchre. The cupola is very flat,
and covered with grass and brambles. Some re-
mains of a wall denote an enclosed place, that
formerly stood facing the sepulchre. Perhaps
combats of gladiators were given here in honour
of the persons whom they interred.

Nothing

Nothing attracts the notice of the traveller more forcibly than the long row of grand aqueducts, which formerly were extended far beyond Tibur, the present Tivoli, to this place, and by which water was brought to the city. The beautiful arches of the lofty wall, over which the water ran, rise high in the air. The work was begun by Claudius and finished by Nero. Six aqueducts met together at the Porta Prænestina: one of them was subterranean, and proceeded from the river Anio, now the Teverone. The greatness of the work of the aqueducts, of which there were several, was very astonishing, because the Romans, probably to prevent the too quick course of the water, did not build them in a continued right line, but frequently with large windings. Time, and still more effectually perhaps the barbarians that have successively taken and ruined Rome, has rendered these aqueducts useless, except the three which still remain, and which three continue to supply several of the fountains that adorn the city, and afford its inhabitants water.

In the large place called Navona, which occupies the space where the Circus of Alexander Severus formerly stood, there are three fountains. That in the middle is large. On a rock, which is perforated on four sides, the emblems of the four principal rivers of the world are lying: the god of the Danube as a giant; the Nile, with his head covered, in allusion to the unknown sources of the stream; the Ganges; and the Rio de la Plata. Vast streams pour from their urns into the large basin, and supply the pipes of other fountains.

The Fontana de Paolo gushes through three

* The history of which is as follows: In the time of the second Punic War, the Romans were terrified, by a passage in the Sybilline books, which said that their foreign enemies could not be driven back, nor overcome, till the Idean Mother, that is Cybele, the mother of the gods, should be brought from Pessinus to Rome. The senate sent to Attalus, king of Pergamus, hoping to obtain the goddess through his means. The ambassadors, on their journey, consulted the oracle of Delphi, which foretold them a favourable reception from Attalus; but advised them, when they should have brought the goddess to Rome, to place her in the house of the best man in the city. Attalus received the ambassadors in a friendly manner, conducted them to Pessinus in Phrygia, (Liv. xxix. 10, 11.) and presented them with a holy stone, which the inhabitants called the Mother of the Gods. Valerius, one of their train, was sent by the ambassadors with the intelligence that the

goddess was coming; and requesting them to seek the best man of the city to receive her. The senate were not a little embarrassed by the message of Valerius. How were they to discover the best man in the city? This would have been a victory, said Livy, which they would each individually have prized beyond all the honours and dignities that the senate or the people could bestow. Publius Scipio Nasica, a kinsman of the first Scipio Africanus, was adjudged to be the best of the Romans. He was still a youth when he was commissioned to go, with the principal women of the city to Ostia, at the mouth of the Tiber, and receive the goddess. The ship having struck on the sands, from which it could not be released, Claudia, as a different history relates, took her girdle, tied it to a rope which was fastened to the ship, and drew the vessel to the land. By this miracle she vindicated her chastity, which had before, according to Livy, been doubted.

The Museum of the Capitol contains one of the richest and finest collections of antiques that have been formed. The palace, in which the master-pieces of art are contained, is one of the three buildings of which the modern Capitol consists. There is a gallery round the court, which is walled without, and within is supported by pillars, and in which there are many remarkable antiques. To enter into a description of the immense quantity of antiques which are here preserved in six large apartments and a long gallery, would far exceed our limits. We shall, however, describe only the more remarkable. There is a gallery round the court, which is walled without, and supported by pillars within, in which there are many remarkable antiques. Here are two large Egyptian statues of the goddess Isis, which merit attention on account of their great antiquity. Here is also an ancient Roman altar, in which Claudia is represented in bas-relievo, drawing the ship containing the Cybele with her girdle*. Claudia is represented on this altar in the act of drawing the ship in which the statue of Cybele is seated. On one side of the altar is a Phrygian bonnet, and on the other a shepherd's crook, and a crotalum. The shepherd's crook is indubitably a symbol of Atys, the shepherd beloved by the goddess.

miniature, of the wonderful Egyptian pyramids; which, without doubt, are the most ancient, as they certainly are the most durable, monuments of architecture. This of Cestius is a hundred and sixty palms or spans high, a hundred and thirty in breadth at bottom, and is covered with large stones of white marble. We learn, from the inscription, that the building was completed in three hundred and thirty days. The passage has been cut in modern times. It is small, and a person must go with his body bent to reach the burial vault; which is twenty-six palms in length, eighteen in breadth, and nineteen in height. The sarcophagus has been removed. On the side walls are traces of Arabesc painting; and above, on each of the four sides, a hovering genius with garlands of flowers. These geni are in good preservation, and the drawing of them is free. The only entrance into this burial place is from above, as in the Egyptian pyramids. A stone was removed at a tolerable height up the pyramid, to give entrance; and the dead were brought down into their cells through oblique dark passages. One side of the pyramid is concealed by a part of the Aurelian city wall, which surrounds it; and the whole building can only be seen at a distance from the city. Facing this pyramid there is an open place, which is the burial ground of the Protestants.

In a little excursion from Rome to La Riccia, (the ancient Aricia;) which is about three German miles from Rome, the Count informs us that the Campagna di Roma is very naked, destitute of trees, and ill cultivated; and in which little is to be met with except the monuments of the ancients. The eye long continues to follow the aqueduct which was carried from there to Tivoli, but which, in various places, is fallen to ruins. Many of the sepulchres of the ancients are on the road, and have more or less fallen to decay. They particularly point out the direction of the ancient Appian way; on each side of which, according to the custom of the ancients, who erected these monuments on the road side, many are now standing*.

* This custom gives us the true meaning of so many ancient inscriptions, which begin with the words "*Sistite militem, viator.*" It was rational to address the passenger on the high road; but it is absurd, or at least thoughtless, to begin inscriptions of modern monuments, erected in bye places, with the words, "Stop, Passenger."

Albano is a small insignificant town, yet is much visited and inhabited in autumn and the beginning of spring, by the principal Romans, who have villas here. High old walls, which appear to surround a kind of court, are supposed to be the remains of the barracks in which the Roman soldiers lived. Pompey and Clodius had country houses here; as afterwards had Tiberius, Caligula, and Domitian. Many great ruins of the villa of the latter are at present to be seen in the Villa Barbarini. They extend as far as Castell Grandolfo, and to the banks of the Alban lake, on which Domitian used to represent his Naumachia†. Ruins of an amphitheatre, and vast terraces supported by Arcades are the principal objects. The district of Albano was so called from the ancient town of Alba, which was much older than Rome, and which the Romans destroyed about six hundred years before the building of Albano.

La Riccia is one of the oldest towns in Italy. About eleven hundred years before Christ its inhabitants were driven out by the Pelasgi and Etruscians united. Near La Riccia there is an ancient monument, which some have supposed to be the sepulchre of the Horatii and Curiatii.

The gate which leads out of the city of Rome to the ancient suburb was built by Dolabella, the son-in-law of Cicero, in the year that he was Consul. Not far from this place is the church of Lateran, the oldest church in Rome, and probably the most ancient in Christendom. This building was founded by Constantine; and was originally built in the style of St. Paul's church at Rome.

Facing the Lateran stands the largest and most ancient obelisk. It was brought to Rome by Germanicus, and is supposed to be of the time of the ancient Egyptian king Rhameses‡, who was a powerful conqueror.

Another obelisk, which stands in front of the council house, on the Monte Citorio, is said to be of the age of Sesostris||.

To the son of Sesostris, Pheron, who is said to be Pharaoh, the oppressor of the Israelites,

† Naval engagements.

‡ Perhaps that Rhameses who reigned in Egypt 1808 years before Christ.

|| Sesostris reigned in Egypt 1722 years before Christ.

whom the power of God by the arm of Moses destroyed, the obelisk is ascribed, which stands before the church of St. Peter. It is the only one which contains no hieroglyphics*.

The obelisk which was on the Piazza del Popolo is ascribed, by Pliny, to a much later king, Semmeserteus; in whose time Pythagoras visited Egypt, Pythagoras was contemporary of Cyrus and Solon†.

Beside these four principal obelisks, there are seven others that ornament different places of Rome.

The Pantheon is the only monument that has withstood the ravages of time, or rather of the barbarians, who so often desolated Rome. It was built by Agrippa after the battle of Actium, and consecrated to Jupiter the Avenger, whose statue was placed in the principal niche over the entrance. In the other six niches were statues of other gods. The architrave rests on sixteen large columns of *giallo antico*, or yellow African marble, the chapiters of which were of the brouze of Syracuse. The cupola is perfectly hemispherical. The light falls entirely from above, through a circular aperture, which is twelve ells in diameter, and has a clear and pleasant effect. In the wall between the niches there were tabernacles, with frontispieces supported by small columns of *giallo antico*; which, as well as the niches themselves, now serve for altars. The brazen gates, which formerly were embellished with bassi relievi, notwithstanding that they have been robbed of their ornaments, are beautiful in their grandeur. The whole architrave, with its posts and entablature, are of the noblest architecture. The columns of the portico bear deep traces of conflagrations; to

which calamity Rome was so frequently subject. The emperor Phocas granted the Pantheon to Pope Boniface IV. by whom it was consecrated as a church. By degrees it was embellished with statues and pictures. The church is now called the Rotunda, and is dedicated to the Holy Virgin and all the martyrs.

There are several columns erected at Rome as monuments of the fame of different persons. The pillar of Trajan was erected on the Forum which bore his name. Trajan's statue was removed by Sixtus V. from the top of this pillar and that of St. Peter placed in its stead. The pillar of Antonine was erected, by the senate, to the emperor Marcus Aurelius Antoninus. The same pope likewise removed the statue of Marcus Aurelius Antonine from the top of this pillar and put in its place the statue of St. Paul.

The Museum Pium Clementinum is certainly beyond all comparison the most beautiful collection of antiques now in existence. At first it only occupied some apartments on that side of the Vatican which, from its extensive prospect, has been called the Belvedere. Clement XIV. enlarged the place, because he improved the rich collection. The present pope has built two new galleries and two charming rotundas in addition, and adorned it with numerous masterpieces. In this museum is likewise a gallery of paintings.

The Palazzo Borghese is one of the largest and most magnificent palaces of Rome. It contains two galleries; one of which belongs to the prince Borghese, and the other to his uncle prince Aldobrandina. In the first, which is very spacious, are many beautiful pictures; as there are likewise in that of the prince Aldobrandina.

that in an u

ing of this marsh has been begun by the present pope, Pius VI. and those verdant fields are contemplated with delight which, for ages, had been covered with stagnant water. Parts that are the most humid are either converted to pasture or planted with trees. The Apennines rise on the left, and on the right is a prospect of the sea. Much, however, remains to be done before this road from Rome to Naples will be passable at all seasons of the year; and which must be passed if a carriage be used. The air of this part is very dangerous in July, August, and September. Farther on the country is extremely delightful and amazingly fertile. Pears have been gathered on the 24th of December, and sent as a present to the pope. Thus do productive harvest and the flowery spring shake hands together, in a country, such as the much-loved Fenelon sang of his abbey in the south of France,

Où le ciel serain nous donne
Le Printems, après l'Automne;
Sans fair place à l'Hiver.

Where Spring succeeds to Autumn, each serene;
And icy Winter dares not intervene.

The fortress of Gaeta, (formerly called Cajeta,) is high, and built on a circular rock on a promontory on the sea shore. There is a small isthmus, by which this promontory is connected with the winding coast, on which the long and narrow suburbs of Gaeta are built, that contain about fourteen thousand inhabitants. In the fortress there are only three thousand; its works are hewn in the rocks, and rise very high above the sea. Here is a phenomenon so remarkable as seldom to be equalled. A rock of an incredible height seems to be burst open from top to bottom: the two sides are full three ells distant; and in the centre, where the opening is much

* Pious tradition relates that the rock was thus cleft on the death of our Saviour. A chapel has been built upon the stone; to which the people go through a passage that has been hewn in the rock, and which is fifty-seven paces in length.

† There is one among them whose influence is so great that they call him Capo de gli Lazaroni, i. e. the chief of the Lazaroni. He goes barefoot, and in rags, like the rest. He is the orator for the whole body when they have any thing to demand of the government. He then generally applies to the Eletto del Popolo, i. e. the representative of the people: a kind of tribune, so far as such an office can exist in an unlimited monarchy like that of Naples. He

the greatest, there is a large stone, which forms a natural bridge, and connects the two rocks. This stone lies on the outward side, next the sea.*

The city of Neapolis, or Naples, is of high antiquity, and Greek origin. It was called Neapolis, or New City, to distinguish it from its sister Palæopolis, or old City; but since the time of Augustus they have formed but one city. Naples is very large, and extremely populous: it contains above four hundred thousand, or probably as many as five hundred thousand, inhabitants; yet so excellent is the soil, that the necessaries of life are in great plenty and very cheap. The common people of Naples, and indeed of all Italy, are very moderate in eating and drinking; and would rather suffer all the inconveniences of life than remove them by their labour. Abstemious in a high degree, the clothing they need is trifling, the fuel none, and they can even live without a habitation. The class of people called Lazaroni, some of whom are met with even in Rome, are here computed at forty thousand. Many of these live in the open air, and at night, or in bad weather, take shelter under gateways, porticos, the eaves of houses, or under the rocks. They cannot easily be persuaded to work whilst they have the smallest coin in their pockets. They never think of making provision for to-morrow. With care they are unacquainted. Should any one offer money to a Lazaroni, when he is not pressed by necessity, he raises the back of his hand to his chin, and tosses his head upwards, being too idle to speak, in token of refusal; but, if any thing delights him, if he be invited to partake of any pleasure, no man is more talkative, more alert, more full of antics than himself†.

The streets of Naples are uncommonly crowded;

likewise appeals to the king in person. To disregard any remonstrance of this people, or not to comply, without stating the grounds of refusal, would be dangerous. They regard their king, and in case of necessity, it is asserted, he might depend upon their assistance. Previous to the king's making a journey to Germany, in 1791, Nicola Sabbato, the chief of the Lazaroni, made him a speech. He lamented that the king should be so long absent from his people; yet rejoiced in a journey that should afford pleasure to a prince who took so much satisfaction in the good of his subjects. "We are," said he, "thirty thousand strong; and in your absence we will preserve the peace of the country. You certainly have nothing to fear from

ed; yet the crowd is much less inconvenient here than in many other cities. The coachmen too are less insolent than such gentlemen usually are: when mounted on their throne they look down with contempt on the multitude beneath. The number of coaches, however, is so great, that the foot passenger must be continually on his guard: yet the coaches are much less dangerous than the little one horse cabrioles; which are driven through the city by the young gentlemen, who imagine that the foot passengers should vanish before them, as easily, and as instantly, as the yielding air before the breath of their snorting horses. In general, the city is well built; and the houses are mostly flat roofed. The royal palace is capacious, and has a noble appearance. The situation of the city is inexpressibly beautiful. Mount Vesuvius rises to the left, and Portici lies at its feet. On the right of the city the hill Posilipo extends itself far into the sea. The fortress of Castell del Novo is built on an island, which is connected with the city by a bridge.

Through the hill Posilipo a large cavern toward the sea has been made, which serves the city as a gate. When this cavern was made no man knows; but it is one of the most wonderful and greatest of the works of man. It is a grotto cut through a volcanic rock, nine hundred and sixty paces long, nine broad, and of a considerable height. Strabo, who lived in the time of Augustus, has mentioned it. The cavern was widened by Alphonso I. king of Naples; and after him by Charles V. The people ascribe it to Virgil, who lived seven years at Naples: his

from any man; but, should any one have the insolence to spread inflammatory opinions, we will tear him into as many pieces as we are men, and each of us will have a morsel of him to smoke in our pipes." During the absence of the king this Nicola Sabbato visited the princes and princesses, that, as he said, he might give the people an account of their welfare. He likewise visited the prime minister, Mr. Acton; and, on one occasion, came to him out of breath, demanding to speak to him. "I have just seen a man," said he, "in the dress of a pilgrim, in the great square, who is distributing French hand bills: the meaning of which neither I nor any of us yet understand; and he is kissing a stone which he brought from the ruins of the Temple. He will certainly excite an insurrection. We would have thrown him into the sea, but I wished first to know your opinion; though I think we ought to have thrown him into the sea." The minister had much difficulty to persuade him that a preliminary enquiry was necessary. He continually returned to the necessity of throwing the man

sepulchre is shewn over the entrance of the Posilipo grotto. Some of the common people suppose him to have been a saint, others a sorcerer*. The road through this grotto leads to Pozzuoli, the Puteoli of the ancients, a neighbouring place. To the north-west, and immediately facing the city stands the six sided fortress called Castello di Sant' Elmo, which is entirely hewn out of a rock. What is called the Tomb of Virgil is upon the Posilipo, beside the entrance of the cavern. Although so near a great city it stands in a solitary place, among trees and rocks, from which there is a prospect toward the sea: a situation worthy the delicacy and sensibility of the great poet.

Pozzuoli was founded by the former inhabitants of the island of Samos, five hundred and twenty-one years before the birth of Christ. The Romans called it Puteoli, from the numerous wells that are found in its vicinity. Puteoli in Latin, and Pozzo in Italian, signify a well. Large pillars were erected on the haven, to resist the force of the waves; several of which still remain. The hill called Monte Barbaro has been unfruitful since the time of the great earthquake which desolated Pozzuoli in the year 1538.

The royal palace of Capo di Monta is built on a height, very near to the city of Naples, and on the north side. The architect did not discern that the foundation on which it stood was hollow till after it was finished; and this foundation which was rectified after it was built, cost more than the grand building itself. It was intended as the residence of the king, and it is visited only for the sake of the gallery, which contains many

into the sea; and when the minister told him he would send soldiers to put the man in prison, he replied, "There is no occasion for soldiers; I will undertake that business. The man was accordingly taken to prison by the Lazaretti. The contents of the hand-bill were declared seditious. The insurgent was one of those emissaries that were sent, by the Count, by the too provident care of the French emperor over Europe, to enlighten, improve, and make the people happy. He had disguised himself like a pilgrim, and was subject to the gallows, according to the common rights of nations; but the government only thought proper to banish him to the island of Maritima, one of the Ogades, on the west side of Sicily.

* When Robert of Anjou, king of Naples, once passed through this cavern with Petrarch, he asked him whether it were really true that Virgil had effected this miracle by magic? To which the poet answered, "I have never seen that Virgil was a magician; and the traces that I see are those of the pickaxe, not of the Devil."

ictures; but, were those only preserved which are really beautiful, the very numerous collection, consisting of fifteen hundred, would be reduced to one hundred. In one apartment there are numerous vases, which are called Etruscan, but should be called Greek, for they were found in tombs that were in the south of Italy and in Sicily: those of Sicily are frequently the most beautiful. The collection of ancient gems, both cameos and intaglios, is considerable. This collection is very rich in ancient coins, of brass, silver, and gold.

With respect to its churches Naples can bear no competition with most of the great cities of Italy. Those of this city are neither of noble architecture, nor are they rich in paintings. The principal church is dedicated to St. Januarius, and may more properly be called magnificent than beautiful. The treasury is well stored with church effects and relics. Here, in a glass bottle, a red mass is preserved that is affirmed to be the blood of the saint. People assert, that this mass twice a year, the bottle being handled by the archbishop, becomes fluid, by the aid of a miracle. Perhaps it is so composed as to become fluid by the natural warmth of the hand.

Solfatara is the name of a plain that lies to the east of the city, is tolerably elevated, and surrounded by hills that connect with each other. There is no doubt but there was formerly a volcano here. The ground is still entirely volcanic: hot smoke ascends out of numerous cavities, that are to be found both on the plain and the surrounding hills. The places where these vapours rise are in part sulphureous, in part bound in alum, and in part with vitriol; which three materials appear to be engendered where the smoke ascends. The sulphur predominates, and fills the whole place with its powerful stench. The ground is so hollow that a large stone, let fall through a hole not more than a foot deep, occasions a sound that rumbles along through a considerable space. The ancients named this place the Forum of Vulcan.

Mount Vesuvius lies about seven English miles east of Naples; and as Count Stolberg saw at the time of an eruption we shall describe it in his own words. Tolerably high up the mountain, says he, yet a full league and a half from the summit of the pyramid which is properly called Vesuvius, there is a hermit, who lives on

a hill, by its side, which is called Somma. This Somma is a great ruin of nature, and of the ancient Vesuvius. It has crumbled away to half of its height, and evidently discovers itself to have been a volcano. In like manner the present Vesuvius rose, above seventeen hundred years ago. Like Monte Nuovo, which was suddenly thrown up in the year 1538 by an earthquake, it has the form of a sugar loaf, with a broad base, the top of which is cut off, and is hollow to a great depth, like the crater of a volcano. The hermit warned us of approaching danger; but I did not so much fear the stones that were thrown up as the difficulty of the ascent. However I saw it was very necessary for us to take care how we approached too near to these dangerous showers. The stones were cast with such violence out of the hollow mountain, that the velocity of their fall was not to be compared to the velocity of their ascent. The ascent up Mount Vesuvius is extremely difficult: sometimes the cutting dross of the lava on which you tread, and at others, because, when you mean to ascend, you sink deep into the ashes. The guides lessened the inconvenience; for they bound linen round their bodies, by which we held fast, and were aided by their strength: still, however, the difficulty was great. The places you pass are terrifying. The whole ground is uneven, and strewed over with stones, prodigious pieces of scoria, or deep pits of ashes; which have all been thrown from the mountain: the projecting parts of which frequently conceal the smoky summit from those who are ascending; and you are repeatedly inclined to despair of arriving at your journey's end, while at every step when you mean to go forward, you sink back and imagine you shall be swallowed up in the ashes. You are often obliged to stand still with weariness, or to sit down on the cutting dross; and the sense of weariness is increased by the surrounding aspect of desolation. The emissions from the flaming mountain were so violent that it was impossible, at that time, to reach the summit. We ascended the mountain to a huge crag of rock, which, in one of its ancient eruptions, had been projected out of the crater. It is at the distance of one-third of the whole ascent from the summit; and thus far was the space to which this rock had been whirled. Here we beheld and heard the mountain incessantly in labour.

5 T

Whenever

Whenever the rumbling din became louder, a thundering shower of stones continually followed. I cannot compare this subterranean uproar to any thing better than to the noise of cannon at sea; and it was as quick in succession as the discharge of artillery in such a combat. The rock on which we sat shook very sensibly at each discharge of the mountain. The successive showers of ashes increased in blackness, and were always accompanied with stones. These, when they fell to the ground, rolled down over the dross, with a noise resembling hail against a glass window. At intervals, when the din of the mountain and the showering of the stones had ceased, we heard a fearful gurgling, as of boiling water. A yellow smoke, instead of the black shower, occasionally rose from the throat of the mountain, and we saw the reflection of the subterranean flames tremble among the rising pillars of smoke; strong gusts of which were likewise impelled out of the many little mouths round the crater. Thus we sat upon the trembling rock, which is itself a prodigious monument of the power of the fire-emitting mountain, and enjoyed one of the grandest spectacles of nature. The smoke became yellow at the approach of night, and, on our return to Portici*, we saw it rise of a flame colour. The heat that proceeded from an aperture, which burst forth in the month of August 1790 was insufferable, and though when we were there it was a year and a half since this eruption happened, the hot surface would not permit us to touch it with our hands.

The pleasant lake of Agnano lies not far from Solfatara, and something nearer than that to Naples. It is chiefly surrounded by high shores.

* At Portici, says the Count, we took torches, and visited the theatre of the ancient Herculæa, or, as the Romans called it, Herculaneum. This Greek town was entirely buried and destroyed by ashes and lava, during the great eruption of Vesuvius, in the year 79 after the birth of Christ, and in the first year of the reign of Titus. A part of the seats of the ancient theatre were brought up, in 1713, by a farmer, who was sinking a well. Emanuel, prince of Elbeuf, of the house of Lorraine, who was building in Portici, purchased the right of the farmer of digging farther, and a statue of Hercules was presently discovered, and afterwards one of Cleopatra, with others. At length they came to a circular temple, which contained four and twenty alabaster pillars, and as many statues, which were all sent to Vienna by the prince Eugene of Savoy. In 1736 Don Carlos, king of Naples, undertook to build a

Near a part of the shore, at the foot of a hill, there is a cavern, which was called by the ancients the cavern of Charon. It is better known at present by the name of La Grotta del Cane; i. e. the Cavern of Dogs; because it is a common custom to put a dog into the cavern, in order to convince strangers of the mephitic qualities of the air. The dog presently loses his senses, and must die, were he not dragged out, and, to recover him, dipped in the water of the lake. It is impossible to fire a pistol in the grotto, for the air prevents the powder in the pan from taking fire. The hot sulphur baths of the lake appear stronger than the vapour of the cavern. These baths are called Stufe, or stoves, di San Germano. They are much esteemed for their effects, and emit a hot vapour, the smoke of which is so fine that artificial means must be taken to render it visible.

Monteleone was founded by the Greeks of Locri, by whom it was called Hippon, or Hipponium. The town is situated on a gentle declivity of the sea shore, on which Agathocles once built a pier. The surrounding country is shady, fertile, and hilly. This town was almost destroyed by the earthquake of 1783, and it is now chiefly composed of shops built of wood, and houses built of wood, brick, and mortar. These kind of barracks, as they are called by the Italians, are frequently more expensive than stone houses, because wood is scarce and stone abundant.

Mileto, a small town was likewise destroyed by the earthquake of 1783, and at present consists of a few houses built in the same manner as those of Monteleone.

The present Oppido is built on a kind of broad terrace of the woody Apennines, three Italian

palace in Portici, and purchased the house and land of the prince of Elbeuf, and the ancient town was discovered at the depth of eighty feet. The bed of the river was found which ran through the town, as likewise were the temple of Jupiter, with his statue of gold, the theatre, and several large equestrian statues of the two Balbi, father and son. Herculaneum and Pompeii were both buried under the ashes thrown from the volcano in the above eruption; and the flaming lava took its course through both those towns. The people dare not leave the cavities dug to come at Herculaneum empty, because Portici and the village of Resina are built immediately over the buried place. After taking out many remarkable articles, of household furniture, arms, coins, and manuscripts rolled up, the opening was again enclosed.

miles from the former. On the 5th of February, 1783, by the earthquake, what may be called a family. Oppido, supposed to be the Italian authors the changed into a heap of contained three thousand barracks only five hundred perished on the de through the tumbling monastery became the woman, who now (17) maimed eleven days and house. Her child was fed on chesnuts, which providentially, had put the child her own execution but as she had no support even this wretched aid died on the fifth day. effects of this earthquake that, in the two following either did not conceive, or brought forth those that were born alive.

When the first account reached Naples the king, the distracted province; sent the people money herself of her jewels; and were at first contributed. The people are easily moved, and quickly dies away. Some suffered by the earthquake assistance offered them, others whose sufferings whole province bestowed Francesco de la Vega, a museum at Portici, who money and full power possessed the art of doing and his conduct, as witnessed the terrified inhabitants. The loss of the death, including those buried under the ruins,

miles from the former Oppido, which, on the 5th of February, 1783, was entirely destroyed by the earthquake, or rather engulfed, by what may be called a whirlpool of the opening earth; for it was the centre of this terrible calamity. Oppido that was, which Cluverius supposed to be the ancient Mamertum, and Italian authors the ancient Metaurum, is now changed into a heap of stones. The former town contained three thousand inhabitants; the present barracks only five hundred. About twelve hundred perished on the desolating day. Some were burned alive, overtaken by the flames that spread through the tumbling houses. The monks of a monastery became the prey of these flames. A woman, who now (1792) lives in Messina, remained eleven days under the ruins of her own house. Her child was with her; and they both fed on chestnuts, which the mother, not improvidentially, had put in her pocket. She gave the child her own excremental water to drink; but as she had no supply of liquid for herself, even this wretched aid soon failed, and the child died on the fifth day. So remarkable were the effects of this earthquake on the human organs, that, in the two following years, the women either did not conceive, were prematurely delivered, or brought forth dead children; and of those that were born alive many immediately expired.

When the first account of this dreadful event reached Naples the king was desirous of visiting the distracted province; but being prevented, he sent the people money. The queen deprived herself of her jewels; and people of all ranks were at first contributors. The sanguine Neapolitans are easily moved; but their emotion quickly dies away. Some communities that had suffered by the earthquake generously refused the assistance offered them, that it might be given to others whose sufferings were more severe. The whole province bestowed its blessings on Don Francesco de la Vega, the superintendent of the museum at Portici, whom the king sent with money and full powers into Calabria. He possessed the art of doing much with a little; and his conduct, as wise as it was humane, inspired the terrified inhabitants with new courage. The loss of the province of Calabria by death, including those that were swallowed up, buried under the ruins, or killed by disease, has

been estimated at thirty-two thousand souls. No town suffered so much, according to its population, as Oppido.

The province of Calabria, one of the most favoured in Europe, and with which, Sicily and the shores of the bay of Naples excepted, no other perhaps can be compared; this province, where heaven, earth, and sea united smile, was already almost depopulated before the devastation occasioned by the earthquake. Its few inhabitants were extremely poor. The whole system of the country is strikingly bad. The countryman is obliged to pay the king heavy taxes for the oil of his press, and the raw silk which his worms produce: though he has already paid his landlord for the ground on which the olive and the mulberry tree grew. The merchant cannot afford to give him much for his oil, because he is obliged to pay a tax which is equally heavy and unjust, for leave to export it. The argument that the foreign merchant pays this tax is absurd. Is it not evident that the foreigner will pay the cultivator the less the more he is obliged to pay the king? Heavy taxes are likewise paid for wrought silk, and for silk stuffs. Beside, it is surely evil sufficient that the natives should be under the necessity of yielding the carrying trade to foreigners, from the want of protection against the Barbary corsairs. If the peasant be the vassal of a Barone, he is subject to tolls at the mill and at the oil press: beside which he is compelled to pay a tax in kind for the produce of the soil. To this we must add, that the roads, unrepaired, daily become worse; and whole communities are hemmed in and cut off from intercourse with town or country. The small circulation of money is still farther limited by the sudden abolition of monasteries. Thus do the inhabitants suffer dearth in paradise. Thus depopulation increases; in a country where marriages are uncommonly fruitful, but where the dread of increasing wretchedness deters the people from entering into that estate. And truly it requires a paradise, such as Calabria, to invite any inhabitants where such numerous afflictions oppress a people who are habitually cheerful; where the ox-driver notwithstanding plays on his bagpipe, and where the jocund youth, with songs, and springs, and bounds, leads his herd of goats among the mountains.

Bagnara is a small town, whose charming situation

situation is increased by the high waterfalls that embellish it on each side. The present town is built of barracks, above which are the ruins of the former town, among the rocks; which, in 1783, was nearly destroyed by the earthquake.

Farther along the coast is Sciglio, or Scylla. The rock immortalized by Homer, on which the castle of the prince of Scylla is built, gave the town its name. It lies in part immediately on the shore; but the greater part is above, among the rocks. The streets are narrow, and nine different rows of trees are seen standing immediately one above the other. Over the highest of these strait rows, in somewhat of an oblique direction, are six or seven other rows. In the earthquake of 1783 some churches were thrown down, and others were damaged. The houses were most of them spared; yet this little town suffered a great loss of inhabitants, and, Oppido excepted, the greatest. Terrified by the shocks, most of the inhabitants fled to the sea shore. The prince of Scylla also left his high castle, and hoped, not improbably, to find greater safety on the strand; but suddenly a whole mountain on the south shore was torn up, and cast into the sea. The waves, by this prodigious force, being driven from the land, returned with redoubled violence, and carried away with them fourteen hundred and fifty men. Some sought to escape in the boats that were on the strand; but both boats and men were borne away, and neither body nor plank were afterwards seen. It was thus that the prince of Scylla perished.

The situation of Messina is universally and justly celebrated for its beauty. It is built facing the bay, and is covered by mountains; the intermingling heights and depths of which afford traces that appear to denote great convulsions. The bay extending to the right, from S. S. W. to N. N. E. is in the shape of a sickle, and the cape curves in such a manner as almost to enclose the haven. On the point of this cape there is a high light-house. Messina is a very ancient town. In 1741 it was dreadfully visited by the plague, which was soon followed by a destructive kind of small pox. At this time the population was reduced from about seventy to twenty thou-

sand souls. It is affirmed that in the seventeenth century it contained a hundred thousand inhabitants. It was half destroyed by the earthquake in 1783; but it has in great part been rebuilt, and the streets are now more spacious and handsome. The haven of Messina, which Charles VI. made a free port, is certainly one of the finest in Europe. The people of this place trade largely in the products of the island, which is so bountifully gifted by nature. The principal articles are corn, oil, wine, silk, (raw and wrought,) fruits, and pot ash. The present population of Messina is estimated to be thirty-six thousand. The air is very healthy, and, compared with the rest of Sicily, is cool.

Palermo is built on a cape that unites the westward mountains with the promontory of Pegliro. The founders of the ancient town are not to be traced. Panormus, the former name of Palermo, signifies in the Greek a great haven; and, as the haven of this place is large and excellent, there can be little doubt but that it was thus named by the Greeks. This city is regularly built, and is divided into four nearly equal parts by two principal streets, which cross each other, that are equal in their breadth, and that would be beautiful if the houses were better built. Each window has its balcony with an iron railing, for the inhabitants to enjoy the cool of the evening. In long streets, which at the farther end appear narrow, you seem as if you were shut up in an iron cage. It contains above a hundred thousand inhabitants. Palermo is the seat of the viceroy*, of the archbishop, who is primate of the kingdom and chief of the *Braccio Ecclesiastico*, or spiritual court, and of the *Giudice della Monarchia*; which is the title of a principal ecclesiastic, who is the vice legate of the Pope, and is nominated by the king.

The Sirocco is felt in no town of Italy so intensely as here. These hot gusts from the sandy deserts of Africa, in passing the sea, lose much of their power, before they reach the southern shores of Sicily; but they collect new strength in crossing the island. About mid-day a cooling sea breeze springs up; for which reason the morning in Palermo is hotter than the noon.

* We must here remark, that at the time of Count Stolberg's writing this account, in 1793, it was actually the seat of the viceroy; but the subsequent progress of the

French arms, when the royal family fled from Naples, they took up their residence in this town, and it is now the capital of the king of Sicily.

The

The heats felt are increased by the hill Pelegrino, which stops the burning vapours of the sirocco in their course.

Palerino is not only the largest city in Sicily, but is one of the largest and most beautiful cities of Europe: and although Messina has at a distance contended for the rank of principal city, yet this is the capital of the kingdom.

Girgenti, the ancient Agrigentum, has been very famous in history. Its haven lies four Italian miles from the city, and contains the largest granaries of Sicily. Granaries were built on the shores of the island as early as the times of the Saracens. Near the haven of the Girgenti corn is kept in subterranean magazines, cut in the rock, of an astonishing size. This is an excellent method of preserving the corn fresh, for many years, in this hot country. The road is carried along the haven, between the sea and a high shore, the rocks of which are dazzlingly white. When Agrigentum had attained the summit of its greatness, it contained, according to Diodorus, twenty thousand citizens; and, including those who were not citizens two hundred thousand souls. No where are there so many remains of Greek antiquity to be seen as in Girgenti.

Syracuse, in the time of its prosperity, was a hundred and eighty stadia in circumference; that is, two and twenty Italian miles and a half. That Syracuse was, long after it lost its freedom, may be learnt from Cicero, who says, in one of his orations against Verres, "that Syracuse is the greatest and most beautiful of all the Greek cities you have often been told; and you have often told the truth. Its strong situation on every side, by land and sea, is lordly to view. Its havens are enclosed by the city itself; by which they are overlooked. From different entrances they join their streams in one common outlet. That part of Syracuse which is called the island, in consequence of the junction of the isthmus, is separated by a small arm of the sea from the city; to which it is again united by a bridge. So great is the size of Syracuse, that it is usual to say it consists of four cities. One of these is the island; which, girded by two havens, extends itself at the mouth of each; and in this is the building which was the citadel of the hero, and which now serves as the residence of the Roman praetors. It contains several temples;

Vol. II. No. CI.

of which the two grandest are the temple of Diana and the temple of Minerva. On the extreme side of the island there is a sweet spring, that is called Arethusa, of an incredible size, and well stored with fish. It would be wholly overflowed by the sea, did not a stone dam guard it against the waves. Another of the towns of Syracuse is called Aracradina; in which is a great forum, beautiful colonades, a handsome prytaneum, a spacious senate house, and a noble temple of the Olympian Jupiter. The remaining part of the town consists of a large street, that is intersected by many others, which contain the houses of the citizens. The third town is called Tyche; because an ancient temple of Fortuna was here built. It had an extensive gymnasium, and many sacred buildings, and was an exceedingly populous part of Syracuse. The fourth town, which was built the last, is called Neapolis, and in the highest part contains a great theatre, two excellent temples, one dedicated to Ceres, the other to Libera, and the large grand statue of Apollo, surnamed Teminites." A fifth town, named Epipolæ, is mentioned by other writers both Greek and Roman, as part of Syracuse, which was not inhabited by citizens, but was garrisoned, in time of war, with soldiers for its defence. Amico estimates the number of the former inhabitants of Syracuse at a million; and Riedesel at twelve hundred thousand souls. I do not know the authorities, says Count Stolberg, for these estimates of two modern writers; but they do not appear to be exaggerated. It ought not to be forgotten, that there were four slaves to one free man. The number of free men in ancient Syracuse might surely consist of three hundred thousand; and a city, which was four common German miles in circumference, might certainly afford room for a million of people; especially as four-fifths of the number consisted of slaves, who were thronged together in a very narrow compass.

One side of the cathedral rests on twelve or thirteen Doric pillars, which it is supposed belonged to the portico of the temple of Minerva. At present only one half of them appear; the other half having been walled in, when this temple was changed into a church. The temple must have been about as large as that in Eggesta. Facing the cathedral are the statues of the apostles Peter and Paul. The following inscription is

5 U

under

under that of Peter: "Apostolorum Principi, Fundatori suo, Ecclesia Syracusana p." that is, "The congregation of Syracuse erected this statue to the chief of the apostles, their founder." The Syracusans affirm that their first bishop was sent them by Peter. The apostle Paul in his journey to Rome was overtaken by a storm, shipwrecked at Malta, and remained three days at Syracuse. In the inscription upon his statue there seems to be much dignity: "Apostolo Gentium, Hospiti suo, Ecclesia Syracusana p." that is, "The congregation of Syracuse erected this statue to the Apostle of the Gentiles, their guest."

There is a library in the seminary, which is always increasing; but it is the only one in Syracuse. The seminary likewise contains a collection of ancient coins. When we entered this building, says Count Stolberg, the heat was not extreme; but when we returned, in three quarters

of an hour, we felt the wind meeting us as hot if it came from an oven; we being then in the open air and unprotected by shade. Some of us were immediately seized with a pain in the breast which continued so long as this wind prevailed. We were advised, when we came home, to shut up the windows, leaving only sufficient light to see to read, and to sprinkle the apartments with water. By these means the air of the house became supportable. Men were discovered lying dead on the ground. So true it is, that the same degree of heat, in Italy and Sicily, is by no means so dangerous as when it visits a country where the air is not equally pure. The hot wind rages with such excess only once in three or four years; and seldom then during a whole day. It blows from the west, is loaded with the vapours of Africa, and is therefore similar in its effects, upon this eastern coast, to those of the sirocco upon the country round Palermo.

SECTION VIII.

Catania, its ancient and modern State—Changes produced by Lava—Its Population, and Universities—Mount Ætna—Loretto—Ancona—Pesaro—Cavolice—Rimini—San Marino—Bologna—Padua—Venice—Province of Stiria—Vienna.

CATANIA, which in ancient times was called Catana, was one of the first old Greek colonies. It was founded by the same people from Chalcis who, but a short time before, in the first year of the thirteenth Olympiad, seven hundred and twenty-six years before Christ, had made a settlement at Leontium. Charondas, the famous lawgiver and a scholar of Pythagoras, was a native of Catana. The university of Catana may justly boast of being one of the most ancient seats of the sciences. Catana is built at the foot of Mount Ætna. Great remains of antiquity still exist in this town. Several of the warm baths are still in good preservation, and many others are concealed under the foundations of the cathedral. A subterranean octagonal hall appears to be still uninjured; and aqueducts that supplied the water are partly still in existence and work mills. The gymnasium stood near the thermæ, and must have been very large; for though a great part of it was overwhelmed by lava from Mount Ætna in 1669, there still exists, on each side, a spacious street that be-

longed to it with many arcades. Near the gymnasium are the large ruins of the theatre; where not many of the seats of the spectators are preserved; but, as from a part of the half circle the circumference may be determined, and as the place where the stage began is still to be seen, it is easy to form an estimate of the breadth of the whole from its visible length. The preservation of some of them in good preservation, and the stair cases of the three different stories, and many of the vomitoria. The late prince Biscari removed the rubbish under which it lay, at his own expence.

This town has several times been visited by earthquakes and the rivers of fire that are poured out by Ætna. In the spring of the third year of the 88th Olympiad, four hundred and twenty-four years before Christ, the fiery lava issued from the mountain, and laid desolate the territory of Catana. In 1669 it suffered miserably from the terrible eruption of the mountain. The lava flowed in a broad and deep stream toward the town. Instead of melting away the walls, it

stream toward the
way the walls, and

was expected, it was stopped by them, rose above them, and overflowed them. Two remarkable phenomena were produced by this lava, the traces of which will continue till they are removed by some earthquake, or some new eruption. On the west of the town stood the ancient Benedictine monastery, which now constitutes only a small part of the former building. Toward the walls of this monastery a high stream of lava flowed, surrounded it on several sides, and remained, without touching it, immediately before the wall. The aspect of the indurated mass is very remarkable. Another stream of lava overflowed that arm of the river Giudicello which was called Canale del Duca; and, as the water was much valued, the inhabitants made a deep opening through the condensed lava, from which issued a copious stream, and the clear water now continues to run from the vaulted lava like springs from a grotto of rock. The earthquake of 1669 was a dreadful one; and, according to Amico, fourteen thousand of the inhabitants of this place were destroyed, at the same time that the fields were desolated by the streaming fires of *Ætna*. Both these terrors again visited it in 1693, when the town by an earthquake was nearly reduced to a pile of ruins. Catania, however, rose out of its rubbish with surviving beauties. The broad streets are now carried in a right line direction, and handsomely built. As it enjoys both a considerable trade, and is situated in a very fertile country, its inhabitants feel the blessings of prosperity; and in 1783, when a great part of Messina was thrown down by the earthquake, Catania at its own expense assisted to rebuild that city. In population it is the second place in Sicily, and the number of its inhabitants is continually increasing. The present population amounts to about forty-two thousand souls. The university of Catania is the principal, and in a certain sense the only one in the island; for the students, in physic and law, who have entered themselves at Palermo, if they wish for employment, must complete their education at Catania.

The form which the great mouth or throat of *Ætna* has assumed is that of a tunnel, except that the circle is not regular. Its contracting abyss is soon lost to the sight. In various places thin clouds of smoke ascend out of small cavities, from so many chimnies; while the mouth itself

tempestuously emit its whirlwinds of black and white clouds in a spiral column. To go round the crater, or to remain a moment facing the wind, is utterly impossible. The circumference of the mouth or crater is estimated at from three to four thousand paces. Within, as far as the eye can discover, it is coated with sulphur. On the north, separated from the ancient crater by a thin wall, or crust of sulphur, there is a new mouth, which was opened by a falling-in of the summit in May, 1792. We threw stones into this crater, says the Count, which rolled like distant thunder, till they at last fell, with a loud din, into the water below. After throwing the stone, I counted eight and forty pulsations before I heard the dashing of the water. This experiment seems to strengthen the opinion that the months of the volcano are open to, and communicate with, the sea.

A short German mile from Loretto is the handsome little town of Recanati, which is built on a hill, and in which the bishop of Loretto resides six months in the year.

Loretto, a town containing eight thousand inhabitants, owes its origin to the Santa Casa, or Holy House; which, as pious tradition relates, was the same in which the angel Gabriel appeared to the Virgin, and in which, after the return of Mary and Joseph from Egypt, Christ continued to live till he entered on his heavenly mission. We are told by the legend that, in 1291, the angels carried this house from Nazareth to Slavonia, and in 1294 they took it from Slavonia, brought it over the Adriatic, and set it down at Loretto. It now stands in the principal church, encased in marble; on which histories from Holy Writ, by the greatest artists, are masterly cut in alto relievo. In this Santa Casa the supposed miraculous image of the Virgin, a porringer out of which Christ used to eat when he was a child, and a gown of his mother's are exhibited. This Holy House and the miraculous image bring pilgrims from the whole Catholic world, to pay their homage at Loretto; many of whom go round the Holy House on their knees; so that the knees of the pilgrims have made deep hollows in the stone pavement of the church. There are some beautiful pictures in a sacristy belonging to the church. The famous treasure of Loretto is preserved in a great hall, and contains numberless costly

costly works and presents from private persons, kings, and states. In the dispensary of Loretto, which appertains to the Santa Casa, there are three hundred and thirty vases of Faenza shewn. All the poor of Loretto are provided with medicines gratis from this dispensary. The annual revenue of the Santa Casa is estimated at seventy thousand scudi, and its annual expenditure at not less than forty thousand; from which the bishops, canons, and governor of the town are paid. Loretto is half a German mile from the Adriatic, and is protected by fortresses against pirates: indeed the shallowness of the shore will not admit the approach of large ships.

The hilly country between Loretto and Ancona is fertile and pleasant. This town is built on the hills San Ciriaco and Monte Guasco, and in the valley that lies between them. Ancona was a settlement of the fugitive Syracusans, who, in the time of the elder Dionysius, detesting the tyrant, made a descent at this place. They called the town Ancon, from its angular situation: this word in Greek signifying an elbow. The town is handsomely built, and, as it is a free port, the inhabitants enjoy a respectable and visible prosperity. Büsching states its population at twenty-two thousand souls; of whom he estimates the Jews at five thousand. According to an ancient degrading law, the Jews are to wear a red rag, or lappet, hanging from the hat; but it is not enforced; and as, like the Portuguese Jews, they wear no beard, they are only distinguished from the Christians by their national physiognomy; which still continues to characterize them, although they have been scattered nearly eighteen hundred years over the different nations of the earth. They only suffer their beards to grow for eighty days when they are under any deep affliction. All religions are here tolerated. Its trade is increasing, and does injury to Venice. The exchange has a respectable appearance. The road from Ancona leads through a pleasant country on the shores of the Adriatic, and passes through several towns.

Pesaro, the ancient Pisaurum, is situated in the duchy of Urbino. In the year of Rome 568, one hundred and eighty-four years before Christ, the Romans sent a colony to this place. The river on which it was built was formerly called Pisaurus, now La Foglia. The town stands on the shore, but its port will only admit

small craft; therefore its trade is not considerable. It, however, contains about ten thousand five hundred inhabitants.

The province of Romagna begins at Catolica, which is the first post after Pesaro. This place was so called from the Catholic Bishops, who met here, at the time that the council was held in Rimini, A. D. 359, because they were dissatisfied with that assembly; in which it had at first appeared as if the Arians would have maintained their superiority. As this council was called by the emperor Constans, who favoured the Arians, four hundred bishops came to it from the west; who, contrary to the hopes of the emperor, declared in favour of the council of Nice.

Rimini was formerly called Ariminum; and its founding is ascribed to the Umbri, a people of uncertain origin. The Senones were once in possession of it; but they were expelled by the northern Umbri two hundred and eighty-nine years before Christ.

On the road between Catolica and Rimini stands the little town of San Marino, situated upon a high mountain. This small free state would be more celebrated than great nations, were virtue and innocence, rather than the splendour of vice, the admiration of men. Like the little Swiss republic of Gersau, its whole possessions consist of a single mountain. The diameter of its territory is a German mile. A builder, who came from Dalmatia in the beginning of the sixth century, continued to labour thirty years at the rebuilding of Rimini; after which he retired, and lived as a hermit on this mountain. But, greatly as he desired repose, the fame of his sanctity attracted young people to him, and a princess gave him the mountain as a present, on which he here founded a little free state. As the residence of its citizens was founded on a rock, so did he lay the basis of his artless dignified code on the Evangelists. The constitution of the republic is very simple: each house sends a deputy to the great assembly of the citizens; the executive power resides in the council of sixty, one half of which is chosen from the nobles: a majority of two-thirds is required before a conclusive vote can pass: every two months the council choose two capitani, who are in miniature what the consuls were at Rome: the judge and the physician must be both strangers who are elected once in three years. of San Marino are so attentive to the education of their children that they hold the office of schoolmaster in great respect. They have only once made war. In the fifteenth century they took part with pope Pius II. against Sigismund Malatesta, lord of Rimini. The pope made them a present of four fortresses, but they refused to enlarge their territories. In 1740 some malcontents invited pope Clement XII. to take possession of the town, and he sent the cardinal Alberoni to make enquiries whether the majority of the people were inclined to renounce their freedom. Alberoni truly informed him that only a part of them had any such inclination, and the pope was just enough to leave them in the undisturbed enjoyment of their liberties, which they still enjoy. Celebrated for their equity and the simplicity of their manners, they despise trade; for they do not honour wealth, but chiefly subsist on the produce of their lands; which, although the mountain is frequently covered with snow for three months, still produce generous wine and excellent fruits.

The hills near Bologna are covered with country houses, gardens, and small groves, which give them a charming appearance. It is remarkable that the Appennines, from Spoleto and Foligno, divide Italy into two distinct countries; Upper and Lower. Before you come to Loretto the country is flat. The plains begin at Rimini, and extend through all Lombardy, to the foot of the towering Alps. As the country changes, so do the physiognomies and entire manners of the people change; though the differences are not very distinct till you come to the German side of Bologna; and indeed, till you arrive at that city, you always see a link of passing woody hills on the left. In like manner the cattle begin to differ, both in kind and colour, from the cattle of the southern provinces. They are no longer of so light a grey, but some of them are red, and most of them of a mixed colour. The swine, which through all lower and middle Italy are black, are in these provinces white. The men have less animation; and, as the streams of life are here less glowing, they are frequently indulge themselves in the use of opium. Between Bologna and Ferrara, there are hills, much less mountains. Strengthened and fed by the fat soil, both man and beast here seem to have less of the fire of the south, and

Vol. II. No. CI

somewhat more of northern phlegm, or of northern thought.

Padua, which the Italians pronounce Padova, was formerly called Patavium, and is one of the most ancient towns of Italy. Virgil ascribes its origin to the Trojan hero, Antenor; who, according to tradition, came to Italy after the destruction of Troy. Padua was formerly more populous than it is at present, but it now contains about forty thousand souls. This town boasts of being the nursing mother and tutoress of the proud Venice, to which young city it sent magistrates and judges, at the time when, laying its foundations on the little islands where it stands, it offered a secure retreat to the numerous Italians who fled from the desolating Attila. In the cloister of the church of St. Augustin many protestants are buried, and monuments are erected to their memory even in the portico. The university of Padua was founded by Frederic II. in 1222, and became so famous that students were sent thither from all parts of Europe. The great Galileo here taught geometry; and the number of students in former times consisted of eighteen thousand, but there are not now above six hundred.

At the distance of five Italian miles from Venice you come to the open sea, where that magnificent city seems to swim and rise out of the waters. The prospect is unique in its kind. The appearance of the city, when passing through the canals, is still more singular. The houses stand upon piles, over which the waves flow. Some rows of houses are separated by a quay from the canals, or rather from the small arms of the sea, which form the islands. Others stand immediately in the water, which washes the stone steps up which you ascend from the canals to the houses. These houses have back doors into narrow streets; by which, aided by bridges, all parts of the city are made accessible to foot passengers. The canals are covered with gondole, each of which is rowed by a man. These gondole must all be black; and in the middle they have each a small canopy, which must not be covered with any other stuff but black cloth: Hence they have a gloomy appearance. Being long and small, they skim lightly along in so rapid a manner that, though cautiously managed, at first they terrify strangers. The palace of the doge, or duke, is called Il Palazzo di San Marco,

5 X

in

in which are halls for various purposes, each of which is embellished with paintings of the Venetian school. The church of St. Mark is built in the place of that name; the fantastic architecture of which has imparted something of a character of greatness to it. Facing the church in this place are five large arcades, over the center one of which four gilded horses are placed, which the Venetians, in the beginning of the thirteenth century, under the command of their great doge Dandolo, with the aid of the French, brought from Constantinople, after taking that city, and placed them in Venice. They had been sent from Rome to Constantinople by Constantine the Great, and had ornamented the triumphal arches first of Nero, and then of Trajan. The place of St. Mark, which properly consists of two places, La Piazza and La Piazzetta, or the Place and the Little Place, though the smallest is very spacious, adds greatly to the beauty of the city, and is justly esteemed one of the first, if not the very first, and most beautiful of the kind in Europe. Founded on seventy-two islands, the different quarters of Venice are connected with each other by nearly five hundred bridges, under which the gondole* can pass.

About twenty miles south of Venice the republic has nearly completed an undertaking which is scarcely inferior to the greatest works of ancient Rome. A high wall, or pier, of large stones is built on a small cape; the purpose of which is, to protect the shallow waters that surround the seventy-two islands on which the city is built, and many others that are seen scattered around, against the wild waves of the Adriatic. To resist these the wall it constructed upon two distinct terraces of marble; each of which is nine paces broad. The smallest of these terraces, which consists of four steps, is opposed to the inner waters, which are called La Laguna. The joints of the stone, after the manner of the ancient Roman buildings, are filled with a mixture of lime and puzzolana. The latter material is brought from Mount Vesuvius. On the wall is the following inscription: "*Ut sacra æstuaria, Urbis et Libertatis sedes, perpetuum conserventur, colosceas moles*

* It may appear somewhat strange that the dialect of the gondoliers (people that row the gondole) should be different from that of the Venetians, but it is a fact: even Tasso's

ex solido marmore contra mare posuere Curatores Aquarium.—Anno salutis MDCCLI.—*Ab urbe condita MCCCXXX.*" That is, "The Conservators of the Waters have erected this colossal rampart of solid marble, to oppose the sea and forever preserve the sacred shallows, the seat of the City and of Freedom.—In the year of redemption MDCCLI.—From the founding of the city MCCCXXX." Count Stolberg measured the length of this stone pier, as far as it is completed and counted three thousand six hundred and twenty paces, or steps. The population of Venice is estimated at a hundred and sixty thousand souls, and the number of people in its whole territories at two millions and a half.

The duchy of Stiria is well cultivated; the inhabitants of which, though they rather resemble the people of Germany than of Carniola, are very distinctly divided into Vandals and Germans, the numbers of the latter being far the most considerable. The towns and villages of Stiria are well built, and the peasants have better habitations than the Vandals of Carniola. The farther a person goes into Stiria the more pleasant the country becomes. A considerable mountain, called Semmering, separates the province from Austria Proper; the first aspect of which, from the mountain, is delightful in the charms of wild nature. Soon afterward the country becomes flat, is well tilled, and the towns have a good appearance.

Vienna is the capital of the Austrian dominions. Here strangers are welcomed with amenity, and with an air that shews the heart and the lips are not at variance. If a stranger be introduced to certain families he is neither obliged to yawn with the tedious glutton, nor administer to the avarice of a rapacious card party. His host, on the contrary, endeavours to sound his affection, heighten his pleasures, and receive him with that unaffected hospitality which renders his stay agreeable. In the hall of the imperial library this city is the entire collection of books made by the great Eugene; the hero who, beside possessing the talents of the warrior and the statesman, had acquired great and various knowledge. The cabinet of natural history, in minerals and

petrifications, is said to be inferior to none in Europe. Some institutions in Vienna have likewise been partly founded and partly improved by the emperor Joseph II. The sick are better attended in the hospitals; and regularity, industry, health, and cheerfulness animate the children of the orphan house. The Narrenthurm (Idiots' Tower) or Mad house is a remarkable institution, large, circular, and five stories high. The mad people are not allowed to be treated with cruelty: they have good beds, and those who rage are not to be seen. The Orphan House, which is a large and well regulated building, contains three hundred and forty-six children. The boys and girls have two distinct gardens, and are not allowed to be together, except at church. The imperial picture gallery is near the city, in the Belvedere Palace, which was inhabited by the great Eugene. This gallery is particularly rich in paintings of the Flemish and Dutch schools. In the gallery of the prince of Lichtenstein, which is affirmed to be one of the richest collections possessed by any private man in Europe, are some excellent paintings. The circumference of that which is properly the fortified city of Vienna is not large, and only contains about sixty thousand souls; but the suburbs are therefore the more ample, and, according to the estimate made in 1792, the city and suburbs together contain two hundred and fifty thousand inhabitants. In the city itself are numerous and beautiful palaces, but the streets are not spacious, and are in part crooked. The country round Vienna is very pleasant, but the city in the winter is frequently visited by dreadful storms.

APPENDIX

TO
STOLBERG'S TRAVELS,
EXTRACTED FROM A
JOURNEY IN MORAVIA, AND BOHEMIA,

BY
JEAN DE BRIE, made in 1804.

MORAVIA is a province of Germany, which derives the name of Mahern, as it is called by the Germans, and of Morawa, as it is called by

the natives, from the river of that name which rises in the mountains of Glatz in Bohemia, and, passing through the middle of Moravia, falls into the Danube at Presburg. Moravia has Bohemia on the North and West, Poland on the North East, Hungary on the East, and Austria on the South, from which it is separated by the Danube. Its length is about a hundred and twenty miles, and its breadth a hundred miles. A great part of this country is overrun with woods and mountains, where the air is very cold, but much more wholesome than in the low grounds, which has many lakes and bogs. The mountains are generally barren, but the more champaign parts of the country are tolerably fertile, yielding corn, with plenty of hemp and flax, good saffron, and pasture. Nor is it altogether destitute of wine, red and white, fruits and vegetables. It abounds in horses, black cattle, sheep, and goats. The language of the inhabitants is a dialect of the Slavonic, differing but little from that of Bohemia; but the nobility and citizens speak the German and the French. Moravia was anciently inhabited by the Quadi, who were driven out by the Sclavi. Its kings, who were once powerful and independent, afterwards became dependent on, and tributary to, the German emperors and kings. In 908 the Moravian kingdom was parcelled out among the Germans, Poles, and Hungarians. In 1806 that part of it properly called Moravia was declared a marquisate by the German king Henry IV. and united with Bohemia, to whose dukes and kings it has ever since been subject. The states of the country consist of the clergy, lords, knights, and burgesses; and the diets, when summoned by the regency are held at Brunn. It is divided into six circles, each of which has its captain, and it contributes about one-third of what is exacted from Bohemia. The bishop of Olmutz is at the head of the ecclesiastics of this country; and the supreme ecclesiastical jurisdiction, under the bishop, is vested in a consistory. The commerce of this country is inconsiderable: of that which they enjoy, Brunn has the principal part. At Iglau and Trebitz are manufactures of cloth, paper, and gunpowder. The inhabitants in general are open-hearted, not easy to be provoked or pacified, obedient to their masters, and true to their promises; but credulous of old prophecies, and much addicted to

to drinking. The boors, indeed, upon the river Hanak, are said to be a thievish, unpolished, brutal race. The sciences now begin to lift up their heads a little among the Moravians, the university of Olmutz having been greatly improved.

Vienna is on the South side of the river Danube, and opposite to it on the North side is Entzersdorf. From Vienna to Mischau in Moravia is forty-five miles; from Mischau to Austerlitz the distance is seventeen miles, and from Austerlitz, on the same road, to Olmutz is thirty miles, so that from Vienna to Olmutz the distance is eighty-two miles. This latter town is the capital of Moravia. The town, though small is very neat, strong, and populous. It stands on the river Morawa, over which is a large bridge; and by its navigation the inhabitants carry on a good trade with its southern neighbours, particularly Hungary and Austria. The public buildings are very handsome. Its university has been mentioned above. It is the see of a bishop, and St. Cyril, who lived about the year 880 was its bishop. Here is an abbey so advantageously situated for the defence of the town that it is fortified and garrisoned. In 1741 the king of Prussia took it with its whole garrison. In July 1758 he besieged it again; and when on the eve of taking it he was obliged to raise the siege, to go and meet the Russian army, which was advancing against him.

Brinn, or Brunn, is ten miles West of Austerlitz, thirty S. W. of Olmutz, and sixty N. of Vienna. Although this town be situated in Moravia, forty-five miles from the borders of Bohemia, yet it is a dependency of Bohemia, which has occasioned some geographers to mistake it for a part of the latter kingdom. It stands near the confluence of the Schwartz and the Zwittau, is a pretty large well built town, but is not very populous. The inhabitants carry on a great deal of trade. It has four gates, a cathedral, and several other churches, several convents, an episcopal palace, provincial house, and other public structures. The diets of Moravia are held in the provincial house. It is defended by a castle built on Spielberg Hill, which is encompassed by a double wall and two ditches. In 1645 this place held out bravely against the Swedes.

Znaim is thirty-five miles S. W. of Brunn,

and forty N. by W. of Vienna. It is a large place, and has a handsome castle, which is very old, and in which there are said to be a great number of Pagan antiquities. Its situation is on the river Taya, which falls into the Morawa about twenty-five miles above the place where that river falls into the Danube.

The large, strong, and well built town of Iglaue is thirty-seven miles N. W. of Znaim, seventy-four miles W. by S. of Olmutz, and seventy-four N. of Vienna. It lies on a river of the same name, and is situated on the confines of Bohemia, in the road to Hungary, and is therefore much frequented. In the Hussite war this place obstinately adhered to the side of the Pope, but was the first town of Moravia subject to Bohemia which received the Augsburg confession of faith. In 1645 it surrendered to the Swedes, who, to render the town the more tenable, burnt down its large suburbs, and defended it a whole year against the emperor's forces, and even repulsed them. At other times it was alternately taken and retaken in the wars between Bohemia and Germany. Its principal trade is in beer and coarse woollen cloth.

Teltsich is ten miles S. of Iglaue; it is a pretty little town, is well built, and populous. It is near the frontiers of Bohemia, and is seated on the source of the river Taya, which passes by Znaim.

BOHEMIA is, it must be confessed, one of the best countries in the Austrian dominions, and next to Hungary, it yields a greater revenue to the crown. It is bounded by Saxony and Lusatia on the N. by Silesia on the N. E. and E. by Moravia on the E. and S. E. by Austria on the S. and by Bavaria on the W. It is about a hundred and seventy miles from N. to S. and about two hundred and twenty miles from E. to W.

In Bohemia are many mines which contain gold, silver, copper, iron, tin, lead, sulphur, and nitre. In some of its rivers (the principal of which are, the Elbe, the Muldaw, the Caborz, the Egra, and the Sazawa,) is found gold sand. Here are several salt pits; but the inhabitants are chiefly supplied with that article from Misnia. It was formerly a part of the Hlyrcanian Forest, which, though now replaced with a vast many towns and villages, yet has still forests and

woods

It is a large town, which is very fertile, and is said to be a great deal better situated than the Moravian place where it is. The town of Iglaue, seventy-four miles from Prague, is of the same name as the Bohemia, in the north, and is therefore much frequented. It is a place of considerable importance, but was the capital of Bohemia, which was the seat of the king, who, to render it more important, brought down its large population year against year, and repulsed them. It is taken and retaken, and is the seat of the Bohemian and German, and coarse woolen

woods well stocked with deer, wild beasts, and game. In general the soil is good, and the land is fertile, though barren and sandy in some parts. It not only yields corn, but plenty of saffron, which latter, however, is not so good in quality as that which is produced in some other parts of Europe. The gardens and orchards yield abundantly more than is sufficient for the consumption of the inhabitants; they therefore export a considerable part. Vineyards are not much cultivated here, because the wine will not keep. They have beer, both brown and white, which is highly valued, and great quantities of it are exported.

The inhabitants of Bohemia are a mixture of Slavonians, (those living in villages being slaves,) and of Germans. The inhabitants of the town are not fond of arms, arts, or trade; but rather prefer an indolent life. They are in general large bodied and well set, subtle, courageous, and true to their word: but the common sort, are rather thievish, both in the country and even in the towns after sun-set. Their original language is the Slavonian, which was looked upon to be so copious and sweet, that their lawgivers ordered its true orthography and pronunciation to be inviolably preserved; but the most people of fashion, through their intercourse with the court of Vienna, speak High Dutch, which the common people have now intermixed with their own language. A few of the Hussites still subsist in Bohemia, but they keep themselves very close, and the government seems to take no notice of them. The Jews have an open toleration; but the most predominant religion is that of the church of Rome.

The protestant religion had very early footing in this country. They agreed principally with Luther in doctrine and discipline: but the dreadful persecutions which they suffered, through the instigation of several popes, occasioned the Bohemian war in 1618, when the protestants chose Frederic V. elector palatine, for their king; but he being defeated at the battle of Prague in 1620, they were shockingly persecuted and at length banished in 1639; since which time their worship was not tolerated in Bohemia till 1782, when the emperor Joseph granted a general toleration to all persuasions. Since 1639 the Bohemians have been governed very despotically by the house of Austria. They

Vol. II. No. CI.

have still only the shadow of liberty among them, their states meeting every year at Prague; when they seldom refuse the whole of the emperor's demands; for they dread his resentment if they were to make the least demur.

The annual revenue of Bohemia to the house of Austria amounts to nearly a million of pounds sterling. The wealth and grandeur of the nobility, with the extreme poverty and slavery of the peasants can hardly be imagined. The generality of the nobility and gentry despise preferments out of their own country; yet they travel into France or Italy, but not without express leave from the emperor, under the penalty of forfeiting their estates. When they come of age they are obliged to take the oath of fidelity to the king.

Many of the Bohemians have a talent for music, especially the hunter's horn; and there is no village where the mass is not sung in concert. The affairs of Bohemia are directed by a chancellor, who has a vice-chancellor under him, with several assessors and counsellors.

Prague, the capital of Bohemia, is 160 miles N. W. of Vienna, 130 W. by N. of Olmutz, and 80 S. by E. of Dresden. This town is situated in a pleasant and fruitful country, amidst gardens and fine fields, surrounded with palaces and pleasure houses, on the river Muldaw, which passing through it divides it into two parts. Prague is one of the largest cities in Europe, being about fifteen miles in circuit, and next to London, Paris, and Constantinople, is said to be the most populous. It consists of three towns, the Old, the New, and the Little Town. It has a hundred churches, besides nine Jewish synagogues, and a famous university, which stands in the old town, and was founded in 1358, by the emperor Charles IV. It is the only one in Bohemia, and has generally about one thousand four hundred students. Here are several monasteries and colleges, of which there is a very magnificent one which belonged to the Jesuits before their expulsion, near the bridge, from the belfry of whose church there is the best prospect of the city. On a rising ground, called Ratschin Hill, is a magnificent palace of the emperor; and here is the cathedral of St. Viet. The city is the see of an archbishop. Here are Bohemian crystals, which bear a fine polish, and are set in earrings, pendants, rings, &c. but they are principally used

5 Y

used for lustres and drinking glasses, which are vended all over Europe.

Königgratz is 68 miles E. of Prague, and is a large town on the river Elbe, near its confluence with the Orlitz. It has its name from being the appendage of the queens, and their place of residence when widows. It is the principal town of a circle of the same name; and is the see of a bishop, who is suffragan to the archbishop of Prague.

Glatz is thirty-eight miles N. E. of Königgratz, on the confines of Silesia; it is seated on the river Mira, which runs into the Oder. Here is a castle on a rock which is almost inaccessible; it surrendered, however, to the king of Prussia in 1742, and the city, together with the county of the same name, was ceded to that monarch at the treaty of Breslau. Its trade is in silver ore, iron, timber, coals, venison, cattle, butter, and cheese. The great church of Glatz was formerly a pagan temple. The town has good suburbs, and a good town house, but the place suffered much in the civil wars of Bohemia.

Egra is 100 miles W. of Prague, on the confines of Bohemia, and on a river of the same name, which falls into the Elbe near Lentmiritz. It is the capital of a circle of the same name, and has a double wall towards the river, and in other

parts a triple one, with a strong castle. In March 1742 the French took the town; but in September 1743 they surrendered it to the Austrians. In the neighbourhood are mines of silver and copper, with a purgative spa, famous for curing distempers of the eyes, ears, or other parts of the head. Here the channel of the river is broad and deep, bearing large vessels, and abounding with fish.

Tabor is 45 miles S. of Prague, and 110 N. W. of Vienna. The town is not large, but it is a strong place. It was fortified by general Zisca, who was at the head of the Hussites, who had their head quarters at this place. It is seated on a hill, and has a double wall, towers, and bastions.

Budweis is 30 miles S. of Tabor, and 95 N. W. by W. of Vienna. It is seated on the Muldau. At this place the Austrians defeated the French and Bavarians in 1741; but in 1744 it was taken by the Prussians.

Continuing the same road to the southward at the distance of twenty-five miles is Rosenberg, which is likewise built on the banks of the Muldau. It is a place of some strength, though not very formidable; and the town is not large. It might, however, be converted into a place of importance, with but little trouble or expence.

THE END OF STOLBERG'S TRAVELS IN GERMANY.

UP
TRANSYLVANIA

General Description

THE greater part of Transylvania was anciently called the name of Hungary from the Tartar nation, who settled there in the 13th century. This country, situated between 16 and 27 degrees and 44 minutes of North latitude, is bounded to the North by the mountains, which are called the Carpathians, which separate it from Poland, and from which it is separated by the Danube, Servia, and Walachia, and by the Danube, Austria, and Stiria. To the East by Turkey in Europe, and to Upper and Lower Hungary that part which lies beyond the river Theiss towards the West, including Transylvania, is about 150 miles long, and 100 miles broad.

The northern parts of Transylvania are mountainous and barren, but the southern parts, on the contrary, are fertile and fruitful, but not very populous. The Danube flows along the banks of the river, and the city of Semlin, in Servia, is the principal emporium, in Servia, for the trade, in Servia, for the

SECTION I.

General Description of Hungary—Account of Presburg, Altenburg, Raab, and other principal Towns.

THE greater part of the kingdom of Hungary was anciently called Pannonia. It received the name of Hungary from the Huns, a Scythian Tartar nation, who subdued it in the fourth century. This country, including Transylvania, lies between 16 and 27 degrees of East longitude, and 44 degrees 40 minutes and 49 degrees 20 minutes of North latitude. It is bounded on the North by the mountains of Crapack, (generally called the Carpathian Mountains,) which separate it from Poland; by Croatia, Sclavonia, Servia, and Walachia on the South; by Moravia, Austria, and Stiria on the West; and on the East by Turkey in Europe. It is divided into Upper and Lower Hungary, the former being that part which lies towards the east, beyond the river Theiss; the latter that which lies towards the West of that river. Hungary including Transylvania is four hundred and fifty miles long, and three hundred and fifty miles broad.

The northern parts of the kingdom are mountainous and barren, but healthy; the southern parts, on the contrary, are level, and exceedingly fruitful, but not very salubrious. The country along the banks of the Danube, from Presburg to Semlin, in Sclavonia, (which is opposite to Belgrade, in Servia,) for upwards of three hun-

dred miles, is one continued plain, and no soil can be more fertile; but the air, by reason of the many swamps and morasses, is not so wholesome as on the higher and drier grounds. In the extensive country of Hungary there are mines of gold and silver, copper, iron, lead, quicksilver, cinnabar, antimony, yellow orpiment, sulphur, vitriol, marcasite, salt, native and factitious, salt-petre, magnets, asbestos or stone flax, marble of several colours, alabaster, and some precious stones. Corn is in such plenty, that it is sold exceedingly cheap*. Their grapes are large and luscious; and some of their wines are preferred to any in Europe. The people have vast numbers of cattle and horses, the latter mostly mouse-coloured, with buffaloes, deer, wild fowl, game, (which is so numerous, that no person is restrained from hunting,) and fish, (which is likewise so plentiful, that they frequently feed their hogs with it,) and many species of wild beasts, particularly chamois goats and bears. Of vegetables, besides vines, and the common sorts, here are tobacco, saffron, buck wheat, millet, melons, and chesnuts. Here also are excellent warm baths, and springs of various kinds and qualities. The chief mountains are those of Crapack, the sides of which are mostly covered with wood, and their summits with snow. The chief rivers are the Danube;

* It is said to be about one-sixth of the price that article bears in England.

Danube, the Drave, the Theiss, the Waag, the Gran, the Temes, and the Raab, which are all well stocked with fish. There are several lakes in this country, the principal of which are, the Neusidler, (or Lake Pelso;) the Lake Balaton, (or Platten,) and the Palitsher See, near Zegedin.

The inhabitants are a mixture of the descendants of the ancient Huns, Slavonians, Cumani, Germans, Walachians, Greeks, Jews, Turks, and a wandering people called Zigduns, said to be of uncertain origin, but probably the same as those called Gipsies. The Hungarians are said to be of a sanguine choleric temper, and somewhat fierce, cruel, proud, and revengeful. They have been always reckoned good soldiers, being much more inclined to arms, martial exercises, and hunting, than to arts, learning, trade, or agriculture. The nobility affect great pomp and magnificence, and are much addicted to feasting and carousing. The men in general are strong and well proportioned. They shave their beards, but leave whiskers on the upper lip, wearing fur caps on their heads, a close bodied coat girt with a sash, with a short cloak or mantle over all, so contrived as to be buckled under the arm, and leave the right hand at liberty. Their horse soldiers are called hussars, and their foot heyduks. The former wear a broad sword or scymetar, and carry a hatchet or battle axe. Their horses are fleet, but not so large as the German horses, and therefore they stand up in their short stirrups when they strike. Both horse and foot are excellent militia, very good at a pursuit, or ravaging and plundering a country, but are not equal to regular troops in a pitched battle. The women, when they go abroad, wear short cloaks and a veil.

There are five languages spoken in this country, viz. the Hungarian, which, like the people, is of Scythian origin, and has little or no affinity with any European tongue; the German, the Slavonian, the Walachian, and the Latin. The last is spoken, not only by the better sort of people, but also by the plebeians, though very corruptly. The people called Zigduns have also a particular jargon. Christianity was planted in Hungary in the ninth and tenth centuries. In the sixteenth the Reformation made a great progress in it; but at present, though the Roman Catholics hardly make a fourth part of the inhabitants, their religion is

predominant, the Protestants enjoying only toleration. Besides several sects of Protestants, there are also great numbers of the Greek church and Jews; these last pay double taxes of all kinds. Here are likewise a great many Turks, particularly in the parts which border upon Turkey, and in some of the large towns, where are several mosques. Besides colleges and convents, there are several universities belonging to the partizans of the church of Rome; and the Lutherans and Calvinists have their gymnasiums and schools, but they are under certain restrictions.

As to the trade of this country, it is almost wholly in the hands of the Greeks and Jews. The exports consist chiefly of wine, horses, cattle, metal, minerals, saffron, wool, and leather. Hungary in particular furnishes Austria, and the neighbouring countries west of it, with large droves of cattle, as well as a variety of wines, of which those of Tokay are reckoned the best. The principal manufactures are those of copper, brass, iron, and other hard wares. Great quantities of brass and iron are exported wrought and unwrought.

Hungary at first, like most other countries, was divided into many little principalities and states, which were at length united under one head, who had the title of duke. The last of these dukes was Geysa, who becoming a proselyte to Christianity, was baptized; after which he resigned the government to his son Stephen, who took the title of king, in the year 1000. But as the throne was filled by election, though generally out of the same family, the disposal of the crown was disputed between the Turkish and German emperors for nearly two hundred years; and after the year 1527, when Ferdinand, archduke of Austria, was advanced to the throne, the Austrians found means to influence the elections in such a manner, as to keep the crown in their family till 1687, when it was settled hereditarily on their heirs male, and now, in consequence of an act made by the diet at Presburg, in 1723, in case of the failure of heirs male it is to descend to females.

The states of the kingdom consist of the prelates, the barons, the gentry, and the royal free towns. To the first class belong two archbishops, about a dozen bishops, and nearly as many abbots and provosts. To the second, the stadtholder or palatinate, who represents the king

the court judge, the ban or viceroy of Moravia, Croatia, and Slavonia, (for these provinces are now considered as a part of Hungary, because they belong to the emperor of Austria;) the stadtholder of Transylvania; the great treasurer, the cup bearer, the steward of the household, the master of the horse, the lord chamberlain, the captain of the yeomen of the guards, and the grand marshal of the courts, who are styled the great barons; together with the inferior counts or counts and barons. To the third class belong the gentry, some of whom have noble honors, and others only the privileges of nobles. To the fourth class belong the royal free towns, which are not subject to the counts, but hold immediately of the king. The gentry also, who hold of the archbishops and bishops, have the same privileges as the Hungarian nobility. The common people are vassals to the lords, on whose lands they live, whether those lands belong to the crown, the clergy, the nobility, or the gentry.

The ordinary revenue of this kingdom is said to amount to at least a million sterling, arising from the mines, duties on cattle, royal demesnes, salt works, contributions, and customs. The fortifications and garrisons, constantly maintained on the frontiers on the side of Turkey, are a great expense to the government. Hungary can easily bring into the field a hundred thousand men, regulars and militia; (but, as before observed, they are not equal to a veteran army;) for there are fifty thousand generally in regular pay, and the several gesfanchasts, or counties, furnish the remainder when wanted.

Presburg is the capital of Hungary, and is defended by a strong castle with four towers seated on a hill, where the crown of the kingdom is kept. The archbishop of Strigonia resides here, and has very handsome gardens belonging to his palace. Though the town, exclusive of the suburbs, is but small, it is a pleasant well built city. It is populous, and many Italian merchants have houses here. Presburg has suffered much by fires, and other calamities, of which sad ruins are still to be seen. Of the city's five gates, two are small posterns, for sallies in case of a siege. Over one is the following inscription in gold, "Omne regnum in principium divisum desolabitur;" i. e. "Every kingdom divided against itself shall be destroyed."

VOL. II. No. CII.

It was intended as a lesson to the Hungarians, to keep united, lest by their internal squabbles mischief might accrue to the state. Presburg has ditches, on one side dry, on the other marshy, but neither deep nor broad enough for the defence of the town. The ascent of the citadel is by one hundred and fifteen steps. In its middle is a deep well dug in the rock, into which the waters from the Danube penetrate. Upon the hills on the North and West sides of the citadel are excellent vines. At this place the palatine of Hungary resides; he is the king's lieutenant, and has great authority. The Danube is very wide and rapid opposite the town; in summer it is crossed over a bridge of boats; but on the approach of winter, this bridge is withdrawn, and they make use of a flying bridge, composed of two large boats, joined together, which is made to run along by a rope extended across the river, and makes a very safe bridge. Presburg is 32 miles E. by S. of Vienna, and 72 miles S. E. of Znaim.

Altenburg is 16 miles S. of Presburg; it is a fine town, and is the capital of the province of Wieselburg; it is situated on an island, and has a strong castle, standing on a small arm of the Danube and on the Leitha, and has besides a deep and broad ditch surrounding it filled with water. In these parts is no other road out of Hungary into Austria, but close by the castle; so that it has been reckoned the best frontier town on the west side of Hungary.

Raab is 25 miles S. E. of Altenburg, and is the capital of the county of the same name. It is a royal free town and strong fortress, both by nature and art, on the river Raab, where it unites with the Danube and Rabnitz, by the waters of which it is surrounded, forming also the island of Schutt. It is defended by seven large bastions, and four cavaliers and mounts, which overlook them; has two bridges over the branches of the river, and some antique arms in its magazine. The country round it is champaign, and only commanded by a neighbouring hill, that may be sapped and easily blown up. In an open field at a little distance is a watch tower, from which the approach of an enemy may be seen a great way.

Odenburg, which is the principal town of the county of the same name, is about 50 miles W. of Raab, and 36 S. W. of Presburg. This royal

royal free town is likewise called Sopron, and is said to be one of the best in Hungary. Its inhabitants make excellent wine.

Buda, or (as it is called by the inhabitants) Ofen, 115 miles E. by S. of Vienna, 82 S. E. of Presburg, and 190 N. by W. of Belgrade, is on the west bank of the Danube. This town is also called New Buda, or Ofen; the remains of Alt Ofen are in the plain extending from the suburbs of Buda, between the mountains of Pilis and the Danube. Alt Ofen is at present but a mean place, about which are vast heaps of ruins, where remains of Roman antiquities are still found. New Buda is a royal free city, well fortified, and has a castle which many suppose to be nearly impregnable. The houses are tolerably handsome, being most of them built with square stones. The lower city, or Jews' town, extends, like suburbs, from the upper city to the Danube. The upper takes up all the declivity of a mountain, and is fortified with good walls, which have towers at certain distances. The castle, which is at the extremity of the hill, and commands the greatest part of it, is surrounded with a very deep ditch, and defended by an old fashioned tower, with the addition of new fortifications. There is also a suburb, enclosed with hedges, after the Hungarian manner. The most sumptuous structures now are the caravanserais, the mosques, bridges, and baths. These last are supposed to be the finest in Europe, for the magnificence of their building and for plenty of water. Some of the springs are used for bathing and drinking; and others are so hot that they cannot be used without an admixture of cold water. The Danube here is about three-quarters of a mile wide, and there is a bridge of boats between this city and Pest, consisting of sixty-three large pontoons. The adjacent country is fruitful and pleasant, producing rich wines,

* This city was the residence of the kings of Hungary till the Turks took it in 1526. Ferdinand, archduke of Austria, recovered it the next year; but in 1529 the Turks became masters of it again. In 1684 the Christians laid siege to it, but they were obliged to raise it soon after, though they had an army of eighty thousand men. Two years after the Turks lost it again, it being taken by assault in the sight of a numerous army. The booty that the Christians found in it was almost incredible, because the rich inhabitants had lodged their treasure in this city as a place of safety. However, part of these riches were lost

though in some places they have a sulphureous flavour, from the impregnation of the water.

As Buda is on the western side of the Danube, so is Pest on the eastern, like London and Southwark in England, which are separated by the Thames. Pest is the capital of a county of the same name; is situated in a plain, and is 83 miles S. E. of Presburg.

From Raab to Stuhlweissenburg is 38 miles in a S. E. direction, which town is about 30 miles S. W. of Buda. It is a royal free town, and is the capital of a county of the same name. It stands in a morass formed by the river Sarwitz, but is not formidable upon that account. It had formerly good works, but these have long since been demolished. From the town go three very broad dams, between which are churches, houses, gardens, and meadows, so that the parts, like suburbs, are more populous than the town itself. It was some years ago in a flourishing condition; but having several times been subject to the horrors of war, it is now in a declining state.

Baja is a well inhabited town of the country of Bats, 85 miles S. of Buda, and 22 miles S. of Hajosha. Its situation is on the Danube, in a very fruitful country, on the eastern side of the river.

From Baja to Apathy is about 40 miles in a southern direction, through a pleasant country. It is a very large village belonging to the territory of the Jazyges or Philistines. The district in its neighbourhood is remarkably fertile, and produces an amazing quantity of corn and pasture. Although it only bears the appellation of a village, yet it is larger and more populous than many towns which are the capitals of counties. It is about two miles E. of the Danube, and 14 miles N. E. of Eszeg; the name of which latter place is generally spelt Esseck, but it is erroneous.

in the fire occasioned by the assault. This last siege cost the Christians a great deal of blood, because there were those in the camp who carried on a secret correspondence with the Turks. When the seraskier saw the city on fire, he found he could not relieve it, he beat his head against the ground through anger. In 1687 this city had like to have fallen into the hands of the Turks again, by treachery. After this the Christians augmented the fortifications of the town, which so pleased the pope that he contributed a hundred thousand crowns toward the expences, for he looked upon Buda as the key of Christendom.

Carlowitz, or as it is called by the Hungarians, Neusatz, is about 45 miles S. E. of Apathy, and the same distance N. W. of Belgrade. This place is a strong military town of the district of Peterwardein in Lower Hungary, six miles N. E. of Peterwardein, on the western bank of a small river which empties itself into the Danube, at a spot where several islands are formed by the windings of the river. This town is rendered famous in history for the peace concluded here in 1699, between the Turks and the Imperialists; and is likewise noted for its red wine, which is said to be the best in Hungary.

At six miles S. W. of Neusatz is Peterwardein, on the southern bank of the Danube, but in Transylvania, of which country it is a frontier town. It has often changed its master, being sometimes subject to the Turks and sometimes to the Imperialists; for it was frequently taken and retaken by those powers when at war with each other. It was dismantled by the Imperialists, and burnt by the Turks, re-fortified by the emperor, and made one of the strongest frontier towns against Turkey in 1691. In 1716 prince Eugene obtained a signal victory over the Turks in its neighbourhood. It is at present subject to the emperor of Austria, and is a place of great strength.

Comorra or Comorn is a royal free town of Lower Hungary, the capital of the county of that name, (which district is inhabited by Hungarians, Germans, and Bohemian slaves, with some few Rascians,) at the eastern extremity of the island of Schutt. It is distant from Presburg about 46 miles S. E. and about 40 miles N. W. of Buda. In this town is the court house of the country, a college, and an academy. Near it is an amazingly strong fortress, which is surrounded on the west by a deep ditch full of water, on the south and north by the rivers Danube and Waag, whose streams unite here. The Turks often attacked this place, but owing to its great strength were never able to take it. It was destroyed by an earthquake in 1663, but has been since rebuilt.

At 10 miles N. of Comorra is Newhausel, which is the principal town of a district of the same name. It is 38 miles E. of Presburg, and is an important fortress, which gave the Turks great deal of trouble: they, however, took it in 1663; but the duke of Lorraine retook it in

1683. Its situation is a charming one, and the country around it fertile and pleasant.

From Comorra to Gran is 24 miles along the banks of the Danube. The fertile county of Gran lies to the east of the county of Raab, and is extremely productive of all the necessities of life. The town of Gran is a royal free place, and is situated on the south bank of the Danube, opposite to Barkan, where that river receives the Gran, which latter river has its rise in the Carpathian mountains, which separate Hungary from Poland. It is built in a very fruitful country, which produces great quantities of excellent wine, and was once the metropolis of the kingdom. It is exceedingly well fortified, and divided into the Upper and the Lower towns; the latter of which has great command of the Danube. Here is the see of an archbishop, valued before the loss of Newhausel, above-mentioned, at three hundred and forty thousand florins per annum; but now it is not reckoned worth more than one hundred thousand. The castle, the archbishop's palace, and Saint Stephen's cathedral, are the principal among its many noble structures. Here are two large towers, one towards Thonesburg, and the other facing the river, which are joined by a wall fortified with divers redoubts, and a ditch flanked with hewn stone, besides a pallisadoed terrace, and four great points like ravelines; and there is also a strong fort built on St. Thomas's hill. This town has often changed its master, as have many others in this country. In 1596 the Imperialists took it from the Turks. In the siege of it at that time, Sir Thomas Arundel of Wardour castle, for his signal valour in storming the watch tower, and pulling down the Turkish banner, &c. was created a count of the empire by the emperor Rudolph, and afterwards king James I. made him a baron of England; which honours are still enjoyed by his posterity. The Turks, however, retook it, and kept possession of it till 1683, when, after the defeat of their army before Vienna by John Sobieski, king of Poland, the Imperialists recovered and defended it against the Turks, who again attacked it in 1685, but were entirely defeated by the dukes of Lorraine and Bavaria; since which time the house of Austria have remained in possession of it.

Schemnitz, or Scemnitz, is 50 miles N. of Gran, 66 miles N. of Buda, and 72 miles N. E. of Presburg.

Presburg. It is one of the largest mine towns in Hungary, and as it is built on a rocky hill, its streets are consequently rendered very uneven. Here are three Lutheran churches, and the town is defended by as many castles, one of which being built in a very lofty situation, serves the purpose of an excellent watch tower. Here are some of the finest medicinal baths in this part of the world, but the air of the place is not very healthy. The neighbourhood of Schemnitz has been long famous for six rich mines of silver, one of which is in some places very cold, and in others so extremely hot, that the miners are under the necessity of working naked. Most of the ore contains a portion of gold; and in these mines are likewise found crystals, amethysts, and vitriol naturally crystalized. Not far from the town is a rock, where is found a red substance which is called cinnabar of silver, of which the inhabitants make an exceedingly fine vermilion. In these mines upwards of two hundred men are kept constantly at work.

At the distance of 18 miles from Schemnitz, in a northerly direction, is the royal free town of Kremnitz, which is the principal among the mountain towns. Its situation is very low, having high mountains all about it. The town itself is but small, and its suburbs are by far the most considerable part, in which are nine streets. At this town is a mint, where all the gold and silver found in the mines is coined into money, to the amount of about a hundred thousand ducats yearly. During the internal commotions of this country the town of Kremnitz was a considerable sufferer. It was totally destroyed by fire in the year 1777, but has since been rebuilt.

From Buda a good road leads through Gyongyosh to Erlau, or Eger, (for it is situated on the river Eger, which empties itself into the Theiss,) at the distance of 65 miles, in the gespanchaft or county of Borsod. It is surrounded with old walls and bulwarks; and in its neighbourhood is a strong castle on an eminence. The town of Erlau was once in a very flourishing condition, but has been greatly reduced by the frequent sieges and attacks to which it has been subject. It is an episcopal see, and the bishop, who usually resides here, has a considerable revenue. The Jesuits had here an academy and a college, which are now converted to other

purposes than the promulgation of their tenets. In the neighbourhood of Erlau an excellent kind of red wine is produced, which is much drank in this part of Hungary; and not far from the town is a warm bath which is much resorted to. This place made a very brave defence against the Turks in 1552; but in 1596 it was compelled to surrender. In 1606 the Imperialists rifled the town, and committed great outrages in it; notwithstanding their efforts they were not able to make themselves masters of the castle.

At the distance of 30 miles from Erlau is the strong town of Mishkotz on the river Shaj, and 25 miles farther is Kaschau, which is delightfully situated on the river Hernath, and the capital of the county of Abaujvar. Kaschau is a very strong place, it being enclosed with triple wall, and a good ditch, besides being fortified with formidable bastions and a good citadel. Here are two gates, which are opened alternately, and one of the most considerable animals in the kingdom. Here are spoken the German, the Hungarian, the Polish, the Schvonian, and the Turkish languages. As most of the Germans in Kaschau are Lutherans, and the Hungarians Calvinists, the great church is alternately supplied with a minister of each persuasion. A rivulet from a neighbouring mountain enters the town, and divides it into two branches, then runs the length of it, with thirty-four bridges over them. The town house is a most beautiful structure, and the parish church is an admirable piece of architecture. The governor commands all the troops in the neighbourhood; but within six miles of the town, the nobility &c. of the country used, in times of war, to pay homage to the Turks. In 1537 there were two kings of Hungary chosen, by different parties, and between them they made great havoc in this and the neighbouring places. The Turks laid siege to Kaschau in 1592, but their attempts to take it were in vain; and in 1604 the Imperialists besieged it; but they met with no better success than the Turks; it, however, submitted to the Imperialists in 1606. In 1621 it was resigned by treaty to Bethlem Gabor, prince of Transylvania, who had besieged and taken it. In 1668 it was taken by prince Ragotski; and in 1682 it was possessed by Count Tekeli. After which it belonged now to the Turks, now to the emperor, now to the emperor; till at length

the latter prevailed, and it still belongs to the
Emperor of Austria. Thus the inhabitants of
town have been frequently compelled to sub-
mit to all the horrors of war, which certainly
ended to reduce it from its ancient splendor and
magnificence, but still it is a considerable place,
and if the country should remain at peace will,
without doubt, recover a part at least of its
former greatness.

At 20 miles N. by E. of Kaschau is the strong
and royal free town of Eperies, on the river
Tisza, 30 miles from the confines of Poland.
It is the capital of the gespanchaft or county of
Eperies. This town is surrounded with ditches,
wall, and towers. It is the seat of the highest
court in the circle of the Hither Theiss, and is the
seat of an academy and college. Here was formerly
a collegium illustre, belonging to the Lutherans,
but it is now laid aside. This place has long
been famous for its fair and for its salt mines,
particularly one of the latter, out of which pieces
of pure salt are said to have been dug of ten
thousand pounds weight. It is of several colours.
The water of the mines, when boiled, produces
salt which is given to the cattle. Eperies was
one of the four towns yielded to Bethlem Gabor,
prince of Transylvania, but the Imperialists re-
covered it again in 1710.

Traversing the road to the N. W. from
Eperies, at the distance of 28 miles is
Leutschau, which is the capital of the county of
Zips, (vulgarly called Zips,) in Upper Hun-
gary. It is within 20 miles of the confines
of Poland. Being seated at the top of a hill,
it commands a beautiful and extensive prospect.
The town is handsome, large, and well fortified;
it is principally inhabited by Germans, who pro-
fess Lutheranism, and who likewise speak the
Hungarian language. At this place is annually
held a very considerable fair, which induces
people from the neighbouring country to resort
to it, as well for the purposes of traffic as of
amusement. Leutschau is looked upon as a
place of great importance, it being reckoned the
second royal free town of Upper Hungary. It
is, however, like most of the strong towns in
Hungary, been subject to the calamities of war.
In 1631 the mal-contents took possession of it,
and in 1685 the Imperialists wrested it from them,
the year following the mal-contents recovered
it again.

In the neighbourhood of Leutschau, at the
Vol. II. No. CII.

distance only of four miles in a S. W. direction,
in the strong town of Iglo, in the same county,
which has generally shared the fate of that town;
for whoever was master of the former soon got
possession of the latter.

Setting out from Buda in Lower Hungary,
and passing through the large towns of Halasz,
Therbsiopol, and Czernabara, you arrive at
Temeswaer, which is 160 miles from Buda
in a S. E. direction, and 70 from Belgrade
in a N. by E. direction. This is a considerable,
important, and very strong town. It is the
capital of a county of the same name, and has
long been considered as the capital of Upper
Hungary. Indeed when the Turks were in pos-
session of this part of Hungary, it was reckoned
the capital of Slavonia in European Turkey.
Temeswaer formerly passed for impregnable;
but it was taken by prince Eugene in a dry season,
by throwing several thousand bombs into it in
1716. As it is seated in a morass, (to drain
which, and for the purpose of navigation,
a canal of about 100 miles in length has
been made,) it is rendered inaccessible to an
army, except in a dry season, when they are in
want of rain. By the peace of Passarowitz in
1718 it was left in possession of the house of
Austria, to whom it at present belongs.

At 95 miles N. of Temeswaer, and 120 E.
of Buda, is Gros Wardein, (Great Waradin.)
It is the capital of the county of Bihar, is an
episcopal town, and a place of great strength.
It is seated on the river Sebes Kerez. This town
was taken by the Turks in 1660, but the Im-
perialists wrested it from them in 1692, and have
kept possession of it ever since.

The road from Gros Wardein, in a N. W.
direction, leads to Debretzein, which is 30
miles from that place, and 107 miles E. of
Buda. Debretzein is a royal free town in the
Farther Circle of the Theiss, in Upper Hungary.
It is seated on a fine plain, and is both large and
populous; yet it is but indifferently built, and
has neither walls nor towers. The breeding of
cattle in these parts is considerable. For twelve
miles and upwards there is neither hill nor wood,
being a continued heath, consequently the inha-
bitants are in great want of timber. This town
has been three times burnt down by accident. In
1684 it was taken by the Turks, but the Imperial-
ists retook it the same year.

Proceeding still farther on the road is Tokay,
6 A which

which is by 40 miles N. by W. of Debretzien, and 100 N. E. of Buda. This is a very strong town and citadel of Upper Hungary, and is situated on an island formed by the confluence of the Theiss and the Bodrog. The town itself is inconsiderable; but it has been long noted for its excellent wine, called Tokay, which is highly esteemed all over Europe, and sells at a high price. There is only one vineyard that produces it, inasmuch that it is scarce even at Vienna itself; and as it is so scanty, we need not be surprised at the deception of the merchants, who impose upon their customers a different wine, to which they give the same appellation. It is also famous for

a medicinal earth found in its neighbourhood and at some distance from it are some excellent salt works. It has been frequently taken and retaken by the Turks and the Imperialists.

Zegedin, the capital of the gespanchaft of Czongrad, is 55 miles N. W. of Temeswaer, and 70 N. E. of Eszeg. It is situated on the West side of the Theiss, but is in Upper Hungary, and is opposite the mouth of the Marosch, where that river falls into the Theiss. This town, which is defended by a castle, has undergone several sieges, with various success. The Imperialists took it from the Turks in 1686.

SECTION II.

General Description of Transylvania—Its strong Holds and principal Towns described—Account of the Passes.

TRANSYLVANIA is a province annexed to Hungary, and is bounded on the North and West by Upper Hungary, on the East and North-East by Moldavia and part of Wallachia, and on the South by Wallachia. From East to West it is 170 miles long, and from North to South 150 miles. This country is surrounded on all sides by high mountains, and the air is generally healthy and temperate. The soil produces corn, wine, and fruits in great plenty. It abounds with woods and forests, particularly on the sides of its high hills, in which are mines of gold, silver, lead, copper, quicksilver, and alum. It is inhabited by several sorts of persons, principally descendants of the ancient Siculi, Saxons, and Hungarians. They are at present of different religions, which are all tolerated, as Papists, Lutherans, Calvinists, Socinians, Photenians, Arians, and Mohammedans. The administration of affairs is conducted by twelve persons, viz. three Roman Catholics, three Lutherans, three Calvinists, and three Socinians. Transylvania is a very important province, and must ever turn to the advantage of its possessor whenever a war shall happen between the emperor and the Turks, by reason of the considerable supplies either of them might draw from it: and as it is a frontier province the king of Hungary will always find it his interest to keep possession of it. This country was formerly a part of Hungary,

till it was rent from the body of that kingdom by Soliman the Magnificent, and erected into a separate principality, who appointed the tribute it should pay at the Porte. Prince Charles of Lorraine easily perceived, that whichever of the two monarchs was master of it, would without difficulty keep the sovereignty of Hungary; he possessed himself of it by open force, for his brother-in-law. He was very sensible that the salt, plies drawn from this province, its advantageous situation, its nearness to Wallachia and Moldavia, and its strong cities, were of the greatest importance. And these considerations prevailed with him to prefer the conquest of it before the reduction of all the rest of Hungary. The emperor easily made himself master of it, and this conquest had great consequences; for from that time, 1711, the emperor has always been absolute sovereign of it. The militia is commanded by the governor, whose commission is the more important, as Transylvania is reckoned the bulwark of Christendom.

Transylvania takes its name from its being seated by vast mountains and forests, which divide it from Hungary, being a part of the ancient Dacia. The Hungarians call it Erdely, the Germans Siebenbergen, and the Dutch Sevenbergen, the two latter signify the same thing, viz. the seven cities, from that part of the country which is inhabited by the Saxons. water in some places is reckoned unwholesome,
because it passes through minerals of several
sorts; but where it is not impregnated by them,
it is reckoned as good and as wholesome as that
in other countries.

We have before said that Transylvania is in-
habited by three sorts of people, viz. 1. The
Siculi, who pretend to be the most ancient, and
are supposed to be a race of the ancient Scythians,
or the descendants of the Huns. They are divided
into seven cantons. 2. The Saxons, who are
thought to be descendants of the Daci, (the
country was conquered from them by Trajan,
the Roman emperor,) for they still call them-
selves Decen, or rather Detschen, (which word
greatly resembles what is called Dutch,) and
possess the province denominated the Seven
Towns. 3. The Hungarians, who inhabit that
part of the country which lies on the frontiers of
Wallachia.

The part of Transylvania inhabited by the
Saxons is divided into five counties, viz. Atland,
Landvordenwald, Burdland, Velnland, and Nos-
terland.

The principal place in the county of Atland is
Hermanstadt, which is 30 miles S. E. of
Gyssenbergy, and 120 miles E. of Temeswaer.
Hermanstadt is the capital of Transylvania, and
was formerly the residence of its prince. It was
called Hermanstadt from its founder Herman, a
Saxon, and Cibinium from the river Cibin or
Tibis, on which it is seated. It is the see of a
bishop, who is suffragan to the archbishop of
Elocaza in Hungary. About it are many fish
ponds and other pools of water, which render
the access difficult, and by that means, as also
the strong walls, and several bastions, it is able
to make a good defence against an enemy. The
houses are well built and generally slated, and
are well supplied with water from several
springs; even the river is conveyed through the
streets in canals made for that purpose. The
arts of justice for the Saxons are held in it, and
the chief trade of the inhabitants consists in cloth
and meal. It received an Imperial garrison in
1677. Hermanstadt is a granary for the whole
principality, and by keeping the corn under
ground for many years without damage, they

Thus it appears, that all the names by which this
country is designated have no resemblance in sound to each

were enabled to hold out seven years after the
death of Lewis king of Hungary.

Saltzburg, eight miles N. of Hermanstadt, is
a very neat town, and is principally famous on
account of its extremely rich salt mines, which
yield an amazing revenue to the crown.

Michelsburg, seated on a hill about a German
league S. W. of Hermanstadt, is a small, but well
built town. It has a very strong fortress built on
the top of the hill, which nature, assisted by art,
has rendered so secure, that it may be considered
as almost impregnable.

Helten, about the same distance from Her-
manstadt on the S. E. is a neat town, and is
noted for a strong castle built for its defence.
The inhabitants of this town carry on consider-
able manufactures of silk and cloth, and trade
largely in fruit, of which this part of the country
affords great abundance and variety.

Agnabet, or Agnethin, is about ten miles
N. E. of Hermanstadt, on the river Harbach.
This is a considerable town, and by some is
reckoned one of the principal places of Trans-
sylvania; but it does not appear to merit so high a
character.

The county of Landvordenwald lies west from
Hermanstadt; the only place of note in this
county is Millenbach, otherwise called Sebeste,
or Zazebes, which is its capital, and was the first
built by the Saxons in the county. It lies in a
very hollow valley, tolerably secured on the west
side by morasses, but open on the other. This
place is about 16 miles W. from Hermanstadt.

The county of Burkland lies E. from Herman-
stadt towards the frontiers of Moldavia. Of this
county Cronstadt is the capital, which is 53
miles E. of Hermanstadt. This place is called
by the Greeks Stephanopolis, by the Italians
Corona, but by the natives Brassa*. It is sup-
posed to be the Pretoria Augusta of Ptolemy.
Cronstadt is surrounded by walls, towers, and
ditches, and therefore a place of strength. It
has, however, been frequently pillaged, and has
greatly suffered from earthquakes. This town
carries on a considerable trade, is the see of a
bishop; has a good college, and is the seat of an
university, which possesses the best library in the
country. Not far from Cronstadt is the forest of

other. Hence arises the greatest difficulty of reconciling
the accounts of different historians and geographers.

Zeidenwald,

Zeidenwald, which is about ten miles in length, but part of it is so marshy, that the people are obliged to travel over it on planks.

Mergenburgh is 12 miles N. W. from Cronstadt; but although it be not a place of much importance, yet the inhabitants carry on a pretty good trade with the neighbouring towns and villages. It is situated on the river Aluta or Olt.

Fogaras is 24 miles W. by N. of Cronstadt. It is a small, but well inhabited town, and is likewise situated on the river Aluta. It is defended by an exceedingly strong fort, which the Turks vainly attempted to make themselves masters of in the year 1661. The inhabitants of this town carry on a very good trade with their neighbours.

The county of Veloland lies N. W. of Hermanstadt, of which Segeswaer, or Schepsburg, or Sebesburg, is the capital. It is 40 miles N. of Hermanstadt, and is sited at the conflux of the rivers Kokel and Giorgen. It stands on the side of a hill, so that the houses appear one above another, like an amphitheatre. It is divided into the upper and the lower town: the former, being seated on a hill, is well fortified; but the latter is more populous, on account of the conveniency of water for their manufactures, especially the dressing of cloth. On the neighbouring hills there are excellent vineyards, and upon one of them is a college.

Megies or Megisward, is 15 miles S. W. of Segeswaer, on the river Kokel. It is situated in a plain full of rich vineyards, by reason of which the country about is called Wineland. The church belonging to this town is built on a neighbouring hill, in the nature of a castle, and therefore it is made use of for the defence of the town.

The county of Noswerland lies N. W. from Hermanstadt; the only remarkable place in which is Nasenstadt, which is called by the Germans Bestris. This place is about 48 miles N. W. from Hermanstadt, on the river Bistris, in a spacious plain. The town is very neat, though it is not very large, and is encompassed with hills bearing vines. At the distance of about four miles from this place are the gold mines of Redua, and some gold is frequently found in the sands of the neighbouring rivulets.

That part of Transylvania which is inhabited by the Hungarians is divided into six counties,

which are those of Weissenburg or Alba Julia, Huniad, Thorda, Döboka, Clausenburg, and Zatmar.

Weissenburg, (as the Germans call it,) or Alba Julia, (as the Latins call it, from Julia Augusta, mother to Marcus Aurelius Antoninus Pius,) or Giulia Frierwar, (as it is called by the Hungarians,) is about 28 miles N. by W. of Hermanstadt. This town is also called Carlsburg. It is seated on the river Lompay, was formerly the capital of the kings of Dacia, and afterwards of some of the princes of Transylvania, having a magnificent palace, which is now gone to decay. The mighty ruins shew it was once very large and spacious. It stands on the side of a hill, with a delightful plain before it. It is the see of a bishop, and is the seat of an university.

Clausenburg or Colosvar, the capital of the county of the same name, is 40 miles N. of Weissenburg, and 67 N. W. of Hermanstadt. This town, which is large and populous, is seated on the little river Samos, and is defended by a castle, good walls, and strong bulwarks. It is a place of considerable trade, and is perhaps the most wealthy of any in Transylvania. Over the Portina gate is still to be seen an inscription to the honour of the emperor Trajan. The Latins called this town Claudiopolis. The Socinians, Lutherans, and Calvinists have each their places of worship here, and were in possession of the cathedral till 1603; when it was taken from them and given to the Jesuits, whose college and church they in their great zeal had demolished. The town is inhabited by Saxons and Hungarians, who are promiscuously permitted to bear offices. It is the more frequented, as being one of the places where the states of Transylvania meet, and where the prince holds the provincial courts of justice. The Turks besieged it in vain 1601, but took it in 1603, and it was retaken the same year by the Imperialists. Prince Abassi besieged it in 1661 with a large body of Turks; when the governor, though so ill provided with cannon and ammunition, that he was obliged to melt the bells belonging to the churches, held out till relief arrived, and the Turks were obliged to raise the siege.

Neustadt, or Nagybania, the capital of the county of Zatmar, on the northern border of Transylvania, is 65 miles N. by W. of Clausenburg.

or Alba Julia, and having a gold mine in its neighbourhood.

The province of Transylvania is defended in some measure by nature; for there are seven passes which lead into it from different parts, and these are so situated as that they may be easily defended against an enemy. The first, on the side of Hungary, is where the river Kreutschker Kerez runs into it, with so many windings, that it must be crossed thirty times. The second, where the river Marosh falls into Hungary, near Tizza, called the Iron Gate, about 60 miles W.

by N. of Hermanstadt. The third, where the Temesh runs into Hungary, about a mile N. of Marga. The fourth, is at the Red Tower on the river Aluta, about six miles S. of Roseuthur, and 16 miles S. E. of Hermanstadt. The fifth, called Botza Pass, is 25 miles E. by S. of Cronstadt, on the frontier of Wallachia, in a place called Turk-field. The sixth is called Borgo Pass, and is one mile E. from Ilutza, and ten miles E. by N. from the small town of Borgo. And the seventh is called Boduer Pass, and is near the N. E. corner of the country, about seven miles N. of Kretshunest.

SECTION III.

Description of Slavonia and its principal Towns—Of Croatia and Morlachia, and Particulars relative to their principal Places.

THE country of Slavonia formerly comprehended all the territories which lie between the Adriatic Sea and the Euxine or Black Sea; its language then extending over all the eastern parts of Europe, where it is still very much used. These countries were conquered by the Scavi, Tartar or Scythian nation, in the reign of the emperor Justinian. At present it is confined between the rivers Drave and Danube on the N. and E. and the Save on the S. so that it is bounded by Lower Hungary on the N. Upper Hungary on the E. Bosnia and Servia on the S. and Croatia on the W. It is about 150 miles long from E. to W. and 55 miles broad (where broadest) from N. to S. but its mean breadth is about 35 miles. Slavonia is a fine, level, and fruitful country, producing corn, cattle, and pasture; but being a southern frontier against Turkey, it has been consequently exposed to the ravages both of the Christian and the Ottoman troops, so that it has not been so productive to the government as might have been expected. The country is well watered by several streams and rivulets which fall into the Drave, the Danube, and the Save. The air is fine and temperate, and the people robust and warlike. Those who inhabit the eastern parts are called Slavians. With regard to their religion, the Slavonians are partly of the Romish, and partly of the Greek church, but the former is at present

the established religion; and consequently, since the country came under the dominion of the house of Austria it greatly predominates over the other, which was the established religion while it was under the jurisdiction of the Turks. Slavonia does not produce above ten thousand pounds sterling to the emperor per annum. In 1746 it was united, by a fresh act, or decree, by Maria Theresa, with the kingdom of Hungary. At present it is subdivided into the banats of Sirmi, Verowitz, Walpo, and Posseg; and the generalates of Gradiscani, Broden, and Petrovarra.

The Banat of Posseg is 52 miles long, and 26 miles broad; Possega, or Poshega, is its capital, and is indeed the metropolis of Slavonia. It is 190 miles S. by E. from Presburg, and 210 miles S. by E. from Vienna. It stands on the river Otawa, in a very fruitful country. Its fortifications are good; and it contains above a thousand houses, and has a considerable trade. The Turks took it in 1544, and kept possession of it till 1687, when being besieged, they surrendered it to the Imperialists, who have been masters of it ever since.

Csernak, in the banat of Walpo, is 28 miles N. of Poshega. It is but a small place, yet its inhabitants carry on a moderate trade, by means of the Walpo, on the south bank of which it is situated. The Walpo falls into the Drave.

The banat of Verowitz is 55 miles long, and 30 miles broad. Eszeg, (or Esseek, or Ossek, as it is generally called,) is 45 miles E. by N. of Poshega, and is situated on the south bank of the river Drave, about ten miles before that river falls into the Danube. This is a large town, and is strongly fortified. The most remarkable thing here is a large wooden bridge over the Drave and the neighbouring morasses; it is a mile in length, and thirty yards broad. It originally consisted of thick planks of oak supported by nine or ten large trees in a row between each arch. It was raised in 1566 by the Turkish emperor Soliman, who had twenty thousand men at work upon it. In 1664 count Serini burnt the bridge, but the Turks soon rebuilt it. In 1685 the Hungarians burnt a part of it, and the following year they entirely destroyed it by fire. The town has been often taken, and after the battle of Mohatz the Imperialists drove the Turks completely out of it. Here are large caravanserais or inns, for the accommodation of armies, or travellers, which are continually passing this way: the houses are of timber, and the streets are flanked with trees. On account of its garrison and a Slavonian regiment of horse lying in its neighbourhood, it is reckoned one of the military towns.

The banat of Sirmi, in its greatest length, is about 70 miles, but its mean breadth is about 20 miles. Semlin, or Zemlin, which may be considered as a place of the greatest importance in this part of Slavonia, (though it is properly in the generalate of Petrovarra,) is situated on the west side of the rivers Danube and Save, at the point where those rivers form a conjunction, and at the eastern extremity of the province of Slavonia, is directly opposite to Belgrade in European Turkey, which is seated on the S. E. angle of those rivers on the opposite shore. Semlin is 85 miles S. E. of Eszeg, and 116 E. of Poshega. It is a place of a considerable trade.

The generalates of Gradiscani, Broden, and Petrovarra, extend the whole length of Slavonia, on the south side, and form an excellent barrier against the Turks. The principal town of these generalates is Brodo, which is situated 20 miles S. E. of Poshega, on the N. bank of the river Save, and is a place of some strength. The inhabitants, which may be considered as rather numerous, carry on a tolerable trade; but that

which renders this place famous in history is the battle which was gained here by the Turks in 1688 over the Imperial army.

Croatia was formerly known by the name of Liburnia, and was once a flourishing kingdom of much larger extent than it is at present. Croatia, properly so called, is that part which lies between Lower Hungary on the N. Slavonia on the E. Bosnia on the S. E. Dalmatia on the S. Morlachia on the S. W. (which, however, is generally considered as part of Croatia, and is called Maritime Croatia, because it borders on the Adriatic Sea,) and Stiria and Carniola on the W. Including Morlachia, it is about 140 miles long, and 65 miles broad. The Hungarians call the country Horvath Orszag, and the Germans Crabatten. The inhabitants are descendants from the Slavi; and were formerly called Kruati, from which the Greeks formed Crobati. Croatia is fruitful in corn, wine, oil, and all other necessities of life; but being a frontier province like Slavonia, it labours under similar inconveniences. The inhabitants are of good stature, valiant, hardy, good soldiers, the horsemen especially, who are so famous, that they are entertained in several of the courts of Germany in their horse guards. Their infantry are called Uskokes, and are remarkably agile in running up the mountains.

Morlachia, or Maritime Croatia, is separated from Croatia Proper by a chain of mountains. The inhabitants are said to be of Walachian extraction, as is indicated by their name; Morlachia being a contraction of Mauro-Walachia, that is, Black Walachia. But this is denied by the Abbé Fortis, who published a volume of travels in Dalmatia, (of which country Morlachia forms a part.) He informs us, that the origin of Morlachia is involved in the darkness of barbarous ages, together with that of many other nations, resembling them so much in customs and language, that they may be taken for one people, dispersed in the vast tracks from the Adriatic Sea to the Frozen Ocean. The emigrations of the various tribes of the Slavi, who under the names of Scythians, Geti, Goths, Huns, Slavini, Groats, Avari, and Vandals, invaded the Roman empire, and particularly the Illyrian provinces during the decline of that em-

pire, must have strangely produced analogies of the nations which perhaps removed thither as at more remote periods. The remainder of the Ardinei, Aillyrian people anciently settled who probably could not receive dependance on the Romans, form an union with foreign themselves in dialect and according to Abbé Fortis, it is conjectured, that many families in Hungary by the irruption of the Tughiz Khan and his successors, the deserted vallies between Dalmatia. This conjecture is confirmed by the traces of the which are still to be found in the called Zara. With regard to the name, the abbé observes, which generally call themselves Vlassi, Vlassi; a national language is found in the records of the thirteenth century. The powerful men, or men of authority, of the Moro-Vlassi, as they are now called, point out the original of the orders on the Adriatic Sea; and so different from the others on the coasts, in dialect, dress, customs, that they seem clearly original, or at least the original, at such distant periods, but they have had time to acquire their national character, and remarkable diversity among the lives in several districts, produce different countries from with regard to the character, he informed that they are maritime neighbours. The coasts of Dalmatia tell many of their avarice and cruelty of an ancient date; and in later times, they contributed to the corruption of the nation to the bad disposition of; and though thievish among them, the abbé informs, by travel securely through the is faithfully escorted and

ire, must have strangely perplexed the genealogies of the nations which inhabited it, and which perhaps removed thither in the same manner as at more remote periods of time. The remainder of the Ardinei, Autariati, and other Illyrian people anciently settled in Dalmatia, who probably could not reconcile themselves to a dependance on the Romans, might nevertheless form an union with foreign invaders not unlike themselves in dialect and manners; and, according to Abbé Fortis, it seems no ill-founded conjecture, that many families, driven out of Hungary by the irruption of the Moguls under Genghiz Khan and his successors, might people the deserted vallies between the mountains of Dalmatia. This conjecture is also somewhat confirmed by the traces of the Calmuc Tartars, which are still to be found in a part of that country called Zara. With regard to the etymology of the name, the abbé observes, that the Morlacchi generally call themselves, in their own language, Vlasi; a national term, of which no notice is found in the records of Dalmatia till the thirteenth century. The word signifies powerful men, or men of authority; and the denomination of Moro-Vlasi; corruptly Morlacchi, as they are now called, may perhaps point out the original of the nation. Morlachia borders on the Adriatic Sea; but the Morlacchi are so different from the other inhabitants of the coasts, in dialect, dress, dispositions, and customs, that they seem clearly to be of a different original, or at least the colonies must have settled at such distant periods from each other, that they have had time to alter in a great measure their national character. There is also a remarkable diversity among the Morlacchi themselves in several districts, probably on account of their different countries from whence they came. With regard to the character of these people, we are informed that they are much injured by their maritime neighbors. The inhabitants of the coasts of Dalmatia tell many frightful stories of their avarice and cruelty; but these are all the of an ancient date; or, if any have happened in later times, they ought rather to be ascribed to the corruption of a few individuals, than to the bad disposition of the nation in general; and though thievish tricks are frequent among them, the abbé informs us, that a stranger may travel securely through their country, when he is faithfully escorted and hospitably treated.

The greatest danger is from the Heyduks, or Banditti, of whom there are great numbers among the woods and caves of these dreadful mountains on the confines. There, says the abbé, a man ought to get himself escorted by a couple of these "honest fellows;" for they are not capable of betraying him, although they belong to a banoniti; their situation being more apt to raise compassion than diffidence. They lead their lives among the wolves, wandering from one precipice to another, exposed to the severity of the seasons, and frequently languish in want of the necessaries of life, in the most hideous and solitary caverns. Yet they very seldom disturb the tranquillity of others, and prove always faithful guides to travellers; the chief objects of their rapine being sheep and oxen, to supply themselves with food and shoes. Sometimes it happens, that, in their extreme necessity, the Heyduks go in parties to the shepherds' cottages, and rudely demand something to eat, which they do not fail to take immediately by force if the least hesitation be made. It is seldom indeed that they meet with a refusal, or with resistance, as their resolution and fury are well known to be equal to the savage life which they lead. Four Heyduks are not afraid to assault a caravan of fifteen or twenty Turks, and generally plunder it and put them to flight. The greatest part of the Heyduks look upon it as meritorious to shed the blood of the Turks; to which cruelty they are easily led by their natural ferocity, inflamed by a mistaken zeal for religion, and the discourses of their fanatic priests. As to the Morlacchi themselves, they are represented as open and sincere to such a degree, that they would be taken for simpletons in any other country; and by means of this quality they have been so often duped by the Italians, that the faith of an Italian, and the faith of a dog, are synonymous among the Morlacchi. They are very hospitable to strangers, and their hospitality is equally conspicuous among the rich and the poor.

Carlstadt is the capital of Croatia; it is situated on the river Kulpa, in the banat of Severin, 180 miles S. by W. of Presburg, and 180 miles S. of Vienna. It is a strong town, and is the usual residence of the governors of the province. It received its name from the archduke Charles, who caused it to be fortified in 1579. The inhabitants carry on a pretty good trade.

Agram is a strong town on the river Save, 27 miles

miles N. W. of Carlstadt. This town is a very great thoroughfare, by means of which the inhabitants enjoy an extensive trade with many towns and villages in its neighbourhood. This place is also called Zagrab.

From Agram the road leads through Beloratz, Trikrally, Grany, and Ostritz, to Warasdin, which is the capital of a district of the same name. This town stands on the northern frontier of Croatia, on the southern bank of the Drave. It is 37 miles N. by E. of Agram, and 62 miles N. E. of Carlstadt, and is a remarkably strong place: it commands a great trade by reason of its situation on the navigable river Drave, and is seated in a very pleasant country.

Kreutz is a strong place in the interior of Croatia, which is situated at an equal distance from Warasdin and Agram, it being 30 miles N. E. of Agram, and 30 miles S. E. of Warasdin.

Petrinia is a small but strong town on the river Kulpa, which falls into the Save about seven miles E. of this town. It is 35 S. by W. of Kreutz, and 37 miles E. of Carlstadt. The inhabitants are humane and friendly, and the trade which is carried on by them greatly surpasses that which falls to the lot of many others which are much larger and more populous.

From Petrinia the road leads in a south-eastern direction to Costainitz, which is situated on the river Unna on the borders of Croatia, and in the Banat Croatia. It is 18 miles S. E. of Petrinia, and 51 miles E. by S. of Carlstadt. The inhabitants carry on a good trade with their neighbours the Turks, who are situated in Bosnia on the opposite side of the river.

Ogulin, a strong town of Croatia, is 20 miles S. W. of Carlstadt; and Fiume, another strong

place, is 35 miles W. of Ogulin. Fiume is likewise called St. Veit. This latter town has a good harbour on the shore of the Adriatic Sea, therefore the inhabitants enjoy a good maritime trade. It was situated in Istria, but is now reckoned in Croatia.

From Fiume the road leads through Bukari, Hrelin, Stanke, Novi, Klenovitz, and St. Elizabet, to Zeng or Segna, which is 30 miles S. E. of Fiume, in Morlachia, on the Carnaro Bay on the East shore of the Adriatic. It was formerly called Flanaticum. Segna is the see of a bishop, under Spalatto; it is strong both by nature and art, having an excellent castle, with vast woods and crags on the land side, but its harbour is indifferent.

Karlapago, which is seated on the sea shore is another strong town of Morlachia, and is 30 miles S. by E. of Segna. It is opposite to the island of Pago, and is situated in a pleasant though not very fertile part of the country.

Gospitch is 15 miles E. by N. of Karlapago in Croatia Proper, and being situated on the road through which there is a great thoroughfare towards Turkey, the inhabitants carry on an extensive traffic in various kinds of merchandize.

Zwonigrad, at the southern extremity of Croatia, is 44 miles S. E. of Gospitch, and 94 miles S. E. of Carlstadt. This town being situated on the frontiers of Turkey, has been fortified with a great deal of wisdom. Its fortifications are amazingly strong, and appear to have been the work of much skill, as well as of great labour. The inhabitants of this place being the general carriers between this part of Croatia and Turkey carry on an extensive trade, and enjoy certain privileges.

SECTION I.

Entrance into Austrian Poland—Limits of the dismembered Province—Its Population and Productions—Arrival at Cracow—Description of that City—University—Palace—Citadel occupied by the Confederates in the late Troubles—History of that Transaction—Cathedral—Tombs of several Polish Sovereigns.

THE entrance into Austrian Poland is just beyond Bilitz, after having crossed the rivulet Biala, which falls into the Vistula. From Bilitz the journey to Cracow is through the territories which the house of Austria secured to itself in the partition before the last. The district claimed by the empress of Germany in her manifesto is thus described: "All that tract of land lying on the right side of the Vistula from Silesia above Sandomir to the mouth of the Bug, and from thence by Franepole, Zamoise, and Rubiessow, to the Bog. From the Bog the limits are carried along the frontiers of Red Russia to Zabras upon the borders of Volhynia and Podolia; and from Zabras in a straight line to the Dnieper, where it receives the rivulet Podhorts, taking in a small slip of Podolia, and lastly, along the boundaries separating Podolia from Moldavia*." The importance of this acquisition to the house of Austria will best appear from the number of inhabitants, which, according to the numeration

made in 1776, amounted to two millions five hundred and eighty thousand seven hundred and ninety-six. The mountainous parts of Galacia and Lodomeria produce fine pasture; the plains are mostly sandy, but abound in forests, and are fertile in corn. The principal articles of traffic are cattle, hides, wax, and honey. These countries contain mines of copper, lead iron, and salt; of which the latter are the most valuable.

Crossing a narrow slip of Austrian Poland of about 86 miles in length you reach Cracow, leaving on the right hand a chain of Mount Crapack, or the ancient Carpathian Mountains. The country is at first somewhat hilly, but afterwards chiefly plain, covered with forests. The roads are bad, the villages few and wretched beyond description; the hovels, all built of wood, seem full of filth and misery, and every thing wears the appearance of extreme poverty.

The Vistula is the limits of the Austrian dominions, which reach to its southern banks†.

convincing proof that there ever existed such kingdoms, that they depended upon Hungary, and ought, by virtue of an hereditary though dormant title, to revert to the empress as sovereign of Hungary, was derived from the Austrian army; for what people can resist an argument backed by two hundred thousand troops, unless they can defend their side of the question by an equal number?

† According to the partition treaty, this river was marked as forming the limits between the Austrian and Polish territories: the house of Austria at first construed the Vistula to mean the old channel of that river now dry, called the Old Vistula; and by force of this strained interpretation included Casimir in the dismembered province; but not long afterwards the empress of Germany restored Casimir to the Poles; and accepted the Vistula as it now flows, for the boundary of her dominions.

* A remarkable circumstance attended the taking possession of this district, which will shew with what uncertainty the limits were at first traced. The partition being made according to the map of Zannoni, the river Podhorts was taken as the eastern boundary of this dismembered province; but when the Austrian commissioners visited the spot, where according to Zannoni the Podhorts flowed into the Dnieper, they found no river known to the inhabitants which answered to that name. They advanced, therefore, the frontiers still more eastwards, and adopting the Sebravce the Strytz for the boundary, called it the Podhorts. This old country has, since the partition, changed its name: it is now incorporated into the Austrian dominions under the appellation of the kingdoms of Galicia and Lodomeria, which kingdoms some ancient diplomes represent as situated in Poland, and subject to the kings of Hungary: the most

Having crossed the Vistula by a bridge into Casimir, you pass the dry channel, termed the Old Vistula, by a second bridge, and enter Cracow.

Cracow is a curious old town: it was formerly the capital of Poland, where the kings were elected and crowned, and was once almost the center of the Polish dominions, but by the changes which have taken place it is now a frontier town.

Cracow stands in an extensive plain, watered by the Vistula, which is broad but shallow: the city and its suburbs occupy a vast tract, but are so badly peopled, that they scarcely contain sixteen thousand* inhabitants. The great square in the middle of the town is very spacious, and has several well-built houses, once richly furnished and well inhabited, but most of them now either untenanted, or in a state of melancholy decay. Many of the streets are broad and handsome; but almost every building bears the most striking marks of ruined grandeur: the churches alone seem to have preserved their original splendour. The devastation of this unfortunate town was begun by the Swedes at the commencement of the last century, when it was besieged and taken by the Charles XII.; but the mischiefs it suffered from the ravager of the North were far less destructive than those it experienced during the late dreadful commotions, when it underwent repeated sieges, and was alternately in possession of the Russians and Confederates. The effects of cannon, grape, and musket-shot are still discernible on the walls and houses. In a word, Cracow exhibits the remains of ancient magnificence, and looks like a great capital in ruins: from the number of fallen and falling houses one would imagine it had lately been sacked, and that the enemy had left it only yesterday. The town is surrounded with high walls of brick, strengthened by round and square towers of whimsical shapes in the ancient style of fortification: these walls were built by Venceslaus

king of Bohemia during the short period in which he reigned over Poland. The university of Cracow was founded and endowed by Casimir the Great, and improved and completed by Ladislaus Jaghellon. The number of students amount to about six hundred. The library is neither remarkable for the number or rarity of its books. The university of Cracow was formerly, and not unjustly, called the mother of Polish literature, as it principally supplied the other seminaries with professors and men of learning; but its lustre was greatly obscured by the removal of the royal residence to Warsaw, and still more by the late intestine convulsions. The most flourishing period of the university was under Sigismund Augustus in the sixteenth century, when several of the German reformers fled from the persecutions of the emperor Charles V. and found an asylum in this city. They gave to the world several versions of the sacred writings, and other theological publications, which diffused the reformed religion over great part of Poland. Sigismund Augustus indeed afforded protection to men of learning of all denominations, and extended universal toleration to every sect of Christians. Towards the southern part of the town near the Vistula rises a small eminence or rock, upon whose top is built the palace, surrounded with brick walls and old towers, which form a kind of citadel to the town. This palace owes its origin to Ladislaus Jaghellon, but little of the ancient structure now appears, as the greatest part was demolished by Charles XII. in 1702, when he entered this town in triumph after the battle of Polusow. It has been since repaired: the remains of the old palace consist of a few apartments, which are left in their ancient state as they existed in the century before the last. The walls of the first of the apartments are decorated with paintings of tilts and tournaments; and all the rooms in the palace are of fine dimensions, containing several remains of ancient magnificence, but totally without

* The city, exclusive of the suburbs, contained in 1778 only eight thousand eight hundred and ninety-four souls.

† While speaking of the university of Cracow, it may not be improper to mention, that the art of printing was first introduced into Poland by Haller, who exercised that profession in the city of Cracow; and one of the earliest books printed by him was the constitutions and statutes compiled by Casimir the Great, and afterwards augmented

by his successors. The characters are Gothic, the same which were universally used at the invention of printing; the great initial letters are wanting, which shews that they were probably painted and afterwards worn away. The year in which this compilation was printed is not positively known; but its publication was certainly anterior to 1496, as it does not contain the statutes passed by John Albert in that year.

furniture*. From the apartments there is an extensive view of the country, which is principally agricultural. At some distance from Cracow, at Ladskron situated upon the Vistula, the Confederates possessed during the war from whence they made expeditions against the Russian army, the service of the king. The troops from this fortress, taken by surprise; a which merits a particular description who shewed the palace, when the Polish troops, by a precarious passage, and surprise, consisting of eighty-four in the morning a party of Confederates, all of whom were taken prisoner, the lieutenant, whose name was, the palace through a communication being discovered, and the guard instantly fell upon them, were so confounded with the assault, they all yielded without the least resistance, the masters of the citadel. They were killed at the first onset, and were confined in a dungeon.

* This palace was formerly the residence of the king of Poland, who, from the time of Ladislaus Jaghellon, was crowned at Cracow. The Polish history concerning the time when it was destroyed by the sovereigns of this country, the probable account is, that in 1296, Charles, king of Hungary, and of the royal title, and was crowned at Cracow. He was succeeded by his son, who, offending the Poles by his conduct, was deposed before Venceslaus king of Bohemia, the son of Premislaus, being crowned and crowned after flying from his country, a calamitous adventures, was at length restored. Having regained his throne, he was restored, in the lifetime of his dominions; and he reigned some years without the title of king. In 1320 was crowned at Cracow, to the ceremony of the coronation, and for the future his successors were crowned at this city. Since that time Poland have expressly enjoined the ceremony of coronation; and such was the attachment of the Poles to this

period in which the university of Cracow was founded by Casimir the Great, and completed by his son, the number of students was not less than 1000.

The library of Cracow was formerly the mother of all the libraries of Poland, principally supplied by the king and his successors, and men of letters, who were greatly obscured by the influence of the university of Cracow, and the convulsions of the sixteenth century. The German reformer, emperor Charles V. They gave of the sacred and public religion over great Augustus, and the universal toleration towards the southern parts of the kingdom. A small town rises a small hill, the top is built with black walls and towers, the citadel to the town. Ladislaus Jagiello, who is now appearing, published by Charles V. this town is now. It has been the old palace, which are left in the century, the first of the paintings of the kings in the palace, several remain, totally without

the palace was formerly the residence of the kings of Poland, who, from the time of Ladislaus Loketec, had been crowned at Cracow. The Polish and German historians differ concerning the time when the title of king was first assumed by the sovereigns of this country; but the most probable account is, that in 1295, Premislaus assumed the royal title, and was crowned at Gnesna by the archbishop of that diocese. He was succeeded by Ladislaus Loketec, who, offending the Poles by his capricious and tyrannical conduct, was deposed before he was crowned; and Wenceslaus king of Bohemia, who had married Richsa, daughter of Premislaus, being elected in his stead, was in 1300 consecrated and crowned at Gnesna. Ladislaus, after flying from his country, and undergoing a series of calamitous adventures, was at length brought to a sense of his misconduct. Having regained the affection of his subjects, he was restored, in the life-time of Wenceslaus, to part of his dominions; and he recovered them all upon the demise of that monarch in 1305: he governed, however, some years without the title of king; but at length in 1320 was crowned at Cracow, to which place he transferred the ceremony of the coronation; and afterwards enacted, that for the future his successors should be inaugurated in the cathedral of this city. Since that period, the laws of Poland have expressly enjoined that Cracow should be the place of coronation; and such has been the superstitious attachment of the Poles to this usage, that when John

ever found means to escape by climbing the wall of the citadel, and alarmed the Russian soldiers within the town; these without delay attacked the castle, but, receiving a warm fire from the Confederates, they imagined the enemy to be more numerous than they really were, and desisted from the assault. This event happened on the 2d of February, 1772. The same evening Monsieur de Choisy, in the service of the Confederates of Landskron, being made acquainted with the success of the enterprize, advanced towards Cracow at the head of eight hundred Confederates (amongst whom were thirty or forty Frenchmen, most of them officers), and, having defeated a detachment of two hundred Russians, was received into the citadel. But the Russian garrison in the town, which before consisted of only four hundred men, being likewise reinforced, the Confederates in the citadel underwent a regular siege: they defended themselves with the most undaunted spirit for the space of three months; and at length capitulated upon the most honourable terms†.

Near to the palace is the cathedral, which stands within the walls of the citadel. In this cathedral, all the sovereigns of Poland, from the time of Ladislaus Loketec, have been interred, a few only excepted. The sepulchres of the kings

Sobieski was desirous of being crowned at Leopold, on account of its vicinity to the army, which he was to command against the Turks at the time of his election, the Polish patriots strongly opposed any innovation; and that monarch was under the necessity of repairing to Cracow for the performance of the ceremony.

Since Ladislaus, all the succeeding sovereigns were crowned at Cracow, excepting the late king. Previous to his election a decree was issued by the diet of convocation, that the coronation should be solemnized for this turn at Warsaw, without prejudice in future to the ancient right of Cracow; but as Poland no longer subsists a separate nation, it having been divided among the emperor of Russia, the king of Prussia, and the emperor of Austria, the quarrels concerning the place of coronation is now done away.

† The subterraneous passage through which the seventy-six confederates introduced themselves into the palace, is a drain which conveys all the filth from the interior part of the palace to a small opening without the walls near the Vistula. They entered this small opening, and crawled upon their hands and knees a considerable way, one behind another, until they came out through a hole in the walls of the palace; so that if the Russians had either been apprized of their attempt, or had over-heard them in their passage, not one person could have escaped: the danger was great, but it shews what spirit and perseverance will effect.

of

of Poland are not distinguished by any peculiar magnificence: their figures are carved in marble of no extraordinary workmanship, and some are without inscriptions.

About an English mile from Cracow are the remains of an old structure, called the palace of Casimir the Great; but probably little of the original palace, as it was built by Casimir, exists at present. In the inner court are the remains of a corridore with pillars of the Doric order; and upon one side of the walls is the white-eagle of Poland carved in stone, and around it an inscription seemingly in old Gothic characters, of which can only be made out, Ann. Dom. M.CCCLXVII, which answers to the era of Casimir, who died in 1370. Several marble

columns were scattered around, which shewed the ancient magnificence of the building. The greatest part of the fabric was evidently of later date than the reign of Casimir, and was doubtless constructed by succeeding sovereigns upon the foundation of the ancient palace; perhaps by Stephen Barthori, as in one place the inscription, *Stephanus Dei gratia*, may be traced; and also by Sigismund III. as his cypher is to be seen with the wheat-sheaf, the arms of Gustavus Vasa, from whom he was lineally descended. This palace was the principal residence of Casimir: in the garden is a mound of earth, or a barrow, which is called the tomb of Esther the fair Jewess, who was the favourite mistress of that monarch*.

SECTION II.

Mode of saluting and Dress of the Poles—Account of Salt-Mines of Wielitska—Their Extent and Profit—Journey to Warsaw—Arrival at Warsaw—Description of the City—Palace—Portraits of the Kings of Poland—Supper in Prince Poniatowski's Garden—Description of Powonski—Public Library—State of Learning—Wretched Administration of Justice—Prisons of Warsaw—Punishments for criminal Offences—Torture abolished—Laws relating to Debtors.

THE Poles seem a lively people, and use much action in their ordinary conversation. Their common mode of salute is to incline their heads, and to strike their breast with one of their hands, while they stretch the other towards the ground; but when a common person meets a superior, he bows his head almost to the earth, waving at the same time his hand, with which he touches the bottom of the leg near the heel of the person to whom he pays his obeisance. The men of all ranks generally wear whiskers, and shave their heads, leaving only a circle of hair upon the crown. The summer dress of the peasants consists of nothing but a shirt and drawers of coarse linen, without shoes or stockings, with round caps or huts. The women of the lower class wear upon their heads a wrapper of white linen, under which their hair is braided, and hangs down in two plaits. Several of them

wear a long piece of white linen hanging round the side of their faces, and covering their bodies below their knees: this singular kind of veil makes them look as if they were doing penance.

The dress of the higher orders, both men and women, is uncommonly elegant. That of the gentlemen is a waistcoat with sleeves, over which they wear an upper robe of a different colour, which reaches down below the knee, and is fastened round the waist with a sash or girdle. The sleeves of this upper garment are in warm weather tied behind the shoulders; a sabre is a necessary part of their dress as a mark of nobility. In summer, the robe, &c. is of silk; in winter of cloth, velvet, or stuff, edged with fur. They wear fur-caps or bonnets, and buskins of yellow leather, the heels of which are plaited with iron or steel. The dress of the ladies is a simple polonaise, or long robe, edged with fur.

* To the influence of Esther it is said the Jews owe the numerous privileges enjoyed by them in Poland, which is called the paradise of the Jews. But when the character of Casimir is considered, we may conceive that they were indebted for their favourable reception in Poland more to his policy than to his affection for his mistress; for in those

times the Jews were the richest and most commercial individuals in Europe; by allowing them therefore to settle in Poland, and by granting them some extraordinary immunities, he introduced trade and much wealth into his dominions.

* There are many Jews descended from the same stock as the Israelites. One of the most famous is Vol. II.

The Poles, in their features, look, customs, dress, and general appearance, resemble Asiatics rather than Europeans; and they are unquestionably descended from Tartar ancestors. Mascow, a German historian, well versed in the antiquity of nations, remarks, that the manner in which the Poles wear their hair is, perhaps, one of the most ancient tokens of their origin. So early as the fifth century some nations, who were comprehended under the name of Scythians, had the same custom. For Priscus Rhætor, who accompanied Maximus in his embassy from Theodosius II. to the court of Attila, describes a Scythian lord, whose head was shaved in a circular form, a mode perfectly analagous to the present fashion in Poland.

In this part of Poland, are the celebrated salt-mines of Wielitska, which are situated within eight miles of Cracow. These mines are excavated in a ridge of hills at the northern extremity of the chain which joins to the Carpathian mountains: they take their appellation from the small village of Wielitska; but are sometimes called in foreign countries the mines of Cracow, from their vicinity to that city. Those who are deacons of visiting the inner parts of the mine are fastened to the great rope that is employed in drawing up the salt*, and are let down gently, about a hundred and sixty yards below the first layer of salt. They then pass a long and gradual descent, sometimes through broad passages or galleries capable of admitting several carriages abreast; sometimes down steps cut in the solid salt, which has the grandeur and commodiousness of the staircase in a palace. They each carry a light, and several guides precede them with lamps in their hands: the reflection of these lights upon the glittering sides of the mine is extremely beautiful, but does not cast that luminous splendour, which some writers have compared to the lustre of precious stones. The salt dug from this mine is called *Zielna* or Green Salt, or what reason it may be difficult to determine; for its colour is an iron grey; when pounded it is a dirty ash colour like what we call brown salt. The quality of the salt improves in proportion to the depth of the mine: towards the sides

and surface it is mixed with earthy or stony particles; lower down it is said to be perfectly pure, and requires no other process before it is used than to be pounded. The finest of this grey salt, however, is of a weak quality when compared with the common sea-salt: it is therefore undoubtedly by no means perfectly pure, but is blended with extraneous mixtures, though it serves very well for common purposes. Being almost as hard as stone, the miners hew it with pick-axes and hatchets, by a tedious operation, into large blocks, many of which weigh six or seven hundred pounds. These large masses are raised by a windlass, but the smaller pieces are carried up by horses along a winding gallery, which reaches to the surface of the earth. Beside grey salt, the miners sometimes discover small cubes of white salt, as transparent as Crystal, but not in any considerable quantity; they find likewise occasionally pieces of coal and petrified wood buried in the salt. The mine appears to be inexhaustible, as will easily be conceived from the following account of its dimensions. Its known breadth is one thousand one hundred and fifteen feet; its length six thousand six hundred and ninety-one feet; and depth seven hundred and forty-three; and the best judges on the spot suppose, with the greatest appearance of probability, this solid body of salt to branch into various directions, the extent of which cannot be known: of that part which has been perforated, the depth is only calculated as far as they have hitherto dug; and who can ascertain how much farther it may descend?†.

Many of the excavations or chambers, from whence the salt has been dug, are of an immense size; some are supported with timber, others by vast pillars of salt, which are left standing for that purpose: several of vast dimensions are without any support in the middle. There is one of this latter sort in particular, which is certainly eighty feet in height, and so extremely long and broad, as almost to appear amid the subterraneous gloom without limits. The roofs of these vaults are not arched, but flat. The immense size of these chambers, with the spacious passages or galleries, together with the chapels mentioned

* There are two other openings, down one of which the miners descend by stairs, down the other by ladders.

† One of the most remarkable curiosities of the place is, several small chapels excavated in the salt, in which mass is

said on certain days of the year; one of these chapels is above thirty feet long and twenty-five broad; the altar, the crucifix, the ornaments of the church, the statues of several saints, are all carved out of the salt.

in the note, and a few sheds built for the horses which are foddered below, probably gave rise to the exaggerated accounts of some travellers, that these mines contain several villages inhabited by colonies of miners, who never see the light. It is certain that there is room sufficient for such purposes; but the fact is, that the miners have no dwellings under ground, none of them remaining below more than eight hours at a time, when they are relieved by others from above. In truth, these mines are of a most stupendous extent and depth, and are sufficiently wonderful without the least exaggeration. They are as dry as a room, without the least damp or moisture; for there is only one small spring of water, which is impregnated with salt, as it runs through the mine*. These mines have now been worked above six hundred years, for they are mentioned in the Polish annals so early as 1237, under Boleslaus the Chaste, and not as a new discovery: how much earlier they were known cannot now be ascertained. Their profits had long been appropriated to the king's privy purse: before the partition they furnished a considerable part of the late king's revenue, who drew from them an annual average profit of about 3,500,000 Polish florins, 97,222*£*. 4*s*. 6*d*. sterling. They now belong to the emperor of Austria, being situated within the province which he dismembered from Poland; but they are far from yielding a revenue equal to that which they had afforded to the king of Poland; for the Austrian commissioners imprudently raised the price of salt, from an idea that Poland could not exist without drawing that commodity as usual from Wielitska, and would therefore be obliged to receive it at any price. This mode of proceeding offending the Poles, the king of Prussia, with his usual sagacity, did not neglect this opportunity of extending his commerce; he immediately imported large quantities of salt, which he procured chiefly from Spain, to Dantzic, Memel, and Koningsburg, from whence it was conveyed up the Vistula into the interior provinces: by these

* Such an enormous mass of salt exhibits a wonderful phenomenon in the natural history of this globe. Monsieur Guetard, who visited these mines with great attention, and who has published a treatise upon the subject, informs us, that the uppermost bed of earth at the surface immediately over the mines is sand, the second clay occasionally mixed with sand and gravel and containing petrefactions of marine

means he furnished great part of Poland with salt, at a cheaper rate than the inhabitants could procure it from the house of Austria; and in 1778 the mines of Wielitska only supplied the districts which immediately border upon Austria Poland.

The road from Cracow to Warsaw has not a single object throughout the whole tract, which can for a moment draw the attention of the most inquisitive traveller. The country, for the most part of the way, is level, with little variation of surface: it is chiefly overspread with vast tracts of thick gloomy forest; and even where the country is more open, the distant horizon is always skirted with wood. The trees are mostly pines and firs, intermixed with beech, birch, and small oaks. The occasional breaks in the forest present some pasture ground, with here and there a few meagre crops of corn.

Without having actually traversed it, one can hardly conceive so comfortless a region: a forlorn stillness and solitude prevails almost through the whole extent, with few symptoms of an inhabited and still less of a civilized country. Though in the high road, which unites Cracow and Warsaw in the course of about 258 English miles, you will scarcely meet above two carriages and about a dozen carts. The country is equally thin of human habitations: a few straggling villages, all built of wood, succeed one another at long intervals, whose miserable appearance corresponds to the wretchedness of the country around them. In these assemblages of huts, the only places of reception for travellers are hovels belonging to Jews, totally destitute of furniture and every species of accommodation. It is difficult to procure any other room but that in which the family live; in the article of provisions eggs and milk are the greatest luxuries, and even these cannot always be obtained; the only bed to be had is straw thrown upon the ground, and a traveller may think himself happy when he can procure it clean.

The natives are poorer, humbler, and more

bodies, the third calcareous stone. From all these circumstances he conjectures that this spot was formerly covered by the sea, and that the salt is a gradual deposit formed by the evaporation of its waters. See *Memoire sur les Mines de Sel de Wielitska, in l'histoire de l'Academie des Sciences* for 1762.

miserable

miserable than any people in the more western
parts of Europe: wherever a traveller stops, they
beck around him in crowds; and, asking for
charity, use the most abject gestures.

The road bears as few marks of human in-
dustry as the country which it intersects. It is
best where it is sandy; in other parts it is scarcely
passable; and in the marshy grounds, where
some labour is absolutely necessary to make it
support the carriages, it is raised with sticks and
boughs of trees thrown promiscuously upon the
surface, or formed by trunks of trees laid cross-
ways.

After a tedious journey at length you approach
Warsaw; but the roads being neither more
passable, nor the country better cultivated, and
the suburbs chiefly consisting of the same wooden
hovels which compose the villages, you have no
suspicion of being near the capital of Poland
until you arrive at its gates.

The situation of Warsaw is not unpleasant: it
is built partly in a plain, and partly upon a
gentle ascent rising from the banks of the Vis-
tula, which is about as broad as the Thames
at Westminster-Bridge, but very shallow in
summer. The city and its suburbs occupy a vast
extent of ground; and are supposed to contain
between sixty and seventy thousand inhabitants,
among whom are a prodigious number of foreign-
ers. The whole town has a melancholy appear-
ance, exhibiting that strong contrast of wealth
and poverty, luxury and distress, which per-
vades every part of this unhappy country. The
streets are spacious, but ill-paved; the churches
and public buildings are large and magnificent;
the palaces of the nobility are numerous and
splendid; but the greater part of the houses,
particularly in the suburbs, are mean and ill-
constructed wooden hovels. The palace of
Warsaw (late the king of Poland's residence)
was built by Sigismund III. Warsaw is far
more commodious for the capital than Cracow,
because it is situated nearer to the center of the
kingdom, and because the diet is assembled in
this city. The palace stands upon a rising
ground at a small distance from the Vistula, and
commands a fine view of that river and of the
adjacent country. Next to the audience-cham-
ber is an apartment fitted up with marble,
which his late majesty dedicated, by the following
inscription, to the memory of his predecessors

the kings of Poland: "*Regum Memoria dicavit
Stanislaus Augustus hocce monumentum, 1771.*"
The portraits of the sovereigns are ranged in
chronological order: the series begins from
Boleslaus, and is carried down to the present
time. These heads are all painted by Bacciarelli,
and are well executed: the portraits of the earlier
kings are sketched from the painter's imagination;
but that of Ladislaus II. and most of his succes-
sors are copied from real originals. They alto-
gether produce a pleasing effect, and may be
considered as an agreeable species of genealogical
table.

Mr. Coxe, who was on his travels in Poland
while the Poles had a king in the year 1778,
says, (for we shall use his own words,) "In the
evening (of August 5) we had the pleasure of
meeting his majesty at his brother's, prince
Poniatowski, who gave us a most elegant enter-
tainment at a garden which is situated near his
villa, and is richly ornamented with buildings.
The taste of the Polish nobility is not to be con-
trolled by want of any materials; for if they
cannot procure them from nature, they make a
representation of them by art. In the present in-
stance, as there are no quarries of stone near
Warsaw, the prince has substituted a composition
so nearly resembling stone, that the most minute
observer can scarce discover the difference. We
arrived at the garden about nine; it was a
beautiful evening of one of the most sultry days
we had experienced this summer. After walking
about the grounds, we came to a grotto of arti-
ficial rock, where a spring of water dripped
through the sides, and fell into a bason with a
pleasing murmur. We were scarcely assembled
in this delightful spot, when the king made his
appearance: we rose up to meet him; the usual
compliments being passed, we attended his ma-
jesty about the grounds, and then returned to the
grotto, round which we ranged ourselves upon a
bank covered with moss. The moon was now
risen, and added greatly to the beauty of the
scene. I happened to be seated next to the king
(for all form and ceremony was banished), who
talked with me as usual, in English, on the arts
and sciences, literature, and history. In the
course of this conversation I ventured to ask
whether there was any good poetry in the Polish
language. His majesty told me, "We have
some lighter pieces of poetry, by no means con-
temptible,

temptible, and an indifferent epic poem; but the work of chief poetical excellence in our tongue is a fine translation of the *Gerusalemme Liberata* of Tasso, far superior to any translations of that admirable poem in any other language; some Italians of taste and judgement have esteemed it not much inferior to the original performance." I then took the liberty of enquiring about the historical productions of Poland; when the king informed me, that they had no good history of their country in Polish, which he looked upon as a national reflection, though he flattered himself it would be soon removed, as a person of genius and erudition, admirably calculated for the undertaking, was now employed in that work. Upon expressing my surprize at a circumstance almost peculiar to Poland, that they had no history in their native tongue, his majesty condescended to acquaint me, that they had several excellent historians, all of whom however had written in Latin; "the knowledge of this language," his majesty remarked, "is very general among the Poles*"; the earliest laws are all drawn up in Latin until the reign of Sigismund Augustus, when they began to be composed in the vernacular language; the older *Pacta Conventa* are all in Latin; those of Ladislaus IV. being the first that appeared in Polish." The conversation, in which I was at a loss whether to admire most the knowledge or condescension of the king, was interrupted by the prince, who proposed a turn in the garden before supper: his highness led the way, and the company followed; we passed through a subterraneous passage, long and winding, with here and there a single lamp, which shed a glimmering light; we came at length to a wooden door, which seemed the entrance into some hovel; it opened, and we found ourselves, to our great astonishment, in a superb saloon, illuminated with innumerable lamps. It was a rotunda, with an elegant dome of the most beautiful symmetry; in the circumference were four open recesses between pillars of artificial marble†: in the recesses were sophas, with paintings in fresco, representing the triumphs of Bacchus, Silenus,

* "I had several opportunities (says Mr. Coxe) of remarking the prevalence of the Latin tongue in Poland; when I visited the prisons, I conversed in that language with a common soldier, who stood guard at the entrance: he spoke it with great fluency."

Love, and the victory of the Empress of Russia over the Turks. As we were all admiring the beauty and elegance of the rotunda, our ears were on a sudden regaled with a concert of exquisite music from an invisible band. While we were listening to this agreeable performance, and conjecturing from what quarter it came, a magnificent table was suddenly spread in the midst of the saloon with such expedition, as to resemble the effects of enchantment. We immediately sat down to supper with the king, the prince, and a chosen company: our spirits were elevated by the beauty of the saloon, by the hospitality of the prince, and by the affability of the king; who, so far from being a constraint to the society, greatly enlivened it by his vivacity, and seemed the soul of the party. I never passed a more agreeable evening; the conversation was animated and rational, while the social ease and freedom, which diffused itself through every part of the company, realized this beautiful convivial picture:

La Liberté convive aimable

Met les deux coudes sur la table‡.

Even with the lustre of a crown, which is apt to dazzle our judgements, the king of Poland could not fail of being esteemed one of the most agreeable and polite gentlemen in Europe: he has a surprizing fund of interesting conversation, and I never yet had the honour of access to his company without being both informed and delighted. His majesty did not retire until one o'clock, when the company separated, and returned to Warsaw, highly pleased with our evening's entertainment."

The elegance and luxury of the Polish nobility in their houses and villas is really exquisite in the extreme; in their decorations and furniture they seem to have blended the English and French modes; in their entertainments they are exquisitely refined; and as they spare no expence, and have a natural good taste, they generally succeed in creating pleasure and surprize. Their hospitality and politeness exceed those of almost every other nation.

Poronski

Poronski, the villa of prince Adam Zartotiski, about three miles from Warsaw in the midst of a forest: the situation is almost level, with here and there a gentle slope, which produces an agreeable variety. A river runs through the grounds, which are laid out in the English taste, with a beautiful intermixture of lawn and wood; walks are cut through the wood, and carried along the side of the water. The house, which stands upon a gentle rise, has the appearance of a cottage, constructed like those of the peasants, with trunks of trees piled upon each other, and thatched with straw: beside the principal building, inhabited by the prince and princess, there are separate cottages for the children and attendants, each of which has its inclosures and small garden; this group of structures bears the resemblance of a village, composed of huts scattered at a small distance from each other. Other buildings, such as summer houses, pavilions, rustic sheds, and ruins, are dispersed throughout the grounds; the stables are constructed in the form of an half demolished amphitheatre. Several romantic bridges, rudely composed of the trunks and bent branches of trees, contribute to heighten the rusticity of the scenery. From the appearance of the principal cottage without, one might expect the inside to be furnished in the simple style of a peasant's hovel, but within every species of elegant magnificence which riches and taste could collect are to be found. All the apartments are decorated in the most costly manner; but the splendour of the bath room is peculiarly striking: the sides are covered from top to bottom, with small square pieces of the finest Dresden China, each ornamented with an elegant design; and the border and ceiling are painted with beautiful festoons. The expence of fitting up this apartment must have been prodigious; there are at least three thousand square pieces of china employed, each of which cost at Dresden three ducats*. Near the house is an enclosure, surrounded with large blocks of granite heaped upon another, and fallen trees placed in the most natural and picturesque shapes. The several cottages inhabited by the children are each fitted up in different styles, but with equal elegance. Every thing without doors gives one the idea of a happy peasant's family; within all is costliness and taste. The grounds are prettily laid out in

Vol. II. No. CIII.

the English taste of gardening. Here is likewise a Turkish tent of rich and curious workmanship, pitched in a beautiful retired field near the stables. This tent belonged to the grand-vizier, and was taken during the late war between the Russians and the Turks: under it is a bettee, and a carpet spread upon the ground. Passing through the house is a small spot of rising ground, where, in the evening, you are suddenly struck with a most beautiful illumination. A rustic bridge, consisting of a single arch over a broad piece of water, is studded with several thousand lamps of different colours; while the reflection of this illuminated bridge in the water is so strong as to deceive the eye, and give the whole the appearance of a brilliant circle suspended in the air: the effect is splendid beyond description, and considerably heightened by the gloom of the forest in the back-ground. While the traveller is admiring this delightful scene, a band of music strikes up at a little distance, and amuses him with a concert. From this enchanting spot, you are led across the illuminated bridge, to a thatched pavillion, open at the sides, and supported by pillars ornamented with garlands and twisted festoons of flowers: within this pavillion, when any strangers are present, they generally sup on a cold collation, to partake of which they sit down to a table which is covered with all kind of delicacies, with the most costly wines, and every species of fruit which art or nature can furnish. When the supper is ended they rise from table, and take a walk in the gardens, which are suddenly illuminated, and they range about as fancy dictates: and here they are gratified with the sound of wind instruments, played by persons dispersed in different parts of the grounds. The bishop of Plotsko has a palace at Jablonska about eight miles from Warsaw. The palace is a handsome building, constructed after a design, and at the expence, of the late king for his brother, who was bishop of that see. One of the apartments, called the Turkish saloon, is remarkable for its elegance and singularity: it is in the Oriental taste, of an oblong shape, very high, with a fountain in the middle, surrounded with a parterre of flowers. Between the parterre and sides of the room are ranges of Turkish sophas. The variegated tints and rich fragrance of the flowers, joined to the transparency and

6 E in

* About £17s. 6d.

murmurs of the fountain, produce a most pleasing effect, and, together with the coolness of the apartment, render it a delicious retreat from the heats of summer. The Vistula winds along at a small distance from the palace, through a sandy and almost level country.

The public library at Warsaw owes its beginning to the private bounty of two bishops of the family of Zaluski; the following inscription is over the door; *Civium usui perpetuo Zaluscorum par illustre dicavit 1714*. It has since received several large additions from various benefactors; and contains above a hundred thousand volumes. It is very rich in books and manuscripts relating to the Polish history.

There are two universities, one at Cracow, and the other at Vilna; the former was under the direction of priests, called Academicians; and the latter was superintended by the Jesuits; but in both, the course of studies was chiefly confined to theology. After the suppression of the Jesuits, the king established a committee of education, composed of members distinguished either by high station, or enlightened understandings. The committee has an absolute power in matters of education, appoints professors, regulates their salaries, and directs their studies.

Although from the nature of the government learning has never been widely diffused in Poland, yet there never have been wanting men of genius and literature, who have been an ornament to their country: and perhaps no nation can boast a more regular succession of excellent historians; or a greater variety of writers deeply conversant in the laws, statutes, and constitution. Under Sigismund I. and his son Sigismund Augustus, the arts and sciences began to be greatly distinguished by royal patronage; they were cherished by some of the succeeding monarchs, particularly John Sobieski; but no prince paid them more attention than the late king Stanislaus Augustus. His munificence in this particular was attended with the happiest effects. The Polish literati have, within a few years, given to the public a much greater variety of elegant performances than ever appeared in any former period of the

* Many of these towns are at present reduced to such a low state, as scarcely to deserve the name of villages: in these places, of course, the judges are necessarily persons of the lowest description, and totally unqualified for the discharge of their high office. Innocence and guilt, by this

same length. What is more material, a taste for science has spread itself among the nobles, and begins to be regarded as an accomplishment.

Atrocious crimes, such as murder, &c. are punished in Poland by beheading or hanging; lesser delinquencies by whipping, hard labour, and imprisonment: the nobles never suffer any corporal punishment; but are liable only to imprisonment and death.

Torture was abolished in 1776, by an edict of the diet, introduced by the influence of the late king; a regulation as expressive of his majesty's judgement as of his benevolence. It is an infinite satisfaction to see the rights of humanity extending themselves in countries, where they had been but little known.

The defects of the police in this country are by no circumstances so strongly evinced, as by frequent impunity of the most atrocious crimes: this abuse may be traced from the following causes: 1. The greatest criminals find at times little difficulty in engaging the protection of some of the principal nobles, who occasionally assemble their vassals and retainers in arms, and drive the officers of justice from their lands. 2. The law, esteemed by the Polish gentry the great bulwark of their liberty, which enacts, that no gentleman can be arrested for misdemeanors until he is convicted of them, notwithstanding the strongest degree of presumptive proof: the offender, of course, if likely to be found guilty, takes care to withdraw himself before the completion of the process. Murder indeed, and robbery on the highway, and a few other capital crimes, are excluded from this privilege: but even in those flagrant enormities no gentleman can be taken into custody, unless actually apprehended in the commission of the offence; and when the crime is thus positively ascertained, which in the nature of things can seldom occur, the culprit cannot be sentenced to capital punishment by any other tribunal than a diet. 3. The right which every town possesses of having its own criminal courts of justice, with judges selected solely from the inhabitants*. 4. There are no public officers whose province it is to

means, are often not distinguished, and as often wantonly confounded. Not only the power of levying discretionary fines, but the infliction of corporal punishment, and even of death itself, is entrusted to these contemptible tribunals.

prosecute the offenders in the king's name. Hence, even in case of murder, robbery upon the highway, and the most atrocious crimes, the delinquent generally escapes, unless some individual indicts and brings him to trial: this seldom happens, as the process is attended with no small share of expence. 5. The power which every plaintiff possesses of withdrawing his prosecution, even in cases of the greatest enormity: this custom screens all but the indigent from the pursuit of justice; as persons of moderate property are generally able to bribe the necessity or avarice of their prosecutor*.

The laws relating to debtors are as follow: The creditor proceeds against the debtor at his own expence; and, until the trial is finished, allows him eight groschens, or three half-pence,

a day for his maintenance; when the debt is proved, the creditor is released from the above-mentioned contribution: the debtor continues in prison, at the discretion of his creditor, until the debt is discharged; and, if he has no means of subsistence, is obliged to maintain himself by working with the delinquents in cutting wood, sawing stone, or cleaning the streets. In case a gentleman contracts a debt, an action lies against his lands and goods, and not against his person, unless he gives a note of hand with a double signature, one intended as an ascertainment of the debt, the other as a renunciation of his exemption from arrests; but a person of high distinction, even though he should bind himself by this engagement, can bid defiance to all danger of imprisonment.

SECTION III.

Biallistock—Entertainment at the Countess of Braniski's Palace—Duchy of Lithuania—Its Union with Poland—Description of Grodno—Diets—Physic Garden—General Productions of Lithuania—Account of the Wild-Ox—Of the Remiz and its pendent Nest—Manufactures—Number of Jews—Badness of the Roads and Want of Accommodations—Close of the Dietine at Minsk—Poverty and Wretchedness of the Natives—Comparative View of the Swiss and Polish Peasants—Remarks on the Plica Polonica.

OPPOSITE to Warsaw, on the other side of the Vistula are the suburbs of Praga†. About an English mile from Warsaw a forest begins, and continues, with little interruption, the distance of eighteen miles. Some of the places in the road to Biallistock, though extremely wretched, enjoy their own police and courts of justice: they consist of wooden huts, mostly wretched, some roofed with wood, and a few with tiles. The country is chiefly sandy and

* This practice, founded on a narrow principle, that strages against individuals are merely private, not public offences, is an instance of the grossest barbarism, which all civilized nations have renounced; for it requires a very small degree of legislative improvement to perceive, that private wrongs, when unchastised, become highly injurious to the community at large, by affording encouragement to similar offences. In visiting the prisons, says Mr. Cox, saw the bad effects of this usage exemplified in a striking instance. Two persons, indicted for the assassination of a king, had been permitted to remain in prison upwards of a year, without being brought to a trial. The widow of the deceased, upon whose accusation they were imprisoned, having agreed, on the payment of a stipulated sum, to

level as far as the Bog, which may be crossed at Gran: the river is broad and shallow. On the farther side of this river is a better soil, and the country is more diversified. The road is not unpleasant, running through fields sown with different species of corn, hemp, and flax; but the forest is still in sight, and seems to skirt the horizon. In many places the wood encroaches upon the fields, and young trees shoot up in great numbers wherever cultivation has been

dropped the suit and grant them a release, their inability to satisfy her demand had been the only reason for detaining them so long in confinement; and as when I saw them they had just raised the money, they were upon the point of obtaining a final discharge.

† When Count Suwarroff took Praga, in 1794, when the inhabitants were tranquil, when ten hours had elapsed after his taking possession of the suburbs, and when he had sufficient time to get thoroughly intoxicated, (for he seldom undertook any military exploit till he was half inebriated,) the inhuman monster ordered an undistinguished massacre of the inhabitants of this ill-fated place. This sealed the fate of Poland, and it ceased to be an independent nation.

neglected.

neglected. This is the case in most parts of Poland, many traces of former enclosures, and even the vestiges of paved streets, being discernible in the centre of the forests.

The largest place on the road is Bielsk, capital of the palatinate of Podlachia, where the dietine for the district is held: it is little better than a miserable village, though called, in the geographical descriptions of Poland, a large town. Between Bielsk and Woytzi the cottages are infinitely worse even than those wretched dwellings which are in the towns where the inhabitants are more free; in the latter are furniture and some conveniences; in these nothing but the bare walls. The peasants are perfect slaves, and their habitations and appearance correspond with their miserable situation: a traveller could scarcely figure to himself such objects of poverty and misery. The country from Warsaw to Biallistock is in general sandy; but in some places the soil is very rich. All parts are fit for cultivation, and many spots have the appearance

* Mr. Cox, speaking of his visit to the countess Braniski, says, "The morning after our arrival, the countess, to whom we had a letter from prince Stanislaus Poniatowski, honoured us with a most polite invitation to dinner, and sent her carriage to convey us to the palace. We were most politely received by our noble hostess, and were convinced from her amiable manners, condescending behaviour, and lively flow of conversation, that affability and good sense are natural to the family of Poniatowski. We found a large company assembled at table, whom the countess had invited to partake of her hospitable board, which was elegantly supplied with every delicacy. Among other topics, the conversation turned upon our mode of travelling through a country so poor and wretched, and so deficient in comfortable accommodations. "I suppose," said a Polish gentleman, "you carry your beds with you;" to which we replied in the negative. "How do you sleep then?" "Upon straw, when we can get it; and when we are not so fortunate, upon the floor, upon a bench, or upon a table." "You take your provisions," returned the Pole.—"Very seldom."—"How do you live then?"—"Upon what we can procure: one of our servants is sent before and generally contrives to obtain some kind of provision, which may soothe, if not satisfy, the demands of hunger; but we have travelling appetites, and are not fastidious."—"You are not, however, without knives, forks, and spoons; for such conveniences are not known among the peasants."—"We each of us carry a clasp-knife; are now and then so fortunate as to meet with a wooden spoon; and never regret the want of a fork." Here our noble hostess made a proposal to supply us with knives, forks, and spoons; together with wine and provision: upon our declining this offer, she pleasantly replied, "Perhaps you are above accepting them; I know the English are very haughty; will you purchase them?" We made answer,

of great fertility. The harvest, however, even in the most fruitful tracts, is but indifferent; in circumstance evidently owing to defect in husbandry.

Biallistock is a very neat and well-built town. The streets were broad, and the houses, which are in general plastered, stand detached from each other at uniform distances. The superior neatness of Biallistock is owing to the illustrious family of Braniski, whose palace stands close to the town, and who have contributed to ornament their place of residence. It belongs to the countess Braniski*, sister of the late king, and widow of the late great general Braniski; who, notwithstanding this alliance, warmly protested against the election of his late majesty.

From Biallistock, for some way, is a continued forest; afterwards the country becomes more open, abounding with corn and pasture; the towns and villages are long and straggling; all the houses, and even the churches, of wood; crowds of beggars surround a carriage whenever

that we were not afraid of laying ourselves under any obligations to a person of her politeness and generosity; but the object of our travels was to gratify curiosity rather than appetite; and that we thought ourselves most likely to become acquainted with the domestic economy of the peasants, by partaking of their accommodations, and by relying on them for the supply of our wants. Willing, however, not to appear rude in a rejection of the whole offer, we accepted a few bottles of wine. The countess did us the honour to conduct us herself through the apartments of the palace, which is a large building, in the Italian taste; and, on account of its grandeur and magnificence, generally called the Versailles of Poland. It was formerly only a royal hunting seat; John Casimir gave it, together with Biallistock and some other estates, to Czarnieski, a general highly distinguished by his victories over the Swedes at the time that Poland was nearly crushed by her enemies. Among the curiosities preserved in the palace is a golden cup, which Czarnieski used after the custom of those times to wear fastened to his girdle; and an embroidered sash which he took among the spoils after a defeat of Charles X. and supposed to belong to that monarch. Czarnieski left one daughter, who married Braniski the father of the late great general, by which marriage the estate came into that family. There is one apartment which Augustus III. used to occupy whenever he passed this way to the diet of Grodno; and which, out of respect to the memory of their late sovereign, is left in its original state. In another room is a fine portrait of Augustus in his royal robes, with his head shaved in the Polish fashion, as he appeared on the day of his coronation. In the afternoon we drove about the parks and grounds, which are very extensive, and elegantly laid out in the English taste. We closed this agreeable day with a supper at the palace, and took leave, with regret, of its amiable and noble mistress.

shops; Jews make their appearance without
end. The next town of consequence is Grodno,
which has some wretched suburbs inhabited by
Jews. Here the Niemen is broad, clear, and
shallow, with rising banks, beyond which is the
town, which is built upon an eminence overlook-
ing the river. Though Vilna is the capital, yet
Grodno is esteemed the principal town in Lithua-
nia.

Formerly Lithuania was entirely unconnected
with Poland, and was governed by its own
sovereigns under the title of great dukes. From
that rivalry, which usually subsists between con-
tiguous states, the two nations were engaged in
a series of perpetual wars until 1386, when the
great-duke Ladislaus Jaghellon, having espoused
Edwige and embraced the Christian religion,
was raised to the Polish throne, and reigned
over both countries. Becoming a sincere con-
vert to the new religion, (which he at first
adopted from interested views,) he endeavoured
to propagate its doctrines among his idolatrous
subjects in Lithuania*. Having introduced
Christianity into that country, he nominated his
brother Casimir Skirgello governor of that duchy,
and returned to Poland; but a civil war being
excited by the ambition of Alexander, surnamed
Vitoldus, and the discontents of those who were
ill attached to their Pagan rites, Lithuania was
for some time a scene of tumult and hostility.
At length, by a compromise in 1392, Vitoldus
was appointed great duke, and Ladislaus con-
tented himself with a reservation of nominal
sovereignty. In 1413 it was stipulated, in a diet
of Poles and Lithuanians held at Hrodlo, that,
upon the demise of Vitoldus, the Lithuanians
should acknowledge no other great-duke but the
person whom the king might appoint, with the
consent of the two nations; that, in case
Ladislaus died without issue, the Poles should
elect no king without the consent of the Lithua-
nians; and that a diet, composed of repre-
sentatives from both nations, should meet when-
ever it was thought necessary, at Lublin or

* In subservience to this great work, he ordered the
sacred groves to be cut down, the oracular shrine to be
destroyed, the sacred fire to be extinguished, and the ser-
vants worshipped as Gods by his superstitious subjects to
be slain. A belief universally prevailed among the people,
that whoever profanely attempted to destroy these objects
of their worship, would be struck with instantaneous

Parzow. This compact was, however, some-
times violated, till Sigismond I. united the two
sovereignties, and was succeeded in both by his
son Sigismond Augustus.

Hitherto the connection between the two na-
tions had been more an alliance than an union;
but Sigismond Augustus having no children, and
being the only surviving male heir of the Ja-
ghellon family, planned the union of Poland and
Lithuania, lest upon his decease the connection
should be dissolved, and the two nations be again
governed by different princes. After some dif-
ficulties, and being once frustrated in his attempt,
he obtained, from a general diet held at Lublin
in 1569, that Poland and Lithuania should from
henceforth be united and considered as one nation;
that one sovereign should be chosen conjointly
by both people; that the Lithuanians should
send nuntios to the general diet, be admitted into
the senate, and have an equal share in the public
honours and employments; that no alliance
should be made with foreign powers, and no am-
bassadors dispatched without the consent of both
parties; that the same money should pass current
in both countries; in short, that they should
have no distinction of privilege or interest. Upon
the ratification of this union, Sigismond Augustus
renounced all hereditary right to Lithuania.
From this period the same person was uniformly
elected king of Poland and great duke of Lithu-
ania; the two nations were incorporated into one
republic; and continued so till the final partition
of Poland.

Grodno is a large straggling place, but con-
tains no more than three thousand Christians,
excluding the persons employed in the manufac-
tures, and a thousand Jews. It has greatly the
appearance of a town in decline; containing a
mixture of wretched hovels, falling houses, and
ruined palaces, with magnificent gateways, re-
mains of its ancient magnificence. A few habita-
tions in good repair make the contrast more
striking. The old palace in which the kings
used to reside during the diets, stood upon a

death: when the falsity of this tradition was proved by the
impunity of those concerned in the supposed sacrilege, the
Lithuanians flocked in such crowds to be converted, that
the priests could only bestow separate baptism on persons
of distinction; but distributed the multitude in ranks, and,
sprinkling them with water, gave one christian name to
each rank without distinction of sex.

hill of sand rising abruptly from the river, and forming part of its bank: some remains of the ancient walls still exist. Opposite to this hill is the new palace built, but never inhabited, by Augustus III. as it was not finished at the time of his death. In this palace are the apartments wherein it was intended the diets should be held, if they are ever again summoned to Grodno; but, alas! Lithuania is now under the dominion of Russia. The late king of Poland established in Grodno a Royal Academy of Physic for Lithuania, in which ten students were instructed in physic, and twenty in surgery. They were all lodged, boarded, and taught at his majesty's expense, and the institution greatly flourished under the royal patronage and protection. The physic garden, which did not exist in 1776, made, in 1778, a very respectable appearance; which was entirely owing to Mr. Gillibert's attention and care, that gentleman being superintendent of the college and physic garden.

The animals roving in the very large forests of Lithuania are the bear, the wolf, the elk, the wild-ox, the lynx, the beaver, the glouton, the wild cat, &c. The wild-ox, or common bull in a wild state, is probably the same quadruped which is described by Aristotle under the name of *Bonassus*, styled *Urus* in the Commentaries of Cæsar, and called *Bison* by some naturalists. It is rather larger than the common English bull, and shaped like a buffalo, but without the protuberance over its shoulders: its neck is high and thick, and covered with long hair, or mane, which somewhat resembles that of an old lion; the forehead is narrow, with two horns turning inwards, and the tongue of a blueish colour. The male is sometimes six feet in height, and is more fierce and shaggy than the female*.

* Linnæus has classed the *Bonassus*, the *Urus*, and the *Bison* under three species; Buffon reduces them to two, the *Urus* and the *Bison*; and Pennant has comprised them all under one species. His opinion has been lately adopted by Pallas, in a very curious dissertation published in the Acts of the Imperial Academy of Sciences at St. Petersburg. That celebrated naturalist informs us, that this species of the wild-ox, which was formerly very common in Europe, exists no where in that continent, but in these Lithuanian forests, in some parts of the Carpathian mountains, and perhaps in the Caucasus. He agrees also with Buffon, in holding the *bison* or wild-ox of America to be only a variety of this *urus* changed by the climate.

† Naturalists have long differed concerning the origin of amber. Some maintain it to be an animal substance; others class it among the minerals; some assert, that it is a vegetable oil united with a mineral acid; but the most common

Lithuania is very rich in ornithology; among the birds of prey the eagle and vulture are very common. *Remiz* or little species of titmouse called *Parus Pendulinus*, is not unfrequently found in these parts. They are of the smallest species of titmice. The head is of a very pale blueish ash colour; the forehead of the neck and the breast tinged with red; the belly white; veins black; back and rump of a yellowish rust colour; quill feathers cinerous, with the exterior sides white; the tail rust-coloured. The male is singularly distinguished from the female by a pair of black-pointed whiskers. Its nest is in the shape of a long purse, which it forms with amazing art, by interweaving down, goss-a-mere and minute fibres, in a close and compact manner, and then lining the inside with down alone, so as to make a snug and warm lodging for its young brood. The entrance is at the side, and small and round, with its edge more strongly marked than the rest of this curious fabric. The bird attentive to the preservation of its eggs or little ones from noxious animals, suspends it at the less end to the extremity of the slender twigs of a willow, or some other tree, over a river. Contrary to the custom of titmice, it lays only four or five eggs: possibly Providence hath ordained this scantiness of eggs to the *Remiz*, because, by the singular instinct imparted to it, it is enabled to secure its young much more effectually from destruction, than the other species, which are very prolific.

A great quantity of yellow amber is frequently dug up in the Lithuanian forests, sometimes in pieces as large as one's fist, and it is probably the production of a small resinous pine†. The duchy abounds in iron ore, called by Linnaeus *Tophus humoso ochraceus*, and described by

opinion seems to be that it is a fossil bitumen. A few hold it to be the resinous juice of a pine hardened by age; the latter opinion was also maintained by the ancient Romans. Amber is most usually found upon the sea-coast, and there frequently discovered several feet beneath the surface of the ground, yet has been supposed to have never been dug at any considerable distance from the sea; a circumstance which has led several naturalists to conjecture, that it owes in a great measure, its production to the sea. But this hypothesis is confuted by the discovery of large pieces of amber in the heart of the Lithuanian forests far from the sea. See Plin. Hist. Nat. L. 37. Sec. XI. Tacitus, Moribus Germanicus. Macquaire's Chymistry, v. II. p. 206. Bishop of Landaff's (Dr. Watson) Essays on Chymistry, v. III. p. 12. and particularly Wallerius System. Mineralog. v. II. p. 115—117. where the reader will find a list of the principal naturalists, who have written upon Amber.

Walleri-

Walleri under the article of *Ferrum limosum*,
which produces forty pounds of metal in an hun-
dred weight; it yields also several species of cop-
per and iron pyrites; black agate, which always
presents a resemblance to the roots of pines; detach-
ed masses of red and grey granite; pudding stones,
containing crystals of white quartz; the *echinus*
crystallized; a prodigious quantity of false precious
stones, particularly amethysts, topazes, garnets,
also chalcedonies, cornelians, milky agates, the
crullus catii, or cat's eye, jaspers, and particularly
the red species. Lithuania is extremely rich in
marine petrefactions, and chiefly in those which
are common in the Baltic; of these the madrepores
are the most numerous, and amongst others the
porolithum Gothlandicum is not uncommon;
which is described in the first volume of the
Annates Academicæ as extremely rare.

The principal manufactures are cloth and
linen, silk stuffs, embroidery, stockings, hats, lace, fire arms, needles, cards,
teaching wax, and carriages. The country fur-
nishes sufficient wool, flax, hemp, beavers hair,
and wax for the supply of the manufactures which
employ those commodities; but the silk, cotton,
colours, gold and silver for the embroidery,
and fine thread from Brussels for the lace, are
imported. The manufactures employ three thou-
sand persons, including those dispersed in the
contiguous villages, who spin linen and worsted
thread. The apprentices are boys and girls, all
children of Polish peasants, who are clothed and
fed, and have besides a small allowance in money.
The directors complain that there is no emulation
among them; and that, although they are better
dressed and clothed than the other peasants, yet they
cannot excite them to industry by any other means
than force. These manufactures are still in their
flourish, but their institution reflects a considerable
stain upon the late king's reign; and more par-
ticularly as his attention was not withdrawn from
them during the civil convulsions which shook his
throne, and at length overturned it.

In Lithuania there are a vast number of Jews,
indeed there are in every part of Poland; but
they seem to have fixed their head-quarters in this
country. If you ask for an interpreter, they bring
you a Jew; if you come to an inn, the landlord
brings you a Jew; if you want post-horses, a Jew pro-
cures them, and a Jew drives them; if you wish
to purchase, a Jew is your agent: and this per-

haps is the only country in Europe where Jews
cultivate the ground: in passing through Lithu-
ania, you frequently see them engaged in sowing,
reaping, mowing, and other works of husbandry.

The roads in this country are quite neglected,
being scarcely superior to by-paths winding
through the thick forest without the least degree
of artificial direction: they are frequently so nar-
row as scarcely to admit a carriage; and are con-
tinually so obstructed by stumps and roots of
trees, and in many parts so exceedingly sandy,
that eight small horses can scarcely drag a car-
riage along. The postilions are frequently boys
of ten or twelve years of age, hardy lads, who
ride posts of twenty and even thirty English
miles without a saddle, and with scarcely any
covering except a shirt and a pair of linen draw-
ers. The bridges across the rivulets are so weak-
ly constructed and so old, that they seem ready
to crack with the weight of a carriage.

Bielitz is distant about 90 English miles from
Grodno. Novogrodec, which is on the road
from Grodno to Minsk, is all built of wood, ex-
cept two or three ruinous brick-houses, a con-
vent that belonged to the Jesuits, and some
mouldering stone-walls surrounding a small emi-
nence, upon which are the remains of an old
citadel. Near Novogrodec are a large number
of barrows, which the peasants call Swedish
burying-places. In this part the country is less
sandy, of a richer soil, and somewhat diversified
with hill and dale: the solitary extent of the
forests is more than usual interspersed with vil-
lages, and dotted with fields of pasture, in which
are numerous herds of cattle.

Still farther on the road is the small village of
Mir, where the poverty of the inhabitants denies
a scanty supply of the most ordinary refresh-
ments, and the highest entertainment which the
place affords is being a suspension of the dangers
of travelling, and an intermission of fatigue.
The distance from Mir to Minsk is between sixty
and seventy miles; the roads bad, and in some
places are several bridges to be crossed not very
passable in the day time without the utmost cir-
cumsppection; so that if a traveller should attempt
to pursue his journey in the night, it would be
doubtless at a great risk of his personal safety.

At Minsk, however, a person may experience
comforts to which he had before been a stranger.
He will here find a neat white-washed room with
a brick

a brick floor, no fleas or flies, plenty of clean straw, good bread, and fresh meat.

Minsk is a large place; where are two churches and the monastery which belonged to the Jesuits, which are constructed of brick; and the remaining buildings, though formed of wood, have a neater look than the generality of dwellings in this country.

From Minsk to Smolewitzo, which is 30 miles, (on account of the badness of the roads,) takes near twelve hours to perform the journey. No traveller has any inducement to remain longer than is absolutely necessary in these hovels, abounding in vermin, and in which filth and wretchedness are united.

In various parts of the forest, through which a traveller must pass is a circular range of boards fixed to several trees about twelve feet from the ground, and projecting three in breadth from the trunk. Upon any great hunting party, ladders were placed against these scaffoldings; so that when any person is closely pressed by a bear, he runs up the ladder, and draws it up after him: the bear, although an excellent climber, is stopped in his ascent by the projection of the boards.

We were very happy at length (says Mr. Cox) to reach Naitza, although we took up our station in one of the most wretched of all the wretched cottages we had yet entered. The only article of furniture it afforded was a small table, and the only utensil a broken earthen pot, in which our repast was prepared, and which served us also for dishes and plates. We ate our meagre fare by the light of a thin lath of deal, about five feet in length, which was stuck into a crevice of the wainscot, and hung over the table: this lath, thanks to the turpentine contained in it, served us instead of a candle, of which there was not one to be found in the whole village of Naitza. It is surprising, that the careless method of using these lights is not oftener attended with more dreadful effects; for the cottagers carry them about the house with such little caution, that we frequently observed sparks to drop from them upon the straw which was prepared for our beds: nor were we able, by the strongest expressions of fear, to awaken in them the slightest degree of circumspection. For some time after coming into this country, we used to start up with no small emotion in order to extinguish the

sparks; but, such is the irresistible influence of custom, we became at last ourselves perfectly insensible to the danger of this practice, and caught all the indifference of the natives. I once even so far forgot myself as to hold a lighted stick for a considerable time over a heap of straw, while I was negligently searching for some trifle. This supineness, which I so easily acquired in this particular, convinced me (if I may compare small things with great), that I could live with the inhabitants at the foot of Mount Vesuvius without dread of an eruption; or sit unconcerned with the natives of Constantinople amid the devastations of the plague.

It is inconceivable how few are the wants of the Lithuanian peasants! Their carts are put together without iron; their bridles and traces are generally plaited from the bark of trees, or composed merely of twisted branches. They have no other instrument but a hatchet, to construct their huts, cut out their furniture, and make their carts. Their dress is a thick linen shirt and drawers, a long coarse drugged coat, or a sheepskin cloak, a round black felt cap lined with wool, and shoes made from the bark of trees. Their huts are built of trunks of trees heaped on each other, and look like piles of wood in wharves with penthouse roofs. How very unlike the Swiss cottages, though constructed of the same materials. Nor are their houses more dissimilar than their manners. The striking difference between the Swiss and Polish peasants, in their very air and deportment, strongly marks the contrast of their respective governments. The Swiss are open, frank, rough, but ready to serve you; they nod their heads, or slightly pull off their hats as you pass by, but expect a return of civility; they are roused by the least rudeness, and are not to be insulted with impunity. On the contrary the Polish peasants are cringing and servile in their expressions of respect; they bow down to the ground; take off their hats or caps, and hold them in their hands till the traveller gets out of sight; they stop their carts on the first glimpse of a carriage; in short, their whole behaviour gives evident symptoms of the abject servitude under which they groan. Yet liberty is as often the subject of encomium in Poland as in Switzerland; how different, however, are its operation in the two countries! In the one it is equally diffused, and spreads comfort and happiness through

through the whole centers in a few, and a species of despotism.

In travelling through Poland cannot fail observing a hair, or clotted hair, which is called *Plica Polonica*, because it is common in Poland; although it is also found in Tartary, and several other countries. According to some, it is an ingenious Swiss, in Poland, and who has written a treatise upon this subject, is supposed to proceed from a humour penetrating into the blood, and then exudes either in the form of folds, or in one of the symptoms, more or less, of the constitution of the person. These symptoms are itching, intermitting fevers, paleness of spirits, rheumatism, and sometimes even convulsions. These symptoms gradually become affected. If the head, he relapses into complaints which precede, and he continues to lose his fresh growth of hair. This disorder is thought to be contagious when the physical causes have rendered the *Plica* more common than in other parts. I am not at work to enumerate the symptoms, which each person has.

* *Memoire sur la Plique*.
† The dilatation of the blood vessels to admit small globules.

through the whole community: in the other it centers in a few, and is in reality the worst species of despotism.

In travelling through this country a person cannot fail observing several persons with matted or clotted hair, which constitutes a disorder called *Plica Polonica*: it receives that denomination because it is considered as peculiar to Poland; although it is not unfrequent in Hungary, Tartary, and several adjacent nations, and instances of it are occasionally to be found in other countries. According to the observations of Dr. Vicat, an ingenious Swiss physician long resident in Poland, and who has published a satisfactory treatise* upon this subject; the *Plica Polonica* is supposed to proceed from an acrid viscous humour penetrating into the hair, which is tubular†: it then exudes either from its sides or extremities, and clots the whole together, either in separate folds, or in one undistinguished mass. Its symptoms, more or less violent, according to the constitution of the patient, or malignity of the disease, are itchings, swellings, eruptions, ulcers, intermitting fevers, pains in the head, languor, slowness of spirits, rheumatism, gout, and sometimes even convulsions, palsy, and madness. These symptoms gradually decrease as the hair becomes affected. If the patient is shaved in the head, he relapses into all the dreadful complaints which preceded the eruption of the *Plica*; and he continues to labour under them, until a fresh growth of hair absorbs the acrid humour. This disorder is thought hereditary; and is proved to be contagious when in a virulent state. Many physical causes have been supposed to concur in rendering the *Plica* more frequent in these regions than in other parts; it would be an endless work to enumerate the various conjectures with which each person has supported his favourite

hypothesis: the most probable are those assigned by Dr. Vicat. The first cause is the nature of the Polish air, which is rendered insalubrious by numerous woods and morasses; and occasionally derives an uncommon keenness even in the midst of summer from the position of the Carpathian mountains; for the southern and south-easterly winds, which usually convey warmth in other regions, are in this chilled in their passage over their snowy summits. The second is unwholesome water; for although Poland is not deficient in good springs, yet the common people usually drink that which is nearest at hand, taken indiscriminately from the rivers, lakes, and even stagnant pools. The third cause is the gross inattention of the natives to cleanliness; for experience shews, that those who are not negligent in their persons and habitations, are less liable to be afflicted with the *plica*, than others who are deficient in that particular. Thus persons of higher rank are less subject to this disorder than those of inferior stations; the inhabitants of large towns than those of small villages; the free peasants than those in an absolute state of vassalage; the natives of Poland Proper than those of Lithuania. Whatever we may determine as to the possibility that all, or any of these causes, by themselves, or in conjunction with others, originally produced the disorder; we may venture to assert, that they all, and particularly the last, assist its propagation, inflame its symptoms, and protract its cure. In a word, the *Plica Polonica* appears to be a contagious distemper; which, like the leprosy, still prevails among a people ignorant of medicine, and inattentive to check its progress; but is rarely known in those countries, where proper precautions are taken to prevent its spreading.

* *Memoire sur la Plique Polonoise.*

† The dilatation of the hair is sometimes so considerable as to admit small globules of blood; this circumstance,

which however very rarely happens, has probably given rise to the notion, that the patient, if his hair be cut off, bleeds to death.

END OF COXE'S TRAVELS IN POLAND.

TRAVELS

IN

DENMARK, NORWAY, AND SWEDEN.

BY THOMAS NOWEL, ESQ.

IN 1801.

SECTION I.

General Description of the Kingdom of Denmark—Its Climate, Population, Privileges of the Nobles and Burghers, Language, Police, Artists, Taxes, Army, Navy, Form of Government, and Laws.

THE kingdom of Denmark, one of the northern states of Europe, was formerly called Dania. It has the German Ocean on the W. the Skager Rack on the N. which separates it from Norway; the Cattegat and the Sound on the E. which separate it from Sweden; and part of Saxony on the S. The extent of this country is not easily ascertained, from the very irregular position of its several parts: it is, however, contained between 53 degrees 30 minutes and 57 degrees 45 minutes N. latitude, and between 8 degrees and 12 degrees 40 minutes E. longitude from Greenwich. Geographers usually divide it into Jutland, the duchy of Sleswick, the duchy of Holstein, and the islands at the entrance of the Baltic. All these together constitute the kingdom of Denmark, yet neither of them particularly is called by that name.

It is a singular circumstance, that the king of Denmark has not a navigable river in all his dominions. The Eyder is not by any means adapted to ships of burden; and the Elbe is rather one of the confines or boundaries, than an inland river of this kingdom. There are here some lakes, which afford abundance of freshwater fish, and the forests are well stocked with game of all sorts, as stags, elks, wild boars, hares, and plenty of wild fowl.

The air of the north parts of Jutland is cold and piercing; but in the more southern parts, as well as in the islands of Funen and Zealand, it is milder and more temperate; though in the low marshy parts, and in the isle of Laaland, the air

is thick, moist, and rather unhealthy. The shifting of the winds, indeed, renders the weather somewhat variable; but at the same time it purges the atmosphere of fogs and vapours. The west wind is the most violent, and blows very frequently in these parts. Denmark is chiefly situated on a level, and, excepting the tract of land about the middle of Jutland, is very fertile; so that the country maintains its inhabitants in plenty, and yields a rich provision of every thing necessary for the support of human life. It can better dispense with horned cattle and horses, than with any sort of grain. The climate is not in general so rigid as in some parts of Germany, which are situated much more to the south. This may arise from the adjacent sea, the vapours of which dissolve the nitrous particles brought by the wind from the northern latitudes, before they reach this region. The gentle breezes blowing from the sea continue also to make the air cooler in summer. The year in these parts properly consists only of two seasons, viz. winter and summer; for spring and autumn are very seldom known. During the three months of June, July, and August, the heat is more intense than in England, and very sultry in the night. But it is a close and disagreeable heat; and the thickness of the atmosphere even tinges the beams of the sun with a deepness and gloom which is extremely offensive to the eye, particularly of a foreigner. In Copenhagen, during these months, the plague of the fly, as it is there called, is exceedingly troublesome. These the inhabitants endeavour

to destroy by means of a poisonous liquid; the effects of which are so certain, that, on sprinkling it in their kitchens and chambers, pecks of dead insects may be swept together in one room.

The latest and most accurate calculations of the number of inhabitants in the kingdom of Denmark, excluding those in the Greenland and Iceland, make the whole amount to two millions four hundred and forty-four thousand. However disproportionate this number may seem to the extent of the Danish territories, the uncultivated condition in which they lie, renders it highly probable; and even this seems to be more than sufficient for the purposes of commerce. Population in these modern times generally keeps pace with plenty, especially in northern countries; the number of his Danish majesty's subjects must therefore be greatly increased by the improvements lately introduced into agriculture and other arts. This part of Europe, however, is thought by some to have been much more populous than it is at present.

The Danes are divided into nobles, burghers, and peasants; and the noblest are distinguished by the appellation of the higher and lower nobility. There never were any princes or dukes, except the king's sons, in Denmark, one nobleman excepted, Knut Pors, who was created Duke of Holland by Christopher II. so that the rank of higher nobles included only counts and barons, which titles were introduced by Christian V. The privileges of counts are many and great: they have the right of primogeniture. Their younger sons and daughters are stiled barons and baronesses, and possess all the dignity annexed to that rank. In their counties or baronies they exercise the right of patronage, and appoint a judge and secretary, from whose sentence there is no appeal but to the supreme court of judicature. They pay neither tythes nor contributions for their hereditary estates; and are allowed three hundred acres of land free from all taxation or impost. All suits carried on against them must commence in the supreme court of judicature. They bear a coronet over their coat of arms. Barons are distinguished by nearly the same immunities; but enjoy only one hundred acres of land exempted from tythes and contributions, and are somewhat inferior in rank and title. No person is made a feudal count or baron who is not able to purchase so much land

as may be changed into a feudal county or barony. But this qualification is not requisite to the lower nobility, who, in matters of life and honour, can only be cited before the supreme court of the king. As to orders of knighthood, there are but two in this country, viz. that of Dannebrogue, which is of great antiquity; and that of the Elephant, which was instituted by Christian I in honour of his son's marriage, and is conferred only on persons of the first quality and most extraordinary merit. The number of members which constitute this most honorary order, besides the sovereign, is only thirty.

The burghers of this country enjoy greater or less privileges according to the cities of which they are members, their extent of property, or their personal deserts. Those of Copenhagen have some peculiar distinctions, which are said to be very extraordinary and extensive. They obtained them in 1650, and had them both confirmed and considerably enlarged in 1661.

The peasantry of Denmark are of different classes. Some possess a spot of land as their own property, for which they pay to the lord of the manor an inconsiderable acknowledgement: they are otherwise exempted from all exactions, excepting the general contribution. These are called land-owners. Those who have only a farm, pay for the profits of it at a stipulated rent in money, cattle, or corn, once a year, and do inferior service for a certain number of days at the manor, and at the pleasure of their landlords. There are still others who act as servants to these two classes of peasants. Slavery, or the state of servitude, was abolished for the most part in this nation by Frederic IV. in 1702, and is continued only in some parts of the duchy of Sleswick.

In the times of heathenism the Danes paid religious worship chiefly to their gods, the principal of which were Thor, Odin, and Freya. Many attempts were made in the middle ages to introduce Christianity in Denmark, but those who endeavoured to enlighten the people in this way were generally persecuted with the most unparalleled barbarity. At length Lutheranism met with a favourable reception in this kingdom, and gained the sanction of a national establishment by the diet held at Copenhagen in 1537. The ecclesiastical government is divided into six dioceses; one in Zealand, another in Funen, and four

four in Jutland. The government of these is committed to bishops, or superintendents of the church and clergy.

Men of eminence in the republic of letters are as frequent and numerous here as in any other European state of a similar extent. Indeed there is scarcely any branch of literature, or any particular science, in which individuals in this kingdom have not acquitted themselves with credit. The climate, however, seems to form an invincible obstacle to the progress and improvement of what we call polite learning and the fine arts. A short summer succeeds to the long series of cold and darkness, which environs them from October till April; and during that period they often experience very great heats for a few days, or sometimes weeks. Certainly man is much affected by physical causes; and one is not surprised to find the elegant arts confined more to luxurious and southern climates; and faintly raising their heads amidst the snowy and inhospitable regions, where the inhabitants seem in some degree to partake of the asperities of the soil, and where royal munificence, however unbounded, can only raise, as it were a few sickly and straggling plants.

The language of Denmark, like that of Norway, is a corruption of the Teutonic. High Dutch and French are spoken at court. The nobility have also of late years made great proficiency in the English, which is now publicly taught at Copenhagen, as a necessary branch of polite education.

The police is singularly rigid and regular: Denmark is therefore seldom infested with those highway robberies, burglaries, and various kinds of felonies, so common in other commercial countries. Murder and manslaughter often happen; and the punishment of the criminal guilty of such enormities, is decapitation. Here the public executioner, though (as in every other place) he be universally despised, is usually very rich; as he is the general contractor for emptying all jakes, removing all kinds of filth, and particularly dead domestic animals, which no other Dane would touch on any account.

The Danish apothecaries are all under the most excellent and exemplary regulations. Only two are allowed in Copenhagen; and only one in all other towns of importance. They are severally licenced by the college of physicians, and

confirmed by the king. They are also bound, under certain penalties, to keep an exact register of all the drugs they sell; by whom prescribed, and to whom administered. If some such regulation as this were adopted in other countries, it would be a mean of keeping empirics from vending their pernicious nostrums, and would hinder many of those, who are called regularly bred, from selling those deleterious drugs which have been the cause of much mischief even in the metropolis of Britain.

There are many artists of the first celebrity and most extraordinary skill at Copenhagen; and every branch of mechanics is at present well executed in Denmark. A few years ago a general warehouse or magazine was opened by authority in the metropolis, to which manufacturers bring all the goods they have not been able to dispose of in other towns, and are paid ready money for them. From this great storehouse all sorts of vendible commodities are constantly delivered out to retailers on credit.

Denmark enjoys the most commodious situation for navigation; and by establishing a general mart or staple in Copenhagen, might be made the center of all the northern trade, especially of that carried on in the Baltic. Formerly, all the commerce in this country was carried on by the Hanse towns, which were afterwards supplanted by the Dutch and English; but chiefly by the former. In process of time, the Danes understood the advantages of abandoning all neutral bottoms, and using their own. Frederic IV. may with propriety be stiled the real founder of the Danish commerce, which Christian VI. powerfully supported, and Frederic V. very much encouraged by his royal munificence and bounty.

The royal revenues of Denmark arise from impositions made at the king's pleasure on his own subjects, from the duties paid by foreigners, and from his own demesne lands, including all sorts of mulcts and confiscations. Wine, salt, tobacco, and every kind of luxury, are all moderately taxed. Marriages, paper, corporations, land, houses, and poll-money, raise a considerable sum. The expences of fortifications are defrayed by the people; and when the king's daughter is married they contribute a hundred thousand rix-dollars towards her portion. But the internal taxes of this country are very uncertain.

tain, as they are uniformly raised by the will of the king. Customs on imports and exports are more paid by strangers arise chiefly passing through the Sound in the narrow strait which runs between Denmark and Zealand. These tolls are the size of the ship and the value of the cargo exhibited in bills of lading has more than once thrown the into a flame: it was often disputed between the Danes and Dutch; and the Swedes, on the opposite side of the pass, for some time paid it; but in the treaty of 1720, between the two rival states, under the auspices of the British majesty George I. the Danes agreed to pay the same rates which are exacted by Great Britain and the Netherlands at Elsinore, which is situated at the entrance of the Baltic.

The army of Denmark, in time of peace, consists of thirty thousand cavalry, exclusive of militia; but in time of war it amounts to fifty thousand regulars, and an equal number of militia. The naval force of Denmark is considerably augmented, and is now a maritime nation*. The fisheries, especially of the northern seas, afford great numbers of men. Every sea-faring man being obliged to serve, when called upon, to serve his country for six years, for which he is fully registered. The six years of service is required of them. The number of seamen in Denmark and Norway amounts to twenty thousand men. There is always a body of four thousand men, augmented for sudden occasions, at Copenhagen.

The form of government is formerly the same as that which was established by the Goths and Vandals, where the king was elected by their conquests; but whether it is elective or an hereditary kingdom is undetermined, since both sides are espoused by historians of each party. Admitting the crown to be hereditary, it is not less certain, that the states

tain, as they are uniformly raised or lessened at the will of the king. Customs, and tolls on imports and exports are more stable. The tolls paid by strangers arise chiefly from foreign ships passing through the Sound into the Baltic, by the narrow strait which runs between Schonen and Zealand. These tolls are in proportion to the size of the ship and the value of its cargo, exhibited in bills of lading. This exaction has more than once thrown the northern nations into a flame: it was often disputed by the English and Dutch; and the Swedes, who commanded the opposite side of the pass, for some time refused to pay it; but in the treaty of 1720 between these two rival states, under the guaranty of his Britannic majesty George I. the Swedes agreed to pay the same rates which are paid by the subjects of Great Britain and the Dutch. This toll is paid at Elsinour, which is seated on the Sound at the entrance of the Baltic.

The army of Denmark, in time of peace, consists of thirty thousand cavalry and infantry, exclusive of militia; but in time of war they muster fifty thousand regulars, and augment the militia. The naval force of Denmark has likewise been considerably augmented, and it is considered as a maritime nation*. The fisheries along the coasts, especially of the northern parts of Norway, afford great numbers of excellent seamen. Every seafaring man being obliged, once in his life, when called upon, to serve his king and country for six years, for which purpose they are all registered. The six years being expired, no more service is required of them. The number of seamen in Denmark and Norway thus registered amounts to twenty thousand men. Besides these there is always a body of four thousand sailors regimented for sudden occasions, and in constant pay, at Copenhagen.

The form of government in Denmark was formerly the same as that which was established by the Goths and Vandals wherever they extended their conquests; but whether it was anciently elective or an hereditary kingdom seems yet undetermined, since both sides of the question are espoused by historians of equal reputation. Admitting the crown to be hereditary, it is nevertheless certain, that the states commonly made

their choice out of the royal family, and that they also on some occasions departed from this custom. The present form of government in Denmark is grafted on the ruins of that aristocratic power which the nobility exercised over their inferiors with the most unsufferable arrogance and inhumanity. In 1660 the whole nation was in a most calamitous situation. A peace not very honourable succeeded a most unfortunate war. The treasury was so much exhausted, that, on disbanding the troops, there was no money to pay up their arrears. The soldiers then became insolent and licentious. The power of the nobles had lately arisen to an enormous height; and their haughtiness and rapacity extended with their power. The clergy, for want of importance, were discontented and chagrined at the obloquy and disrespect to which they found themselves reduced. The peasantry, irritated and made desperate by the oppressive taxes occasioned by a long, expensive, and abortive war, were turbulent and unmanageable. These and other alarming circumstances rendered an immediate convention of the states indispensable. Here the commons proposed that an equitable tax should be laid on all without distinction, in proportion to their circumstances. This was strenuously and resolutely opposed by the nobles, who asserted their hereditary privileges as a full exemption from every kind of impost. The other party had recourse to the great law of nature, which they contended was superior and prior to all prescription; and urged with unanswerable force the unalienable extent of their natural rights. They stated, as the fundamental principle of the proposition before them, that it was incumbent on those who engrossed the largest share of the lands, wealth, and honours of the kingdom; to bear an equal proportion of the common burden, and contribute accordingly to the general defence. This mode of reasoning was too convincing to produce any other effect than silence or fury; and the consequence of a disagreement between the interests and convictions of men is easily foreseen. Tenacious alike of their real and imaginary claims, both parties were highly inflamed against each other. In the midst of this violent ferment, Otto Craeg, a nobleman more intrepid than pru-

together with the Danish fleet to the British arms in the description of Copenhagen here given.

dent, boldly told the commons, that they neither understood the rights of the nobility, who were their masters, nor their own, who were no more than slaves. These degrading expressions proved like oil to a furnace, and threw the whole assembly into a blaze. The speaker of the commons, fired with indignation, swore a solemn oath, that the nobility should certainly repent the contempt with which they had treated them. The term slavery operated like a watch-word concerted by the burghers, the clergy, and the court. The assembly broke up in a rage; and the commons, under the auspices of their leader, adjourned to the Brewer's Hall, where it was instantly and unanimously resolved to make a solemn tender of their liberties and service, and to establish in his family an hereditary succession to the crown. This resolution was executed next day. The bishop of Copenhagen officiated as speaker for the clergy and commons. The king thankfully accepted their grant, and promised immediate relief and protection. The gates of the metropolis were shut; and the nobility, finding themselves divested of all their late hereditary consequence, submitted with the best grace they could, to confirm the king's supremacy and their own insignificance. Thus from motives of revenge, probably fermented by artful and designing courtiers, the people, with a rude and daring temerity, resigned their independence for ever, and in one fatal moment, changed the whole face of affairs, made the crown hereditary, and the king absolute. It is happy indeed for the Danes, that ever since the year 1660, when this memorable revolution took place, few or no instances have occurred of abusing the despotic powers thus vested in the crown, which are at present, perhaps, more unlimited than those of any other monarch in Europe.

The code of Danish laws is so peculiarly perspicuous and concise, that the whole is comprised in one volume. This celebrated work, which discovers an amazing fund of legislative wisdom, is composed with infinite simplicity, and written in the native language of the country. It is divided into six books, and treats clearly, though briefly, of the procedure of the courts of justice; of ecclesiastical laws; of official and honorary law; of maritime and naval law; of property law; and of criminal law. By means of a system thus formed on the most ob-

vious and equitable principles, the lowest and least intelligent easily understand their duty; and when either injured or accused, are enabled to plead their own cause.

The town of Hamburg, although it is not properly belonging to Denmark, yet as it has been of late much subject to violence during the present war on the continent, must be particularly noticed. It was formerly the metropolis, not only of the district of Stormar, but of all Holstein, which is a part of Denmark, till it became a free imperial city of that part of Germany. It is large and very populous, lying on the north side of the river Elbe, which here forms the boundary of the king of Denmark's dominions on the South. Hamburg lies partly on islands, and partly on the continent, having a very good harbour. The Hamburgers possess a territory for twelve miles round, in which are several villages and fine seats. Charlemagne built a fort here, and erected a church, the only one in Hamburg for three hundred and fifty years. It has undergone many revolutions since, and is now greatly increased. Its streets are spacious, and its houses, built with brick, being very high, making a grand appearance. This town was the second of the Hanseatic union, and one of the principal among them. Hamburg being naturally strong, is as well fortified by nature as a place of its magnitude can well admit of. From its situation it has all possible advantages for trade, both foreign and domestic. To it, in time of peace, merchants of all nations resort, whose goods are sent up the Elbe into Prussia and the heart of Germany. From Hamburg a canal has been dug to the river Trava, for the sake of a communication with Lubeck and the Baltic, without the trouble of going round Denmark; so that by an inland navigation of fifty-five miles, they save a hazardous one by sea of seven hundred miles. Its trade is very considerable: for the Elbe, and many other navigable rivers falling into it, after a course through some of the richest and most trading parts of Prussia, and other states, furnish this city with all the products and manufactures of Austria, Bohemia, and Upper and Lower Saxony. The principal merchandize it exports, especially to Great Britain, is linen of several countries, sorts, well known in London; also great quantities of linen yarn, rags for paper makers, plates, wire of iron, pipe staves, and corn. The Hamburgers trade annually employ the Greenland whaler in peaceable times, and the government senate and three companies a mixture of the aristocracy and commons.

Hamburg has long been the care of the poor. Orphans, the revenue of a thousand pounds sterling, and a number of houses in the island. The churches are of fabrics, but open the and in some are books of St. Katharine has statues in niches, and al lanterns diminish the spire like the Street, London, but in the middle of its steeples, organ, which is reckoned to have six thousand pipes, and town hall is an structure; the exchange to it, is a fine building. plates, wire of iron, brass, and steel, clap-boards, pipe staves, and other timber, kid skins, and corn. The Hamburgers have a good share in the Greenland whale fishery, having generally, in peaceable times, fifty or sixty ships in this trade annually employed.

The government of this city is vested in the senate and three colleges of burghers, and is a mixture of the aristocratical and democratical forms.

Hamburg has long been celebrated for its care of the poor. They have a hospital for orphans, the revenue of which is about sixty thousand pounds sterling per annum. The number of houses in the city are about thirty thousand. The churches are large and handsome fabrics, but open thoroughfares during the day, and in some are booksellers shops. The church of St. Katharine has a stately front, with several statues in niches, and the steeple formed of several lanterns diminishing to the last, which supports a spire like that of St. Bride's in Fleet Street, London, but much taller: round the middle of its steeple is a gilt crown; and its organ, which is reckoned the finest in Europe, has six thousand pipes. Here is also an university, which is well endowed. The senate house and town hall is an ancient, large, and noble structure; the exchange, which stands opposite to it, is a fine building, but inferior to that of London. The city is nearly circular, and five or six miles in circumference. The walls and fortifications that lie open to view, are planted with rows of lofty trees; so that none of the houses can be seen from without, on that side of the walls which are next Altena. It has six gates, and three entrances by water. A canal divides it into the Old and the New city. It is surrounded by a high wall, with twenty-three bulwarks, beside other out-works, and a very deep ditch: a noble line with other works runs from the largest bason of the Alster to the Elbe, about half a mile above the town; and on the other side of the bason, about midway between that and the Elbe, below the town, is the star scone, so strong a fortification, that the king of Denmark with all his army could not take it in 1686, after six weeks' siege. In the new town towards Altena, are large streets of mean houses, principally inhabited by Jews. The two channels of the North and South Elbe, into which this river

is separated two or three miles above the city, forming several isles towards Harbourg, re-unite six miles below the city. Towards the east it is washed by the little river Bille, and towards the North by the Alster, forming a very large bason without the town, and another within the walls; after which it turns the public mills, and passing by sluices and canals through the city, falls into the Elbe. Here are eighty-four bridges, thirty-eight water mills, and six wind mills. It has also six large market places. Spring tides, especially with a N. W. wind, do frequent damage to the town, of which there were two melancholy instances in 1651 and 1719.

The jurisdiction of Hamburg comprises the bailiwics of Rutzenbittel, Bilwerder, Ochsenwerder, and Eppendor. The four cantons of Altegame, Newgame, Kirchwerder, and Ro-lacke, belong to Hamburg in common with the city of Lubeck; as does also a castle, with the small town and bailiwick of Bergedorf. They put in a bailiff alternately, as also an equal number of soldiers to garrison the castle. Here are several convents and cloisters, which having been secularized, are now Lutheran; the tenure of the foundation of one of these in particular is still continued, by offering a glass of wine to every malefactor that is carried by it to execution. Hamburg is two miles S. E. of Altena, 60 miles S. E. of the German Ocean, 42 miles S. W. of Lubeck, and 58 miles N. E. of Bremen. Although this town lies in the same degree of latitude with that of Lincoln in England, it is colder in winter, but hotter in summer than the latter city.

Altena is a large and populous village of Storman, a province of Danish Holstein, situated, as above mentioned, two miles N. W. of Hamburg. Here a governor for the king of Denmark resides. It is now indeed almost joined to Hamburg by a row of houses on the Elbe, as Islington is to London. This village received its name, according to the Danish historians, from a ludicrous circumstance, which is as follows: Deputies from Hamburg, in a remonstrance to the king of Denmark against building this village too near their city, frequently made use of the words "dat is all ta nae," i. e. "that is all too near;" the king taking particular notice of the three last monosyllables, said in a bantering manner to the deputies, he could not excuse himself from going on with the building; but that,

to oblige them, he would call it by the name they had given it, "All ta nae," which was corrupted into Altena. Formerly it was a place of refuge, not only for insolvent debtors, but even for malefactors, that came from Hamburgh; and though it depended entirely on the trade of that city, yet it was out of its jurisdiction. A treaty was concluded here, in 1689, between the king of Denmark and the duke of Holstein-Gottorp about the partition of the duchy of Holstein. The government of this town is vested in an upper president chosen by the king, the burgher-master, and corporation. The court of appeal is held at Gluckstadt. It is now estimated to contain upwards of three thousand houses, and thirty thousand inhabitants. Here are two churches for the Lutherans, two for the Calvinists, one for the Calvinist French, another for the Roman Catholics, and two for the Menonite churches, exclusive of other sects. The Jews here are numerous, and have a large synagogue; but pay two thousand ducats per annum protection money. Here are three docks for building ships, and a variety of manufactures are carried on. In 1710 it lost two hundred houses by fire; and in 1712 it was burnt by the Swedish army under Steinbeck. About the same time it suffered very much by the plague. It was originally a village in conjunction with the lordship of Pinneburg; but in 1640, coming with that lordship under the dominion of Denmark, it soon became a town, and in 1644 obtained a charter. The Danes would have fortified this town long ago; but the Hamburgers, having obtained a grant of the emperors of Germany, that no fort should be built within two miles of them, would never permit it. Altena, however, is now the emporium, or market, for the sale of goods brought by the Danish East India company from the Indies.

Gluckstadt, which is 38 miles N. W. of Hamburgh, and 36 miles N. W. of Altena, is a strongly fortified town of Danish Holstein, on the banks of the river Elbe, near the influx of the river Rhyn into it. The emperor Ferdinand II. besieged this town two years in vain, principally owing to the assistance it received from the Danish fleet in the Elbe, for it cannot be taken unless blocked up by a fleet. The Danes usually keep in it a garrison of two thousand foot. Here are several canals, one of which divides the town

into two parts, and is intersected by another at the end of the market place, which is very magnificent. At one corner is the great church, where the Calvinists and Papists have each a chapel. Its harbour is capable of receiving a royal navy, the Elbe being here very wide, deep, and safe. At the end of the canal running into it from the town, is a tower built in the water, on piles, round which are platforms, with batteries of cannon that command the Elbe. The town standing in a marshy bottom, there is no approaching it on the land side, but by a stone causeway about three quarters of a mile in length, on the side of Krempe, (a town which stands mid-way between Itzehoe and Gluckstadt.) The king of Denmark attempted to oblige all ships that pass up the Elbe to pay toll; but in this project he was opposed by all the powers of Europe, particularly the Hamburgers; and although matters were accommodated, yet the duties demanded by his Danish majesty were laid on; so that a heavy toll is demanded at this town, and it was declared a free port in 1773. In this town the police is rigid, and the punishment for offences singular. In some cases thieves are condemned to draw the dust cart, and are chained to them like Turkey galley slaves. Between Gluckstadt and Elmesborn the country is rendered very fertile by frequent inundations of the Elbe.

Itzehoe is a small town, lying on the river Stör, which abounds with fish, and falls into the Elbe at Gluckstadt. Itzehoe is 15 miles N. E. of Gluckstadt, at the foot of a mountain, and is defended by an old castle. Its inhabitants enjoy a good trade by means of its river. The place is in a flourishing condition, and its inhabitants daily increasing in number. It is very well built, especially that part of it which is called the New town, and there is a church in each. At Itzehoe there is a Lutheran nunnery, for an abbess and nineteen ladies of quality, who are not compelled to make any vows, or to practise any Romish custom.

Meldorp is 24 miles N. of Gluckstadt, and is the capital of Ditmarsh, a canton of Holstein. It is situated a little above the river Mide, (which falls into the German Ocean,) near its mouth. Its church is large and beautiful. Here are three market places, viz. the north, the south, and the west; with an excellent seminary for teaching

by another at which is very magnificent great church, and has each a of receiving a very wide, deep, canal running into it in the water, forms, with battlements, the Elbe. The town, there is no stone bridge, but by a stone bridge a mile in length, which stands between the town and Gluckstadt, and is obliged to oblige all to pay toll; but in all the powers of the burghers; and moderated, yet the majesty were laid out in 1773, and the punishment in some cases by the dust carts, the galley slaves, born the country, and frequent inundations.

Reidsborg is another town of Danish Holstein. The road from Hamburg N. W. to Gluckstadt, and from Gluckstadt by Itzehoe N. E. to Reidsborg, is through a charming country; as is likewise the road which leads directly North from Hamburg to Reidsborg. That part which is called the Old Town is situated on an island formed by the river Eyder, which runs in two branches through the town, and separates itself at this place in such a manner, that the branch above the Old Town is called the Upper, and the main stream the Lower Eyder. That which is known by the name of the New Town or Neuenwerk lies on the other side of the Lower Eyder, is regular and handsome, and has particular fortifications of its own, which environ the Old Town in the form of a half moon. It is well garrisoned; and here is the royal armoury, the carriage house, and the granary, all of which are large and spacious buildings. A commercial college or board of trade was established at this town about seventy years ago. It consists of about six hundred houses, and its inhabitants possess peculiar franchises. It owes its name and origin to the ancient castle of Reinoldsborg, which was erected by count Adolphus III. in 1200, and which was repaired and improved in the next century by Count Gerhard the Great.

Kiel is 12 miles E. of Reidsborg, 50 miles E. of Gluckstadt, and 58 miles N. of Hamburg. This town is situated on a bay of the Baltic, in Holstein, and is a place of considerable trade. Its harbour is excellent, and is much frequented by shipping from Germany, Sweden, and all other parts of the Baltic, and is a populous and wealthy town. Both the town and the harbour are defended by a castle or a neighbouring hill. On the east side of this castle the sea washes its walls, and on the other side of the bay is a delightful, though woody country. A garden facing the castle is the only place by which Kiel has a communication with the main land. This garden lying along the sea Vol. II. No. CV.

side, is above two hundred paces broad, consisting of a terrace walk; level with the foundation of the castle, from which there is a small descent to parterres full of flowers, and adorned with a fountain and wilderness: and this leads to others, from which there is a little ascent to a second terrace. It suffered greatly in the wars between Denmark and Sweden. Here the duke of Holstein Gottorp founded an university in 1665, which had many learned professors. It is divided into the New and Old Town, the former of which is the largest and most pleasant, the streets of which are planted with rows of trees. The old town, which stands on a kind of peninsula, is fortified with deep ditches; and on the harbour are fine walks with trees. Here is a palace which faces the north side of the town. At Kiel are several good buildings, particularly a large church and hospital, which before the reformation was a Franciscan monastery. The town is much enriched by its annual fair, which is held for three weeks after Twelfth-day, and is frequented by multitudes of all ranks, especially the nobility of the duchies of Sleswick and Holstein. Vast sums of money are here negociated, and payments according to previous contract punctually made; insomuch that he who does not keep his credit at this fair, is looked upon as in a state of bankruptcy, and is liable to punishment as well as disgrace. During this fair even Hamburg is, as it were, deserted, every body hurrying hither to pay rents, renew leases, or let out money to interest, &c. by all which means the town is so full, that it is a difficult task to procure a lodging in it. The Old and New towns are joined by a bridge, at the end of which is a draw-bridge and a gate, where a guard is constantly kept. There was a project on foot some years ago to cut a navigable canal from the river Eyder to this town, by which ships of two hundred tons were proposed to be carried immediately from the German Ocean into the Baltic, without going round Jutland and through the Sound. This was intended to be done by the czar Peter the Great, who stipulated that for this service Russian ships should not be obliged to pay toll to Denmark; but on that monarch's death the design was laid aside. At the mouth of the harbour is the small fort of Christian Preiss, which entirely commands the entrance.

About six miles N. of Kiel, but in Sleswick,

is Ekerolforde, which is a well inhabited and flourishing place, being almost surrounded with water and situated on the same bay as Kiel is, so that its harbour is both capacious and sufficiently deep. Formerly it was a pretty-large staple, but its navigation seems now to be on the decline. The streets are broad, and planted with rows of trees. The town has suffered very much by fire.

Sleswick is 15 miles N. of Rendsborg, and 25 miles N. W. of Kiel. It is the capital of the duchy of Sleswick, and takes its name from being situated on the Weick or gulph of Sley. The duchy of Sleswick is about eighty miles long and forty-four broad, having Jutland on the N. the Baltic on the E. Holstein on the S. and the German Ocean on the W. It is watered by several rivers, which in most places render it beautiful and fertile. The eastern parts of the duchy lie considerably higher than the western; and in the latter particularly are many extensive and fruitful plains, which produce great quantities of all kinds of grain. The nobility of Sleswick are very rich, and the common people enjoy more independence than in any other of the Danish dominions. The cities in this duchy have their own magistrates, altogether independent of those in the country; but the governor-general for the time being is also president or chief judge in all the separate towns. The town of Sleswick was formerly a place of great trade, where merchants from all the ports of Europe were to be found. Many are the revolutions it has undergone, and various the efforts it has made to overcome its numerous misfortunes. It has more than once been plundered and ravaged by the sword; and in 1447 was entirely consumed by a dreadful conflagration. It recovered, however, in part at least, from all these disasters, and was in a flourishing condition till the removal of the ducal court, in the beginning of the last century; so that even at the present day many of its principal buildings are destitute of inhabitants. Its streets appear desolate, its markets forsaken, and its shipping annihilated. In former times a causeway, leading from the west end of the quay to several places, lay on the south side of the town, and was defended by the strong castle of Jurgenburg, which is now in ruins. At the end of this mole, which is now only to be seen at low water, stood the castle on the main land, where Abel, when duke of Sleswick, resided; who, on ascending the throne by the murder of his brother, be-

stowed it on the Augustine monks, by whom was converted into a convent, and stood where the orphan house now stands.

From Sleswick to Flensburg the distance is 21 miles N. Flensburg is a large and handsome town, situated at the bottom of the bay of Flens which is twenty-four miles inland from the Baltic. It is a fine haven, where ships of the greatest burden may ride with the most complete safety, and even come up to the warehouses. On the land side it is encompassed with mountains upon one of which, near the suburbs, is a castle commanding the bay on that side. Here are four churches. The town of Flensburg is the capital of a bailiwick called Angsen or Engeland which is the country of the English Saxons, or Angles, who came over into Britain, and gave it the name of England.

Tonder is 24 miles W. by N. of Sleswick, and is an inland town on the river Widaw, which had formerly a harbour that has been for several years choaked up; but it is defended by a small fort.

Hadersley, or Hadersleben, is a sea-port town of Sleswick, 32 miles N. of Sleswick. It is watered on the W. by the lake of Hadersleben upon the E. by the gulph of Haderslebfiorde which is so shallow near the town, that ships of burden are obliged to anchor two miles off. This gulph, into which the lake empties itself, is very narrow, and falls into the Baltic about ten miles E. of the town. Hadersleben is well built, its streets being broad, and its houses uniform. It had formerly a castle, which stood on the top of a neighbouring hill, but has been long since demolished, and a new one built, called Hadersburg, which stands between the lake and gulph above mentioned. On the W. of this castle stands the new town, which is separated from the old one by a small stream, and is better built than the old town. The country in its vicinity abounds with corn-fields, and excellent pastures, which, with the fish caught in the lake and neighbouring gulph, render this a very flourishing place. This place gave birth to king Frederic II. in 1534, and Frederic III. in 1609. Hadersleben is the capital of a considerable prefectorship, which is divided into the seven districts of Habersleberharde, Tusterupharde, Gramharde, Froesharde, Kalshinharde, Giddingharde, and Northerangstorharde.

Colding, or Kolding, is a small town in the bailiwick

Koldinghuus, and diocese of Ripen, 19 miles N. of Hadersleben. It stands on the river Truethis, or Koldingers-aue, which falls into a bay that extends itself from the Little Belt. It lies low, being situated between two mountains; is a pretty old place; has a parish church, a rich hospital with a church of its own, a Latin school handsomely endowed, and a harbour, which by the neglect of its inhabitants is now choked up; so that ships of small burden only can at present resort to it. On the N. W. side of the town stands on an eminence the castle of Koldinghuus, anciently called Oernsborg, i. e. Eagle Castle. Among its greatest curiosities is the giant tower, built by Christian IV. which is flat at top, and surrounded with a stone balcony, or range, at the four corners of which is a stone image seven feet high. This castle has a church of its own. The air here is reckoned very fine and healthy, wherefore Christian III. made it his usual residence, and here he died in 1559*.

Aarhuus is 50 miles N. E. of Colding, and 43 miles S. E. of Wiburg. It is the capital of a bishopric of the same name, which is 15 geographical miles in length and between eight and nine in breadth. This bishopric is the best of all the Jutland dioceses: the soil is uncommonly fruitful, and vast quantities of corn are annually exported. Here are many navigable bays, lakes abounding with fish, good rivers and streams, and spacious forests; the diocese contains about seventy seats of the principal nobility. The town of Aarhuus lies low, in a beautiful plain between the sea, and an inland lake, from which last the water is conveyed, by means of a pretty broad canal, through the town. It is entirely open, large, and populous; has two market places, two principal churches, an university, a palace for the bishop, a free cathedral school of six classes, and a well-endowed hospital. The cathedral church is a handsome building, begun in the year 1201, and contains many beautiful monuments. The inhabitants of this city carry on a good trade. The harbour, which is situated at the mouth of the river Gude, is safe and commodious, but not remarkably large; and, at certain seasons, the water in it is not of a sufficient

depth for large vessels. At this place is the usual ferry to Kallundburg in Zealand.

The town of Wiburg is 13 miles N. W. of Aarhuus, and 38 S. W. of Alborg. Wiburg is a considerable town, is the capital of the bishopric of Wiburg, and is remarkable for being the seat of the chief court of justice in Jutland. The hall where the council assemblies has the archives of the country, which escaped the devastation occasioned by the dreadful fire that happened in 1726, and which burnt the cathedral church, that of the Black Friars, the town house, and the bishop's palace; but they have all been rebuilt more magnificently than before. It is seated on the lake Weter, on a kind of peninsula, at the southern extremity of the lake.

Alborg, or Aalborg, is 38 miles N. by E. of Wiburg, and 65 N. by W. of Aarhuus. It is the capital of a bishopric of the same name. It is called Aalborg, or Eal-town, from the vast quantities of eels which are taken there. It is seated on a branch of the Lymfiord lake, about 20 miles from the sea. Here is an exchange for merchants, and a safe and deep harbour. The inhabitants carry on a considerable trade in herrings and corn, and have several good manufactures of guns, pistols, saddles, and gloves.

The island of Funen, which is one of the Danish islands, has the Great Belt on the E. the Baltic on the S. the Little Belt on the W. which separates it from Jutland and Sleswick in Denmark Proper, and the small island of Samsoe on the N. This is the most fruitful country belonging to Denmark, having a good and well cultivated soil. It consists of small and very fertile hills, some of them woody, and is in general well peopled. From Funen are exported great quantities of corn, large herds of black cattle, and abundance of hogs. This is an appendage to the king of Denmark's eldest son, and its government is the most considerable in Denmark. Odensee, which is 85 miles W. by S. of Copenhagen, is the capital of Funen, and is the see of a bishop. Its cathedral church is a remarkable building. The Danish language is spoken here in its greatest purity; and in 1538 a diet was held at this place, in which the reformation of this kingdom was

* Colding is principally remarkable for the toll paid at the bridge over the Aue, for all foreign goods carried in carriages that way; also for all black cattle and horses that go into the duchy of Sleswick or farther. The num-

ber of oxen alone, which are annually driven through Colding, is computed at forty thousand head, for each of which a rix dollar is always exacted.

settled.

settled. There are four churches in this town, and the best beer in Denmark is brewed here.

On the sea coast of the isle of Funen is Faaborg, which is 28 miles S. W. of Odensee: it lies in a low and fruitful spot, and its inhabitants carry on a good trade in corn and all sorts of provisions, but the harbour is rather indifferent. Here is a pretty good hospital. The town has suffered much from accidental fires, and from burning and plundering by the enemy, particularly the Swedes. Not far from this town, at the church of Horne, is a ferry to the isle of Alsens; and in the bay near the town are several small islands.

Alsens is another island belonging to Denmark, of which the principal town is Sonderberg, which is about 18 miles E. by N. of Flensborg. Alsens belongs to the duchy of Sleswick, and is near the main land, from which it is separated by a narrow strait called Alsensund. This island is upwards of 12 miles in length and about six broad. It is populous and fruitful, being a rich and pleasant spot, having an exuberance of all sorts of grain, wheat alone excepted. It produces excellent fruit and vegetables; and has no want of woods, in which wild game of various kinds are to be met with. Here are several fresh water lakes, which afford abundance of fish. The island of Alsens is divided into the Suder and the Norder-Harde, or the jurisdictions of Sonderburg and Norburg.

The island of Langeland, which receives its name from its long form, is situated in the Great Belt, S. E. of Funen, and W. of Laaland: it is 32 miles long, and about six miles where broadest. The soil is fruitful throughout, abounding in wheat, rye, and barley, of which great quantities are annually exported. It is under the jurisdiction of the governor of Funen, and contains but one royal bailiwick, namely, Tranekia, to which belong Norre and Sonderherred; and in each division are seven parishes. Here is also a fort called Tranekiar, where is kept a strong garrison. Round this island are three smaller ones, viz. Omme, Agger, and Echolm. The principal town in this island is Budkioping, which is rather a small place.

Laalande is another island belonging to Denmark, which has Langeland on the W. Falster on the E. and Zealand on the N. E. This island is all low ground, which its name imports.

Its greatest extent from S. E. to N. W. is 30 miles, and its greatest breadth from N. to S. is about 15 miles. It produces all sorts of corn in abundance, particularly wheat, with which it supplies Copenhagen and other places in the kingdom. This island is divided into three districts or bailiwicks, viz. those of Halsted, Aalholm, and Marieboe-Kloster. The inhabitants breed but few cattle, because they find husbandry more advantageous; yet from the soil lying low and damp, the air is rather unhealthy. Of all the inhabitants here, the ministers are mostly in the easiest circumstances, on account of their plentiful income. About the middle of this island there is a lake, on the North of which lay the nunnery of Marieboe. Besides noblemen's seats, here are four towns and a village, viz. Naskow, Rodbye, Marieboe, Nystadt, and Saxkiobing.

The island of Falster lies east of Laalande, from which it is separated by a narrow strait, and is in the diocese of Funen. The soil is of the same nature as that of Laalande. It is about twenty miles long, and its mean breadth about nine. It has been by some writers called the orchard of Denmark, from the vast quantities of fruit which it produces; and it abounds with wild game. The whole of this island belongs to the queen dowager, and is divided into two districts, viz. the southern, consisting of thirteen parishes, and the northern, which contains fifteen. Its chief place is Nycoping, or Nyekiobing, or Stobbekiobing, which is situated 60 miles S. by W. of Copenhagen, and is defended by a strong fort.

The island of Seeland, Zeeland, or Zealand, is the largest and most fertile island of the Baltic Sea, and is the seat of the Danish government. On the east it has the Sund, which separates it from Sweden. Its greatest length from N. to S. is about seventy miles, and its mean breadth, from E. to W. is about fifty miles. The land here is pretty low, and has but few hills, though there are many woods and forests which take up almost a fourth part of the island, which abounds with wild game, excellent pasture, and plenty of grain, especially barley, oats, and rye. Round the coast are several deep bays, some of which run many miles inland. These and the adjacent sea are exuberant in fish, as are the fresh water lakes and rivers which wash the island. Although the air of Seeland is thick and foggy,

leggy, yet, it is observed, that many persons attain to a great age. On the coast are several safe and commodious harbours, particularly Copenhagen, Callundborg, &c.

Copenhagen, called in old writings Hafnia, is the capital of Seeland, and is the metropolis of Denmark. Its name, Copenhagen, literally signifies the Merchants' Port, and seems to have originated from the convenience and utility of this harbour, which is equally beautiful and commodious. The city is situated upon a fine bay of the Baltic Sea, near the strait called the Sund, on the eastern shore of the island. Copenhagen was originally but a mean little village of fishermen's huts, which, by the assistance of the bishops of Roeskilde, gradually rose to magnitude and consequence. In process of time it was constituted a city, and made the royal seat of the Danish sovereigns. The houses were formerly of wood, but in the year 1728 almost the whole were reduced to ashes by fire; and since that time they have been more sumptuously and securely built of free stone. The present superb palace was then erected at an immense expence, and the town embellished with various elegant houses for the nobility, magnificent churches, and some stately public edifices. The exchange of the East India Company, their military repository, the king's stables, the college, the magazine of provisions, the orphan house, the opera house, and the martial academy, are all structures planned and finished with taste and elegance.

The citadel is a regular fort defended by five bastions, a double ditch full of water, and several advanced works. The arsenal is furnished with naval stores sufficient for the equipment of no inconsiderable armament; it exceeds that of Venice, and the royal fleet usually lies here. The harbour is surrounded by the fortifications of the town; and the entrance is so narrow that only one ship can enter at a time. In the night-time this entrance is shut up by a strong boom laid across. The passage is defended on one side by the cannon of the citadel, and on the other by a strong block house, well mounted with heavy artillery. The whole haven is capable of containing five hundred sail of large ships. It is enclosed by a wooden gallery, close to which every ship has her appointed station; a circumstance that adds greatly to the beauty and convenience

of the scene, than which nothing can be more rich and regular, when a number of shipping happen to be in the port. The harbour owes most of its excellence to the little island of Amack, which diverts the waves, and shelters it from the surge of the sea. Here stands that lofty range of houses known by the name of the New Town. The whole city is about five miles in circumference, and from the space it occupies in the bottom of a spacious bay, which embraces the sea in the form of an amphitheatre, and the declivity of the situation, exhibiting as it were in detail all the natural and artificial beauties of the place, it makes a most magnificent appearance at a distance. This metropolis contains four royal castles; ten parish, and nine other churches; a considerable number of public and private palaces; above four thousand burgher's houses, several of which contain ten or more families; and the whole number of inhabitants are estimated at one hundred thousand. The city is generally divided into three parts; Old Copenhagen, New Copenhagen, and Christianshafen. Copenhagen is one of the most magnificent, beautiful, and elegant cities in Europe. Between Copenhagen and that part called Christianshafen there is a lofty pillar erected in the middle of the water, on which is a statue representing a naked woman with a swan. The royal palace, called Rosenburg, is a small edifice, and is built in the semi-gothic taste. It is, however, a grand structure, and is surrounded by a ditch and sort of fortification. The adjoining gardens are extensive, and are embellished with a profusion of ornaments. In summer they serve the inhabitants for a public pleasure walk. The new palace was built by Christian VI. and though it cost six millions of dollars, yet the inscription over the grand portal declares, that the sovereign erected it from the ordinary revenues of the crown, without laying any additional taxes or imposts on his subjects. Beside the supreme and other colleges, there are in this capital several literary societies, academies for painting and drawing, the surgeons' theatre, trading companies, the bank, insurance offices, and a great many manufactories, in which silk and woollen stuffs, cloths, linen, gold and silver lace, porcelain, &c. are made; and the port is frequented by a vast number of ships annually. The tower of Trinity Church is used as an

astronomical observatory: it is round, one hundred and fifteen feet high, and fifty-four feet in diameter: it is flat at the top, and is surrounded by an iron balustrade. The ascent to this tower is spiral, and so spacious and easy, that a coach and horses may be drove up and down with ease; which experiment was tried by Peter the Great, czar of Russia, in 1716.

In the history of this city, it is observed, that from a mean fishing place in the eleventh century, it rose to a city in 1254, and then continued an episcopal see till 1443, in which year it became the residence of the kings of Denmark, and has remained such till the present time. In 1360 and 1372 it was taken and plundered by the Hanse towns, and in the years 1306, 1428, 1523, 1535, 1638, and 1659, it was closely besieged. The plague visited it eight times, between 1546 and 1711, and swept away a great number of its inhabitants. In 1626 it was considerably enlarged, and in 1700 it was bombarded by the British, Dutch, and Swedish fleets. The fire in 1728, alluded to above, broke out on the 20th of October, and in forty-eight hours destroyed twenty-four streets, &c. sixteen hundred and fifty houses, five churches, the university, the council house, and several public buildings. The anniversary of this accident is kept in a religious manner.

In August, 1807, the English government fitted out a large fleet and a body of thirty thousand land forces, which were sent to the isle of Seeland, with a view to compel the Danes to enter into the measures of the English, and to force them to join them in hostilities against the

French; but the Danish government resolutely refused to yield to the terms of accommodation proposed by the English. In consequence of this refusal to the menaces of the British government, the English army of thirty thousand men were landed, and the city of Copenhagen was invested on the 17th of that month; but the Danes did not allow the progress of the British army without interruption, although no serious conflict took place: and, after a most strenuous defence on the part of the Danes, the town and citadel of Copenhagen surrendered, on article of capitulation*, the 7th of September†.

Roeskilde is 22 miles W. of Copenhagen and 35 miles S. W. of Elsinore. It is a very ancient, and was once a very considerable city of Seeland: it was indeed formerly the capital, and the royal residence of the kings of Denmark. Its bishops, as has been mentioned above, were the means of bringing Copenhagen into reputation and their munificence to that place paved the way for the ruin of Roeskilde; inasmuch that since Copenhagen became the metropolis, and the removal of the episcopal see thither also, it has rapidly gone to decay. It stands at the bottom of Isefjord Bay, but that part of it is now so choked up with sand, that Roeskilde has but little trade. Here were once twenty-seven churches, but they are now reduced to two only.

Elsinore, or Elsinore, is 35 miles N. E. of Roeskilde, and 25 miles N. of Copenhagen, of that strait of the sea called the Sound. This place, next to the capital, is the richest and most elegant town in the island of Seeland. It has two churches and a grammar school, where

* By the third article of capitulation it was agreed, that "the ships and vessels of war of every description, with all the naval stores belonging to his Danish majesty, shall be delivered into the charge of such persons as shall be appointed by the commander in chief of his Britannic majesty's forces."

† Besides getting possession of the town and citadel of Copenhagen, the dock-yards, storehouses, &c. &c. the English took eighteen ships of the line, viz. Christian the Seventh, 96 guns, built in 1803; Neptune, 84 guns, built in 1789; Waldemaar, 84 guns, built in 1798; Princess Sophia Frederica, 74 guns, built in 1775; Justice, 74 guns, built in 1777; Heir Apparent Frederic, 74 guns, built in 1783; Crown Prince Frederic, 74 guns, built in 1781; Puen, 74 guns, built in 1787; Oden, 74 guns, built in 1788; Three Crowns, 74 guns, built in 1789; Skjold, 74 guns, built in 1792; Crown Princess-Maria, 74 guns, built in 1791; Dannemark, 74 guns, built in 1794; Norway, 74 guns, built in 1800; Princess Carolina,

74 guns, built in 1805; Detmarsken, 64 guns, built in 1780; Conqueror, 64 guns, built in 1795; and Mars, 64 guns, built in 1784.—Fifteen frigates, viz. Pearl, 44 guns; Housewife, 44 guns; Liberty, 44 guns; Iris, 44 guns; Rota, 44 guns; Venus, 44 guns; Nyade, 36 guns; Triton, 28 guns; Frederikstein, 28 guns; Little Belt, 28 guns; St. Thomas, 22 guns; Fylla, 24 guns; Elbe, 20 guns; Eyderen, 20 guns; and Gluckstadt, 20 guns.—Six brigs, viz. Sarpe, 18 guns; Glommen, 18 guns; Ne Elven, 18 guns; Mercure, 18 guns; Courier, 14 guns; and the Flying Fish.—And twenty-five gun boats.—All this was achieved, viz. the taking of Copenhagen, (from its investure on the 17th of August till its surrender on the 7th of September), and the fleet above stated, with the loss of many credence is to be given to the official documents signed (Cathcart) of thirty-nine of the military killed, and one hundred and forty-three wounded only!!! *Gazette Extraordinary of Sept. 16, 1807.*

great many poor scholars are educated and maintained gratis. Here is also a good hospital, and likewise the king's custom house. The inhabitants of Elsineur carry on a considerable trade, and it is famous both on account of its being the place by which the Swedes and Norwegians usually pass into Denmark, and for the toll which is paid here by every ship that sails through the Sound. The celebrated castle of Cronberg stands on the north side of Elsineur, on the narrowest part of the entrance into the Baltic, and was certainly intended to command the mouth of the Sound, which is here not more than half a mile wide. This is one of the best and strongest fortresses in Denmark, and is in excellent condition. It is a fine Gothic chateau, and was built by Christian IV. and was often made the seat of the royal residence. It is here that the ships which enter the Baltic are obliged to come to and pay toll. It is built in the form of a square, and within is a fine quadrangle. The towers at the corners are very superb, and in the most

improved style of Gothic architecture*. There is a little hunting seat or palace about a quarter of a mile from Elsineur, whither the king makes excursions frequently for a few hours in the summer. Nothing worth seeing distinguishes the building, but the prospect from the roof is beautiful beyond description. It looks down on the town of Elsineur and the castle of Cronberg, and commands beyond these a view of the Sound and the coast of Sweden to a great distance.

Callundborg, or Calenberg, formerly called Herwig, is a good town, and stands at the bottom of a bay which opens in the Great Belt. It is 38 miles W. of Roeskilde, and 60 miles W. of Copenhagen. Originally this town consisted of a few fishermen's huts, but it experienced the bounty of the bishops of Roeskilde, who made it a city, and beautified it with a castle, a church, and other public buildings. At this place the gulph forms a safe and commodious harbour, by which means the town enjoys a pretty good trade.

SECTION II.

General Description of Norway; its Length and Breadth, Government, Mountains, Cataracts, Lakes, Forests, Climate, Air, Soil, Mines, Language, and Religion—The principal Towns of Norway described.

THE country of Norway is about a thousand miles in length, from Lindesnaes (the Naze) in the South, to North Cape at the extremity of Finmark in the North; and its breadth, from the frontiers of Sweden Westward to Cape Statt, is about two hundred and thirty; but the country grows gradually narrower towards the North, inasmuch that in some places it does not exceed thirty miles. On the South it is bounded by the Skager-Rack, or Categat, the entrance into the Baltic; on the east it is separated from Sweden by a long chain of mountains; and on the West and North it is washed by the German Ocean or North Sea. The coast of Norway extends above fourteen hundred miles, and is studded with an immense number of islands, which afford habita-

tion to a vast quantity of fishermen and pilots, and pasture for a few cattle. These islands form an infinite number of narrow channels, and a natural barrier of rocks, which renders Norway inaccessible to the naval power of its enemies. If any attempt of this kind were made it would be extremely hazardous, as the shore is bold, steep, and impending; so that close to the rocks, the depth of the sea amounts to one, two, or three hundred fathoms. The perils of the North Sea are moreover increased by sudden storms, sunken rocks, violent currents, and dreadful whirlpools. The most remarkable vortex on this coast is called Moskoe-strom, from the small island Moskoe, belonging to the district of Lofoden, in the province of Nordland. Norway

* The late unfortunate queen Matilda, sister to George the Third, King of Great Britain, was confined for some time in this castle as a state prisoner. She was brought here on the 17th of January, 1772, when the royal apart-

ments were by no means fit for her reception; the colonel commandant—therefore, with equal humanity and politeness, resigned his own to her majesty.

is divided into the four governments of Aggerhuus, Bergen, Drontheim, and Wardhuus. The great chain of Norway mountains, running from North to South, is called indifferently Rudfield, Sudefield, Skarsfield, and Scoreberg. The height and breadth of this extensive chain likewise vary in different parts. To pass the mountain Hardanger, a person must travel about seventy English miles, whereas Filefield is about fifty over. This last mountain rises about two miles and a half in perpendicular height; but Dofrefield is reckoned the highest mountain in Europe. The river Drivane winds along the side of it in a serpentine form, so as to be met nine times by those who travel the winter road to the other side of the chain. The bridges are thrown over roaring cataracts, and are but indifferently fastened to the steep rocks on either side; so that the whole exhibits a very dreadful appearance, sufficient to deter the traveller from hazarding such a dangerous passage: for which reason people generally prefer the road over Filefield, which is much more tedious. This, however, is the post road for the king's carriages. The way is distinguished by posts fixed at the distance of two hundred paces from each other, that in snowy or dark weather the traveller may not be bewildered. For the convenience of resting and refreshment, there are two mountain stoves or houses, maintained at the expence of the public, and furnished with fire, light, and kitchen utensils. Nothing can be more dreary and dismal than these mountains, which are covered with eternal snow, and where neither house, tree, nor living creature is to be seen, but here and there a solitary rein-deer, and perchance a few wandering Laplanders. Norway abounds with fresh water lakes; the principal of which are, Rysvand in Nordland, Snaasen, Selboe, Grent and Little Mios, Slirovand, Sperdille, Rand, Vestn, Saren, Modum, Lund, Norsoe, Huidsoe, Fariavand, and Oeyevand: all these are well stocked with

fish, and are navigable for large vessels. Water have been formerly carried on upon these inland seas, in some of which are small floating islands, or parcels of earth with trees on them, separated from the mainland, and probably preserved in compact masses by the roots of trees, shrubs, and grass, interwoven in the soil*. Of all the waterfalls in Norway, that of Sarp is the most dangerous for its height and rapidity. The current drives seventeen mills, and roars with such violence, that the water, being dashed and commuted among the rocks, rises in the form of rain, where a beautiful rainbow may be always seen when the sun shines. In ancient times this cataract was made use of for the execution of traitors and other malefactors; they were thrown down alive, that they might be dashed in pieces on the points of the rocks. Great part of Norway is covered with forests of wood, which constitute the principal article of commerce in this country. They chiefly consist of fir and pine, for which great sums are received from foreigners who export an immense number of masts, beams, planks, and boards.

The climate of Norway is various in different parts of the kingdom. At Bergen the winter is so moderate, that the seas are always open and practicable both to mariners and fishermen, except in creeks and bays, that reach far into the country towards Filefield, when the keen N. E. wind blows from the land. On the E. side of Norway, from the frontiers of Sweden to Filefield, the cold generally sets in about the middle of October with great severity, and lasts till the middle of April; during which interval the waters are frozen to a very considerable thickness, and the face of the country is covered with snow†. The cold is still more intense in the part of Norway called Finmark, situated in the frigid zone, near the polar circle. But if the winter is generally cold, the summer is often excessively hot in Norway. The rays of the sun

* In 1702 the seat of the family of Borge, near Fredericstadt, being a noble edifice, with lofty towers and battlements, suddenly sunk into an abyss a hundred fathoms deep, which was instantly filled by a piece of water three hundred ells in length, and about half as broad.

† In the year 1719, seven hundred Swedes, who intended to attack Drontheim, perished in the snow on the mountains of Rudenor Tydel, which separates Jemtland in Sweden from the diocese of Drontheim in Norway. A company of two hundred Norwegian sledge men, under

Major Emahus, found them all frozen to death on the ridge of the mountain, where they had been surprised by a storm accompanied with snow, hail, and extreme cold. Some of these unhappy victims appeared sitting, some lying, and others kneeling in a posture of praying. They had cut in pieces their muskets, and buried the little was they afforded. The generals Labarre and Zoega lost their lives; and of the whole corps, consisting originally of ten thousand men, no more than two thousand five hundred survived this dreadful catastrophe.

reverberated from the sides of the mountains, so as to render the weather close and sultry in the valleys; besides the sun's absence below the horizon is so short, that the atmosphere and mountains have not time to cool. The heat is so great that vegetation is remarkably quick: barley is sown, grows, ripens, and is reaped in the space of six weeks or two months. The longest day at Bergen consists of nineteen hours, the sun rising at half an hour after two and setting at half after nine. The shortest day does not exceed six hours; for the sun rises at nine in the morning, and sets at three in the afternoon. In the beginning of the year, the day-light increases with remarkable celerity; and, at the approach of winter, decreases in the same proportion. In summer one may read and write at midnight by the light of the sky. In the district of Tromsøen, at the extremity of Norway, the sun is continually in view at midsummer. The air of Norway is generally pure and salubrious. On the sea coast, indeed, it is rendered moist by vapours and exhalations; but in the midland parts of the country, towards the mountains, the climate is so dry, that meal may be kept for many years, without being worm-eaten or damaged in the least. The inhabitants have no idea of sickness, except what is occasioned by excesses. The winds that chiefly prevail on the western coast are those that blow from the S. whereas on the other side of the field, the winds that produce and continue the hard frosts are always northerly. In the summer, there is a kind of regular trade-wind on the coast of Bergen. In the forenoon the sea begins to be cooled with a westerly breeze, which continues till midnight. Then the land-breeze begins from the E. and blows till about six in the morning. The coast is likewise subject to sudden squalls and storms. Hurricanes sometimes rise at sea, and in these latitudes the phenomenon called a water-spout is not uncommon. The fresh water of Norway is not very light or pure. The soil varies in different places according to the situation of rock or valley. The mountains here, as in every other country, are bare and barren; but the earth washed down from them by the rains, enriches and fertilizes the valleys. There is also clay found in different parts of this kingdom, of which the inhabitants begin to make earthen-ware. In a cold country like Norway, roughened with rocks and moun-

tains, interspersed with bogs, and covered with forests, we cannot expect to find agriculture in perfection. The ploughed lands, in respect to mountains, woods, meadows, and wastes, do not exceed the proportion of one to eighty; so that the whole country does not produce corn sufficient to maintain above half the number of its inhabitants. The kingdom is moreover visited by some unfavourable years, in which the sun seems to have lost his genial power; the vegetables are stunted, the trees bud and bloom, yet bear no fruit, and the grain, though it rises, will yet produce nothing but empty ears and straw. This calamity, however, rarely occurs; and, in general, the cultivated parts of Norway yield plentiful crops of excellent rye, barley, and oats. Pease are likewise propagated in this country, together with wheat, buck-wheat, hops, hemp, and flax, but not to any considerable advantage. The meadows are well stored with pasturage for sheep and cattle, and the fields are productive of those vegetables which are common in other northern countries. Within these eighty years the people of Norway have bestowed some attention on the culture of gardens, which in former times was so neglected, that cities and towns were supplied with leeks, cabbage, and roots, from England and Holland. At present, however, the Norwegians raise their own culinary and garden roots and vegetables, which thrive there as well as in any other country. The scurvy being a disease that prevails along the sea coast, nature has scattered upon it a variety of herbs, efficacious in the cure of that distemper, particularly a plant called erich's-grass, that grows in great plenty on the island of Northland; from whence the people of the Continent fetch away boat-loads of it to be preserved in barrels, as a succedaneum for cabbage. The common fruit trees thrive tolerably well in Norway, the inhabitants of which have plenty of cherries, apples, and pears. Some kinds of plums attain maturity, which is seldom the case with grapes, apricots, and peaches. But even the apples and pears that ripen here are summer fruits; that which grows till the winter seldom coming to perfection. Of the trees that grow wild in Norway, the principal are the fir and the pine. The first yields an annual revenue of a million of rix dollars, if we include the advantages resulting from the saw-mills and the masts, one of which

last has been known to sell for two hundred six dollars. The red fir tree which grows on the mountains, is so rich in turpentine, as to be almost incorruptible. Even a hundred years after the trunk of the fir tree has been cut down, the peasants burn the roots for tar, which is a very profitable commodity. In the fens, the resin of the fir tree is by nature transformed into a substance which may be called Norway frankincense. Norway likewise produces some forests of oak, which is found to be excellent for ship building. Hazles grow here in such abundance, that a hundred tons of the nuts are annually exported from Bergen alone. A great diversity of stones is found in Norway, some of which are of a surprising figure. Several mountains consist chiefly of a brown pebble, which decays with age. In some places the grey and black pebbles are intermixed with iron, copper, black lead, silver, and gold.

In Norway are inexhaustible quarries of excellent marble. Gold has formerly been found in a small quantity in the diocese of Christiansand, and coined into ducats. There is at present a very considerable silver mine wrought at Kongsburg: on the account and risk of his Danish majesty: the ore is amazingly rich, but interrupted in such a manner, that the vein is often lost. Many masses of pure silver have been found; and among the rest, one piece weighing five hundred and sixty pounds, preserved in the royal museum at Copenhagen. Such is the richness of these mines; that the annual produce amounts in value to a ton and a half in gold. About five thousand people are daily employed, and earn their subsistence, in those stupendous works. Other silver mines are prosecuted at Jarlesberg, but not to the same advantage; and here the ore is mixed with lead and copper. In many parts of this country copper-mines have been discovered; but the principal, and perhaps the richest in all Europe, is at Raraas about a hundred English miles from Drontheim. This work yields annually about eleven hundred ship-pounds of pure copper, the foundries belonging to it consume yearly about ten thousand lasts of coals, and five hundred fathoms of wood. The next in importance is the copper work at Lykken, about 20 miles from Drontheim. A third mine is carried on at Indset or Quickne, at the distance of 30 miles from the same place; and

here they precipitate the copper from its menstruum, by means of iron. There is a fourth copper-work at Silboe, about 30 miles distant from Drontheim, although the least considerable of the four. Other copper-mines of less note are worked in different parts of the kingdom. Iron is still in greater plenty, and was the first metal wrought in this country. Many hundred thousand quintals are annually exported, chiefly in bars, and part of it in stoves, pots, kettles, and cannon; the national profit arising from this metal is estimated at about three hundred thousand six dollars. There is a species, called moose iron, found in large lumps among the morasses of this the peasants make their own domestic tools and utensils, such as knives, scythes, and axes. The lead mixed in the silver ore is an article of small importance in Norway; yet some mines of this metal have been lately opened in the district of Soloer, by the proprietors of the copper-work at Oudal. A vitriol work has been begun near Kongsburg: the mines yield great plenty of sulphur; which, however, the Norwegians will not take the trouble to melt and depurate, because immense quantities are found at a cheaper rate in the island of Iceland. Alluvial is found between the slate-flakes near Christiania in such plenty, that works have been set up for refining this mineral, though they have not yet brought it to any degree of transparency. His Danish majesty has established salt works in the peninsula of Valoe, about six English miles from Tonsberg, where this mineral is extracted in large quantities from the sea water. Many Danish, English, Scotch, Dutch, and German families have settled in Norway, and now form no inconsiderable part of the trading people; but the original inhabitants are the descendants of those ferocious Normanni, who harassed almost all the coasts of Europe with piratical expeditions in the eighth, ninth, and tenth centuries. They speak the same language as that which is used in Denmark, though their original tongue is the dialect now spoken in Iceland. They profess the Lutheran religion, under an archbishop established at Drontheim, with four suffragans; namely, of Bergen, Staffaner, Hammer, and Christiania. By the union of Calmar the two kingdoms of Norway and Denmark were united under one monarch, the viceroy resides in the capital, and presides in the supreme court, which

which appeals are made from the subordinate courts of judicature. The Norwegians are generally well formed, tall, sturdy, and robust, brave, hardy, honest, hospitable, and ingenious; not savage, rash, quarrelsome, and litigious. The peasants never employ any handicraftsmen for necessities to themselves and families. The Norwegians have evinced their valour and fidelity in a thousand different instances. The country was always distracted by intestine quarrels, which raged from generation to generation. Even the farmers stand upon their punctilios, and challenge one another to single-combat with their knives. On such occasions they hook themselves together by their belts and fight until one of them is killed or mortally wounded. The nobility and merchants of Norway fare sumptuously; but the peasant lives with the utmost temperance and frugality, except at festivals: his common bread is made of oatmeal, rolled into broad thin cakes, like those used in Scotland. In times of scarcity; they boil, dry, and grind the bark of the fir-tree into a kind of flour which they mix with oatmeal: the bark of the elm-tree is used in the same manner.

Christiansand is the capital of the diocese of the same name in Norway, where the diocesan bishop and bishop have their residence. It takes its name from Christian IV. king of Denmark, and the large sandy beach upon which it is built. It is 240 miles N. W. from Copenhagen, and 55 miles N. W. from Runberg, the nearest town to it, on the opposite side of the Skagerack, in Denmark Proper. The town is built in a quadrangular form, has broad and regular streets, good houses; and a town bailiff or magistrate. It is commodiously situated, for on three sides it is surrounded with fresh and salt water, and on the fourth side with fields and partly mountains. In 1734 the church with the greater part of the town was burnt by an accidental fire, but it was shortly after rebuilt.

Stavanger is a town on the western coast of Norway, in the government of Christiansand, 10 miles N. W. of Christiansand. It stands on the southern shore of the bay of Bukkefiord, which is very large and full of small islands. This place, though small, is the see of a bishop under the archbishop of Drontheim, and is defended by the strong fortress of Doeswyck, which stands seaward about two miles from the town.

The district in which Stavanger is situated is the most temperate and best peopled, perhaps of any in Norway, though it has no other town of note.

Bergen, the largest and most considerable trading place in all Norway, is 410 miles N. W. of Copenhagen, and is situated on the southern shore of a bay which the natives call Waag. On the land-side the town is defended by high mountains; so that no enemy can approach it. On the sea-side the harbour is sufficiently guarded by fortifications. The harbour is strongly defended on the north side by the citadel of Christiansholm, also by Rothouzen, Sverresborg, the Commun and castle, and on the left side by batteries erected upon Nordnas and Fredericksberg, which last is reckoned among the most considerable fortifications about Bergen. Besides, on Syndas is a black house, and a particular round citadel called Christiansberg. All the churches and public buildings, as also most of the burghers houses on the shore, are of stone. Formerly here were thirty churches and convents: but at present in Bergen are only four parish churches, three of which are Danish, and one German; and besides there is a church in the great hospital of St. Jurgen, and a little church in St. James's church-yard. The castle is a considerable building. The large cathedral or high school, was built in 1554 by bishop Petri, and endowed by him; the revenues of which have been since augmented: so that twelve scholars are annually maintained in it. The school for navigation was formerly very numerous, but is now much declined. The Frederick-seminary is also worth notice. The town carries on a large trade in all kinds of fish, coarse goods, hides, fine furs, tallow, fir-timber, and wooden-wares. These commodities are brought hither from the northern countries, and exported abroad; in exchange for which, corn and other goods are returned. The Hanse towns erected a factory or counting-house here; in which the towns of Lubeck, Hamburgh, Rostock, Deventer, Embden, and Bremen, have the greatest share. In the seventeen edifices with warehouses, are forty-two burghers shops, and seventeen factories with shops also; of which the Lubeckers have one, the Hamburghers one, and the Bremeners the other fifteen. They have altogether eight halls for the merchants to assemble and feast in. Three several councils have been holden here; and the place

place has been five times burnt down; particularly in 1248, when eleven parish-churches were burnt; in 1756, when one thousand six hundred and sixty families were deprived of their dwellings. The number of its inhabitants amounts to about thirty thousand; and besides the magistracy, it has a town-bailiwick. It is the see of a bishop, under the archbishop of Drontheim.

Drontheim, which is 260 miles N. E. of Bergen, and 540 miles N. of Copenhagen, is the principal town of the government of Drontheim, and the see of an archbishop. It is situated on the river Nid, which issues from Tydel, a rising ground, and falls into the lake Selbøsea. This town being the capital of Norway, had formerly ten churches and five convents; but at present there are no more than two churches and an hospital church. The cathedral, a magnificent structure, built of beautiful marble, was burnt as far as the choir in 1530; which part is still standing, and is large enough for a church. Here the diocesan antman and archbishop reside. At Drontheim a considerable trade in timber, fish, coarse goods, and copper from the neighbouring works of Meldal and Roraas, is carried on. Its principal strength lies in the mountain fort of Christianstein, the fortifications on the land side, and Munkholm. This town, being built almost entirely of timber, has suffered considerably by three different conflagrations. In the summer time the inhabitants have no occasion to burn candles, since it is light enough to see without for a considerable time all night, the longest day being about twenty hours and a quarter long. On the E. side of the town is the suburb of Bakkelandat, with a church of its own, and not far from thence is Ladegaard, with another. The abovementioned fort Munkholm stands on a rock in the harbour, defending both it and the town towards the sea. In this fort it is usual to confine state prisoners.

Friderikstein, or Fredericshall, is a well built town of Aggerhuus in Norway, at the southern extremity of the country, on the borders of Sweden, and is situated on a bay of the Skager Rack, by the conveniency of which the inhabitants enjoy a pretty good trade. It is 246 miles N. of Copenhagen in Denmark, is a well fortified place, and is reckoned the key of the kingdom of Norway. Charles XII. of Sweden having set down before it in 1718, was killed as he was viewing the trenches. This town has

been frequently burnt, and was totally destroyed by an accidental fire in 1763, when nothing escaped the ravages of the devouring element but a magazine.

At 12 miles N. W. of Friderikstein is Friderikstadt, which is another well fortified place, and is situated on another bay of the Skager Rack. The inhabitants of this town likewise enjoy a good share of commerce. It is 26 miles due W. of the frontiers of Sweden.

Christiana is 50 miles N. of Friderikstadt, and is the principal town of the diocese of its own name or Aggerhuus. It is one of the finest towns in Norway, where the sub-governor, or amtman of the diocese, the supreme juridical court, and the bishop, have their seats. In this town a provincial court is also held. It is large and regularly built, and the inhabitants carry on an extensive trade, its situation being well calculated for that purpose; for it is seated at the bottom of a bay called Christiana Fiord. It has two suburbs, called Waterland and Piverig. After Opslo had been burnt down, the town of Christiana was built in 1624, near the castle of Aggerhuus, so as its guns can command all the streets. Its school was made an academy in 1636, with a salary for the master, and foundations for twenty scholars; but on the dissolution of the academy in 1653, it again received the appellation of a school. The fortress of Aggerhuus is exceedingly strong, but the date of its foundation is not known. In 1310 it was again besieged by duke Erich of Sweden; and in 1567 the Swedish army, which closely besieged it for eighteen weeks, was shamefully defeated. In 1717 the like fruitless attempt was made upon it by the Swedes under Charles XII. Before the fortifications stands a cluster of houses called Hovedtangen.

Wardhuys is a sea-port town of Norwegia Lapland, and is seated on an island of the same name. The town is very small, and is situated near the continent. It has an old fort, where the governor resides, and a street consisting of poor cottages. The government of this province extends from the gulph of Ostrasion to Russia Lapland, and comprehends the most northern part of Norway, which produces little of anything except a few pastures. The longest day at Wardhuys is about two months, and consequently the shortest day is the of the same duration.

SECTION III.

General Description of Sweden; its Length and Breadth, Boundaries, Longest Day, Climate, Soil, Roads, Rocks and Islands, Lakes and Rivers, Minerals, Inhabitants, Wealth of Sweden, Language and Religion—Cattle and other Beasts, Trade and Manufactures, Money, Prerogatives of the King—The principal Towns of Sweden described.

THE kingdom of Sweden is one of the northern states of Europe, which comprehends the greater part of the ancient Scandinavia. It has Denmark and Norway on the W. Danish Finland on the N. Russia on the E. and the Baltic Sea on the S. and S. E. It extends about seven hundred miles in length, from Ystad in the S. to Utsjola in the N. and its mean breadth is about five hundred miles. Sweden is situated between the 11th and 32d degree of East longitude, and stretches nearly from the 53th to the 60th degree of North latitude. The longest day in the southern part of Sweden is about seventeen hours fifteen minutes, while at the northern extremity it is somewhat more than two months. At Stockholm, the capital of the kingdom, it is eighteen hours long.

Sweden can scarcely be said to enjoy either spring or autumn; for a severe winter prevails during nine months in the year, and insufferable heat immediately succeeds excessive cold. It freezes all at once in the month of October, without any of those insensible gradations which in other countries usher in the season, and render the variations in the atmosphere more pleasing and tolerable. Nature, however, to alleviate this inconvenience, has given to Sweden a serene sky and a pure air. The almost unintermitting heat of the summer's sun produces flowers and fruits in a short time. The tediousness of the long winter nights is mitigated by the evening and morning twilights, which continue in proportion as the sun is more or less removed from the Swedish hemisphere. Night in this country is every where singularly luminous and pleasing. The brightness of the moon, never obscured by clouds, but highly increased by the snow lying on the earth, and frequently by the northern lights, render it as convenient to travel and do business, either within or without doors, by night as by day. The air appears universally clear, keen, and salubrious. Violent storms of

wind and rain are seldom known; and the steady piercing N. wind only serves to purify and refresh the atmosphere.

Though Sweden is extremely mountainous, it affords many tracts of even ground fit for agriculture. The soil is in general sandy and swampy, but is not void of fertility. Gothland produces the greatest quantity of grain, as wheat, rye, barley, oats, and pease: but every part of Gothland is not equally fertile. Sweden also affords good pastures, and in the southern parts some orchards which yield fine fruit; but this country is more famous for its mines than the produce of the soil. Nordland, being full of rocks and mountains, produces but little corn: however it has some spots for grazing. Lapland yields still less grain than Nordland; but Finland is in most places extremely fertile, though far from being properly cultivated. The corn in the short, but hot, summers of this climate suddenly grows up and ripens; but it is far from being sufficient for the subsistence of the inhabitants, and therefore several hundred thousand quarters are annually imported from abroad, particularly from Livonia, Pomerania, and Wismar. Mr. Wraxall's account of the soil of this country is superior to any thing yet published. "I think (says he) it may be very justly asserted, that not one twentieth part of this country is in a state to be cultivated. I have travelled near seven hundred English miles in this kingdom, and, except in the province of Scania and some parts of Finland, I did not see twenty acres of good land lying together. The soil in those places where it is capable of being cultivated is tolerably fruitful, though seldom more than eight inches deep. It is easily ploughed, and generally best, where there is least of it, that is, in the little spaces between the rocks; and frequently the barren land, enriched with the ashes of trees which are burnt upon the spot for making of charcoal, produces a plentiful crop;

6 M

but

but the danger of destroying too much of the woods, which are so necessary for their iron works, has occasioned several laws to be published to limit that custom. It is true, that if agriculture had been properly encouraged, and the farmers permitted to make the most of their farms, they might have grain sufficient for their own consumption; but as things are managed at present, they cannot subsist without great importation of all sorts of grain." Some patriots among the Swedes strenuously endeavour to promote schemes for the encouragement of agriculture and manufactures; and if the success be answerable to the present favourable appearance, the produce of the country will soon be sufficient to support some millions of inhabitants more than it does at present, and that in greater affluence and plenty. In the year 1752, the king granted the new society of agriculture a great deal of waste land for forty or fifty years rent-free, and exempted them from taxes. Hitherto considerable advantages have been made in the forests by cutting down the trees, burning them, and strewing the ashes on the land before it is sown. This sort of ground thus prepared yields a great crop of corn for three years after. The south parts of Sweden produce pretty good fruit and vegetables; but towards the north these gradually become more scarce, they degenerate in flavour and goodness, and in the most northern parts no such vegetables are to be found. In the beginning of the summer the fields in the south are stored with a variety of flowers, and, according to some authors, strawberries, raspberries, and such kind of fruit, grow upon every rock. In dry years melons are brought to perfection in the gardens; but peaches, apricots, and other wall fruit, are extremely scarce: as are also pears, apples, and plums; and those they have are not well tasted. They have, however, cherries of several sorts, and tolerably good. According to Motraye, the gardens about Stockholm are very fine; and, notwithstanding the severity of the winter, their green-houses afford orange, fig, myrtle, and other trees, plants, and flowers, of the most tender nature. Finland produces excellent turnips: and flax, hemp, and tobacco are cultivated to great advantage. Their woods consist chiefly of pines, beech, birch, alder, juniper, and some oaks, which are generally straight, tall, and fit for building. But

the extensive woods in Sweden become thinner, and daily decline from the immense consumption of wood in making charcoal, tar, pitch, pot-ash, and in burning the land. Oaks in particular grow very scarce.

The highways in Sweden are better than can be imagined, considering the many rugged mountains and rocks in the country. These are in a manner planned and made even by the peasants, so that there are scarcely better roads in any country of Europe; nor can a man anywhere travel with more security and less expence for horses are hired for about a penny a mile; but then there are very poor accommodations on the road both for lodging and diet. The easiest and most expeditious method of travelling is in winter, when they make use of sledges, especially in those parts of the country which abound in lakes and rivers; for these being all frozen, they meet with no obstacles in their way, and they can more conveniently carry provisions with them in a sledge than on horseback.

The coasts of Sweden are encompassed with innumerable capes, rocks, and islands; so that the approach to the continent is something dangerous: these which they call *Sheers*, derive their distinguishing names from the provinces opposite to which they lie, as the Upland *Sheers*, the Sudermanland *Sheers*, &c. These islands of rocks lie very near each other and are of different dimensions. Several thousands of them are inhabited by people who live chiefly by fishing.

The lakes of Sweden are very numerous: the large ones amount to seventeen. The number of rivers is likewise considerable: the largest of them are in the Swedish language called *Elbe*. The principal of these are the *Dal-Elbe*, in the *Vale* Country, which is the largest river in Sweden; the *Gullspang*, which divides *West Gothland* from *Wermeland*; the *Götheshe Elbe*, or *Göthic* river, which rises in the lake of *Wener*, and about forty-five miles before it falls into the *Skager Rack* forms a cataract, by precipitating itself from a high precipice; the *Slang*, which divides *East Gothland* into two parts; and the *Motalaström*, which issues from the *Wetterlake*, being increased by seventeen smaller rivers, forms a cataract, by falling sixteen feet, and discharges itself into the *Baltic*. Both the lakes and rivers abound in fish of several kinds; the principal of which are salmon and trout of various

various sorts. Sweden likewise affords medicinal springs of experienced virtue.

This country abounds with minerals and fossils of almost all kinds, as topazes, amethysts, crystals, cornelians, agate, a reddish stone called violstein, coral, a greenish semi-pellucid stone, porphyry, lapis-lazuli, asbestos, load-stone, touch-stone, free-stone, mill-stones, stucco-stones, slate, lime-stones, coarse and white marble, and beautiful petrifications; also excellent white marble with beautiful green veins, which are sometimes of a dark, and at others of a bright vivid green, finely interwoven; marienglas or window-glass, vitriol, mercury, amianthus, lead ore, cobalt, allum, fullers-earth, petroleum, sulphur, mother of pearl, &c. gold, silver, tin, lead, copper, and iron.

The Swedes are of a tall stature and robust constitution, capable of enduring hardships and fatigues. Where they are not too much exposed to the weather they have good complexions; and their hair, like that of other nations, is inclined to yellow. The women are of a just proportion; they have also fine features, and those who are employed at home are generally fair; but the peasants are accustomed to make their females undergo an equal share in all laborious employments. They go to plough, thresh their corn, row on the water, serve the bricklayers, and carry burthens like men. The inhabitants are, however, far from being sufficient to people the country. There is a remarkable instance of this in one place, where, though not the most northerly part, there are scarcely four thousand seven hundred people to be found in the compass of twelve thousand and seven square miles. The inhabitants of Sweden and Finland have been computed by some well-informed Swedes at about three millions six hundred thousand, reckoning eighteen thousand farms, on which are one million six hundred thousand souls, including the women, children, and servants; and it is said these farms make up above half the number of the inhabitants of the whole kingdom. Indeed, at present some parishes are so extensive, and at the same time so thinly inhabited, that a peasant must travel several Swedish miles to visit his next neighbour; others contain not more than twenty farms, and yet take a tract of land equal to the whole province of Holland, though perhaps such a parish has not so many cottages as

there are towns in that flourishing country. The common people subsist by agriculture, -working in the mines, grazing, hunting, fishing, and commerce both domestic and foreign.

The principal wealth of Sweden arises from its mines: some gold ore has been discovered, and there are several large silver mines, said to be very rich. The number of the copper mines, hammering-mills, and smelting houses, is considerable. Iron ore is in such plenty that it generally appears on the surface of the earth, and is remarkable for its richness. Indeed the produce of the mines constitute two-thirds of the national revenue. The inhabitants of the N. part of Sweden are strangers to delicacies and live very hardly. They have a sort of bread made of the bark of birch and pine trees, straw, and roots. Their clothing in winter is suitable to the climate: the rich wear clothes lined with warm furs; instead of which, those who cannot afford them, make their clothes of sheep skins with the wool on; and thus are better provided with clothing to the season, and to their own condition than the people in most other countries. The fashion resembles that of the Germans and other European nations: and like them, they wear in summer such clothes and stuffs as they can produce: the great adorn themselves with lace and embroidery.

The Swedish tongue has such an affinity with the Danish and Norwegian, that the inhabitants of these three kingdoms readily understand each other: but Finland and Lapland have their respective dialects. Christianity was introduced into Sweden in the ninth century, and Gustavas Vasa was among the first princes who countenanced the doctrines of Luther, and gave them a legal establishment. The Swedes are singularly steady in their religious principles and have such an aversion to popery, that castration is the certain fate of every Roman Catholic priest discovered in their country.

In several parts of Sweden the inhabitants subsist by grazing, but in all the northern countries the cattle are small, and the wool of the sheep is very coarse, so that in order to mend the breed, rams are imported from England and Spain. The horses are strong, hardy, and vigorous. The kingdom affords plenty of all kinds of deer, elks, hares, and all sorts of tame and wild fowl: and some parts of Sweden are much infested with

lynxes,

lynxes, bears, wolves, foxes, otters, martins, and weasels. All sorts of animals, quadrupeds, birds, and fish are similar in most particulars to those in the various territories of Denmark. The Swedish horses are well known to be much more serviceable in war than those of Germany.

The fresh and salt water fish, which are the same here as in the neighbouring countries, are however taken in such quantities, that their very pikes are pickled and prepared with others for exportation. The train-oil of the seals found in the Gulph of Finland affords a very lucrative branch of commerce. All the northern countries are more or less distinguished by such protuberances, declivities, or inequalities, as are evidently produced by their affinity to the pole, or the turbulent rigour of the climate. Their seas, bounded on all sides by rocky shores, rushing over innumerable shelves and promontories, and agitated without intermission by the fiercest winds, are generally stormy and furious; nor is the land less subject to that striking irregularity, which, under the directions of a boisterous atmosphere, so incessantly disfigures the face of the ocean. These appearances are common to all the countries in the world in proportion as they verge towards the polar regions. Those peculiar to Sweden are neither numerous nor extraordinary. A few leagues from Gottenburgh is a hideous precipice, down which a mighty catract of water rushes with such impetuosity, and to such a depth, that large bodies of timber, precipitated from the height by the torrent, disappear sometimes for a half, and at other times for a whole hour. The bottom of this dreadful abyss, formed by the weight of a powerful stream falling some hundreds of feet perpendicularly, perhaps from the beginning of time has never yet been found, though sounded by lines of several hundred fathoms. There is in the southern parts of Gothland a slimy lake, which sings whatever is put into it of a combustible quality. Several parts of Sweden are also said to contain a stone or certain petrefaction of a yellowish colour intermixed with various streaks of white, which seem as if compounded of gold or silver, and which afford sulphur, vitriol, allum, and minium. The peasants in this country, as we have already observed, chiefly subsist by agriculture, mining, grazing, hunting, and fishing. Their materials for traffic are the bulky

and useful commodities of masts, beams, deal boards, and other sorts of timber for shipping; tar, pitch, barks of birch, pot-ash, wooden utensils, hides, flax, hemp, peltrey, furs, copper, lead, iron, cordage, and fish. Till the sixteenth century, they sold their own crude ore to the Hanse Towns, and bought it back again when manufactured; but since that time, the method of manufacturing all sorts of iron ware has been assiduously cultivated. Assisted by the Dutch and Flemings they have also set up several manufactures of glass, starch, tin, woollen, silk, soap, leather-dressing, and saw-mills. They have sugar-baking, tobacco plantations, and manufactures of sail cloth, cottons, fustian, and other stuffs. Ships of considerable burthen, for sale as well as for their own use, are likewise built in their docks. Those towns, though lying near the sea which have no foreign trade, are called Land Towns; others, and these are twenty-four in number, are called Steeple Towns, where the merchants are allowed to import and export commodities in their own ships. Those in the mine districts are called Mine Towns. The different branches of trade, however, and every thing relating to merchandize, are monopolized in the kingdom, and only a fixed number of artificers and traders allowed in every town. Thus when a young man has served his time to any particular business, he cannot exercise it till he has also served a certain number of years as a journeyman, and then not till there is a vacancy by the death of one of the masters. The stagnation of inland commerce prevents the inhabitants of the different provinces from bartering the superfluities of their respective products. The profits of agriculture, though the most important objects of commerce, are very much neglected, and little encouragement is given to carry the native produce of the earth to any foreign market: for this reason, many very extensive tracts of land in the most fertile provinces still remain uncultivated. Indeed, there has been no great progress made in the internal improvement of this country during the last two hundred years.

Very little of either silver or gold is to be found in this depopulated and half-famished country. The two things which supply the place, and by which a miserable semblance of commerce is still carried on, are paper and copper. Their bank notes are as low as one shilling

and six-pence; and they have them of all value rising gradually from that sum. This, too, is a misfortune which originated in Charles. the Twelfth's unhappy passion for war. Baron Gortz, in the latter end of that monarch's reign, had the address for facilitating the schemes of his master against the peace of Denmark, to give copper the value of silver; by which the Swedes were obliged to give all the silver they then possessed, in exchange for this wretched and chimerical equivalent; the payments are therefore this day made in copper, which is here the chief medium of trade, and extremely inconvenient. They have still, however, a few gold coins, and pieces of silver about five shillings and two pence value each, in circulation: and the several subsidies which of late years, under Louis XV. and XVI. paid them by France and other courts have considerably increased their currency.

On the 19th of August, 1772, Gustavus III. of Sweden restored to the crown those prerogatives which it had lost for more than half a century. His profound secrecy and dissimulation in this dangerous and critical juncture, much surpassed what might have been expected from a youthful age. To this important plot, which was executed with as much dexterity and precision, as it had been planned, it is said, that only five persons in the kingdom were privy. The soldiery and people were successively gained by the eloquence of the young king, who addressed them in a language equally simple and terrible. No popular commotion took place, conspiracies were formed, and few imprisonments clouded the memory of this illustrious occasion, nor did the most strenuous opposers of the measures experience in the smallest degree diminution of the royal favour or that account: the senate only took a new oath of allegiance to the prince; and every part of the kingdom, cordially acquiescing in what had happened, reverted to its original tranquillity. We must not, however, suppose an unlimited monarchy or absolute government established in Sweden. Nor is this new political institution by any means an exact model of the English, though some respects the Swedish is still more restrictive than the British sovereign, as he can neither declare war nor peace without the consent or concurrence of the other branches of the supreme

VOL. II. No. CVI.

legislature. His prerogative is greatly enlarged; but he is not by any means superior to the laws of his country.

Opposite to Elsineur in the island of Seeland, in Denmark, is the town of Helsingborg, in South Gothland, in Sweden. This is a very ancient staple or trading town, and is situated at the foot and declivity of a high mountain, on the top of which it formerly stood. This place having suffered greatly by former wars, has now only a battery of a few guns. The harbour is shallow. From this place is the direct passage over the Sound into Denmark, from which it is distant but a small space. It carries on a good trade, and in their ribbon-weaving young girls are usually employed instead of young men. From a mountain in its neighbourhood issues the Helsingborg spring, which furnishes the town with forty-three large measures of cold, clear, and well tasted water, which is fetched from thence, and shipped off in large quantities. Helsingborg is 29 miles N. by E. of Copenhagen, and 290 S. W. of Stockholm.

Laholm is 32 miles N. by E. of Helsingborg, and 262 S. W. of Stockholm. It is situated at the mouth of the river Laga on the Cattegat, near the entrance of the Baltic. Here is a citadel and a good harbour. The inhabitants by means of its harbour enjoy a decent trade.

Halmstadt, which is 12 miles N. of Laholm, and 260 S. W. of Stockholm, is a pleasant well built sea-port town; it is the capital of Halland, a subdivision of South Gothland. It is situated at the mouth of the Nissa, which falls into the Cattegat, and its inhabitants carry on an extensive trade. It is famous for its salmon. In 1619 Gustavus Adolphus, king of Sweden, and Christian IV. king of Denmark, had a friendly interview here: the latter had fortified it, but it was yielded to Sweden by the treaty of Brombo, in 1645; and in its neighbourhood Charles XI. of Sweden obtained a victory over the Danes.

Falkenberg is 22 miles N. by W. of Halmstadt, and 251 S. W. of Stockholm. It is a small, but ancient maritime town of Halland in South Gothland, and is seated at the mouth of a river of the same name, which falls into Cattegat. It has a considerable fishery of salmon, but that of herrings is small. The harbour here is tolerable, and is defended by a castle. Near the village of Axtorn in its neighbourhood, a

6 N

battle

battle (called the battle of Falkenberg) was fought in 1565, in which the Danes were defeated by the Swedes.

Warberg is 12 miles N. of Falkenberg, and 245 S. W. of Stockholm, and is likewise in the subdivision of Halland in South Gothland. It is but a small town, but is defended by a strong castle. It stands on the Cattegat, and has a decent harbour.

Gottenburg, or Gothenburg, is 41 miles N. by W. of Warberg, and 240 S. W. of Stockholm. It is the capital of West Gothland, and is seated on the Skager Rack, at the mouth of the Gothesba, where it forms an excellent harbour. It was originally built by Charles IX. of Sweden, in 1607, on the island of Hisingen; but being destroyed by the Danes in 1611, the inhabitants, about seven years after, removed to the place where it now stands, and were favoured with several considerable privileges. Gottenburg carries on the greatest trade of any city in Sweden, except Stockholm. The streets are broad and kept very clean; and since the year 1746 the greater part of the houses have been rebuilt with stone. It is regularly fortified, and on the land side is defended by two citadels, called the Lion and the Crown; and towards the sea by the citadel of New Elsburg. The governor of the prefectures of Gottenburg and Bohus, who is also commandant of the forts and fortifications, resides in this city. Gottenburg is the see of a bishop, and has two printing-offices, a city church, a seminary, an orphan house, an edifice called the crown-house, where the garrison attend divine service, a German church, and several quays and docks. The number of its inhabitants are estimated at fifteen thousand. In 1731 an East India company was established in this city, for the harbour is a very fine one, and is resorted to by a great number of ships: there is here also a college of admiralty, and a court of appeals.

Marstrand is an old staple town of Bohus, a district of West Gothland, at the distance of 20 miles N. W. of Gottenburg, and 240 W. by S. of Stockholm. At this place is an excellent harbour, which is defended by the citadel of Carlstein, a fortress which is said to be impregnable.

* In the eleventh century a society was founded here in memory of king Canute IV. or the saint of that name, and called Canute's Gild, having members of both sexes, among

This town has been so reduced by the wars between the Swedes and the Danes, and by several fires, that in the year 1745 there remained no more than twenty poor burghers to inhabit it: it has, however, somewhat increased, and even now is but thinly inhabited.

Lidköping is 70 miles N. W. of Gottenburg and 180 miles W. by S. of Stockholm. It is a small but well built town of West Gothland, and is situated at the mouth of the small river Lida, where it falls into the Wener Lake. It has one of the largest and most pleasant market places in the whole kingdom.

Falköping is an inland town of West Gothland, 28 miles S. E. of Lidköping, and 60 E. by N. of Gottenburg. It is situated in a fruitful spot, but quite divested of wood, between two mountains, and on the south bank of a little lake which empties itself into the Lida. The country round about it is called Falbygden. In the neighbourhood of this place a battle was fought in 1388, between king Albert and queen Margaret, in which the former, together with his son, were taken prisoners.

Landskröna, or Landskröon, is 13 miles S. of Helsingborg, in Gothland. It is situated on the shore of the Sound, has a safe and good harbour, and is much more resorted to by merchants especially at its annual fair on Midsummer Day. Here is a strong castle not far from the island of Huenä, which is a place of great importance. Near this town Christian V. of Denmark was routed in a pitched battle by Charles XI. king of Sweden, on July 24, 1677; but the succeeding year the Danes took the place.

Malmo, (called by the Dutch Ellebogen because it stands on an angle or elbow,) is 2 miles S. of Landskröna, and is a populous and pretty trading town of Schonen, in Gothland: it has a harbour on the Sound, upon which it lies. This town is reckoned to contain about two thousand inhabitants. It had formerly walls, ditches, and bastions on the land side, with a castle and fortress on the sea-side*.

Cimbrishamn is a small maritime town of Schonen in Gothland, 45 miles E. of Malmo, on the eastern shore of Sweden. Here is a harbour

whom have been several kings, princes, and persons of distinction.

its name imports, and its inhabitants have a pretty good trade. From this place some of the ancient Cimbræ are said to have migrated.

Christianstadt is 32 miles N. of Cimbrishamn, and stands on the river Hedge-a, which surrounds it on three sides. It was built by Christian IV. king of Denmark, and had its name from him. The inhabitants carry on a good trade, and it contains about eighteen hundred inhabitants. The town is surrounded with ramparts and horn-works, besides a fort which lies near the church, but which is not considerable. The landschapman, or governor of the province resides here.

Carlshamn (formerly called Christianshamn) is 30 miles E. by N. of Christianstadt, and 250 by W. of Stockholm. It is situated in the district of Blekingen, in Gothland, and is a staple town. On a rock near the mouth of the river is a fort, which defends both the town and a commodious harbour. Here are two churches, a woollen manufactory, and a wharf for shipping; without the town, at a small distance, is a copper work. The number of its inhabitants is about fourteen hundred.

Carlsrona, or Carlsroon, is a fine staple town of Blekingen, in Gothland, on the Baltic. It is 28 miles E. of Carlshamn, and 238 by W. of Stockholm. This is reckoned one of the best towns of Sweden. Part of this town is on the isle of Biorkholm, where is a lazaretto for sailors, and on Stubholm, where is the arsenal, &c. and on the wharf, where the fleet is. The small and great islands round the town, with the forests of oak and beech, render the situation very pleasant. It has three churches; the number of its inhabitants computed at five thousand. Here is a royal college of admiralty; also a dock which is separated from the town by a high stone wall. The provincial governor resides here. The harbour lying between Aspoe and Stork-oe is so commodious, that the whole royal fleet may be quite secure in it, and its entrance is defended by the gadel of Kongsholm and Drottningshiar. The dock is particularly remarkable; it is a large excavation made by art in a rock, about eighty feet deep, and from three hundred to four hundred and fifty feet long, where the royal fleet is. It has a large opening towards the sea for the greatest ships of war to come in. It is shut by two water gates, at which time the cavity

may be drained in twenty-four hours, and left a quite dry dock for repairing or careening any ship. When she is to come out again, the water may be let in through two openings in the said water-gates; before which is an engine to hinder the waves of the sea from beating against them with all their force. In 1779, a grand bason was formed there by Mr. Tunberg, reckoned one of the finest performances of the age. It contains twenty-four places in which ships may not only be kept dry, but may be taken out by letting in water at any time, which may be done with any one separately.

Calmar is a fine staple town belonging to a district of the same name in East Gothland, and is one of the oldest towns in the Gothic kingdom. It is 43 miles N. E. of Carlsrona, and 193 S. by W. of Stockholm. It lies on the open sea, directly opposite to the isle of Oland, and is built nearly in a circular form, with regular streets. It formerly had a different site, and contained several churches and convents; but after it was burnt in 1647, it was removed towards the isle of Quarnholm. Its castle is well fortified. In the wars between the Swedes and the Danes this place has been often taken and retaken. Here the famous treaty was signed which united Sweden and Norway to Denmark in 1397. It is the see of a bishop, has an university, a fine cathedral, a ship dock a commodious quay, and is surrounded with a royal chase on the land side. The principal export trade of this place consists of deals, tar, and allum; it has likewise good linen and woollen manufactures. It is remarkable, that near this place is a spring of fresh water in the open sea.

Westerwyk, which is 60 miles N. of Calmar, and 120 S. by W. of Stockholm, is a sea-port town of the province of Smaland in East Gothland, and is a place of some trade, for its harbour is safe and commodious.

Nykoping is a large city, 70 miles N. of Westerwyk, and 54 S. W. of Stockholm. This town is the capital of Sudermauland in Sweden Proper, and is supposed to be the oldest in the kingdom. Here the kings and princes of this province formerly had their residence. It has a pleasant and healthy situation on a bay of the Baltic. It was defended by a strong castle till the year 1719, when it was taken and destroyed by the Russians.

Stockholm, the metropolis of Sweden, is 240 miles

miles E. by N. of Gottenburg; 340 N. E. of Copenhagen, 430 W. of Petersburg, and 920 E. by N. of London. This city is the seat of the Swedish government, and is situated at the junction of the Baltic with the lake of Maler. It seems to borrow its name from the materials of which it is built, and the foundation on which it stands. The houses are mostly timber, and built on a cluster of islands. The circuit it takes from one gate to the other is twelve miles, and the space it occupies contains six islands and some peninsulas. The islands which inclose the greatest part of the city are surrounded by two arms of a river, which run with great rapidity out of the Maler lake, over each of which there is a wooden bridge. From the city is a prospect on one side over the lake, and on the other over the sea, which here forms a gulph, that running between several rocks has the appearance of another lake. This place, about three hundred years ago, was no more than a bare island, with a few mean cottages for accommodating the fishermen and their families; but it was thought a proper spot for a fortress to check the incursions of the Russians. Here, therefore, a castle was first erected; next a palace for the Royal Family; and then a complete set of apartments for the whole court and principal officers of state. In this manner Stockholm soon surpassed in magnitude and splendour all the cities in Sweden. The castle, which has been repeatedly enlarged and refitted for these public purposes, is a place of no great strength or beauty, but is a very capacious edifice, containing accommodation for the king's household, most of the ministers, the national court of justice, the college of war, the chancery, treasury, colleges of reduction, liquidation, commerce, and execution. Here are also kept the public records, an armory, chapel, and a library. Most of the inferior officers and servants of the court are quartered on the burghers, at their landlord's charge, for lodging, fire, and candle. In this city are nine large and beautiful churches, all of which have lofty spires: and instead of bells, they have pretty musical chimes in their steeples, which play on festivals and other solemn occasions. The church of St. Nicholas is chiefly

distinguished from the rest by its size and magnificence. It is covered with copper, supported by four massy pillars of marble and adorned with a great variety of elegant tombs and monuments. The statue of St. George on horseback trampling on the dragon is much admired. Over the altar is a cabinet finely gilt, which holds a table of a pyramidal form with shelves of massy silver. On this are several historical scripture pieces in basso relievo. There are other silver statues about the altar of the same magnitude; as that of Moses with the two tables of the law, John the Baptist, with a cross and a lamb; and the Evangelists, with the drapery usually assigned them by painters and statuary. To Stockholm most of the goods of their own growth as iron, copper, wire, pitch, tar, masts, deals, &c. are brought for exportation. The greatest part of foreign commodities are imported into this port, where there is a haven capable of receiving a thousand sail, with a quay near an English mile long, close to which vessels of the greatest burthen may lie with their broadsides; the only inconveynency is its being ten miles from the sea, the river very crooked and no tides. It opens into the Baltic, but is of dangerous access, by reason of rocks; and its entrance is defended by two forts: within, ships are so secure from the wind, that it has been said they need neither anchor nor cable to hold them.

Soderhamn, *i. e.* the South Harbour, is a town of Helsingland in Sweden Proper. It is situated on the Gulph of Bothnia, 140 miles N. of Stockholm, at the mouth of the river Liusnia; it has a good harbour, and has been built within about sixty years, nevertheless it appears to be in a flourishing state.

Umea is a town of West Bothnia in Sweden, 200 miles N. by E. of Soderhamn, and 312 miles N. by E. of Stockholm. It is situated at the mouth of a river of the same name, which empties itself into the Gulph of Bothnia. At this town the governor of Umea Lapmark resides, and the place enjoys a tolerable share of trade.

Pitea is a sea port town of West Bothnia, situated on a small island at the mouth of the river Pitea, where it falls into the Gulph of

* This is the fabulous history of his delivering Cleodinda, daughter of the king of Lydia, and twelve other devoted virgins, from the fury of the monster he subdued.

The princess is represented kneeling, with her hands lifted up, and other signs of the sincerest acknowledgements to their gallant preserver.

Bothnia. It is 103 miles N. by E. of Umea, and 420 miles N. by E. of Stockholm. This town is joined to the continent by a wooden bridge, at the end of which a gate is erected. The streets run in parallel lines; but the church stands at some distance from the town; so that the bridge must be crossed to go to it. Pitea was originally built by Gustavus Adolphus in 1621, about three miles higher up in the country; but that town being destroyed by fire in 1666, was rebuilt on its present situation, where it has a very commodious harbour. The old town of Pitea is now only a village, consisting of a few houses irregularly scattered on a fine common.

Lulea, a sea-port town of West Bothnia, is 80 miles N. E. of Pitea; it is situated at the mouth of a river of the same name: its harbour is tolerably commodious, but the inhabitants do not enjoy much trade.

Tornea, the capital of Tornea Lapmark in West Bothnia, is 56 miles E. by N. of Lulea, and 490 N. by E. of Stockholm. It is seated at the mouth of a river of the same name, on an island, and at the most northern part of the Gulph of Bothnia. The inhabitants of Tornea carry on an extensive trade with the northern parts of Sweden; and although the cold is very severe in winter, they are exceedingly healthy. The longest day at this town is about twenty-two hours. The river Tornea rises in Norwegian Lapland, and falls into the Bothnic Gulph at Tornea, after a course of about three hundred miles. It is extremely rapid, receiving in its way twenty-nine other rivers, one of which is very broad. On the melting of the snow, this and the other rivers overflow their banks; and all of them have several dreadful cataracts.

Gamla Carleby, or Old Carleby, is a sea-port town of Finland, on the eastern shore of the Gulph of Bothnia. It is 375 miles N. E. of Stockholm, stands on a fruitful plain, and has a good and safe harbour. The business of ship-building is carried on here to a considerable extent, and affords employ to a great number of hands. The inhabitants likewise trade largely in furs. In spring and autumn the peasants of these parts make salt from the sea water, which by pouring a little sour milk upon it in the refining pan, turns immediately from a grey tinge to a colour as white as snow.

VOL. II. NO. CVI.

Ny Carleby, or New Carleby, is 29 miles S. W. of Gamla Carleby, and is likewise on the coast of the Gulph of Bothnia. Here is also a good harbour, and the inhabitants carry on a considerable trade in tar.

Wasa, Vasa, or (as it is sometimes called) Mustasar, is another sea-port town of Finland; at the distance of 70 miles S. W. of Old Carleby, and 280 miles N. E. of Stockholm. A considerable trade in tar is likewise carried on by the inhabitants of this town.

Christianstadt is a maritime town on the Gulph of Bothnia in Finland, 60 miles S. of Wasa, and 230 N. E. of Stockholm. This town which is populous, was founded by Count Peter Brahe; on the peninsula of Koppo, and received its name from his first wife.

Bjorneborg, the capital of the district of the same name, in Finland, lies on the sea coast, at the distance of 60 miles S. of Christianstadt, and 185 miles N. E. of Stockholm. It is situated on a long strip of land on the eastern shore of the Kumo Elf, or Gulph of Bothnia, which below the town is subdivided into several arms, and by that means forms several small islands for the space of half a mile. It is said at first to have been built in the parish of Kumo, but was afterwards removed to Ullsby or Wanhakyla, and in 1558, to its present site. From this place are sent annually great quantities of wooden ware, and abundance of fish, particularly salmon and large cod or white fish, not only to Stockholm, but also to other parts. The place where ships take in their lading is near Sandred, about a mile from the town.

Nystadt is 50 miles S. of Bjorneborg, and 150 N. E. of Stockholm. It is seated on a commodious bay of the Bothnic Gulph, and is noted for a peace concluded here in 1721, between the emperor of Russia and the king of Sweden. It enjoys a good trade.

Abo is 32 miles S. E. of Nystadt, 158 E. by N. of Stockholm, and 284 W. of Petersburg. This town, which is the capital of Finland, stands on the angle formed by the Gulphs of Bothnia and Finland, on the river Aurojoeki, which runs through the town. Abo is by far the best town in Finland, and was built as early as the year 1155. It is surrounded with mountains, has the privilege of a staple, and has an excellent and commodious harbour. Abo is the see of a bishop,

G O

who

who is suffragan to the archbishop of Upsal, which was founded about the year 1226. In 1628 Gustavus Adolphus erected and endowed a college at Abo, which, in 1640, queen Christina turned into an university, granting it many privileges. The great or episcopal church, built in 1300, is a handsome structure. This is the only royal jurisdiction in the province, the governor of which resides here. It was almost entirely reduced to ashes in 1687. Near the harbour stands a rock surrounded by the sea; and, when ships pass it, the compass, they say does no longer point to the north; whence it is suspected that it contains mines of load-stone.

Helsingfors is the capital of the province of Nyland in Finland. It is 92 miles E. of Abo, 240 E. of Stockholm, and 195 W. of Petersburg. Helsingfors is but a small town, and is situated on a peninsula and gulph of its own name, at the mouth of the river Windä, which here falls into the Gulph of Finland, and forms a pretty good harbour, which is one of the best in the whole kingdom.

Tavastehus is an inland town of Finland, and capital of a district of its own name. It is 60 miles N. of Helsingfors, and 80 N. E. of Abo. The district in which this town is situated is a fruitful level country, intersected by rivers and lakes, which abound with fish. The inhabitants chiefly subsist by agriculture, grazing, and breeding of cattle, and some of them are employed in the fishery.

Louisa, or Degerby, is 55 miles E. of Helsingfors, and 145 W. of Petersburg. This is a well situated town, on an angle of the Finnic Gulph, where is a commodious harbour, by means of which the inhabitants carry on a good trade.

On the coast of Sweden there are an innumerable quantity of islands which belong to that kingdom; the principal of which are, the Isle of Gothland, the Isle of Oland, and the Isle of Aland.

The Island of Gothland is situate on the Baltic Sea, at the distance of 60 miles from the eastern coast of East Gothland. Its greatest length, from S. W. to N. E. is about 80 miles, but its mean breadth is about 24 miles. There is but one considerable town in this island; viz. Wisby, but there are a great many villages. Wisby is a

sea-port town, on the west side of the island, and is 120 miles S. by E. of Stockholm. It is seated on a good harbour, which is defended by a strong castle. The town of Wisby has received so much damage from the sea, that it is greatly reduced from what it was formerly. The whole of the inhabitants on the Isle of Gothland are estimated at about ten thousand.

The Isle of Oland, or Oeland, is a beautiful spot directly east of the coast of East Gothland. It is 86 miles long from N. to S. but not more than ten in the widest part from E. to W. It is divided into two parts; viz. the North and the South. In the former are several fine forests, and many quarries of stone; but in the latter the ground being more level, is fit both for tillage and pasture. The island in general yields plenty of honey, wax, butter, and nuts. Both parts of Oland abound in mines of allum, black marble, and free stone, remarkable for its hardness. The number of its inhabitants are said to exceed seven thousand persons; who are chiefly employed in agriculture, working in the quarries in cutting free stone, burning of lime, in fishing and in navigation. The Isle of Oland is about 12 miles E. of the shore of East Gothland.

The Isle of Aland lies at the entrance of the Gulph of Bothnia, about midway between Sweden Proper and Finland. In the intermediate channel are many small islands, particularly between Aland and Finland. This island is about 27 miles long; and 16 miles broad, where broadest. The soil is so fruitful, that the inhabitants have a sufficiency of corn throughout the year. The pastures are very good, as are likewise the cattle. The inhabitants speak the Swedish language, and have their subsistence mostly from agriculture, breeding of cattle, the fishery, hunting, and navigation; also from the taking of sea-fowl, and from the loppings or profits of the woods. They trade in butter, cheese, wood-ware, coals, and chalk. Formerly this island had its own kings; and even after it came under the dominion of Sweden it had, for some centuries, its own stadtholders or governors. The clergy of this island are under the bishop of Abo. The most remarkable places in this island are Castelholm, Grelsby, and Haga; which are domains belonging to the crown, in the first of which is a post-house.

VIEW OF THE RUSSIAN EMPIRE,

BY

WILLIAM TOOKE, F. R. S.

MEMBER OF THE IMPERIAL ACADEMY OF SCIENCES AND OF THE FREE ECONOMICAL
SOCIETY OF ST. PETERSBURG.

SECTION I.

Introductory Remarks—Climate—Nature and Quality of the Ground—Face of the Country: Forests, Mountains, Steppes, Morasses, Wastes, Salt Places—The principal Mountains of Russia enumerated—The principal Plains of Russia.

THE Russian empire, which in various respects now fixes the attention of Europe, has for several years been the subject of a multitude of investigations and writings, by which the knowledge of that country is considerably improved and enlarged. The care which Catherine the Second, from her first accession to the throne, and during the whole of her reign, devoted to the cultivation of this knowledge, has been attended with so much success, that Russia, which, prior to the year 1762, was a sort of *terra incognita* in our part of the globe, is now in possession of a very considerable store of materials, from which the present state of this remarkable country may be illustrated and described.

Russia, an empire but little known or regarded in the seventeenth century, at the opening of the eighteenth made her appearance all at once among the states of Europe; and, after a short trial of her powers, became the empire and the arbitress of the North. The whole system of Europe took another form; the arctic eagle extended her influence to the regions of the Adriatic and the banks of the Tagus, while the lightning of her eye struck terror into the recesses of Mount Caucasus and made the Hellespont trem-

ble. The arts of Europe were transplanted, and bloomed both on the shores of the Neva and those of the Irtysh: a new world was opened to commerce; and the sciences, the manners, the luxury, the virtues, and the vices of western Europe have found their way into the deserts of oriental Asia, and to the inhospitable coasts of the Frozen Ocean. The æra of these remarkable phenomena was the commencement of the eighteenth century*.

By Russia is sometimes understood the whole Russian empire: yet these two expressions have properly a very different signification. Russia Proper implies those principalities and provinces which for many ages past have been inhabited by Russians†; and the following are its divisions, namely: 1. Great Russia, which has always bore the name of Russia in the strictest import, and comprises those large tracts of country, principalities, viceroalties, and dukedoms which have uninterruptedly composed the Russian dominion; as Mosco, Vladimir, Novgorod, Pskove, Pereslavl, Riavanskoi, Kaluga, Tula, Yaroslavl, Kostroma, Tver, Vologda, &c. 2. Little Russia, comprehending the Ukraine‡, or in general the present three governments of Kief, Tschernigof, and Novgorod-Sieverskoi§. 3. White Russia,

* In the year 1697 Peter the Great began his first journey into foreign countries. In 1699 he concluded the amity with the Porte, by which he acquired Azof, and was enabled to construct a navy on the Euxine. In 1700 the battle of Narva was fought, where the Swedes for the first time shewed their superiority in discipline and the arts of war.

† For about thirteen or fourteen hundred years, as far back as authentic history reaches: this however is principally to be understood of Great and Little Russia.

‡ Which word signifies the borders.

§ It was long separated from Great Russia; but united to it again in 1654.

by which, for a long period of time, was meant the principality, or the present government of Smolensk; to which are now added the two governments of Polotzk and Mohilef, still sometimes called the White-Russian territory: otherwise the name of White Russia is no longer heard of. To these were added, 4. New Russia, by which were denoted the large tracts of country near the Ukraine, towards Poland and the Turkish dominions: namely, New Servia and the province of St. Elizabeth, which now belong to the government of Ekatarinoslaf, and therefore its name has fallen into disuse.—The three last have not always been united with Great Russia.

But, by the Russian empire, is likewise understood not only those just mentioned, but also such kingdoms, countries, and provinces as have been at various times since added to it by conquests and appropriations: as, 1. The kingdom of Kazan, which was conquered by tzar Ivan Vassillievitch in 1552, at present consisting of several governments. 2. The kingdom of Astrakhan, taken by the same monarch*; at present likewise divided into several governments. 3. The vast country of Siberia; which by calculation, contains upwards of ten millions and a half of square versts, comprehending within it several kingdoms, taken by roving Kozaks on their own account, and then surrendered to the tzar, who completed the conquest; this at present consists of several, but those the most extensive governments. 4. The provinces on the shores of the Baltic, captured from the Swedes by Peter I. and for ever incorporated with the Russian empire by two treaties of peace: Livonia, Esthonia, Finland, and Ingria or the present governments of Riga, Revel, Vyborg, and St. Petersburg. 5. The countries taken from Poland, now the governments of Polotzk and Mohilef, which the empress Catherine II. united to the empire. 6. The territory she annexed to Russia by the peace concluded with the Turks in 1774. 7. The Krim and the Cuban, or the province of Taurida and the government of Caucasus, united to the empire by that sovereign in 1783. 8. The tributary islands in the eastern ocean, now added to Russia. 9. The countries that have more recently submitted to the Russian

supremacy, namely, Kartuelia, or Kartolinia, &c. 10. The possessions in America; consisting partly of islands, partly of the continent of California, where the principal establishment is called Donalesk. 11. Some other countries incorporated with the empire at various periods; as, the Kirghis-kozaks, of the middle and little horde, who submitted themselves in 1731, and several others.

Hence it appears that the Russian empire has not always been of such magnitude as at present. Even in the thirteenth century Lithuania was not so far from Moscov[†] as now. From this slight inspection it is manifest that the amplitude of the empire is far greater than that of the largest monarchy in ancient or modern times. Accordingly, the empress, in her letter of grace to the Russian nobility in 1785, expresses herself in the following manner: "The Russian empire is distinguished on the globe by the extent of its territory, which reaches from the eastern borders of Kamtschatka to beyond the river Duna which falls into the Baltic at Riga: comprising within its limits a hundred and sixty-five degrees of longitude: extending from the mouths of the rivers Volga, Kuban, Don, and Dnieper, which fall into the Caspian, the Palus Mæotis and the Euxine, as far as the Frozen Ocean, over two and thirty degrees of latitude." The same number of degrees is assigned it by this sovereign, in her instructions to the commission for framing a code of laws. But, from her own words, it plainly appears, that she only takes notice of the countries contiguous to each other, according to the general extent: but none at all of the islands, or the numerous promontories and points of land that strike out from them. The islands in the eastern ocean are not once mentioned. Even the isle of Oesel, with its western promontory reaches several degrees farther than the river Duna. If we take all these into the account the Russian empire, according to the newest and best charts, will be found to extend from about the forty-third to the seventy-eighth degree of north latitude; and from the thirty-ninth to the two hundred and fifteenth degree of longitude: this last, however, including the islands lying in the eastern ocean. Without reckoning the islands,

* Kabarda likewise soon afterwards submitted.

† The proper name of this capital is Moskva; but Moscov is grown into such familiar use by long established

custom, that we should no more think of altering it than of reducing Warsaw to its right name of Varschau, or calling the Tartars by their proper name Tatar.

the empire extends in length nine thousand two hundred miles, and in breadth two thousand four hundred.

Russia, by its magnitude and situation, has every various frontiers as well as neighbours. On two sides, namely, to the north and the east, we omit the establishment on the continent of America, it is bordered by seas. On the other sides it is bounded partly by Terra Firma, partly by seas, and here and there by rivers; viz. to the west by Sweden and the Baltic; but to the south, by Courland, Poland, Turkey, the Euxine, and the Caspian, by Persia, China, and various tribes of uncivilized nations.

From the enormous extent of the Russian empire it will naturally be inferred that the temperatures of the atmosphere must be various. It contains many regions that are blessed with the purest air, and the mildest sky; but a greater number of others where the weather is extremely cold and cold, and many others again where the exhalations from the earth are not of the most salubrious nature. The parts towards the south enjoy a warm and agreeable temperature, in which almost all the plants and vegetables of countries situated much nearer to the equator flourish and abound. Others again, in high northern latitudes, though not congealed in everlasting ice, are yet oppressed with so severe a frost as to exclude the arts of agriculture. On the whole, therefore, the climate is not excessively hot, except at certain seasons in Taurida, seldomer and less lasting in a few other places; but in many parts is extremely cold. However, the one tract of country not only supplies the deficiencies of the other; but nature has kindly provided that every climate should be fitted to the wants of its inhabitants, and has adapted them to the temperature of their sky. High to the north she has dispensed corn, but plenty of moss, for the animals; and for mankind, an infinite variety of berries, fish, and wild fruits. Farther to the south her liberality is displayed: beneath a mild and genial atmosphere she bestows on the inhabitants superfluity of the finest productions.

* In and about Mosco the rivers freeze about the middle latter end of November, and break in March or the beginning of April. The birch-trees come out in May, and shed their leaves in September. About Kursk all sorts of fruit are ripe in August, and then the corn is all got in. *Georgi's Travels*.

In Irkutsk the thermometer, on the 9th of December,

Vol. II. No. CVII.

In the middle and northern regions the winters are very cold, and the days uncommonly short; but the summers are so much the longer, and the heats are sometimes great. In severe frosts it is no unusual thing for men to be frozen, so as either to die on the spot, or, without speedy assistance, for the limbs that are frozen to fall off by degrees.

The freezing of the rivers happens in various ways, according to the degree of cold, the quality of the water, the current, and the nature of the bed*. Some carry floating ice, which at length consolidates; others, on a sudden frost, are covered at top with icy particles like gruel, which in a day or two congeal; others again, of a gentle current, are in one night covered with a thin scum of ice which gradually increases in substance; while the rivers in Russian Dauria, or the province of Nertsinsk, differ from all these, and exhibit a quite different property: for there the ice first forms at the bottom; which is then lifted up by the water, where it remains till the whole river is entirely frozen up; and at times so much ice comes gradually to it, that the water can scarcely find a free passage beneath it. Some derive the cause of this either from the quality of the beds of the rivers there, which universally consist of chalk stone; or from the frigidity of the soil, which all the summer through never thaws to a greater depth than two arshines.

The frost, and still more the quantity of snow in connection with it, is of infinite advantage to the empire, as by that means the land-carriage is inconceivably facilitated. Many provinces could neither procure the necessaries of life, nor turn their own products into money, were it not for the frost and snow. No sooner is the sledgeway formed, than all the country roads are covered with carriages. In several districts, masts, balks, firewood, &c. can only be fetched in the winter, especially from marshy forests. Immense quantities of flax, hemp, tobacco, deals, tallow, &c. are brought by sledgeway from the distant provinces of Russia to the ports of the Baltic.

1772, stood at two hundred and fifty-four degrees; notwithstanding that the Angara there commonly freezes not till towards the end of December, and frequently not till the middle of January; and breaks up at the end of March, or before the middle of April. *Georgi's Travels*, vol. i. p. 36.

There are regions where the greater part of the year may be called winter, others where the winter lasts but a few weeks; some where storms are very frequent, others where they are extremely rare: of the latter sort are the parts about the Frozen Ocean.

The cold and its effects are here very remarkable. There are annually from one hundred and fifty to one hundred and ninety days of frost, the severity and continuance of which freeze the ground every winter from two to two and a half, and sometimes even three feet deep. The ice of the Neva is from twenty-four to thirty-six, but generally twenty-eight inches thick. It is curious to observe, that, though this thickness of ice is formed by the sheets of ice lying horizontally on one another, yet the huge blocks of it that are cut out for filling the ice-cellars, on being left exposed to the sun, fall to pieces in perpendicular spiculæ, each of the thickness of one's little finger. So likewise in the spring, by pressing on a walking stick; while the ice is still of its primitive thickness, the stick will go through, because it pushes down one or more of these spiculæ from their connection with the rest.

The covering of the Neva with ice, and the breaking up of it, are remarkable phenomena. When the ice is setting in, as it is called, small detached flakes of ice are seen floating down the current, which soon grow into large fields, and acquire so great a momentum, that the bridges must be hastily taken asunder, to prevent their being carried away by the ice; a disaster which has happened more than once. These large plains of ice continue for a day or two passing with the current, while the boats are seen rowing between them; till all at once the floating ice stops, either by the gulf being already closed below, or the flakes of ice freezing together: when immediately foot passengers, who have been waiting on the shores for this moment, go over in all safety. Nothing is more common than to see boats crossing the river, and, in two hours afterwards, to behold hundreds of people going over on foot.

No less rapid is the departure of the ice. In the spring the first indication of this approaching event, is the standing of the snow-water on the ice; then the ice becomes more porous, or divides into spiculæ, lets the water through and becomes of a blackish colour. At length it parts, while the roads that have been well trod during the

winter remain: so that often foot passengers are seen on these roads, and between them and the floating sheets of ice, boats in great numbers passing and repassing. By the force of the current, and shocks received from the floating ice, at length the roads give way; the ice continues to fall down with the stream for a day or two to the gulf, and the whole river is clear. A week or fortnight after this, the ice of Ladoga comes down, which, according as the wind may happen to be, continues a couple or more days, sometimes as many weeks, and renders the atmosphere uncommonly chilly.

The ice and the cold are of service to the inhabitants in various ways. Distances are much shortened by their means, inasmuch as people, horses, and carriages of all sorts, can cross the Neva, and the other rivers, lakes, and canals, in all places and directions: and the Cronstadt gulf supplies, in some measure, the want of navigation during the winter, by the transport of commodities of every denomination over the ice.

The Neva never broke up before the 25th of March, and never later than the 27th of April. The earliest standing of the ice was the 20th of October, and the latest the 1st of December. Its standing and breaking up it determines the summer and winter.

On the breaking up of the ice, when the river is so far open as to be navigable for boats, the event is announced to the town by the firing of three cannons from the fortress. Upon this the surveyor of the city wharf goes in a barge with the city flag flying, accompanied by a number of other barges, to the fortress, and salutes it with seven guns, on which the fortress returns the salute with five. From the fortress he then proceeds to the imperial winter-palace, where on being come near the shore, he again makes another discharge of cannon, which is followed by three cheers from the crew, repeated by the companies of the numerous barges. This done they all return in procession to the place from whence they came. Previous to this ceremony no boat may dare to shew itself on the Neva: but from that moment any one may pass upon it that will: and so long as the Neva continues open the rising and setting of the sun are noticed by a gun from the fortress. But this is discontinued during all the time that the Neva is covered with ice.

The severe cold here has not that violent benumbing

numbing effect either on man or beast as people in southern climates might imagine. The drivers and their horses, from being seasoned to the cold, feel little or no inconvenience in pursuing their employment through the streets of the town and along the roads, though the beards of the former and the muzzles of the latter are covered with hoar-frost and little icicles from the congelation of their breath; and in the severest cold they travel all day, without receiving any detriment. Nay, even from twenty to twenty-four degrees of Reaumur, women will stand rinsing the linen through holes in the ice, four, five, or six hours together, often barefoot, with their hands dipping in the water all the while, and their dragged petticoats stiff with ice.

The winds are in some parts very violent, especially in Siberia, where reigns a certain tremendous kind of winter-hurricane, which they call *bureen*, and which not unfrequently buries both men and cattle in whirlpools of snow and sand. Storms, in most of the districts, are not frequent, and generally speaking not so violent, as in other places; neither was any mischief ever known to have been done by lightning. In the parts to the north thunder and lightning are even great rarities. On the other hand, the northern lights are ordinary appearances; and in many of the northern districts, a few months excepted, are, in a manner to be seen daily.

Earthquakes in most of these parts happen but seldom. Yet there have been some, felt over *Sampschatka* to the mountains of *Altai*.

In the northern districts the days in the winter are extremely short; but in summer therefore so much the longer. On the shortest day, the 10th of December, old stile,

	the sun rises		and sets
Astrakhan,	about 48 min. after	7.	12 min. after 4.
Kief,	7	8.	53
Mosco,	37	8.	23
Riga,	47	8.	13
Tobolsk,	56	8.	4
St. Petersburg,	15	9.	45
Archangel,	24	10.	36

The quality of the soil, in this enormous empire, as may well be supposed, is extremely various. There are entire, and these very extensive governments, that are full of mountains; but others, in still greater number, that consist of vast steppes and plains, some of which are insupportable to the eye:

Captain Plescheyef says, "Russia is divided by nature into two great parts by a range of mountains called *Ural*, which form one continued uninterrupted barrier across the whole breadth of it, dividing Siberia from the rest of Russia.

"That part of Russia which lies on this side the *Ural* mountains presents a vast extended plain verging towards the west by an easy gradation. This plain, from its prodigious extent, has a great variety of climates, soil, and products. The northern part of it is very woody, marshy, but little capable of cultivation, and has a sensible declension towards the *White Sea* and the *Frozen Ocean*. The other part of this extensive plain includes the whole district along the river *Volga*, as far as the deserts reaching by the *Caspian* and the *Sea of Azof*, constituting the finest part of Russia, which in general is rich and fertile, having more arable and meadow land, than forests, swamps, or barren deserts.

"The most remarkable, for superior quality and flavour of every kind of fruit and other productions of the earth, is that part which extends towards *Voronetch*, *Tambol*, *Penza*, and *Sinbirch*, as far as the deserts. It every where abounds in an admirable rich soil, consisting of a black mould, strongly impregnated with salt-petre. But that part which commences between the sea of *Azof* and the *Caspian*, and extending near the shores of the latter runs between the *Volga* and the *Ural*, and then stretching as far as the river *Emba*, is nothing but a desert, level, arid, high, sterile, and full of saline lakes.

"The parts lying on the other side of the *Ural* mountains, known by the name of *Siberia*, is a flat tract of land of considerable extent declining imperceptibly towards the *Frozen Ocean*; and by equally gentle degradations rising towards the south; where at last it forms a great chain of mountains, making the boundary of Russia on the side of *China*. Between the two rivers *Oby* and *Irtish*, and the *Altay* mountains, runs a very extensive plain, called *Barabinskaja* steppe or the deserts of *Baraba*, the northern part whereof is excellently adapted to agriculture; but the southern, on the contrary, is a barren desert, full of sands and marshes. The country, between the rivers *Oby* and *Yenissey* consist more of wood-land than of open field; and the other side of the *Yenissey* is entirely covered with impervious woods, as far as the lake *Baikal*; but the soil is every where fruitful; and wherever the natives

natives have been at the pains of clearing and draining the ground, it proves to be rich, and highly fit for cultivation. The parts beyond the Baikal are surrounded by ridges of high stone mountains. Proceeding farther on towards the east, the climate of Siberia becomes gradually more and more severe, the summer shortens, the winter grows longer, and the frosts are more intense.

"In such temperature of climate, the greater part of Siberia, that is, the middle and southern latitudes of it, as far as the river Lena, is

extremely fertile and fit for every kind of produce; but the northern and eastern parts being encumbered with wood are deprived of this advantage, being unfit both for pasturage and culture. The whole of this part, as far as the 60th degree of north latitude and to the Frozen Ocean, is full of bogs and morasses covered with moss, which would be absolutely impassable, did not the ice, which never thaws deeper than seven inches, remain entire beneath it."

SECTION II.

Of the Seas forming the Boundaries of the Russian Empire—Of the Inland Seas, and principal Lakes of Russia—Its principal Rivers—Mineral Waters—Canals.

THE Frozen or Northern Ocean in ancient times was called by the Russians *Morè Muremskoe*, but at present *Ledovitoè morè*. By the Goths it was termed *Gandawyck*, by the Cimbrians *Mare Marusa*, and by the Latins, *Mare Sarmaticum*, and *Mare Seythicum*. The Swedes call it *Is-Hafoet*, and the Norwegians *Lebersee*. It borders the whole of the northern part of the empire, from the confines of Lapland to the *Tschukotskoy-Noss*; that is, from 50 to 205 degrees of longitude, and consequently laves the shores of the governments of Archangel, Tobolsk, and Irkutsk. Several bays of very considerable expanse are formed by this vast ocean. The greatest is the bay in the vicinity of Archangel, which commonly goes under the name of the *White-Sea*, extending from north to south within the land, from 69 to 63 degrees of north latitude, and contains a multitude of petty islands.—Next follows the *Tcheskaia Guba*, the *Karian Bay*, called also the *Karian Sea*, *Karskoe morè*; then the *Obskoe bay*, which is uncommonly spacious; the *Taymurskaia guba*, or bay; the *Khatangskaia guba*; two bays at the mouth of the *Lena*; and lastly, the *Tashaunskaia guba*, at 185 degrees of longitude.—Of the numerous islands in this ocean the most considerable are; *Novaya Zemlia* and *Kolgurva*; but both of them are uninhabited, and only frequented by fishermen and hunters. *Novaya Zemlia* is indeed well supplied with waters but is rocky, unfruitful, and destitute of

woods; scarcely are a few stunted bushes and poplar plants to be met with there. But, on the other hand, this island abounds in rein-deer, white bears, white and blue foxes, and the shore is swarmed with morasses, wallrusses, &c. Its magnitude is estimated at nine hundred and fifty versts in length, five hundred and twenty in breadth, and three thousand and ninety in circumference, without following the sinuosities, and four hundred and twenty-five thousand five hundred and nine German miles of superficies according to Mr. Storch. On the northern side it is entirely encompassed with ice mountains. Among the lakes there is one of salt water. From the middle of October till February the sun is not visible at all; but they have numerous and strong north lights. In summer there are no thunder storms. The snow falls in many places to the depth of four arshines. For two months, namely June and July, the sun never sets. Between this island and the main land is the famous passage known by the name of *Vaygat's Straits*.—Though this sea contains many bays, not less numerous are the capes or points of land that strike out into it; these spits of land are called in Russian *Muiss* or *Noss*. In all this great sea there are only three harbours whence at this time any navigation is pursued, namely, *Kola*, *Archangel*, and *Mesen*, where that of *Archangel* is the most famous. But that navigation, in comparison of the prodigious ex-

of this sea, is very trifling; however it is partly owing to the short portion of the year followed by the ice for this purpose; and in some regions there is scarcely time for undertaking it at all. As for the northern passage to China, which, as every one knows, has been so often attempted, nothing has hitherto been discovered favourable to any hopes from future enterprises. The shores in many places, especially in those of the White Sea, are beset with rocks; in other parts low with shoals, that, in a manner, forbid access, and the country adjacent is very marshy. The water in this sea is proportionably but little salt, though near Archangel it is so briny, that some quantities of common salt are prepared from it. The ebb and flow are moderate, and in the parts lying most to the north scarcely perceptible. The fishery is very considerable, particularly of black-fish, herrings, whales, morses, porpoises, sea dogs, &c.

The Euxine or Black-sea laves the shores of Georgia and a part of the governments of Caucasus and Ekatarinoslaw. It is divided into the Euxine Proper, the Pontus Euxinus, computed to be a thousand versts in length, and five hundred in breadth; and the sea of Azof, the Palus Mæotides of the ancients, which (not including the bay of Taganrok) is stated to be two hundred versts long, and one hundred and sixty versts broad. Both these are now entirely within the confines of the Russian empire.

The Baltic or East-Sea, anciently called Variatzkoie morè, or the sea of the Varagians, lies westward of Russia. That part of it which washes the coasts of the governments of St. Petersburg, Reval, and Vyborg is called the Gulf of Finland, which is above four hundred versts long, and from a hundred to a hundred and twenty broad.

The Caspian, an inland sea, was anciently called by the Greeks, the Hyrcanian Sea; the Persians give it the name of Akdinghis, the White-Sea; by the Georgians it is termed the Kurshianskian sea and the Persians denominate it Gursen from the old Persian capital, Gurgan,

which is said to have stood in the province of Strabat, only seven versts from the sea. The name Hyrcanian sea is as much as to say the Persian sea; for in the Persian language, Persia is not called the Persian, but the Hyrcanian empire. The Caspian reaches in length, from about the 37th to the 47th degree of north latitude, and in breadth, where it is the widest, from the 65th to the 74th degree of its longitude. Its superficial contents amount to above thirty-six thousand square miles English.

There are several other seas or lakes in the Russian empire, the principal of which are, 1. The lake Baikal; in the government of Irkutsk, which extends from the 51st to above the 55th degree of N. latitude. 2. The Ladoga lake, in the government of Vyborg, between the Gulf of Finland and the lake of Onega. It is a hundred and seventy-five versts* long, and a hundred and five broad. 3. Lake Onega, in the government of Olonetz, between the Ladoga and the White Sea. It is one hundred and ninety versts long, and seventy versts broad. 4. The Peipus. 5. The Ilmen. 6. The Bielo-ozero, or White Lake. 7. The lake Ishany; and, 8. The Altyn-noor.

The principal rivers are, The Duna, called by the Russian Dvina, and by the Lithuanians Daugava. It derives its origin from a lake in the government of Tver, at Biala, not far from the sources of the Volga, and falls into the Baltic at Dunamunde, not far from Riga. At Riga this river is nine hundred paces broad. The Duna is generally covered with ice in November, which breaks up again in March or April. This river has in general a sandy and clayey shore, and a discoloured water. 2. The Neva, which draws its current from the Lake of Ladoga, flows through the city of St. Petersburg, and falls by several arms into the gulf of Cronstadt. The Neva and its different branches (with the Livoga canal) supplies the city of Petersburg with water: its waters may be ranked with the lightest, clearest, and purest of those which flow in rivers†. 3. The Dvina, called

* A Russian verst is about three quarters of a mile English.

† It is a well known fact, that foreigners, for the first month or two of their stay at St. Petersburg, perceive a certain alteration in their habit of body, becoming more lax than usual, which has chiefly been attributed to the waters of the Neva. This circumstance induced Model, and after

him Georgi, both professors of the Imperial Academy; to submit it to a chemical process, when the result of both these gentlemen proved that the charge was ill-founded. The accident to foreigners seemed therefore to arise from the difference in their way of living, rather than to the operation of the waters of the Neva.

by the Russian Sievernaia Dvina, *i. e.* the Northern Dvina, falls into the White Sea at Archangel. This river has the honour of having given reception, in 1553, to the first English ship that ever sailed to Russia. 4. The Petshora. 5. The Oby. 6. The Irtysh. 7. The Tobol. 8. The Yenissey. 9. The Tunguskis. 10. The Khantanga. 11. The Lena. 12. The Yana. 13. Anadyr. 14. The Kamshatka. 15. The Amoor. 16. The Yemba. 17. The Ural. 18. The Volga. 19. The Kuban. 20. The Don (formerly called Tanais). 21. The Dnieper (the Boysthenes of the ancients). 22. The Bog, or Bogue. And many others.

It is somewhat surprising, that in an empire so extensive as that of Russia, so few mineral springs should have hitherto been found. The mineral waters at present known, and occasionally applied to medicinal purposes, are, sulphureous and liver of sulphur waters; among which are reckoned the hot springs (which are the most numerous). Some are of lukewarm, others warm, and a few of hot water.—Strong martial, or vitriolic waters are not uncommon.—Bituminous waters, or those impregnated with Naphta, are not unfrequent.

There are in Russia a considerable number of canals; the construction of which was a principal object with Peter the Great. Some canals were begun by his orders, but were afterwards left unfinished from the difficulties which arose in the progress of the work. Four particularly derive their origin from him, *viz.* 1. That to Cronstadt, which, after being carried upwards of two versts, was then abandoned. 2. The

Ladoga canal, which in length is one hundred and four versts, and seventy fathoms in breadth. 3. A canal, along which, by means of some rivers, a communication is formed between Moscow and the Don. 4. That at Vishnei-Volotskoy, by means of which a passage is had from the Caspian into the Volga; and thence, in conjunction with some rivers and lakes, into the Neva, and so into the Baltic. The late empress from the very beginning of her reign, bestowed a peculiar attention to this important object, and actually caused three canals to be dug, besides those of Cronstadt and St. Petersburg; in order particularly to render more commodious the passage from the Caspian into the Baltic; and then by means of rivers, to connect the Caspian with the Baltic; and then by means of some rivers, united by canals, to join the Caspian to the White Sea. Several other plans have been set on foot, namely, the uniting of the Dnieper, the Daiepr, and the Volga.—Almost all the rivers of Siberia disembogue themselves into the Frozen Ocean. Not one of all that take their rise in Siberia, runs to the countries of the Mongols, Bukharians, Kalmuks, and Tartars; whereas many of those which rise in the Mongols, and the country of the Kalmuks, flow northwards through Siberia. They are so commodious for navigation, that a vessel might go from the Volga through St. Petersburg to Selenhinsk, where it is only navigable two voloks; * one between the river Tschussovaia and the Taghil, and the other one between the Ket and the Yenissey; the latter of about ninety versts, and the former not so wide.

SECTION III.

General View of the Nations which compose the Russian Empire, whether descended from the Scythians, Finns, Mongoles, Tartars, or other Tribe

THE whole Russian territory at present consists of fifty alike organized provinces, which are called governments or viceroalties. As in this distribution less regard was had to the superficial contents than to the population, so are

the areal dimensions of the governments generally various; while the population, with a few exceptions, is pretty equal. Each government is again divided into several circles; some of the largest have also a farther distribution into dis-

* Avolok in the Russian language, signifies nothing more than a small tract of land between any two rivers that run

nearly in a parallel between those two rivers, and has no communication.

districts. In each circle is a circle-town, where the circle-administration has its seat, and one of these circle-towns is at the same time the government-town, in which the governor-general and the principal officers reside, and by which the whole government is usually denominated.

Beside these fifty governments, belonging to the Russian empire, are two more countries, having a military-civil constitution, namely, the country of the Donskoy-Kozaks, and the country of the Euxine-Kozaks. Two-and-fifty provinces therefore, properly speaking, compose the Russian empire: the Georgian states, Harduella and Kakhetty, several petty districts of people, in the parts of Caucasus, with the country of the Kirghis-Kozaks, are to be reckoned among the countries under the protection and in the dependence of Russia.

Great part of the country now called Russia was, in periods of remote antiquity, inhabited towards the north-east and north, by a people of Finnish origin, perhaps descended from the ancient Scythians. Towards the north-west, were tribes consisting of a motley race of Sauromates and Grecian colonists; and from them are descended the modern Lithuanians, Lettorians, Livonians, and Courlanders; as were also the ancient Prussians. The whole southern part of Russia, even to the Krimea, was for some time inhabited by Goths; and, between the Volga, the Don, and Mount Caucasus, dwelled a nation descended from the Medes, called Sauromates, that is, the northern Medes. In process of time, when nations of barbarians issued, one after the other, in swarms, from the east, and some of the different tribes of Goths had, since the middle of the third century, penetrated into the western regions of the Roman empire; part of the Sauromates found themselves under the necessity of retiring farther toward the north and the west. Even at that early period they had the same political constitution we still see prevalent among them. Each individual of the nation was either master or slave. Those who were of distinction among them, called themselves tribes, slaf, and slavnè, or noblemen; whence again, all such as either were renowned for great achievements, or only capable of performing them, were afterwards in like manner styled slavnè. Under this denomination it was that they became known to the Europeans, who were not till very lately

acquainted with the particular tribes of those nations. These tribes had their appellation frequently from some river, town, or district. So the Polabes were named after the Laba, or Elbe; *po*, in the Slavonian and Russian tongues, signifying *near*. The Pomeranians dwelt *po morce*, or *near the sea*.

No other country throughout the globe contains such a mixture and diversity of inhabitants. Russians and Tartars, Germans and Mongoles, Finns and Tonguses, live here at immense distances, and in the most different climates, as fellow-citizens of one state, amalgamated by their political constitution, but by bodily frame, language, religion, manners, and mode of life, diversified by the most extraordinary contrasts. It is true, there are some European countries in which we find more than one nation living under the same civil constitution: whereas in Russia dwell not only some, but a whole multitude of distinct nations; each of them having its own language, though in some cases debased and corrupted, yet generally sufficient for generic classification; each retaining its religion and manners, though political regulations and a more extensive commerce produce in some a greater uniformity; the generality of the main stems, in short, bearing in their bodily structure, and in the features of their faces, the distinctive impression of their descent, which neither time nor commixture with other nations have been able entirely to efface.

This extraordinary variety of inhabitants, while it gives great attraction to the study of Russian statistics, adds likewise to its difficulties. Instructive and interesting as it is to the reflecting observer, to trace the human being through every degree of civilization, in the several classes of manners, and in all the forms of civil society; yet toilsome and dry is the occupation which must necessarily precede that satisfaction. The united efforts of the numerous inquisitive historians, both foreign and domestic, who have employed themselves on these subjects, have hitherto been able to cast but a feeble light on the origin of the greater part of the nations of the Russian empire, and the researches of many of them have been lost in traditions, the romantic obscurity whereof has left us no hope of arriving at the truth.

Besides the Slavonians, to whom the predominant

minant nation belongs, there are in the Russian empire three main national stems, whose original identity is historically placed beyond all doubt, and among whom several other tribes are to be counted as relative or collateral branches, namely, Finns, Mongoles, and Tartars. To these may be added the Tunguses; who, though not a primitive stock, yet are the only one of their race in Russia. A sixth class is formed by those nations, with whose language and history we are still too much unacquainted for being able with any degree of certainty to assign them a place in the national system at large; and this classification is terminated by the dispersed multitudes of European and Asiatic nations who have settled here and there in particular provinces; either as conquerors with violence, or voluntarily and on invitation as colonists: but their number is inconsiderable.

The Slavonian stock is one of the most remarkable and most widely extended in the world. Next to the Arabians, there is no people throughout the globe that has diffused its language, its dominion, and its colonies to so surprising an extent. From the shores of the Adriatic northwards as far as the Frozen Ocean, and from the shores of the Baltic through the whole length of Europe and Asia, as far as America, and to the neighbourhood of Japan, we every where meet with Slavonian nations, either dominant or dominated. All the branches of this grand stock, who have formed peculiar states, may be ranged by their present condition in seven classes, that is, into Russian, Polish, Bohemian, German, Illyrian, Hungarian, and Turkish Slavonians. Three of these branches we find in the spacious territory of the modern Russian empire: the Russians, the Poles, and the Servians.

The aborigines of Russia were of two races: Finns and Slavonians. The former possessed the regions of the Volga and the Duna; the latter dwelt about the Dnieper and the Upper Don.

A second main stem of the nations dwelling in Russia is that of the Finns, of which, though not one branch has ever arisen into a ruling nation; yet, as being the common stock of most of the northern nations of Europe, is exceedingly remarkable for its antiquity and its wide extent, from Scandinavia to a great distance in the Asiatic regions of the north; and thence again

to the shores of the Volga and the Caspian. Dispersed as all the Finnish nations are in this prodigious space, yet the resemblance in bodily frame, in national character, in language, and in manners is preserved. It is scarcely less remarkable, that the generality of the Finnish races still dwell only in the north, which has ever been their favourite abode, and on which account they are likewise called inhabitants of morasses or fens; and the chase and fishery have ever been with each of them their chief occupation and trade.

The Mongoles, a nation remarkable as the disturbers of the world, every where extended their ravages, as if the annihilation of the human race had been their ultimate object. Had not their violences brought about revolutions in the state of governments and of mankind, and produced consequences that are still visible, the historian would never have profaned his pen by recording the catastrophies of these barbarians, and their bloody trophies would along ago have been consigned to oblivion. In the ninth century three nations appeared roaming about the northern side of China and the Korea; in the west, or in modern Mongolia, the Mong-u, were in the sequel called Monk-kos, and Mongoles. Part of these people are the same with the Tunguses. The Mongoles, at present among the inhabitants of the Russian empire, in the seventeenth century withdrew themselves from the Chinese dominion, and voluntarily put themselves under the Russian supremacy. The Russian Mongoles inhabit the regions about the Selenga in the Irkutskoi district of the government of Irkutsk.

A fourth primitive stock of the nations dwelling in Russia are the Tartars, who compose a distinct nation which originally belonged to the great Turkish stock. The first known mother-country of the Turks or Tartars lies on the eastern and northern sides of the Caspian, where their descendants have still their seats. Formerly they were spread from the Oxus or Gihon into the Mongoley and the Orenburg territory. Here they served from time immemorial as a mound against the incursions of the nations who would penetrate from the east to the west or contrariwise, till at length the Mongoles, like a rushing stream that has burst its banks, swept away all opposition, and established several independent king-

doms,

*Modes of Travelling used by the YAKOUTS or VIKARS of
RUSSIAN TARTARY.*

W. G. Smith del.

doms, which were, however, after a lapse of many years, subjugated in their conquered countries; and the whole remains of this nation, once so great, now subsist under foreign sovereignty. Many hordes belong, either as subjects, or as dependent wards of the Russian empire; others are in like manner appanages to the Ottoman Turks, or subject to the great Mogul, to China, and to Persia. The Tartars belonging to the Russian empire inhabit the northern coasts of the Caspian and the Caspian, the north side of the Caucasus Mountains, the extensive steppes from the river Ural to the Soongarey, the southern Ural, in Siberia, the southern frontier mountains and steppes from the Tobol quite over the Yenisey, and the deserts in the middle region of the Lena; likewise not a few Tartar colonies are dispersed among the Russian habitations, particularly in the governments of Ufa, Kazan, and Tobolsk. As these regions have for the most part, since the flourishing epocha of the Mongole-Tartarian monarchy, been inhabited by them, frequent memorials are found there of their ancient grandeur, magnificence, and culture, of which some are of an antiquity demonstrably of above a thousand years. It is no rare thing to come suddenly upon the ruins of some town, which, in its crumbling remains, plainly evinces the progress which the arts had made among a people whom we are wont to consider as barbarians*. Still more frequently are seen sepulchres, which, by their inscriptions, throw light upon the history of this nation; and, in the vessels and implements preserved in them, supply us with interesting proofs of its opulence, its taste, and its industry†. The Tartars, next to the principal nation, constitute the most numerous part of the inhabitants of the Russian empire‡. The branches of this nation which belong to Russia are, the Proper Tartars,

the Nogayans, the Meschtscheryaks, the Baschkirs, the Kirghises, the Bukharians, the Yakutes, and the Teleutes; to which may in some sort be added the tribes of Caucasus.

The Mandshure swarms comprise two nations, viz. the Mandshures or Mandshu, and the Tunguses. Both nations are related by descent, as appears from their traditions, their language, and their bodily structure. The whole of these people together possess extensive countries and deserts in eastern Siberia and in the northern Mongolia: the Mandshu are even still very powerful; one of their princely families being in hereditary possession of the throne of China. The Mandshu, particularly the Daourian stem of that people, while they inhabited the modern Russia, were by no means an uncivilised people. According to their written accounts and traditions, they had a constitution composed of nomadic and civil parts, and adapted to their situation, their mode of life, and their various exigencies. They lived peaceably among themselves and with their neighbours, sedulously attending to agriculture, grazing, and mining. Traces are still seen about the Bargusin and other rivers, of their gardens, orchards, and fields artfully laid out, and watered with artificial water-courses. The Daourian mine works on the banks of the Argoon, still famous under the name of Nertschinskian Mines, as well as all Daouria, afford numerous proofs of the mineral labours of the ancient Daourians.

That the Tunguses originally composed one people with the Mandshu, is apparent not only from the resemblance of their features, manners, and customs, but also chiefly from the agreement of their languages. The Tunguses called themselves *Œvees*, probably from the supposed founder of their race; or, in the manner of most

* Near Kasimof, on the Oka, a circle town of the government of Riazan, is standing a Tartarian suburb, which seems formerly to have been the court residence of a Khan. Among the ruins is a lofty round tower, an oratory or chapel, the remains of a palace and a mausoleum, all constructed of brick or burnt tiles. Not far from Astrakhan are the ruins of the old Astrakhan; and higher up the Volga, near Tzaritzin, similar heaps of rubbish, which have evidently been a spacious town. On the Volga, below the mouth of the Kama, are found well preserved and partly magnificent remains of the ancient Brachtimof, or Bulgar. In the citadel of Kazan are still seen monuments of the Tartarian monarchy. On the Irtysh, in the vicinity

of Tobolsk, are the remains of Sibir, the capital. In Siberia, and the Kirghisian steppe, are many ruins of towns not to mention memorials of inferior consequence.

† In the Museum of the Imperial Academy of Sciences at St. Petersburg, are preserved a multitude of vessels, diadems, weapons, military trophies, ornaments of dress, coins, &c. which have been found in the Tartarian tombs on the Volga and in Siberia. They are of gold, silver, and copper: The greatest antiquity of the tombs is eleven hundred years, the latest four hundred.

‡ Not long since it was so; but at present, owing to the last division of ill-fated Poland, the Poles are more numerous than the Tartars.

of the Siberian tribes, from the word which in their language signifies *men*. The extensive deserts, in which they have now their nomadizing seats, reach from west to east, from the Yenissey across the Lena as far as the Amoor and the Eastern Ocean. From north to south they keep between the 53d and 65th degree of north latitude, and accordingly neither touch upon the Soongarian borders nor the coasts of the Frozen Ocean. Being a very accommodating people, they have admitted into these their seats; namely, the Ostiaks, Samoyedes, and particularly Yakutans. The districts are mostly in the government of Irkutsk. When the Russians attacked the Tunguses, the latter displayed more courage than the other Siberians, and not till the close of the sixteenth century were they brought into that imperfect state of submission in which they are held at present. The Tunguses on the coasts of the Eastern Ocean are known by the name of Lamuts.

Besides the several nations which have been mentioned, and the branches arising from them, there dwell in the Russian empire some nations whose origin is utterly uncertain, and who seem to stand in no relation with the branches that are known. These, from several particulars, may be reduced to two classes, one comprising the Samoyedian, and the other the Eastern Siberian Nations.

The history and the origin of the Samoyedes is not more known even among the people themselves, than by the Russians and the rest of Europe. Leading a nomadic life in bleak and savage deserts, without the arts of writing and chronology, they endeavour to save from oblivion the memory of their transactions and heroes only by songs; which, perhaps with some truth for their foundation, are embellished with so many fabulous additions, that even this mode of tradition affords us no means of becoming acquainted with their ancient state. The cold and trackless wilds of the Samoyede nations have never yet been trod by the foot of any inquisitive traveller; the collectors of the tribute and surveyors, from whom we might expect some sort of information, have naturally more in view their proper business and the advantages of traffic, than the collecting of historical accounts; and out of their territory individuals from the Samoyede tribes are very seldom seen. The pre-

sent home of the proper Samoyedes are the coasts of the Frozen Ocean, from about the 65th degree of north latitude, quite up to the sea-shore. Novaya Zemlia indeed is not inhabited by them, but eastward across the Yenissey extend the coasts on which they live up to the 75th degree of latitude. In these regions, the coldest, rudest, and most desolate of all the earth, dwell the Samoyedes, solitary indeed and scattered, from the White Sea to the other side of the Yenissey and almost up to the Lena, therefore both in Europe and in Siberia. They call themselves Nenetsch, persons, or Chosovo men. Several petty tribes may also be classed with the Samoyedes.

The nations which we comprehend under the general head of Eastern Siberian nations are the Yukaghires, the Kamtschadales, the Koriaks, the Tschuktsches, and the inhabitants of the north-eastern Siberian-American Archipelago the Kurilians, and the Aleütans.

There are also in Russia very considerable colonies of the two wandering nations, who are every-where at home, and have no-where any country, viz. Jews and Gypsies. The Jews are in great numbers throughout the Polish provinces which now belong to the Russian empire; and they are seen in pretty strong bodies in the borders of the neighbouring governments: whereas in the rest of Russia they are found very sparingly, and in most parts not at all. Taurida, however, is an exception to this, where they are partly fixed as ancient inhabitants. At the time when the Chazares were masters of the Crimea, even some of their sovereigns, according to the traditions, possessed the religion of Moses. The Gypsies are particularly in the provinces of both Great and Little Russia, where they strove about in large companies.

From this contracted view, in which some of the petty tribes have been entirely omitted, it appears that the inhabitants of the Russian empire form at least eighty distinct nations, as well in their lineage as in their manners and their language, essentially different from each other. To see so extraordinary a multitude of nations and tribes united in one body politic is certainly a curious phenomenon, of which we should look in vain for another example in the history of the world. This mingled mass of people, so extremely numerous, presents a spectacle which

must be highly interesting to every reflecting observer. Its physical, civil, and moral state, forms a grand and instructive picture, in which are seen all the modifications whereof this state, by the most various causes and operations, is susceptible: a commentary on the history of mankind, illustrative of the gradual development of civilization by the most lively and striking example.—On the whole scale of human nature, from the rude and brutal condition to the summit of sensible and intellectual refinement, there is scarcely a remarkable transition which may not be matched from the list of these people. Here are seen nations of hunters and fishers, roaming about their forests, without permanent habitations, defying all dangers and indifferent to the accommodations of life, who have scarcely any notion of property, who feed upon raw flesh and unprepared fruits, and wrap themselves in the skins of the beasts with which they contend for their existence, and by which they sustain their lives.—Near to these we find pastoral nations, obtaining their nourishment, their clothing, and even a sort of affluence solely from their flocks and herds; living with them in moveable tents on everlasting perambulations, and passing their days in a patriarchal simplicity of manners, generally without the art of writing, and without the knowledge and use of money.—Again, we behold nations, who devote themselves to the labours of agriculture, carrying on their various occupations, one while incomplete and directed to single objects, at another on a general scale and with ingenuity and industry. We observe the progress of culture, in regions where the virgin earth, the first time for thousands of years, opens her bosom to the strange band of the countryman; and where, instead of temporary huts of felt, houses and villages arise to our view.—With equal surprise we see villages changed into towns, and houses into palaces, where productive industry has erected her manufactories, and where diligence collects the products of the distant parts of the world for traffic.

As all the gradations of living are found among the inhabitants of the Russian empire, so we see so many examples of all the modifications of civil constitution. Among the Tschuktsches and the inhabitants of the Eastern Isles we scarcely find an idea of social connection; among other nations in the east of Siberia and among the Lap-

landers, we perceive in the family government of fathers and elders, the first rude sketch of monarchy; but far more considerable is the number of those who divide themselves into stems and hordes, which are again parted into races. A pure democracy is discernible in the generality of the branches of the Kozaks; while the Kalmyks and Kirghises have a mixed republican-monarchy. Not less numerous are the corruptions of these several forms of government, which at last dissolve into the elements of unlimited monarchy.—Some nations have a family nobility hereditary in their offspring; while others have only a personal nobility, founded on the respectability of age, on the influence of wealth, or on the brilliancy of personal talents.—Of all the modifications of civil constitution none is perhaps so singular as the military democracy of the Kozaks, the essence and aim of which is war, and even of which we have been witnesses of a corruption, in its denying the other half of the human race all civil and domestic community.

Not less edifying and diversified is the view of the religious ideas and forms of worship which these nations have adopted for the service and the honour of the Supreme Being. We find in the Russian empire not only the generality of the known parties and seats of the Christian faith, but the Jewish, the Mahammedan, the Lama, and the Schamane religions have here their numerous votaries.—From the most monstrous polytheism to the total unacquaintance with any idea of a supreme intelligence, there are innumerable windings in which the human intellect may stray, and the religious opinions of the savage and half-savage tribes of the Russian empire present us with no inconsiderable supplement to the history of these aberrations.

Great as the difference is between the modes of life, constitutions, and religions of the inhabitants of the Russian empire, so motley and various is also the picture of their physical condition, their manners, customs, dresses, dwellings, utensils, and weapons. What a contrast between the flat, broad, beardless physiognomy and the yellow figure painted skin of the east Siberian nations, and the European form and complexion of the several genuine Russian stems! What a distance from the earth-holes of the Samoyedes to the palaces of residence, from the needlework of fish bones and sinews to the weaving of tapestry,

tapestry, from the sling and the arrow to the fire arms of the modern mode of war in Europe! If the view of such a great and striking diversity in all the concerns of mankind, and in all the displays of their activity, afford instructive and entertaining matter for reflection, our astonishment is not less excited by the consideration, that this prodigious mass of people can be kept in the most unconditional submission to the unlimited will of one ruler, and the confluence of all forms of government, however great their diversity, maintained in the general form of one state. The key to this singular phenomenon is to be drawn from the political and religious toleration which

marks the spirit of the Russian monarchy. In no state of the world is there a complete uniformity and unity of administration, though nowhere is the physical and moral variety greater than here. Forbearance is shewn in all regards, which do not oppose the being and aim of the government; and the omnipotence of the unlimited will is only apparent where the direction of all the energies is necessary to one end.—Thus the individuals of this extensive empire have a sphere in which they may range, till, by their gradual approach to civilization, one great and happy nation may arise from the multifarious aggregate of hives of which it consists.

SECTION IV.

Of the Population of the Russian Empire, and the Public Institutions for the Preservation and Increase of the Population.

THE Russian empire, which, in regard to its superficial contents, is exceeded by no country in the world, must also, in regard to the number of its people, be reckoned among the most powerful. By the revision or enumeration of the people, made in 1783, in order to levy the personal tax on head-money, it was found to be, in the forty-one viceroyalties of which Russia at that time consisted, of male inhabitants: Merchants, one hundred and seven thousand four hundred and eight; burghers, two hundred and ninety-three thousand seven hundred and ninety-three; Odnodvortzi and free countrymen, seven hundred and seventy-three thousand six hundred and fifty-six; exempt from taxes, three hundred and ten thousand eight hundred and thirty; crown boors, four million six hundred and seventy-four thousand six hundred and three; private boors, six million six hundred and seventy-eight thousand two hundred and thirty-nine; making a total of twelve millions eight hundred and thirty-eight thousand five hundred and twenty-nine: which doubled on account of females, amounts to twenty-five million six hundred and seventy-seven thousand persons of both sexes. This, however, is supposed to be much below the truth; for since the year 1783, there have been great acquisitions; so that the population has considerably increased; therefore we may

with safety assert that the population at present amounts to thirty-six millions.

Of this prodigious mass the greater part by far belongs to European Russia. The five governments of Perm, Ufa, Kolhyvan, Tobolsk, and Irkutsk, comprehended under the general name of Siberia, contain all together, according to the revision lists, only two million two hundred and fifteen thousand, or, with the unnumbered tribes and classes, perhaps above three million five hundred thousand inhabitants.

To preserve and increase the population of the empire, the Russian government have adopted several modes. It is certain that Nature, for wise and good purposes, has made the first period of human life dependent on the nursing and care of others, and the whole of its physical existence on a thousand accidental circumstances; but no less certain is it that man is his own destroyer, and that the physical and moral corruption of large societies begets numberless new evils the origin whereof can never be charged on Nature. If, for example, by well-attested observations, of a thousand children nourished by their mothers, only three hundred died; but of just the same number who are suckled by nurses, five hundred are a prey to death,—if in Russia annually two hundred thousand grown persons are brought prematurely into the bills of mortality

ality by the immoderate use of strong liquors,—this surely is not the fault of Nature, who neither teaches us to keep nurses nor to drink brandy, and who, if we follow her simple and beneficent dictates, renders even mortal distempers innoxious.

Unquestionable as it is that the generality of physical evils proceed from man himself, not less so is it that he has the eradication or the mitigation of them in his own power. The care of his own preservation is implanted in the breast of each individual, which only needs some understanding and conduct in order to reach its end: in civil society the care for the preservation of all is a duty incumbent on the state, and requires to be supported with so much the greater energy the more its strength and welfare are dependent on that care. No one will make it matter of doubt, that a wise government possesses great and powerful means to check the mortality of its subjects; and of what may be effected in this regard by public institutions, history affords us instructive and striking examples.

From the following representation it will appear how much in Russia the government has hitherto done in this important part of public concern. A country in which most of the institutions for the preservation of the human race are of a new creation, and where the people live dispersed over an amazing surface, great difficulties naturally present themselves to the provisions that may be undertaken for furthering the noble end for which they were set on foot.

Medicine, as a science, claimed the first attention; but it was not domesticated in Russia till the commencement of the eighteenth century. For though before that period foreign physicians were individually maintained at the court of the emperors, yet public medical institutions were unknown to the empire. Peter the Great first called expert physicians and surgeons, erected hospitals, and endowed a Medical Chancery, which had the supervisal of the whole state of medicine, committing it to the care of its foundation and enlargement. The Medical Chancery became extinct, in consequence of

the erection by Catharine II. in 1763, of the Imperial Medical College, whose foundation forms a new and important epocha in the history of physic in Russia*.

Much has been done since the time of Peter the Great to advance the knowledge of the healing art by the founding of hospitals, establishing of apothekes, and inviting of foreign physicians. The sphere of this imperial college extends over the whole body of physic, and all medical persons throughout, excepting only the medical establishment of the court. It is its duty to see that all the governments and circles are provided with the requisite physicians, surgeons, and apothecaries, according to the imperial precept; it watches over the observance of the duties of every individual under its direction, and has inherently the power to reward and to punish. It has the inspection over the management of the apothekes belonging to the crown, over the hospitals and seminaries of education. It examines all physicians, surgeons, and operators before they can be permitted to practise in the empire, from which even academical testimonies and degrees will not exempt, and publishes in the Gazette the names of the persons to whom that permission is granted. It is competent to confer the degree of doctor in medicine. On learning that some infectious distemper has any where made its appearance, it loses no time in adopting the proper means for stopping its progress. Lastly, it attends to the improvement of the healing art in general; and to this end collects the cases transmitted by the several physicians of the empire, and publishes them from time to time in the Latin language†.

It is only of late years that hospitals have been founded in Russia for the sick, but they now become pretty numerous. The town hospital of St. Petersburg, which was founded in 1784, is built in one of the skirts of the city, and consists of a large, brick, insulated building of handsome but simple architecture. The ground floor is devoted to the æconomical purposes of the institution, and the upper stories are occupied by

* In the express instructions to the college and its members is the following: "Two things the college are to make their principal object: to preserve the people of the empire by the arts of medicine, to educate Russian doctors, surgeons, operators, and apothecaries, and in the next place put the apothekes and their æconomy on a good footing."

† Among other establishments in different parts of the empire, the college, in 1795, erected its own printing office, with a type-foundry adjoining, which has already published several works, the typographical neatness whereof does honour to the overseer.

the patients. The rooms are lofty and spacious; and instead of ventilators, some of the window shutters are pannelled with wire work. This house receives all necessitous patients, venereal excepted, and attends their cure without fee or reward. All patients on admission are immediately bathed and have their heads shaven: this done, they receive the hospital clothing, and severally a bed. In 1790 six contiguous buildings of timber on brick foundations were erected behind the main edifice, by the college of general provision, and furnished with two hundred and fifty beds.

In the mad house, which with its small end abuts upon the back front of the main structure, is upon the same footing, and under the same direction, are forty-four rooms in two ranges, the one for male and the other for female lunatics. A broad passage divides them; the door of each chamber is fastened with a spring latch, which the keeper can open from without. The raving are not confined with chains but with leather thongs, while the quiet are suffered to walk freely in the passage or in the court. The whole establishment, treatment, method of cure, and diet, are well conducted, as plainly appears from their effects.

Beside the above and many others of a similar description, there are several Military hospitals, both for land and sea forces. For the land forces, exclusive of the two general land hospitals at St. Petersburg and Mosco, there are fourteen large field hospitals at Astrakhan, Bogoyavlensk, Kherson, Krinkof, Riga, Reval, Elizabethgorod, Orenburg, Vyborg, Frederiksham, Kazad, Lubenau, Smolensk, and in Caucasus, without reckoning the battalion lazarets, which are every where in great numbers. The Military hospital at St. Petersburg has commonly a thousand beds; but in time of war, and when recruits are raising, the number is twice or three times as great.

The eleven Naval hospitals at present subsisting are at St. Petersburg, Cronstadt, Oranienbaum, Riga, Archangel, Kazan, Tazanrok, Bogoyavlensk, Kherson, Reval, and Sevastopol. The Naval hospital at Cronstadt during the Swedish war was obliged to admit annually from sixteen thousand eight hundred to twenty-five thousand

patients, a circumstance which may serve to shew the amazing extent to which these hospitals are extended.

Exclusive of the above there are houses for lying-in-women, foundling hospitals, small poor hospitals, and pest-houses: a particular description of them all would be unnecessary. We shall, however, say a few words on the Foundling Hospital at Mosco, which is a most noble and beneficent institution, by far exceeding that of London.

This foundling hospital receives children at all hours of the day or night, without any question being put to the bringer, except whether the child has been baptized, and whether it has a name. Children may also be carried to the parish priests, or to the monasteries and poor houses of the city, who immediately send them away to the foundling hospital, where the deliverer receives two rubles for each child. This is truly great. The carriers of such children are by day and night under the special protection of the police. At the reception of every child, the day, the time, and the sex are noted in a book with all that the bringer declares of the circumstances of the child, the clothes and other articles that he brings with it, and the birth marks and tokens observed upon it. Hereupon the baptism ensues, if not already administered; the name is entered in a book, and a little crucifix is hung round its neck with the number under which it is registered. It is now examined by the surgeon and brought to the childrens' rooms, where it receives new linen and clothes from the magazine; meanwhile the articles of dress brought with it, if they be not too miserable, are deposited in a magazine apart, there to be kept. The children are either suckled by strong and healthy nurses, each of whom can nourish two babes, or delivered to dry nurses who bring them up with other food. The physical education alone continues two years, when they come into the great room. Till the sixth year boys and girls remain together, and during this period are habituated to easy employments. With the seventh begins the moral and civil education; thenceforward the preservation of the physical existence is a subordinate object*. In the first twenty years since the opening of this hospital, including those

* On the manner in which this beneficial plan is executed we will hear at least one witness, by citing the judgment of

a sagacious and attentive observer, who, being an Englishman and a traveller, could probably have no interest in dissimulating

born in the house, there were admitted thirty-seven thousand six hundred and seven children.— There are several other hospitals on a similar

plan founded in different parts of the empire, particularly at St. Petersburg, Tula, Kaluga, Yaroslaf, Kazan, &c.

SECTION V.

Natural Characteristics of the Inhabitants.

THE Russians are a moderate-sized, vigorous, and durable race of men. The growth of men and longevity of this people are very different in different districts; but in general rather large (than small, and they are commonly well built. It is very rare to see a person naturally deformed; which doubtless is chiefly owing to their loose garments and the great variety of bodily exercises. All the sports and pastimes of the youth have a tendency to expand the body and give flexibility to the muscles.

Easy as it is occasionally by comparison to discriminate the Russian by his outward make from other Europeans, it will, however, be found very difficult to point out the principal lineaments of the national physiognomy; as speaking features are in general extremely rare. The following may be deemed common and characteristic; small mouth, thin lips, white teeth, little eyes, low forehead; the nose has a great variety of turns: it is most frequently seen to be small and turned upwards. The beard is almost always very bushy; the colour of the hair varies through all the shades from dark brown to red, but it is seldom quite black. The expression of the coun-

tenance is gravity and good-nature or sagacity.—Hearing and sight are usually very acute; but the other senses more or less obtuse by their manner of living and the climate. The gait and gestures of the body have a peculiar and often impassioned vivacity, partaking, even with the mere rustics, of a certain complaisance and an engaging manner.

The same features, on the whole, are conspicuous in the female sex, but in general improved, and here and there actually dignified. A delicate skin and a ruddy complexion are in the vulgar idea the first requisites of beauty; but no where is paint so essential an article of the toilet as here, even among the lowest classes of the people. As the growth of the Russian ladies is not confined by any bandages, stays, or other compresses, the proportions of the parts usually far exceeds the line which the general taste of Europe has prescribed for the contour of a fine shape.—The early maturity of girls, at which they generally arrive in the twelfth or thirteenth year is only to be accounted for, in so cold a climate, by the frequent use of hot baths, which, while it accelerates this expansion, also

assembling the truth. "The rooms of the foundling hospital," says Mr. Coxe, "are lofty and large; the dormitories, which are separate from the work-rooms, are very airy, and the beds are not crowded: each foundling, even an infant, has a separate bed; the bedsteads are of iron; the sheets are changed every week, and the linen three times a week. In going over the rooms I was particularly struck with their neatness; even the nurseries were uncommonly clean, and without any unwholesome smells. No cradles were allowed, and rocking is particularly forbidden. The infants are not swaddled according to the custom of the country, but loosely dressed. I could be no judge, merely visiting the hospital, whether the children were well instructed and the regulations well observed; but I was perfectly convinced from their behaviour, that they were in general happy and contented, and could perceive from their looks that they were remarkably healthy. This latter circumstance must be owing to the uncommon care which is paid to cleanliness, both in their persons and rooms.

"In another visit which I paid to this hospital, I saw the foundlings at dinner: the girls and boys dine separately. The dining rooms, which are upon the ground floor, are large and vaulted, and distinct from their work-rooms. The first class sit at table; the rest stand: the little children are attended by servants; but those of the first and second class alternately wait on each other. Each foundling has a napkin, pewter plate, a knife, fork, and spoon: the napkin and table cloth are clean three times in the week. They rise at six, dine at eleven, and sup at six. The little children have bread at seven and four. When they are not employed in their necessary occupations the utmost freedom is allowed, and they are encouraged to be as much in the air as possible. The whole was a lovely sight; and the countenances of the children expressed the utmost content and happiness." See Coxe's Travels through Poland, Russia, Sweden, and Denmark, vol. ii. p. 63. 8vo edition.

brings

brings on early decay of beauty and solidity of bodily frame. Married women seldom retain the fresh complexion and the peculiar charms of youth beyond the first lying-in. By their baths, their paint, and the great submission in which they live with their husbands, the moderate share of beauty with which nature has endowed these daughters of the northern earth is generally faded at an age when the husband is just entering on his prime.

Among the collateral branches of the Russian stock but few variations are discernible in the bodily form. The Malo-Russians have somewhat of the Poles in their physiognomy; the Donkozaks partake of the Tartarian, and the Uralkozaks of the Tartarian and Kalmuck, which proceeds from the commixture, wherein these people have long been accustomed to live. With all of them, however, the main lineaments are Russian, and so impossible to be mistaken, that the form of the face alone affords the strongest proof of their parentage.

The bodily frame of the Russians is excellent. Their happy organization, their cheerful and blithe temper, that hardness which they oppose to every inconvenience, the natural simplicity of their manner of living, and their rude, but dry and wholesome climate, procure to the great mass of the people a degree of physical complacency of which few other nations can boast.

There are not many peculiar diseases prevalent among the Russians, and against most of them they know how to guard themselves by simple diet and domestic remedies. The women every where bring forth with great facility, and usually in the bath-rooms; the number of still-born children is therefore, in comparison with other countries, extremely small. There the small-

pox and measles carry off not nearly so many children as in the greater part of the rest of Europe; but on the other hand the effects of venereal disorders are more dangerous and infectious, the virulence of it being unhappily increased by the cold.—In Siberia, sometimes in summer, a disease called by the Germans the *lustseuche* or air sickness appears, an epidemical disease attacking both man and beast. It shews itself by a bile on some parts of the body, and, if not speedy assistance can be had, is mortal, though not infectious; but they have now found out an easy and safe method of cure.—About the Upper Lena croups or guttress are common enough; young people, however, get quit of them on coming to parts where they have better water.—In the neighbourhood of the Caspian there is a horrible, fædious, and deadly leprosy, which happily, however, becomes less and less frequent in its attacks, and is generally called, from its former country, the Crimean disease.

Most of the household remedies of the common Russians are truly heroic. A mixture of leek, garlic, Spanish-pepper, and brandy, seems with them to be the grand panacea, and is applied without regard or distinction in all diseases of whatever kind and how opposite soever; so also aconite, hellebore, and the like, are in high reputation for their medicinal virtues. In pains and aches of the bones or limbs, and in cholick complaints, they burn moxa of artemisia, &c. on the bare skin.—In general the common Russians use but few medicines; supplying their place in all cases by the sweating baths: a practice so universal among them, and which has decided an influence on the whole physical state of the people, that we must absolutely dwell a little longer upon it*.

* The use of the bath, that venerable relic of the manners of the ancient world, is now almost entirely confined to the oriental nations, where it ministers both to health and to luxury, and is perpetuated by religion. In Europe it has been gradually declining for several centuries, though it was here also in some sort interwoven with religion; Russia and Hungary are at present the only countries in this quarter of the world, where it is still the custom to bathe after the manner of the ancients. In Russia particularly the bath makes so much a part of the system of living, that it is used by people of every age and in all circumstances, by infants, by women at their lying-in, in almost all sicknesses, before and after a journey, after hard work, &c. The bath is a necessary of life so indispensable to the

common people, that they frequent it as often as possible well or ill, and without any particular occasion once a week at least. Persons of the middle station, in good circumstances, and the great, usually construct vapour baths for themselves in their own houses; though these classes the practice is becoming more confined to foreign manners gain ground among them.

The baths have been common throughout Russia from time immemorial; they are described by Nester so long ago as the eleventh century precisely as they are constituted at present.—Among the ancients the baths were public buildings, under the immediate cognizance of the government. Their invention was owing to cleanliness and convenience but in the sequel all the graces of architecture were lavished

The Russian language is an improved dialect of the Slavonian, which, with its characters is still in use in the office of religion. The Russian alphabet has forty-one letters, whereof some are only notes of accents in pronunciation. The language is rich in words, soft, expressive, and requires great pliancy in the organs of utterance. Seminaries have been founded of old in the episcopal seats; gymnasiums and the universities of Kief and Mosco are foundations of great antiquity. There was, however, a deficiency in schools; and therefore the late empress was constantly adding to their number. Besides these, here are institutions for the education of the military and the nobility, and for young ladies of quality; an academy also of sciences; and another for the study of the arts, which were entirely re-erected on a magnificent plan by Catharine II. to whose munificence likewise the nation is indebted for the establishment of an academy for the improvement of rural economy, and a society for the cultivation of the Russian language. In the several institutions for the purposes of education throughout the empire, the pupils are found in

upon them, and at length luxury and voluptuousness so disordered them from their primitive purposes, that they were offensive and shocking even to the moralists of antiquity. Alexander was astonished at the magnificence of the baths in Persia; at Rome, under the emperors, there were once eight hundred and seventy of these edifices, that in point of magnificence and taste might pass for master-pieces of art; and which were doomed in aftertimes to be demolished by the Goths, or converted into churches by bishops.—In our days Hungary is the only country that can still shew baths equal in magnificence to those of the ancient Romans. In Russia, on the contrary, they are always of that simple construction which bespeaks their primitive and most essential destination.

Here the public baths usually consist of mean wooden houses, situated, whenever it is possible, by the side of a running stream. In the bath-room is a large vaulted oven, which when heated makes the paving-stones lying upon it scorch; and adjoining to the oven is a kettle fixed in masonry, for the purpose of holding boiling water. Round about the walls are three or four rows of benches one above another like the seats of a scaffold. The room has little light, but here and there are apertures for letting the vapour escape; the cold water: that is wanting being let in by small channels. Some baths have an anti-chamber for dressing and undressing; but in the most of them this is done in the open court-yard, which on that account has a bordered fence, and is provided with benches of planks.

By far the majority of the baths are constructed as they are here described. In the country, in parts where wood is scarce, they sometimes consist of miserable caverns, commonly dug in the earth close to the bank of some river. In

every necessary article, such as board, lodging, food, raiment, washing, &c. and are dependent on the foundation. Accordingly the entrance into these schools is accounted a service rendered to the country; and in reckoning the years of service, in order to promotion in rank, the years of attendance at school are always included.

The native Russians are of different stature; some are very tall, but few much below the usual height; several of them are remarkably strong limbed; in general they are lean, but well built. Those deformities which in other parts of Europe are mostly owing to the refinements of luxury introduced into education, are here but rarely seen: their mouth and eyes are small, the lips thin, the teeth even and beautiful, the nose, as every where, various, in general not large nor very aquiline; the forehead frequently low, and their aspect rather grave: the beard is strong and bushy, their hair lank, brown, flaxen, or red, seldom entirely black: in sight and hearing they are uncommonly acute: the organs of feeling, smell, and taste, are hardened, like all the rest of their body, by the rudeness of their cli-

the houses of wealthy individuals, and in the palaces of the great, they are formed upon the same construction, but infinitely more elegant and convenient.

The heat in the bath-room is usually from thirty-two to forty degrees of Reaumur, and that greatly increased by the throwing of water every five minutes on the glowing hot stones in the chamber of the oven. By this means the heat often rises, especially on the uppermost bench, to forty-four degrees of that thermometer.—The bathers lie, stark naked, on one of the benches, where they perspire more or less in proportion to the heat of the humid atmosphere in which they are enveloped. In order the better to promote perspiration and completely to open the pores, they are first rubbed, and then gently flagellated with leafy branches of birch. After remaining awhile they come down from the sweating-bench and wash their body with warm or cold water, and at last plunge over head in a large tub of water. Many people throw themselves immediately from the bath room into the adjoining river as the youths of ancient Rome used to leap into a pond after the violent exercise of wrestling, or roll themselves in the snow in a frost of ten or twelve degrees.

The Russian baths, therefore, are sweating-baths: not the Roman tepidaria and caldaria of a moderate warmth, but very violent sweating-baths which to a person not habituated to the practice, bring on a real, though a gentle and almost voluptuous swoon. They are vapour baths, not water, nor yet dry sweating-baths; herein they differ from all the baths of antiquity as well as from those of the modern orientals; and this is also their essential excellence, that they are beneficial in such a variety of cases where hot water baths would be useless or even pernicious.

mate and manner of life. They are mostly of a choleric temperament; in gait and action they are brisk, lively, and agile.

The complexion of the females is brunette, with a fine skin; many of them very handsome. Girls generally arrive early at maturity, numbers in their twelfth or thirteenth year; but many of them lose all their beauty after being married about a couple of years. The frequent use of the hot bath promotes an early developement, and as speedy a decay; and the hideous practice of painting spoils the skin.

The general disposition of the people is gay, careless even to levity, much addicted to sensuality, quick in comprehension, and prompt in execution. Violent in their passions, they easily mistake the golden mean, and not unfrequently rush into the contrary extreme. They are attentive, resolute, bold, and enterprising. To trade and barter they have an irresistible impulse. They are hospitable and liberal, frequently to their own impoverishment. Anxious solitudes about the future here cause but few grey pates. In their intercourse with others, they are friendly, jovial, complaisant, very ready to oblige, not envious, slanderous, or censorious, and much given to reserve. From their natural and simple way of life, their wants are few, and those easily satisfied, leaving them leisure for recreations and repose; and the constant cheerfulness of their temper frees them from troublesome projects, procures them satisfaction in all situations, keeps them healthy and strong, and brings them to an undisquieted, contented, brisk, sometimes a very advanced old age.

In the different villages all over the empire we see the mechanical businesses of towns carried on; but more especially in the parts adjacent to the Volga, and in the vicinity of the governments of Mosco, Nishney-Novogorod, and Kazran.

The employments of the female sex, both in town and country, vary but little from those in the neighbouring countries. They see to the cleanliness of the house, spin, weave linen and coarse cloth on frames, in quality but little inferior to what is brought from Germany; they bleach, full, and colour, knot the ends of the threads for a span long, for table cloths, neck cloths, &c. make felt, bake bread every day, &c. In general they are kept closer to work, and fare harder than is customary among their European neighbours.

The country market towns and hamlets are commonly open; and are mostly built in irregular streets, with little kitchen-gardens and large yards to the houses. They are situated on the banks of the rivers, since the digging of wells is not in practice: as in most parts pebbles are not to be had in any considerable quantity the roads and streets are frequently made of timbers, or banks laid close together, naving the upper part made flat with the hatchet. They contain many, not large, but good-looking churches, mostly of brick and plaister. The monasteries in and near the towns, from their strong walls, massy gates, and numerous church towers, have the appearance of castles. The fortresses dispersed about the country, have seldom earth-ramparts, mostly batteries of bank laid one on the other, in the same manner as they build their houses; and about these a long palisade. The cannons stand on the gates, and upon the angles of the ramparts or batteries of wooden carriages. Their design is to keep the tributary tribes in awe, and the nomads from the borders. Ostrogs, or houses surrounded with a palisade of upright pointed banks, are either in towns, where they serve as prisons for criminals, or solitary in various parts of the country, for the same purpose as the fortresses. Villages, of extremely various dimensions, and parishes are situated on the margins of rivers, brooks, lakes, and sometimes on morasses and springs. The parishes, or church villages, are sometimes very extensive; and contain, it may be five hundred or even a thousand and more farms, from three to seven churches many of brick, markets, and trafficking place. Large villages are frequently called slobodes and are less than church villages: the houses are ranged in strait streets, and the streets mostly laid with timbers. The proper Russian architecture is alike in towns and villages. A messuage consists of a dwelling-house, with little store-rooms, stables, and a stow, or hot bath, by which the yard is enclosed. All these structures are built of banks, unhewn, placed on one another, and notched into each other at the four corners; sometimes, though but rarely, on a brick foundation: these houses are covered with boards, and when the owner can afford it, with oak shingles. The meanest dwelling-houses consist solely of one little room, which therefore has the door to the street. In it is an oven, taking

almost one fourth part of the whole space; joining to it, of equal height with the oven, a broad shelf of board. The top of the oven and this shelf are the sleeping places of the family. The light is admitted into these houses through two or three holes in the walls furnished with shutters, or through a little window of muscovy-glass, or only of bladder, oiled linen, or paper. The smoke finds its way out as well as it can through these apertures in the wall. These rooms, as may well be supposed, are as black as a chimney, and, as all the household functions are performed in them, such as baking, cooking, washing, &c. it is hardly possible to keep them clean. They are called, with the utmost propriety, black rooms. Under the floor of the room is a cellar*.

The corn kilns are without the towns and villages. Places thus built must be very liable to catching fires; and, when once they break out, they rarely leave any thing unconsumed. The household furniture, both in town and country, even among people of opulence, is very simple. The room which, with very few exceptions, is the same time, the kitchen, are a table, benches, the shelf, which serves for the dormitory, and in the corner one or more holy figures. The rich have a great many of them, some with coverings of beaten silver. Before these lamps or wax candles are kept constantly burning, or at least all the festivals, which amounts to nearly the same thing; so that many of these summer-rooms have the appearance of little chapels. Culinary utensils, and those for the use of the table, are as few as can well be conceived. As vehicles they make use of quite small open one horse carts, or somewhat larger, and half covered over with a child's cradle, also with one horse, without a carriage, so that a collateral horse can at any time be put to; both kinds of such a simple mechanism, that almost any boor can make a wretched one, or at least repair the defects of an old one, even upon the road. They are extremely light and commodious.—Splinters, like laths, of

fir or very dry birch-wood are much more commonly used for giving light in the room, after dark, than tallow-candles.

The inferior houses are much pestered with domestic vermin; besides the common house-rat and mouse, they swarm with water-rats, bats, large beetles very frequent, crickets, bugs, fleas in abundance; various kinds of very troublesome flies, gnats, moths, woodlice; in southern low places frogs, toads, and tad-poles; in Siberia little beetles; and about the Tsheremtshan, Lapland beetles. The preparation for their victuals is so simple that foreigners do not easily bring themselves to relish it, but adhere to the customary way of dressing their food in their own countries.

Fresh meats with the watery sauce, or baked pasties of common crust, with minced-meat, or whole fish, fish with water and salt, without other sauce, cabbage and roots chopped together, cabbage-soup, which is never omitted, meagre fish and flesh soups, cool drink, quas, with eggs, minced-meat, and leeks, pancakes, soup of ground hemp and linseed, millet-soup and grits, turned milk with meal and sour milk, &c. almost all seasoned with onions, leeks, garlic, and sometimes pimento, are their ordinary dishes. Where Tartars dwell, they use likewise a few wild roots, especially dog tooth, lily-roots, and others. For the evening repast are served up nuts, orchard-fruits, and the several wild fruits produced by the country round; black strawberries, sloes, &c. At an entertainment of their friends and acquaintance they provide a surprising variety of these kind of dishes. The lower sort feed very poorly at all times, but particularly in the fasts. In large towns, the table in good houses is becoming more luxurious and fashionable from day to day.

The most common domestic drink is quas, a liquor prepared from pollard, meal, and bread, or from meal and malt, by an acid fermentation. It is cooling and well tasted. Corn-spirits, and rectified corn spirits, supply the place of wine.

* A complete town or country house, for the sake of having a cellar, stands raised a fathom above the ground, and has a black room and a white room, and between the two, a small passage. The black-room has frequently a chimney to the oven, and a window of glass or marienglas; the white-room has the oven of tiles, or bricks covered with plaster. The entrance, by a covered flight of wooden steps to the aforementioned passage, is from the back-yard,

not from the street. The magazines or store-rooms are small detached huts for provisions, corn, in short all the necessary stores. The stables are mere hovels or sheds, open to the yard, or at most fronted with wattles, paid with mortar; in the latter case they are called pokletti. The bath room resembles a detached black-room. It stands alone; has an oven like the other, smoke-holes, a water tub, brushes, and benches raised one above another.

In good houses are fruit-wines, raspberry-wine, cherry-wine, bilberry-wine, &c. from the juices of those fruits, meed and brandy made by fermentation, which are pleasant enough to the palate. Tea is in very general use. The true Russian tea, is a decoction of honey, water, and Spanish pepper, and drank warm. It tastes well and cheers the stomach.

In the article of dress they adhere as faithfully, in the country towns and villages, to the manners of their fathers, as they do in food and lodging. The noblesse, all the officers in the civil department; and, besides the light troops, the soldiery all over the empire, the merchants of the chief towns and those who trade with them, the mine-owners, and almost all the people of quality throughout the empire, dress after the German fashion; and the ladies, even in the remotest and most retired parts of the country, are more modishly attired than would easily be imagined. The burghers and mercantile class, however, generally speaking, stick close to the national dress, no less than the peasantry.

The Russians are a race much hardened by climate, education, and habits of life, having their own peculiar usages, which have a greater affinity with the Asiatic than the European, only without the effeminacy. They sleep on the floor, the hard benches, or the boards placed shelf-wise for that purpose, in the summer contentedly lying down in the open air, in the field, or the yard of the house, as they do in the winter on the top of the oven without beds, or merely on a piece of felt, sometimes with, and often without any pillow, either under a thin covering or in their clothes. After performing their evening devotions, accompanied with frequent prostrations and crossings, before the sacred figures of the saints, they betake themselves early to rest, and rise again betimes in the morning, wash themselves, renew their pious orisons, and proceed with alacrity to business. Into the houses of the great and opulent, even at a distance from chief towns, feather beds, and late hours, with other luxuries, have long since found their way.

Whenever acquaintance meet together, their term of greeting is, *Zdravstvui!** or sometimes, *Zdarovui!*† accompanied with shaking of hands,

* Which may be rendered, All hail! or God save thee! or good betide thee!—Salve! Sit saluti!

taking off the cap, bowing, and often with kissing, which is much in practice with both sexes. Even the lowest of the people greet one another with great civility. Inferiors kiss their superiors on the breast, and of people still more elevated above them they kiss the border of the garment; and when the difference is very great, they fall down and strike their forehead upon the shoe of the great man. When they have any thing to request, they assume a tone and gesture as if they were imploring mercy. It is indecorous to speak loud in the presence of superiors; and if any one happens to do so, he is presently chid by the bystanders, with “Do not bawl!” When a man designs to honour his guests, he lets his wife and daughters appear, full-dressed, who kiss the guests, and hand them what they want at the entertainment. They seem to vie with one another in the profusions of hospitality. Old age is universally honoured. On the breaking up of company, they depart, saying, “*Proshai!*” and never omitting the valedictory kiss. On the slightest interruption or alteration to the ordinary course of whatever they are about, at eating, drinking, sneezing, at a sudden start, &c. at the sight of a particular place, of a church, &c. they make the sign of the cross with the fingers, on the forehead, the stomach, and the shoulders, bowing several times, and adding with a deep-fetched sigh: “The Lord have mercy!”

They have usually two meals in the day; in the forenoon about nine o'clock, and in the afternoon at three. The family at these times eat all together; and, when it is numerous, first the males and afterwards those of the other sex. They allow themselves but a short time at table, and are easy and cheerful. Even among the inferior people, the table-linen, and vessels are kept in great cleanliness. If strangers sit down with them there are very copious potations. Intoxication is not disgraceful, and even among people of good condition, if a lady be overtaken in liquor, it is no subject of reproach. They are never quarrelsome or scurrilous in their cups, but friendly, jovial, courteous, speak in praise of the absent, and boast of their friendship; and those that are not able to stand, find ready assistance from those that can. On journeys, merchants and others take their food with remarkably

† Health! Sospes! Saus!

few formalities. In towns and great village stations, women sit in the street, near the public-houses, with tables having roast and boiled meat, fish, pirogges, cabbage-soup, cucumbers, bread, and quas, consequently a superb and every where a cheap repast, which is taken standing, and always accompanied with a glass or two of brandy.

To hot and cold bathing they are so habituated from their earliest infancy that the practice is indispensable. They usually go into the hot bath once a week, besides other frequent occasions, such as, after a slight indisposition, hard work, on returning from a journey, and the like. They use the bath very hot, heating the room with large stones made glowing red, and raising a vapour by repeatedly throwing water upon them; the room all the while being so tight that no particles of heat or vapour can transpire. The bather is extended naked upon a mat thrown on one of the shelves of the scaffold already described, which the higher he ascends the greater the heat he feels. When he has thus lain perspiring for some time, the waiter of the bath, generally a female, comes and washes his body all over with hot water, scourges and rubs him with bunches of leafy birch, wipes him with cloths, and then leaves him to lie and sweat as long as he chooses. Numbers of them run from the hot bath into the cold water flowing by, and in winter roll themselves in the snow, without deriving any bad consequences from it.

With substantial people the marriage-contract is made with mercantile punctuality; the common sort enter into the nuptial state, for its peculiar purposes, as young as they can; and, as housekeeping is not expensive, and as education neither attended with cost nor trouble, they live as much at their ease as before. The betrothing is performed with ecclesiastical rites, generally eight days previous to the marriage, and is indissoluble. During this interval, the bride is only visited by the bridegroom and the friends of her acquaintance, who amuse her with singing. On the last evening the young women bring the bride into the hot bath, where they sit and tie up her hair all the while singing songs descriptive of her future happiness. The marriage is solemnized in the church before the priest, whither they proceed, with the figure of the saint carried before them. During the ceremony a crown is put on each of their heads.

The priest, with due forms, changes their rings, reads to them an admonition of their reciprocal duties, gives them to drink of a cup in token of the present union of their fortunes, and dismisses them with his blessing. At their return from church the father of the bride presents the young couple with a loaf of bread and some salt, accompanied with a wish that they may never know the want of either, for which they thank him on their knees. They then sit down to supper.

The national diversions of the Russians on holidays, at weddings, and other occasions of festivity, are very diversified, and have great resemblance with those customary among the Persians, the Arabians, and Egyptians. Their music is more usually vocal than instrumental. On the whole globe we shall scarcely meet with a country where the song is more jovial and universal than in Russia. They all sing from the child to the hoary head, on all occasions, old women excepted, even while at the most laborious and toilsome work, and generally with all their might; the country roads re-echo with the songs of the drivers, the village-streets with the merry voices of the girls, and drinking-houses are never without a concert. Their songs are simple recitations, ancient or modern; on the subject of love, nature, and tales of chivalry, giants, and heroes, frequently lewd, and their melodies uniform and monotonous, but sometimes pleasing enough. The little groups of girls sitting together of an evening and singing are very entertaining. The men sing, from the fullness of their hearts, exploits of soldiers or kozaks in time of war, or a thousand other subjects that will suit their own style of composition, and their tunes and their thoughtless merry dispositions, reciting sometimes single words or lines from different songs in every tune and for whole hours together.

The dead are sincerely and long lamented by their relations and friends; but, from a natural repugnance to the idea of death, they use but little ceremony with the corpse. They put on it a shroud, then lay it in a coffin, in which it is brought open, only covered with a pall to the grave, attended by priests, chanting hymns, and bearing crosses and lighted tapers in their hands. Being come to the place of interment, the attendants take leave of the body by a kiss, give it a blessing, then fasten up the coffin, let it down into the grave, and shovel in the earth. On these

occasions the nobles and the rich put on black, but others make no change in their dress. The lower sort bury their dead in their ordinary clothes. Such as die in the barks upon the rivers are taken to the shore by their companions, and there put in the ground, without any other ceremony. Great funeral feasts and mourning in black clothes are not customary: among the few dishes they serve about, one is usually a frumenty of soaked wheat, in reference to the passage concerning a sprouting wheat-corn in John xii. 24. In great towns the funeral obsequies are conducted, among people of condition, as they are in other countries.

At the new year is annually held a feast of the dead, on which every body visits the grave of his relations, lays some victuals upon it, and hears mass, in payment for which the priest gets the victuals. Profligates, such as have come to a miserable end, and all who have died without the sacrament, were formerly thrown, without inhumation, into a hut for that purpose, and, on the Thursday before Whitsunday, were buried by the clergy, who said masses for their souls, attended by the inhabitants of the place. At present greater indulgence is shewn to these poor wretches.

The ancient orthodox Greek religion, to which the whole nation is attached, is universally acknowledged in doctrine and discipline. We shall here speak only of its externals. The churches and the sacerdotal vestments are very magnificent. The people at large are very strict in the observance of the outward forms of worship, at-

tendance on mass, keeping the fasts, (which take up one-third part of the year,) performance of domestic devotions morning and evening, confession, receiving the sacrament, &c. To build churches is a meritorious act; hence it is, that even the smallest towns have such a number of these structures, and some of them handsome. As, by reason of the severity of the winters, it is necessary to heat the churches, there are frequently two churches in one church-yard, winter and a summer church; at other times they consist of two stories, used to the same purpose. The clergy are held in great honour, and are extremely tolerant towards all other professions of faith. The titles of metropolitan and archbishop are not attached to the see, but are at present merely personal distinctions conferred by the sovereign, which give the possessors no additional power, and scarcely any precedence. Every one on meeting a priest, kisses his hand, in return for which he receives his blessing with the sign of the cross: this custom is now, however, pretty much confined to country places. Passion week is kept by every person in great apparent solemnity, with frequent ceremonies of devotion to which they are invited by slow and distant strokes of the church-bells: but the Easter-week is passed pretty nearly as in some other countries in various diversions, drunkenness, and debauchery. At this festival it is the universal custom all over the empire to present each other with an egg accompanied with a kiss, at the same time saying "Christ is risen!" to which the other replies "He is risen indeed!"

SECTION V.

The Chace, with a particular Description of the Methods made Use of for taking the several Animals

HUNTING was every where the first occupation of man. Impelled by hunger, and incited to resistance by the attacks of savage animals, his first business was to struggle with them for the support of his life. In most of the countries in our part of the globe the chace has lost this character: it is now, neither from want nor fear, a business of necessity; and even the employments which in the earlier stages of the European nations was a toilsome and dangerous

pursuit, is become an object of diversion and pleasure. But in Russia are still numerous tribes who, in regard to their physical wants, are entirely or principally addicted to the chace, and are obliged to contend for their existence with the savage inhabitants of their deserts. Considered in this point of view, the chace is already a business of very great consequence to the Russian empire: but if we look to the quantity and the value of the products that are obtained

this pursuit, not only to the home consumption, but likewise to its commerce with foreign nations, it acquires one political importance more, which imposes on us the necessity of becoming somewhat more accurately acquainted with the manner in which it is conducted, and the objects to which it extends.

In Siberia the chase is confined to such beasts as have valuable skins, and in pursuance of supreme command to those nations who deliver their tribute in furs, and make hunting their chief employment; but here also the Russian door never fails to devote to the chase the idle days of winter. The wild animals which are pursued for the sake of their skins are found in the greatest plenty in the most northern and eastern parts of Russia, principally on the island between Kamtschatka and America, the discovery whereof is become of vast importance to the fur trade. Next to these the governments of Tobolsk, Perme, Usa, Viatka, Archangel, Olonetz, Vologda, and some others, are most abundant in beasts of the chase.

But precisely where the chase is the most lucrative there it is a very difficult, toilsome, and perilous business; accordingly it is made a principal employment only by the most uncultivated nations, as, the Ostiaks, Samoyedes, Vogules, Tunguses, Tschuktsches, Kamtschadales, Yakutes, the Eastern islanders, and the majority of the Siberian Tartars. With several of these nations the chase is the sole means of profit by which they are enabled to procure food, clothes, and other necessities; and these pay their taxes to government or their tribe, in furs. In defiance of all the hardships attending the chase of large beasts of prey in the monstrous forests and wildernesses of the arctic region, this trade is not only the principal but also the favourite employment of most of its inhabitants. It is by no means unusual for single hunters of these savage tribes to engage in duels with bears, wolves, and other voracious animals, in which they are so sure of the artifice or their aim, that they seldom or never fall in the combat. Some nations, as the Ostiaks of the Oby, never go to the chase but in small

companies, when they beat about the forests for four or six weeks together in quest of prey, taking with them no other provisions than frozen fish in little sledges. Whereas the Tunguses and others roam singly about their wilds, which are covered with mountains, fragments of rocks, and large rivers, and where they often fall a sacrifice to their fondness for this sport. When one of these hunters has the misfortune to break an arm or a leg, or to be wedged between two pieces of rock, in this helpless situation he must either perish with hunger or die of his wounds, or fall a prey to some savage beast.

The chase for the sake of furs being the most important to foreign commerce, we shall make it the first object of our notice. The most valuable of all the animals that are sought for their skin is the sable; to which, by the general consent of all the nations of Europe and Asia, so great and determinate a price has been affixed, that its skin still serves as a standard to the tribute which is paid to the crown by the Siberian nations of hunters. This animal is found in Asiatic Russia, from the Aleütan islands and from Kamtschatka to the districts of the Petschora and of the Kama: but the quality of its skin in this extensive region is extremely different. The finest sables come from Yakutsk and Nertschinsk, and among these are likewise, though rarely, yellow, and extremely seldom, white sables. The Kamtschadale sables are the largest of all. Their skin is thick and long haired, but not very black, therefore most of them go to China, where they are coloured. At the time of the conquest of Kamtschatka, the sables were there in such extraordinary numbers, that a single hunter could easily bring away sixty, eighty, a more of these animals in a winter, and they were held in such little estimation by the Kamtschadales, that they deemed the more useful skin of a dog to be of twice the value. For ten rubles worth of iron ware there was no difficulty in obtaining the value of five or six hundred rubles in sables; and whoever had only followed this trade to Kamtschatka for the space of a year, usually came back with a profit of thirty thousand rubles and upwards*.

The

* The manner in which the sables of Kamtschatka are taken is extremely simple. The Kamtschadales follow the track of this animal in snow-shoes, till they have detected a covert, which is generally a burrow in the earth. As soon as the little creature is aware of his pursuer, he escapes

into a hollow tree, which the hunter surrounds with a net and then either cuts it entirely down or forces the sable by fire and smoke to abandon his retreat when he falls into the net and is killed. In other parts, where these animals are rare, the contrivances to take them are more artificial. Of this

The fox makes also a considerable article of trade, of which in Russia there are four distinct species: the common, among which are the red, the sorrel, the black-striped, (called the cross-fox,) and the entirely white, which are the rarest and clearest; the karagane, of a grey colour, the steppe-fox, and the rock or ice-fox. The latter, which are mostly white, but sometimes of a blueish colour, chiefly inhabit the islands on the coasts of the Frozen Ocean, Kamtschatka, and the Russian Archipelago. The black foxes, which at present fetch most money in commerce, are only found in eastern Siberia*.

Eastern Siberia, and particularly Kamtschatka, abound most in beautiful foxes: they were here in such great numbers about the middle of the eighteenth century, that the finest fire-red fox skins were never sold higher on the spot than at one hundred and thirty to one hundred and eighty

kopecks. The black foxes are in general not so very plenty; their value in commerce is such, that sometimes even a single skin cannot be had for less than one hundred or five hundred, and at times even for a thousand rubles. These animals are naturally the choicest object of the chase among all the eastern Siberian nations, as one skin not unfrequently defrays the tribute of a whole village. The care, therefore, with which they keep the young foxes they take is so great, that the Ostiak women nourish them at their breasts. In summer, when they find young foxes of this sort, they at first feed them, but shortly before they kill them they break one of their legs that they may eat less, as lean foxes have better skins. The true native country of the rock or ice-fox are the islands of the Frozen Ocean and the Eastern Ocean, where they are found in incredible numbers†.

this kind is the sable trap of the Vogules, which is used in several parts of Siberia. A place is sought out where two young trees stand not far asunder, which are immediately stripped of their branches about the bottom. At one of these trees a post is stuck in the ground, and on it is placed a beam horizontally, fastened in such manner to both trees that one end of it lies between the post and the tree. Over this beam another is laid, as a trap-fall, at the end whereof a thin support is put, which, when the trap-fall is up, stands over the notched end of the post; at the extremity of this support is a mat-string, and another at the lower transverse beam tied very short. Both are brought together, and a bit of stick put through them, having at its longer extremity a piece of flesh of wild fowl attached, which by its preponderance keeps the stick down and thus holds the two strings together. The sable creeps cautiously along the lower beam till he can reach the bait and pull it to him: this lets go the stick to which the bait is tied and by which the strings were held together; the stay loses its hold, and consequently the upper beam falls upon the shoulders of the animal and holds him fast.—With the same kind of trap martens and other little beasts are killed.

* The ordinary method of catching these animals is by traps set for them; but the inhabitants of Kamtschatka most commonly make use of an ingenious invention for that purpose. They lay several snares of whalebone which are fastened like hoops to a board, within a circle in the snow; placing in the middle of this circle a mew or sea-gull as a bait. As soon as the fox jumps into the circle to seize his prey, the hunter, who lurks in a pit, draws the hoop together by means of a string, which catches the fox either by the body or the foot, and holds him till the hunter knocks him down with a stick. In Siberia it is very usual to make the fox shoot himself dead, by fastening a gently drawn bow with its arrow upon it to a post fixed in the ground: across the path or track a line is laid, in such a manner connected with the bow, that it is immediately discharged as the fox touches the string in running. The arrow generally pierces

the heart of the animal, and consequently kills it on the spot: to this end the hunter has a rule to determine the height at which the bow must be placed.

† The description which Steller gives of this curious and sly animal is so entertaining, that it may be read with pleasure even more than once. "During my unfortunate abode," says he, "on Behring's Island, I had opportunities more than enough for studying the nature of this animal, far exceeding the common fox in impudence, cunning, and roguery. The narrative of the innumerable tricks they played is might easily vie with Albertus Julius's history of the apes on the island of Saxenburg. They forced themselves into our habitations by night as well as day, stealing all that they could carry off; even things that were of no use to them, as, knives, sticks, our cloaths, &c. They were so inconceivably ingenious as to roll down our casks of provisions several poods in weight, and then steal the meat out of them so ably, that at first we could not bring ourselves to ascribe the theft to them. As we were stripping an animal of his skin, it often happened that we could not avoid stabbing two or three foxes, from their rapidity in tearing the flesh out of our hands. If we buried it ever so carefully, and added stones to the weight of earth that was upon it, they not only found it out, but shoved away the stones, as men would have done, with their shoulders, and lying under them helped one another with all their might. If, thinking to secure it, we put any on the top of a high post in the air, they grabbed up the earth at the bottom, so that the post and all came tumbling down, or one of them clambered up and threw down what was upon it with incredible artifice and dexterity. They watched all our motions, and accompanied us in whatever we were about to do. If the sea threw up an animal of any kind they devoured it ere a man of us could come up, to our great disadvantage; and, if they could not consume it all at once, they trailed it away in portions, to the mountains, where they ever buried it under stones before our eye, running to and fro as long as any thing remained to be conveyed away. While

For smaller furrieries and edgings, the skins of the marten, the squirrel, the ermine, the rabbit and the marmotte are the choicest. All these little animals are coursed with dogs by the boors, who devote a part of their time to the chase; or caught in great numbers, with traps and gins set before their burrows.—The marten is not only found in Siberia but in European Russia, even about the Ladoga Lake and in Livonia; but there in the government of Tobolsk are the finest as well as the most plentiful. The bluckest squirrels come from Yakutsk and Nertschinsk; but they are likewise the smallest. The teleutan are famous for their size, and have also the beautiful silver-colour that renders them so valuable. The striped squirrel is likewise plentiful in Siberia.

While this was doing, others stood upon guard and watched us. If they saw any one coming at a distance, the whole troop combined at once and began digging all together in the sand, till they had so fairly put a beaver or a sea-bear under the surface, that not a trace of it was to be seen. In the night time, when we slept in the field, they came and pulled off our night caps and stole our gloves from under our heads, with the beaver coverings and the skins that we lay upon. In consequence of this we always slept with clubs in our hands, that if they should wake us we might drive them away or knock them down.

When we made a halt to rest by the way, they gathered around us and played a thousand tricks in our view, and when we sat still, they approached us so near that they gnawed the thongs of our shoes. If we laid down, as if intending to sleep, they came and smelled at our noses to try whether we were dead or alive; if we held our breath, they gave such a tug to the nose as if they would bite it off. On our first arrival they bit off the noses, the fingers, and toes of our dead, while we were preparing the grave, and thronged in such manner about the infirm and the sick, that it was with difficulty we could keep them off. Every morning we saw these audacious animals patrolling about among the sea-lions and sea-bears lying on the strand, smelling at such as were asleep, to discover whether some of them might not be dead; if that happened to be the case, they proceeded to dissect him immediately, and presently after all were at work in dragging the parts away: because the sea-lions of a night in their sleep frequently overlay their young, they examine, as if conscious of this circumstance, every morning the whole herd of them one by one, and immediately drag away the dead cubs from their dams. Being now that they would not suffer us to be at rest at night nor day, we were in fact so exasperated at them that we killed them young and old and plagued them by every means we could devise. When we awoke in the morning, there always lay two or three at our feet that had been knocked on the head in the night; and I can safely affirm, that during my stay upon the island above two hundred of these animals were slain by myself alone. The third day after my arrival I knocked down, within the space of three hours, upwards of seventy of them with a club, and made

This delicate little creature climbs the trees and nimbly springs from bough to bough, but his winter holes and the magazines of provisions always found with them, in which various kinds of seeds are collected, he makes in the earth, though on account of the moisture of the ground not remarkably deep. Easy as it would be to catch these animals, and numerous as the fanciers which their beautiful striped fur would ensure, yet none apply to the capture of them.

To the other objects of the chase for furs must be added the bear, the wolf, the lynx, the glut-ton, the ferret, the polecat, &c. which, generally speaking, are spread over the whole of North Russia, and the prodigious quantities obtained of their skins are partly consumed at home and

a covering to my hut of their skins. They are so ravenous, that with one hand we could hold to them a piece of flesh, and grasp a stick or an axe in the other to knock them on the head.

When these busy animals could not get hold on what they wanted, for example, the cloaths we occasionally put off, they voided their excrements upon it, and then scarcely one of the rest passed by without doing the same. From all circumstances it was clear to us that they could never before have seen a human being, and that the dread of man is not innate in brutes, but must be grounded on long experience.

In October and November they, like the foxes, were the most sleek and full of hair. In January and February the growth of it is too thick; in April and May they begin to shed their coat; in June they drop their cubs, nine or ten at a brood, in holes and clefts of the rocks. They are so fond of their young, that to scare us away from them they barked and yelled like dogs, and thereby betrayed their covert. No sooner do they perceive that their retreat is discovered, than, unless they be disturbed, they drag away the young in their mouths, and try to conceal them in a more secret place. On killing the young, the dam follows the slayer with grievous howlings, day and night for a hundred and more versts, and never ceases till she has played her enemy some trick, or is killed by him herself.

They stink much more horribly than even the red fox. In rutting-time they run together day and night, biting each other from jealousy, like dogs. When they couple they make just such a screaming as cats do. In storms and heavy falls of snow they bury themselves in the snow, and lie still as long as it lasts. They swim across rivers with great agility. Besides what the sea casts up or is destroyed by beasts, they seize the sea-fowl by night on the cliffs where they have settled to roost; but they themselves are frequently victims to the birds of prey.—These animals, which are now in such inexpressible numbers on the island, probably were conveyed thither, since there is no other land-animal upon it, from the continent on the drift ice; and, afterwards nourished by the great quantity of animal substances thrown ashore by the sea, multiplied to such an extraordinary degree.

partly sent abroad. The bear is in many respects so useful an animal, and the manner of taking him in Russia so various and so ingenious, that our pains will be amply repaid in enlarging upon them.

The most usual way of killing the bear is with fire-arms and spears or darts. The Laplanders knock them down with clubs, as they can easily overtake them in running with their snow-shoes; but they are generally first shot and then dispatched with spears. In some parts of Siberia the hunters erect a scaffold of several bulks laid on each other, which fall down all together and crush the bear, on his stepping on the trap placed under it. Another method is, to dig pits, in which a smooth, solid, and very sharp-pointed post is fixed into the ground, rising about a foot above the bottom. The pit is carefully covered over with sods; and across the track of the bear a thin rope with an elastic bug-bear is placed. So soon as the bear touches the rope, the wooden bug-bear starts loose, and the scared animal, endeavouring to save himself by flight, falls violently into the pit, and is killed by the pointed post. If he escape this snare, at a small distance, perhaps, several caltrops and other instruments of annoyance await him, amongst which a similar terrific log is erected, and where the persecuted beast, the more he strives to get free, fixes himself faster to the spot at which the blood-thirsty hunter lies in ambush for him. Yet not only beneath and upon the earth, but even in the air has man's inventive genius contrived to lay snares for his liberty and his life. The Koriaks to this end look out for a crooked tree: grown into the form of a gibbet, at the bowed summit of which they attach a noose, hanging with it a bait. The hungry bear is so tempted by this object, that he eagerly climbs up the tree, and is infallibly the victim of his greediness; for, on his moving the branch, the noose draws together, and the bear remains suspended to the tree, which violently springs back into its former direction. But more singular and ingenious is the method adopted by the inhabitants of the mountainous parts of Siberia to make this ferocious animal kill himself. They fasten a very heavy block to a rope, terminating at the other end with a loop. This is laid near a steep precipice in the path which the bear is wont to take. On having his neck in the noose, and finding that

he cannot proceed for the clog, he takes it up in a rage, and, to free himself from it, throws it down the precipice, which naturally pulls him after it, and he is commonly killed by the fall. Should this accidentally not be the case, he drags the block again up the mountain and reiterates his efforts, till with increasing fury he either sinks nerveless to the ground, or puts an end to his life with a decisive plunge.

The bear is found not only in all the Siberian forests, but also in great plenty in the northern provinces of European Russia. The white or polar bear, lives on the coasts of the Frozen Ocean, and on some of the eastern and northern isles where the chase of him is a collateral occupation of the mariners, who visit these coasts for the capture of the morse. Black bears are so numerous in Kamtschatka, that they are seen roaming about the plains in troops, and would infallibly have long since exterminated all the inhabitants were they not here more tame and gentle than in all the world besides. In spring they come in multitudes from the mountains in which they have passed the winter, to the mouths of the rivers for catching fish, which swarm in all the streams of the peninsula. If there be plenty of this food, they eat nothing but the head of the fish, and when they find nets laid in they dexterously drag them out of the water and empty them of the fish. Towards autumn when the fish go up the rivers, they advance with them gradually to the mountains.—When a Kamtschadale spies a bear, he endeavours to conciliate his friendship at a distance, accompanying his gestures by courteous words. Indeed they are so familiar that the women and girls when they are gathering roots and herbs, or turf for fuel, in the midst of a whole drove of bears are never disturbed in their employment by them; and if any of these animals comes up to them, it is only to eat something out of their hand. They have never been known to attack a man, except when they are roused from their sleep, and they seldom turn upon the marksman whether they be bit or not. The humane character of the Kamtschadale bear, who differ so remarkably from his brethren in all other countries, procure him however no exemption from the persecutions of mankind. The great utility of this animal, whose bodily parts from the skin to the entrails are of service to the Kamtschadales in a thousand ways, is sufficient

sufficient motive to self-interested man to declare eternal war against him. When both parties meet, the contest is generally bloody, and almost always terminates to the advantage of the more artful creature. Armed with spears and clubs the Kamtschadales goes in quest of the peaceful bear in his calm retreat, who is meditating no attack, but only thinking of his defence, and gravely takes the faggots which his more brutal persecutor brings him, and with which he himself chokes up the entrance to his den. The mouth of the cavern being thus closed, the hunter bores a hole through the top, and spears with the greatest security his defenceless foe*.

Among the animals already named, the glutton deserves to be mentioned on account of his beautiful skin. These creatures, at the charge of whom credulous travellers have spread so many surprising falsehoods, are found both in northern and southern Siberia, principally about the Anadyr and the Kovyma, where they are famed for their ingenious artifices in taking and killing rein-deer. From the trees they watch these harmless creatures and strew moss upon the ground as a bait. Lured by this, as soon as the rein-deer comes under the tree, the glutton leaps upon his neck, scratches out his eyes, and tortures him with such perseverance, that the poor sufferer beats himself to death against the tree. This done, he buries his prey very carefully in several places, and never yields to the suggestions of his ravenous appetite to taste a morsel till he

has deposited the whole of his provision safely under ground. With equal cunning the glutton in the district of the Lena subdues the much larger and stronger animal the horse; when tamed however he loses of his entertaining pranks a most amusing companion to his master.

To these objects of the chase for furs, lastly, may be added the following animals with short web feet, since their dwelling and the manner of their capture allow them to be brought under no other rubric: the beaver, who is found in the great rivers of Siberia, and in the Sundsha among the mountains of Caucasus, &c. and the river or fish-otter, which likewise is at home in most of the Siberian and in some of the European rivers†.

In fact the uninhabited wilds of Canada and Siberia are the only regions in which the beavers are numerous, and even here they herd together only about the solitary and unfrequented rivers, therefore they are oftenest found singly on the woody banks. The usefulness of this animal sharpens the persecuting spirit of man, from which he is never safe even in the most latent coverts.—The skin of the beaver has hair of two kinds: the short, implicated together and as fine as down, the upper grow more sparingly and are thicker and longer. This latter is of little value; but the flax or down is wrought up into hats, stockings, and caps.—The hunters prefer the winter season for seeking out the holes of the beaver; they stop up the entrance on the side next the water with stakes, enlarge the vent-hole

* It would be difficult to name a species of animals, excepting the sheep, so variously serviceable to man as the bear is after his death to the Kamtschadales. Of the skin of this animal they make beds, covertures, caps, gloves, and collars for their sledge-dogs. Those who go upon the ice for the capture of marine animals make their shoe-soles of them, which have this advantage, that the wearer is not in danger of slipping with them. The fat of the bear is held in great estimation by all the inhabitants of Kamtschatka, as a very savoury and wholesome nourishment; and when melted and thus rendered fluid, it supplies the place of oil. The flesh is reckoned such a dainty, that they seldom eat it alone, but usually invite a number of guests to partake of the delicious repast. The intestines, when cleaned and properly scraped, are worn by the fair sex as masks to preserve their faces from the effects of the sun-beams, which, on being reflected from the snow, are generally found to blacken the skin; by which means the Kamtschadales preserve a fine complexion: the Russians of Kamtschatka make window-panes of these intestines, which are as transparent and clear as those made of Moscow-glass. Of the shoulder-blades are made sickles for cutting grass, and

the heads and the haunches are hung up by the Kamtschadales as ornaments or trophies, on the trees about their dwellings. If the uses of the bear be so various to the Kamtschadales, not less general is the wear of fine and warm fur by persons of the higher classes in Russia. A light black bear skin is one of the most comfortable and costly articles of the winter wardrobe of a man of fashion at Petersburg or Moscow, even the small white hand of a belle is slipped into the large bear muff which covers the half of her elegant shape.

† The beaver, says the most learned naturalist of the age, Buffon, is perhaps the only example still left as an ancient monument of the intellectual faculties of the brutes. The solitary and insulated beaver, instead of shewing a cogitation beyond that of the other species of animals, seems ever, by his more individual capacities, to stand far beneath some of them; his genius and his talents only shine forth when he lives united in society; and even these animals never think of building unless they dwell in desert regions, where men are in such small numbers, that they cannot easily molest them.

which

which they find on the land side, for the purpose of putting through it a dog, who is so trained that he holds the beaver with his teeth, and lets himself be drawn out with it by the hind feet. The otters are likewise either pursued with dogs, or destroyed by spring-guns placed on the margin of the streams they frequent. Among the animals that are sought as well for their flesh as for their skin, the first to be named is the roe-buck, which strays in herds about the Irtysh, the Yenisey, and in Daouria; and is likewise found in the confines of the Samara, the Sok, and in the regions of Caucasus. A tenant of nearly the same districts is the stag, whose degenerate race the deer is not unfrequently seen in Tauri. A third very considerable object of the chase is the elk, which roams over all Siberia, within the 65th degree of latitude, beyond which he is never seen: likewise in Russia Proper even about the Ladoga Lake and in Livonia.—Of these animals a very great number are killed every year. The ordinary hunting season is towards March; about which time the sun has melted the surface of the snow to a consistence which allows the hunter easily to follow his trade in large wooden snow-shoes, whereas the beasts with their claws, break through this crust, and are hindered in running. They are followed by the track, driven into vallies, where the snow is drifted frequently to the depth of several ells, and there are either shot, or kept at bay by the dogs till the pursuer can come up and kill them with his lance. The roe-buck particularly is so liable to wound himself in the feet by flight, that he is very soon incapable of running. The elks often stand on their defence against the dogs, killing several of them with their hoofs, which are the usual weapons of this animal. In many parts likewise the roe-buck and the elk are caught in strong gins and dispatched by spring-guns, which, where the country is woody, are fastened to the trees. The skin of the roe-buck sells cheap, and because they are very light and easily turn off the wet, are frequently used by the peasants as coverings to their huts, and sometimes made into winter garments: about Krasnoyarsk they are in such plenty, that flesh and all they scarcely fetch fifteen kopeeks a-piece. Generally, therefore, it is only their skin that is brought to market, which may be had for about ten kopeeks.

The rein-deer is extremely numerous through

the whole of northern and eastern Siberia; less frequent about the Ural and in the European north. In woody districts, where springs, firearms, and spring-guns are applicable, they are the most usual means resorted to for taking or killing the rein-deer; but in the open downs adjacent to the sea, where these contrivances would fail, the Samoyedes, the Ostiaks, the Tunguses, and others have invented different arts, of which, as an example, we shall take those of the Samoyedes. The rein-deer are wont to go in herds from ten to a hundred, and sometimes even two hundred are seen together. When the Samoyedes go out in parties, and perceive one of these herds, they station their tame rein-deer on an elevated plain to the windward, then suck up, from this place to the savage herd as near as they can venture to come, without betraying themselves by the weather, long sticks, at small distances asunder, in the snow to which goose-wings are tied, to be fluttered freely by the winds. This done, they plant the like pinions on the other side, under the wind; and, the rein-deer being busy with their pasture beneath the snow, and being chiefly guided by their scent, they generally observe nothing of all these preparations. When every thing is ready the hunters separate; some hide themselves behind their snowy entrenchments, while others lie with bows and other weapons in the open air to leeward, and others again go to a distance and drive by a circuitous route the game between the terrified pinions. Scared by these, the wild rein-deer run directly to the tame ones which are standing with the sledges; but here they are alarmed at the concealed hunters, who drive them to their companions that are provided with arms, who immediately commit great slaughter among them. If it so happens, that a savage herd are feeding in the proximity of a mountain, then the hunters hang up all their clothes on stakes about the foot of the mountain, making also with the same frightful pinions a broad passage towards it, in which they drive the game together from a distance. As soon as they are come into this gangway, the women go with the sledges right across the further end of it, shutting the rein-deer in who immediately run round the mountain, and a every round are saluted by the shot from the hunters.

As on such occasions a number of people are required

quisite, the Samoyedes have recourse to other
 precautions to deceive the caution of these animals.
 The marksman goes, for example, clad entirely
 in rein-deer skins, stooping in the middle of five
 or six rein-deer trained to this purpose, which he
 leads by a rope fastened to his girdle, and thus is
 enabled to approach very near to the wild herd,
 without being betrayed. In autumn, when the
 rein-deer are in heat, the hunters choose out a
 vigorous buck from their droves, to whose antlers
 they tie nooses, and then turn him loose among
 the wild herd. The wild stag, on spying a
 strange rival capering among his females, rushes
 on to fight him. During the combat he so en-
 gages his antlers in the loops, that when he
 carries the hunter and strives to escape, the tame
 buck strikes his head to the ground, and there
 lies his antagonist till the marksman can kill him.
 The Shamois and the Bezoun Goat are an ob-
 ject of chase to the Caucasian nations, in whose
 mountains they abound. The Eweck is likewise
 native of these as well as the mountains of
 Siberia. Antelopes traverse in droves the steppes
 about the Don, in the districts of the Volga, the
 Ural, the Irtysh, and in the territory of Nerts-
 chinsk, another species of wild-goat, the Zob-
 rovel, or craw-goat, lives in Daouria and in the
 confines of Mangolia. The first is found in great
 plenty, yet never transgresses the bounds to the
 north of the 55th degree of latitude. The horns
 of this animal are sometimes eleven inches long;
 its face is imperfect, as the eye-ball is obscured
 by a spungy excrescence on the brow. Perhaps
 nature intended by this to temper the glare of
 the steppes which give birth to the antelopes.
 In return she has endowed him with acuter
 faculty organs, by which he has the faculty of
 perceiving both men and wild beasts, when the wind
 is favourable, at the distance of several versts.
 It is surprising that this animal, which seems as
 if were framed for running, (since it is apparently
 for that purpose that he is provided with a wind-
 pipe of nearly two inches in diameter, large lungs,
 and wide nostrils,) should be more easily put out
 of breath, when hunted or vexed, than any other
 animal. The chase, on their running nags, of
 the antelopes is a favourite diversion of the
 Mongoles and the Daurian Tongues of the
 steppes. For this purpose they unite in com-
 panies of fifty, of a hundred, or of two hundred
 persons all well mounted and provided with led

horses, all likewise armed with bows and
 hunting spears, and every one having with him
 a trained dog. They choose one of their com-
 pany for their leader, who directs the chase, and
 has the command while it lasts. When the hunt
 is to proceed, early in the morning three or four
 men, who have a keen eye-sight, are sent for-
 wards, that from certain elevations are to look
 round for game; and where they perceive them
 in troops to stand still till the whole party is come
 up to them, whom they point out, by signs
 agreed on, on which side the beasts are feeding,
 and what course they ought to take. In pur-
 suance of these signals the company disperse,
 and gradually form a spacious arch, in which
 each man is not above sixty or eighty fathoms
 distant from the other, and by which the herd is
 cautiously surrounded. As soon as those latter
 are aware of the hunters, and are betaking them-
 selves to flight, they rush in on all sides, at full
 gallop, upon them; who, panic struck at the
 shouts of the sportsmen and the whizzing of
 their javelins, start different ways, but are slain
 in great numbers from the dexterity acquired by
 all the nations of the Daourian steppes, who
 make it one of their constant exercises to shoot
 and throw their weapons at a mark. The chase
 is still more productive when the scene of it hap-
 pens to lie near a river or a mountainous forest,
 for the goats of the steppes have this singular
 property, that they never take to the water,
 though long and furiously harassed, but rather
 strive to escape by sudden and vast leaps through
 the troops of their pursuers. They are almost
 equally shy of forests. No sooner are they
 hunted into a wood than they are so bewildered
 among the trees as not to be able to flee a hun-
 dred paces, but run their heads against every
 tree, and soon fall breathless.

The wild sheep, called by the Mongoles argali,
 and the rock-ram, kamennoi-baran, are met with
 in the Sayane, the Nertschinskian and Altayan
 mountains, also in Daouria, on Caucasus and in
 Kamtschatka. The argali is larger and more
 powerful than the dam stag; but the ram is
 larger still, whose exuberant horns alone weigh
 full forty pounds. The winter coat of this
 animal is long and shaggy, much mixed with
 wool; whereas the summer hair is short and
 sleek. They live on solitary, dry, and woody
 mountains and rocks, where they can feed on the

various bitter and acrid mountain herbs. The stag is not so shy as the argali, with which it is almost impossible to come up. They are of uncommon speed in running, and when pursued make tortuous circuits, and often double upon the hunters. Though this animal be so wild when full grown, nothing is so easy to tame as the lambs that are taken, and to habituate them to milk and fodder. The *kamennoi-baran* keeps entirely to high inaccessible rocks and never approaches inhabited districts.—The wild boar is found in the steppes of the Samara and the Volga,

in the confines of the river Vral, in Daouria, and even about the Irtysh. Between the Vral and the Yemba they are extremely numerous, where they are hunted in winter by the Kozaks, with dogs, and killed sometimes with carbines, and sometimes with lances. These animals, who feed solely on the roots of sea-weed and sedge, grow to such an extraordinary size, that they are frequently found weighing upwards of six hundred pounds; their bacon is near four inches thick in fat, though their flesh in general is dry and firm and well flavoured.

SECTION VII.

Description of the Fishery.

AS the chase has always been the exclusive occupation of particular nations of the Russian empire, so there are also tribes who maintain themselves by the fishery, and with whom even the establishment of this trade forms a part of their civil constitution. It is naturally to be implied that this can only be the case with those nations and swarms whose habitations border on the sea, or comprise large rivers abounding in fish, and whose civilization is as yet by much too little advanced for selecting more productive and ingenious sources of livelihood. Some of these fisher-nations follow this trade solely for their own support; while others, as the Kozaks of the Don and the Ural, and the tribes on the shores of the Volga, carry on an important and lucrative traffic with the products of their fishery. With most of the hordes and swarms of Siberia the chase and the fishery are equally important as the means of profit; the former is followed chiefly in summer, and the latter in the winter months. The same severity of frost which covers the coasts and the rivers with ice, and thus makes the fisherman idle, smooths the way to the huntsman through forests and over morasses, which in a warmer season would be utterly impassable.

All the trades carried on by the Russians on the northern ocean are of the greater consequence, as the benefits of them extends over the whole empire, and because the consumption of the products thence obtained is general. The arctic

waters, it is well known, breed the largest animals of the cetaceous genus, whales of several species, dolphins, &c. for the capture of which ships are sent by various nations. Here, in the extremities of the north, are likewise engendered the numberless shoals of stock-fish, herrings, and other small kinds, supplying food to whole countries, and by the capture whereof more than one nation has been enriched. The advantages arising from the fishery in these seas are indeed many and great, but the difficulties and perils attending on it are not less either in number or magnitude as the people here have not only to contend with the strength and cunning of the animals they are in quest of, but also with the terrors of an inclement sky, with raging storms and tempests, and with enormous masses of ice that obstruct their navigation, and threaten them every moment with destruction. As the huge sea-animals are seldom met with in the White Sea, and as, for reason of the inhospitable climate of these dreary shores the coast of the Northern Ocean are almost entirely destitute of human beings, the inhabitants of the governments of Archangel and Olenetz principally prosecute their fishery on Spitzbergen and Novaya Zemlia; these islands, therefore, as the chief scene of the northern fisheries deserve to be briefly characterised.

Both islands are completely uninhabited. By misfortune some poor mariners have been shipwrecked on their coasts, it is probable, that the severity of the climate, against which the

had not the means of defence, they have presently perished. Some English and Dutch seamen, who in the first period of navigation in the Northern Ocean, wintered on these islands, for the most part lost their lives, or endured inexpressible misery. Yet the abode there is only dangerous to those navigators who have been used to a more genial climate, and have not been able by proper clothes, nourishment, and motion, to resist the attacks of the scurvy, which are so easily brought on by an indolent and confined life during the winter. The Russian sailors from Archangel and Meseen, who annually visit both Novaya Zemlia and Spitsbergen, are more able to defy the horrors of the climate. They afford frequent examples of a very long sojourn in the polar countries: a seaman from Meseen, Feodor Rachmanin, wintered six-and-twenty times on Novaya Zemlia, which he also visited twice in summer-time, lived six winters on Spitsbergen, and sailed five years successively from the Yeneseey to the shores of Siberia.

The extreme cold which reigns here the greater part of the year is the most piercing with the north wind; south and west winds bring snow and rain. For about the space of three months, Spitsbergen and the northern parts of Novaya Zemlia are shrouded in one uninterrupted night.

This long night is however, somewhat cheered by the aurora borealis, which appears in its full magnificence and splendor only in the polar regions. During the impenetrable darkness, sometimes for upwards of eight days together, tremendous hurricanes, with impetuous falls of snow and icy particles, raged with such fury that the wretched hunters dared not stir from their huts for fear of not being able to find them again. Through this deep polar night the Russian sailors marked the passing days by the burning of lamps, which they filled afresh with fish-blubber every four-and-twenty hours.

The principal objects of the sea-chace about Spitsbergen and Novaya Zemlia are whales and porpoises. For, though the Frozen Ocean produces a multitude of other marine animals, which in various ways might be made subservient to human industry, they seem to excite but little attention, or the capture of them is only an occasional or accidental employment. Every year a ship goes from Archangel to winter at Spitsbergen, and at least one, frequently more, to

Novaya Zemlia. The inhabitants of Meseen, who cannot so well bear the expence of fitting out a ship for a winter voyage as the Archangel merchants, navigate only in summer the coasts of these countries.

Whales abound not only in the higher regions of the Frozen Ocean but they come in considerable numbers into the gulf of Kola; yet this useful fish, the products of which are so much sought after that the French and Dutch send out whole fleets to the North-Sea for them, still always escape the attention of the Russians that dwell upon the coasts.

The people who go out to catch the morse are hired for that purpose by a master or ship-owner, who not only furnishes them with the necessary vessels but fits them out with provisions, stores, and whatever they are likely to want on the voyage, but either agrees to give them a share of what they take, or pays them certain wages. The latter, however, seldom exceed five or ten rubles for the summer; a trifling sum when we consider the hardships, toils, and dangers attending this profession. The morse-catchers usually take with them a year's provisions as they are often obliged to pass the winter on board their ships. Every vessel has an oven for baking bread and cooking their victuals, for the supply of which they take a needful stock of wood. The only drink they carry out with them is water, with which when they go on shore they prepare quas.—The time of departure varies according to circumstances; some set out at the beginning of summer, when the White-seas are free from ice, others not till autumn, especially if they intend to winter on the voyage. The greatest peril to which they are exposed at sea, is that of being hemmed in by the driving masses of ice; in this case the ice by its force beats in the sides of the vessel, and the morse catchers are then reduced to the dreadful alternative either of being buried in the waves on the spot, or of getting on the fields of ice floating at the mercy of the winds, till cold and hunger put an end to their sufferings. And yet it has happened, though very rarely, that some of these poor fellows have been brought alive to land on their flakes of ice.

When the morse-catchers are happily arrived at their place of destination, the first thing they do is to conduct their vessels to some safe anchorage,

age, where they generally find several little huts that have been constructed by their predecessors in this hazardous warfare, and then commit themselves to the small boats, of which every vessel takes with it one, or two, to proceed to the conflict with the beasts of the ocean. This is usually done on the first fine day, because then the morses delight in going on the land or on the ice to repose; and besides, they are at times stimulated to leave their native element for a length of time for the purpose of copulation, which business lasts with these monsters for a month or two, or to cast their young, or to rescue themselves from the bites of the sea-lice, by which the morse in summer is perpetually tormented, and from which they have no other means of escaping than by fleeing into an element which deprives these insects of life. All these causes together collect them frequently on the beach of fields of ice in prodigious numbers. When the captors discover one of these multitudes, they must have the precaution to approach them the wind at a great distance, and then immediately take to the water; whereas in the contrary case they continue lying undisturbed, though they even see the boats advancing to them. Besides the morse-catchers by this means have the advantage of discovering sooner the place where their prey has couched; for these fat animals, especially in summer, emit far round them a horrid stench.

When the captors have reached this formidable encampment, they immediately quit their karbasses or boats, armed with nothing but their pikes, cut off the way to the sea from the morses, and then pierce those animals which come first to save themselves in the water. As it is the way with the morses to scramble over one another in their attempts to escape, from the numbers of the slain there soon arises a bulwark which effectually chokes up the passage to the living; and then the captors proceed with the slaughter till they have left not one alive. It sometimes happens that after such an engagement so great are the heaps of the dead, that the vessels can only contain the heads or the teeth; and the people are obliged to leave the fat or blubber and the skins behind.

But, easy as it is for the captors to conquer the morse by land, more dangerous is the conflict with these animals in their own element. We have only to recollect that the morse is commonly of the size of a large ox, and that, besides their

sharp teeth, they are provided with two long stout tusks, for judging how a sea fight of this kind is likely to terminate. When any of the morses escape into the water before they can all be killed, the captors leap upon the ice and fall upon the animals with harpoons which they strive to strike into their breasts or their belly, and to each of which is fastened a long cord. This done, they drive a stake into the ice, wind the other end of the long harpoon-string round it, and are now drawn about, on the piece of ice on which they stand, by the animal till he has lost his strength, when they draw him up upon the ice by the cord and kill him outright.—But when the morses lie so near to the water, that they can leap in ere the attack begins, then the captors fasten the cord, when they have thrown the harpoon, only to the head of the boat, which is then drawn by the huge animal so deep into the water that the sailors must all run immediately astern. The morse having fruitlessly endeavoured to get loose from the cord, rises erect upon the surface of the water and makes a furious attack on his persecutors. In this he is sometimes so successful as to shatter the boat with his tusks, or to throw himself suddenly by a proportionate leap into the midships. Then nothing is left to the crew but to jump overboard and to hold by the gunnel, till other morse-hunters come to their assistance in this desperate situation. To mitigate the danger of these misfortunes the captors not only previously take all proper measures, but it is even laid down by laws and regulations what conduct every one is to observe during the voyage, and in the actual encounter with the morses. Each of these companies consist generally of a master or pilot, two harpooners, two barrelling people, a steersman, and several rowers, each of whom has his appointed duty.

Though the morses spread from the Kuril islands along all the Russian coast of the Northern Ocean, quite to Norway, Iceland, and Greenland, this trade is the most productive about Spitsbergen and Novaya Zemlia, consequently the morse hunters preferably go thither. Many of them pass the winter on these inhospitable islands, in order to return with greater booty, and they then may pursue the white-bear, the reindeer, and the ice-fox. In this case they build themselves little huts for the winter, which

times are so buried in snow that nobody can come out of them. As no wood at all grows on these islands, the morse-hunters must inevitably perish with cold, were not the sea to cast a great quantity of drift-wood on shore, among which are often found balks fit for building houses*.

Besides the marine animals already mentioned in the capture of which the inhabitants of the sea coasts are principally employed, the Frozen Ocean, likewise teems with the narwhal, the pott-fish, from whose brain spermaceti is prepared, the sea-dog, dolphin, sea-hog, hay-fish, sea-cow, the sea-bear, the sea-lion, the sea-otter, and many others, which animals are caught either for their skin or their blubber. The sea-dogs are commonly most numerous in the Frozen Ocean, and often proceed to the White Sea; there are even several species of them, at least those which are known about the Oby, the Yenisey, and the Lena, under the Russian name of *morskoi saze* (sea-hare), are entirely different from the common sort. These have a silver-white glossy skin and long woolly hair.—The Samoyedes watch for the sea-dogs, or seals, generally in the spring-season, when these animals repair to the mouths of the rivers and get out of the water, through holes which they have made in the ice by their breath. They usually lay near the aperture a board to which a rope is fastened. The Samoyede, lurking behind a block of ice, as soon as he sees the sea-dogs fairly out, draws the board over the opening; the animal's retreat being thus cut off, he is killed without trouble.

Another remarkable animal in these waters is

* The products which are brought into the channels of commerce by the morse-fishery are principally the blubber and the skin of these marine-animals. The captors usually bring home the fat unmelted, whereby it loses much of its goodness, and consequently of its price; but this cannot be altered, as both the want of wood in the countries where the morse is taken, and the haste which the men are obliged to employ, allow them to do no better. When the fat is melted over the fire by these people at home, they usually mix with it the fat of the sea-dog or the baluga, and sell it under the name of *vervannoye-salo*.—Of this oil is annually shipped from the port of Archangel from two to ten thousand tons, the ton at seven pood; the pood at Archangel costs a ruble and a half and upwards. This oil is employed in soap-boiling, in the preparation of leather, and for the consumption of lamps; it is likewise employed in various other purposes by different tradesmen and mechanics.

The morse-skins are hung upon poles, as they are taken out of the sea, in the open air till they are become stiff,

the white-fish, known to the Greenlanders under this name, but to the Russians by that of *beluga*, and which professor Pallas, by way of distinction calls the sea bulga. He belongs to the race of the dolphin, is not above three fathoms long, and is every where found in the Frozen Ocean. These animals keep together in shoals, and are driven upon shallow places in the White Sea and the gulf of the Oby by the Samoyedes, who associate, into numerous companies for that purpose, and harpooned. Their flesh is black, but over the whole body is drawn a white rind, out of which a very pure fat may be prepared. According to Guldensterdt's opinion this species of fish might be beneficially used for obtaining train-oil. That the morse-catchers employ it in preparing the train-oil of that animal has already been remarked.

It is easy to conceive, that a people who make the fishery their principal occupation must have combined a great variety of means, some of them ingenious, for pursuing this business at the least expence of time and trouble. Besides the pursenets, and the fish-weels, and wears that are every where in use, the Ostiaks and Samoyedes customarily go to fish in shallow places in the night-time, by the light of burning birch bark, which they stick on poles. In the secondary rivers most northward the Samoyedes as soon as the ice is strong make openings in it, over which they build huts, and sink in the water little lure-fish, cut out of wood, by lines made heavy with stones, by means of which they easily pierce with forked-spears the fish who are led to them by greediness or cu-

when they are prepared for farther use. Of them are made traces for carriages, horse-harnesses, &c. and from the cuttings excellent size for the paper-manufactories. A morse-skin costs usually three, four, or more rubles.—The morse-teeth are transported partly to St. Petersburg and Mosco, and partly likewise to Archangel; where, and in the districts around it, they are wrought up into all the works for which ivory can be used. Here are made of them all sorts of elegant little boxes and caskets of open work in a variety of fashions, fan-sticks, knife-handles, card-counters, chess-men, &c. which according to the neatness of workmanship and the whiteness of the teeth bear a different price. The thickness of these teeth renders them so heavy, that sometimes five of the large tusks will weigh more than a pood: they are as white as ivory, having this advantage over it, that they are firmer and will not so soon become yellow. A pood of the largest morse-teeth costs upon the spot twenty or thirty rubles.

riosity. They also make little wears across such rivers, let through the aperture with tree-bark sunk by stones to the bottom, and spear those that are visible.—By these and many other inventions the Ostiacks and Samoyedes are enabled to supply themselves and the Russians their neighbours all the year round with fish. In summer they have such a great superfluity of sturgeon alone, which are often a fathom long, and yield two pood of kaviar that they throw away the smaller kinds of fish. The sturgeon, therefore, in Bereslof is never more than forty kopecks a pood, and the fat scarcely fifty kopecks, never above a ruble.

The fishery on the coasts and the islands of the Eastern Ocean is extremely remarkable for the multitude and quality of its objects, and in regard to the employment it occasions. In those districts where agriculture and the rearing of cattle are impracticable from the soil and the climate, and European cultivation can only be prosecuted in particular places as a frequently unsuccessful attempt, no other pursuit is left for the thinly scattered and partly savage inhabitants than the chase and the fishery. The latter principally affords them the greater part of their necessaries of life; and, parsimoniously as nature has dealt out to them the rest of her gifts, so richly has she supplied the waters with the choicest, most useful, and best-tasted kinds of fish.

To this class primarily belongs in more than one respect the whale; though found alike in the Frozen Ocean. About the coasts of Kamtschatka this huge sea-animal is so common, that on the reflux of the waters they are often seen sleeping on the shore, or pursuing the fish quite into the harbours. Neither is it here a thing unfrequent for the whales to be thrown dead on dry land, which the Kamtschadales regard as a lucky accident, as the capture of them is attended with great danger and numerous difficulties. From the southernmost cape of Kamtschatka the inhabitants go out to sea in baiders or little canoes, on the search for sleeping whales, which they wound

with poisoned darts, and leave it then to their good fortune whether the animal be thus killed and cast upon their shores. In the northern districts of this peninsula the whale is taken in large nets made of thick hardened thongs of morse-hides, and sunk in the water at the mouth of the gulph with heavy stones. When the animal is entangled in it, the struggles he makes to get free generally cost him his life; and then he is towed ashore by the captors and slain amidst a variety of religious and fantastical ceremonies. But of all the tribes of these parts none are so addicted to the whale-fishery as the Tschuktschi, and the methods they use come nearest to those of the Europeans. They row to sea in very large baiders the crew consisting of eight or ten people; when they meet a whale one of these vessels bears up to him, whence the harpooner throws a spear into his body, leaving the iron or wooden hook sticking in him while the shaft of the spear is drawn home. To the hook a cord is fastened several hundred fathoms in length, and lies coiled up in the bottom of the canoe. This cord is held fast by the harpooner, letting it out according to the violent motions of the enraged animal: if he plunges he has rope enough; if he rises the holders draw it in, who can always see which way the whale takes by means of a bladder attached to the cord. When the whale rises for the first time, the second canoe pursues him in like manner; and this is repeated by several vessels, till they have altogether sufficiently fixed and fatigued him. Then they suddenly set up a violent shouting, at which the raging animal is so confused that he makes for the land, and throws himself with amazing force upon the shore, where it is afterwards very easy to kill him. This method is in general practiced on most of the islands of the Russian Archipelego. The Tschuktschi rely so much upon their courage and dexterity in this business, that they only take the trouble to carry away the fat of the whale they have taken*.

* The uses made on the shores of the Eastern Ocean of the products of this capture are curious and manifold. The flesh of the whale, though so hard and coarse, will not keep long; it is therefore either immediately consumed, or hung up in the air to dry. The skin is separated from the lard, scraped, smoaked, and, to make it supple, beaten; it is wrought into cords and shoe soles, which are so strong that they never wear out or become unserviceable. The fat is laid in pits filled up with hot stones, purified from the blubber, and then yields a well-tasted lard. The blubber,

which is good for melting as well as for lamp-oil, is poured into the cleansed intestines, which are used instead of barrels or casks, and in which they generally keep liquors. With the whalebone the Kamtschadales sew their baiders together, or they make fishing-nets, fox-traps and water-casks of it. Of the bones of the lower jaw they make under-lays to their sledges, knife-handles, and rings for their dog-harness. The sinews serve them for all the purposes of pack-thread, and the vertebrae of the back-bone are used as mortars for pounding.

The Eastern Ocean contains, besides the whale, a considerable number of other large and remarkable marine animals, of which, however we shall only notice such as by the capture of them employ the industry of the natives, and are useful to the purposes of life. Among these we may particularly reckon the sea-bear, the sea-lion, the sea-cow, and the sea-otter, all natives of that ocean, and of which, as the natural history of them it but little known, we shall at the same time give a short description.

The sea-bears appear in troops in the Eastern Ocean, principally between the Kurily and the Aleutian islands. The largest of these animals are ninety English inches in length, and weigh eighteen or twenty pood. They resemble no land-animal more than the bears excepting only the feet, and the hinder part of the body, which terminates in a grotesque figure. What is more singular in the structure of these animals is their funny-feet, having not only joints and toes, by which they are enabled to go on shore, to set on their breech like the dog, and to use their paws in various ways, but likewise by means of the web between their toes, to swim with equal ease.—The manners of these animals are so peculiar and extraordinary that the account of them would be deemed a fiction, were it not accredited by the testimony of a sagacious and learned observer. The affection of the mother for her young is exceedingly great; and they in return endeavour to divert her by various kinds of frolicsome play. On seeing these gambols, it seems as if they were exercising feats of wrestling, one striving to give the other a fall; and if the father comes up growling, he drives the wrestlers asunder, coaxes the conqueror, and even tries himself to throw him on the ground: the greater the resistance shown by the latter, the more he gains the love of the parents, to whom on the other hand, their playful or timid children, appear to give but little joy. Though polygamy prevails among the sea-bears, and some of them have as many as fifty wives, yet every one watches over his offspring with uncommon jealousy, and is excessively furious if a stranger come too near them. Even when they lie by thousands on the beach, they are always divided family-wise into companies, and in like manner they swim together in the ocean. The aged, who no longer have any cubs, live solitary, and are of all the most grim;

these frequently pass a whole month on the shore in sleep, without taking any food: but whatever approaches them, whether man or beast, they fall upon with the most outrageous fury. The sea-bears at times wage bloody wars together, the usual ground of hostility being either the females or a good couching place. When two are contending against one, others come up to assist the weaker party; and during the combat, the swimming spectators raise their heads above the water, and calmly look on for a length of time, till they also find a motive for mingling in the fight. Sometimes these conflicting armies cover a tract on the shore of two or three versts, and in all the air resounds with their dreadful yells and growlings. It often happens that the combatants make an armistice for an hour to recreate their forces, during which they lie beside one another without any danger: then both parties suddenly rise up, each takes its place, and the battle begins afresh with redoubled fury. This goes so far, that they pursue one another into the sea, when those of the victorious party drag their enemies back to land, and put them to the torture of their bites so long, till at length they lie faint and exhausted, and finally perish by the talons and beaks of the ravenous birds of prey that are hovering round.—The authority with which the husbands rule over their wives and children is frequently displayed in a very tyrannical manner. When the wives, on being attacked by the hunters, abandon their cubs from affright, and these are carried off, the husbands immediately cease from pursuing the common foe, and turn upon the mother, as if to demand an account of what is become of their offspring. Then seizing them with their teeth, dash them with violence against the rocks; the wives stunned with the blows, creep and crouch at the feet of their despots, and caressing them, shed abundance of tears. While the husband continues to feel his vexation, he goes growling to and fro, and rolling his eye-balls just as the land bears are wont to do; but when his rage is abated, he then begins also bitterly to weep for the loss of his young.

From June till the middle of August the sea-bears come ashore, in order, like the land-bears, in winter, by three months of sleep and fasting to disburden themselves of their superfluous fat. This is the hunting season for them. The full-grown.

and aged are not easily frightened, but go boldly up to the men to fight them; yet whole droves of them will plunge all at once into the sea from fear, as if seized by a panic, on any sudden occasion of alarm. On land they run with great swiftness, a man, therefore, who is pursued by them has no means of escape but by climbing up a steep mountain, where they cannot follow him so fast. The capture of these animals about Kamtschatka is prosecuted mostly at sea with javelins furnished with hooks, which quit their shafts. The wounded beast strikes with the speed of an arrow through the water, drawing after him the canoe; and rages till he has bled to death. The skins of the sea-bears are of no great value; as their hair is black, thick, and rugged, and the hide very thick and harsh, they are only used like seal-skins for covering trunks and boxes. Below the long hair, close to the hide, lies, as with the beavers, a fine wool of a black glossy colour. The skin of the young that are cut out of their dam, are far more beautiful, and among the Siberians are of great worth, as they make their whole dress of them.

The sea-lion is not so much unlike in shape to the sea-bear; only he is twice as large and heavy: and besides the male sea-lion has a shaggy mane about his neck. Tremendous as the look of this animal is, and furiously as he defends himself in case of need, yet at the sight of a man he takes immediately to flight, and rushes into the sea. In this his proper element no hunter dares attack him; the usual method is to fall upon him when asleep. When a sea-lion in this condition is luckily descried by a hunter who can depend upon his own strength and fleetness in running, he approaches the sleeping animal against the wind, in order not to be betrayed by the scent, and then strikes the before-mentioned hooked spear through the fore feet, while others are employed in winding the rope to which it is fastened round a post driven into the ground. This done, the animal, who now cannot easily escape, is shot with poisoned arrows, or knocked on the head with clubs. They frequently do no more than wound him with poisoned arrows, and then leave him to his fate; as the salt sea-water aggravates the smart of his wounds, he hastens soon back to the shore, where he then, dead or alive, becomes a prey to his captors. The chase of this animal implies so much courage and agility in the hunters

man, that a Kamtschadale, who has been several times successful in it, passes for a hero, and all his life after is held in particular respect. The captors, not unfrequently go the distance of five- and twenty or thirty English miles out to sea in their canoes, made of the hides of marine animals and the bark of trees, on this perilous enterprise.

Tenderly as the sea-bears love their young, so little instinct the sea-lions seem to have for theirs; whereas the bloody conflicts of those animals are also customary with them. They couch on the same place with the sea-bears, who, from fear, resign to them the best spot; and never interfere in their intestine broils, though the sea-lions do so with them as often as an opportunity offers. The utility of these animals is by no means trifling. The fat, the skin, and the flesh of them are generally sweet and well-tasted, and the webs of the feet yield a jelly which passes for a dainty among the Kamtschadales. Of the hide they make leather and the thong ropes which are used in the capture of these and other marine animals.

A third animal belonging to this collection is the sea-cow, called by the Spaniards *manati*, and is found both on the eastern and the western coasts of America. The largest of these animals are from four to five fathoms long, and about the umbilical region where they measure most in girls, four fathoms and a half. The head resembles that of a buffalo, and is connected to the body by a short neck. The fore-legs consist of two joints, the extremity whereof bears some resemblance to a horse's foot, but is provided beneath with several short bristles which the animal employs in scratching up the sea-weeds that serve him as food from the stones. His back is like that of an ox; the great circumference of the belly declines at once, but the tail is gradually thinner to the fins, which act instead of hind-feet.

These animals love wet and sandy places on the sea-shore; they therefore couch in whole droves about the mouths of rivers, and are here so tame that they will suffer themselves to be stroked and even struck at. The males seemed to cohabit with only one female; at least a herd consisted generally of only a pair of old ones of different sexes, of one grown up, and a small young one. Their appetite is so insatiable, that to feed it they constantly almost keep their head under water and are little concerned for their safety. In their conjugal embraces they manifest an extraordinary tenderness

tenderness, on which occasion the female plays the prude, and not till after reiterated opportunities at last yields, as if forced to compliance. The attachment of the males to the females proceeds to such length, that they submit to the most certain danger of death, if the latter be taken; and it not unfrequently happens that they will starve with hunger by the skeleton of their murdered companion. The manner of taking these animals is with large spears barbed with iron; and fastened to a long stout rope. The hunters row warily up to a drove, and the marksman, who stands in the fore part of the canoe, throws the barbed shaft at the animal, who thereupon is drawn a-shore by means of the rope, by people placed there for that purpose. But as at least two persons are necessary for this employment, and the animal resisting with the utmost exertion of his strength, the canoe follows him, and the captors endeavour to harrass him with repeated wounds till he can no longer hold out. As soon as the sea-cows in the vicinity perceive the danger of their associate, they run up to his assistance. Some strive to overturn the canoe with their backs, others throw themselves athwart the rope, trying by that means to break it asunder, or they beat about with their tails in hopes to draw out the hooks from the skin of the wounded beast, in which too they sometimes succeed.

The thick and strong hide of these animals is employed by the Americans for shoe-soles and belis; the Tschuktsches stretch them out by sticks and make use of them as canoes. The flesh of the sea-cow is indeed more coarse and fibrous than beef, but when boiled it is very like it in taste, with this advantage, that even in the hottest weather it does not easily spoil; the flesh of the young calves is, however, far more tender. The fat under the skin, which surrounds the whole body to a hand breadth, is white and mild, smells and tastes very agreeable, and yields, when boiled, a butter resembling in taste the oil of almonds. As the multitude of these animals about Kamtschatka is excessively great in general, and one of them weighing about two hundred pounds, or eight thousand pounds, this nourishment might be alone sufficient to supply all the inhabitants the whole year through with wholesome and well-tasted meat.

The sea-otter wrongly called the Kamtschadale, differs from the river-otter only in this,

that he lives in the sea, that he is about half as big again, and approaches nearer to the beaver in fineness of hair. There is no doubt of its being an American marine-animal, and only a stranger on the coasts of Asia, where it dwells in what is called the Beaver-sea, from the 50th to the 56th degree of north latitude. It is in length usually five and its circumference in the thickest part of the body is three feet; the largest of these animals weigh from about seventy to eighty pounds. Their fur, in length, beauty, blackness, and glossiness of the hair, far excels the fur of the river-beaver. One such fur will sell at Kamtschatka for twenty, at Yakutsk for thirty, at Irkutsk forty to fifty, but on the Chinese borders in barter for eighty or a hundred rubles. The flesh of this animal is tolerably palatable, and even the flesh of the female is, contrary to the stated laws of nature, the best shortly before and after the breeding season. The food of the sea-otter is crabs, conchylide, little fishes, some sea weeds, and also flesh. There is no manner of doubt that this useful animal, if some people of spirit would go to the expence, might be brought into Russia and there rendered tame, since they are as fond of living in lakes, rivers, and ponds, as in the sea.—In point of manners, there is no animal of all that we have mentioned so amusing and agreeable as this creature so much sought after for his fur. Their favourite manner of lying is family-wise together. The male caresses the female with his fore-paws, with which he can do every thing in the most ingenious ways; and the female plays with her young, and rejects the dalliance of the father with an affected coyness. Their love for their young is so great that they not only rush into extremities for their deliverance, but not seldom grieve to death at the loss of them. On their flight they carry their sucklings in their mouth and drive the full grown before them. When they are so fortunate as to escape their pursuers they deride them as soon as they are safe in the sea with all manner of diverting tricks; one while keeping them themselves right on end in the water and jumping over the waves, at the same time holding the fore paw over the eye as if to shade it from the sun while narrowly looking out for somebody; then lying flat on the back and stroking their belly; then throwing their young into the water, and fetching them out again.

When a sea-otter is closely pressed, and sees no means of escape, he scolds and grins like an angry cat, if he receives a blow he immediately makes himself ready to die; he lies on his side, draws up his hind-legs together, and covers his eyes with his fore-paws.

The Kurils in the spring-season go out to sea in leather canoes or baiders the distance of ten versts and more for the capture of these animals. When they surprise a sea-otter, they immediately

shoot arrows at him; and, as the animal cannot keep long at a time under water on account of respiration, he presents himself repeatedly at short intervals to the attacks of his enemies. By the bubbles that rise the hunters know which way he turns, and follow him in the vessel. When at length exhausted and breathless, he wishes to repose on the surface of the water they kill him with a lance.

SECTION XII.

Account of the Mines of Russia.

THE empire of Russia possesses mines which may be matched with the richest and most productive of those in any quarter of the globe; the working, whereof for a century past has created a new national occupation with ample returns, and the astonishing spoils whereof have afforded the means to a beneficent administration for the most extraordinary undertakings.

The principal scene of these transactions lies in the cold metallic regions of Siberia, the acquisition whereof, after the lapse of a hundred years, unexpectedly became of such great importance to the Russian empire; for though the soil of this enormous country is almost everywhere pregnant with ores and noble as well as useful minerals, the European part, however, is herein by no means to be compared with the Asiatic. The largest works are at present carried on in the Uralian, in the Altayan, and in the Nertschinskian mineral mountains: of less importance are some iron and copper mines in those of Olonetz, and in several other parts of the empire. In the Uralian mountains are gold, iron, and copper mines, which latter are some of the most important in the empire. The Altayan mountains contain the richest gold and silver shafts, also veins of lead, copper, and iron, impregnated with gold and silver. But in the Nertschinskian mountains are very rich mines of lead containing gold and silver.

The discovery of these shafts, as well as the

origin of the proper mine working in Russia of no older a date than the beginning of the eighteenth century, as the single attempts that were made prior to that period for finding and working the metals, were but very insignificant. The nation has possessed iron-ore from times immemorial. The boors formerly collected themselves, smelted it and made iron of it. When they were deficient in this metal, instead of they had recourse to hard wood, which, in order to make still harder for their own use and for posterity, they laid in bogs; both methods are practised still in some parts of the empire.—Siberia at a time reaching back beyond all history mining was so vigorously practised by a nation who now bear the name of Tschudes, that the various and large Halde, still subsisting, have given rise to a great number of newly adopted and in part very rich mines.

Of the two proper gold-mines belonging to the Russian empire, that of Beresof near Ekatarinburg on the Ural is by far the most material. Here annually is obtained about four hundred thousand pood* of ore, which on an average yields from every thousand pood forty to six solotniks of fine gold. To these mines belong the Cavaderous and the Pyschma, on the river Beresof, and Uktus, together having eight hundred and sixty-one troughs. The whole number of men employed in these works amounts upwards of two thousand; whereof about

* Concerning the Russian weights and measures it is to be observed, that a berkorech contains ten pood; a pood

forty pounds; a pound ninety-six solotniks; a solotnik ninety-six parts; three solotniks are one lote.

thousand two hundred are in actual employ daily. No enrolled boors are any longer allowed to them.

The mines of Beresof have afforded annually three, four, five, or six, but in later years seven or eight pood of gold. From the commencement of the works here in the year 1754 till the year 1788, therefore in thirty-four years, generally about a hundred and twenty pood has been gained, which in value is estimated at one million one hundred and ninety-eight thousand rubles, and, after deducting the costs, have yielded above four hundred and eighty thousand net profit. If we take the gold and silver here obtained, as it proceeds from the separation, according to its standard in coinage, and balance it with the expences, which are paid in copper money, according to the true value of it, then a profit of near eight hundred thousand rubles will appear.

The Voytzer gold-mines in the mountains of Olonetz, which annually afford only a few (from one thousand seven hundred and forty-four to one thousand seven hundred and seventy, in general fifty-seven) pounds of gold, have, on account of the smallness of their produce, been some years since abandoned.

The most important silver-mines are those of Kolyvan in the mineral mountains of Altay, which were undertaken by the crown in the year 1745. The main shaft is the Schlangenberg, one of the richest ever known in the world; the Semionofskoy in point of consequence holds the next station. Besides these two there are still others, of less importance, alternately or constantly worked; and from a new shaft, Filipofskoy, in the Ulba, it is expected that the produce will be time equal that of the Schlangenberg. From all these mines together are at present annually obtained upwards of two million pood of ore, the contents whereof have of late years become poorer by one half. At first the pood of it contained five or six solotniks of auriferous silver, since only four, and latterly, especially since 1785, it contains not above two and a half. Here are five founderies, and the head-quarters are at Barnaul. The workmen employed in 1786 were altogether fifty-four thousand. The whole expenditure amounts yearly to four hundred thousand rubles, of which one half is paid in copper coined on the spot, the other half in bank assignments.

From the year 1745, when the crown took

these mines into possession, to the year 1787, therefore in forty-two years, they have afforded twenty-four thousand four hundred and sixty pood of fine silver, and about eight hundred and thirty pood of fine gold, which together amount in value to upwards of thirty millions of rubles. The expences for this whole time even including the charges of separation at St. Petersburg, come to not above seven millions, consequently here is a pure gain of twenty-three millions of rubles, which is very much increased if we estimate the copper coin, in which this expence is paid at its real value, and consider, that even this is got and coined at the mines themselves:

The silver, or rather the auriferous and argentiferous lead mines of Nertschinsk have been in constant work ever since their discovery in the year 1704, but with alternate success. Here, from the several shafts, more or less rich, are obtained annually about two million pood of ore, which however is very poor, and at present on an average scarcely contains a solotnik or one and a half in a pood. Here are five founderies of which Staroi-Nertschinsk is the chief, which is also the head-quarters. The workmen are about two thousand, and the boors inrolled to it for cutting of wood, about thirteen thousand. The annual expences amount to about two hundred thousand rubles in copper coin and bank assignments.

From 1704 to 1787, therefore in eighty years, these mines produced eleven thousand six hundred and forty-four pood of silver, from which since the year 1752 about thirty-two pood of gold has been separated. Both together amount in value to about ten millions of rubles.

According to the foregoing statements, therefore, in the interval between 1704 and 1788, at all the gold and silver mines were gained about a thousand pood of gold and about thirty-six thousand pood of silver, amounting together in value to upwards of forty-five millions of rubles, and on which the expences were not more than fifteen millions of rubles.

The most important copper-mines of the Russian empire are principally in the Uralian, Altayan, and Olonetzian mountains. The Uralian mineral mountains, which contain by far the richest mines, and to which belong all the copper-works in the governments of Perm, Ufa, Viactka, and Kazan, had in the year 1779 in all sixty

sixty founderies, together containing two hundred and twenty-nine furnaces, and at which in 1782 above one hundred and ninety thousand seven hundred and fifty-two pood of copper were obtained. In the Altayan mountains is likewise a considerable copper-mine; besides, there arises from the cupriferous silver-ore a tolerable quantity of copper: at present in all about fifteen thousand pood. In the year 1782 here were coined eighteen thousand seven hundred and ninety-three pood of copper. The spoil got from the Olonetzian mountains, and the other separate copper-works cannot be computed at more than a few hundred poods.

The entire annual amount of the copper obtained is therefore about two hundred thousand pood, the value whereof in money, reckoning the pood only at ten rubles, makes a sum of two millions of rubles. As for some years past the extraction of the copper has greatly declined, we can in fact at present scarcely admit more than two hundred thousand pood as the certain yearly total; and the price of that metal has accordingly risen.

The iron-mines form the greatest of all Russia's mineral wealth, after the salt-works. It is known to all the world, that this empire has in all its mineral mountains, and even in many of its plains, a prodigious quantity of iron-ore of all the known sorts; but the most numerous and the richest mines are in the Uralian mountains, where in the year 1779 were generally at work seventy forges and five hundred and thirty-two large hammers. There are, besides, two smelting-houses in the Altayan and Sayane mountains and several in the governments of Olonetz, Vologda, Nishnei-Novgorod, Kostroma, Kursk, Tula, Tambof, &c. Without being liable to much mistake, we may at present admit for the whole empire, about a hundred forges and eight hundred hammers; but besides the iron-works there are carried on in the gross, there are a great number of boorsmiths who smelt the ore at home and of the iron make various kinds of utensils. Such little smithies are particularly in the governments of Olonetz and Archangel, in some regions of the Volga, and in Siberia near Krasnoyarsk, Yenisseisk, &c.

END OF TOOKE'S VIEW OF THE RUSSIAN EMPIRE.

AN
ACCOUNT OF AN EMBASSY
TO THE
KINGDOM OF AVA,
SENT BY THE GOVERNOR-GENERAL OF INDIA, IN 1795.

BY MICHAEL SYMES, ESQ.

LIEUTENANT-COLONEL IN HIS MAJESTY'S 76th REGIMENT.

INTRODUCTION.

THERE are no countries on the habitable globe, where the arts of civilized life are understood, of which we have so limited a knowledge, as of those that lie between the British possessions in India and the empire of China. Concerning India beyond the Ganges, scarcely more was known to the ancients, than that such a country did exist. Underserved importance is sometimes attributed to that which is imperfectly known.

At length the enterprizing genius of Emanuel, at the close of the fifteenth century, opened a new world, and laid the foundation of general wealth to Europe, on the ruin of the Egyptian trade, and of the state of Venice. Early in the sixteenth century, the Portuguese made themselves masters of Malacca, and soon acquired influence among the neighbouring maritime states. To the writers of this nation history is principally indebted for whatever information has been obtained of the eastern countries of India.

The Portuguese acquaint us, that four powerful states divided among them the regions which lie between the S. E. province of British India, Yunan in China, and the Eastern Sea; their territories extended from Cassay and Assam, to the N. W. as far South-eastward as the isle of Junkseylon. These nations were known to Europeans by the names of Arracan, Ava, Pegue, and Siam. Arracan, properly Yee-Kien, borders on the S. E. province of British India, and in-

VOL. II. NO. CX.

cludes the sea coast with what is called the Broken Islands, as far as Cape Negrais; Ava, the name of the ancient capital of the Birmans, has been usually accepted as the name of the country at large, which is Miamma. This empire is situated eastward of Arracan, being divided from it by lofty mountains, called Anou-pec-toumiou, or the great western hilly country. On the N. W. it is separated from Cassay by the river Keen-Duem; on the N. it is bounded by mountains and petty principalities, that lie contiguous to Assam; on the N. E. and E. it reaches China and North Siam; on the S. its limits have so often varied that it is difficult to ascertain them with precision. Pegue, called by the natives Bagoo, is the country S. of Ava, which occupies the sea-coast as far as Martaban, properly Mondimaa; Prome (or Pee) was its northern frontier, and Siam adjoined on the East. The kingdom of Siam, or Sbaan, comprehended as far S. as Junkseylon, E. to Cambodia and Laos, and N. to Dzencee (probably the Chiamce of Loubere), and Yunan in China. This nation calls itself Tai, and is further distinguished by the appellations Tay-yay, or Great Tai, and Tai-nay, or Little Tai: their former capital was named Yoodia or Yoodra; whence the Siamese are frequently called Yoodras by the Birmans.

The Portuguese exercised an influence in the Birman and Pegue countries, as well as Arracan, so long as they maintained an ascendancy over

other European nations in the East; but on the seizure of their settlements and abridgement of their dominions by the Dutch, the consequence that had been annexed to the Portuguese name sunk into insignificance; and the Christian settlers degenerated into a contemptible race, distinguished only for their feebleness and vice.

In the beginning of the seventeenth century, both the English and Dutch had obtained settlements in the Birman dominions, which were afterwards forfeited by the misconduct of the latter; and Europeans of all nations were banished from Ava. The English, after many years, were reinstated in their factories at Syriam and Ava; and the island of Negrais was likewise taken possession of by the English, where the government of Fort St. George established a settlement; but little benefit seems to have been derived from it.

The supremacy of the Birmans over the Peguers continued throughout the seventeenth, and during the first forty years of the eighteenth centuries, when the Peguers revolted; a civil war ensued, which was prosecuted on both sides with savage ferocity. In 1744 the British factory at Syriam was destroyed by the contending parties, and the views of commerce were suspended by precautions of personal security. Success long continued doubtful: at length the Peguers, by the aid of arms procured from the Europeans trading to their ports, and with the assistance of some renegade Dutch and native Portuguese, gained several victories over the Birmans. These advantages they pursued with so much vigour, that, early in 1752, the capital of Ava was invested. The Birmans, disheartened by repeated defeats, after a short siege, surrendered at discretion. Dweepdee, the last of a long race of Birman kings, was made prisoner with all his family, except two sons, who effected their escape to the Siamese; from whom they found a favourable reception, and were flattered with assurances of security and success.

Bonna Della, or Beinga Della, king of Pegue, when he had completed the conquest of Ava, returned to his own country, leaving his brother Apporaza to govern the late capital of the Birman king, whom he carried with him a prisoner to Pegue; enjoining his brother to reduce the refractory, displace suspected persons, and exact on oath of allegiance from such Birmans as should be suffered to retain their former posses-

sions. Matters at first bore the appearance of tranquillity and submission; and the principal inhabitants acknowledged themselves vassals of the conqueror.

Alompra, a Birman of low extraction, was continued by the conqueror in the chieftship of Monchaboo, at that time an inconsiderable village, about twelve miles from the river, W. of Keoum-meoum. This man, who possessed a spirit of enterprize and boldness equal to the most arduous undertakings, at first, like many others, dissembled the reluctance he felt at the imposition of a foreign yoke, and submitted to the necessity of fortune; but, unlike others, he entertained hopes of emancipation, and meditated on the best means of accomplishing his future purpose. He had at this time, in the town and neighbourhood of Monchaboo, about a hundred devoted followers, on whose courage and fidelity he could safely rely. He strengthened and repaired the stockade that surrounded the town, without awakening suspicion in the minds of the Peguers, who did not imagine that a person so inconsiderable would attempt an act of rebellion under the check of a numerous garrison, distant only fifteen leagues. Thus resting in imaginary security, there were not more than fifty Pegue soldiers in Monchaboo, who, on all occasions, treated the Birmans with contemptuous arrogance. Alompra, availing himself of the resentment excited by some particular act of indignity, roused his already well-prepared adherents to active resistance, and attacking the Peguers with irresistible violence, put every man of that nation to the sword. Well-knowing the consequence should he be taken, he now thought of placing the crown upon his own head, and he waged war with the Peguers; meeting with encouragement he pursued the war, and at length entirely vanquished the Peguers, and wore the diadem. Partial to the scene of his first success, he removed the seat of government to Monchaboo, which he constituted his capital, and fixed on the place of his future residence. Not content with obtaining the throne of the Birman empire, he pursued the Peguers, took the city of Pegue with the king, and annexed his kingdom to his lately acquired possessions. At length the Birmans attacked Arracan, which they likewise added to their empire; and also great part of the kingdom of Siam.

The tranquillity of the Birman empire was however

however, frequently disturbed by insurrections in the conquered provinces; at length, in 1793, a peace was concluded with the Siamese, by which the Birmanians acquired a great accession of the more important parts of that kingdom. Become now pre-eminent among the nations which separate the gulf of Bengal from the Chinese sea; possessed of a territory equal in extent to the German empire, (before its dismemberment by Napoleon, emperor of the French;) blessed with a salubrious climate, and a soil capable of producing almost every article of luxury, convenience, and commerce, that the East can supply, Miamma, or Birma, thus happily circumstanced, enjoyed the pleasing prospect of a long exemption from the miseries of war; but unbending pride, and resentment unjustifiably prosecuted, nearly embroiled them in fresh troubles, before they had time to profit by the advantages of peace, and threatened to raise them up a foe far more formidable than the Chinese, Arracaners, Peguers, Siamese, and Cassayers.

The trade of Arracan, which is chiefly carried on with the eastern ports through an inland navigation, when the rivers are swollen by the rains, had suffered repeated interruptions from piratical banditti, who, infesting the Broken Islands, among which the channels wind, that are the usual course of boats, not only committed depredations on private merchants, but had even the hardness to attack fleets laden with the royal treasures*. These robbers, when the season of the year did not admit of their plundering on the water, sought adventures by land; and, as the Birmanians alledge, conveyed their booty of goods and cattle across the river Naaf, into the Chittagong province, where, secure from pursuit, being then under the protection of the British, they disposed of their spoils to advantage, and lived at ease, until returning want impelled them to renew their predatory incursions†.

The banks of this river are covered with deep jungles, interspersed with scanty spots of cultivation, and a few wretched villages, where dwell the poorest classes of herdsmen, and the

families of roving hunters, whose occupation it is to catch and tame the wild elephants, with which these forests abound. The asylum that such unfrequented places offered to persons concerned in a lawless traffic, rendered it easy to be carried on without the knowledge of the English officers of justice; nor could it possibly reach the notice of the Supreme Board, unless a proper representation was made, either by the individuals that were aggrieved, or by the government of their country. This, however, was a condescension, to which the mighty emperor of the Birmanians, who conceives himself superior to every potentate on earth would never stoop. To ask redress was beneath his dignity; he proceeded by a more summary course to do himself justice. On its being ascertained that three distinguished leaders of the robbers had sought refuge in the British districts, his Birman majesty, without communicating his intention, or in any form demanding the fugitives, thought fit to order a body of five thousand men, under an officer of rank, to enter the Company's territories, with positive injunctions to the commander not to return, unless he brought with him the delinquents, dead or alive; further, to support this detachment, an army of twenty thousand men were held in readiness at Arracan.

So unexpected an aggression, offered without any previous remonstrance, or the assignment of any plea, left no room for discussing the merits of the case. The Birmanians having taken upon themselves to redress their own grievances, it became necessary to convince them that they had mistaken the mode; and what they might readily procure from English justice, they could never extort through fear: to accomplish this purpose, a strong detachment was formed at the presidency, the conduct of which was entrusted to Major General Erskine; the troops proceeded from Calcutta to Chittagong, a battalion of Europeans and artillery by water, and the native sepoys‡ by land.

Serec Nunda Kiozo, the Birman chief, to whom the arduous task of reclaiming the fugitives,

* Customs are usually received in kind, viz. one tenth of the commodity.

† The river Naaf, which bounds the British and Birman territories, is situated at a considerable distance from the town of Chittagong, the seat of provincial government, and residence of the English magistrate.

‡ The word *sepoys*, by which name the native troops of India are always called, is derived from the Persian word *sipah*, which means a soldier, and is constantly used to distinguish the native troops from European soldiers. EDITOR.

was assigned, acted with more circumspection and prudence than the government from which he had received his instructions. After he had crossed the river, and encamped on the western bank, he dictated a letter to the British judge and magistrate of Chittigong, acquainting him of the reasons for the inroad; that the caption of the delinquents was his sole object, without harbouring any design of hostilities against the English. At the same time he declared, in a style of peremptory demand, that until they were given up, he would not depart from the Company's territories: in confirmation of this menace, he fortified his camp in the Birman manner, with a stockade, and seemed determined to resist any attempt to oblige him to retire. These matters being reported to the government, the Governor General was pleased to order the magistrate of Chittigong to apprehend the refugees, and keep them in safe custody until further directions.

On the approach of General Erskine, the Birman general sent a flag of truce, to propose terms of accommodation, stipulating for the surrender of the fugitives as the basis of the agreement. General Erskine replied, that no proposals could be listened to whilst the Birmans continued on English ground; but so soon as they should withdraw from their fortified camp, and retire within their own frontiers, he would enter on the subject of their complaints; notifying also, that unless they evacuated the Company's possessions in a limited time, force would be used to compel them. The Birman chief, in a manly confidence of the English character, personally waited on General Erskine, and disclosed to him the nature of his instructions, the enormity of the offenders, and the outrages they had committed. General Erskine, whose moderation and judgement on this occasion cannot be too highly commended, assured him, that it was far from the intention of the British government to screen delinquents, or sanction in their country an asylum for robbers; but as the manner in which the Birman troops had entered the Company's district was so repugnant to the principles that ought to regulate the conduct of civilized nations, it was impossible for him to recede from his first determination. He gave hopes, notwithstanding, that if the Birmans peaceably retired, the Governor General would institute a regular inquiry into the charges preferred against the prisoners; adding, that instant compliance with

the conditions prescribed, was the only ground on which they could expect so great an indulgence. The Birman general, either contented with this intimation, or convinced that opposition would be fruitless, professed his reliance on General Erskine, and agreed to withdraw his troops: the retreat was conducted in the most orderly manner; and so strict was the subordination observed in the Birman army, that not one act of violence was committed either on the person or property of British subjects while it continued within the Company's district. General Erskine was afterwards empowered, by the Governor General, to investigate the charges against the refugees, when, after a formal and deliberate hearing, their guilt being established on the clearest evidence, they were delivered over to their own laws, by whose sentence, two out of the three underwent capital punishment.

The amicable termination of this difference afforded a favourable opportunity to acquire a more accurate knowledge than had hitherto been obtained, of a people whose situation, extent of territory, and commercial connections with British India, rendered a liberal intercourse with them highly desirable. The trade between Calcutta, Madras, and Rangoon, had of late years so rapidly increased, as to become an object of national importance, more particularly on account of teak timber, the produce of Ava and Pegue, whence Calcutta and Madras draw all their supplies of wood for ship building, and for various other purposes. A commerce in one article so essential to us, and so extensive as to require an annual return of Indian commodities to the amount of two hundred thousand pounds sterling, was an object worth cultivating. Representations had, at different times, been made to the Supreme Board, complaining of injustice and oppression at the port of Rangoon: to prevent the recurrence of a like misunderstanding; to form a commercial connection on equitable and fixed principles, and to establish a confidential and authentic correspondence, such as ought to subsist between two great and contiguous nations, Sir John Shore (now Lord Teignmouth) thought proper to send a formal deputation to the Birman court. Nor were these the only ends to be answered by the embassy; the influence which the natural enemies of Great Britain had acquired in that quarter was to be combated, and, if possible,

able, overcome; whilst the natives were to be impressed with an adequate sense of the power, the resources, and, above all, the equity of the British character, in such a manner as to convince them that their real interests were connected with a state that neither meditated, nor would suffer encroachments and sought for nothing beyond an interchange of merchandize, on terms mutually beneficial. The result of this mission, through the various stages of its progress and completion, will be detailed in the subsequent pages.

The Birmans, under their present monarch, are certainly rising fast in the scale of Oriental nations. Knowledge increases with commerce; and as they are not shackled by any prejudices of caste, restricted to hereditary occupations, or forbidden from participating with strangers in every social bond, their advancement will, in all probability, be rapid. At present, so far from be-

ing in a state of intellectual darkness, although they have not yet explored the depths of science, nor reached to excellence in the finer arts, they yet have an undeniable claim to the character of civilized and well instructed people. Their laws are wise, and pregnant with sound morality; their police is better regulated than in most European countries; their natural disposition is friendly, and hospitable to strangers; and their manners rather expressive of manly candour, than courteous dissimulation: the gradations of rank, and the respect due to station, are maintained with a scrupulosity which never relaxes. A knowledge of letters is wisely diffused, that there are no mechanics, few of the peasantry, or even the common watermen, (usually the most illiterate class,) who cannot read and write in the vulgar tongue. Few, however, are versed in the more erudite volumes of science.

SECTION I.

Sail from Calcutta, on board the Sea Horse—Make the Cocoa Islands—Touch at Port Cornwallis in the Great Andaman.—Some Account of the Island—Prepare to depart.

HAVING received my commissions from the Governor General, one appointing me Agent Plenipotentiary, with power to treat, in the name of the Supreme Government of India, with the Emperor of Ava; the other, vesting in me authority to take cognizance of the conduct of the British subjects trading to, or residing in, the countries that I was destined to visit; on Feb. 21, 1795, I embarked (says Col. Symes) at Calcutta, on board the *Sea Horse*, an armed cruizer belonging to the East India Company, Captain Thomas, Commander, attended by Mr. Wood, Assistant Secretary, and Dr. Buchanan, Surgeon to the mission. Our numbers were more than twenty persons. On the evening of the 26th, our pilot left us in seven fathoms water; but the wind being foul, we anchored for the night, and next morning stood to the south-east with a favouring breeze, which blew without intermission till the 4th of March, when we made the

Great and Little Cocoa Islands, so called from being clothed with cocoa nut trees of unusual luxuriance. These islands are flat, small, and swampy; they are uninhabited, and destitute of good water. Steering between the southern Cocoa and the north end of the Island of Andaman, we opened Port Cornwallis* on the east side of the latter. At eleven o'clock on the 5th, we hauled our wind and stood in; at one we came to anchor a quarter of a mile from the shore. On landing we were received by Captains Ramsay and Stokoe (Colonel Kyd, the Governor, being absent,) with the kindest hospitality, which continued during the time we remained their guests.

The Andaman Islands are a continuation of the Archipelago that extends from Cape Negrais to Atcheen Head, stretching from 10° 32' to 13° 40' N. lat. and from 90° 6' to 92° 59' E. lon. The Great Andaman, the most northern, is

* The settlement in Port Cornwallis is not situated on the principal island, but on a smaller one within the harbour, named Chatham Island by the English; the utmost length

of which does not exceed two miles, and the breadth little more than half a mile: the southern extremity terminates in a narrow neck of land, fordable at low water to the main.

about 140 miles long, and 20 broad. A separation, or strait, however, has lately, owing to a fatal accident, been discovered in this island, which, in fact, divides it into two, and opens a clear passage into the Bay of Bengal*. The first settlement of the English was made in 1791, near the southern extremity of the island, in a bay on the east side; but was afterwards removed in 1793, by advice of Admiral Cornwallis, to the place where it is now established. The original object of the undertaking was to procure a commodious harbour on the east side of the bay, to receive and shelter his Majesty's ships during the continuance of the north-east monsoon; it was also used as a place of reception for convicts sentenced for transportation from Bengal.

In the evening we walked round the grounds that had been cleared, making a circuit of little more than a quarter of a mile. A small garden, diligently tilled, produced but a scanty crop of Indian vegetables. A shallow soil, impregnated with leaves and decayed brushwood, washed down by the mountain streams, proved at first unfavourable to cultivation; the pains, however, which had been bestowed, seemed likely in the end to overcome this discouragement. The situation of the settlement on the side of a hill, rising abruptly from the verge of the sea, although calculated to avoid the unwholesome effects of stagnant waters, was yet at times attended with great inconvenience, owing to the impetuosity of the torrents.

Notwithstanding the colony had been established on its present site little more than sixteen months, the habitations of the commandant and officers, were rendered extremely comfortable: the first constructed of stone and planks, the latter of mats and clay, thatched with leaves of the rattan, or covered with boards. The surgeon had a separate dwelling assigned him, and there was likewise a commodious mess-room. The number of inhabitants altogether was about seven hundred, including a company of sepoy as a

guard over the convicts, and a defence to the settlement.

A situation more picturesque, or a view more romantic, than that which Chatham Island and Cornwallis harbour present, can scarcely be imagined: land-locked on all sides, nothing is to be seen but an extensive sheet of water, resembling a vast lake, interspersed with small islands, and environed by lofty mountains clothed with impenetrable forests. The scenery of nature in this sequestered spot is uncommonly striking and grand.

All that voyagers have related of uncivilized life seems to fall short of the barbarism of the people of Andaman. The ferocious natives of New Zealand, or the shivering half-animated savages of Terra del Fuego, are in a relative state of refinement compared to these islanders. The population of the Great Andaman and all its dependencies, does not, according to Capt. Stokoe, exceed two thousand or two thousand five hundred souls: these are dispersed in small societies along the coasts, or on the smaller islands within the harbour, never penetrating deeper than the skirts of the forests, which hold out little inducement for them to enter, as they contain no animals to supply them with food. Their sole occupation seems to be that of climbing rocks, or roving along the margin of the sea in quest of a precarious meal of fish, which during the tempestuous season they often seek for in vain.

The Andamaners are not more favoured in the conformation of their bodies, than in the endowments of their mind. In stature they seldom exceed five feet; their limbs are disproportionately slender, their bellies protuberant, with high shoulders and large heads; and, strange to find in this part of the world, they are a degenerate race of Negroes with woolly hair, flat noses, and thick lips; their eyes are small and red, their skin of a deep sooty black, whilst their countenances exhibit the extreme of wretchedness: a horrid mixture of famine and ferocity. They go quite

* In the month of February, 1792, a vessel was freighted from Madras to carry stores to his majesty's fleet at Andaman. The master, being unacquainted with the harbour, sent a small boat, in the afternoon, to explore an opening in the land, that appeared like the entrance; the boat stood in, it felt dark, and she was swept, by a rapid current, through a channel that divided the main island, and opened into the Bay of Bengal. The north-east monsoon prevailed with

great violence: unable to work against stream and wind, the boat was borne to leeward, and driven irresistibly into the Indian Ocean. Eighteen days afterwards she was picked up by a French ship, near the equinoctial line. The crew consisted of two Europeans and six lascars; and, shocking to relate, when relieved by the French ship, three of the Lascars had been killed and eaten by their companions.

made, and are insensible of any shame from exposure*.

Their religion is the simple but genuine homage of nature to the incomprehensible Ruler of the universe, expressed in adoration to the Sun as the primary and obvious source of good; to the Moon as the secondary power; and to the genii of the woods, the waters, and the mountains, as inferior agents. In the spirit of the storms they confess the influence of a malignant being; and, during the south west monsoon, when tempests prevail with unusual violence, they deprecate his

wrath by wild chorusses, which they chant in small congregations assembled on the beach, or on some rock that overhangs the ocean.

The language of the Andamaners has not been discovered to possess the slightest affinity to any that is spoken in India, either continental or islandic. Captain Stokoe informed me, that what he heard was not at all harsh or disagreeable to the ear; their songs are wildly melodious, and their gesticulation, whilst singing, is extremely impassioned.

SECTION II.

Sail from the Andamans—Arrive at the Mouth of Rangoon River—Arrival at Rangoon, and extraordinary Conduct of the Government—Concession on the Part of the Rangoon Government.

HAVING passed five days at the Andaman Islands; the Hindoos, whose religion forbids them to drink water drawn by impure hands, having filled their own casks; and the stock of our numerous company being replenished; we prepared to depart, and on the 10th we stood to sea. Next morning at day light we made the isle of Narcondam†. On the 16th we found ourselves nearly in the latitude of the roads of Rangoon: we anchored for the night in five fathoms, and perceived lights on the beach. Next morning we discovered low land, about six miles to the N. W. Here we remained till the

18th, waiting for a pilot, standing off and on with short tacks during the day, and at anchor in the night. Finding that our signals, by firing guns and hoisting colours in the usual manner, were not answered, Mr. Palmer, the second officer, was sent in the pinnace, with instructions to proceed up the river as far as Rangoon, in case he did not find a pilot sooner. On the ensuing day Captain Thomas ventured to stand in; and steering by land-marks, and sending a boat a-head, crossed the bar without a pilot, at half-flood, in four fathoms. At twelve o'clock we entered the Rangoon river. Four miles within the extremes

* The few implements used by the Andamaners are of the rudest texture; a bow from four to five feet long, the string made of the fibre of a tree, or a slip of bamboo, with arrows of reed, headed with fish bone, or wood hardened in the fire, is their principal weapon. Besides this, they carry a spear of heavy wood sharply pointed, and a shield made of bark to defend themselves from the assaults of their enemies; for even these poor wretches have rights to assert, and dignities to maintain; necessity has taught them an expert management of their arms, on which they rely for subsistence: happily for them, their numerous bays and creeks abound with fish, which they shoot and spear with surprising dexterity. They are said also to use a small hand net, made of the filaments of bark; the fish when caught is put into a wicker basket, which they carry on their backs. Having kindled a fire, they throw the food on the coals, and devour it half broiled. A few diminutive swine are to be found in the skirts of the forests, and among the mangrove thickets in the low grounds; but these are very scarce, and are probably the progeny of a stock left by former navigators. When a native has the good fortune to slay

one, he carefully preserves the skull and teeth to ornament his hut. They cross the bays, and go to fish either in canoes formed of a hollow tree, or on rafts of bamboo; which they direct by paddles. Their habitations display little more ingenuity than the dens of wild beasts: four sticks stuck in the ground, are bound together at the top, and fastened transversely by others, to which the branches of trees are suspended; an opening is left on one side, just large enough to admit of entrance: leaves compose their bed. Being much incommoded by insects, their first occupation in a morning is to plaster their bodies all over with mud, which, hardening in the sun, forms an impenetrable armour; they paint their woolly heads with red ochre and water: when thus completely dressed, a more hideous appearance is not to be found in human form. Although the principal food of the Andamaners consists of fish, yet they eagerly seize on whatever else presents itself; lizards, guanas, rats, and snakes supply a change of repast.

† Narcondam is a barren rock, rising abruptly out of the ocean, about twenty leagues E. of the Andamans. It is uninhabited, and seemingly destitute of vegetation.

we came to a small village, whence a boat rowed towards us*. The Birman officer on board the boat enquired, in broken Portuguese, the name of the ship, whence she came, what arms and ammunition were on board, and the name of the commander. Being satisfied in these points, he carefully committed them to writing. Mr. Palmer now appeared in the ship's boat, bringing a pilot with him from Rangoon; and our cautious visitor took his leave.

About two o'clock a small boat from Rangoon met the ship: a man in it hailed our pilot in Hindoostanee, and desired him to cast anchor, as it was the intention of the governor of Rangoon to come down and receive the British deputation in person. Of course we complied with his request. We continued at anchor till the next day, when about noon the fleet came in sight: it consisted of from twenty to thirty boats; on a nearer approach, only four out of the number seemed to belong to persons of superior condition. Three persons, apparently of higher rank, came on board: they meant to be civil, but were perfectly free from restraint, and took possession of chairs without waiting for any invitation, or paying the smallest regard to those who were not seated; whilst their attendants, seemingly as much at ease as their masters, formed a semicircle around them on the deck. The chief of the three, a good-looking young man, of short stature, I understood to be a person of consideration: he was governor of the province of Dalla. The second, an elderly plain man, said he was Nak-huan-gee; literally, the royal ear. I was afterwards informed he was transmitter of intelligence, or reporter, to the imperial court; an office of much confidence. The third, a Seree, an inferior secretary, was a man of little relative importance compared with the other two. We conversed for an hour, through the medium of an interpreter who spoke the Hindoostanee: they were extremely inquisitive, and asked many questions concerning the objects of the mission, which were answered in friendly but general terms. Having paid their compliments, they arose to depart, and returned to their boats, making lavish professions of friendship. At length we reached Rangoon. The Princess Royal East Indiaman, that had come from

Madras for a cargo of timber, fired a salute to the Company's colours; and the Sea Horse paid a compliment to the battery on shore, of eleven guns, which were returned by an equal number: the pilot came to below the town, apart from the other ships about half a mile. As soon as the Sea Horse dropped anchor, all the boats withdrew without further notice or explanation.

Being desirous of sending some of our attendants on shore to refresh themselves, particularly the Hindoos, whose religion enjoins them not to eat victuals dressed on board, and who were on that account put to great inconvenience, being obliged at sea to subsist on dried fruits, sweetmeats, and parched pulse: I sent one of the attendants to the governor of Dalla, to acquaint him with my wish. He, in reply, desired that I would defer landing till the following day, when a habitation that was preparing for our reception would be in readiness: with this request I acquiesced, and communicated the same to Captain Thomas, and the gentlemen of the deputation, who forbade their servants to leave the ship without express permission.

About five o'clock in the afternoon the interpreter returned on board, and informed me, that the Raywoon, or governor of the town, meant to wait on me the next day at the dwelling assigned to us; intimating also, that he was ordered to remain on board to receive my commands. He spoke the Hindoostanee fluently; and I desired the Moonshee, a discreet and sensible man, to entertain him. The night passed without any communication with the shore, or with the other ships in the river.

Next morning, the 21st, at ten o'clock, the Seree, or under secretary, came on board, accompanied by a man of Portuguese extraction, who spoke very imperfect English. The Seree told me he was about to depart for Pegue, charged with dispatches for the Maywoon, or Viceroy; and requested to know whether I had any commands: I replied in the affirmative; adding, that it was my wish to send a confidential person to his Excellency, to deliver to him a letter from the Governor General of India, and another from myself. Finding I would not trust my dispatches to him, the Seree promised to call at

* This proved to be a watch-boat, which is stationed at the mouth of the river, to send intelligence of the arrival of

vessels to the nearest guard, whence it is forwarded to the governor of Rangoon.

noon, and convey my messenger to Pegue (about ninety miles distant) in his own boat; a promise which he omitted to perform.

In the afternoon, Mr. Wood, Dr. Buchanan, and myself, landed, and were conducted to a spacious temporary building which had been prepared for our reception: it was situated on the verge of the river, about five hundred yards below the town, opposite to where the Sea Horse was moored; it consisted of only one story, raised three feet from the ground, supported on posts driven into the earth; an elevation very necessary to the comfort of its inhabitants, as the high spring tides washed the foundation pillars, and almost insulated the building, by filling a channel which the rains had excavated. This edifice, about ninety feet in length, was entirely composed of bamboos and strong cane mats, and divided into several compartments; the roof was lofty, and covered with the same materials, which were laid in such a manner as to afford protection from rain, and shade from the sun: the floor, a bamboo grating, was likewise spread with mats; and in one apartment small carpets were laid, doubtless designed as a mark of distinction. On landing, we were received by the Serec, who made a frivolous excuse for not having called according to his promise. On entering the virando, or balcony, we were saluted by the sounds of very discordant music, issuing from the instruments of a band of musicians sent by the Governor to welcome us; to these he had obligingly added a set of dancing girls, and tumbling boys, who exhibited a variety of movements in attitudes, some of which was not ungraceful. Having dismissed this noisy assemblage, and taken a view of our habitation, we thought it more advisable and more commodious to sleep on board. Leaving therefore part of the guard and a few of our attendants to occupy the house, we returned at dusk, and passed the night on board the Sea Horse, better lodged, and more comfortably, than if we had continued in our new dwelling.

Not a boat, however, of any description, during all this time, came to our ship, either from the English merchantmen in the river, or from shore; a circumstance that bore the appearance of distrust and prohibition on the part of the government; but the truth was, that matters of etiquette had not been adjusted.

VOL. II. NO. CXI.

On the following morning, Captain Thomas and the gentlemen of the deputation accompanied me on shore to our habitation. We found no person of distinguished consequence there; but crowds of the lower class, both men and women, were collected from curiosity. In a short time several baskets were brought, with the Raywoon's, or Governor's compliments, containing venison, ducks, chickens, bread, and roots: the same company of musicians that had performed on the preceding day, attended to amuse us. At twelve o'clock the approach of a person of erudition was announced, when a tall elderly man, of a graceful appearance, followed by several attendants, was ushered in, under the title of Baba Sheen, whose manners were easy and respectful. After informing me, through the medium of a Portuguese interpreter, that he was second in authority at Rangoon, and held the office of Ackawoon, he apologized for the absence of the Raywoon, or Governor of the town, who, he said, was prevented from waiting on me by indisposition; and added, that he would be happy to shew me every attention in his power. I expressed my sense of his politeness; remarking, that my wants were confined to permission to purchase a few necessaries, and the means of finding a messenger to the Viceroy of Pegue, with a letter from the Governor General of India, and one from myself, which I was desirous should be delivered as speedily as possible. To this he replied, that he would forward by express any commands I might have; observing that it was an useless trouble to send a servant of my own. His meaning was obvious, and as this was his first visit, which might be considered rather as ceremonious, than as intended to discuss business, I did not press the matter farther; being, however, determined not to protract the purposes of the mission longer than was necessary. We parted about two o'clock; and, at his desire, my Moonshee wrote a list of such articles as we stood in need of, and tendered payment beforehand; an offer that was declined. Early in the afternoon Baba Sheen, the Ackawoon, paid us another visit, and brought with him, as interpreter, a Mussulman merchant, who spoke Persian tolerably well, through whom I was enabled to convey my sentiments with more ease than at our former meeting.

A great deal of trifling and evasive answers,
7 D however,

however, took place on the part of the Rangoon government; and the petty marks of authorized disrespect from different quarters, at length determined me to come to a full and satisfactory *claircissement* with that government, before I would consent to visit the Viceroy at Pegue. In pursuance of this resolution, I sent to Baba Sheen, desiring to see him as soon as convenient; and he accordingly soon after paid me a visit. After recapitulating the various causes of umbrage which had been given me, I added, that all these reasons combined, which were further strengthened by the Viceroy's returning a vague and verbal reply to the Governor General's letter, contrary to their known usage, rendered it impossible for me to proceed to Pegue, until he should explain the motive for such mysterious conduct; and I desired, that if any doubts were entertained respecting the objects of my mission, or the nature of my designs, he would express himself freely, and give me an opportunity, by removing them, to undeceive their government. He replied, as usual, in equivocal terms, and by an assurance that it was no more than what was conformable to custom. I said, I was sorry that our customs were so incompatible with theirs: that I could not, consistent with what I owed to the dignity of my own government, longer submit to my present situation; that as their forms and ours differed so widely, and, from what he said, were not likely to correspond, without a derogatory concession on one part or the other, there was no help for it; we could not apply the remedy, and should part as we had met, on terms of mutual good will and friendship. As I had thus far acquiesced, Baba Sheen did not expect that matters would take such a turn: intelligence of my arrival had been forwarded to the court, and the authors of my departure would be subject to its displeasure: he appeared alarmed, and earnestly asked, "What is it you desire?" I replied, immediate release from all personal restraint; that the spies which were stationed on board the Sea Horse, and the sentinels that accompanied every boat that left or came to the ship should be removed; that my servants should have the same liberty that the servants of other strangers enjoyed, with leave to purchase

what they wanted; that boats from shipping in the river should have free access, and the commanders permission to visit me; that Mr. Wood should have safe conduct to the Viceroy of Pegue, to receive in person a verbal acknowledgement of the Governor General's letter, and an invitation to me to visit Pegue, or bring with him a written reply; that unless these reasonable requisitions were acceded to, I must beg leave to depart, which I should do on the most amicable terms; and only regret that the public character I had the honour to fill, did not admit of concessions on my part which would be considered as humiliating by my countrymen. To this Baba Sheen answered in his former strain, endeavouring to amuse me with a story quite impertinent to the subject. I told him it was very well; the English and Burman nations, I hoped, would long continue to maintain a friendly intercourse: at the same time begged to be favoured with his commands to Calcutta. Finding, however, that I was determined, he said he would consult the Raywoon, and give me a reply in the afternoon: he then took his leave.

At four o'clock, Mr. Wood and myself met the Raywoon and Baba Sheen at our habitation: they came accompanied by a numerous train of followers; among whom, the Nak-haan attended, to listen to, and note the conversation. After talking for three hours to no purpose, and offering to yield in some things, they at length agreed to give up every point. Mr. Wood was to accompany Baba Sheen to Pegue; the captains of the English ships were to have free access; our attendants liberty to purchase what they wanted, and to go where they pleased; the spies stationed on board the Sea Horse were to be removed, and boats suffered to pass from the ship to the shore without a Birman sentinel. These matters being stipulated, and a punctual performance solemnly promised, I relinquished my design of going away for the present, and we parted with apparent contentment and good humour on both sides: and the morning of the 29th produced a satisfactory adjustment of every point in contention, by an unqualified acquiescence on the part of the Rangoon government, to my several requisitions.

SECTION III.

Consent to go to Pegue before the Return of Mr. Wood.—Suspensions of the Birmans awakened by designing Persons—Arts used to counteract the English Deputation—Embark for Pegue—Appearance of the Country—Destitute of Population, and infested by Wild Beasts.

AT the earnest solicitation of Baba Sheen, I consented to embark for Pegue on March 31, and not wait the return of Mr. Wood, who had gone thither to the Viceroy, as I had at first intended. The annual festival at the great temple of Pegue was about to be celebrated with sumptuous magnificence; and the Viceroy had expressed a particular desire that the English gentlemen should witness the rejoicings. I told Baba Sheen that I would relinquish my original determination on this point, as a mark of my confidence in him, and perfect conviction of the friendly inclinations of the Viceroy.

Previous to this amicable termination of a disagreement which at first bore an inauspicious appearance, I had conjectured what were the real motives of their distrust, and my conclusions afterwards proved to be rightly founded. Pride, the natural characteristic of the Birmans, was increased by the arts of designing men, and suspicion was awakened by misrepresentation. The Birmans, sensible of the advantages of commerce, but inexpert in the practice, desirous to improve, but unacquainted with the principles of trade, and of late years given toleration to all sects, and invited strangers of every nation to resort to their ports; and being themselves free from those prejudices of cast which shackle their Indian neighbours, they permitted foreigners to intermarry and settle among them. These settlers flocked to Rangoon, and were received with hospitality by a liberal nation: many of them soon acquired wealth by means of their superior knowledge. The Parsees, the Armenians, and a small proportion of Mussulmen, engrossed the largest share of the trade of Rangoon; and individuals from their number were frequently selected by government to fill employments of trust that related to trade and transactions with foreigners, duties of which the Birmans supposed that these persons could perform better than themselves.

Several private merchants had thus acquired influence in Rangoon. These people naturally beheld with a jealous eye any advance of a commercial nature, that may tend to diminish their influence, and deprive them of that dictatorial power, which they assume and exercise over all merchants and mariners that resort to Rangoon: but of none are they so apprehensive as of the English; a connection with whom, they apprehend, might teach the Birmans to transact foreign business without their assistance, and give them a more adequate sense of their own interests. Under these fears they had long been discriminating the seeds of suspicion, and warning the Birmans to be on their guard against British fraud, as well as British force; but no sooner did they hear of the present deputation, than the alarm bell was sounded from all quarters. They represented our designs to be of the most dangerous tendency; and endeavoured to work on the superstition of the people, by the promulgation of a prophecy, that in less than twelve months the English colours would fly on the Rangoon flag-staff. These artifices, not now practised for the first time, were not void of effect. This accounts for the coolness of our reception at Rangoon.

This day the captains of the principal ships in the river dined with me on shore. The Raywoon, knowing that I was to have company, sent a whole antelope, with Indian vegetables in abundance; and acquainted me, that boats would be in readiness for us on the following day at noon, as I had promised to leave Rangoon by the evening's tide.

The morning of the following day was spent in preparation for our journey to Pegue; and about noon three boats were in readiness at the creek near our dwelling. The one designed for my conveyance was comfortable, according to Birman notions of accommodation*.

It was rowed by twelve Birman watermen, who

was so low as not to admit of a person standing upright; an inconvenience scarcely to be endured by an European, but not at all regarded by Asiatics.

It consisted of three small compartments, partitioned by mats, neatly fastened to slips of bamboo cane: the room was lined with India chintz; the roof, however,

used

used short oars made in the English form, and who seemed to understand their business. A large heavy boat was provided for the soldiers and our domestics, and a small cutter attended as a kitchen: the boat destined for Dr. Buchanan did not arrive until it was dark, and being a very indifferent one we imagined it was kept out of sight for that reason.

The mouth of the Syrian or Pegue river, where it joins with that of Rangoon, is about three miles below the town; we therefore waited till the ebb tide was nearly spent, in order to drop down, and take the first of the flood to ascend the river of Pegue. At eight o'clock at night we embarked, accompanied by two war-boats; in one of which was the Nak-baan of Rangoon, and in the other an inferior officer. A black Portuguese, in the service of the provincial government, who spoke the language of Hindostan, came as official interpreter: we had likewise another Portuguese, named Panntchoo, who engaged in my service at the Andaman

Island, and who was a valuable acquisition to me during the mission*.

Early in the morning Dr. Buchanan and myself walked out with our guns, accompanied by half a dozen attendants: the country round, as far as our view could reach, displayed a level plain with clumps of trees at distant intervals; a thick reedy grass had grown in some places very high in others, where it had been burnt, there appeared good pasturage for cattle: we saw the embanked divisions of a few rice plantations, and discovered the vestiges of former culture and population; but during a walk of two hours the eye was not gratified by the sight of a house, or an inhabitant: desolated by the contentions of the Birmans and Peguers, the country had not yet recovered from the ravages of war. The banks of the river, on each side, are low, and the land seems adapted to produce excellent crops; but is now quite deserted, and become the undisputed domain of the wild beasts of the forest.

SECTION IV.

Arrive at Pegue—Polite Reception—Invited to the Celebration of the Annual Festival—Procession &c. described—Introduction to the Maynoon, or Viceroy—Grand Display of Fireworks—Curiosity of the Birmans—The Birmans close the Year with a purificatory Ceremonial, in which the English Gentlemen bear a Part.

AT noon we got under way, and soon passed a village on the right, consisting of about twenty houses; the river gradually diminished in breadth, and at this place was not more than forty yards wide, the banks covered with coppice and long reeds: after passing another and larger village where there was a chokey or watch-house, we proceeded through a cultivated country, and numerous villages appeared on each side. At seven in the evening we were in sight of Pegue, and judged the distance by water from Rangoon to be about ninety miles, most part of the way in a northward direction; but the windings of the river are so great, that the road in a strait line must be much less. When we approached the

landing-place, Mr. Wood came down to meet us, and the favourable account he gave of the reception, added not a little to the satisfaction of having finished our journey: we also found Baba Sheen on the bank waiting our arrival; who conducted us with great civility to our habitation which we were pleased at finding far superior to that we had left†.

We had each a small apartment as a bedroom, with carpets spread over the mats, and a large room to dine in and to receive visitors. Hunts were also erected for our attendants; and bamboo palisade, inclosing a court sufficient spacious, surrounded the whole. Shortly after our arrival, two officers of government waited

* He spoke the Birman language fluently, and that of Hindostan intelligibly: the latter was the medium commonly used in my conversations with Birmans, and I was seldom at a loss to find some person that understood it.

† Like Birman houses in general, it was raised between

three and four feet from the ground, composed wholly of bamboos and mats, and indifferently thatched. This is a defect that extends universally to their own dwellings, and affords matter of surprize in a country where the coarse grass used for thatching is so plentiful.

me with compliments of congratulation from the Maywoon: they staid but a short time, perceiving that we were busy in arranging conveniences for the night.

In the afternoon of the next day an officer called Che-Key, second in rank to the Maywoon, and the Scree-dogee, or secretary of the provincial government, accompanied by Baba Sheen, paid us a visit to tea. They informed me, that the Maywoon, or Viceroy, who had been much engaged in directing the preparations for the ensuing festival, hoped we would wave ceremony, and give him our company on the following morning at the great temple of Shoemadon, to view the amusements of the first day: an invitation that I gladly accepted, from motives of curiosity as well as of respect.

At eight o'clock in the morning Baba Sheen arrived, in order to conduct us to the temple; and brought with him three small horses, equipped with saddles and bridles. After breakfast, Mr. Wood, Dr. Buchanan, and myself mounted, and, attended by Baba Sheen, and an Achedoo, an officer belonging to the Maywoon's household, also on horseback, set out to view the ceremony. We entered the new town by the nearest gate, and proceeded upwards of a quarter of a mile through the principal street till we came to where it was crossed at right angles by another, which led from the Maywoon's residence to the temple. Here our progress was stopped by a great concourse of people, and we perceived on each side of the way troops marching by single files, in slow time, towards the temple. By the advice of Baba Sheen, we occupied a convenient spot to view the procession*.

As we had not been formally introduced, the Maywoon passed by without honouring us with

any notice. Proceeding to the foot of the steps that lead to the pagoda, his elephant knelt down to suffer him to alight. Whilst he was in the performance of this act, the parade elephants knelt also, and the crowd that followed squatted on their heels. Having ascended the flight of steps, he put off his shoes, and walked once round the temple without his umbrella, which was laid aside out of reverence to the sanctity of the place. When he had finished this ceremony, he proceeded to the scene of amusement, a sort of theatre erected at an angle of the area of the temple. Two saloons, or open halls, separate from the great building, formed two sides of the theatre, which was about fifty feet square, covered by awning of grass, spread on a flat roof of slender canes, supported by bamboo poles. Beneath the projecting verge of the roof of one of the saloons there was an elevated seat, with a handsome canopy of cloth, for the accommodation of the Maywoon and his three children; and on a bare bench beneath him sat the principal officers of his court. Seats were provided for the English gentlemen, covered with fine carpeting, but without any canopy. The diversions of the day consisted entirely of boxing and wrestling. In order to prevent injury to the champions, the ground had been prepared, and made soft with moistened sand. At the latter exercise they seemed to be very expert: a short man was particularly distinguished for his superior skill and strength; and it was said, that in former contests he had killed two of his antagonists. The first that encountered him on the present occasion, though much superior in size, was, after a short struggle, pitched on his head, and, as the bystanders said, severely hurt. Many others displayed great activity and address; but in the art

* The troops that we saw were the Maywoon's guard; five or six hundred men passed us in this manner, wretchedly armed and equipped; many had muskets that appeared in a very unserviceable state, with accoutrements not in a more respectable condition; some were provided with spears, others with sabres; whilst their dress was as motley as their weapons. Several were naked to the middle, having only a summerband, or waist-cloth, rolled round their waist, and passed between their legs; some were dressed in old velvet or cloth coats, which they put on regardless of size or fashion, although it scarcely covered their nakedness, or trailed on the ground: it was finery, and finery in any shape was welcome. Some wore Dutch broad-brimmed hats bound with gold lace, others the crowns of hats without any brim

at all: the officers of this martial band, who were for the most part Christian descendants of Portuguese ancestors, exhibited a very grotesque appearance. The first personages of rank that passed by were three children of the Maywoon, borne astride upon men's shoulders; the eldest, a boy about eight years of age; the youngest, a girl not more than five; the latter only was legitimate, being the first-born of his present wife; the two elder were the offspring of concubines. The Maywoon followed at a short distance, mounted on the neck of a very fine elephant, which he guided himself. His dress was handsome and becoming; a number of parade elephants in tawdry housings brought up the rear.

of boxing they seemed very deficient, notwithstanding they used fists, knees, and elbows. The battles were of short duration; blood drawn on either side terminated the contest; and even without it, the Maywoon would not suffer them to contend long. At the end of an engagement both combatants approached the Maywoon's throne, and prostrated themselves before him, with their foreheads to the ground, whilst an attendant spread on the shoulders of each two pieces of cotton cloth, as the reward of their exertions, which they carried away in a crouching position, until they mingled with the crowd. The places of those who retired were immediately filled by fresh pugilists. This amusement lasted three hours; then tea and sweetmeats were served up in great profusion in the name of the Maywoon.

Colonel Symes then received a message intimating that the Maywoon hoped to see him the next day at the government house. The English embassy then marched through the town, the objects of universal curiosity, till they reached the gate of an inclosure surrounding the Maywoon's dwelling. When the Maywoon entered he sat down, and silence was kept for some time, which I first interrupted, says Colonel Symes, by telling him, that the governor general of India, having received his friendly letter, and being well assured of the amicable disposition of the Birman government towards the English nation, had charged me with the delivery of letters and presents to his majesty at Ava, and had likewise requested his acceptance of a few articles which I had brought with me. I then rose, and presented the governor general's letter; he laid it on a tray before him, talked of indifferent matters, and was extremely polite in his expressions and manner, but carefully avoided all discourse that had the least relation to business, or the objects of the embassy. After half an hour's conversation, on uninteresting topics, he invited us to a grand display of fireworks, which was to take place on the following day, and soon after withdrew unceremoniously. Tea and sweetmeats were then served up.

Previous to the display of fireworks, the different companies from the several Mious or districts, passed the government house in review before the Maywoon and his family, each company distinct. A small waggon, drawn by four buffa-

loes, profusely decorated with peacock's feathers, and the tails of Thibet cows led the procession, on which were laid the fireworks of that particular company: next advanced the men belonging to it, dancing and shouting; the females, in a separate troop, came last, singing in full chorus, and clapping their hands in accurately measured time. Each division or company exhibited in turn its own fireworks; and the display of rockets was strikingly grand. Each company, after contributing its share towards the general entertainment, marched past the Maywoon, to the sound of musical instruments; after which they amused the Maywoon and his company with songs and dances, manifesting every lively demonstration of joy.

Every day during the abode of the Colonel and his retinue at Pegue, vast numbers both of men and women, prompted by harmless curiosity, surrounded the paling of the inclosure allotted for their residence from morning till night; those of a better class usually entered, some previously asking permission, but many without it. Perfectly free from restraint among themselves, the Birman scruple not to go into your house without ceremony, although you are an utter stranger. To do them justice, however, they are not at all displeased at your taking the same freedom with them. This intrusion is confined wholly to your public room; they do not attempt to open a door and where a curtain dropped denotes privacy, they never offer to violate the barrier. On entering the room they immediately descend into the posture of respect. Of all our customs, says the Colonel, none seemed to surprize them more than our preparations for dinner: the variety of utensils, and our manner of sitting at table, excited their wonder: they never took any greater liberty than merely to come into the room, and sit down on the floor; they meddled with nothing and asked for nothing, and when desired to go away always obeyed with cheerfulness.

The three last days of the solar year of the Birman are usually spent in merriment and feasting; and Colonel Symes and his company were invited by the Maywoon to be present on the 10th of April, at the exhibition of a dramatic representation. At a little before eight o'clock, the hour when the play was to commence, they went to the house of the Maywoon. The theatre was the open court, splendidly illuminated by lamp

and torches. The performance far excelled any Indian drama the Colonel had ever seen. The dialogue was spirited without rant, and the action animated without being extravagant; the dresses of the principal performers were showy, but becoming. By way of interlude between the acts, a clownish buffoon entertained the audience with a recital of different passages; and by grimace, and frequent alterations of tone and countenance, extorted loud peals of laughter from the spectators*.

On the 12th of April, the last day of the Birman year, the embassy were invited by the Maywoon to bear a part in a sport that is universally practised throughout the Birman dominions on the concluding day of their annual cycle. To wash away the impurities of the past, and commence the new year free from stain, women on this day are accustomed to throw water on every man they meet, which the men have the privilege of retorting: this licence gives rise to a great deal of harmless merriment, particularly amongst the young women, who, armed with large syringes and flaggons, endeavour to wet every man that goes along the street, and, in their turn, receive wetting with perfect good humour; nor is the smallest indecency ever manifested in this or in any other of their sports. Dirty water is never met: a man is not allowed to lay hold of a woman, but may fling as much water over her as she pleases, provided she has been the aggressor. If a woman warns a man that she does not mean to join in the diversion, it is considered as an avowal of pregnancy, and she passes without molestation.

About an hour before sun-set, says the Colonel, we went to the Maywoon's, and found that his

lady had provided plentifully to give us a wet reception. In the hall were placed three large china jars, full of water, with bowls and ladles to fling it. Each of us, on entering, had a bottle of rose-water presented to him, a little of which we in turn poured into the palm of the Maywoon's hand, who sprinkled it over his own vest of fine flowered muslin; the lady then made her appearance at the door, and gave us to understand that she did not mean to join in the sport herself, but made her eldest daughter, a pretty child, in the nurse's arms, pour from a golden cup some rose-water mixed with sandal-wood, first over her father, then over each of us: this was a signal for the sport to begin. We were prepared, being dressed in linen waistcoats. From ten to twenty women, young and middle aged, rushed into the hall from the inner apartments, who surrounded and deluged without mercy four men ill able to maintain so unequal a contest. The Maywoon was soon driven from the field; but Mr. Wood having got possession of one of the jars, we were enabled to preserve our ground till the water was exhausted: it seemed to afford them great diversion, especially if we appeared at all distressed by the quantity of water flung in our faces. All parties being tired, and completely drenched, we went home to change our clothes, and in the way met many damsels who would willingly have renewed the sport: they, however, were afraid to begin without receiving encouragement from us, not knowing how it might be taken by strangers; but they assailed Baba Sheen and his Birman attendants, who accompanied us, with little ceremony. Having put on dry clothes, we returned to the Maywoon's, and were entertained with a dance and puppet-show.

SECTION V.

State of the ancient City of Pegue—Description of the new Town—Account of the Temple of Shoemadoo—Monastic Retreats of the Rhahaans—Officers of the Provincial Government—Administration of Justice.

THE extent of ancient Pegue may be still accurately traced by the ruins of the ditch and

wall that surrounded it: from these it appears to have been a quadrangle, each side measuring

* The Birmans seem to delight in mimicry, and are very expert in the practice, possessing uncommon versatility of imitance. An eminent practitioner of this art amused the company with a specimen of his skill, and exhibited a masterly display of the passions in pantomimic looks and nature: the transitions he made from pain to pleasure,

from joy to despair, from rage to mildness, from laughter to tears; his expression of terror, and, above all, his look of idiotism, were performances of first rate merit in their line. Had his fates decreed him to have been a native of Great Britain, his genius would have rivalled that of any modern comedian of the English stage.

nearly

nearly a mile and a half; but in several places the ditch is choked up by rubbish that has been cast into it, and the falling of its own banks. The fragments of the wall likewise evince that this was a work of magnitude and labour; its breadth at the base not being less than forty feet. In the centre of each face of the fort there is a gateway about thirty feet wide; and these gateways were the principal entrances. The passage across the ditch is over a causeway raised on a mound of earth, that serves as a bridge, and was formerly defended by an entrenchment, of which there are now no traces. It is impossible to conceive a more striking picture of falling grandeur, and the desolating hand of war, than the inside of these walls displays. Alompra, when he got possession of the city in the year 1757, razed every dwelling to the ground, and dispersed or led into captivity all the inhabitants. The temples or praws, which are very numerous, were the only buildings that escaped the fury of the conqueror; and of these the great pyramid of Shoemadoo has alone been revered and kept in repair.

The present king of the Birmans, early in his reign, sought to conciliate his subjects by mildness, rather than to govern them by terror. Indeed no act of the Birman government seems more likely to reconcile the Peguers to the Birman yoke, than the restoration of their ancient place of abode, and the preservation and embellishment of the temple of Shoemadoo. The king, sensible of this, as well as of the advantages that must arise to the state from the increase of culture and population, issued orders in 1790 to rebuild Pegue, encouraged settlers by grants of ground, and invited these scattered families of former inhabitants to return and repopulate their deserted city. The more effectually to accomplish his purpose, the king ordered the Maywoon of Rangoon to make Pegue the place of his future residence. These judicious measures have so far succeeded, that a new town has been built within the site of the ancient city. The number of inhabitants at present amount to about seven thousand. There can be little doubt that the respect paid to their

favourite temple of worship, and the security and encouragement held out to those who venture to return, will, in time, restore the city to its ancient splendour. The plane of the town is not yet filled with houses, but a number of new ones are building. The Kioums or monasteries of the Rhahaans, and the habitations of the higher ranks, are usually elevated six or eight, those of the lower classes from two to four feet. There are no brick buildings either in Pegue or Rangoon, except such as belong to the king, or are dedicated to their divinity Gaudma; his majesty having prohibited the use of brick or stone in private buildings, from the apprehension, that if people got leave to build brick houses, they might erect brick fortifications, dangerous to the security of the state. The houses therefore are made of mats, or sheathing boards, supported on bamboos or posts; but from their being composed of such combustible materials, the inhabitants are under continual dread of fire, against which they take every precaution. The roofs are light covered, and at each door stands a large bamboo with an iron hook at the end, to pull down the thatch: there is also another pole, with a grating of iron at the extremity, about three feet square, to suppress flame by pressure. Almost every house has earthen pots, filled with water, on the roof; and a particular class of people*, whose business is to prevent and extinguish fires, are perambulate the streets during the night.

The object in Pegue that most attracts attention, is the noble edifice of Shoemadoo, or the Golden Supreme. This extraordinary pile of buildings is erected on a double terrace, or raised upon another. The lower and greater terrace is about ten feet above the natural level of the ground, forming an exact parallelogram: the upper and smaller terrace is similar in shape, and rises about twenty feet above the lower terrace, thirty above the level of the country. A side of the lower terrace is one thousand three hundred and ninety-one feet long, of the upper six hundred and eighty-four. The walls that sustain the sides of the terrace are in a ruinous state: they were formerly covered with plaster wrought in

* These people are called Pagwaat; they are slaves of government; men who have been guilty of theft, and, through mercy, had their lives spared. These men are distinguished by a black circle on each cheek, caused by gunpowder and punctation; as well as by having on their

breast, in Birman characters, the word *thief*, and the name of the article stolen, as on one was *Putchoo Khoo*, cloth thief. These men patrol the streets at night, to put out all fires and lights after a certain hour. They are constables, and are also the public executioners.

various figures. The area of the lower is strewed with the fragments of small decayed buildings, but the upper is kept free from filth, and is in tolerably good order*.

The terraces are ascended by flights of stone steps, which are now broken and neglected. On each side are dwellings of the Rhahaans, raised on timbers four or five feet from the ground†.

Shoemadoo is a pyramidal building, composed of brick and mortar, without excavation or aperture of any sort; octagonal at the base, and spiral at the top; each side of the base measures a hundred and sixty-two feet: this immense breadth diminishes abruptly, and a similar building has not aptly been compared in shape to a large speaking trumpet. Six feet from the ground there is a wide projection that surrounds the base, on the plane of which are fifty-seven small spires of equal size, and equidistant; one of them measured twenty-seven feet in height, and forty in circumference at the bottom. On a higher ledge there is another row, consisting of fifty-three spires of similar shape and measurement. A great variety of mouldings encircle the building; and ornaments somewhat resembling the fleur-de-lys surround the lower part of the spire; circular mouldings likewise girt it to a considerable height, above which there are ornaments in stucco not unlike the leaves of a Corinthian capital; and the whole is crowned by a Tee, or umbrella, of open iron-work, from which rises a rod with a gilded pendant‡.

The circumference of the tee is fifty-six feet: it rests on an iron axis fixed in the building, and is farther secured by large chains strongly rivetted to the spire. Round the lower rim of the tee are appended a number of bells, which, agitated by the wind, make a continual jingling. The extreme height of the edifice, from the level of the country, is three hundred and sixty-one feet, and above the interior terrace three hundred and thirty-one feet.

Such Rhahaans or priests as devote themselves,

* There is reason to believe that this building and the fortresses are coeval, since the earth of which the terraces are composed appears to have been taken from the ditch; there being no other excavation in the city, or in its neighbourhood, that could have afforded a tenth part of the quantity.

† These houses consist only of a large hall; the wooden pillars that support them are turned with neatness; the roofs are covered with tiles, and the sides are made of boards; and there are a number of bare benches in every house, on

to religious seclusion, and prefer the tranquillity of rural retirement to the noise and tumult of a town, take up their abode in groves. In their choice of a residence they commonly select the most retired spots they can find, where shady trees, particularly the tamarind and banyan, protect them from the noon-day sun. In these groves they build their kiousms, and here they pass their solitary lives. All kiousms or monasteries, whether in town or country, are seminaries for the education of youth, in which boys of a certain age are taught their letters, and instructed in moral and religious duties. To these schools the neighbouring villages send their children, where they are educated gratis, no distinction being made between the son of a peasant and of him who wears the tsaloe, or string of nobility. A piece of ground contiguous to the grove is inclosed for a garden, where they sow vegetables and plant fruit trees; the Indian sweet potatoe, and the plantain, being the most nutritious, are principally cultivated; the charity of the country people supplies them abundantly with rice, and the few necessities which their narrow wants require. Abstracted from all worldly considerations, they do not occupy themselves in the common concerns of life: they never buy, sell, or accept of money.

In the town of Pegue there are only three persons besides the Maywoon or Viceroy, whose rank entitles him to distinction: these are the Raywoon, Chekey, and the Seree-dogee. These officers exercise the function of magistrates, and hold separate courts at their own houses, for the determination of petty suits. Each has his distinct department; but this private jurisdiction is very limited: all causes of importance relating to property, and matters of a high criminal nature, are solemnly tried in open court. The three before-mentioned officers unite, and form a tribunal, which sits at the Rhoom, or public hall of justice, where they hear the parties, examine witnesses, and take depositions in writing: these

which the Rhahaans sleep; but there was no other furniture.

‡ The tee or umbrella is to be seen on every sacred building that is of a spiral form: the raising and consecration of this appendage is an act of high religious solemnity, and a season of festivity and relaxation. The present king bestowed the tee that covers Shoemadoo. It was made at the capital; and many of the principal nobility came down from Ummerapoora to be present at the ceremony of its elevation.

depositions are sent to the Maywoon, who represents the King, and the Judges transmit their opinions along with the evidence, which the Maywoon either confirms or rejects as he thinks proper, and, in cases of capital conviction, orders execution, or pardons the culprit. From his judgment there lies no appeal, except when it

happens that an offender who holds an office under a royal commission is brought to trial: in that case, the minutes of the evidence taken in court must be forwarded to the council of state, to be by them submitted to the King, who himself applies the law, and awards the sentence.

SECTION VI.

Leave Pegue and reach the Village of Deesa—Abundance of Game—Buffaloes; their Antipathy to Red or Scarlet—Deesa infested by Tigers and wild Elephants—Reach Rangoon—Geographical Position of Pegue erroneously laid down in modern Maps—Description of the Town of Rangoon—Account of the People called Carianers—Description of the Temple of Shoedugong—Town of Maindu—Mima-Shun-Rua, the Village of Prostitutes.

COLONEL Sykes and the rest of the embassy left Pegue on the 26th, and arrived the next day at the village of Deesa; where, shortly after their arrival, the Mion-gee, or chief person of the village, came to pay his respects. The country about Deesa abounds in various kinds of game, particularly deer. About a mile east of the town is an extensive plain, where a herd of deer was soon discovered, but they were so watchful and wild, says the Colonel, that I could only get near enough to fire a random shot from a rifle, which did not take effect. In endeavouring to approach them unperceived, I left my servants and guide at a considerable distance. The report of the gun alarmed a drove of buffaloes: the whole troop raised their heads, and, instead of running away, seemed to stand on the defensive. Two came out from the herd, and, with their tails and heads erect, trotted towards me, not in a straight line, but making half a circle, as if afraid to advance; but at length they drew so near, that I expected a direct charge to be made upon me. In this extremity the Mion-gee discovered me, and made signs to me, which I comprehended, and slipped off my scarlet coat, which I flung, together with my hat, into some long grass: the buffalo desisted from the pursuit, and returned towards the herd, quietly grazing as he retired. This circumstance proves, that the buffalo entertains the same antipathy to the colour of red or scarlet that some other animals are known to do. The Mion-gee, when I joined him, seemed quite as much alarmed as I was; he said

that if I had sustained any injury, his head would have paid the forfeit of the accident. In the thickets that border on the banks of the river to the north and south of the village, tigers frequently prowl about, and carry away the dogs from the village, but dare not attack the buffaloes, who appear to be almost as fierce as themselves; and in a forest, about twelve miles to the north-east, are immense herds of wild elephants, which frequently destroy whole crops of rice and sugarcane. The next morning they left Deesa and arrived at Rangoon.

The authorities on which the geography of the city and river of Pegue has been laid down, though doubtless the best that could be procured, are nevertheless far from being accurate. The Pegue river is called by the natives Bagoo Kion, or Pegue rivulet, to distinguish it from Mionp, or river. It is navigable but a very few miles to the northward of the city of Pegue, and for this it is wholly indebted to the action of the tide. It has no communication with the sea, except by the Rangoon river, and in the fair season, at low water, is almost dry. There seems to have been a mistake of this stream for the Sitang river, about fifteen miles east of Pegue, which is a great and independent body of water, that partly describes the course that in the map is given to what is called the Pegue river. Nor does the meridian measurement of the city of Pegue, as reported by former travellers, at all correspond with later observations. Mr. Wood, an accurate astronomer, and furnished with excellent instruments, places
Pegue

Pegue in seventeen degrees forty minutes N. latitude, above forty geographical miles S. of the position assigned to it in the map. The difference in longitude is less than that of latitude. Mr. Wood, from a mean of observations of the immersion and emersion of Jupiter's satellites, determines Pegue to be in ninety-six degrees, eleven minutes, fifteen seconds, about thirty-two miles W. of its supposed situation. This eastward error may have given occasion to the mistake of the Sitang river for that of Pegue. Indeed the authorities for the geography of this country are, in most places imperfect, and in some altogether erroneous.

Increasing trade, and consequent population, have extended the present town far beyond the limits that formerly comprehended Rangoon, as it was originally founded by Alompra. It stretches along the bank of the river about a mile, and is not more than a third of a mile in breadth. The city or miou is a square, surrounded by a high stockade; within which in several places are erected wooden stages for musqueteers to stand on in case of an attack. A battery of twelve cannon, six and nine-pounders, raised on the bank, commands the river; but the guns and carriages are in such a wretched condition, that they could do little execution. Close to the principal wharf are two commodious houses, used by the merchants as an exchange, where they usually meet in the cool of the morning and evening, to converse and transact business. The streets of the town are narrow, and much inferior to those of Pegue, but clean and well-paved. The houses are raised on posts from the ground; the smaller supported by bamboos, the larger by strong timbers. All the officers of government, the most opulent merchants, and persons of consideration, live within the fort; shipwrights and people of inferior rank inhabit the suburbs; and one entire street, called Tackallay, is exclusively assigned to common prostitutes, who are not permitted to dwell within the precincts of the fortification. Swine are suffered to roam about the town at large: these animals, which are with reason held unclean, do not belong to any particular owners; they are servants of the public, common scavengers; they go under the houses, and devour the filth. The Birmanas are also fond of dogs, numbers of which infest the streets; the breed is small, and extremely noisy; whenever we walked out,

the inhabitants were apprized of the approach of the English by the loud barking of these troublesome curs.

A singular description of people called Carayners, or Carianers, inhabit different parts of the country, particularly the provinces of Dalla and Bassien, several societies of whom also dwell in the districts adjacent to Rangoon. They are a simple innocent race, who speak a language distinct from that of the Birmanas, and entertain rude notions of religion. They lead a pastoral life, and are the most industrious subjects of the state. Their villages form a select community, from which they exclude all other sects, and never reside in a city, intermingle, or marry with strangers. They profess, and strictly observe, universal peace, not engaging in war, or taking part in contests for dominion, a system that necessarily places them in a state of subjection to the ruling power of the day. Agriculture, the care of cattle, and rearing poultry, are almost their only occupations. A great part of the provisions used in the country is raised by the Carianers, and they particularly excel in gardening. They have of late years been heavily taxed and oppressed by the great Birman land-holders, in consequence of which many have withdrawn to the mountains of Arracan. They have traditional maxims of jurisprudence for their internal government, but are without any written laws: custom with them constitutes the law. Some learn to speak the Birman tongue, and a few can read and write it imperfectly. They are timorous, honest, mild in their manners, and exceedingly hospitable to strangers.

The temple of Shoedagon, or Dagoung, about two miles and a half north of Rangoon, is a very grand building, although not so high by twenty-five or thirty feet, as that of Shoemadoo at Pegue. It is much more ornamented, and is ascended by above a hundred stone steps, that have been suffered to fall into decay. The situation renders Shoedagon a conspicuous object at the distance of many miles. The tee and the whole of the spire are richly gilded, which, when the sun shines, exhibit a singularly splendid appearance. The road leading from the city to the temple is formed with care; a wide causeway in the centre prevents the rain from lodging, and throws it off to the sides. Numberless little spires are ranged along the edge of the road, in which are niches to receive

receive small images of their divinity Gaudma. Several kioums or monasteries lay in this direction, generally removed a short distance from the public way, under the shade of pipal or tamarind trees.

The Birmans, like all the natives of the East, are fond of processions; scarcely a week passes that there is not a religious display in Rangoon; either a funeral of some person who leaves sufficient to defray the expence of a pompous public burning, or the ceremony of admitting youths into the convents of the Rhahaans. The age of induction is generally from eight to twelve years. On an appointed day the youth parades the streets, dressed in yellow, and mounted on a horse richly caparisoned, led by two servants: a band of music goes before, and a party of Rhahaans encircle him: his male friends follow in a troop, and the females of their families bring up the rear, the latter carrying on their heads the offerings meant for the Rhahaans. Thus they proceed to the convent of which the novice is to become a member, where he is presented in form to the senior of the brotherhood. This ceremony is repeated three times, and at each perambulation fresh presents are to be provided. From the many convents in the neighbourhood of Rangoon, the number of Rhahaans and Phonghis* are very considerable; they were estimated at upwards of fifteen hundred. Like the Carmelites, they go barefooted, and have their heads close shaven, on which they never wear any covering. Yellow is the only colour worn by the priesthood: they have a long loose cloak which they wrap round them so as to cover most part of the body: they profess celibacy, and to abstain from every sensual indulgence†.

The Rhahaans never dress their own victuals, holding it an abuse of time to perform any of the common functions of life, which, so long as they occupy, must divert them from an abstract contemplation of the divine essence. They receive the contributions of the laity ready cooked, and prefer cold food to hot: they never eat but once a day, and that at the hour of noon. The

* The inferior order of priests, vulgarly called Tallapoins.

† The prescribed punishment for a Rhahaan detected in an act of incontinence is, expulsion and public disgrace: the delinquent is seated on an ass, and his face daubed with

Rhahaans never take any active share, or publicly interfere in politics, or engage in war; by which prudent conduct they excite no resentment. The Birmans and Peguers profess the same religion, so that which ever are conquerors the ministers of religion are always respected.

In the city and suburbs of Rangoon there are five thousand taxable houses, and about thirty thousand inhabitants. This town having long been the asylum of insolvent debtors from the different settlements of India, it is crowded with foreigners of desperate fortunes, who find from the Birmans a friendly reception, and, for the most part, support themselves by carrying on a petty trade, which affords a decent subsistence to those who act prudently. Here are to be found fugitives from all countries of the East, and of all complexions: the exchange, or place of their meeting, exhibits a motley assemblage of merchants, such as few towns of much greater magnitude can produce: Malabars, Moguls, Persians, Parsees, Armenians, Portuguese, French, and English, all mingle here, and are engaged in various branches of commerce. The members of this discordant multitude are not only permitted to reside under the protection of government, but likewise enjoy the most liberal toleration in religious matters: they celebrate their several rites and festivals, totally disregarded by the Birmans, who have no inclination to make proselytes. In the same street may be heard the solemn voice of the Muezzin calling pious Islamites to early prayers, and the bell of the Portuguese chapel tinkling a summons to Romish Christians. Processions meet and pass each other without giving or receiving cause of offence.

On the west side of the river, opposite to Rangoon, is the town of Maindu, the residence of the governor of the province of Dalla. The town of Maindu is composed of one long street; at the east end is a creek, which goes all the way to Bassien, and has twelve feet depth of water at high tide; on the west side is a smaller creek, on the bank of which stands a village called Mima-Shun-Rua, or the village of prostitutes, being

black paint interspersed with spots of white: he is thus led through the streets, with a drum beating before him, and afterwards turned out of the city: but such instances of degradation are very rare.

inhabited

inhabited wholly by women of that description*. The situation of the town of Rangoon is exceedingly advantageous for trade, and the river is equally commodious for the construction of ships†. The spring tides rise twenty feet in perpendicular height: the banks are soft, and so flat

that there is little need of labour for the formation of docks. Vessels of any burden may be built. Indeed Nature has liberally done her part to render Rangoon the most flourishing sea-port of the eastern world.

SECTION VII.

Imperial Mandate arrives for the English to proceed to the Capital—Maywoon of Pegue ordered to accompany it—Huntsmen employed to catch Alligators and Rhinoceroses—The Maywoon leaves Rangoon, and the English Deputation prepare to follow—Description of the Boats—Depart from Rangoon—Pass several Towns and Villages—Arrive at Peeay-mew, or Prome—Description of Prome—Leave Loonghee—City of Pagahm—Temple of Shoegeegoon—Destructive Conflagration—Embark on board the royal Barge—Leave Pagahm—Description of ancient Ava—Appearance of Ummerapoora, the Capital—Residence of the British Deputation; and Reception on landing.

THE month of May was now far advanced, and, says the Colonel, we became a little impatient at remaining so long in a state of uncertainty, especially as the officers of government did not all relax in the formality and coldness of their deportment, nor were we yet assured what might be the nature of our reception at court. From this unpleasant state of suspense we were at length agreeably relieved by the arrival of a letter from the Maywoon of Pegue to the council of Rangoon, acquainting them that he had received the imperial mandate to make preparations for our conveyance by water to the capital; and that it was his Majesty's farther pleasure that he should accompany the deputation in person. Baba-Sheen lost no time in imparting to me the intelligence, which was soon after communicated by an official message from the Raywoon, inviting me to the Rhoom, or public hall,

to hear the order formally announced in council. This was a ceremony I begged leave to decline; but I sent my moonshee, or Persian secretary, to attend the meeting. A visit of the deputation to Ummerapoora being now decided on by the highest authority, the Colonel applied to the Raywoon for leave to purchase suitable boats for the use of himself and retinue; but an officer from the Raywoon informed him, that it was inconsistent with the usage of their government to admit of a public minister being at any expence for his conveyance; and that the superintendent of the port had received instructions to prepare as many boats as the Colonel thought necessary. Conformably to the imperial mandate the Maywoon left Pegue, and arrived at Rangoon on the 25th of May, attended by a numerous retinue.

About this time an order came from court to the provincial government of Pegue, which fur-

* Prostitution in this, as in all other countries, is the ultimate resort of female wretchedness; but here it is often attended with circumstances of peculiar and unmerited misery. Many who follow this course of life are not at their own disposal, nor receive the earnings of their unhappy profession; they are slaves sold by creditors to a licensed pander, for debts more frequently contracted by others than by themselves. Accordig to the laws of Pegue, he who incurs a debt which he cannot pay, becomes the property of his creditor, who may claim the insolvent debtor as his slave, and oblige him to perform menial service until he liquidates the debt; nor does the unhappy man, always suffer in his own person alone; his immediate relatives are often included in the bond, and, when that is the case, are liable to be at-

tached and sold to discharge the obligation. The wretchedness into which this inhuman law plunges whole families is not to be described. Innocent women are often dragged from domestic comfort and happiness; and from the folly or misfortune of the master of the house, in which they perhaps have no blame, are sold to the licensed superintendent of the Tackally, who, if they possess attractions, pays a high price for them, and reimburses himself by the wages of their prostitution.

† The Birmans use teak, the most durable wood that is known, and best adapted to the purposes of ship-building. This wood is produced in the forests of the Birman and Pegue empires in inexhaustible abundance.

nished a subject of much conversation. The emperor of China, having never seen a rhinoceros or an alligator, entertained an ardent desire to view those formidable animals before his death, and had intimated his wish through a provincial legate from Yunan, who had lately arrived at Ummerapooa for the purpose of settling some mercantile arrangements. The king of Ava, solicitous to gratify his august brother of China, had sent an order to catch twenty alligators and as many of the rhinoceros tribe, and convey them to the metropolis, whence they were to be transported to the imperial city of Pee-Kien (Pekin). Strong nets were thrown across the Pegue river; the fishermen began successfully; several alligators were taken in two or three days, and put into boats, in the bottom of which wells were constructed. The Rhinoceros hunters were not equally fortunate.

The Maywoon left Rangoon on the 28th of May, and as the boats for the English deputation were not quite ready, the Colonel prepared to follow him with the utmost expedition. My barge, says Colonel Symes, was sixty feet in length, and not more than twelve in the widest part: by taking away one thwart beam near the stern, laying a floor two feet below the gunwhale, and raising an arched roof about seven feet above the floor, a commodious room was formed, fourteen feet long, and ten wide, with a closet behind it: at the stern there was a stage, on which the Seedegee, or steersman, stood, and a vacant space of seven or eight feet, where a kettle might be boiled, or dinner prepared. On each side of the cabin a small door opened on the platform, and there were three windows which, when raised, admitted a free circulation of air. The roof was made of Bamboos covered with mats, and over all was extended a painted canvas, that effectually secured us from the heaviest rain. The inside was neatly lined with matting. The conveyances of the other gentlemen were nearly of the same size and construction. Twenty-six boatmen composed the crew of my vessel, exclusive of the Leedegee, who is the chief or captain.

Two days after the deputation left Rangoon, a short way from which town the river becomes narrower, with a winding course, owing to which they did not advance above three leagues in a direct line from ten o'clock in the morning

till three in the afternoon. Proceeding on the voyage they passed a town called Panlang, which had formerly been a considerable city, and likewise three small villages. At the latter place they passed a comfortable night, that part being infested by mosquitoes of an unusual size, and extremely venomous. A little beyond Panlang, which town they left on the first of June at day-break, the river contracts greatly, and does not appear to be more than two hundred yards across. In three hours they reached Kettoree-Rua, or Paroquet village; and in two hours more Yang-ain-Chain-Yah, where they entered the great river, and passed the night. The course of the stream was nearly north and south, and about a mile wide. The next morning they joined the Maywoon, who, with his suite, and a vast concourse of boats, was waiting for the arrival of the deputation.

On the 3rd of June the whole fleet got under way; and at nine o'clock passed Denoobew, an extensive town, ornamented with a lofty temple, resembling Shoedagon in form, but of a smaller size. At sun-set they stopped near the town of Yeoungbenzah, which town they left at day-break the next morning. From the 3rd to the 10th of June, they passed several towns and villages, when the Maywoon expressed a desire to remain three or four days at Meayday, a town and district two days journey north of Prome, which he holds in Jaghire by a grant from the king. This intention was far from being disagreeable to any of the party, as the boatmen were fatigued, and the servants and the guard required a short time to adjust their conveniences for the remainder of the voyage. The deputation had now reached the city of Peeaye-mew, or Prome.

The city of Prome is renowned in Birman history for having been the scene of many long sieges and bloody conflicts. The buildings are not remarkable; but, though I saw little to notice, says Colonel Symes, I found that I was myself an object of universal wonder: an English officer dressed in uniform was a phenomenon perhaps never before seen in this part of the world. My attendants also created no little surprise; the dogs, numbers of which infested the streets, set up a horrid barking; the men gaped, the children followed me, and the women, as usual, expressed their astonishment by loud laughter and clapping their hands; yet not the least

least indication of contempt was manifested, nor was any thing done that could be construed into an intention to offend. At the upper end of the present city are to be seen the ruins of the ancient fort of Prome: it had been a small pentagon, built of brick, and from its situation must have been very strong. The modern fort is nothing more than a palisaded inclosure with earth thrown up behind it. Adjacent to the town is a royal menagerie of elephants, consisting of two rows of lofty well-built stables, in which these animals are lodged during the rains. The city of Prome and the province in which it stands are the jaghire, or estate of the second son of the king: they likewise give him his title. Prome is sometimes called Terreketteree, or single skin; and the Birman have an old legendary tale respecting the origin of this name*.

At length a messenger was sent by an order from the Lotoo, or Grand Council, to meet the English deputation, and to acquaint the Colonel that his Majesty had been pleased to direct that three officers of distinguished rank should proceed to Pagahm-mew, a city seven days journey below Ummerapoora, to wait his arrival, and escort him to the capital. The king, he observed, had done the deputation the extraordinary honour to send a royal barge for the Colonel's personal accommodation, with two war-boats to tow it. This was considered as a flattering mark of his Majesty's good inclination, and a favourable omen was drawn from it. To have our barge drawn by war-boats was an honorary privilege granted only to persons of the first consequence: it is grounded on the idea, that it is inconsistent with the dignity of a man of high rank to be in the same boat with people of such mean condition as common watermen; it is a singular instance of the characteristic pride. The Shawbunder displayed great shrewdness in his conversation. He asked me several questions respecting the powers with which I was invested; and as the visit might in some degree be considered as official, in part gratified his curiosity, by explaining in general terms the nature of the mission and the capacity in which I expected to be received,

without at all disclosing the specific objects I had in view.

The Shawbunder left Loonghee on the first of July, to announce our approach to the Birman officers, who were already arrived at Pagahm: we postponed our departure until the following day, and at seven in the morning quitted this pleasing and rural place. In our journey we passed many towns and villages; sometimes we went swiftly through the water, at others we were stationary, and even lost ground, as the wind frequently subsided, and the stream was very rapid.

At length after a voyage of seven days, in which they passed several towns and villages, they approached the once magnificent city of Pagahm. They could see little more from the river than a few straggling houses, which bore the appearance of having once been a connected street: in fact, scarcely any thing remains of ancient Pagahm, except its numerous mouldering temples, and the vestiges of an old brick fort, the ramparts of which are still to be traced. The town of Neoundah, about four miles to the north, which may be called a continuation of Pagahm, has flourished in proportion as the latter has decayed.

We reached Neoundah early on the 9th of July. At this place the deputation from the capital, of which I had been apprized the Shawbunder, was waiting my arrival. The Serce informed me, that a temporary house which I saw on a clear piece of ground about a hundred yards from the brink, had been erected as a compliment to me; it was much larger than that which the Maywoon had prepared at Meeaday. Early in the afternoon I left my boat, and was received at the house by the Birman officers with every formal testimony of respect; on a part of the floor elevated a few inches, a carpet was spread, on which I took my seat. The principal person of the deputation was a Woondock, a junior counsellor of state; the others were the governor of a district called Miengdong north of Ava, the governor of Pein-Keing bordering on China, and the commandant of the Siamese guards. On

* It is related, that a favourite female slave of Tutebong-mangee, or the mighty sovereign with three eyes, importuned her lord for a gift of some ground; and being asked of what extent, replied in similar terms with the crafty and amorous

Elisa, when she projected the site of ancient Carthage. Her request was granted, and she used the same artifice. The resemblance of the stories is curious.

entering the town of Pagahm is a long, narrow, winding street; about thirty feet wide; the houses were built of Bamboo, and raised from the ground: this street was full of shops, containing no other articles than lackered ware: boxes, trays, cups, &c. varnished in a very neat manner were displayed in the front of the shops; they were of various colours; some had figures painted on them, others wreaths of flowers. Having reached the extremity of the town in this direction, we came upon a well paved road, that led to the great temple named Shoegeegoon, to which we proceeded. On each side of the road there was a range of small temples, neglected and in ruins: the kioums, or monasteries, were in good repair, and we saw some handsome houses for the accommodation of strangers. Shoegeegoon is neither so large nor so well built as the temples at Rangoon or Pegue, the height does not exceed a hundred and fifty feet: it is surrounded by a spacious area paved with broad flags, on which there are a number of smaller buildings, profusely gilded, and laboriously carved. A staircase on the outside leads up to a gallery, about a third of the height of the principal temple, whence we had an extensive prospect of the country, which appeared to be exceedingly unproductive and barren: the ruins of innumerable religious buildings were to be seen in every direction, which cover a space of ground not less than six or seven miles along the river, and three miles inland. Pagahm is said to have been the residence of forty-five successive monarchs, and was abandoned five hundred years ago in consequence of a divine admonition: whatever may be its true history, it certainly was once a place of no ordinary splendour. Returning by a different way, we walked through an alley occupied by blacksmiths' shops, furnished with bill hooks, spike-nails, adzes, &c. A little farther on we saw the ruins of a street that had been consumed by fire only two days before: from seventy to eighty houses were destroyed by the conflagration. It was the Tackally, and the sufferers were the already wretched, the miserable public prostitutes.

Here are a great number of religious edifices, which differ in structure from those we had seen in the lower provinces: instead of a slender spire rising to a great height from an expanded base, the temples of Pagahm, in general, carry up a heavy breadth to very near the top, and

then come abruptly to a point, which gives a clumsy appearance to the buildings. Many of the most ancient temples at this place are not solid at the bottom; a well arched dome supports a ponderous superstructure; within, an image of Gaudmasits enshrined, four gothic doorways open into the dome: in one of these is a human figure standing erect, which the Serce told me was Gaudma; and another of the same personage, lying on his right side asleep, both of gigantic stature. The divinity, however, is rarely to be found in these attitudes, the posture in which he is generally depicted, is sitting cross-legged on a pedestal, adorned with representations of the leaf of the sacred lotus carved upon the base; the left hand of the image rests upon his lap, and the right is pendant. Passing through the suburbs, we came to a part where the inhabitants were employed in pressing oil from the sesamum seed: the grain is put into a deep wooden trough, in which it is pressed by an upright timber fixed in a frame, the force is increased by a long lever, on the extremity of which a man sits and guides a bullock that moves in a circle thus turning and pressing the seed at the same time: the machine was simple, and answered the purpose effectually. There were not less than two hundred of these mills within a narrow compass. From the circumstance of the cattle being in good order, we concluded that they were fed on the seed after the oil was extracted. The land about Pagahm scarcely yields sufficient vegetation to nourish goats.

At nine o'clock in the morning of the 11th of July the Colonel took possession of the royal barge with ceremonious formality, accompanied by the Woondock and Baba Sheen. The platform on the outside contained space for thirty two rowers, sixteen on each side; but on this occasion the oars were not fastened, as it was meant to be drawn by war-boats: the inside was divided into three small apartments handsomely fitted up, the roof and sides were lined with white cotton, and the floor covered with carpets and fine mats.

Aungwa, or Ava, once the metropolis of the Birman empire, is divided into an upper and lower city, both of which are fortified: the lower which is the most extensive, I judged to be about four miles in circumference; it is protected by a wall thirty feet high, at the foot of which there is a deep and broad fosse. The communication

between

between the fort and the country is over a mound of earth crossing the ditch, that supports a causeway; an embankment of earth in the inside sustains the wall; the upper or smaller fort, which may be called the citadel, and does not exceed a mile in circuit, was much stronger, and more compact than the lower: but neither the upper nor the lower had a ditch on the side of the river. The walls are now mouldering into decay; ivy clings to the sides and bushes, suffered to grow at the bottom, undermine the foundation, and have already caused large chasms in the different faces of the fort. The materials of the houses, consisting chiefly of wood, had, on the first order for removing, been transported to the new city of Ummerapoora: but the ground, unless where it is covered with bushes, or rank grass, still retains traces of former buildings and streets. The lines of the royal palace, of the Lotos, or grand council hall, the apartments of the women, and the spot where Piasath, or imperial spire, had stood, were pointed out to us by our guide. Clumps of bamboo, a few plantain trees, and tall thorns, occupying the greater part of the area of this lately flourishing capital.

Numerous temples, or which the Birmans ever lay sacrilegious hands, were dilapidating in time. It is impossible to draw a more striking picture of desolation and ruin.

Among the religious buildings within the fort, the named Shoegunga Praw, noways distinguished for size or splendour, was in former times held peculiarly sacred, and is still revered above the rest. At the present day, when an officer of rank is about to enter on a great public trust or a new commander is appointed to the army, the oath of allegiance is administered in this temple with great solemnity, a breach of which is considered the most heinous crime that a Birman can be guilty of, and is invariably punished by the severest tortures. How Shoegunga obtained this distinction I was not able to learn. We were informed, that a temple of much magnitude, named Gatherpoo Praw, stood a short distance to the westward of the fort, in which was a colossal image of Gaudma, formed out of a solid block of marble. This temple and image we had a better opportunity of viewing on our return.

Leaving Ava in the rear, the river bends again to the northward, when the opposite city of Pegu again, and the apires, the turrets, and the

lofty Piasath of Ummerapoora, create an unexpected pleasure, and exhibit a fine contrast to the gloomy and deserted walls of Ava. Chagain, on the north side, once too the seat of imperial residence, is situated partly at the foot, and partly on the side, of a rugged hill that is broken into separate eminences, on the summit of each stands a spiral temple; these temples, rising irregularly one above another to the top of the mountain, form a beautiful assemblage of objects, the effect of which is increased by their being carefully whitewashed and kept in repair. As we sailed near the opposite shore, the sun shone full upon the hill, and its reflected rays displayed the scenery to the highest advantage: in addition to this, the swollen state of the river gave to the waters the semblance of a vast lake, interspersed with islands, which seemed to be immersed.

They soon came to the mouth of the channel that communicates with the lake of Tounzemahn, through which it receives its waters from the river. The situation of Ummerapoora has already been described; the southern fort is washed; during the rainy season, by the waves of the lake, and the houses of the city and suburbs extend along the bank as far as the extreme point of land. Across the lake, and opposite to the fort, stands the small village of Tounzemahn, near which, in a tall grove of mango, palmyra, and cocoa-nut trees, a dwelling was prepared for the British deputation. On entering the lake, the number of boats that were moored, as in a harbour, to avoid the influence of the sweeping flood, the singularity of their construction, the height of the waters, which threaten inundation to the whole city, and the amphitheatre of lofty hills that nearly surrounded the place, altogether presented a novel scene, exceedingly interesting to a stranger. We rowed towards the grove, whilst the greater part of the fleet went to the opposite side: on reaching the bank I perceived a war-boat belonging to the Maywoon of Pegue, who, I understood, was at the grove waiting our arrival. I was received on landing by Baba Sheen, and some inferior officers; they accompanied me to the house, which was situated about three hundred yards from the brink of the lake, overshadowed by lofty trees, that completely defended it from the meridian sun. When we came to the entrance of the virando, or balcony, the Maywoon of Pegue, the Governor of Bamoo, a province

province bordering on China, and the Woondock before-mentioned, welcomed me to the capital. Being seated on carpets spread along the floor, the conversation turned on general topics, and particularly on European geography, a subject on which the Governor of Bamoo appeared very desirous of information. After some time, the Woondock, addressing himself to me, said; that his Birman majesty had been absent a few months, at a country residence named Meengoung, where he was erecting a magnificent temple to their divinity, Gaudima, but was expected to return soon to Ummerapoora; that, in the mean time, instructions had been given to his ministers to provide every thing requisite for the accommodation of the English gentlemen, and that Baba Sheen was commanded to reside near us, in order to supply our wants, and to communicate our wishes; to this the Maywoon of Pegue added, that the two inferior Sercees, or provincial under secretaries, who had accompanied us from Rangoon, were likewise directed to attend our orders, and, being persons to whom we were accustomed, would probably be more agreeable to us than entire strangers.

These polite and hospitable attentions were received and acknowledged with real satisfaction; nor was it at all diminished by the freedom with which the Woondock informed me, that it was contrary to the etiquette of the Birman court, for a public minister from a foreign nation to go abroad before his first audience. He therefore hoped I would not cross the lake in person, or suffer any of my people to do so, until the ceremonies were past; but as our customs differed from theirs, and the Europeans habituated themselves to take exercise, I was at full liberty to walk or ride into the country or over the plains that lay between our dwelling and the hills, as far as I thought proper; recommending to me, at the same time, not to go to any great distance, as it would be considered by the common people in the light of a derogation from my own consequence. I thanked him for his counsel, which was delivered with many expressions of civility, and readily acquiesced in what he assured me was an established custom.

The usage of debarring a public minister from entering the capital previous to his first formal presentation, I understood, was neither recent nor uncommon; it has long been the known prac-

tice of the Birman and Siamese governments; Monsieur Loubere makes mention of it in his account of an embassy to Siam, sent from the court of Louis the Fourteenth. It is founded on that cautious policy which governs all nations eastward of India in their intercourse with foreign states.

The place of residence appointed for the embassy was a spacious house of one story, raised from the ground somewhat more than two feet, and better covered than Birman houses usually are: it consisted of two good sized rooms, and a large virando, or balcony; the partition and walls were made of cane mats, with latticed windows in the sides; the shape of the roof was such as distinguished the houses of nobles: it was altogether a comfortable habitation, and well adapted to the climate. Mr. Wood had a smaller house, erected behind mine and parallel to it; and Dr. Buchanan another at right angles. Small separate huts were constructed for the guard, and for our attendants: the whole was surrounded by a strong bamboo paling, which inclosed a court-yard. There were two entrances by gates, one in front of the principal house, the other backwards: at each of these, on the outside of the paling, was a shelter, in which a Birman guard was posted, to protect the deputation from thieves, keep off the populace, and probably to watch and report the movements.

The building denominated Rhoom is the official hall of justice, where the members of provincial governments, and all municipal officers are accustomed to assemble for the transaction of public business. Every man of high rank in the Birman empire is a magistrate, and has a place of this description and name contiguous to his dwelling; but always on the outside of the enclosure of his court-yard, and not surrounded by any fence or railing, in order to manifest publicly and shew that it is the seat of majesty and justice to which all mankind may have free access. An imperial mandate to a governor, or an order from a governor to a petty miougee, or a chief of a small town or district, is invariably opened and read aloud in this sanctified hall. The Birman government, in the administration of public affairs, suffers no such thing as privacy or concealment. The Rhoom is likewise an appendage of dignity, as it denotes him to whose habitation it is annexed to be a person of rank and consequence.

quence: a building of this sort was erected within a few yards of the front gate of the inclosure to the building belonging to the embassy.

For two days after our landing, the boatmen and servants were employed in transporting our baggage from the boats to the house, and our time was chiefly taken up in arranging the domestic economy of our new residence, in which we found a liberal provision of all such necessaries as the natives themselves require; my rooms were carpeted, but the chairs, table, &c. were my own. Rice, gee (clarified butter), fire-wood, and pots for dressing victuals, were supplied to our people in abundance*.

The delinquent refugees, of whom mention has been made as having been surrendered, by order of the Governor-General, to the justice of their country, had reached Ummeropoor some weeks previous to the arrival of the deputation. The Birman guard that escorted them had brought a letter directed to Colonel Symes from General Erskine, the English commander at Chittigong; this letter the Birman minister, as it was alledged, through mistake, but more probably by design, caused to be opened, and procured a translation from an Armenian interpreter. The circumstance was reported to the king, who ordered that the letter should be safely deposited in the Lotoo, and given to him on his arrival: the royal injunctions were punctually obeyed: an officer, in his dress of ceremony, brought it over. A proposal was first made, that the Colonel should go himself to the room, solicit its restoration, receive it as an act of grace, and do homage to the king, by bowing with his face towards the palace.

* A few stalls, or petty shops, were established in the grove, to afford the smaller ingredients of cookery, such as greens, spices, salt, tamarinds, &c. Here also tobacco and beetle leaf were sold; and to enable the attendants to purchase such articles, one hundred tael, about twelve pounds sterling, were distributed amongst them: this was an act of munificence which the Colonel, with great difficulty avoided the obligation of, in his own person; but no remonstrance could prevail on the Birman officer to dispense with it in the instance of the domestic.

† Caution and policy, says the Colonel, had, perhaps, as great a share with the Burmans as superstition, in thus regarding the ceremony of our introduction: it was to them a novel incident; they were desirous to penetrate thoroughly into the objects we had in view, before any part of the subjects came into formal discussion. They might probably also wish to have an opportunity to judge of our national character, and to determine, from our conduct, in what

From this he entirely dissented, as the cause of complaint was with him, and confidence had in some measure been violated by their breaking the seal. The proposition perhaps did not originate from any authority, as it was immediately given up, and the letter in a silk wrapper, was formally presented to him on a tray, by the officer who conveyed it across the lake. In a few days the return of the king was announced by the discharge of rockets, and by the general bustle that so important an event caused among all classes of people.

The period of the arrival of the embassy occurred at a juncture that supplied the Birman court with a plausible excuse for postponing the consideration of public business, and delaying the formal reception of the deputation as well as the delivery of the letter from the Governor-General to the King. It happened, that in the ensuing month there was to be an eclipse of the moon, an operation of nature which they ascribe to the interference of a malignant demon. On such an occasion, affairs of state, and all important matters of business, that will admit of procrastination, are put off to the following month. The astrologers were assembled to consult on the first fortunate day after the lapse of that inauspicious moon, when they discovered that the seventeenth of the moon Touselien, corresponding with the 30th of August, was the earliest that would occur, and that day was accordingly appointed for the public reception of the English embassy†.

Amongst other regulations of this punctilious court the Colonel was given to understand, that

manner to regulate their own; if such were the motives, they were consistent with that sagacity which I found invariably displayed by the Birman government in all its resolutions and acts of a public nature. But the prevailing characteristic of the Birman court is pride; like the sovereign of China, his Majesty of Ava acknowledges no equal; indeed, it is the fixed principle of all nations eastward of Bengal, to consider foreign ministers as suppliants come to solicit protection, not as representatives who may demand redress; rather as vassals to render homage, than as persons vested with authority to treat on equal terms. Of this system I was early apprized, and felt no disappointment at hearing of a general rumour current among the higher ranks of Burmans, that a deputy had arrived from the English government, bearing tribute for their king. Reports of this nature were no otherwise regarded, than as an admonition to regulate my actions with scrupulous circumspection.

it was not customary for the King to receive any letter in a formal manner without being previously apprized of its contents. This created some difficulty in respect to the letter from the Governor General, which was at length surmounted by an agreement on my part to admit of a copy being made in my presence; but it was stipulated by them, that it should be transcribed in the rhoom adjacent to my house, and not in my private residence. In this proposal I acquiesced; and accordingly a formal deputation consisting of seven or eight officers of state, was directed to proceed to the rhoom, where they were to open the letter, and see it properly transcribed; these personages came with much parade, apparelled in their robes of ceremony; on landing, they walked directly to the rhoom, and, having taken their seats, sent a Terrezoyee, or inferior officer, along with Baba Sheen, to request the Colonel would come, and bring him the Governor General's letter. I obeyed this summons, accompanied by the other gentlemen and his usual attendants. On entering the rhoom he was civilly desired, as the occasion was a solemn one, to make obeisance towards the piaseth, or spire of the royal palace, which was more than two miles distant, a ceremony that he complied with, by raising his right hand to my head and making a slight inclination of his body, after the manner of the Mohammedan Salaam. Being seated he delivered the letter, which was written in English and in Persian, to the Woondock, or superior officer; it was immediately opened by a secretary: and an Armenian interpreter, named Muckatees, who spoke and wrote English fluently, was ordered to make a copy in English, whilst a Mussulman moonshee made another in Persian. When the writing was finished, the Colonel delivered a paper, which he desired might be laid before his Majesty's council, declaratory, in general terms, of the friendly wishes and views of the Governor-General in deputing him to the Birman court, and expressing his desire to maintain a confidential intercourse

* It is customary among nations eastward of Bengal, when a public deputation is sent to a foreign court, to nominate three members, who constitute a council; although the president or chief of these is invested with all the power, and controls the proceedings of the rest, yet the distinction between them is not so wide as to preclude the juniors from

with such persons as his Majesty, or his council, should think proper to authorize.

The business being concluded, the Colonel returned to his house, and received a ceremony visit from the Birman officers, among whom there were some personages of high distinction, a Woondock, but not the one that met him at Pagahm, presided; the master of the elephants, the old governor of Peen-keing, two Seredogees, or secretaries of state, and some other officers, whose names and stations he did not learn, were present; their robes, which were very graceful, were made either of velvet or flowered satin, with wide bodies, and loose sleeves: they were all invested with the chain of nobility, and wore caps covered with light green taffety. Three of higher rank than the rest, had a wreath of gold leaves encircling the bottom of the caps, not unlike the strawberry leaves in a ducal coronet; their attendants, who were numerous, carried a variety of utensils, such as their beetle box, water flaggon, drinking cup, and spitting pot; of which latter, from their filthy practice of chewing beetle, they stood in constant need. The Colonel regaled them with tea, and English raspberry jam spread on biscuits: they ate sparingly, and refreshed themselves with copious bowls of tea, unadulterated either by cream or sugar.

About this time the Chinese minister, who was then labouring under severe indisposition, sent a polite message to the Colonel, expressing his regret that he had it not in his power to visit him in person; but that his two colleagues would wait on him whenever he should be at leisure to receive them. The Colonel returned his acknowledgments, and appointed the following day*.

The two junior members of the Chinese deputation came at the appointed hour, accompanied by seven or eight attendants. There is no personage on earth so solemn and ceremonious as a Chinese officer of state; his dignity is preserved by profound silence, unless when occasion renders it necessary to exercise the faculty of speech,

a high degree of consequence being attached to their stations, and in case of the demise of the principal, the senior member executes all diplomatic functions, thus wisely guarding against any impediment which a casualty might throw in the way of negotiation.

which

which is always slow, monotonous, and dull; men gentlemen, in the familiarity of private life, seldom depart from their gravity, or relax into a smile. On entering a room where there is company, good breeding is evinced by a modest but pertinacious refusal to sit down till the master of the house is first seated, which would be an equal violation of decorum on his part*. They were very fond of cherry brandy; they tasted our tea, and, before they departed, politely presented me with some fans, two or three pieces of silk, two small boxes of tea, and three bottles of shouchou, a very fiery spirit distilled from rice, of which the Chinese are extremely fond. I returned the visit on the following day, and was received with much pomp and ostentation as circumstances would admit: in the front of the house a silk ensign waved, on which was embroidered the imperial dragon of China, and at their gate were suspended whips and chains, importing the power which the owner possessed to inflict corporal punishment. The two junior members met me at the threshold of their habitation, apologized for the unavoidable absence of the chief personage, and introduced me into a hall, the walls of which were concealed by screens of

silk, and the chairs covered with loose pieces of satten; this interview was rendered more interesting than the former, by a spontaneous question on the part of the senior Chinese, to know whether I had heard of the safe arrival of Lord Macartney in England. His lordship having left China only the preceding year, it was not possible to have had accounts of his reaching England, and the issue of his lordship's negotiations was at that time wholly unknown. They treated us with tea and sweetmeats, and smoked their long pipes with unrelaxed solemnity. I repaid their civilities by giving them some broad-cloth and brandy, and took my leave.

The interval that elapsed between the time of our arrival at Ummerapooora, and of our formal introduction at court, afforded us leisure to acquire some insight into the customs, religious tenets, and moral economy of the Birman nation. We shall therefore proceed to give a more general account of the country, and endeavour to illustrate the character of this people from their manners, and the state of society; from the progress which the arts had made; and from the usages of the inhabitants in common life.

SECTION VIII.

Religion of the Birmans—Their Laws—Jurisdiction of the Metropolis—Lawyers—The Royal Establishment—Council of State—Honours not Hereditary—Insignia of Rank—Dress—Resemblance to the Chinese—Marriages—Funerals—Population—Revenues.

THE Birmans are Hindoos; not votaries of Brahma, but sectaries of Boodh, which latter is admitted by Hindoos of all descriptions to be the ninth Avatar †, or descent of the deity in his capacity of preserver. He reformed the

* This custom sometimes produces a very ludicrous scene, and the guests are not unfrequently obliged to be dragged from their chairs, and placed in them almost by compulsion. On entering the door, they both made an abrupt stop, and resisted all solicitation to advance to chairs, that had been prepared for them until the Colonel should first be seated: in this dilemma he immediately seized on the foremost chair, till Dr. Buchanan grappled with the second: thus we saw fixed them in their seats, both parties, during the struggle, repeating Chin Chin, Chin Chin, the Chinese term of salutation. The conversation was not at all lively or interesting; for though, says the Colonel, I sat between

doctrines contained in the Vedas, and severely censured the sacrifice of cattle, or depriving any being of life; he is called the author of happiness: his place of residence was discovered at Gaya in Bengal, by the illustrious Amara ‡, renowned

them, our words had to make a wide circuit before they reached each other's comprehension. I spoke in the language of Hindostan to a Mussulman who understood Birman; he delivered it to a Birman who spoke Chinese, the Birman gave it to the first official domestic, who repeated it to his master in the Chinese tongue.

† Sir William Jones on the Gods of Greece, Italy, and India.

‡ See the translation of a Shanscrit inscription on a stone found in the temple of Boodh, at Gaya, by Mr. Wilkins. Asiatic Research. vol. I.

amongst men, "who caused an image of the supreme Boodh to be made, and he worshipped it; reverence be unto thee in the form of Boodh; reverence be unto thee, Lord of the earth; reverence be unto thee, an incarnation of the deity; and, eternal one, reverence be unto thee, O God, in the form of Mercy."

Gotma, or Goutum, according to the Hindoos of India, or Gaudma, among the inhabitants of the more eastern parts, is said* to have been a philosopher, and is by the Birmans believed to have flourished above two thousand three hundred† years ago: he taught, in the Indian schools, the heterodox religion and philosophy of Boodh. The image that represents Boodh is called Gaudma, or Goutum, which is now a commonly received appellation of Boodh himself: this image is the primary object of worship in all countries situated between Bengal and China. The sectaries of Boodh contend with those of Brahma for the honour of antiquity, and are certainly far more numerous. The Cingaleze in Ceylon are Boodhists of the purest source, and the Birmans acknowledge to have originally received their religion from that island. It was brought, say the Rhahaans, first from Zehoo (Ceylon) to Arracan, and thence was introduced into Ava, and probably into China; for the Birmans assert with confidence that the Chinese are Boodhists.

Whatever may be the antiquity of the worship of Boodh; its reception is very widely extended. The most authentic writer‡ on the eastern peninsula calls the image of Gaudma, as worshipped by the Siamese, Somona-codom§.

The Birmans believe in the Metempsychosis, and that after having undergone a certain number of transmigrations, their souls will at last

* Sir William Jones on the Gods of Greece, Italy, and India.

† This agrees with the account of the Siamese computation given by Kämpfer.

‡ Loubere.

§ Being unacquainted with the language of Siam, which, from so short a residence as four months, it was impossible he could have acquired, he confounds two distinct words Somona, and Codom, signifying Codom, or Gaudma, in his incarnate state; the difference between the letters C and G may easily have arisen from the mode of pronunciation in different countries; even in the Birman manner of uttering the word, the distinction between these letters is not very clear. The Boodh of the Indians and the Birmans, is pronounced by the Siamese Pooth, or Pood; by the vulgar,

either be received into their Olympus on the mountain Meru, or be sent to suffer torment in a place of divine punishments. Mercy then hold to be the first attribute of the divinity. "Reverence be to thee, O God, in the form of Mercy!" and they worship God by extending mercy unto all his creatures.

The laws of the Birmans, like their religion are Hindoo; in fact, there is no separating the laws from their religion: divine authority revealed to Menu the sacred principles in a hundred thousand slokas, or verses; Menu promulgated the code; numerous commentaries on Menu were composed by the Munis, or philosophers, whose treatises constitute the Dherma Sastra, or body of law. The Birmans generally call their code Derma Sath, or Sastra. The laws, as well as the religion of the Birmans found their way into the Ava country from Arracan, and came originally from Ceylon. The Birman system of jurisprudence is replete with sound morality, and is distinguished above all other Hindoo commentary for perspicuity and good sense; it provides specifically for almost every species of crime that can be committed, and adds a copious chapter of precedents and decisions to guide the inexperienced in cases where there is doubt and difficulty. Trial by ordeal and imprecation are the only absurd passages in the book; but on the subject of women it is, to an European, offensively indecent: like the immortal Menu, it tells the prince and the magistrate their duty, in language austere, manly and energetic; and the exhortation at the close is at once noble and pious**.

Laws, thus dictated by religion, are in general conscientious.

Poo; which, without any violence to probability, may be converted by the Chinese into Foe. M. Gentil assumes that the Chinese admit, by their own accounts, that Foe their object of worship, was originally brought from India. || Meru properly denotes the pole, and, according to the learned Captain Wilford, it is the celestial north pole of the Hindoos, round which they place the garden of Eden, and describe it as the seat of delights.

** We select the following passages as a specimen:

"A country may be said to resemble milk, in which expression is like to water; when water is mingled with all its sweetness immediately vanishes: in the same manner expression destroys a fair and flourishing country. Therefore Surkaab will only inhabit the clearest stream; so a prince can never prosper in a distracted empire. By drink-

conscientiously administered. The criminal juris-
prudence of the Birman is lenient in particular
cases, but rigorous in others; whoever is found
guilty of an undue assumption of power, or of
any crime that indicates a treasonable intent, is
punished by the severest tortures. The first
commission of theft does not incur the penalty of
death, unless the amount stolen be above eight
hundred kiat, or tackal, about a hundred pounds;
or attended with circumstances of atrocity, such
as murder or mutilation. In the former case,
the culprit has a round mark imprinted on each
cheek by gunpowder and punctuation, and on
his breast the word thief, with the article stolen;
for the second offence he is deprived of an arm;
but the third inevitably produces capital punish-
ment: decapitation is the mode by which crimi-
nals suffer, in the performance of which the Bir-
man executioners are exceedingly skillful.

The city of Ummerapoora is divided into four
distinct subordinate jurisdictions, in each of
which a Maywoon presides. This officer, who,
in the provinces, is a viceroy, in the metropolis
resembles a mayor, and holds a civil and criminal
court of justice; in capital cases he transmits the
evidence in writing, with his opinion, to the

where milk the body is strengthened and the palate is grati-
fied; but when mingled with water, pleasure no longer is
found, and the springs of life gradually decline.

"A wise prince resembles a sharp sword, which at a
single stroke cuts through a pillar with such keenness that
the fabric still remains unshaken: with equal keenness his
government will penetrate advice.

"A wise prince is dear to his people, as the physician
is to the sick man; as light to those that are in darkness;
an unexpected sight to the eyes of the blind; as is the full
moon on a wintry night; and milk to the infant from the
breast of its mother."

The commentator then proceeds to denounce tremendous
judgments against an oppressive prince and corrupt judge;
the latter is thus curiously menaced:

"The punishment of his crimes, who judges iniquitously,
and decides falsely, shall be greater than though he had slain
one thousand women, one hundred priests, or one thousand
kings."

The book concludes as follows:

"Thus have the learned spoken, and thus have the wise
decided, that litigation may cease among men, and conten-
tious be banished the land: and let all magistrates and judges
rejoice the laws as they are herein written; and to the
best of their understanding, and according to the dictates
of their conscience, pronounce judgment agreeably to the
tenor of this book: let the welfare of their country, and
the benefit of their fellow creatures, be their continual
study, and the sole object of their attentions. Let them ever
remember of the supreme dignity of the Roolah, and the

Lotoo, or grand chamber of consultation, where
the council of state assembles; the council after
close examination into the documents, reports
upon them to the King, who either pardons the
offender, or orders execution of the sentence: the
Maywoon is obliged to attend in person, and see
the punishment carried into effect.

Civil suits may be transferred from the courts
of the Maywoons to the Lotoo; this removal,
however, is attended with a heavy expence.
There are regular established lawyers, who con-
duct causes, and plead; eight only are licensed
to plead in the Lotoo: they are called Ameen-
dozaan: the usual fee is five tackal, equal to
sixteen shillings; but the government has large
profits on all suits that are brought into court.

There is no country of the East in which the
royal establishment is arranged with more minute
attention than in the Birman court; it is splendid
without being wasteful, and numerous without
confusion; the most distinguished members are
the Sovereign, his principal queen, entitled Nan-
doh Praw; the Engy Teekien, or prince royal;
the crown descending to the male heirs in a direct
line.

Next in rank to the princes of the blood royal,

Bramins, and pay them that reverence which is due to their
sacred characters: let them observe becoming respect towards
all men, and they shall shield the weak from oppression,
support the helpless, and, in particular cases, mitigate the
severity of avenging justice.

"It shall be the duty of a prince, and the magistrates of
a province, wisely to regulate the internal police of the
empire, to assist and befriend the peasants, merchants,
farmers, and those who follow trades, that they may daily
increase in worldly wealth and happiness; they shall pro-
mote all works of charity, encourage the opulent to relieve
the poor, and liberally contribute to pious and laudable
purposes, and whatsoever good works shall be promoted by
their influence and example, whatsoever shall be given in
charity, and whatsoever benefit shall accrue to mankind
from their endeavours, it shall all be preserved in the records
of heaven, one-sixth part of which, though the deeds be
the deeds of others, yet shall it be ascribed unto them; and
at the last day, at the solemn and awful hour of judgment,
the recording spirit shall produce them, inscribed on the
adamantine tablet of human actions. But, on the other
hand, if the prosperity of the nation be neglected, if justice
be suffered to lie dormant, if tumults arise, and robberies
are committed, if rapine and foul assassination stalk along
the plains, all crimes that shall be thus perpetrated through
their remissness, one sixth part shall be brought to this ac-
count, and fall with weighty vengeance on their heads; the
dreadful consequences of which surpass the power of tongue
to utter, or of pen to express.

Arracan name for Rhahadn.

are

are the Woongees, or chief ministers of state. These form the great ruling council of the nation; they sit in the Lotoo, or imperial hall of consultation, every day, except on the Birman sabbath, from twelve till three or four o'clock, or later, as there happens to be business; they issue mandates to the Maywoons, or viceroys of the different provinces; they controul every department of the state, and, in fact, govern the empire, subject always to the pleasure of the King, whose will is absolute, and power undefined.

To assist in the administration of affairs, four officers, called Woondocks, are associated with the Woongees, but of far inferior authority; they sit in the Lotoo in a deliberative capacity, having no vote: they give their opinions, and may record their dissent from any measure that is proposed; but the Woongees decide: the Woondocks, however, are frequently employed to execute business of great public importance. Four Attawoons, or ministers of the interior, possess a great degree of influence: that sometimes counteracts with success the views and wishes of the Woongees; these the King selects to be his privy counsellors, from their talents, and the opinion he entertains of their integrity; they have access to him at all times; a privilege which the principal Woongee does not enjoy. There are four chief secretaries, called Serees-dogees, and have numerous writers or inferior Serees under them. Four Nachaangees sit in the Lotoo, take notes, and report whatever is transacted. Four Sandohgaans regulate all ceremonials, introduce strangers of rank into the royal presence, and are the bearers of messages from the council of state to the king. There are nine Sandozains, or readers, whose business it is to read all official writings, petitions, &c. Every document, in which the public is concerned, or that is brought before the council in the Lotoo is read aloud. The four Maywoons are restricted to the magisterial superintendence of their respective quarters of the city; they have nothing farther to do with the Lotoo, than to obey the commands they receive from thence. The Assaywoon, or paymaster-general, is also an officer of high importance; the place is generally held by one of the Woongees, who is called Assay Woongee. There are several other officers of distinction, who bear no ostensible share in the administration of public affairs; such as the Daywoon, or

king's armour-bearer, the Chaingcewoon, or master of the elephants; also the Woons of the queen's household, and that of the prince royal. Each of the junior princes has a distinct establishment.

In the Birman government there are no hereditary dignities or employments; all honours and offices on the demise of the possessor, revert to the crown. The tsaloe, or chain, is the badge of the order of nobility, of which there are different degrees, distinguished by the number of strings, or small chains that compose the ornament; these strings are fastened by bosses where they unite; three of open chain work is the lowest rank; three of neatly twisted wire is the next; then of six, of nine, and of twelve: no subject is ever honoured with a higher degree than twelve: the king alone wears twenty-four.

Almost every article of use, as well as ornament, particularly in their dress, indicates the rank of the owner; the shape of the beetle-box which is carried by an attendant after a Birman of distinction wherever he goes, his ear-rings, cap of ceremony, horse furniture, even the metal of which his spitting-pot and drinking-cup are made (which if gold denote him to be a man of high consideration), all are indicative of the gradations of society; and woe be unto him that assumes the insignia of a degree which is not his legitimate right!

The court dress of the Birman nobility is very becoming; it consists of a long robe, either of flowered satin or velvet, reaching to the ankles, with an open collar and loose sleeves; over this there is a scarf, or flowing mantle, the ends hang from the shoulder; and on their heads they wear high caps made of velvet, either plain or of silk embroidered with flowers of gold, according to the rank of the wearer. Ear-rings are a part of male dress; persons of condition wear tubes of gold of about three inches long, and as thick as a large quill, which expands at one end like the mouth of a speaking trumpet; others wear a heavy mass of gold beaten into a plate and rolled up; this lump of metal forms a large orifice in the lobe of the ear, and drags it down by the weight to the extent sometimes of two inches. The women likewise have their distinguishing paraphernalia: their hair is tied in a bunch at the top of the head, and bound round with a fillet, the embroidery and ornaments of

which express their respective ranks; a short shift reaches to the pit of the stomach, is drawn tight by strings, and supports the breasts; over that is a loose jacket with close sleeves; round their waist they roll a long piece of silk, or cloth, which, reaching their feet, and sometimes trailing on the ground, encircles them twice, and is then tucked in. When women of condition go abroad, they put on a silk sash, resembling a long shawl, which crosses their bosom, and is thrown over their shoulders, gracefully flowing on each side. The lowest class of females often wear only a single garment, in the form of a sheet, which, wrapped round the body, and tucked in under the arm, crosses their breasts, which it scarcely conceals, and descends to their ankles; thus, when they walk, the bottom of the cloth, where it overlaps, is necessarily opened by the protrusion of the leg, and displays to a side view as high as the middle of the thigh; such an exposure, in the opinion of an European, bears an indecent appearance, although it excites no such ideas in the people themselves. Women, in all dress, stain the palms of their hands and their nails of a red colour, for which they use a vegetable juice, and strew on their bosoms powder of sandal wood, or of a bark called Sunnucka, with which some rub their faces. Both men and women tinge the edges of their eyelids and their teeth with black; this latter operation gives to their mouths a very unseemly appearance in the eyes of an European, which is not diminished by their being constantly filled with beetle leaf. Men of rank wear, in common dress, a tight coat, with long sleeves made of muslin, or of extremely fine nankeen, which is manufactured in the country; also a silk wrapper that encircles the waist: the working class are usually naked to the middle, but in the cold season a mantle or coat of European broad cloth is highly prized. The Birmans in their features bear a nearer resemblance to the Chinese than to the natives of Hindostan. The women, especially in the northern part of the empire, are fairer than Andoo females, but not so delicately formed; they are, however, well made, and in general inclined to corpulency; their hair is black, coarse, and long. The men are not tall in stature, but are and athletic; they have a very youthful appearance, from the custom of plucking their heads instead of using the razor: they tatoo their

Vol. I. No. CXIII.

thighs and arms into various fantastic shapes and figures, which they believe operate as a charm against the weapons of their enemies. Neither the men nor the women are so cleanly in their persons as the Hindoos of India, among whom diurnal ablution is a religious as well as a moral duty. Girls are taught, at an early age, to turn their arms in such a manner as to make them appear distorted; when the arm is extended the elbow is inverted, the inside of the joint being protracted, and the external part bending inwards; from this cause, the pendant arm seems as if it were broken.

Marriages among the Birmans are not contracted until the parties attain the age of puberty: the contract is purely civil; the ecclesiastical jurisdiction having nothing to do with it. The law prohibits polygamy, and recognizes but one wife, who is denominated Mica; concubinage, however, is admitted to an unlimited extent. A man may repudiate his wife under circumstances, but the process is attended with a heavy expence. Concubines, living in the same house with the legitimate wife, are, by law, obliged to perform menial services for her, and when she goes abroad they attend her, bearing her water-flaggon, beetle-box, fan, &c. When a husband dies, his concubines, if bound in servitude to him, become the property of the surviving widow, unless he shall have emancipated them by a specific act previous to his decease. When a young man is desirous to espouse a girl, his mother, or nearest female relation, first makes the proposal in private; if the suit be well received, a party of his friends proceed to the house of the parents of the maiden, with whom they adjust the dotal portion. On the morning of the bridal day the bridegroom sends to the lady three loongees or lower garments, three tulbecks, or sashes, and three pieces of white muslin; such jewels also, ear-rings and bracelets, as his circumstances will admit. A feast is prepared by the parents of the bride, and formal writings are executed: the new-married couple eat out of the same dish, the bridegroom presents the bride with some laapack, or pickled tea, which she accepts and returns the compliment: thus ends the ceremony, without any of that subsequent riot and resistance on the part of the young lady and her female friends, with which the Sumatran damsels oppose the privileges of an ardent bridegroom.

7 K

When

When a man dies intestate, three-fourths of his property go to his children born in wedlock, but not in equal proportions; and one-fourth to the widow, who is the guardian both of the property and the children, until the latter attain the age of maturity. A Birman funeral is solemnized with much religious parade, and external demonstration of grief: the corpse is carried on a bier, on men's shoulders; the procession moves slowly; the relations attend in mourning; and women, hired for the occasion, precede the body, and chant a dirge-like air. The Birmans burn their dead, unless the deceased is a pauper, in which case he is either buried or cast into the river, as the ceremony of burning is very expensive. The bier is placed on a funeral pile six or eight feet high, made of billets of dried wood laid across, with intervals to admit a circulation of air, and increase the flame. The Rhahaans walk round the pile, reciting prayers to Gaudma, until the fire reaches the body, when the whole is quickly reduced to ashes: the bones are afterwards gathered and deposited in a grave. Persons of high distinction, such as the Seredaw, or chief ecclesiastic of a province, a Maywoon, a Woongee, or a member of the royal family, are embalmed, and their remains preserved six weeks or two months after decease, before they are committed to the funeral pile: during this period the body is laid in state in some kioum or religious building; but at the capital it is

placed in a sacred saloon, beautifully ornamented with gilding, and exclusively appropriated to that sacred purpose. Honey is the principal ingredient made use of to preserve the body from putrefaction.

Of the population of the Birman dominions it may be estimated that it amounts to about fourteen millions four hundred thousand persons. Few of the inhabitants live in solitary habitations; they mostly form themselves into small societies, and their dwellings thus collected compose the Ruas, or villages; if therefore, we reckon the numbers, including Arracan, at seventeen millions, the calculation may not be widely erroneous.

Although it seems difficult, and perhaps impossible, under such a system, to ascertain, by any standard currency, the amount of the royal revenue, yet the riches which the Birman monarch is said to possess are immense, a supposition that may readily be admitted when it is considered that a very small share of what enters his exchequer returns into circulation. The hoarding of money is a favourite maxim of oriental policy; an eastern potentate cannot be brought to comprehend that the diffusion of property among his subjects is a surer source of wealth to himself, and security to his throne, than the possession of Lydian treasures, locked up in vaults, and concealed in secret recesses, contrived by sordid avarice and foolish cunning.

SECTION IX.

Military Establishment—Infantry—Cavalry—Artificers—War-Boats—Gunpowder known—Weapons—Food—Climate—Soil—Produce—Minerals—Precious Stones—Commerce—Currency—Weights—Measures—Character of the Natives—Beggars unknown—Animals—Division of Time—Music—Language—Extent of the Empire—Rivers.

THE Birmans may be termed a nation of soldiers, every man in the kingdom being liable to be called upon for his military services; and war is deemed the most honourable occupation: the regular military establishment of the Birmans is, nevertheless, very inconsiderable; not exceeding the numbers of which the royal guards is composed, and such as are necessary to preserve the police of the capital. When an army is to be raised, a mandate issues from the

golden palace, to all viceroys of provinces, and miougees of districts, requiring a certain number of men to be at a general rendezvous on an appointed day, under the command sometimes of the viceroy himself, but oftener that of an inferior officer: the levy is proportioned to the population of the district, estimated from the number of registered houses that it contains. The provincial court determines the burthen which each house is to bear; commonly every two

th

three, or four houses are to furnish among them
one recruit, or to pay three hundred tacksal in
money, (about forty or forty-five pounds). This
recruit is furnished with arms, ammunition, and
a certain daily allowance of grain from govern-
ment, but is not entitled to pay. The families
of these conscripts are retained in the districts
which they inhabit, as hostages for the good
conduct of their relation. In case of desertion
or treachery, the innocent wife, children, and
parents of the guilty person, are dragged to
execution without the least remorse or pity; even
backward subjects the family of the delinquent
to capital punishment*.

Infantry and cavalry compose the regular
guards of the king: the former are armed with
muskets and sabres: the latter are provided with
a spear seven or eight feet long, which they
manage with great dexterity, seldom requiring
making use of any other weapon. The in-
fantry are not uniformly clothed: seven hundred
the constant duty within the precincts, and at the
general gates of the palace. On the day of my
public reception, says Colonel Symes, I saw
about two thousand, and have no doubt that all
the troops in the city were paraded on that occa-
sion. All the troopers in the king's service are
natives of Cassay, who are much better horsemen
than the Birmans. They ride, like all orientals,
with short stirrups and a loose rein. The horses
of Ava are small, but very hardy and active.
Contrary to the practice of other eastern countries,
they castrate their horses, and are thus enabled
to maintain them with little trouble and expence,
and can also turn a number of them loose in a
field together, without any risk of their injuring
one another. Horses are frequently exported in
umber ships to Madras, and other parts of the
East, where they are disposed of to considerable
advantage.

The government of Ava is extremely attentive
to provide, in times of peace, for the contingen-
cies of war; the royal magazines, I was told,
says the Colonel, could furnish twenty thousand
muskets, which, if they resembled the specimens
I saw, cannot be very formidable; these have
been imported, at different periods, into the
country, by ships trading to Rangoon and other

* This barbarous law, which is rigorously enforced,
has had a powerful effect in securing the allegiance of the
people, and of impelling them to vigorous exertion; and it

parts of the empire, and are either of French
manufacture, or condemned muskets from the
English arsenals in India. The Birmans are
very fond of their arms, of which they take great
care; their gunsmiths, who are all natives of
Cassay, keep them in repair; but they are in
general so bad as to be out of the power of art to
render them serviceable. I saw a tolerably good
fowling piece which they said was entirely the
work of a Cassay artificer; this however, was
allowed to be an extraordinary effort of genius:
the person who shewed it to me, presented me,
at the same time, with a bamboo which threw
out a short spear of iron by means of a spring; it
was executed by the maker of the gun, and seem-
ed to be formed after a model of an English
walking stick, that contained a concealed spike;
the imitation evinced much ingenuity, although
the workmanship was coarse, and the iron badly
polished.

By far the most respectable part of the Birman
military force is their establishment of war-boats.
Every town of note, in the vicinity of the river,
is obliged to furnish a certain number of men,
and one or more boats, in proportion to the mag-
nitude of the place. The king can command, at
a very short notice, five hundred of these vessels:
they are constructed out of the solid trunk of the
teak tree, which is excavated partly by fire, and
partly by cutting; the largest are from eighty to
one hundred feet long, but the breadth seldom
exceeds eight feet, and even this space is pro-
duced by artificially extending the sides after the
trunk has been hollowed. They carry from fifty
to sixty rowers, who use short oars that work on
a spindle; the prow is solid, and has a flat sur-
face, on which, when they go to war, a piece of
ordnance is mounted, a six, a nine, or even
a twelve pounder; the gun carriage is secured
by lashings to strong bolts on each side, and
swivels are frequently fixed on the curvature of
the stern.

Each rower is provided with a sword and a
lance, which are placed by his side whilst he
plies the oars. Besides the boatmen, there are
usually thirty soldiers on board, who are armed
with muskets: thus prepared, they go in fleets
to meet the foe, and when in sight, draw up in a

is perhaps, the only sure mode of inciting to enterprizes of
danger men who are not actuated by any innate sense of
honour, and who do not feel any national pride.

line,

a line, presenting their prows to the enemy. Their attack is extremely impetuous; they advance with great rapidity, and sing a war-song, at once to encourage their people, daunt their adversaries, and regulate the strokes of their oars; they generally endeavour to grapple, and when that is effected, the action becomes very severe, as these people are endued with great courage, strength, and activity. In times of peace, they are fond of exercising in their boats, and they display great dexterity in the management of them. The vessels being low in the water, their greatest danger is that of being run down by a larger boat striking on their broadside, a misfortune which the steersman is taught to dread, and to avoid, above all others. It is surprising to see the facility with which they steer, and elude each other in their mock combats. The rowers are also practised to row backwards and impel the vessel with the stern foremost: this is the mode of retreat, by means of which the artillery still bears upon their opponent. The largest of the war-boats do not draw more than three feet water. When a person of rank is on board, there is a sort of moving tilt or canon. For his particular accommodation, placed some in the centre, and sometimes on the prow. The sides of the boat are either gilt as far as the water's edge, or plain, according to the rank of the person it carries. Gilded boats are only permitted to the princes of the blood, or to persons holding the highest stations, such as a Maywoon of a province, or a minister of state.

It is not improbable that the use of gunpowder was known in India before its effects were discovered in the west; yet it does not appear, that the natives of Ava applied it to the purpose of musketry till the Europeans instructed them in the art. According to Indian accounts, cannon were fabricated in the east long before the era of European conquest; their artillery, however, was not capable of being transported with facility, or at all used in the field: they were made of iron bars beaten into a cylindrical form, rudely put together, but of great strength, and enormous weight, from which, when raised on a rampart or tower, they threw huge stones to annoy the enemy. The musket was first introduced into Pegue and Ava by the Portuguese, and is an implement of war which the natives unwisely prefer

to their own native weapons, the spear and sabre; a partiality that is highly prejudicial to themselves, for nothing can be less formidable than such fire arms as they possess, or have the means of procuring. The proper indigenous weapons of the country are the spear, the javelin, which is thrown from the hand, the cross-bow, and the sabre; the latter is used by the Birmians not only as an implement of war, but is likewise applied to various purposes as an instrument of manual labour: with this the peasant fells trees, shapes timbers, cuts bamboos, or defends himself against an enemy, and wild beasts: he never travels without it, and generally, when on a journey, carries a shield on his left arm. They encumber themselves with less baggage than perhaps any other people; and are satisfied with a scanty portion of the hardest fare.

In their food, the Birmians, in comparison with the Indians, are gross and uncleanly. Although their religion forbids the slaughter of animals in general, yet they apply the interdiction only to those that are domesticated: all game is eagerly sought after, and in many places it is publicly sold: reptiles also, such as lizards, guanas, and snakes, constitute a part of the subsistence of the lower classes. They are extremely fond of vegetables; but at those places where garden greens are not to be procured, they gather wild sorrel, and sometimes substitute the tender leaves of trees; these, boiled with rice, and moistened with a little oil, or seasoned with gnappa, or pickled sprat, compose a meal for a Birman peasant or boatman. The higher ranks, however, live more delicately, although their fare is not very sumptuous.

The climate of every part of the Birman empire bears testimony to its salubrity, by the best possible criterion, the appearance and vigour of the natives. The seasons are regular, and the extremes of heat and cold are seldom experienced; at least, the duration of that intense heat which immediately precedes the commencement of the rainy season is so short, that it incommodes but for a very little time. During our residence in the country, we lost only one man by disease; another met an accidental death, for in wandering through the woods he became the prey of a tiger.

The soil of the southern provinces of the Birman empire is remarkably fertile, and produces as luxuriant crops of rice as are to be found

in the finest parts of Bengal. Farther northward the country becomes irregular and mountainous; but the plains and valleys, particularly near the river, are exceedingly fruitful; they yield good wheat, and the various kinds of small grain which grow in Hindostan; as likewise legumes, and most of the esculent vegetables of India. Sugar canes, tobacco of a superior quality, indigo, cotton, and the different tropical fruits, in perfection, are all indigenous products of this favoured land.

Besides the teak tree, which grows in many parts of the Birman empire, as well to the north of Ummerapooora, as in the southern country, there is almost every description of timber that is known in India. Dr. Buchanan, in one of his afternoon excursions, perceived a large log of fir, which, his attendant informed him, had been washed down by the torrents from a mountainous part of the country, four days journey northward of the capital, where it grows in abundance, and of considerable magnitude: the natives call it Zuenyo; they extract the turpentine, which they turn to use, but consider the wood of little value, on account of its softness. If they could be prevailed upon to transport it to Rangoon, it might prove a beneficial material to the navigation of India. Top-gallant masts and yards made of teak are thought to be too heavy. European and American spars are often bought for these purposes at a very exorbitant price, an inconvenience which the fir of Ava, if conveyed to the market, would probably obviate.

The kingdom of Ava abounds in minerals; six days journey from Bannoo, near the frontiers of China, there are mines of gold and silver, called Badouem: there are also mines of gold, silver, rubies, and sapphires at present open on a mountain near the Keenduem, called Woboloon-tann; but the most valuable, and those which produce the finest jewels, are in the vicinity of the capital, nearly opposite to Koom-meoum. Precious stones are found in several other parts of the empire. The inferior minerals, such as

contain iron, tin, lead, antimony, arsenic, sulphur, &c. are met with in great abundance: amber, of a consistence unusually pure and pellucid, is dug up in large quantities near the river; gold likewise is discovered in the sandy beds of streams which descend from the mountains. Between the Keenduem and the Irrawaddy, to the northward, there is a small river called Shoe Lien Kioup, or the Stream of Golden Sand. Diamonds and emeralds are not produced in any part of the Ava empire; but it affords amethysts, garnets, very beautiful chrysolites, jasper, loadstone, and marble*.

An extensive trade is carried on between the capital of the Birman dominions and Yunnan in China. The principal article of export from Ava is cotton, of which there are two kinds, one of a brown colour, of which nankeens are made, the other white, like the cotton of India. This commodity is transported up the Irrawaddy in large boats as far as Bannoo, where it is bartered at the common jee or mart, with Chinese merchants, and conveyed by the latter, partly by land, and partly by water, into the Chinese dominions. Amber, ivory, precious stones, beetle nut, and the edible nests brought from the eastern Archipelago, are also articles of commerce: in return, the Birmans procure raw and wrought silks, velvets, gold leaf, preserves, paper, and some utensils of hardware.

The commerce between the capital and the southern parts of the empire is facilitated by the noble river that waters the country; its principal objects are the necessaries of life; several thousand boats are annually employed in transporting rice from the lower provinces, to supply Ummerapooora, and the northern districts; salt and gnapée may likewise be reckoned under the same head. Articles of foreign importation are mostly conveyed up the Irrawaddy; a few are introduced by way of Arracan, and carried over the mountains on the heads of coolies, or labourers; European broad cloth, a small quantity of hardware, coarse Bengal muslins, Cosseimbuzar silk hand-

it is on that account held sacred. Birmans may not purchase the marble in mass, but are suffered and indeed encouraged to buy figures of the deity ready made. Exportation of their gods out of the kingdom is strictly forbidden. The city of Chagata is the principal manufactory of these marble divinities.

* The quarries of marble are only a few miles from Ummerapooora. It is equal in quality to the finest marble of Italy, and admits of a polish that renders it almost transparent. Blocks of any size that it is possible to transport might be procured, but the sale is prohibited; nor is it allowed to be carried away without a special order. Images of Gaudma being chiefly composed of this material,

Vol. II. No. CXIII.

kerchiefs, China ware, which will not admit of land carriage, and glass, are the principal commodities. Cocoa nuts also, brought from the Nicobar Islands, where they are of uncommon excellence, are looked upon as a delicacy, and bear a high price: merchants carry down silver, lace, precious stones, and some other articles, to no great amount. The Birman, like the Chinese, have no coin; silver in bullion, and lead, are the current monies of the country; weight and purity are, of course, the standard of value, and in the ascertainment of both the natives are exceedingly scrupulous and expert. What foreigners call tackal, properly kiat, is the most general piece of silver in circulation: it weighs ten penny weights ten grains and three-fourths; its subdivisions are, the tubbee, two of which make one moo; two moo one math; four math one tackal; and one hundred tackal compose one viss. Money scales and weights are all fabricated at the capital, where they are stamped, and afterwards circulated throughout the empire; the use of any others is prohibited.

Rice is sold by a measure called Fayndaung, or basket, the weight is sixteen viss, about fifty-six pounds. There are many subdivisions of measurement. The average price of rice at the capital is one tackal, rather more than half-a-crown, for a basket and a half. At Rangoon and Martaban one tackal will purchase four or five baskets.

The bankers, called by foreigners Pymon, are likewise workers in silver, and assayers of metal: this is a class of people very numerous; and indispensably necessary, as no stranger can undertake either to pay or receive money without having it first examined. Every merchant has a banker of this description, with whom he lodges all his cash, and who, for receiving and paying, gets an established commission of one per cent; in consideration of which he is responsible for the quality of what goes through his hands; and in no instance did the Colonel ever hear of a breach of trust committed by one of these bankers*. The quantity of alloy varies in the silver current in different parts of the empire; at Rangoon it is

* Any person may have his silver either purified, or depreciated to whatever standard he chooses; the nearest silversmith will be glad to perform the work free from charge for his labour, as the bringer by the operation must lose a trifle, which the artist gains: the small quantity of

adulterated twenty-five per cent; at Ummerna poora, pure, or what is called flowered silver, is most common: in this latter all royal dues are paid. The several modifications are as follows:

Round, or pure silver.	
Rounika,	5 per cent. of alloy.
Rounizee,	10 per cent.
Rouassee,	20 per cent.
Moowadzoo,	25 per cent.
Woombo,	30 per cent.

The Birman measures of length are, a Paul gaut, or inch, eighteen of which compose the Taim, or cubit. The Saundaung, or royal cubit, equal to twenty-two inches. The Dha, or Bamboo, which consists of seven royal cubits: one thousand dha make one Birman league, or Dain, nearly equal to two British miles and two furlongs; the league is also subdivided into tenths. The Birman keep their accounts in decimals after the manner of the Chinese.

It has already been noticed, that the general disposition of the Birman is strikingly contrasted with that of the natives of India, from whom they are separated only by a narrow range of mountains, in many places admitting of an easy intercourse. Notwithstanding the small extent of this barrier, the physical difference between the nations could scarcely be greater, had they been situated at the opposite extremities of the globe. The Birman is a lively, inquisitive race, active, irascible, and impatient: the character of these Bengal neighbours is too well known, as the reverse, to need any delineation; the unworthy passion of jealousy which prompts most nations of the east to immure their women within the walls of an harem, and surround them with guards, seems to have scarcely any influence over the minds of this extraordinary and more liberal people. Birman wives and daughters are not concealed from the sight of men, and are suffered to have as free intercourse with each other as the rules of European society admit; but in other respects women have just reason to complain of their treatment; they are considered as not belonging to the same scale of the creation

metal that adheres to the crucible is his profit. I was informed, that the silversmith can sell these crucibles afterwards to refiners for forty tackals a thousand, and that adequate gain accrues to the purchaser from the metal extracted from the pot after it is broken.

as men, and ever the law stamps a degrading distinction between the sexes; the evidence of a woman is not received as of equal weight with that of a man, and a woman is not suffered to ascend the steps of a court of justice; but is obliged to deliver the testimony on the outside.

The custom of selling their women to strangers, which has before been adverted to, is confined to the lowest classes of society, and is perhaps oftener the consequence of heavy pecuniary embarrassment, than an act of inclination: it is not, however, considered as shameful, nor is the female dishonoured; partly perhaps from this cause, and partly from their habits of education, women surrender themselves the victims of this barbarous custom with apparent resignation. It is also said, that they are very seldom unfaithful to their foreign masters; indeed they are often essentially useful, particularly to those who, by keeping their accounts and transacting their business; but when a man departs from the country, he is not suffered to carry his temporary wife along with him; on that point the law is exceedingly rigorous: every ship, before she receives her clearance, is diligently searched by the officers of the custom-house: even if their vigilance were eluded, the woman would be quickly missed; and it would be soon discovered in what vessel she had gone, nor could that ship ever return to a Birman port but under penalty of confiscation of the property, and the infliction of a heavy fine and imprisonment on the master: female children also, born of a Birman mother, are not suffered to be taken away. Men are permitted to emigrate, but they think that the exportation of women would impoverish the state, by diminishing the sources of its population.

One vice is usually the parent of another: the Birmans, being exempt from that jealousy, do not resort to the diabolical practice of emascinating male children, to educate them as spies over their women. Chastity, they know, is more strictly guarded by principles of honour, and attachment than by moats or castles. When Mrauc was conquered by the Birmans, several youths were made prisoners, belonging to the prince of the country, who had adopted that degenerate custom of Mohammedan growth. These people are maintained by the Birman monarch rather as memorials of his conquests, than for any services they are required to perform. Fidelity is not a characteristic of Birman wives;

in general they have too much employment to leave leisure for the corruption of their minds. A woman of the highest rank seldom sits in idleness at home; her female servants like those of the Grecian dames of antiquity, ply "the various labours of the loom:" whilst the mistress superintends and directs their industry. On the occasion of a formal visit to the mother of the present queen, we observed in one of the galleries of the palace, three or four looms at work wrought by the damsels of her household. Weaving is chiefly a female occupation. Most Birman families make all the cotton and silk that is required for their domestic consumption.

The Birmans, in some points of their disposition, display the ferocity of barbarians, and in others all the humanity and tenderness of polished life: they inflict the most heavy vengeance on their enemies; as invaders, desolation marks their track, for they spare neither sex nor age: but at home they assume a different character: there they manifest benevolence, by extending aid to the infirm, the aged, and the sick: filial piety is inculcated as a sacred precept, and its duties are religiously observed. A common beggar is nowhere to be seen: every individual is certain of receiving sustenance, which, if he cannot procure it by his own labour, is provided for him by others.

The Birmans divide their time as follow: The space in which the finger can be raised and depressed is called charazi; ten charazi make one piaan; six piaan one bizana (about a minute). The day, of twenty-four hours, commencing at noon, is divided into eight portions, or yettee, of three hours each, thus denominated: Moan Yettee; or noon; Loung Yettee, three P. M. Lay Yettee, six P. M. Gneah Yettee, nine P. M. Gneah Gnek Yettee, midnight; Gneah Layhee Loung Yettee, three in the morning; Mieh Line Yettee, six A. M. Gneah Tek Yettee, nine A. M.

These divisions of time are ascertained by a machine resembling the hour-glass, and sometimes by a perforated pan placed in a tub of water: they are announced by a stroke on an oblong drum, which is always kept near the dwelling of the chief magistrate of the city, town, or village; it is commonly raised on a high bamboo stage, with a roof of mats to protect it from the weather. The edifice at the royal palace for the reception of this instrument is of masonry,

masonry, and very lofty, whence the sound is said to be distinctly conveyed to the remotest extremes of the city.

The Birman year is divided into twelve months, which, strictly speaking, cannot be called synodical, although they comprehend the days. A revolution of the moon; in passing from one conjunction with the sun to another, is performed in twenty-nine days twelve hours and forty-four minutes; but the Birman lunations consist of twenty-nine and thirty days, alternately, which causes a difference between the Newtonian and Birman lunar account of eight hours and forty-eight minutes.

In order to complete a solar revolution, they intercalate in every third year a month of thirty days.

The Birmans are extremely fond both of poetry and music; they call the former Yeddoo: when repeated by a scholar, it flows soft and measured to the ear; it is sometimes in successive, and often in alternate rhymes. A line is called Tageoung; a stanza, Tubbouk. They have epic as well as religious poems of high celebrity, and they are fond of reciting in heroic numbers the exploits of their kings and generals.

Music is a science which is held in considerable estimation throughout the Birman empire, and is cultivated at the present day more generally than in India, notwithstanding it is called by the Greeks, the language of the gods. The royal library of Ummers-poura is said to contain many valuable treatises on the art. Some of the professional musicians display considerable skill and execution, and the softest airs are pleasing even

to an ear unaccustomed to such melody. The principal instruments are a Soum, or harp, made of light wood, hollowed and varnished, in shape somewhat like a canoe with a deck; at the extremity a piece of hard wood is neatly fastened, which tapers to the end, and rising curves over the body of the harp; from this curvature, the strings, usually made of wire, are extended to a bridge on the belly of the instrument: there are two sounding holes, one on each side of the bridge. The size of the Soum varies from two to five feet in length. The Tarr resembles our violin; it has only three strings, and is played on with a bow. The Pullawny, is a common flageolet. The Kyezoup, is a collection of cymbals, which are suspended in a bamboo frame; these cymbals, varying in size, produce modulated gradations of sounds. The Patola, or guitar, is a curious instrument; it is the exact form of a crocodile in miniature; the body of which is hollow, with sounding holes on the back; three strings of wire extend from the shoulder to the tail, and are supported on bridges at each extremity; the strings are tuned by means of pegs in the tail, to which they are fastened; it is played on by the finger, and is generally used to accompany the voice. The Boundaw is a collection of drums, oblong in form, and varying in size, which are suspended perpendicularly in a wooden frame by leather thongs. The whole machine is about five feet in diameter, and four feet high. The performer stands in the centre and beats on the drums with a small stick. The instrument is also introduced when there is a band, and is much used in processions, being carried by two men, whilst the performer shuffles along on the inside, playing as he goes. The Heem is the pipe of Pan, formed of several reeds neatly joined together, and sounded by a common mouth-piece; when played with skill, it produces a very plaintive melody. These are the principal instruments of music in use among the Birmans.

Of the ancient Palls, whose language constitutes at the present day the sacred text of Pegue, and Siam, as well as of several countries eastward of the Ganges; and of the migration from India to the banks of the Nile of Ethiopia, we have but very imperfect information. As a nation they have long ceased to exist: they are said to have pos-

n they have long
said to have posses

in former times, a dominion stretching from the
Indies as far as Siam, and to have been conquered
by the Rajaputras, who changed the name of
their country from Palisthan to Rajaputra. In
the old books of the Hindoos they are called
Paliputras, and it may be concluded that they
were the Palibothri of the ancients.

It has been the opinion of some of the most
enlightened writers on the languages of the East,
that the Pali, the sacred language of the priests
of Boodh is nearly allied to the Shanserit of the
Bramius; and there certainly is much of that
holy idiom engrafted on the vulgar language of
Ava, by the introduction of the Hindoo religion.
The character in common use throughout Ava
and Pegue is a round Nagari, derived from the
square Pali, or religious text; it is formed of
circles or segments of circles, variously disposed
and combined, whilst the Pali, which is solely
applied to the purposes of religion, is a square
letter, chiefly consisting of right angles.

The Birman language contains thirty-three
simple sounds, to represent which, their alpha-
bet, commonly called Kagye Kayue, consists of
an equal number of distinct characters, exclusive
of various marks and contractions, that supply
the place of long and short vowels, diphthongs, &c.
These are explained and enumerated in separate
series, in the Birman spelling-book, entitled
Kayeboundie, in which every possible combina-
tion is given and exemplified. The Birmans
write from left to right, and though they leave no
distinguishing space between their words,
they mark the pause of a sentence and the full
stops. Their letters are distinct, and their
manuscripts are in general very beautiful.

The common books of the Birmans, like those
of the Hindoos, particularly of such as inhabit
the southern parts of India, are composed of the
palmyra leaf, on which the letters are engraved
with a stylus; but the Birmans far excel the
Braminical Hindoos in the neatness of the execu-
tion, and in the ornamental part of their volumes.

In the recitation of poetry, the language is ex-
ceedingly melodious; even the prose of common
conversation appears to be measured, and the
concluding word of each sentence is lengthened
by a musical cadence, that marks the period to
the ear of a person wholly unacquainted with
the meaning.

It is difficult to ascertain with precision the

Vol II. No. CXIII.

exact limits of the Birman empire. Dr. Bu-
chanan, who accompanied the embassy, sought
for geographical information with the most dili-
gent inquiry; he procured, but not without con-
siderable trouble and expence, sketches of every
part of the Birman territories; and he has trans-
mitted the materials which he thus collected to
the East-India Company. Those sketches, how-
ever, being contained in various and detached
pieces, not forming any connected body, nor yet
reduced to a graduated scale, can hardly be
brought into the shape of a regular map without
aid of some further communications; they are
nevertheless documents of much intrinsic value
and importance; it is therefore to be hoped that,
with the aid of some additional lights, a vacuum
on the terrestrial globe will, ere long, be filled
up, and a portion of the earth delineated, which
heretofore has been very imperfectly known. On
a probable calculation from Dr. Buchanan's
papers of the extent of the present Birman em-
pire it appears to inclose the space between the
ninth and twenty-sixth degrees of north latitude,
and between the ninety-second and hundred and
seventh degrees of longitude east of Green-
wich, about one thousand and fifty geographical
miles in length, and six hundred in breadth:
these are the ascertainable limits, taken from the
Birman accounts; but it is probable that their
dominions stretch still farther to the north. It
should, however, be remarked, that the breadth
often varies, and is in many places very incon-
siderable, on what is called the Eastern Peninsula.

Dr. Buchanan, in the summary or general outline
of the geographical materials which he collected,
thus expresses himself on the subject of rivers:--
It appears, "that the Arracan river is not so con-
siderable as has been supposed, but takes its rise
in hills at no great distance to the north.

"That the river coming from Thibet which is
supposed to be that of Arracan, is in fact the
Keenduem, or the great western branch of the
Ava river.

"That what is supposed to be the western
branch of Irrawaddy, is in fact the eastern one
which passes by Ava, and runs to the north,
keeping west from the province of Yunan, and
leaving between it and that part of China a
country subject to the Birmans.

"That the Loukiang, which is supposed to
be the great branch of the Irrawaddy, has no

7 M

com-

communication with that river; but on entering the Birman dominions assumes the name of 'Thaluayn, or Thanluayn, and falls into the sea at Martaban.

"That the river Pegue, which is supposed to come from China, rises among hills about a hundred miles from the sea, and which form the boundary between the Birman and Pegue kingdoms.

"That between the Pegue and Martaban rivers there is a lake, from which two rivers proceed; the one runs north to Old Ava, where it joins the Myoungnya, or Little River of Ava, which comes from mountains on the frontiers of

China; the other river runs south from the lake to the sea, and is the Sitang river in the map.

"That the rivers of China, which are supposed to be the heads of the Pegue river, are those of the viceroy Siam.

"That the rivers of Siam and Cambodia communicate by a very considerable branch, called the Annan."

This disposition of the rivers gives an entire new face to the geography of India beyond the Ganges; and from the diligence and ability with which Dr. Buchanan collated the several accounts that he received: I am inclined to believe that his statement is nearly correct.

SECTION X.

Permission granted to make Astronomical Observations—Bengal Painter employed at Court—Mode of catching wild Elephants—Attention of Viceroys to Foreign Ministers—Ceremony arranged—Procession—Manner of Entrance—Introduction into the Lotoo, or Grand Council Hall—Description of the Court, and its Magnificence—Formalities observed in returning—Commercial Intercourse with Birma likely to be advantageous to Britain.

GEOGRAPHY is the foundation of all historical knowledge, without which history becomes little better than romance. Having hitherto found the most authentic geographical information that could be obtained relative to countries eastward of the Ganges extremely erroneous, the Colonel was desirous of determining the true situation of the capital of Ava, especially as he had now a favourable opportunity of profiting by the assistance of a gentleman of high professional talents. It was, however, requisite to obtain the sanction of the Birman government, before Mr. Wood could commence astronomical observations; and, in reply to an application made through the Maywoon of Pegue, the most liberal encouragement was given to proceed with the observations. Being obliged at night to leave the grove and go out on the plain, in order to have a distinct view of the heavenly bodies, the peasants that inhabited the neighbouring villages believed him to be a necromancer; and his telescope and time-keeper instruments of magic. In their wonder they sometimes crowded about him so as to disturb his operations; but it was nothing more than harmless curiosity; they wanted to discover by what means he held com-

munication with the Natts, the supernatural and invisible agents of the air.

The reputation which the Bengal draughtsman belonging to the deputation had acquired by his botanical drawings, having come to the knowledge of his Birman majesty, or, in the Birman phrase, having reached the Golden Ears, the king was pleased to desire a specimen of his skill, and sent a painting on glass, executed by Siamese artist in his own service, signifying his royal will that it should be copied upon paper. This picture, which was a tolerable performance, represented the mode of catching wild elephants in the forests. It was thus described: The hunters, mounted on tame elephants that are trained to the business, by lying flat on their backs, introduce themselves unnoticed into a wild herd, and take an opportunity to cast a running noose in the track of the one that is meant to be secured. The other end of the rope is fastened to the body of the tame elephant, who immediately throws the wild one down; a battle then ensues, in which the trained elephant, being assisted by its associates, soon overpowers the inhabitant of the woods, who is deserted by all others; it is afterwards borne away a prisoner

that bound by two of its captors, whilst another
moves on at its head, and a fourth urges it be-
hind. In a few weeks, by proper discipline, the
animal becomes docile, and submits to its fate.
Those that are taken in this manner are for the
most part females. Male elephants are usually
trained by the blandishments of the females,
trained for the purpose, into an inclosure or
Kedah, from whence they cannot extricate
themselves, and are easily secured.

When a public minister is delegated from a
foreign power to the Birman court, it is the
established custom for the Maywoon, or governor
of the frontier province which the minister first
enters, to provide for his conveyance to the
capital, and to attend to his convenience so long
as he continues to reside in the country; a service
which he is frequently obliged to perform in
person.

As the time approached that was appointed for
my public entry into Ummerapoora, says Colonel
Munro, which as yet we had only viewed from
our residence on the opposite bank of the lake, I
deemed it proper to make some enquiry respecting
the ceremonials usually observed on such occa-
sions, and the exterior forms of homage that
would be required. I wished also to ascertain
the relative degree of rank that would be given
to the agent of the Governor General of India;
and as I was officially given to understand that
the Chinese deputies were to be introduced on
the same day, I urged my right to precedence,
with the thorough persuasion that they did not
constitute an imperial embassy, but were merely
provincial legation, although probably sanctioned
by the monarch of China. The necessity of
ascertaining these points became evident, from the
superstitious regard to external forms which the
Birmans manifested upon every occasion. The
Colonel was informed that he should be allowed
parity of rank with the nobility of the court, and
precedence over the Chinese deputies would
be granted to him.

On the 29th of August, the day preceding that
on which the deputation was to be formally in-
duced, the Colonel received a message, de-

siring to know what number of attendants he
meant to take with him, and to specify the rank
they bore, particularly that of the pundit, the
moonshee, and the painter. He was at the same
time acquainted, that it was not customary to
admit armed men into the palace. Late in the
evening he received another message, informing
him, that the profession of Dr. Buchanan was
held by the Birmans in a less dignified estimation,
than it bore among Europeans; and that it was
unusual, on such solemn occasions, to receive a
person of his station into the Lotoo, or great
council hall. He endeavoured to vindicate the
liberal and enlightened profession of medicine;
and the difficulty was at length overcome. They
agreed to receive the doctor, but stipulated that
he should ride on horseback in the procession,
and not be indulged with an elephant, a privilege
which, they said, was granted only to persons of
the highest consequence.

Preparatory to their visit, the presents intended
for his Birman majesty were carefully assorted,
and put into separate boxes. The next day,
(the 30th) they took an early breakfast, and the
Seree-dogee, or secretary of the Lotoo, acquainted
them that boats were prepared to convey them
across the lake. The presents having been sent
before, they walked to the water side, attended
by Baba Sheen, the Seree-dogee, and several in-
ferior officers. Three war-boats were ready at
the bank to receive them: the largest was of fifty
oars. In about twenty minutes they crossed the
lake, where three elephants and several horses
were waiting to convey them, and some Birman
officers of inferior rank attended at the bank,
dressed in their robes and caps of ceremony.
The furniture of the animals we were to ride was
far from being superb. Men of rank in the
Birman empire always guide their own elephants,
and sit on the neck, in the same manner that the
drivers or mohaats do in India. Owing to this
custom they are unprovided with those commod-
ious seats in which an Indian gentleman reposes
at ease on the back of this noble beast, whilst the
government of it is entrusted to any other
person*.

The

The procession was marshalled in the following order:
the maha-gaun, or master of the ceremonies, on horseback;
the maha-pussee, or register of strangers, on horseback;
the maha-sere, or register of presents, on horseback;

dressed in their official robes or cap. Soldiers that com-
posed the escort. The elephant of the representative of the
Governor-General; Mr. Wood and Dr. Buchanan on horse-
back; Baba Sheen, as chief interpreter. The Chinese
deputies,

The procession being arranged, they commenced their march, keeping a moderate pace, so as not to distress the bearers of the presents. After proceeding a short way, they entered a wide and handsome street that was paved with brick: the houses on each side were low, built of wood, and covered with tiles; they had been evidently prepared for the occasion, being fresh whitewashed, and decorated with boughs and flowers; the shops, which are usually open towards the street, displayed their best goods. In front of each house was a slight latticed railing of bamboo, advanced into the street, to the distance of three or four feet; over this space was spread a shade of bamboo mats, that reached from the eaves of the houses to the railing, forming a sort of covered balcony, every one of which was crowded with spectators, men and women indiscriminately. They proceeded till they came to the rhoom, which was a lofty hall, raised four or five feet from the ground, and open on all sides: it was situated about a hundred yards from the gate of the palace court, in the centre of a spacious area. Putting off their shoes they entered the saloon, and sat down on carpets, that were spread for them, with their faces towards the palace gate. The presents intended for his Birman majesty were here deposited. They were delayed in the rhoom for two hours, till the arrival of the royal family, who came with numerous and splendid attendants. A few minutes after the Engy Tekien, or prince royal, had entered, they received a summons, in compliance with which they proceeded from the rhoom, observing the same order as before; the presents carried in front, and the members of the Chinese embassy following the English deputation. As they proceeded, the Sandohgaan was exceedingly troublesome, by calling on them to make frequent superfluous obeisances, whilst his manner of requiring them was conspicuously uncivil. The Colonel checked his insolence by observing, through Baba Sheen, that if the Sandohgaan wished him to proceed, he must alter his tone and demeanour. This reproof, however, had only a momentary effect: he soon resumed his arrogant behaviour, which he repeated

deputies, on elephants, preceded by their servants, bearing flags. A Woondock, or second counsellor of state. Two Terrezogeos, or officers who hold judiciary stations. The

throughout the day whenever opportunity offered. On approaching the gate the greater part of the attendants belonging to the English deputation were stopped, and not permitted to follow them; but the gentlemen of the embassy were requested to put off their shoes, which, of course, they immediately complied with.

The area is spacious, and contains the Lotoo or grand hall of consultation and audience, where the Woongees met in council, and where affairs of state are discussed and determined. Within this inclosure there is an inner court, separated by a brick wall, which comprehends the palace and all the buildings annexed to the royal residence. They ascended a flight of stairs, where is a noble saloon, or open hall, called the Lotoo, where the court was assembled in all the splendour that Birman pomp and grandeur could display. On entering this hall a stranger cannot fail to be surprized at the magnificence of its appearance; it is supported by seventy-seven pillars disposed in eleven rows, each consisting of seven. The space between the pillars is about two feet, except the central row, which is two feet wider. The roof of the building is composed of distinct stages, the highest in the centre. At the farther part of the hall is a high gilded lattice extending quite across the building, and in the centre of the lattice is a gilded door, which, when opened, displays the throne; this door is elevated five or six feet from the floor, so that the throne must be ascended by means of steps at the back, which are not visible, nor is the seat of the throne to be seen, except when the king comes in person to the Lotoo. At the bottom of the lattice there is a gilt balustrade, three or four feet high, where the umbrellas and other insignia of rank were deposited. The royal colour is white, and the umbrellas were made of silk of that colour, richly bespangled with gold. Within this magnificent saloon were seated, on their inverted thrones, all the princes and principal nobility of the Birman empire, each person in the place appropriated to his particular rank and station. Proximity to the throne is, of course, the mark of honourable station; which was occupied by the princes of the blood, the Woongees, the

servants of the embassy walked on each side, two by two, and a number of constables attended, with long white sticks to keep off the populace.

Engy Teekien (or heir apparent) sat on a small
stool, about six inches high; the other princes
on fine mats. The space between the central
pillars that front the throne is always left vacant,
for this curious reason, that his majesty's eyes
may not be obliged to behold those whom he
does not mean to honour with a look.

After we had taken possession of mats that
had been spread for us, says Colonel Symes, it
was civilly intimated, that we ought not to pro-
trude the soles of our feet towards the seat of
majesty, but should endeavour to sit in the
posture that was observed by those around us.
With this desire we would have readily complied,
if it had been in our power, but we had not yet
learned to sit upon our legs. The flexibility of
muscles which the Birman, and indeed all the
natives of India, possess, is such as cannot be ac-
quired by Europeans. A Birman, when he sits,
 seldom touches the seat with his posteriors, but
is supported by his heels. It is scarcely practi-
cable for an European, dressed in close garments,
to place himself in such an attitude; and if he
were able, it would be out of his power to con-
tinue long in it. We inverted our legs as much
as possible, and the awkwardness with which we
did this excited a smile from some; not a word,
however, was uttered, and our endeavours seem-
ed to give satisfaction. Eight Bramins in white
sacerdotal gowns, and silk caps of the same
colours, studded with gold, assembled round the
foot of the throne, within the balustrade, and
performed a long prayer in not unpleasing recitative;
this ceremony lasted a quarter of an hour. When
they had withdrawn, the letter from the Go-
vernor-General, which Colonel Symes delivered
to a Woondock, was placed on a silver tray in
front of the railing, and a Sandohgaan, or reader,
advanced into the vacant space, and made three
prostrations, touching the ground each time with
his forehead: he then read, or rather chanted, in a
loud voice, a Birman translation of the letter.
When this was done, he repeated his prostrations,
and next proclaimed a list of the presents for the
king. These several readings being finished, he
repeated his obeisances and retired. After an in-
terval of a few minutes, an officer, entitled
Akhaangee, advanced, and proposed a question
to the Colonel, as if from his majesty; on re-
ceiving an answer he withdrew, as it might be

Vol. II. No. CXIV.

supposed to communicate the reply; and returned
in an adequate time to ask another: thus he put
three separate questions, which were as follow:
"You come from a distant country; how long
is it since you arrived? How were the king,
queen, and royal family of England, when the
last accounts came from thence? Was England
at peace or war with other nations? and was your
country in a state of disturbance?" To these
questions the Colonel returned satisfactory
answers. In a few minutes after his last reply
had been conveyed, a very handsome desert was
set before the deputation, which consisted of a
variety of sweetmeats. There appeared to be
not less than a hundred different small fishes:
they tasted of a few, and found some of them
very palatable. About half an hour afterwards
they were informed by the Sandohgaan that there
was no occasion for them to remain any longer.
When they rose to leave the Lotoo, (his Birman
majesty not being present,) the Sandohgaan de-
sired them to make three obeisances to the throne,
by a slight inclination of the body and raising
the right hand to the head. They were then
reconducted to the saloon, where they were
informed it was necessary they should remain till
the princes came forth from the palace, and had
got upon their elephants, as their etiquette did
not allow any person, on such occasions, to
mount before the members of the royal family.
They accordingly took their places in the hall as
before; and shortly afterwards the court broke
up with as much form and parade as it had as-
sembled; although it differed in some particulars.

With a people less attentive to punctilio, or
less regardless of the privileges and external in-
dications of rank, I should certainly (says the
Colonel) not have considered it necessary to con-
trovert matters of no intrinsic value in themselves,
but which, when intended to produce an effect
on the minds of those who can only judge from
appearances, become, to a person in a public
capacity, of real importance. Every occurrence
of this day, and every object that presented itself,
evinced the previous care that had been bestowed
on the minutest points of etiquette: the utmost
splendour of the court had been displayed on the
occasion; and I was credibly informed, that the
non-appearance of his majesty was neither cus-
tomary when a foreign minister from a sovereign
state was to be introduced, nor owing to any ac-

7 N

cidental

cidental prevention: but that it was a matter predetermined, in order to afford a pretext for spreading abroad that the representative of the English nation had delivered his dispatches, and rendered tribute, (for so they denominated the presents,) without being honoured with an interview of their king. These apparent indications of arrogance, which were not diminished by the unworthy artifice of making me believe that his majesty was to have received in person the letter from the Governor General, as coming from a sovereign and an equal power, gave me reasonable grounds to be dissatisfied with the manner in which the ceremonials had been conducted, and made me suspect the real light in which it was the wish of the court that I should be considered. As nothing degrading to my public character, however, had yet been avowed, I refrained from any formal declaration of my sentiments till subsequent circumstances confirmed my conjectures, and rendered an explanation unavoidable. Every thing being satisfactorily explained, the answer of his Birman majesty was at length received; by which it appeared, that several advantages

were granted to the English; and it was apprehended, that by the intercourse likely to take place between British India and the Birman nation great benefit would accrue to the English.

Having settled every thing relative to the mission, and received the presents for the Governor-General, the deputation arranged matters for their departure, and accordingly returned to Bengal.

Timber for maritime purposes is the only article the Birman empire produces of which we stand in indispensable need, and to promote and encourage the culture and exportation of those commodities which form the valuable staples of British India, almost all of which the kingdom of Ava is capable of yielding, would operate to the manifest injury of our own provinces. We require, and should seek for nothing more than a mart for our manufactured goods, and, in return, to bring back their unwrought materials. Interference in any other shape, appears to be impolitic, and likely, in the end, to prove prejudicial to ourselves.

END OF SYMES'S EMBASSY TO AVA.

OBSERVATIONS

MADE ON A TOUR FROM

BENGAL TO PERSIA,

In the Years 1786-7.

WITH A SHORT ACCOUNT OF THE REMAINS OF THE CELEBRATED

PALACE OF PERSEPOLIS.

BY WILLIAM FRANKLIN,

Ensign on the Honourable Company's Bengal Establishment.

SECTION I.

Embarkation from Calcutta—Description of Point de Galle—Anjengo—Cochcen—Tellicherry—Goa—Tomb of Xaviere—Bombay described—Muscat—Abu Shehr—Journey to Shirauz—Description of Shirauz; Tomb of Hâfiz; Rocknabad; Mosellay; Tomb of Sadi; remarkable Channel—Marriages of the Persians—Christenings, or naming of Children in Persia—Funerals of the Persians—Price of Blood—Police at Shirauz—Persian Festivals—Fruits of Shirauz—Breed of Horses—Manufactures and Trade—Climate—Character of the Modern Persians—Women of Shirauz—Superstition of the Persians; their Talismans; Manner of charming Scorpions—Mode of Living.

ON the 27th of February 1786, Ensign Franklin embarked at Calcutta on board the ship *Yarmouth*, Captain Greenly commander, for Bombay, in his way to Persia; and on the 4th of March arrived at Point de Galle, which is a small fort, situated on the south-west side of the island of Ceylon. The inhabitants, excepting the Dutch, are a mixture of Malabars and native Portuguese; but great numbers of the latter, especially of the lower class of people. The living here is very cheap, but there is little trade. Topazes, amethysts, and other precious stones, are found on the island of Ceylon, and brought here for sale; but it is dangerous to purchase them, when set, without being skilled in those commodities; the people who sell them being very expert in making the false stones appear like the true ones, by colouring them at the bottom. No kind of spice, nutmegs, or any other rarities

* I observed, (says the Ensign,) in the course of a few days' stay on shore; several people whose legs were swelled in a most extraordinary manner; this the natives account for, from the badness of the water, and the vapours which

for which this island is so celebrated, are to be met with at this place. The harbour is circular; at the entrance of it lie many rocks, just above the surface of the water, which make it dangerous for strange ships to go in, without a pilot; the waves beat with amazing violence against the fortifications. Along, and almost all around the harbour, are the country-houses of the inhabitants, which have a pleasing effect; the road to these, by land, is through a grove of cocoa-nut trees, which forms an agreeable shade. However, this place must be very unhealthy, as high hills lie close behind the houses, and exhale noxious vapour both morning and evening, which make it precarious to the inhabitants in point of health; they are in general sickly, but particularly Europeans*. Fish is to be had here in great plenty; poultry of all kinds is very scarce; the fruits are chiefly plantains, pine apples, and

arise from the adjoining hills. I have heard that the inhabitants of Malacca are liable to the same disease, and similar causes.

pumple

pumpkin noses; the cocoa nuts are also in great plenty and very good; the bread is tolerable, but the butter execrable, it being little better than train oil.

On the 29th saw the land a little to the eastward of Cape Cormorin, and on the 31st of March came to anchor in the roads of Anjengo, which is a small fort and English residency, the first that you arrive at upon the Malabar coast from Cape Cormorin: the inhabitants are Malabars and native Portuguese, mixed. It is reported to be one of the first places in India for intelligence, and the English have received great service from it in that respect during the American war. At Anjengo there is a post to several parts of India; this is but lately established.

On the 9th of April, came to anchor in Cocheen roads, and went on shore immediately. Cocheen is very populous, and a place of great trade; the inhabitants are a mixture of a variety of Eastern nations, being composed of Malabars, Armenians, Persians, Arabians, Jews, Indians, and native Portuguese. The Jews occupy a whole village, a little to the westward of the town; they live separate from the rest of the inhabitants: the Ensign went into several of their houses, and could not help observing, in this people, a striking peculiarity of features, different from any he had ever seen; a resemblance seemed to run through the whole, as if they were all of one family: they seldom or ever marry out of their own tribe, by which the likeness is preserved, from father to son, for a long time. The same similarity of features is to be observed amongst the Jews of Amsterdam in Holland, and other parts of Europe: This certainly serves to distinguish them more as an original people than any other. They have a good synagogue here, and are less oppressed, and have more liberty, than in most other parts of the East. The rajah of Cocheen resides here, but lives in an indifferent state. He is a Gentoo. Cocheen, in former times, was a place of considerable celebrity, and was one of the places pitched upon by the first Portuguese

* Here the English troops sustained a severe siege for several years, against the army of Hyder, under the command of Sadik Khan; however, on the arrival of Major Abington with a reinforcement from the Bombay settlement, the garrison made a most spirited and successful sally; in which, having defeated the enemy and killed great numbers of them, they at length compelled them to raise the siege; obtaining, at the same time, a considerable booty of horses,

settlers in the East, after the discovery of the passage round the Cape of Good Hope by Vasco de Gama; but that people have now very little left of the vast wealth and power they formerly enjoyed; a revolution of three centuries has reduced them below mediocrity in the general scale of European adventurers. The fort is a very large one, and very well fortified on the land side; towards the sea not so well, but it is secured by a very dangerous bar, which will not admit of ships coming nearer the shore than three or four miles. Provisions of every kind are to be had here in the greatest plenty.

The 10th, sailed; and on the 15th, came to anchor in Tellicherry roads. Among other places which he saw in and about Tellicherry, he had a view of the fortifications, or rather of the regular lines drawn round Tellicherry, for the defence of the place. These lines are exceedingly strong; they take in a space of about three miles and a half in circumference, and are well defended by batteries and redoubts; a river runs parallel to the western angle, which breaking off from thence runs among the hills*. The lines in some parts appear rather out of order, as they have not been thoroughly repaired since the siege of the place. The garrison of Tellicherry consists generally, in time of peace, of one battalion of sepoys, a company of artillery, and sometimes a company of European infantry; they are also able to raise about three thousand native militia. The view of the country around Tellicherry is very pleasant, consisting of irregular hills and vallies. Tellicherry is esteemed by all who reside there, to be one of the healthiest places in India, Europeans seldom dying there; it is also much resorted to by convalescents: the sea produces plenty of fine oysters, and provisions of all kinds are to be had in abundance. Here in the Company's garden, is the pepper vine which grows in a curious manner, and somewhat similar to the grape; the pepper on it, when to gather, appears in small bunches; it is in something larger than the head of a small pe-

tents, and elephants. The General of the enemy was dangerously wounded and taken prisoner, and died a few days after, of that and a broken heart, at Tellicherry. He lies buried close to the fort of Tellicherry; a tomb has been erected to him, in which lamps are continually burning, which many Mussulmen visit out of respect to the memory of the deceased.

* The town brought actions, also re

V

board, at Tellicherry.
Tellicherry; a tomb
are continually built
of respect to the men

the pepper, however, for the Company's ships' cargoes; is brought from some distance in the country. Tellicherry also produces the coffee tree. On the 29th, anchored in the roads of Goa, off the Fort Alguarda. Goa is a large city, and was once populous; it is the capital of the Portuguese settlements on this side the Cape of Good Hope; it is the residence of a Captain-General sent from Portugal, who lives in great splendour. The city stands upon the banks of a river of the same name, about twelve miles distance from the entrance of the harbour: the view up this river is truly delightful; the banks on either side are adorned with churches; and country-seats of the Portuguese, interspersed with groves and vallies; the river has several pleasing openings as it winds along, its banks are low, but the hills behind rise to an amazing height, and add grandeur to the spectacle. The city of Goa itself is adorned with many fine churches, magnificently decorated; and has several handsome convents; the church of Saint Augustinae is a noble structure, and is adorned in the inside by many fine pictures; it stands on the top of a hill, from whence is an extensive view of the city and adjacent country: it is a circumstance that has always been observed; and very justly, that the Portuguese have ever chosen the spots for their convents and churches in the most delightful situations. The body of this church is spacious, and the grand altar-piece finished in the most elegant style. The building of the choir is of Gothic architecture, and therefore of antiquity. This church has a convent adjoining to it, in which live a set of religious monks, of the order of St. Augustine. Adjoining to this church is a convent of religious women, who have taken the veil, and are therefore prohibited from all kind of intercourse with the world: these chiefly consist of the daughters and nieces of the Portuguese inhabitants of the place; and a sum of money is generally given with them, on their entrance into the convent. A little lower, on the declivity of the hill, stands another church, dedicated to the Bon Jesus, in which is the chapel of Saint Francisco de

* This chapel is a most superb and magnificent place; the tomb of the saint is entirely of fine black marble, brought from Lisbon; on the four sides of it the principal actions of the life of the Saint are most elegantly carved in basso relievo; these represent his converting the different

Xaviere, whose tomb it contains*. On the sides of this chapel are excellent paintings, done by Italian masters; the subjects chiefly from scripture. In the valley below is another convent for young ladies who have not taken the veil; out of this convent the Portuguese and others who go there may marry: some of the ladies have small portions, others none.

The Captain-General of Goa is also Commander in Chief of all the Portuguese forces in the East Indies. Goa is at present on the decline, and in little or no estimation with the country powers; indeed their bigotry and superstitious attachment to their faith is so general, that the inhabitants, formerly populous, are now reduced to a few thinly inhabited villages; the chief part of whom have been baptized; for they will not suffer any Mussulman or Gentoo to live within the precincts of the city; and these few are unable to carry on the husbandry or manufactures of the country. The court of Portugal is obliged to send out annually a large sum of money, to defray the current expences of the government; which money is generally swallowed up by the convents and soldiery. There was formerly an inquisition at this place, but it is now abolished; the building still remains, and by its black outside appears a fit emblem of the cruel and bloody transactions that passed within its walls! Provisions are to be had at this place in great plenty and perfection; the Captain-General lives in great state.

May 13th, saw the light-house at Bombay; the island of which name is in the possession of the English East India Company; it is situated on the coast of Conkan, in lat. nineteen degrees North, and long. seventy-two degrees thirty-eight minutes East; it was granted, as part of the marriage portion with the infants of Portugal, to Charles II. The harbour is capable of containing three hundred sail of ships, with the greatest safety: there is also a most excellent dock, in which ships of his Majesty's squadron, and others, are repaired, refitted, and completely equipped for sea. They build also here all sorts of vessels; and the workmen in the yard are very

unions to the Catholic faith; the figures are done to the life, and most admirably executed: it extends to the top in a pyramidal form, which terminates with a coronet of mother-of-pearl.

ingenious and dexterous, not yielding to our best ship-wrights in England. This island is very beautiful, and as populous for its size as any in the world; merchants and others coming to settle here from the different parts of the Deckan, Malabar, and Coromandel; as well as the Guzérat country: amongst those of the latter place, are many Parsee families; these are descended from the remains of the ancient Guebres, or worshippers of fire: most of the country merchants, as well as the menial servants of the island, are of this faith. They are very rich, and have in their hands the management of all mercantile affairs. Their religion is much corrupted from the ancient worship; they acknowledge that several Hindoo forms and ceremonies have crept in amongst them, probably in compliance to the natives; in order to conciliate their affections*. The island of Bombay is about eight miles in length; and twenty in circumference: the most remarkable natural curiosity the island produces is a small fish; this fish, according to the description of a gentleman who has seen it, is in form somewhat like a muscle, about four inches long, and has upon the top of its back, and near the head, a small valve, on the opening of which you discover a liquor of a strong purple colour, which, when dropped on a piece of cloth, retains the hue. It is found chiefly in the months of September and October; and it is observed the female fish has not this valve, which distinguishes the sexes†.

The breed of sheep on this island is very indifferent, and all the necessaries of life are much dearer than in any other part of India. A work on this island is worthy of observation; it is a causeway on the southern part, about a mile in length, and forty feet in breadth, eight of which on each side are of solid stone; the remainder in

* It seems their sacred book, the Zend, which is said to have been written by their celebrated prophet Zerdusht (called by us Zoroaster) is at present only a copy of a few centuries; which must of course, invalidate its authenticity; as that prophet, according to the Persian historians, lived more than three thousand years ago; and indeed it is an indisputable fact, that what religious books were in being at the time of the Grecian conquests of that country, were carefully collected and burnt, by the express orders of Alexander, and were totally destroyed at the subsequent conquests of that country by the Saracens: at which period also happened the introduction of the Mohammedan religion. By these means their religion and language underwent a total

the centre is filled up with earth, a cement of clay, and other materials; the whole forming such a body as will endure for many ages. This work keeps up the communication with the other parts of the island during the season of the Monsoon, which would otherwise overflow it, and cause infinite damage.

December 13th; after being detained seven months at this island, for want of a passage, he at length embarked on-board an Arabian ship, bound for Bussora. There was on-board an exact epitome of Asia, being a collection of Armenians, Persians, Arabians, Ethiopians, Jews, Greeks, and Indians; who created as much confusion of tongues as at the building of the tower of Babel.

On the 24th, saw Cape Rosalgate; and on the 1st of January, 1787, came to anchor in the harbour of Muscat: the entrance into this harbour is truly picturesque; it has a bold shore, with a range of high mountains extending about sixty miles in length from Cape Rosalgate (which is opposite the Sciodian Gulph), to Muscat, and forms a very grand natural prospect; the ruggedness of the rocks marking very characteristically the country of Arabia. The inner harbour is guarded by two forts, very indifferently situated. Muscat itself is a place of considerable trade, as well with the Arabian and Persian Gulphs, as with Surat, Bombay, and the Coasts of Malabar and Coromandel. The town, as is usual in most Eastern countries, is badly built, and the streets very narrow; they have, however, a good and well furnished bazar, (market,) roofed at the top; the streets cross each other at right angles, and to each is allotted its particular merchandises for sale. Muscat lies in lat. twenty-three degrees fifteen minutes N. opposite to the Gulph of Ormuz, and is governed by an Imaum, or inde-

pendent prince, who has long since disappeared, as is evident by the many fruitless efforts made to decipher those inscriptions still discernible on the walls of Persepolis, bearing not the least analogy to any character now existing. Hence it may be inferred, that what is now given as the ancient character and language of this celebrated people, is no more than an invention of a later date, and there remains not a probability that their real Zend will ever be known.

† It is not improbable to suppose that this fish is of the same nature as the ancient Murex or shell fish, by which the Romans attained the art of dyeing to such perfection, and is similar to that found formerly on the coasts of Tyre.

pendent prince, over the province of Oman, of
which Muscat is the capital. This province
of Oman is a part of Yemen, or Arabia Felix;
the Imaum resides at a distance of two days
journey inland, where he lives in splendour.
The whole country round this place is one con-
tinued solid rock; without a blade of grass, or
any kind of verdure to be seen; but this barren-
ness the natives affirm to be amply recompensed
by the fertility and beauty of the inland country*.
Several Gentoo merchants reside here, for the
convenience of trade; also a broker on the behalf
of the English East India Company; but the
government will not admit of any European
factory being established. The police in Muscat
is excellent. Captain James Mitchell, our fellow-
passenger, died, to the great grief of us all: we
interred him the same day, on shore, at Muscat;
a Dutch ship lying in the harbour, commanded
by Captain Stewart, saluted the corpse on going
on shore with nine guns, as did also an English
sloop, there at the same time. His funeral was
decently conducted as circumstances would
admit, and every attention possible was paid to
his remains.

On the 26th, we sailed for Bussora, and on
the 28th of February arrived at Abu Shehr,
which is a small sea-port town on the coast of
Persia, and is under the government of a Sheich,
who is tributary to Shirauz. The English East
India Company have a factory here, but little
business is carried on; caravans come frequently
to this place from Shirauz, and bring the com-
modities of that city, which are exported to dif-
ferent parts of India. An opportunity offering
of proceeding to Shirauz, Ensign Franklin em-
barked it, and accordingly determined to set out
with a cafila or caravan, just then on the point of
departure. On the 15th of March, he left Abu
Shehr; the cafila consisted of about thirty mules,
and twenty or thirty horses; these and camels
being the only mode of travelling made use of in
this country. The first day's march was about
four fursengs, or sixteen English miles; the road
setting out lay over a barren plain, but the

The reflection of the sun from these rocks must neces-
sarily cause intense and almost insupportable heats, which
during the summer season are so great, that all the natives,
who are able, retire inland as soon as they commence this;
and to the fatal effects of the small-pox, for which they
have no cure, being ignorant of the application of medicine,

latter part of the way coming to some verdure,
they halted at a place called Checanduck†. The
16th they travelled four fursengs, the most part
in the night, and arrived about eight o'clock in
the morning, near Berazgoon, a considerable
and populous village, surrounded by a brick
wall, and flanked with turrets; under the do-
minion, and dependent of, Shirauz.—Halted
that day and the next, for the purpose of shoeing
the horses and mules belonging to the cafila, pre-
paratory to ascending the mountains, they were
now approaching. On the 18th encamped near
the village of Dowlakie, distance three fursengs.
19th, entered the narrow pass which is the road
to the four mountains, and is exceedingly difficult,
from the great number of loose stones. On the
20th, began to ascend the first mountain, at the
distance of six fursengs, which is very high, and
the road almost impassable, from the vast number
of large loose stones that had fallen down on
each side in the way: near two miles of the latter
part of the ascent is almost perpendicular, and
so very narrow as only to admit of one person or
beast of burden passing at a time: the scene was
truly disagreeable and even dangerous, from the
steep precipices, and frequent slipping and falling
of the horses and mules; the only means of safety
on one side depended on a small parapet wall,
about three feet high; on the other the mountain
towering up into the clouds strikes the beholder
with an awful dread; a broad and rapid river
runs at the bottom, which by its roaring adds to
the terrific grandeur of the scene. Having attained
the summit, there is a level extensive plain;
which is about four fursengs, or sixteen miles, in
extent; it is situated between the mountains, and
abounds in game, particularly the red-legged
partridge, which we saw in great abundance.
A little after nine we encamped at the village of
Khisht; where they began to experience a sensible
alteration in the weather. At Dowlakie, in the
valley below, they were almost scorched to
death with heat; whereas the air on the top of
this mountain, and the plain of Khisht, is very
sharp and piercing; distance three fursengs. 21st,

causes the people in general to be afflicted with disorders in
their eyes; so much so, that you scarcely meet one person
out of three, who has not visibly suffered from either of
the causes above mentioned.

† The Persian furseng is the *Parasanga* of the Greeks,
and is equal in measurement to nearly four English miles.

being

being the Persian festival of the Nooroze, or New Year's Day, we halted*.

22d, ascended the second mountain, which is still higher than the former, but the road not so dangerous; and arrived at the village of Comariget†. This day they travelled three fursengs; on the 23d, arrived at the city of Kazeroon, distance five fursengs. On the 24th, arrived at the foot of the third mountain, situated on the confine of the plain, where the city of Kazeroon is built; distance three fursengs. 25th, began to ascend the third mountain, which although not so high and steep as the two former, yet is sufficiently so to make the ascent uneasy and difficult; a great part of the road on one side is made of masons work entirely, the materials hewn out of the mountain: it has a parapet wall of about three feet high, like the former: its ascent is winding. Arrived in four hours in a most delightful valley, by an easy and gentle descent; entirely covered with a species of the oak and birch, which being situated between two high mountains, is extremely pleasant; the air began now to be piercing cold, and the snow lay very thick on the mountain, which they were to pass the next day; proceeded on through the valley; and encamped about nine o'clock at the foot of the fourth and last mountain, in the way to Shirauz; distance travelled this day three fursengs. 26th, began to ascend the mountain, which the Persians call the Peera Zun, or the old woman, by way of distinction. This is higher than all the former, and near twelve miles in length. The view from the top is most strikingly romantic, the three preceding mountains seeming beneath your feet; the summit is covered with snow, and in many places where the rain had fallen, was ice of considerable thickness. Below, on each side, they beheld the

* In the ancient times of Persia this day used to be celebrated with great joy and festivity throughout the empire, and has since been kept as such under the Mohammedan government. The people of the casila made themselves as merry as their circumstances would admit of; and although in general the food of these people is no more than a few dates and butter-milk, yet on this occasion, the Cheharwader, or master of the casila, sent to the neighbouring village, and procured some mutton, which he gave to his men, and partook with them of a comfortable pilau.

† At this place the Rah Dar, or toll-gatherer, demanded one *tomun* (about thirteen rupees), as a toll, although the custom for every passenger, whether European, Jew, or

vallies opening to the beauties of spring, well watered by running streams, the great lake on the plain of Kazeroon appearing in its full extent. By a steep descent they gained the plain below, and encamped near the village of Desterjin.— This day we travelled four fursengs and a half. 27th, arrived at the village of Khoon Zineoon: near this village runs a very pleasant river, which extends to Shirauz†. 28th, arrived at a caravanaserai in ruins, near the village of Chinai Rehadar. This day we travelled four fursengs. 29th, arrived in safety at the city of Shirauz, the place of his destination, four fursengs.

Shirauz, the capital of Farsistan, or Persia Proper, is situated in a valley of great extent and surprising fertility; this valley is twenty-six miles in length, and twelve in breadth, and is surrounded on all sides by very high mountains: it lies according to Mr. Niebuhr, in 29° 30' 31" N. about a hundred and ninety-six miles to the North-East of Abu Shehr. The purity of the air of this place has at all times been celebrated and with great justice. The city in circumference is one furseng and sixty measured paces the fortifications, considering the country, are tolerably good; a wall extends quite round the city, five and twenty feet high, and ten thick with round towers at the distance of eighty paces from each other. Shirauz has a most excellent dry ditch around it, the work of the late Vali Kerim Khan; it is sixty feet in depth, and twenty in breadth, and would alone, exclusive of the other works, enable the city to hold out a long time against any power in Persia, where artillery is but little known, and less used. The city has six gates; each of which has an appointed guard allotted to it, of one hundred men; and four Khans or officers, who every morning and evening attend at the citadel

Armenian, is only one *plastre*, which is equal to one *rupee*. He alleged that I was a *Feringi* (Christian), and therefore ought to pay more. As the *Ensign* had no resource, he would have been obliged to comply, had not the master of the casila opposed the imposition, and threatened to complain on our arrival at Shirauz; on which the toll-gatherer desisted.

† Mr. Niebuhr has laid this down as the *Rodhe*, probably from the people who gave him his information, calling it *Rood Khoona*, as that name in Persian implies stream, or river; the natives of the place mentioning it the appellation of *Rood Khoona Zineoon*, or the river Zineoon.

order to pay their compliments to the Khar, or
in his absence to the Beglerbeg. It is the duty
of these guards to prevent all persons departing
from the city who have not permission so to do;
and if any person noxious to government, escapes,
the officer's head answers for it. The gates of
the city are shut at sunset, and opened at sunrise,
during which periods no person is permitted to
pass in or out.

Within the city, at the upper end, nearest to
the gate Râg Shâh, stands the Citadel, which is
built of burnt brick, and is a square of eighty
yards circumference, flanked with round towers,
and encompassed with a dry fosse of the same
breadth and depth as that of the city; this is
called by the Persians the Ark, and is also the
work of Kerim Khan; it also serves occasionally
as a state prison*. Opposite to the citadel, in a
large handsome square, is a gallery where the
Khan's music, consisting of trumpets, kettle
drums, and other instruments, plays regularly
at sunrise and sunset. When the Khan is in
camp, or on a journey, these are always placed
in a tent near him: one side of this square leads
to the Dewân Khân, or chamber of audience,
and the other opens into a street which leads to
the great mosque. The Dewân Khâna is a very
handsome building, situated at the upper end of
a large garden, to which you are conducted
through an avenue, planted on each side with
the Persian Chinar tree, a species of the sycamore.
The chamber of audience is a large building, of
an oblong form, with an open front; the inside,
about one-third up the wall, is lined with white
marble from Tauris, and the ceiling and other
parts are ornamented with a beautiful gold
enamelled work, in imitation of the Lapis Lazuli:
there are several pictures in it; some of which
are tolerably well executed. In front there are
three handsome fountains, with stone basins,
which are constantly playing. In the great square
before the Citadel is the Tope Khâna, or park of
artillery: it consists of several pieces of cannon
mounted on bad carriages, most of the guns
which are Spanish and Portuguese, excepting
two English twenty-four pounders) are so dread-
fully honeycombed, that they would certainly
not on the first discharge.

* At the door of the Ark is a painting, done in very
vivid colours, representing the combat between the cele-
brated Persian hero Rostum, and Doero Sifed, or the

Shirauz has many good bazars and caravan-
serais: that distinguished by the appellation of
the Vakeel's bazar is a long street, extending
about a quarter of a mile, built entirely of brick,
and roofed something in the style of the Piazzas
in Covent Garden; it is lofty and well-made; on
each side are the shops of the tradesmen, mer-
chants, and others, in which are exposed for sale
a variety of goods of all kinds: these shops are
the property of the Khan, and are rented to the
merchants at a very easy monthly rate. Leading
out of this bazar is a spacious caravanserai, of an
octagonal form, built of brick; the entrance
through a handsome arched gate-way: in the
centre is a place for the baggage and merchandise,
and on the sides above and below commodious
apartments for the merchants and travellers; these
are also rented at a moderate monthly sum.
About the centre of the above-mentioned bazar is
another spacious caravanserai, of a square form,
the front of which is ornamented with a blue and
white enamelled work, in order to represent
China ware, and has a pleasing effect to the eye.
This building is larger than the former, and is
chiefly resorted to by Armenian and other Chris-
tian merchants; there are besides separate bazars
in Shirauz, for the different companies of artificers,
such as goldsmiths, workers of tin, dyers, car-
penters, joiners, hatters, and shoemakers; these
consist of long streets, built very regularly, and
roofed.

The Jews have a quarter of the city allotted to
themselves, for which they pay a considerable
tax to government, and are obliged to make fre-
quent presents: these people are more odious to
the Persians than those of any other faith; and
every opportunity is taken to oppress and extort
money from them; the very boys in the street
being accustomed to beat and insult them, of
which treatment they dare not complain. The
Indians have a caravanserai allowed them in
another quarter of the city, for which they are
also under contribution. There is a mint at Shi-
rauz where money is coined, the process of which
is very simple, like most in other places of the
East, the gold or silver being laid in a dye fitted
for the purpose, and struck with a large hammer,
which completes the operation. Here also the

Whito Demon. The story is taken from Ferdousi's Shah
Nameh, and the figures are at full length, but ill-propor-
tioned.

public Serâfs (or money changers) set and regulate the exchange of gold and silver.

Shiranz is adorned with many fine mosques, particularly that built by the late Kerim Khan, which is a noble one: being very well disguised in a Persian dress, the Ensign had an opportunity of entering the building unobserved; it is of a square form; in the centre is a stone reservoir of water, made for performing the necessary ablutions or washings, previous to prayer; on the four sides of the building are arched apartments allotted for devotions, some of the fronts of which are covered with China tiles; but Kerim Khan dying before the work was completed, the remainder has been made up with a blue and white enamelled work of the kind before described. Within the apartments, on the walls, on each side, are engraved various sentences from the Korân, in the Niskhi character; and at the upper end of the square, is a large dome with a cupola at top, which is the particular place appropriated for the devotion of the Vakeel; this is lined throughout with white marble, ornamented with the curious blue and gold artificial lapis lazuli, and has three large silver lamps suspended from the roof of the dome: here mullahs or priests are constantly employed in reading the Koran. This mosque has very good detached apartments, with places for ablutions and other religious ceremonies; at a little distance, on the outside, the late Vakeel had laid the foundation for a range of very handsome buildings, which he designed to have been occupied by mullahs, dervishes, and other religious men; but, dying before the work was brought to perfection, the troubles in Persia since that period have prevented any other persons from finishing them, and in this imperfect state they remain at present; much to be regretted, as it would have added greatly to the beauty of the whole. In the centre of the city is another mosque, which the Persians call the Musjidi Noð, or the new mosque; but its date is nearly coeval with the city itself, at least since it has been inhabited by Mohammedans: it is a square building of a noble size, and has apartments for prayer on each side; in them are many inscriptions in the old Cufic character, which of themselves denote the antiquity of the place, in the centre of the square is a large terrace, on which the Persians perform their devotions, both morning and evening; this terrace is capable of containing

upwards of two hundred persons, and is built of stone, raised two feet and a half high from the ground; there are here two very large cypress trees of an extraordinary height, which the Persians affirm to have stood the amazing length of six hundred years: they are called Aâshûk Maâshûka, or the lover and his mistress, and are held by the people in great veneration. The mosque has a garden adjoining to it, and place necessary for performing ablutions.—In another quarter of the city is a square building of a very large size, formerly a college of considerable note where the arts and sciences were taught; but it is now decaying very fast: at present it goes by the name of Mudrussa Khan, or the Khan's college; but literature and the sciences have long since been neglected at Shiranz.

There are places in Shiranz, distinguished by the name of Zoðr Khâna, the house of strength or exercise; to which the Persians resort for the sake of exercising themselves. These houses consist of one room, with the floor sunk about two feet below the surface of the earth, and the light and air are admitted to the apartment by means of small perforated apertures made in the dome. In the centre is a large square terrace of earth well beaten down, smooth, and even; and on each side are small alcoves raised about two feet above the terrace, where the musicians and spectators are seated. When all the competitors are assembled, which is on every Friday morning by day-break, they immediately strip themselves to the waist; on which each man puts on a pair of thick woollen drawers, and takes in his hands two wooden clubs of about a foot and a half length, and cut in the shape of a pear; these they rest upon each shoulder, and the music striking up, they move them backwards and forwards with great agility, stamping with their feet at the same time, and straining every nerve, till they produce a profuse perspiration. After continuing this exercise about half an hour, the master of the house, who is always one of them, and distinguished by the appellation of Pehlwan or wrestler, makes a signal, upon which they leave off, quit their clubs, and, joining hands in a circle, begin to move their feet very briskly in unison with the music, which is all the while playing a lively tune. Having continued this for a considerable time, they commence wrestling; but before the trial of skill in this art begins, the

commence wrestling
in this art begins,

master of the house addresses the company in a particular speech, in part of which he informs the candidates, that as they are all met in good fellowship, so ought they to depart, and that in the contest they are about entering into, they should have no malice or ill-will in their hearts; it being only an honourable emulation, and trial of strength, in which they are going to exert themselves, and not a contentious brawl; he therefore cautions them to proceed in good humour and concord: this speech is loudly applauded by the whole assembly. The wrestlers then turn to their diversion, in which the master of the house is always the challenger; and, being accustomed to the exercise, generally proves conqueror, by throwing each of the company two or three times successively. The spectators pay each a Shahee, in money, equal to three-pence English, for which they are refreshed during the diversion with a calean and coffee. This mode of exercise bears some resemblance to the gymnastic exercises of the ancients.

The baths in Persia are very commodious, and well worthy the attention of a stranger; they generally consist of two large apartments, one of which furnishes an accommodation for undressing, the other is the bath; on the sides of the first are benches of stone, raised two feet from the ground, on which are spread mats and carpets, where the bathers sit to undress, and from thence they proceed to the bath through a long narrow passage. The bath is a large room of an octagon form, with a cupola at top, through which the light and air are admitted; on the sides of this room are small platforms of wood raised above a foot from the ground, on which the people who enter to bathe perform their devotions; a ceremony the Persians always previously observe: at the upper end of the room is a large bason or reservoir of water, built of stone, well heated by means of stoves underneath the bottom, with iron gratings over them; and adjoining is another reservoir of cold water, either of which the bather has his choice. When he comes out of the hot bath, which is generally in the space of ten or twelve minutes, the people of the house stand ready to perform the operation of rubbing, and to effect this he is laid at full length on his back, with a pillow to support his head; a brush made of camel's hair is then used, which completely rubs off all the dirt the body has contracted. After rubbing some time, they rinse the whole body with several

basons of warm water, and the person is reconducted to the dressing apartment, where he shifts and dresses at leisure, receiving a calean to smoke. The Persians are much more scrupulous than any other Eastern nation in permitting foreigners to go into their baths, which if attempted with their knowledge, they prevent.

During the spring, the baths in Persia are decorated in great finery, a custom distinguished by the natives under the name of Gul Reâzee (or the scattering of roses), from the vast quantity of those flowers strewed in the apartments; this ceremony continues a week or ten days, during which time the guests are entertained with music, dancing, coffee, sherbet, &c. and the dressing apartment is decked out with paintings, looking-glasses, streamers, and other ornaments, at the expence of the master of the hamaum, who compliments his customers on the occasion, though a small present is generally made by them to the musicians. The baths are used alternately by men and women every other day, but each sex generally use them once a week, or in every ten days at farthest.

The bath built by Kerim Khan is particularly beautiful; it has for the outer apartment a large handsome octagon, to which a light is conveyed from the top. To this bath none are admitted but those of a higher rank, it being chiefly used by the principal Khâns, or officers of the army, and their families.

In the centre of the city, adjoining to the Musjidi Noò is a very large building called the Shâh Cheraûg, or the king's lamp; it is considered as a place of the greatest sanctity about Shirauz, being the mausoleum of the brother of one of their Imaums, or heads of the faith; this place is of considerable antiquity, nor is the exact date of its foundation ascertained; but by an extract from the chronicles of the place, it appears to have been repaired by the celebrated Prince Azzud ud Dowlah Deilemee, of the family of Buyah, who was Emeer ul Omrah to one of the Khaliphs of the house of Abbâs, and was a prince of great abilities, learning, and piety. He reigned in the fourth century of the Mohammedan Hejira. This building was formerly magnificent, but is now going to ruin. The last person who repaired it was Kerim Khân, who gave it a complete new covering, but since his time it has been neglected, and has suffered much by rain and other accidents, owing to the
very

very great age of the building; which is about nine hundred years: however, there are at present some of the Imaum Zâdas, or descendants from their Imaums, residing in it, who are supported by the remains of the former ample revenues of the place.

The tomb of the celebrated and deservedly admired Hafiz, one of the most famous of the Persian poets, stands about two miles distant from the city walls, on the North East side, and nearest the gate Shâh Meerzâ Hamzâ. Here the late Vakeel Kerim Khân has erected a most elegant Ivân or hall, with apartments adjoining: this building is executed in the same style as the Dewan Khâna, nor has any cost been spared to render it agreeable: it stands in the middle of a large garden; in front of the apartments is a stone reservoir, in the centre of which is a fountain. In the garden are many cypress trees of extraordinary size and beauty, as well as of great antiquity. Under the shade of these trees is the tomb of the poet Mohammed Shems id deen Hâfiz, of fine white marble from Tauris, eight feet long and four broad: this was built by order of Kerim Khân, and covers the original one*. The principal youth of the city assemble here, and shew every possible mark of respect for their favourite poet, making plentiful libations of the delicious wine of Shirauz to his memory. Close by the garden runs the stream of Roknabad, so celebrated in the works of Hafiz; this, however, is now dwindled into a small rivulet, which takes its source from the mountains to the N. E. This water is clear and sweet, and in that respect deserves the fame it has obtained; it is held in great estimation by the modern Persians, who attribute medicinal qualities to it.

* On the top and sides of the tomb are several pieces from the poet's own works, most beautifully cut in the Persian Nustaleek character. During the spring and summer seasons, the inhabitants visit here, and amuse themselves with smoking, playing at chess, and other games, reading also the works of Hafiz, who is in greater esteem with them than any other of their poets, and they venerate him almost to adoration, never speaking of him but in the highest terms of rapture and enthusiasm: a most elegant copy of his works is kept upon the tomb for the purpose, and the inspection of all who go there.

† This hall is twenty-seven feet by eighteen, and forty feet high; one-third of the height of the hall is lined with white marble from Tauris, and the rest and the ceiling are ornamented with blue and gold enamel: it is built on the same plan as those of Hafiz and the Dewan Khâna, and is

The celebrated bower of Mosellây is situated a quarter of a mile to the westward of the tomb, but is entirely in ruins, no trace or vestige remaining of that pleasantness which you are taught to expect on perusing the works of Hafiz: yet one may judge by the situation, which is really a delightful one, that it might formerly have been agreeable. At present the country round about is rugged and barren, and now serves as a place for celebrating the Mohammedan festival of the Ide Korbân, or the ceremony which is observed on that day, in commemoration of Abraham's offering up his son Isaac whom they call Ismael.

A little to the northward of Hafiz's tomb, is a magnificent building, called by the Persians Hest Tun, or the Seven Bodies, on account of seven Dervishes or religious men, who coming from great distance to reside in this country, took up their abode on the spot where the above building is erected, and there remained until they all died, each burying the other successively, until the only survivor, who was interred by the neighbour upon this spot, and in memory of which even Kerim Khân erected a beautiful hall, with adjoining apartments†. Before the hall is a handsome stone reservoir, where the Persians observe their ablutions previous to their performing the devotions near the graves of the seven Dervishes (each of which have handsome tomb-stones on them), in a spot of ground allotted for that purpose.

On a parallel line with Hest Tun, about three quarters of a mile distant, is the garden of Gushai, so called from the pleasantness of its situation, signifying in Persian, *heart-expanding*: it is situated at the foot of a high mountain, and

really a noble building. It has also some tolerable paintings executed in the Persian style, amongst which is one of Abraham's offering up his son Isaac, with the angel descending; and another of Moses, when a boy, tending a flock of his father-in-law Jethro. Over the doors of the hall are placed the portraits of the two celebrated poets Hafiz and Sâdi, done at full length: that of Hafiz is in the old Persian dress. He is painted with a fresh complexion, and a very large pair of whiskers, and in picture appears to be about six and thirty years of age; the other, of Sheikh Sâdi, is the figure of a venerable old man with a long beard turned white by age, dressed in a religious dress, with long flowing robes, in his right hand holding a small crooked ivory staff, and in the other a charger of censers.

of which issues a stream of clear, fresh water, for the reception of which there has been made a succession of stone basons, so fashioned as to make the water fall down from one to the other, after the manner of a cascade, and at about sixty paces distant from each other; these forming separate falls, have a pleasing effect to the eye. In the centre is a summer-house, built of stone, through which the water runs by means of a stone channel: in this place the Persians sit and amuse themselves, smoking and playing at games of chance, and regale themselves with what they may have brought from the city. This garden is, upon the whole, extremely agreeable, the water clear and cold, and the air delightfully mild and refreshing.

A mile to the eastward of Dil Gushaie, is the tomb of the celebrated Sheikh Sâdi aforementioned, situated at the foot of the mountains that bound Shirauz to the N. E. and is a large square building, at the upper end of which are two alcoves, recesses in the wall; that on the right end is the tomb of the Sheikh, just in the state it was in when he was buried, built of stone, six feet in length, and two and a half in breadth: on the sides of it are engraved many sentences in the old Persi character, relating to the poet and his works*. On the top of the tomb is a covering of painted wood, black and gold, on which is an inscription of the Sheikh's, written in the modern Persi character, and on removing this board perceived the empty stone coffin in which the Sheikh was buried. This the religious, who come here, take care to strew with flowers, garlands, and various relics. On the top of the tomb is placed, for the inspection of all who sit there, a manuscript copy of the Sheikh's works, most elegantly described. On the side of the walls are many Persian verses, written by those who have at different times visited the place. The building is now going to decay. Adjoining

Sâdi flourished about five hundred and fifty years ago, and his works are held in great esteem amongst all the nations for their morality, and for the excellent precepts they inculcate.

This the present Persians superstitiously attribute to its having been built with what they call Pool Helaâl, or lawful money, i.e. money not acquired by oppression and tyranny; they say such buildings as have been erected by tyrants will moulder and fade away; whilst, on the contrary, the works of good and just princes endure for ages unhurt. They have formed these opinions by attending to the tra-

VOL. II. No. CXV.

to this building are the graves of many religious men, who have been buried here at their own requests.

A little to the left of this building, under ground, is a very remarkable channel, to which you descend by a flight of seventy stone steps; and at the bottom are surprized at the sight of a handsome building, of an octagonal form, through which the channel runs. It is built entirely of stone, which, although the work of many ages past, yet remains complete and perfect†. On the sides of this building are recesses and alcoves, where those who visit it sit and smoke, and find it perfectly cool and refreshing, even in the hottest day of summer.

A quarter of a mile to the northward of the gate Shaâh Meerza Hamzâ is a large octagon building, in the inside of which is the tomb of Abdurrahëem Khân, the second son of the late Vakeel Kerim Khân, who died in the twelfth year of his age. This tomb is eight feet in length, and three in breadth, standing in the centre of the room, covered with a piece of brocade; it is of very fine marble from Tauris, elegantly gilt: on the top and sides are inscriptions in the Persian language, well cut, in the Nustâleek character, and the room has a beautiful dome, with the cupola and sides ornamented with blue and gold enamelled work, imitative of China ware. The Persians excel all the eastern nations in this kind of enamel; and what makes it so pleasing to the eye, is the brightness of the colours, which far exceed, in their liveliness, any thing that can be done in Europe; and are equal to those produced in China.

Kerim Khân, amongst other beneficial works during his lifetime, built several summer-houses in the neighbourhood of Shirauz. The gardens in which they are, are laid out in agreeable style, though quite different to our ideas of the beauties of gardening; they consist generally of long

dition of the place, which they say was built by a king of Persia named Jemsheed, a prince famous in the Persian history for his piety and justice, and the same who built Persepolis, he having first, at a vast expence and much labour, dug out a stream of water from the adjacent mountains, which was conveyed by an aqueduct to this well, from whence it flows through a stone channel formed under ground, about two feet in breadth, and supplies all the places adjoining to Shirauz with excellent water. The present natives attribute great virtues to the supposed properties of this water, and are fond of bathing in it.

7 Q

strait

strait plantations of sycamore and cypress trees, planted regularly on each side the walk, in form of avenues, and have parterres of flowers in the centre, with stone fountains in different parts of the garden, which add much to the coolness and beauty of them. On the side of the walls are erected scaffoldings of wood, covered over at top with thin laths, on which the grape vines grow, and form pleasant arbours.

As the religion of the Persians is known to be Mohammedan, and as very good accounts have already been given of it, I shall touch but lightly on the subject; but as they are of the sect of the Shciâs, or followers of Ali, some of their customs, as well religious as civil, may probably differ from those of the Turks, who are of the sect of the Sunnies, or followers of Omar. We shall therefore make a few remarks on what is most worthy of observation in each of them: and first respecting their marriages.

When the parents of a young man have determined upon marrying him, they look out amongst their kindred and acquaintance for a suitable match; in which having succeeded, the father or mother of the young man, or sometimes his sister, assemble a company of their friends, and go to the house where the person they intend to demand lives: being arrived, a conversation takes place, in which the business is opened and the match proposed. If the father of the woman be contented with the proposals, he immediately orders sweetmeats to be brought in, which is taken as a direct sign of compliance; and the company for that time take leave. Some days after, the females of the family of the man assemble at the house of the intended bride, where the terms of marriage are settled, and the usual presents on the part of the bridegroom are promised. These, if the person be in middling circumstances, generally consist of two complete suits of apparel of the best sort, a ring, a looking-glass, and a small sum in ready money of about ten or twelve tomans, which sum is denominated Mehr u Kawèèn, or the marriage-portion, it being given for the express purpose of providing for the wife in case of a divorce. There is also provided a quantity of household stuff of all sorts, such as carpets, mats, bedding, utensils for dressing victuals, &c. After this a writing or contract is drawn up, in the presence of, and witnessed by, the Cadi, or magistrate, or in his absence by

an Akhund, or priest: this writing the Persians call Akud Bundèe, or the binding contract, in which the father of the bride sets forth, that on such a day, in such a year, he has given his daughter in marriage to the son of such a person (mentioning the name of the bridegroom and his father), who also on his part enumerates the different presents he makes in his son's name to the bride, as well as the stipulated money called Mehr u Kawèèn. This writing is signed and sealed by both parties, as well as the Cadi and the Mullah, and is deposited in the hands of the bride's father, where it always serves as a record in case of a divorce, to enforce the fulfilling of the marriage-articles: for on this occasion the husband is obliged to make good the contract even to the minutest agreement, before the divorce can be complete. When this ceremony is finished the marriage by the Mohammedan law is deemed perfect. It is, however, observable that portions are never given with daughters in Persia, as the custom in Europe, and in most places of the East. Nothing now remains but to celebrate the nuptials, and this is generally performed the second or third day after signing the contract, in the following manner: The night before the wedding, the friends and relations of the bride assemble at her house, attended by music, dancing girls, and other signs of festivity. This night distinguished by the appellation of Shub Hin Bundee, or the night in which the hands and feet of the bride are stained with the herb Hinna, well known all over the East. Previous to the ceremony, a large quantity of this herb is sent by the bridegroom to the house of the bride, and on the day of staining she is first conveyed to the bath, where having bathed, she is brought back to her own house; after which they stain her hands and feet, at the same time painting her eyebrows and forehead with the antimony powder called Surma: when this is finished, they send back what remains of the herb to the house of the bridegroom, where the like operation is performed upon him by his friends. The wedding day being come, the friends both of the bride and bridegroom, men and women, assemble at the house of the bride, in order to carry her to the house of her future husband: they are attended by sorts of music, singers, and dancing girls, and are dressed in their smartest apparel, each of the women having on a veil of red silk. The

writing the Persian binding contract, in sets forth, that on he has given him of such a person bridegroom and his part enumerates the his son's name to the translated money called writing is signed and well as the Cadi and in the hands of the y's serves as a record force the fulfilling of on this occasion the good the contract ent, before the divorce ceremony is finished medan law is deemed servable that portion enters in Persia, as in most places of the as but to celebrate the generally performed the nning the contract, the night before the relations of the bride ded by music, dancing tivity. This night lation of Shub Hin which the hands are with the herb r the East. Previous quantity of this herb the house of the bride he is first conveyed ated, she is brought after which they st same time painting b in the antimony powe is finished, they se herb to the house of e operation is perfor . The wedding nig oth of the bride an, by the Mohammedan law, being always abled to put his wife away at discretion: this performed by giving her every thing he had promised previous to marriage, and by re-demand- g the contract of his wife's relations. The cere- ony of divorce is called by the Persians Tellaak. again, after the divorce, the husband should

be inclined to take his wife back, he is at liberty so to do, and this for three times successively; and when it so happens, the contract must be renewed each time: but after the third time he is expressly forbidden to re-marry the same woman. With respect to the number of wives a man has, although by the Mohammedan law he is certainly allowed as many as he is able to maintain, yet in general, amongst the Persians, that person is most esteemed who attaches himself to one.

Contracts of marriage in Persia, as well as in many other countries in the East, are often made between families at a very early period; and although consummation does not take place till many years after, yet the woman contracted cannot divorce herself, or be absolved from the contract, unless by the consent of her betrothed husband, except on forfeiture of a considerable sum of money. The same is also binding on the part of the man. A widow in Persia is obliged to wait four months after the death of her husband before she is permitted by law to marry again.

At the christening, or rather naming, of children, in Persia, the following ceremony is observed: The third or fourth day after the child is born, the friends and relations of the woman who has lain-in assemble at her house, attended by music and dancing girls, hired for the occasion; after playing and dancing some time, a Mullah, or priest, is introduced, who taking the child in his arms, demands of the mother what name she chuses the infant should be called by; being told, he begins praying, and after a short time applies his mouth close to the child's ear, and tells him distinctly three times (calling him by name) to remember and be obedient to his father and mother, to venerate his Koran and his Prophet, to abstain from those things which are unlawful, and to practise those things which are good and virtuous. Having repeated the Mohammedan profession of faith, he then re-delivers the child to his mother; after which the company are entertained with sweetmeats and other refreshments, a part of which the females present always take care to carry away in their pockets, believing it to be the infallible means of their having offspring themselves. The ceremony of the Sur ut, or circumcision, in Persia, is generally performed during the Chehula, or space of forty days from the birth of the child; as within that period it is less dangerous, than at a more advanced age. Some there

there are, however, who do not undergo the operation until the expiration of seven or eight years; but it is absolutely necessary that it should take place before the age of fourteen, as after that time it is deemed unlawful: on this occasion the parents of the child invite their relations and friends to an entertainment. The operation is performed after the Jewish ritual, and in the manner practised by the Mussulmen of India.

The funerals of the Persians are conducted in a similar manner to those in other Mohammedan countries.—On the death of a Mussulman, the relations and friends of the deceased being assembled, make loud lamentations over the corpse; after which it is washed and laid out on a bier, and carried to the place of interment without the city walls, attended by a Mullah, or priest, who chaunts passages from the Koran all the way to the grave. If any Mussulman should chance to meet the corpse during the procession, he is obliged, by the precepts of his religion, to run up to the bier, and offer his assistance in carrying it to the grave, crying out at the same time, “*Lâh Allâh Ill Jilâh!*” i. e. “*There is no God but God.*” After interment, the relations of the deceased return home, and the women of the family make a mixture of wheat, honey, and spices, which they eat in memory of the deceased, sending a part of it to their friends and acquaintance, that they also may pay him a like honour.

The Persians are very strict in respect to the price of blood, or *Lex Talionis*, this being laid down and authorised as a positive command in the Koran; it is called *Deint*. At Shirauz, if a man murders another person, he is obliged to pay a *Deint*, either in money or goods, to the value of eight hundred piastres, which is to be received by the relations of the deceased; but if this is not agreed to, and the relations insist upon it (the acceptance being entirely optional), the murderer is to be delivered up to the nearest of kindred to the person slain, and is by them put to death; but should it so happen that the murderer escapes, the two families are at perpetual variance, until full satisfaction be made, either by paying the price of blood, as related, or ap-

prehending the murderer and surrendering him a circumstance often attended with very bloody consequences*.

The police in Shirauz, as well as all over Persia is very good. As before observed, at sunset the gates of the city are shut; no person whatever is permitted either to come in or go out during the night; the keys of the different gates being always sent to the Hakim, or Governor, and remaining with him until morning. During the night, three Tiblas, or drums, are beaten three different times; the first at eight o'clock, the second at nine, and the third at half past ten. After the third Tibla has sounded, all persons whatsoever found in the streets by the Daroghah, or judge of the police, or by any of his people are instantly taken up, and conveyed to a place of confinement, where they are detained until next morning, when they are carried before the Hakim; and if they cannot give a very good account of themselves, are punished, either by a bastinado, or a fine.

Civil matters are all determined by the Civil and ecclesiastical ones (particularly divorce by the Sheikh as Sellaum, or Head of the Faith, an office answering to that of Mufti in Turkey). Justice is carried on in Persia in a very summary manner; the sentence, whatever it may be, being always put into execution on the spot. Theft is generally punished with the loss of nose and ear; robbing on the road, by ripping up the belly of the criminal, in which situation he is exposed upon a gibbet in one of the most public parts of the city, and there left until he expires in torment; a dreadful punishment, but the sight deters others from committing the same crime, and renders robberies in Persia very uncommon. The punishments in this country are varied and cruel.

The Persians observe the fast during the month of Ramazan (the ninth of the Mohammedan year) with great strictness and severity. About an hour before day-light, they eat a meal which is called *Sêhre*, and from that time until the evening at sun-set, they neither eat nor drink of any thing whatever. It is even so very rigid that if in the course of the day the smoke of

* There is yet, however, another mode of compromise; which is, the relations of the murderer giving in marriage a daughter, or niece, to the son of the deceased, as the price

of blood; and when this is the case, the two families coming one, the reconciliation is always complete.

Calcutta

Calcutta, or the smallest drop of water, reaches
their lips, the fast is in consequence deemed
broken, and of no avail. From sun-set until the
next morning they are allowed to refresh them-
selves*. From this fast, women under particular
circumstances relative to their sex, very old per-
sons, the sick, and children under the age of
fourteen, are exempted: every other person is
enjoined to keep it, as absolutely necessary to
salvation. Travellers also, during this month
(when on actual journey), are exempted from
observing the fast; but in lieu thereof are obliged,
on their return home, to fast an equal number of
days in another month: though the Persians say,
that one day's fast in the month of Ramazân is
more acceptable to God than all the remainder
of the year put together†. People of a religious
turn of mind begin this fast seven or eight days
before Ramazân, and some continue it as many
more during the succeeding month.

The 23d of September, which this year (1787
A. D.) happened on the 10th of the Moham-
medan month Zu al Huj, A. H. 1201, is kept in
Persia as a grand festival, and was celebrated at
Shirauz with extraordinary rejoicings; it is called
by the Persians Ide Korbân, or the festival of
sacrifice; being the same, they say, as that in
which Abraham offered up his son Isaac, whom
they call Ismaël. A few days previous to its
commencement, each family takes care to purchase

* This fast, when the month Ramazân falls in the middle
of summer, as it sometimes must do (the Mohammedan year
being lunar), is extremely severe, especially to those who
are obliged by their occupations to go about during the day-
time, and is still rendered more so, as there are also several
nights during its existence which they are enjoined to spend
in prayer. The Persians particularly observe two; the one
being that in which their prophet Ali died, from a wound
which he received from the hands of an assassin three days
before; which night is the 21st of Ramazân, the day of
which is called by the natives Yeom al Kutul, or the day
of murder;—the other is the night of the 23d, in which
they affirm that the Korân was brought down from Heaven
by the hands of the Angel Gabriel, and delivered to their
prophet Mohammed, wherefore it is denominated Loilut ul
Kudur, or the night of power. The first of these nights
the Turks and others of the sect of the Sunnies do not ob-
serve, and the latter they keep on the night of the 27th;
but both nights are spent by the Persians entirely in prayer;
besides which, the most religious men generally allot a part
of each day in the month for the purpose of reading the
Korân.

† This month, by way of eminence, is styled by the
Mohammedans Al Mubarik, or the blessed: and they affirm

a fine fat sheep, which they design for the sacri-
fice, distinguished by the name of Gusefund
Korbân, or the sheep of sacrifice; this sheep they
take great care of, and he must be without spot
or blemish, in order to represent the purity of
Isaac. The day being come, they adorn the
victim with ribbands, beads, and other finery;
also staining his face, feet, and different parts of
his body with the herb Hinna. The neighbours
reciprocally visit each other, and exchange the
wish of a happy Ide or festival. Their mode of
salutation is "*Ide Shûmd Mubârik bâshed!*" i. e.
"*May your festival be fortunate!*" The victim
being slain, they send the different parts of him
as presents to their friends and to the poor. Some,
indeed, do not reserve any part for themselves;
but every Mussalman is enjoined by his religion
to give a part of what he kills that day to the in-
digent; who generally find means to make a com-
fortable meal. The day is spent in the utmost
festivity‡.

No place in the world produces the necessities
of life in greater abundance and perfection than
Shirauz; nor is there a more delightful spot in
nature to be conceived, than the vale in which it
is situated, either for the salubrity of the air, or
for the profusion of every thing necessary to ren-
der life comfortable and agreeable. The fields
yield plenty of rice, wheat, and barley, which
they generally begin to reap in the month of

that whatever Mussulmans die during it, will most assuredly
enter into Paradise; as they believe the gates of Heaven are
then opened by the command of God.

‡ Among those of higher rank, the following ceremonies
are observed: The Khân, or in his absence the Beglerbeg,
goes in procession to the place of sacrifice, which is without
the city, and is called the Korbân Gah. A favourite
camel, chosen for the occasion, is led forth, which is
dressed out in great finery, and is considered as sacred.
On their arrival at the place, the Khân first strikes a lance
into the breast of the animal, and the crowd are permitted
to rush in, by which he is presently cut into a thousand
pieces; and happy in their estimation is the person who
can procure the least portion of him, as they look upon it
a great blessing, and an infallible omen of future good for-
tune. The procession returns to the city, where a scaffold-
ing is erected before the palace, and the people are enter-
tained with rope-dancing, singers (male and female),
tumblers, ram-fighting, and other diversions, until evening.
The Persians, on this occasion, have all of them by heart
an ode made for the day, which they repeat as they walk
the streets; and cheerfulness, with contentment, sits on
every countenance.*

7 R

May,

May, and by the middle of July the harvest is completed. Most of the European fruits are produced here, and many of them are superior in size and flavour to what can be raised in Europe, particularly the apricot and grape. Of the grape of Shirauz there are several sorts, all of them very good, but two or three more particularly so than the rest; one is the large white grape, called Reesh Babà, without seed, which is extremely luscious and agreeable to the taste; the small white grape, called Askeri, also without seed, and as sweet as sugar; the black grape, of which the celebrated wine of Shirauz is made*. The wine of Shirauz is really delicious, and well-deserving of praise; so much so, that people who have drunk it for a space of time seldom care for any other, though at the first taste it is rather unpleasant to an European. They have another kind of large red grape, called Sahibi, the bunches of which weigh seven or eight pounds each: it is sharp and rough to the taste, and makes vinegar of a very superior quality. The cherries here are but indifferent; but apples, pears, melons, peaches, quinces, nectarines, and the gage plums, are all very good, and in the greatest plenty. The pomegranate is good to a proverb; the Persians call it the fruit of Paradise.

The breed of horses in the province of Fars is at present very indifferent, owing to the ruinous state of the country; but in the province of Dushistaan, lying to the south-west, it is remarkably good. The sheep are of a superior flavour, owing to the excellence of the pasturage in the neighbourhood of Shirauz, and are also celebrated for the fineness of their fleece: they have tails of an extraordinary size, some of which weigh upwards of thirty pounds; but those which are sold in the markets do not weigh above six or seven. Their oxen are large and strong, but their flesh is seldom eaten by the natives, who confine themselves chiefly to that of sheep and fowls. Provisions of all kinds are very cheap; and the neighbouring mountains affording an ample supply of snow throughout the year, the meanest artificer of Shirauz may have his water and fruits cooled without any expence worthy his consideration; this snow being gathered on the tops of

* This wine is pressed by the Armenians and Jews, in the months of October and November, and a vast deal is exported annually to Abu Shehr, and other parts in the Persian Gulph, for the supply of the India market.

the mountains, and brought in carts to the city, is sold in the markets. The provisions are regulated at Shirauz with the greatest exactness, by the Darogha, or judge of the police, who sets a fixed price upon every article, and no shopkeeper dares to demand more, under the severe penalty of losing his nose and ears; such being the punishment attached to a crime of this nature; by which the poorest inhabitants are effectually secured from imposition, in so capital an article as the necessaries of life.

Manufactures and trade are at present greatly decayed in Persia, the people having had no interval of peace to recover themselves since the death of Kerim Khan to the present period: but if a regular and permanent government were once again to be established, there is little doubt but they would flourish, as the Persians are very ingenious, of quick capacities, and even the lower class of artificers are industrious and diligent. They work in filigree and ivory remarkably well, and are good turners. They have at Shirauz a glass manufactory, where they cast very good glass, of which great quantities are exported to different parts of Persia; by which the manufacturers acquire considerable profit. Most of the woollen goods, silks and worked linens, are brought from Yezd and Carmania, from both of which places they also export felts and carpets. A great quantity of copper is produced from Tauris, and other of the more northern parts of Persia. Kôm is remarkable for excellent sword-blades. India goods are imported chiefly from Abu Shehr. In matters of trade amongst the natives, the whole is under the regulation of the Caloduter, or town-clerk, who regulates the duties to be paid to the Khan on all imports: this is sometimes executed with a severity which leaves the merchant little or no profit upon his goods†. All goods are opened here, even to the meanest article, and a duty is exacted upon every thing foreign.

The climate of Shirauz is one of the most agreeable in the world, the extremes of cold and heat being seldom felt. During the spring of the year the face of the country appears uncommonly beautiful. The flowers, of which they

† The Caloduter has an apartment in the grand Caravan serai, where himself or his assistant resides, who is called the Goom Rook, or Custom-master; and is always present on the arrival of a caravan.

carts to the city, provisions is regulated with exactness, by the police, who sets a price, and no shop-keepers, under the severe laws, such being the nature of this nature; merchants are effectually prevented from capital an article

at present greatly having had no in-terest since the present period: but if merchants were once a little doubt but they are very ingenious, and of a lower class of argu-ment. They work tolerably well, and are at Shirauz a glass of very good glass, exported to different manufacturers across the woollen goods, are brought from both of which places are carpets. A great many are brought from Tauris, and parts of Persia. Kom is a sword-blades. India is from Abu Shehr. In Persia, the whole of the Calcutta, or the duties to be paid on this is sometimes left leaves the merchant his goods†. All that to the meanest article upon every thing

is one of the most extremes of cold and during the spring of Persia appears uncomfortable, of which they

at in the grand Caravan-ent resides, who is called, and is always present

have a great variety, and of the brightest hues, the fragrant herbs, shrubs, and plants, the rose, the sweet basil, and the myrtle, all here contribute to refresh and perfume the natural mildness of the air. The nightingale of the garden (called by the Persians *Boobul Hezar Dastan**), the goldfinch, and the linnet, by their melodious warblings, at this delightful season of the year, serve to add to the satisfaction of the mind, and to inspire it with the most pleasing ideas. The beauties of nature are here depicted in their fullest extent; the natural historian and the botanist would here meet with ample scope for pursuing their favourite investigations. With such advantages, added to the salubrity of the air, how can it be wondered at, that the inhabitants of Shirauz should so confidently assert the pre-eminence of their own city to any other in the world?—or that such beauties should fail of calling forth the poetical exertions of a Hâfiz, a Sâdi, or a Jâmi? Their mornings and evenings are cool, but the middle of the day is very pleasant. In summer the thermometer seldom rises above seventy-three in the day time, and at night it generally sinks as low as sixty-two. The autumn is the worst season of the year, that being the time when the rain begins to fall, and during the autumnal months it is considered by the natives as the most unhealthy; colds, fluxes, and fevers being very general. In winter, a vast deal of snow falls, and very thick, but ice is rarely to be found, except on the summits of the mountains, or towards Ispahan, and the more northern parts of Persia. One thing, which is most to be esteemed in this country, and renders it preferable to any other part of the world, is their nights, which are always clear and bright, and the dew, that in most places is of so pernicious and dangerous a nature, is not of the least ill consequence here: there is none at all in summer, and in the other seasons it is of such a nature, that if the brightest scimitar should be exposed to it all the night, it would not receive the least rust. This dryness in the air causes their buildings to last a great while, and is undoubtedly one of the prin-

* The nightingale with a thousand notes.

† To account for this, we must understand it as a pledge of faith and protection, when we consider that the continual wars in which this country has been involved, with very little cessation, since the extinction of the Sefi family, have greatly tended to an universal depravity of disposition, and

principal reasons that the celebrated ruins of Persepolis have endured for so many ages, and comparatively speaking, in so perfect a state; that place being situated in much such another valley as Shirauz, and but two days journey from thence. The nights in Persia, and more particularly in the southern parts of it, are most excellently adapted for the science of astronomy, being of extraordinary brightness. The Persians, with respect to outward behaviour, are certainly the Parisians of the East. Whilst a rude and insolent demeanour peculiarly marks the character of the Turkish nation towards foreigners and Christians, the behaviour of the Persians would, on the contrary, do honour to the most civilized nations: they are kind, courteous, civil, and obliging to all strangers, without being guided by those religious prejudices so very prevalent in every other Mohammedan nation; they are fond of enquiring after the manners and customs of Europe; and, in return, very readily afford any information in respect to their own country. The practice of hospitality is with them so grand a point, that a man thinks himself highly honoured if you will enter his house and partake of what the family affords; whereas going out of a house, without smoking a Calean, or taking any other refreshment, is deemed, in Persia, a high affront; they say that every meal a stranger partakes with them brings a blessing upon the house†.

The Persians, in their conversation, use such extravagant and hyperbolic compliments on the most trifling occasions, that it would at first inspire a stranger with an idea, that every inhabitant of the place was willing to lay down his life, shed his blood, or spend his money in his service; and this mode of address (which in fact means nothing) is observed not only by those of a higher rank, but even amongst the meanest artificers, the lowest of which will make no scruple, on your arrival, of offering you the city of Shirauz and all its appurtenances, as a peishkush or present. This behaviour appears at first very remarkable to Europeans, but after a short time

a perpetual inclination to acts of hostility. This has lessened that softness and urbanity of manners for which this nation has been at all former times so famous; and has at the same time too much extinguished all sentiments of honour and humanity amongst those of higher rank.

becomes

becomes equally familiar. Freedom of conversation is a thing entirely unknown in Persia, as that "*walls have ears*" is proverbially in the mouth of every one.—The fear of chains which bind their bodies has also enslaved their minds; and their conversation to men of superior rank to themselves is marked with signs of the most abject and slavish submission; while, on the contrary, they are as haughty and overbearing to their inferiors.

The Persians, in their conversation, aim much at elegance, and are perpetually repeating verses and passages from the works of their most favourite poets, Hafiz, Sâdi, and Jâmi; a practice universally prevalent, from the highest to the lowest; because those who have not the advantages of reading and writing, or the other benefits arising from education, by the help of their memories, which are very retentive, and what they learn by heart, are always ready to bear their part in conversation. They also delight much in jokes and quaint expressions, and are fond of playing upon each other; which they sometimes do with great elegance and irony. There is one thing much to be admired in their conversations, which is the strict attention they always pay to the person speaking, whom they never interrupt on any account. They are in general a personable, and in many respects a handsome people; their complexions, saving those who are exposed to the inclemencies of the weather, are as fair as Europeans.

The women at Shirauz have at all times been celebrated over those of other parts of Persia for their beauty, and not without reason. Many are tall and well-shaped; and their bright and sparkling eyes is a very striking beauty: this, however, is in a great measure owing to art, as they rub their eye-brows and eye-lids with the black powder of antimony (called *surma*), which adds an incomparable brilliancy to their natural lustre. The large black eye is in most estimation among the Persians, and this is the most common at Shirauz. As the women in Mohammedan countries are, down to the meanest, covered with a veil from head to foot, a sight is never to be obtained of them in the street; but in their houses they sometimes unveil themselves, and converse with familiarity. The women in Persia, as in all Mohammedan nations, after marriage, are very little better than slaves to their husbands.

Those mild and familiar endearments which grace the social board of an European, and which at the same time they afford a mutual satisfaction to either sex, tend also to refine and polish manners, are totally unknown in Mohammedan countries. The husband, of a suspicious temper, and chained down by an obstinate and persevering etiquette, thinks himself affronted even by the inquiry of a friend after the health of his wife. Calling her by name, is never allowed of; the mode of address must be, "May the mother of such a son, or such a daughter, be happy; I hope she is in health." And none, except those of the nearest kin, as a brother, or uncle, are ever allowed to see the females of the family unveiled: it would be deemed an insult. The Persian ladies, however, during the days of courtship, have in their turn pre-eminence; a mistress making no scruple of commanding her lover to stand all day long at the door of her father's house, repeating verses in praise of her beauty and accomplishments; and this is the general way of making love at Shirauz; a lover rarely being admitted to a sight of his mistress, before the marriage contract is signed.

The Persians, in their dispositions, are much inclined to sudden anger; quick, fiery, and very sensible of affronts, which they immediately resent on the spot. They are a brave and courageous people; but their frequent wars have much depraved their ancient urbanity of manners; and this ferocity of disposition has also introduced a strife, peculiar to the lower class of inhabitants of Shirauz. When two people begin fighting, it always raises a great crowd, who generally separately take the part of one or the other in the contest, and the whole presently becomes a scene of tumult and confusion, until the arrival of the *Dârôgha*, or judge of the police, who puts an end to the fray. These riots are very frequent, and even the boys are fond of running to them in order to have a share in the contention. In their capacities they are ready, prompt, and ingenious: but these talents they too often employ in the most discreditable way, being the great liars in the world, practising the most improbable falsities with the gravest air imaginable; and as far from being abashed by a detection, they always endeavour to turn it off with a laugh, and even confess themselves, that they think there is no harm in telling a lye, provided it can be

may benefit to themselves: and they will always, in every business they are engaged in, endeavour first to bring it about by lying and knavery; which, if unsuccessful (as those with whom they deal are full as expert as themselves), they will then conclude the bargain with truth and honesty; but either way is equally indifferent to them.

The Persians universally have a fixed belief in the efficacy of charms, omens, talismans, and other superstitions. Besides what they have received since their conversion to Mohammedanism, they have in general retained all that their ancestors before practised. Indeed, the only difference is, that what was before authorised and commanded by the Magian religion, has been subsequently allowed by the religion of Mohammed. They are, of all people, the most addicted to the idea of fortunate or auspicious days and hours, the *dies fasti atque nefasti* of the Romans; and even on the minutest and most trifling occasions will seek for a lucky moment. Going a journey can never be performed without first consulting a book of Omens, each chapter of which begins with a particular letter of the alphabet, which is deemed fortunate or inauspicious; and should they unluckily pitch upon one of the latter, the journey must of course be delayed until a more favourable opportunity. Entering a new house, the putting on of a new garment, with numberless other common and trifling occurrences, are determined by motions equally absurd and frivolous. In their marriages they pay the strictest attention to this point; a lucky hour for signing the contract, and another for the wedding-day, being deemed absolutely necessary to the future happiness of the intended couple. Those also who are in good circumstances, generally send for a *Muunjim*, or astrologer, at the birth of a child, in order to calculate his horoscope with the utmost exactness.

To a man they have their Talismans, which are generally some sentence from the Koran, or saying of their prophet Ali, written either upon paper, or engraved upon a small plate of silver, which they bind round their arms, and other

* During the summer season, scorpions appear in great numbers; they are quite black in appearance, and very large, and the sting of them is dangerous, but not mortal; none, however, which are found in the more northern

parts of the body; but those of higher rank make use of rubies, emeralds, and other precious stones. The women of condition have small silver plates of a circular form, upon which are engraved sentences from the Koran; which, as well as the Talismans, they bind about their arms with pieces of red and green silk, and look upon them as never-failing charms against the fascinations of the Devil, or wicked spirits, and who they say are constantly roaming about the world, to do all the mischief in their power. They are equally absurd in their ideas of the heavenly bodies, at least the middling and lower class of people, particularly in respect to the falling of the stars, eclipses of the sun and moon, and the appearances of meteors and comets. As for their religious system, they believe there are nine heavens, the lowest of which is that immediately above their heads: they imagine, therefore, that on the falling of a star, it is occasioned by the angels in the lower heaven giving blows on the heads of the devils, for attempting to penetrate into those regions.

Among other customs of a superstitious nature, they believe that scorpions, of which there are great numbers in this country, and very venomous, may be deprived of the power of stinging, by means of a certain prayer which they make use of. The person who has the power of binding, as it is called, turns his face towards the sign Scorpio, in the heavens, which they all know, and repeats this prayer. Every person, present, at the conclusion of a sentence, cups his hands; after this is done, they think that they are perfectly safe: nor, if they should chance to see any scorpions during that night, do they scruple taking hold of them, trusting to the efficacy of this fancied all-powerful charm*.

The Persians are, of all Mohammedan nations, the least scrupulous in drinking wine, as many of them do it publicly, and almost all of them in private (excepting those who have performed the pilgrimage to Mecca, and men of religion); they also are very liable to be very quarrelsome when inebriated, which is often attended with fatal consequences. They eat opium, but in much less quantities than the Turks; and indeed in

parts of Persia, and particularly in the province of Cashan, are of so dangerous a nature, as often to cause immediate death.

every thing they say or do, eat or drink, they make a point to be as different from this nation as possible, whom they detest beyond measure; esteeming Jews and Christians superior to them, and much nearer to salvation.

Matters of religion in Persia are managed by the Sheikh as Sellaum, or the Head of the Faith, an office answering to that of Mufti among the Turks. He takes cognizance of all ecclesiastical matters, and on public festivals and other occasions preaches in the grand mosque; but he has not, like the Mufti, any power in affairs of state, being entirely confined to his religious office.

In point of dress, the Persians differ remarkably from the Turks; for in Turkey any person who was not a Scîud, or descendant of the Prophet, wearing the least green upon his garment, would most probably be stoned: whereas in Persia, the general and favourite colour is green, even to their shoes; and people of all persuasions and denominations may wear it as they please. A Turk also thinks himself defiled by the touch of a Christian, even on his garments. The Persians, on the contrary, will eat out of the same plate, drink out of the same cup, and smoke out of the same Calcan, as readily as they would with their own children. The Persians, in some parts of their devotions, differ from the Turks, as they always pray with their open hands; whereas those of the Turks are closed and placed before them. The Persians also, in their ablutions, before prayer, wash their faces and beards with their right hand only, the other being reserved for meaner occasions, and they only slightly touch the fore and hind part of their feet; but the Turks wash with both hands, and rub all over their feet. The Jaiè Numiâz, or carpet on which they pray, is always endeavoured to be placed with the upper part of it facing to the temple of Mecca, but this they only guess at.

In religious opinions they are far more tolerant than the Turks: they acknowledge the authority of the Old and New Testament, which they say were sent from heaven, and delivered to Moses and Christ, equally with the Koran; only they affirm that the last was given to purify and correct the errors of the two former, which they pretend have been much corrupted from their original state, both by Jews and Christians. They acknowledge Jesus Christ to have been a great prophet, but deny him to have been the

Son of God, and the Saviour of Mankind; and pretend that their prophet Mohammed is the last or seal of the prophets, the number of which they say, amounts to one hundred and twenty-five thousand; from which circumstance he is called Khatim al Ambeai, or the Seal of the Prophets. In their opinion, all nations are to be converted to Mohammedanism on the day of judgment; and on that day the people of each faith flying to their particular prophet for protection, shall by him be screened and defended from God's wrath through mediation, and finally become all of one faith, which is to be Mohammedanism. In like manner they apply many things to their own Impostor, which only belong to our Saviour.

The mode of living of the Persians is in general as follows: They always rise at day-break, in order to perform their devotions. Their first prayer is denominated Numaz Soobh, or the morning prayer; it is said before sun-rise, after which they eat a slight meal, called Nâshâ, or breakfast; this consists of grapes, or any other fruits of the season, with a little bread, and cheese made of goat's milk; they afterwards drink a cup of very strong coffee, without milk or sugar; then the Calcan, or pipe, is introduced. The Persians, from the highest to the lowest ranks, all smoke tobacco. Their second hour of prayer is called Numaz Zôhur, or mid-day prayer, and is always repeated when the sun declines from the meridian. Their dinner, or Châh, which is soon after this prayer, consists of curried bread, and fruits of various kinds; animal food not being usual at this meal. The third hour of prayer is called Numaz Asur, or the afternoon prayer, said about four o'clock. The fourth hour of prayer is Numaz Shâm, or evening prayer, which is said after sun-set; when this is finished, the Persians eat their principal meal called Shâmi, or supper. This generally consists of a Pilau, dressed with rich meat-sauces, and highly seasoned with various spices: sometimes they eat Kibaab, or roast meat. When the meal is ready, a servant brings notice thereof, and at the same time presents an ewer and water; they then wash their hands, which is an invariable custom with the Persians, both before and after eating. They eat very quick, conveying the food to their mouths with their fingers; the use of knives and forks being unknown in Persia.

Sherbe

herbets of different sorts are introduced, and the meal concludes with a dessert of delicious fruits. The supper being finished, the family sit in a circle, and entertain each other by relating pleasant stories (of which they are excessively fond), and also by repeating passages from the works of their most favourite poets, and amusing themselves at various kinds of games. The fifth and last prayer is styled Numaz Akhir, the last prayer; or sometimes Numaz Shab, or the night prayer, repeated about an hour after supper. The city of Shirauz is divided into twelve districts, or neighbourhoods; over each of which one of their Imaums, or Heads of Faith, is believed to preside, as a kind of guardian angel. Every Thursday night, which the Persians call the night of Friday, the cryers and other domestics of the mosques make a Zikir, that is, a

recital of the life and good actions of the Imaum or Saint who presides over the districts, by whose influence the inhabitants hope to obtain their wishes, and be absolved from their sins. These Imaums are alluded to by the Persians in their conversations; they swear by them, and invoke them on all occasions of distress and adversity, as well as return them thanks on any good fortune befalling them.—The mosques of the Imaum Zada, or descendants from the Imaums, serve as sanctuaries for criminals; but the most sanctified place in Shirauz, and which no one ever violates, is the Shah Cheraug, where the greatest criminal can be protected, if the inhabitants of the place should receive him. However, persons offensive to government are generally delivered up when demanded.

SECTION II.

A short Account of the Remains of the celebrated Palace of Persepolis—Visit to the Tomb of the Persian Hero Rostum—Mode of Travelling in Persia—City of Bussora.

ON Thursday evening, the 30th of August, Ensign Franklin left Shirauz in company with Mr. Jones, for the purpose of visiting the remains of the celebrated palace of Persepolis. The next morning they arrived at the village of Zarkan, situated eight fursengs, or thirty-two English miles, from Shirauz. The road to this place is chiefly through a rocky, mountainous country; approaching, however, to Zarkan, is some cultivated land. Zarkan is a large village under the government of Shirauz, and is ruled by Calentar, or chief magistrate. From its vicinity to the mountain, the view of this place is very pleasing; the neighbourhood produces the large grape. September the 1st, they crossed the Bund Meer river, which Mr. Niebuhr has laid down as the ancient Araxes; over this river is a stone bridge, which the natives call Pool Khan. They proceeded on through the plain, and in five hours and a half arrived at the ruins. This stage is five fursengs: the road lies entirely through the plain, which beginning about five miles to the northward of Zarkan, is continued up to Persepolis, which is situated close under the moun-

tains. Their Casla encamped in a garden a mile and a half to the northward of the ruins, near the village of Merdasht, from whence the whole plain takes its name. This plain is exceedingly delightful; it abounds in game of several sorts, amongst which are partridges, wild pigeons, quails, and hares.

What remains of the celebrated palace of Persepolis, is situated on a rising ground, and commands a view of the extensive plain of Merdasht. The mountain Rehumut encircles the palace in the form of an amphitheatre: you ascend to the columns by a grand stair-case of blue stone, containing one hundred and four steps. The first object that strikes the beholder on his entrance, are two portals of stone, about fifty feet in height each; the sides are embellished with two sphinxes of an immense size, dressed out with a profusion of bead-work, and, contrary to the usual method, they are represented standing. On the sides above are inscriptions in an ancient character, the meaning of which no one hitherto has been able to decypher.

At a small distance from these portals you ascend another flight of steps, which lead to the grand

grand hall of columns. The sides of this stair-case are ornamented with a variety of figures in basso relievo; most of them have vessels in their hands: here and there a camel appears, and at other times a kind of triumphal car, made after the Roman fashion; besides these, are several led horses, oxen, and rams, that at times intervene and diversify the procession. At the head of the stair-case is another basso relievo, representing a lion seizing a bull; and, close to this, are other inscriptions in ancient characters. On getting to the top of this stair-case, you enter what was formerly a most magnificent hall; the natives have given this the name of Chehil Minâr, or forty pillars; and though this name is often used to express the whole of the building, it is more particularly appropriated to this part of it. Although a vast number of ages have elapsed since the foundation, fifteen of the columns yet remain entire; they are from seventy to eighty feet in height, and are masterly pieces of masonry: their pedestals are curiously worked, and appear little injured by the hand of time. The shafts are enfilad up to the top, and the capitals are adorned with a profusion of fret-work.

From this hall you proceed along, eastward, until you arrive at the remains of a large square building, to which you enter through a door of granite. Most of the doors and windows of this apartment are still standing; they are of black marble, and polished like a mirror: on the sides of the doors, at the entrance, are bas-reliefs of two figures at full length; they represent a man in the attitude of stabbing a goat: with one hand he seizes hold of the animal by the horn, and thrusts a dagger into his belly with the other; one of the goat's feet rests upon the breast of the man, and the other upon his right arm. This device is common throughout the palace. Over another door of the same apartment, is a representation of two men at full length; behind them stands a domestic, holding a spread umbrella: they are supported by large round staffs, appear to be in years, have long beards, and a profusion of hair upon their heads.

At the South-West entrance of this apartment are two large pillars of stone, upon which are carved four figures; they are dressed in long garments, and hold in their hands spears ten feet in length. At this entrance, also, the remains of a stair-case of blue stone are still visible. Vast

numbers of broken pieces of pillars, shafts, capitals, are scattered over a considerable extent of ground, some of them of such enormous size that it is astonishing how they could have been brought whole, and set up together. Indeed every remains of these noble ruins indicate the former grandeur and magnificence, truly worthy of being the residence of a great and powerful monarch; and whilst viewing them, the mind becomes impressed with an awful solemnity. Exclusive of the ancient antique inscriptions already mentioned, are others of a modern date able to be read as well as some in the Syrian character; the whole of which the celebrated Mr. Nicouhr has accurately copied and published.

Behind the hall of pillars, and close under the mountain, is the remains of a very large building of a quadrangular form: this may either have made part of the palace, or, not unlikely, a detached temple, as there is a considerable space of ground filled up with earth and mounds of sand betwixt the two; and as it has within-side symbols emblematical of a religious meaning. The building has four principal entrances to it, two from the North-East, and two from the South-West. The walls are divided into several partitions, which are ornamented with various pieces of sculpture, the most common of which has the figure of a man at full length; he is sitting in a chair, with his feet supported by a stool; behind the chair stands a domestic holding an umbrella; the man has in his hand a round staff; before him are two hundred branched candlesticks, with candles in them; beyond these is a little boy, and behind him is a woman with a goblet in her hand. Underneath this figure are several others in long garments; some of these are armed with bows and arrows, others with spears, and all of them have caps, in the form of turban, which we learn from ancient historians was the mode of dress observed by the Medes.—Over the doors of this building, which are twelve in number, are bas-reliefs of a lion seizing hold of a bull, similar to that observable on the grand stair-case: the recesses in the walls are all lined with fine granite, and their fronts have handsome cornices of stone. Besides the usual figures, there is a very extraordinary one, and is, I suppose, emblematical of the ancient religion of the Persians; it represents a man seated on a pillar, who holds

pillars, shafts, and a considerable extent of such enormous size, they could have been together. Indeed the ruins indicate the existence, truly worthy of great and powerful nations, the magnificent, the awful solemnity of antique inscriptions, and of a modern date, some in the Syrian which the celebrated copyist and publisher

and close under the very large building, this may either have, not unlikely, a considerable space and mounds of sand, has within-side a religious meaning. The entrances to it, two from the South, lead into several parts, and with various pieces, common of which have length; he is sitting supported by a stone domestic holding in his hand a round, branched candle; beyond these is a woman with her arms raised; beneath this figure are some of these, others with spears, in the form of turban; the Medes.—Over which are twelve in number, seizing hold of the walls are all the fronts have hands, the usual figures, and is, I suppose, the origin of the Persian on a pillar, who holds

in his hand a small vessel; he has a girdle twisted round the centre of his body, the two ends of which project a considerable distance beyond his clothes, and have much the appearance of wings; he is dressed in long garments, with a cap, turreted. Underneath the figure are several lions, a symbol of empire amongst the ancient Persians, very well executed.

Behind this ruin, a considerable way up the mountain Rehemut, to the north, is the remains of a curious place cut out of the rock, which was formerly an ascent to it by steps, but these being destroyed by time, you are obliged to clamber up by the rock. There is another building parallel to this, about the distance of eight hundred yards to the south. They are city buildings of three sides, two of which are plain, and forty feet in height; the third has several fine sculptures boldly executed; in the centre is a pillar with the mystic figure, already described, sitting at the top: opposite to this stands a man upon a pedestal of three steps; in his left hand he holds a bow, his right is held up, pointing to the figure on the pillar. To the left is a pillar of stone two feet high, upon which fire is burning, and a little on one side is a large globe suspended in the air which has much the appearance of being intended for the Sun. These two mentioned symbols were considered by the Persian Magi as the two grand principles of their religion, as they adored the Omnipotent Creator of the universe under these types, being each in his nature the purest and freest of corruption of created things: it may, therefore, be presumed they were intended to represent certain mysteries in the Magian faith. The man with the bow may possibly be designed for a chief of the Magi; or, to hazard a further supposition, the celebrated lawgiver and prophet Zoroaster himself. However, this is only a supposition. The modern natives call this place Mujlis Jemsheed, or the assembly of King Jemsheed, as they say that prince used to visit the place, with his nobles and great men of his court, in order to enjoy a delightful view of the adjacent country, of which, indeed, there cannot be a finer prospect than from thence.

They affirm that at the end of the passage is the Talisman, and that whoever arrives thither, and asks questions of future events, will be answered from within; but they say that no one has ever yet been able to penetrate to the

Underneath the above-mentioned devices are small openings, which lead to a subterraneous passage, cut out of the mountain; it is six feet in height, and four in breadth: the passage leads a considerable way into the rock, but is quite dark after advancing about thirty yards, and emits a most noisome damp smell. The natives call this place the Cherk Almàs; that is, the Talisman, or diamond of fate*.

Descending to the foot of the mountain, to the south are the remains of a small square building, which has several doors and windows still standing, having carved figures on them; but as these are only visible to the waist downwards, it is probable the sand from the mountains has choked up the remainder: the figures are the same with those in other parts of the palace.—A little to the westward of this building, is a stone staircase which leads into a magnificent court, of a quadrangular form. Several pedestals of pillars, and the remains of two grand portals to the east, are still visible: they are all of granite, and the cornices of the portals appear to have been very superb; they are of an oblong shape. On many of the broken pieces of the pillars are ancient inscriptions.

In several parts of the palace are stone aqueducts, made for the purpose of draining off the water that comes from the mountains: they are of blue stone cut under ground eight feet deep; and two and a half in breadth.

These venerable ruins have suffered much by the ravages of time and weather; but what still remains of them is as hard and durable as the rock itself. Earthquakes, which are frequent in Persia, have also proved the means of throwing down many of the columns, and otherwise injuring the apartments; and several of those which have not been overturned by the violence of the shocks, have had their tops nearly removed off, and in this situation remain. The sand, which is constantly washed down from the mountains by the rain, in the winter season, has choked up numbers of places, and even covered the pedestals of several pillars.

The old inscriptions discernible on the walls, and other parts of the palace, may be reckoned

extremity of the passage, being opposed by the Demons and Genii, whom they believe to dwell there; and superstitiously imagine, that all lights taken in there will go out of themselves.

among the greatest curiosities, as they have never yet been decyphered, either in the East or in Europe; and what is very extraordinary, the most learned and curious in the Oriental languages have been baffled in every attempt made to learn their meaning:—like the hieroglyphics of Egypt, they remain buried in an impenetrable mystery*. It is one of the most considerable difficulties to solve when and by whom this palace was originally built. The Grecian historians have given very imperfect and dubious accounts of it, and the Persians no less so. By the present natives, the place is called Takhti Jemsheed, or the throne of Jemsheed; who they affirm built it between three and four thousand years ago: he is also expressly mentioned as having erected the Chehil Minâr, or hall of forty pillars. It is related in Grecian history, that Alexander the Great set fire to and destroyed this rich and splendid palace, instigated to it in a fit of debauchery by the celebrated courtesan Thaïs†.

It is to be remarked, that in the figures throughout the whole of the palace, the rules of art are not attended to; the muscles of the figures are wanting, yet the drapery is finely done, and the proportions in general are well kept up, though the contour is only observed, which gives a sameness to the whole.

The materials of which the palace is composed, are chiefly hard blue stone; but the doors and windows of the apartments are all of black marble, and so beautifully polished, as to reflect an object like a mirror. One of the principal things worthy of admiration, is the immense strength of the foundation. The whole of the palace takes in a circumference of one thousand four hundred square yards: its front is six hundred paces from north to south, and three hundred and ninety from east to west. Being built at the foot of a mountain, a great deal of it has been smoothed with infinite labour, to make the stones lie even. The height of the foundation, in front,

* Mr. Niebuhr has given all these inscriptions in his second volume, most elegantly and accurately copied, which may possibly assist the curious in their attempts to elucidate them.

† This circumstance, although it has the sanction of history, if one reflects upon the appearance of what still remains of these ruins, any person on viewing them would suppose such an event impossible to have taken place; as, in their present state, all the fire that could be applied,

is in several parts from forty to fifty feet, and consists of two immense stones laid together: the sides are not so high, and more unequal, owing to the vast quantity of sand which has fallen from the mountain.

The Hall of Pillars appears to have been detached from the rest of the palace, and to have had a communication with the other parts by hollow galleries of stone. By the pedestals of the pillars, the hall seems originally to have consisted of nine distinct rows of columns, each containing six; making consequently, in all, fifty-four. The fifteen that remain, are from seven to eighty feet in height; the diameter at the base twelve feet, and the distance between each column twenty-two. By the position of the front pillars the hall appears to have been open towards the plain; but four of the pillars, facing the mountain, and which are at some distance from the rest, seem to have been intended for a portico or entrance from the east: they are also of a different style of architecture. The materials of the columns are a mixed sort of red stone granular. The hall, situated on an eminence and commanding an extensive view of the plain of Merdâst, is strikingly grand, and conveys to the beholder the idea of an Hall of Audience of a powerful and warlike monarch.

On the 2d of September, the Ensign and Mr. Jones went to visit the tomb of the celebrated Persian Hero, Rostum (called by the natives Nushkee Rostum). It is situated three miles and a half to the north-east of Persepolis: the place consists of four distinct chambers, excavated high in the rock. The devices, in the walls and parts, are exactly the same as those of Persepolis, representing the mystic figure, with the crescent, the fire and the sun. Underneath the first chamber, the second chamber, is a gigantic figure of a man on horseback, cut in stone, and very perfect, in its proportions, completely armed and accoutred, and dressed something after the Roman fashion. On his head a helmet is a globe; two figures are before him

would not make the smallest impression on those masses of stone, equal in point of durability and hardness to the solid rock; and of such are the materials of the whole building. These sentiments arose to Mr. Frazer whilst on the spot, and his opinion was strengthened by the fullest acquiescence of Mr. Jones, who thought, like himself, it was absurd to give credit to the story that it had been burnt by Alexander.

the one kneeling down in a supplicating posture, and the other in the act of taking hold of the horseman's hand, as if to mitigate his wrath; the horseman is looking sternly upon the figures, and the hand at liberty is applied to the hilt of his sword. On one side of this figure is an inscription in ancient characters, but different from those on the walls of Persepolis. Several attendants are in waiting behind the equestrian figure, all of them as large as life; but the proportions are not at all adhered to in the first sculpture, the man being twice the size of the horse on which he rides. A little to the northward is another representation. At the foot of the rock there are two figures completely armed; one of them is in the action of letting go a ring, which the other grasps. The figure to the right has a globe on his helmet, and a large battle-axe in his hand: that to the left has a domestic behind him, holding an umbrella. Under their horses' feet are two human heads; and a little on one side appear the heads of several figures, attendants; most of them have a broad fillet encircling their temples, and a profusion of hair flowing loose. Sir John Chardin supposes, that this may be intended to represent the action of Alexander the Great, receiving the submission of the Persian monarch Darius; but as we are informed by Grecian history, that Darius never saw Alexander, being murdered in his flight shortly after the loss of the battle of Arbela, by his servant Bessus; so I should imagine, says Mr. Francklin, the Persians themselves would hardly have taken such pains to render the dishonour and ruin of their lawful king so permanent and known to the latest posterity, in order to praise one who had utterly overturned their religion and their laws. Moreover, the work itself bears not the least trace of having been the production of any Grecian artists, as the Greeks at that period were arrived at the highest perfection in the arts and sciences; and had such a thing been done during the time of Alexander, he would most certainly have made use of one of the many celebrated artists who followed him into Asia; but these figures are disproportionate, and executed in a rude manner. Ensign Francklin supposes, that the above device was of a date prior to the Grecian conquests of Persia, and that it was intended to represent some remarkable action in the life of the hero Rostum

(from whom the whole of the place takes its name), and that it was cut to perpetuate the memory of it.

Near the foot of the rock is a square building of blue stone, twenty feet in height, by eight in breadth. This place has several windows; the inside is empty, and there are small niches in different parts of the wall. The natives affirm that the celebrated Rostum was interred in this spot; but many travellers have supposed it to have been the tomb of Darius Hystaspes, from a passage of Herodotus, the Grecian historian, amongst whom Sir John Chardin and M. Le Brun are both of the latter opinion.

In a part of the rock, to the eastward, is the sculpture of a figure on horseback, the face of which has been much mutilated, and is scarcely visible; enough, however, remains to perceive that the figure is that of a man: he has long flowing hair, and has a projection, resembling a horn, on the left side of his forehead. The natives call this figure "*Iskunder Zu Al Kerneen*," or "Alexander Lord of the Horns," that is, of an empire extending from east to west; and they affirm, that it is positively intended for Alexander the Great. Horns, we know, were considered by the ancients as emblems and symbols of power and majesty, and from this we may conclude, without a contrariety to reason, that the Persian idea of this figure is a just one; as Alexander is always described by the Grecian historians, having a horn on his forehead, or rather a particular *lock of hair*, resembling one; and it is also observed on the coins and medals of that prince, which are still to be seen in the cabinets of the curious. Behind the figure on horseback are several others; they are in armour, on foot, and seemingly attendants on him.

On the 4th of September, 1787, Ensign Francklin returned to Shirauz; and on the 11th of October, he set off from Shirauz on his return to India. On the 14th he arrived at Kazeroon, which, by its remains, appears formerly to have been a city of considerable note, and in size little inferior to Shirauz; it is situated in the centre of an extensive plain, surrounded by high mountains; there is a fine lake, about four miles east of the city. In the vicinity of Kazeroon, great quantities of opium are produced, but the Persians do not make this very valuable commodity an article of trade.

trade. The city, excepting a mosque, and the Governor's palace and gardens, has nothing remarkable in it.

As to the mode of travelling in Persia, we may observe, that a *Cafila* is composed of camels, horses, and mules, the whole of which are under the direction of a *Cheharwa Dâr*, or Master. It is to him the price of a mule or camel is paid, and he stipulates with the traveller to feed and take care of the beast during the journey; he has under him several inferior servants, who help to unload the beasts of burden, take them to water, and attend them during forage. The *Cafila*, whilst on the journey, keeps as close as possible, and on its arrival at the *Munzil Gah*, or place of encampment for the day, each load is deposited on a particular spot, marked out by the master, to which the merchant who carries the goods repairs; his baggage forms a circle; in the centre are placed the bedding and provisions: a rope or line made of hair is then drawn round the whole, at the distance of about three yards each way, which serves to distinguish the separate encampments. During the night, the beasts are all brought to their stations, opposite to the goods they are to carry in the morning, and are made fast to the hair rope aforementioned. At the hour of moving, which is generally between three and four in the morning, they load the mules and camels. In doing this, the passengers are awakened by the jingling of the bells tied round the neck of the beasts, in order to prevent their straggling during the march. When every thing is ready, the *Cheharwa Dâr* orders those nearest the road to advance, and the whole move off in regular succession, in the same order as the preceding day.

On the 22d of December he embarked on board

the Scorpion cruiser, Captain Jervis, for Bussora. 24th, in the evening, passed the Bussora Bar, and on the 28th came to anchor opposite the town.

The city of Bussora is situated at the extremity of the Persian Gulph, in latitude $31^{\circ} 30'$ North, on the banks of a fresh water river, called the *Shat al Arab*, which is a branch of the *Euphrates*; that river uniting with it about fifty miles to the N. W. of Bussora. The city is a very large one, but indifferently fortified: a mud wall encircles the town, having bastions and turrets also of mud; it had formerly a wet fosse, this is now dried up in many parts. Although the Great Desert extends to the very walls of the city, the banks of the river on each side are exceedingly fertile and pleasant; they produce corn, pulse, rice, and several European fruits; but that which most adds both to the pleasant situation and profit of the place, is the date tree; by the cultivation and produce of this tree, a considerable revenue arises to the Turkish government. The vicinity of Bussora abounds in game, particularly hares, partridges, and the wild hog, whose flesh is of a delicious flavour. The modern Bussora is fourteen days journey (by couriers) from Aleppo. There is a very grand mosque in Bussora, and also a convent of Italian missionaries. The city is at present under the government of the Turks, and the residence of a *Mus-sellem*, appointed by the *Bashâ* of Bagdad, under whom he acts.

On the 12th of February, 1788, he embarked on board the brig *Futta Illahi*, Captain Nimmo, on his return to India; and on the 25th of April, he arrived at Calcutta, after an absence of two years and two months.

JOURNEY FROM INDIA,

TOWARDS

ENGLAND,

In the Year 1797;

BY AN OVER-LAND ROUTE, THROUGH COUNTRIES HITHERTO UNKNOWN TO EUROPEANS,

PARTICULARLY THROUGH

CURDISTAN, DIARBEKR, ARMENIA, AND NATOLIA,

IN ASIA;

AND

ROMELIA, BULGARIA, WALLACHIA, TRANSYLVANIA, &c.

IN EUROPE.

BY JOHN JACKSON, ESQ.

ON the 4th of May, 1797, Mr. Jackson left Bombay, and embarked on board the country ship Pearl, R. Spence, Master, bound to Bussora; and anchored off Carrick Town, in seven fathoms water, on the 8th of June, after a dangerous passage, in which the ship was frequently menaced by a number of vessels of war belonging to one of the Arabian powers.

Captain Reid and Mr. Jackson went ashore in a country boat at Carrick Town, with a view to shoot antelopes, of which there were many on the island, having first obtained the Sheikh's permission. They took with them two Arab guides, and presently saw about twenty antelopes, which, however, were so very shy, that they could not get near enough to have a shot; nor does it appear possible to take them withoutawks, the mode usually practised in those countries. The swiftest greyhounds would be of no use, for the antelopes are much swifter of foot than most other animals. They are of a light brown colour, about the size of a goat, but with longer legs, and have small horns almost erect. They directed their walk to the highest part of

the island, which appears to have been a volcanic production, having coral rocks and sea shells on its very summit; and in many places great quantities of lava have run down towards the sea. Here is plenty of good water, but very little vegetation, except near the springs. Being on shore in the middle of the day, they found the heat much greater than it is in India.

The island of Carrick, which contains between six and seven hundred inhabitants, is about twelve miles long and seven broad. It abounds with goats, but has very few cows, and no beasts of prey. Nor are there any fowls, tame or wild, except stock and turtle doves. It produces very few vegetables, particularly at this season, the heat being so intense as to destroy all vegetation, except in the immediate vicinity of water. Wheat, rice, and barley, however, are grown, but not in sufficient quantity to supply the inhabitants, the principal part of whose food is fish, which they catch in abundance all round the island. There is also very fine turtle, but the natives do not eat it.

On the 11th they saw the entrance of Bussora River,

River, N. W. distant off shore three leagues; and, while at anchor, a great many pelicans hovered about the ship. On the 12th Captain Reid and Mr. Jackson went ashore on the Arab side of the river; but only shot a few wild pigeons, procured some eggs and greens from the Arabs, and bought a bullock for six piastres. The extent of their walk inland did not exceed about half a mile, which space was planted throughout with date-trees, the male trees being generally planted North West of the females, because the wind usually blows from that point. The males are very easily distinguished, being higher than the females, and not so full of leaves at the top. The ground is full of cuts for the purpose of letting in the water from the river at tide-time; for without this the dates would not thrive, as they require much moisture. After having passed through the plantation, they entered some villages on the edge of the Desert, beyond which neither trees nor other vegetation were to be seen. All the prospect consisted of a burning desert covered with a crust of salt, making a noise under the feet similar to that caused by walking on frozen snow. Without being on shore in the middle of the day, and at the season near midsummer, a stranger to this country could not possibly form any idea of the heat upon the Desert. The bare feet of an European would be blistered in a moment, and Mr. Jackson felt some inconvenience to his, even through a pair of strong boots.

The houses here are built of clay, and covered with the leaf of the date-tree. The inhabitants are very numerous, and most of them have weak eyes, occasioned, probably, by the reflection of the sun upon the desert. Their dress is very simple; that of the men being in general no more than a woollen cap to defend the head from the sun; and a coarse woollen cloak, with short wide sleeves. An Arab always wears his woollen cap, though he has often no other cloathing. The woman's dress is equally simple, being only a few yards of blue cotton cloth wrapped round them.

These people have numerous flocks of cattle, sheep, and goats, which they drive every morning at sun-rise to the river side, where they find very good pasture. They are watched all day by men, women, and children, who frequently amuse themselves by bathing in the river; for an Arab, when he has an opportunity, will bathe five or six times a day. The flocks are always driven

back at sun-set to the villages, where they remain all night. Every village and fixed residence is surrounded with a lofty mud wall, to defend it from beasts of prey, particularly lions, which are here very numerous.

The Arab women were not so shy as we expected to find them. They seemed much entertained by the novelty of the European dress, and very civilly offered them milk, bread, &c. Their bread is in cakes, but not fine; and their milk is not very palatable to an European, being curdled and quite sour. It immediately turns sour after sun-rise; but the Arabs prefer it in that state.

On the Persian shore are the ruins of a very large and ancient city, extending about twelve miles along the banks of the river, and containing many tombs which still appear entire. This city was destroyed by the Persian Emperor, Nadir Shah; and among the ruins several wolves were seen.

In the whole extent from the sea to this part of the Persian side of the river, there is very little culture, and but a thin population. It appears, however, to have been once well cultivated; there are still many embankments to prevent the river overflowing the country, and numerous canals to water the ground, similar to those on the opposite Arabian shore. As to plantations, we only saw a few straggling date-trees, which being neglected, bore very little fruit.

The next day, June 13th, they saw numerous herds of cattle, sheep, and goats, with a great many horses, on the Arabian side of the river. An Arab Sheikh, or a man of any consequence, usually keeps several horses ready saddled, in case of any alarm, and is always ready to ride off at a moment's notice. These horses are fed with grass cut by the side of the river at low water, or on some of the islands, which are very numerous. For this purpose they make use of large baskets, covered with a coat of bitumen, which effectually keeps out the water, and two men will paddle in them at a tolerable rate. Some of these baskets are large enough to carry a dozen people, and are frequently used as ferry boats.

On the 14th they observed, that on the Arabian side of the river the culture and population were nearly the same as before; but the Persian side had a better appearance. Vegetation was there much more flourishing; and at sun-set, a considerable

where they - and fixed residence in wall, to defend the lions, which sh as we expected much entertainment in dress, and very much, &c. Their milk is curdled, being curdled, and turns sour after it in that state. The ruins of a very old building about twelve miles, and containing a great number of entire. This city was built by an Emperor, Nadir, and several wolves were

considerable tribe, with their flocks, began to pitch their tents, not appearing to have any fixed residence. They lighted fires, which continued burning all night. On the 15th they weighed anchor, but only gained about six miles. The Persian side of the river improved in its appearance, having a few small villages close to the river side, and some date-trees. It being rather swampy, there were also a good many willows, and a few elm-trees. The Arabian side, too, looked better than what they had lately passed, being cultivated farther from the river. The date-trees being planted about ten feet from each other, and full of leaves at top, afford a very good shade; and the people are enabled to cultivate the ground during the whole day, without suffering much inconvenience from the heat of the sun, which out of the shade, and in the middle of the day, is at this season not to be endured. They found here a very strong brown soil, which does not appear to want any manure, nor do the Arabs at this place ever make use of any.

On the 16th, they gained about six miles more, and the Persian side of the river now exhibited a high degree of cultivation. They saw many inhabitants and numerous flocks and herds; but did not much intercourse with the people, as they are not so much to be trusted as their opposite neighbours the Arabs. They are a very strong, robust, hard-featured people; and their dress is nearly similar to that of the Arabs. A piece of blue calico, about five yards long, is the whole of the woman's dress, and the children are entirely naked. The men have a very ferocious appearance, and will destroy whomsoever they can overpower, which renders it impossible to travel much in this country. Wild hogs are very numerous among the marshes, and there are various kinds of game in great plenty, which affords fine sport to a shooting party; but it will always be necessary to go in a considerable body, and never very far from the river, to avoid being off by the savage inhabitants. The Arabian side of the river was nearly the same as before, except that the canals were cut farther inland,

which implied of course more cultivation. Some of the canals are very broad, and Mr. Jackson crossed over several in the wicker baskets before described, which are indeed very convenient where there is not much current.

The 17th they gained also about two leagues. A party of them went out a shooting on the Arabian side of the river, but were not very successful. Extending their walk inland about three miles, they found the whole well watered by means of canals from the river, and the population very great. The dates and other trees afforded an agreeable shade, and made their little incursion very pleasant. They found great abundance and many varieties of garden vegetables; some of them European, and several peculiar to the country. Beside the dates, which are the chief support of the inhabitants, there were great quantities of pomegranates nearly ripe; red and white grapes, some of them ripe; an abundance of oranges, limes, and lemons, but none of these had attained maturity. There were also many well-tasted apples, chiefly of the kind called codlings, but a little sweeter than those in England. They took with them about a bushel of these, for which they paid a very trifling sum*. The inhabitants are remarkably civil. There being no regular road, the Europeans frequently lost their way; and the natives would very readily offer their services to conduct them into the right path.

On the 18th Mr. Jackson set out for Bussora by land, with an Arab guide. They were frequently stopped on the road by soldiers; but his guide always satisfying them, he was permitted to pass without molestation. Many of the inhabitants seemed to view him with astonishment; and in all probability some of them had never seen an European before, this part being out of any accustomed road, and where no one can travel on horseback on account of the numerous canals. The country through which he passed had a delightful appearance, being well watered, and in luxuriant vegetation. Extensive crops of wheat, barley, and paddy, were nearly ripe; and of fruit and vegetables the quantity was im-

that on the Arabian side and population were but the Persian side. Vegetation was there at sun-set, a considerable

I was very much pleased, says Mr. Jackson, with the little journey; and, though I had lately been in the island of Ceylon among the cinnamon, in the Travancore country, and in every part of the Malabar coast, I certainly should give the preference to this place; for the abundance.

of various kinds of fruits, the fragrant smell from the oranges, lemons, and sweet-scented shrubs, and the agreeable shade of the lofty date-trees, rendered it a most delightful spot.

mense.

mense. The city of Bussora is supplied from this neighbourhood, and the Turks and Arabs consume a very large quantity in proportion to their other food. After walking about ten miles, he reached the English factory at Bussora. Here he obtained a horse, and a guide, also mounted, and set out immediately from Bussora for Margill, the country residence of Samuel Manesty, Esq. the resident. This stands about three miles above the city, and is pleasantly situated on the banks of the river.

During his stay at Margill, which was about a week, he frequently visited the city of Bussora, which is very large and extremely populous. The Bazar, or Market-place, is nearly two miles long, and appears to be well supplied. It abounds with drugs of various kinds peculiar to the country, and which, though of considerable value in Europe, may be bought here at a moderate price, money being of more value here than in many other countries. European manufactures are scarce and dear; and the people prefer those of England to all others. English superfine broad cloth, and watches, will sell for more than double what they cost in England.

The length of the city walls, from the river toward the Great Desert, is about four miles, and from North to South about three miles. The walls are chiefly built of clay, and of course cannot make any very stout resistance, particularly against artillery. Of this, however, there is very little in the country; in the city were only ten pieces, most of them brass indeed, but only two or three of them serviceable. Being exposed to the sun, the carriages were dropping to pieces.

Here are several mosques and minarets, many of which are very handsome buildings. Some of the latter are entirely covered with variegated tiles, which have a very singular appearance. Most of the public buildings, as mosques, minarets, and hummums, are built of brick; but the English factory is now by far the best structure in the whole city. Within the walls are several vacant spots not built upon, and which appear to have been occasioned by fire. The houses in general are very indifferent, being chiefly built of clay with a small proportion of bricks. Their timbers are the trunks of date-trees, not squared, but round, and in the same state as when brought from the plantation: they

are also very soft and spongy, and will not last long. The very thick walls, and these clumsy timbers, form together a very uncouth piece of architecture. The roofs are flat, and surrounded by a parapet. Here the inhabitants sleep during the summer season, in the open air. To an European every house appears like a prison, as it can receive no light from the street, because it has no windows. Every house forms a square, and the inhabitants have no communication with their neighbours. Within the square are various offices; some under ground, where the people retire during the heat of the day. The kitchen, the water, and not unfrequently the horses, are kept on the ground floor. The hall, where the receive company, the harem, and many other offices, are on the second, which has generally a gallery supported by pillars continued nearly round the inside of the whole building. They have generally two flights of steps; one leading to the hall, where alone strangers are admitted, the other leading to the harem, to which none but the family can have access. Women of the higher class are seldom seen out of doors; but when they do go out, they are always veiled. Many of the Arab women, particularly of the lower class, expose their faces.

Both men and women slaves are sold publicly in the Bazar. The majority of the people are Arabs, the rest are Turks and Armenians. The Turks are mostly men of some consequence, either being officers in the army, or holding some other posts under government. The Armenians are the merchants, and some of them are very respectable. They have a considerable trade with the East Indies, and chiefly to Bengal. In this trade several ships are employed, the largest of which does not exceed four hundred tons, on account of a difficulty in crossing the bar. The ships from Bussora to Bombay, or Bengal, usually receive a full cargo, the greater part of which consists of copper in small cakes, and drugs of various kinds; and the Bombay ships generally take dried fruits. It is very seldom, however, that a vessel sails to any part of India without taking a considerable number of Arab horses. There are many instances of ships carrying away silver, in bars and specie, to the amount of twenty lacks of rupees; the specie chiefly Spanish dollars and Venetian sequins*. A considerable

* The greatest part of the trade of this branch of the Turkish empire is in the hands of the Armenians, who,

when they have a considerable sum on hand, in order to prevent the Turks from laying hold of it, (which is a

considerable quantity of sugar and rice is frequently imported from India. The specie is sent here by the Armenians to their correspondents in most parts of the empire; considerable sums likewise are often sent from Constantinople. These are usually forwarded under the care of the Tatars*, messengers of government, who receive a handsome premium for their trouble. The Tatars, however, are sometimes robbed and slain by the wandering tribes, who in formidable bodies infest the greater part of the Turkish dominions in Asia.

With respect to the Arabs, the most numerous class of inhabitants, there are a few respectable men amongst them; but great numbers are extremely poor, labouring very hard for small wages. With a very little pay, however, they are enabled to support their families; for their dress costs them little; and their food consists of dates, bread, and water, with which they are perfectly satisfied; and indeed, though their food is so simple, they have generally speaking, twice the strength of Europeans, and are able to endure much more fatigue.

The streets in this city are so extremely narrow, frequently to admit only one horse at a time; added to which, they are in many parts so very rough as to make it difficult for horses to pass. There is a Roman Catholic Church, a tolerably good building; and the people of that persuasion are not in the least molested. Every person wears the dress of the country, particularly mustaches.

On the 25th, every thing having been prepared for their departure for Bagdad, an Arab Sheikh, (in the case) export it to India, where they often receive twelve per cent. interest. The interest is usually remitted back in piece goods, with which they supply the greatest part of the Turkish empire.

* Usually, but very improperly, printed *Tartar*. See Campbell's Journey over-land to India," and other works. It is pronounced *Tatur*, the accent being on the last syllable.

† As these boats were admirably calculated for their intended purpose, the following account of them may not be unacceptable:

Description of the boat generally called a Donck, but sometimes a Kiraffe, used by the Arabs upon the rivers Euphrates and Tigris.

The extreme breadth is seven feet nine inches. The length forty-two feet. It is built of strong rough timbers at fifteen inches distance, connected by small rough pieces of board, and covered with a coat of bitumen about half an inch thick on the outside, which, in case of a leak, is very

named Abdallah Teef, a very respectable man, engaged to conduct them safely thither; for which they paid him one thousand three hundred piastres. This sum, it is to be observed, was only for three boats and guards, having themselves provided a good stock of provisions of all sorts, with culinary utensils, cooks, and other servants, which cost five hundred piastres more. The clothes provided for each person were as follow: one Arab cameline, or riding cloak; two under coats; two pair of drawers; two shirts; one cummerbund; one turban; one woollen cap; and one pair of yellow slippers. The boats being brought up to Margill, they went on board; two of the boats containing the passengers, the other boat the additional guards: Immediately after embarking, they were dressed so as exactly to resemble the Arabs in appearance; and their mustaches were now grown pretty long, having never shaved since they left India. Every attention was paid to their personal safety, the Sheikh being always in one of the boats, and his brother, Ahmood Sollav, in the other †. These boats usually go from Hilla down the Euphrates to Bussora in three days, and are seldom four. From Bagdad down the Tigris to Bussora they can never go in less than eight days, though the stream is much more rapid than the Euphrates; but it is above twice the length, on account of the many windings, and it runs a great way to the eastward towards Persia. On the Arabian side, above Margill, there is neither cultivation, inhabitants, nor vegetation, except near the banks of the river, where are a great number of camels

easily repaired. The inside is lined with the same kind of rough boards, none above three feet long, and of very unequal breadths; the lining is, of course, full of holes.—Some of these boats, instead of boards, are covered with basket-work, having a coat of bitumen upon it.—They are very sharp at each end, and sail fast.—Their oars are rough poles, having a piece of board tied on with a cord. They have besides strong timbers, which go down to the keel, and are about three feet above the gunwale; these are full of notches, to which they fasten the oars with strong kya rope; and by these means they either raise or lower the oar, as is most convenient. They have no tiller; but are enabled to steer with great accuracy by means of a strong kya rope fastened to both sides of the rudder; and they very seldom use more than five oars at a time. In the fore-part was a place built with brick and clay for the purpose of dressing victuals; and this convenience was of great use, as it enabled them to provide every thing necessary without delaying the passage by frequent landings.

sum on hand, in order to hold of it, (which is

grazing. Here is also much game. The Persian side of the river has a better appearance, exhibiting extensive plantations of date-trees, and many villages. The river is here about two miles broad, bearing N. N. W. and S. S. E.

On the 26th they arrived at Corny, the conflux of the rivers Euphrates and Tigris. Here they remained two hours, and observed that the Tigris bore E. N. E. and the Euphrates due W. A ship of war was moored near the middle, between the two rivers, as a guard-ship, and to prevent vessels passing without paying customs. The two rivers, united here, form an immense body of fresh water. From this place to the Persian Gulph is called by the natives Shat-el-Arab. The tide has seldom any influence so far as Corny, except at the full and change of the moon; and even then the water is only raised a little; the current is not checked.

Corny is supposed by some learned men to have been the site of the Garden of Eden. Its present wretched appearance, however, gives it no pretensions to the name of the Terrestrial Paradise, as described by Milton. It is a small village, surrounded by a mud wall; containing few inhabitants, with very little cultivation. There is, indeed, a small plantation of date-trees between the village and the river, and which forms a very agreeable shade. Here the Arabs sit and spend most of their time, seeming to depend for their livelihood much more on their exactions from passengers, than on their own industry.

Leaving Corny they went up the Euphrates, which is called by the Arabs Shat-el-Fraat. The country here was very little inhabited, being wet, swampy, and covered with reeds and willows*.

At sun-set several jackalls were prowling near the banks of the river. In the evening they made their boats fast to the western banks of the river

near a large tomb, where they remained all night, but had very little rest, the mosquitoes being extremely troublesome, and the howling of the jackalls, wolves, and other wild beasts, in the neighbourhood, rendering their situation truly dismal.

At day-break June 27, they resumed their voyage, tracking up the right bank of the river. The country afforded a pleasing prospect, abounding with plantations of date-trees and fields of corn. In their passage they passed a breach in the right bank of the river, which has overflowed the Great Desert for about three hundred miles, and has alarmed the inhabitants of Bussora and that neighbourhood very much. The excessive heat of the sun, with the immense numbers of fish and animalcules that perish when it dries up, serve to putrify the air, which in general proves fatal to great numbers; and hence the Arabs call it the water of death. The natives, however, were endeavouring to stop the breach. At night the English got very little rest on account of the mosquitoes, and the horrible noises made by the wild beasts in the vicinity.

On the 28th they reached Suke Shue, and on the following day were treated by the Sheikh with a dinner in the Arab fashion. It consisted of a dozen and a half of fish, about the size of mackarel, fried in ghee; a dozen boiled fowls and cakes made of barley flour, fresh baked, with plenty of milk. They sat upon the ground agreeable to the custom of the country, in a garden adjoining the river, under the shade of a grove of date and fig-trees. The fish, fowls, and bread, were very sweet and good; but the milk was sour, and not very palatable to an European. They did not make use of knives and forks, as in Europe, but ate with their fingers as the Arabs do, tearing the fowls and fish in pieces†.

* I fired at a crane among the willows, says Mr. Jackson; and instantly after the report, a large herd of wild hogs rushed out, some of them of such extraordinary size, that at first sight I could scarcely believe they were hogs. Their colour is a deep red. In the neighbourhood of Bussora some wild hogs have been killed, whose carcasses have weighed ten cwt. English. As the Arabs do not eat them, they are permitted to remain unmolested. It is said, that they continue growing as long as they live; and indeed the immense size of some of them seems to sanction such an opinion.

† Mr. Jackson informs us, that on this occasion he was

much amused by observing the dexterity of the Arab women in baking their bread. They have a small place built with clay, between two and three feet high, having a hole at the bottom, for the convenience of drawing out the ash, something similar to that of a lime kiln. The oven is usually about fifteen inches wide at top, and gradually grows wider to the bottom. It is heated with wood, and when sufficiently hot, and perfectly clear from smoke, having nothing but clear embers at bottom (which continue to reflect the heat), they prepare the dough in a large bowl, and move the cakes to the desired size on a board or stone placed before the oven. After they have kneaded the cake to a proper consistency

Suke-Shue is a very large and populous town,
and the residence of Sheikh Twiney, a very pow-
erful Arab Prince. Mr. Jackson walked with
the Sheikh through the town, and went into the
Bazar, or market, which is about a mile long.
It is opened at sun-rise, and continues till nine
o'clock; it is then shut up, opened again at three,
and continues till sun-set.

The Sheikh also took him into a coffee-house;
where he was treated with coffee, after the cus-
tom of the country. He was also obliged to
smoke tobacco, they presenting him with a pipe
about a yard and half long. He sat down on a
mat cross-legged, like the rest of the company,
and they served the coffee in a small China cup
about the size of half an egg-shell; but he could
not get either milk or sugar, without which the
beverage was rather unpleasant, till he became
accustomed to it.

On the 30th they reached a village called
Gomcreek, the neighbourhood of which abounds
in game. Several branches of the river meet at
this place; and a Collector of the Customs is
stationed here. The river, a little above this
place, is very broad, nearly as far as the eye can
reach; but in many parts it is so very shallow,
that reeds make their appearance above the sur-
face of the water. Here they altered their course
to the Eastward, and on the 1st of July, entered
a river called by the Arabs Shat-el-Degela, which
communicates with another named Shat-el-Hie,
being a branch of the Tigris.

I cannot quit the Euphrates, says Mr. Jackson,
without taking notice of its salubrious water,
which is by much the most pleasant that I ever
tasted. Though very muddy when it is first
taken up, it soon becomes perfectly clear; and
while I could get this water, I had not the least

ance, they pat it a little, then toss it about with great
dexterity in one hand, till it is as thin as they choose to
make it. They then wet one side of it with water, at the
same time wetting the hand and arm with which they put it
to the oven. The wet side of the cake adheres fast to the
side of the oven till it is sufficiently baked, when, if not
of proper attention to, it would fall down among the
embers. If they were not exceedingly quick at this work,
the heat of the oven would burn the skin from off their
hands and arms; but with such amazing dexterity do they
perform it, that one woman will continue keeping three or
four cakes at a time in the oven till she has done baking.
In mode, let me add, does not require half the fuel that is
made use of in Europe.

desire for either wine or spirits. They continued
tracking up the river called Shat-el-Degela till
six o'clock, when they made their boats fast to
the banks, and pitched their tents not far from
some Arab encampments.

The Sheikh represented to them, that this was
a very dangerous situation, and recommended
them to keep their arms in their tents, in case of
an attack. They had each a gun, a brace of
pistols, and a sabre; and the Sheikh, his brother,
and all the guards, remained under arms during
the night. They placed some centinels at a dis-
tance from the tents for fear of a surprize, and
passed the watch-word from one to another the
night through, but were not molested.

Whoever travels through these countries,
ought not to put so much value on his life as
Europeans in general do where they are perfectly
secure, except from casualties. This country is
in a state of perpetual warfare; many of the in-
habitants, under no controul, live in a state of
nature, and are not susceptible of the nobler
passions. They murder and plunder, without
remorse, all whom they can overpower, and are
at war against all the world, except their own
tribe. Such is the present state of one of the most
fertile countries in the universe. No traveller is
safe, having reason to expect every moment to be
attacked by a superior force.

On the 2d of July they struck their tents, and
arrived at the head of the Degela, when they
entered a larger river, which is divided into two
branches: the one running S. E. the other W*.
At twelve o'clock they entered the river called by
the Arabs Shat-el-Hie, running from the N. N. W.

The Sheikh always chose as open a country as
he could find, to remain in all night, for fear of
being attacked by the Arabs at a disadvantage.

* Whether these branches have been cut to water the
country, or not, is uncertain; but it is probable they have.
The ground for about forty yards from the river is usually
three or four feet higher than it is farther inland. The
larger branches are often near a quarter of a mile broad,
and the smaller about half that distance. They make the
country through which they pass exceedingly fertile; but
there is no doubt that these different branches are much
larger than they were originally, and that they are still in-
creasing, as the Tigris, from which they are supplied, is
much more rapid than the Euphrates, particularly at this
season, when the freshes are coming down from the snowy
mountains.

During

During the night they were much disturbed by the jackalls, who seemed very near, and made a most hideous noise.

The next day they were visited by some Arabs on horseback. They were about twenty in number, armed with spears and tolwas. As the horsemen approached, our Sheikh, with a double-barrelled gun in his hand, walked about twenty yards to meet the Chief of the other party, who also advanced before his people about the same distance. After some conversation between the two Chiefs, the whole advanced. The Chief was mounted on a beautiful Arab mare, and it is a general rule, that Sheikhs and men of consequence are always mounted on mares, which are usually valued at three times the price of horses*. There is much jungle (wood) in the neighbourhood of this place, and lions are very numerous. Parties of Arabs likewise frequently lie in wait here, and the Sheikh who conducted Mr. Jackson fully expected a night-attack; and he therefore, with his brother and all the guards, remained under arms all night, the Sheikh constantly walking round the tents with a double-barrelled gun in his hand. A very good lookout, and probably the preparations which the horsemen observed making for defence, prevented the travellers from being molested.

The heat of the sun was so excessive on the 4th of July, that the boatmen were not able to endure it. They were in general nearly naked, having no other covering than a small woollen cap, which barely fits the crown of the head. The rapid current of the river continues deepening the beds, and in consequence the Arabs are not able to water many parts of the country, which renders it uninhabitable except on the banks of the river. Where they cannot have water, the excessive heat of the sun soon destroys all vegetation; and particularly at this season. In the afternoon they passed a village on the

western banks of the river, called Waasut. The river is here above half a mile broad. The Sheikh was particularly careful not to go near the village, but continued tracking up the opposite banks, and made as much haste as possible. "All the inhabitants," said the Sheikh, "are desperate thieves, and have no mercy on those who are so unfortunate as to fall into their hands; for they are under no government or controul except that of their own leaders, who are every whit as bad as themselves."

In the afternoon of July 5, they arrived at the town called Hie, from which this river takes its name. It is situated on the eastern banks; and, the inhabitants of this town not being much better than those of Waasut, the Sheikh mustered all his guards a little above the town, amounting to thirty men, all exceedingly well armed, and dressed in their best clothes. He spread a carpet on the ground, and with his brother, and another principal officer, sat down, having all the guards under arms draw up near them. Here they were visited by the principal men in the town, who were treated with pipes and coffee. The Sheikh, however, kept the double-barrelled gun lying on the carpet before him, and ready to fire in a moment; the other officers' men being equally prepared. This ceremony must appear very strange to those who are wholly unacquainted with the singular manner and customs of these people; but all this caution is perfectly necessary till they have given the salam and ate together. When that has been done, there can be no room for apprehension. An Arab, after he has eaten or drank with another, let him be ever so great a stranger, and of whatever religion or country, would sooner perish than suffer him to receive the least injury, either in person or property; and whoever, in distress, puts himself entirely under the protection of an Arab, may rely upon being defended in the most faithful manner.

* To those who are strangers to the language, manners, and customs, of this country, it is no useless thing to recollect, that whenever a man is mounted on a mare it may be depended on that he is above the common class. Dress cannot be relied on; for a Sheikh will often have his meanest servant dressed much better than himself, and will eat out of the same dish with him, as if they were equals.

† An instance of this singular trait in the character of the Arabs occurred not long ago. A Frenchman was carrying dispatches to India, across the Great Desert, from

Aleppo to Bussora. He had with him an interpreter, and an escort of about eighty men, mostly on camels. When about five days journey from Bussora, they were attacked in the evening by a wandering tribe of Arabs. The messenger had a double-barrelled gun, with which he shot the Sheikh of the hostile party; but they rushed with such force at the first onset, that before he had time to charge again he was cut down with a sabre. Most of the messenger's guards being killed, they were stripped by the conquerors, and the messenger among the rest, it being imagined that

It is customary for these people to lay very heavy contributions on vessels and passengers that pass this way, or plunder them when they do not comply with their demands: and in case of the least resistance, they will seize the boats and murder every person on board. In this they have an advantage over boats going up the river, which being obliged to track against both wind and stream, their progress is seldom more than four miles an hour; but going downwards there is very little danger; for the current being very rapid, and the wind usually blowing fresh from the N. W. all vessels go at a great rate, and particularly the small doneks, which sail remarkably fast. He is a small town surrounded by a mud wall; but there are a vast number of inhabitants in proportion to the size of the place.

The locusts in this country are very numerous. Mr. Jackson caught one of a different colour from the common locust, and much larger. Its extraordinary appearance induced him make a sketch of it from life, of the exact natural size. Every part of it is green, except the under wings, which are crimson; and when flying it has a beautiful appearance. The eyes are very remarkable.

On the 7th, they entered the river Tigris, called by the Arabs, Shat-el-Amaar. Nearly opposite, on the eastern banks of the Tigris, is a small town called Coote, off which several stout vessels were lying at anchor. The main body of the river runs S. E.; and from the best observation they could make, it appeared that the river had been originally a canal cut to water the country, but had in course of time increased to a very large river, containing much more fresh water than the Thames. The Tigris is here

dead. After the engagement, the Arabs lighted fires to drink coffee and refresh themselves; and, as is customary with them, sat on the ground in a circle round the fire. The messenger's wound not proving mortal, (for though he had one side of his face cut down, his skull was not materially injured) he at length recovered his senses; and finding himself entirely naked, as well as much weakened by the loss of blood, he had nearly given himself up to despair. Recollecting to have heard of this singular disposition of the Arabs, he resolved to try the experiment, as the only chance of saving his life, or putting an end to his existence. He took a view of the Arabs sitting round the fire, and pointed out him whom he thought most likely to be the chief, being the oldest-looking man in the company. Naked as he was, and almost covered with blood, he rushed into the fire, and threw himself at his feet. His conjecture was

above a mile broad; and, though reckoned at its height, on account of the snow melting upon the mountains, the banks were upwards of ten feet perpendicular above the surface of the water. Several large droves of camels were grazing upon its banks. The river is very crooked, winding from N. N. E. to South. They passed a Turkish camp pitched on the western banks, and made their boats fast to the same banks, about half a mile above them. The Turkish tents had a very handsome appearance, some being red, others green, and some white. The army consisted of six thousand horse; and the Bashaw had two armed vessels to attend him on the river; these were about a hundred and fifty tons burden each, and were built much like the Grabs in the East-Indies. This army had been sent to punish some rebellious Arabs in the neighbourhood, who had murdered the Sheikh of Hilla, and several other officers under the Turkish government. The Sheikh dressed himself and half a dozen of his slaves in their best clothes, and paid a visit to the Bashaw.

On the 10th Mr. Jackson informs us he had an opportunity of observing the progress of the hot winds, called by the natives Samiel, which sometimes prove very destructive, particularly at this season. They are most dangerous between twelve and three o'clock, when the atmosphere is at its greatest degree of heat. Their force entirely depends on the surface over which they pass. If it be over a desert, where there is no vegetation, they extend their dimensions with amazing velocity, and then their progress is sometimes to windward. If over grass, or any other vegetation, they soon diminish, and lose much of their force. If over water, they lose all their electrical

right. This old man was the chief, who immediately covered him with his cloak. He was now at a loss for an interpreter; but, on search being made, the interpreter was found in a similar situation, wounded, but not dangerously. The messenger had his clothes and dispatches returned to him; and the chief entered into an agreement to deliver him safe at Bussora, on the messenger promising to pay him one hundred Venetian sequins. Both parties performed their agreement; the messenger arrived safe, and had engaged a dhow to take him to Muscat. This having reached the English resident's ears, he seized the messenger with his dispatches, and had his wounds dressed by the English surgeon. It was imagined that the messenger, if suffered to proceed, would not have reached India, as his wounds required much surgical assistance.

fire, and ascend; yet he sometimes felt their effects across the river where it was at least a mile broad.

On the 12th they made their boats fast to the eastern banks of the river, and pitched their tents near the ruins of the ancient city of Ctesiphon. The river here takes a circuit to the southward for about ten miles, and leaves only a narrow neck of land, on which are still standing many lofty walls and towers, being fragments of ancient Ctesiphon. In their passage they met with several stout vessels, some upwards of two hundred tons burden, laden with fire-wood, and bound to Bagdad. They appeared to Mr. Jackson of such a singular construction, and so ill adapted for the purpose, that he was induced to take a sketch of one of them. The rudder is composed of a great quantity of rough timbers very awkwardly put together, and is guided by a tiller. They are built of very coarse materials, and covered with a thick coat of bitumen. The lofty head is generally ornamented with a variety of shells stuck into the bitumen. They form altogether a very uncouth specimen of naval architecture, and require twenty, and sometimes thirty trackers; but when the wind blows strong, even they are not able to move them. On enquiring the reason why they made use of vessels so ill adapted to the purpose, that a man with a very slight knowledge of naval architecture might soon discover their inconveniences, and observing, that a vessel built upon a plan similar to the English ware barges would carry as much cargo, draw less water, and might be worked with one-third of the men; the answer he received convinced him of the danger and inutility of attempting any innovation among these people. He was told, that the children invariably continued to follow the trade of their fore-fathers; thus the sons of a carpenter are all carpenters, &c.; that their fore-fathers had always built vessels upon the same plan, and that it would be reckoned very prophane in them to deviate from the custom of their ancestors. This completely solves the problem, and shews to what a length superstition and prejudice is carried among them. These people have continued from

* An Englishman has at Bagdad a privilege which is not granted to the people of any other nation. Whatever baggage he may have with him, instead of being taken to the Custom-house, is allowed to be carried to the place where he is going to reside, and an officer of the customs is sent

the earliest period to speak the same language wear the same kind of dress, and eat and drink in the same manner. Their mode of warfare is still the same; and scarcely the slightest deviation has taken place in their manners and customs, prejudices and passions; though almost every other nation has undergone a thorough revolution within a few centuries.

Should a man here, convinced of a defect in any branch of trade, offer to adopt an improvement, complaint would soon be made to the Musti, and the artist probably pay for his temerity with his life.

At sun-set on the 13th they passed Javer, on the western banks of the river. Though but a small town, it is much celebrated on account of a very beautiful mosque that stands in it. At nine o'clock they crossed the mouth of a large river running from the North, called by the Arabs Shat-el-Deaal, and at half past nine made the boats fast to the eastern banks of the river, which were upwards of twelve feet above the surface of the water.

On the 14th they reached Bagdad. The river was very crooked, being nearly round the compass, yet from the place where they set out in the morning was only three hours walk by land. They arrived at the house of Mr. J. L. Renaud (an agent to Mr. Manesty, of Bussora), which was very conveniently situated adjacent to the river*.

Bagdad is seated on the eastern banks of the Tigris. It is a large and populous city, extending along the banks of the river about three miles, and the length of the walls from the river being about two miles, gives it the form of an oblong square. The houses, though very inferior to the European, are much better built than those of Bussora, but nearly in the same stile. Most of the public buildings, such as mosques, minarets, and hummums, are constructed of hewn stone, and make a very handsome appearance. Here is also an extensive Bazar, which is well supplied with variety of articles; but the prices in general much higher than at Bussora. The Armenians are the principal merchants here

thither to examine it. This privilege was obtained by the solicitation of Mr. Manesty in favour of his country, and will be at all times advantageous to the interest as well as the convenience of a traveller.

the manufactories carried on are few, and those
confined to articles for immediate use, as shoes,
boots, clothes, saddlery, and culinary utensils.
The Armenians at Mosul send great quantities of
copper down the Tigris to Bagdad upon rafts of
timber fastened together. On their arrival the
rafts are sold, wood being very scarce here. The
copper is afterwards shipped for Bussora on board
large dows, which are usually about six months
in performing the voyage thither and back again.
The copper is in small round cakes about six
inches broad, and nearly two inches thick in the
middle, but gradually sloping to the edges. It
is of a quality nearly the same as English battery
cake copper. This trade, which has not long
been carried on, is fast increasing to a very great
extent; for sometimes ships sail from Bussora
laden almost entirely with copper; and it is prob-
able that it will in time prove prejudicial to the
English manufactories. Labour being much
cheaper in these countries than in Europe, they
are enabled to carry it to market at a much cheaper
rate; and this makes it very profitable to those
at present concerned in it. Though Bagdad is
much better built than any other city in this part
of the world, it is still very inferior to many cities
in Europe. Every house wears the appearance
of a prison, as described in Bussora, but com-
posed of better materials; they are in general of
brick, and the timbers very good, being those
which are floated down the Tigris. The streets
are very narrow and dusty. Scorpions, taran-
tulas, and other noxious insects, are very
numerous. Of the former Mr. Jackson fre-
quently killed four or five in a night; they are of
the large black kind, and their stings often prove
mortal. All persons at this season of the year
sleep on the tops of their houses; and the people
run off with their clothes in their hands at sun-
rise; for as soon as it has risen above the horizon
it becomes excessively hot. Mr. Jackson soon
learned, however, that even looking over the
parapet-wall was a deed of danger; for that the
Turks would not hesitate a moment to shoot at any

* The following story is related of the late Kya by the
merchants; and many of them, much to their sorrow, are
enabled to vouch for the truth of it: It also proves to what
a length many of the Turkish Ministers and Bashaws carry
their tyranny and oppression. He was a man (say they) of
superior abilities, had the confidence of the Bashaw, and
kept a most strict watch over the conduct of all officers,

person whom they might discover overlooking
their houses. Here are many cranes, much larger
and very different from any in Europe. They
build their nests upon the tops of the minarets
and the loftiest houses, where they are never mole-
sted, and are in consequence very tame. As
there are no canals to water the city, many poor
people are constantly employed in carrying water
from the river in skins. Some take it on their
backs, while others have asses and mules. With-
out the walls, to the westward, is entirely desert,
not having the least traces of vegetation, except
on the banks of the river. Behind the city, to
the northward, the same barrenness prevails;
there is no water nor any cultivation. To the
eastward, along the banks of the river, there are
excellent gardens, which extend about four
miles; and a great many houses filled with in-
habitants stand without the walls. The city,
however, is chiefly supplied with fruits and vege-
tables from the opposite side of the river, where
there is much cultivation. The Bashaw and
some of the principal people have country seats
in this neighbourhood. This was the site of
ancient Seleucia, built by Seleucus, one of Alex-
ander's generals, who succeeded to the government
of this part of the country; and several of his
coins are still to be met with in Bagdad. The
gold coin is worth about two guineas; it bears as
strong an impression of the head as the ancient
Roman coins, but has a long beard. A little
farther, towards Hilla, are still to be seen some
ruins of ancient Babylon.

Bagdad at present is supposed to contain more
treasure than any city of equal size in the world;
and the immense quantity of specie and bullion
found in the coffers of the late Kya (or Prime
Minister) of Bagdad seems to warrant such a
conjecture. He was murdered a few months
ago by conspirators employed against him by the
present Kya; and when the Bashaw seized on
his property, an exact account was taken of his
treasure, which amounted in value to upwards
of three million sterling*. The present Kya
can

civil and military; hence it was, that so many of them
readily joined in the conspiracy. He was withal very
avaricious, and invented many singular methods of adding
to his treasure; among others, the following proved very
productive: he always kept spies over the merchants in the
Bazaar; and when he heard of any dispute among them, he
would first send for one of the parties, question him re-
specting

can neither read nor write. He was originally a Georgian slave boy; and brought up in the Haram; but was afterwards raised to an inferior office on the military establishment. Having heard that the Bashaw's daughter wished to marry him, he gained over some of the military and civil officers, and caused the Kya to be murdered one evening as he was returning from the Seraglio. When the Bashaw heard of it he immediately fled for protection into the Haram, where he concealed himself till he was informed that no injury was intended towards him. There was a considerable commotion in the city for a few days, which, however, was soon settled by orders being issued, that whoever was found in arms in the streets should immediately be put to death. The present Kya was soon after appointed to succeed, and married to the Bashaw's daughter. When it became necessary to transmit an account of the affair to Constantinople, it was stated, that the late Minister had intended to poison the Bashaw, which was the cause of his being put to death. The present Kya does not appear to be thirty years of age, is comely, and has a very graceful figure; but in all probability he will not continue long in office; the lives of princes in this country are extremely precarious, perhaps more so than in any other country in the universe, as no less than seven have been assassinated within the last twelve months.

Few Europeans transact any business at Bagdad, or keep any Consuls there. The English have no Consul, but their business is managed by an Armenian named Coja Makell, a very respectable man. Mr. Jackson had letters to another Armenian merchant named Coja Stephon Babeck, a very worthy man, who speaks tolerably good English, and is the only resident in the whole city that understands a word of it. The French at present have here a Consul named Rousseau, who is a relation of the famous writer Jean Jaques. They do not, however, carry on much

specting the matter in dispute, and, under a plea of the government being in want of money, enquire how much he would give to gain his cause. The sum was usually in proportion to the wealth of the complainant, and the animosity between the parties; sometimes so much as four or five thousand piastres. He would then set this man aside, send for the other party, and examine him respecting the quarrel, and as to the sum that he would give to gain his cause. This done, he would confront the two parties, and decide

business here, having at present no communication with India:

Mr. Renaud, though only a clerk to Mr. Manesty, waited on the Bashaw for a firman for Mr. Jackson, which he obtained under the Bashaw's seal, and having engaged a Tatar, named Siad Alimed Aga, to attend him, he prepared for his departure. The Mookadar (or keeper of the seals) paid us a visit, which was considered as a very great honour. He gave directions to the Tatar in my presence (says Mr. Jackson) to be attentive to the preservation of my person and property, for that otherwise he should forfeit his head. I had now for the first time an opportunity of observing the ceremony of perfuming, &c. which is usually paid to men of consequence. But the Mookadar was an exception to one very general custom amongst the Turks, as he did not smoke tobacco. On his taking leave he was complimented with an elegant white mualin turban and cummerband, the articles most commonly presented on visits of ceremony.

Mr. Jackson's Tatar dress being ready, as well as the trappings of his horse, he began to prepare for his departure from Bagdad. Though he was to travel under the title of Consul, yet it was necessary to wear the Tatar dress, to avoid being insulted by the populace, as is always the case when they discover an European, whom they call Fringui. He had also his head shaved, which he found to be of great service, as it kept him cool, and was more convenient to him in wearing the Tatar dress. He had entered into a written agreement with his Tatar to give him eight hundred piasters; five hundred to be paid in ready money at Bagdad before his departure, and the remaining three hundred on his safe arrival at Constantinople; and the Tatar engaged not to take any other passengers or merchandize under his care. Mr. Jackson took bills from Bagdad and Constantinople both for his Tatar three hundred piastres, and the money he had

in favour of him who had given the greater sum, returning the other his money, with some harsh censures of his conduct. At length this practice of the Kya was attended with a very good effect. The merchants found themselves egregiously fooled and fleeced, that whenever any dispute occurred, they were very glad to settle it amicably amongst themselves, taking all possible care to prevent its reaching the ears of the Kya.

provided for the remainder of his journey. He
also letters of credit on Constantinople from
Mr. Manesty, in case he should have occasion
for more money. His dress consisted of a yellow
cap about a foot high, broad at top and almost
flat, but becoming gradually narrower till it fitted
the head. The lower part of the cap was cover-
ed all round with black lambskin about four
inches deep, the inside lined and quilted, and in
the upper part stuffed with wool extremely tight.
Being thus calculated to resist any weapon, it is
an excellent safeguard to the head. This cap,
which being very heavy, feels unpleasantly at
times, is called a Culpack, and is only worn by
the Tatars. His other articles of apparel were,
a brown cloth coat trimmed with a broad black
silk binding, wrapped quite round the body with
short wide sleeves, and hanging down to the calf
of the leg; blue Turkish trowsers trimmed with
black silk binding, made very wide, but button-
ed tight round the small of the leg; and strong
leather boots to pull over the trowsers as high as the
knee of the leg. The under-dress is a Turkish
jacket, with long sleeves buttoning close to the
wrist; and a shirt without a collar. Turks of all
descriptions have the neck entirely bare. The
Tatars wear drawers; but Mr. Jackson wore a
pair of strong leather breeches under his trowsers,
which he found of great service. A cummerbund
about six yards long was tied very tightly round
his waist, and in this he hung a brace of pistols,
beside having a large Turkish sabre fastened
round his middle with a belt. His European
clothes, and whatever he had not immediate use
for, he had packed up in wax cloth;
stockings, and other necessities that he
might have occasion for on the journey, he had
put into a leather-pouch, which was fastened
round the saddle.

Being completely equipped, at five o'clock on
the 25th of July, he took leave of his companions.
Mr. Jackson and his Tatar guide rode near a
mile through the Bazar, where the merchants,
having been apprized when he should go, were
waiting with their letters. His Tatar took up-
wards of two hundred under his charge, this
being the only method they have of forwarding
letters from one city to another. The merchants
of Tatars are, therefore, always upon very
good terms; and the office of Tatar, as it is of
the greatest trust, is also very profitable; for, be-

OL. II. No. CXVII.

side their other emoluments, they receive con-
siderable presents from the merchants. The let-
ters are not any great inconvenience to them,
giving no farther trouble than the mere carriage;
for when a Tatar arrives at any considerable city,
the merchants immediately go to the Conac for
their letters. Near the western gate of the city a
caravan was preparing to set out, several hundred
camels being already loaded. As soon as we were
without the gates (says Mr. Jackson) we set off
at a brisk trot, the first part of our road being a
perfect desert, without the least appearance of
vegetation. Having ridden about four miles,
we overtook the Tatar's servant with three horses,
the one on which he rode had my European
clothes, a few necessities belonging to the Tatar,
and a couple of leathern bottles with water.
The second horse had only a cloth on him and a
bridle; being brought as a reserve, in case of
any accident happening to the other horses. The
third was laden with two bales of merchandize, a
thing expressly against our agreement. I had
actually deprived myself of many necessities that
I might not be encumbered; and now finding
that my Tatar had deceived me, I thought of re-
turning to Bagdad, and charging him with his
breach of contract. Reproaching him for his
conduct, I threatened to return, which alarmed
him very much, as such a step would in all prob-
ability have ruined him. He solemnly assured
me, that he should only take them to Mosul.
Though much disconcerted by this conduct in
my Tatar, yet having already paid him five hun-
dred piastres, I thought it better to proceed, even
though I might be detained a few days. The
Tatar then promising to make as much haste as
possible, we continued our journey, and about
nine miles from Bagdad arrived at the banks of a
branch of the Tigris. The road was here very
rough, and full of stunted shrubs. We soon left
the river, and passed through the town of
Yankja. In the vicinity were several flocks of
sheep, watched by shepherds for fear of the
jackalls, which were very numerous, and made a
most hideous noise. On crossing a plain west-
ward of Yankja, I felt much inconvenience from
a hot and sulphureous wind. I tied a handker-
chief over my mouth and nose till it passed us,
and my Tatar did the same; but I began to ap-
prehend some danger. As those winds were so
strong even in the night, what havoc might
they

7 Z

they not make when the sun was at its height, and the earth at its greatest heat! We continued our journey at the rate of about five miles an hour till eleven o'clock, when we arrived at a town called Doucolla, where we slept in the open air on a quilt and a pillow, with all our clothes on. This place and Yankja are both small straggling towns, every house being surrounded by a separate mud wall.

On the 21st they set out at half past four o'clock in the morning and were soon joined by a Turk with a servant and three horses. They passed through several villages, and saw many very fine fields of corn, with great quantities of game. Small cuts that led from a large canal supplied the country with water, and made it very rich; the bridges over these cuts were narrow, and sometimes dangerous for the horses to pass, being only a few sticks laid across, and covered with clay. They continued their route at the rate of four miles an hour till half past six o'clock, when we arrived at a Conac in a small village called Hope. A very fine stream of clear water ran through the village, in which were large quantities of turtle. At seven they arrived at a small town, surrounded by a mud wall, called Massabbas, near the banks of the river Deaal. In this neighbourhood were the remains of some military entrenchments. Here were several wild hogs, some of which were very large, and of an extraordinary size. They crossed the river Deaal over a stone bridge which had two very lofty stone pillars at one end, and in the evening arrived at a village called Chubuccan, where they slept on the bare ground in the open air; and on the next evening they arrived at Adanaque.

This town is situated at the foot of a range of mountains, running East and West, and is well watered by some clear rivulets that run from the mountains. Though here is plenty of stone, yet all the houses are built with clay, and are only one story high. In this place cranes are so abundant, that there is scarcely a house which has not several nests upon it. They are very

* There were indeed only half a dozen of them, but they were all well armed; and were getting their matchlocks ready, in case the Tatar had refused to comply with their demands. It requires some time for a man to prepare a matchlock, as he has to strike a light. They are very certain at a steady mark, but otherwise cannot be depended upon. They are chiefly rifle-barrels, and the Arabs are near a quarter of an hour in charging them.

tame, and the inhabitants never molest them. When any thing disturbs these birds, they make a violent clatter with their long beaks, which is sometimes repeated by the others all over the town; and this noise will sometimes continue for several minutes. It is as loud as a watchman's rattle, and not much unlike it in sound. From Adanaque they set out on fresh horses, and ascended the mountains by very narrow passes. Some were cut through the solid rock, giving room only for one horse to pass at a time. On the top of one of these mountains some Arabs were encamped, who exacted a few piastres from the Tatar*. After crossing these mountains they entered an extensive vale, through which a considerable river runs from West to East, called by the natives Shat-el-Narin. There were several Arabs with their flocks on the banks of the river. Though a considerable body of water, it is a clear stream; but has no bridge over it near the place†.

They continued their journey till they arrived at a town called Karatapa. Here the Tatar dismissed the servant he brought from Bagdad after giving him a severe horse-whipping. After they left Karatapa, though the road was often very rugged, and they had sometimes difficulty enough to discern any track, they rode full gallop the greater part of the way. One servant usually leads one or two horses, and those are whipped by the Tatar or other servants who follow. Travelling still on full gallop, they passed most of those encampments where the Arabs are stationed to exact money. As the night was very dark, no moon being visible, and the road exceedingly rough, there was scarcely a halt among the party but had one or more fallen, though those cattle are in general very sure-footed. They arrived at Kuppree after crossing the river Narin over a stone bridge; and in the morning of the 23d arrived at a town called Tuscomartee, where they rested.

Tuscomartee is very pleasantly situated to the North, at the foot of some hills, and is well

† About the banks of this river were several very curious animals, a species of the Jerboa is described by Buffon. They burrow like rabbits, seem very tame, and run fast upon their hind legs. The tail is extremely long in proportion to the body, and has a large white tuft at the end. When sitting on the ground they have much the appearance of rats, but are about twice the size, and of much lighter colour.

never molest them. These birds, they make long beaks, which others all over the sometimes continue sound as a watchman it in sound. From fresh horses, and very narrow passages the solid rock, giving pass at a time. On mountains some Arabed a few piastres from these mountains through which a coast to East, called There were several the banks of the river of water, it is a fine bridge over it near the

journey till they arrived. Here the Tatar brought from Bagdad horse-whipping. After the road was often, sometimes difficult, they rode full gallop. One servant usually and those are whipped servants who follow. At day-break, they passed near where the Arabs are. As the night was visible, and the road was scarcely a foot and one or more fathoms in general very steep. Kuppree after crossing the bridge; and in arrived at a town called rested.

Pleasantly situated to some hills, and is watered

ver were several very curious. The hoo is described by them as very tame, and runs like a tail is extremely long. It has a large white tuft at the end of its tail, and is about twice the size, and is

watered by several clear streams that flow from them. It commands a very fine prospect over an extensive vale to the South; in which it should seem that in winter there is a great deal of grass, if we might judge from the long brown tufts that still remained. The sun is so very powerful at this season as to destroy all vegetation, except near the rivulets that flow from the mountains, where are numerous flocks of sheep and herds of cattle. These, however, the shepherds are always obliged to drive to the town in the evening, on account of the wild beasts. Though there is a view over this vale for nearly fifteen or twenty miles, not a single habitation was to be seen. Continuing to gallop the whole of the way over a barren country, they arrived at a town called Karakoosh, which is situated on the North of the same extensive vale, which is about twenty miles over, and has a chain of mountains on each side, running East and West. About four miles from Karakoosh they arrived at a Tepellee, a town in the same vale, watered by several streams flowing from the mountains on the North. We did not stop at Tepellee, but continued our journey, riding at about four miles an hour, the roads being rough, and sometimes intricate*.

On the 24th they arrived at Kircook, also situated in the vale before-mentioned. They soon after ascended the chain of mountains on the right. Near the summit are several Naphtha pits. These are dug out of the rock, are about three feet deep, and into them the Naphtha oozes in a thick liquid, having a very strong smell, nearly resembling that of our coal-tar. Just above these pits were several rocks of salt. They soon after found themselves among some hills shaped like cockles, which appear to have been so formed by water, being covered with pebbles and shells, like those usually seen on the sides of the rivers. Toward the top of this chain of mountains, these round hills were very large; but they gradually diminished for about two miles, when the travellers ascended into an extensive vale. This immense range of mountains appears as if it had once formed a barrier. Along the top are the remains of

* The Tatars are excellent riders, being the greater part of their time on horseback; they have not, however, the regard for the beasts, but gallop up hill or down without distinction, and keep on till sometimes the horses fall under the fatigue, unable to go any farther. Nevertheless, the horses are much more hardy and able to endure fatigue,

a very strong wall, built with stone and cemented with bitumen.

Soon after descending into the vale, they galloped the greater part of the way, to Alton Kuppree, which is a large and populous town, built on an island formed by the river Alton, which divides itself close above the town, and uniting again a little below it, the town nearly covers the whole island. Here is at present a very large garrison of Turkish soldiers; and the town may be deemed impregnable, being difficult of access, and the use of artillery not known in this country. On entering the town we crossed the river, over which is an exceedingly high stone bridge of one arch. The passage over this bridge is very disagreeable, it being exceedingly steep on both sides, and like a Gothic arch running up to a point in the center. The pavement upon the bridge too is very bad. This town is at present the capital of Turkish Kurdistan, and a Bashaw resides in it.

On leaving this town they crossed the other branch of the river, over which is a bridge of two arches. This river contains a large body of water, and falls into the Tigris, a few miles below the town.

Evrill, which is thirty-two miles from Alton Kuppree, appears to have been formerly a place of some importance, for it exhibits the remains of an old castle on the top of an artificial hill on the West side of the town, and in the vicinity are several Naphtha pits. It is said to be the ancient Arbela, near which Alexander fought with Darius, and the country for some distance round it is an open champaign.

On the 25th they set out from Karakoosh, a little after nine o'clock; but the sun was now become excessively hot, the inhabitants began to retire into the shade, and some of them down into deep vaults. This part of the country is reckoned the most dangerous at this season, on account of the Samiel winds, which are now at their greatest strength, and more people are destroyed by them than in any other way. Both my Tatar and myself being exceedingly well mounted, we

than those of Europe. The riders do not seem to be much afraid of a fall, which often happens in galloping down hill; for the cap preserves the head, the cummerbund the body, and the strong boots the legs; and the foot is very easily disengaged from the stirrups, which are iron-plates, nearly as long as the foot.

set out at full speed, and continued that pace most part of the way, which is near twenty miles; for the Samiel winds were beginning to rise before we could reach Mosul, and they would have gained strength so fast, that there is no doubt if they had been an hour later, exposed as they were, the whole party, men and horses, would have been laid dead on the ground. They reached Mosul at a quarter before eleven o'clock, after crossing the Tigris over a bridge of boats.

Mosul, which is said by some of the inhabitants to be the ancient Nineveh, is pleasantly situated on a declivity upon the right banks of the Tigris. What it may formerly have been it may be difficult to say, but it is now a very large town, and contains many handsome buildings, exclusive of the hummums, mosques, and minarets, which are all built of hewn stone. Here is not so much reserve of manners as in the cities to the eastward, women of all descriptions being nearly as much exposed as in Europe. The town is very populous, and comprises men of various religions; but the great bulk of the inhabitants are Kurds, or, as the Arabs call them, Kurks. The Bazar is large and well supplied; and most of the articles, except clothing, are very moderate. The people appear much more industrious than they are in any of the towns between this place and Bussorah. Various manufactories are carried on, and in some they even excel the Europeans. Their saddles and trappings for horses, in particular, are very elegant. They also make carpets of silk, with flowers worked in them, which seem to vie with the best of our articles. They are also very dexterous in making edgings and trimmings of various kinds, both for men and women. Their manufactories in copper and iron too are very numerous; and a great variety of articles made of those metals are sent down the Tigris as low as Bussora, exclusive of the immense quantity of metal sent down unmanufactured; for they get the ore in abundance from the mountains to the northward. The town of Mosul is surrounded by a strong lofty wall built with hewn stone. The space

* "I here found," says Mr. Jackson, "that I could not proceed by the usual route, on account of the then turbulent state of the country. The inhabitants of Jesseera were in open rebellion against the Turkish government, had killed the Bashaw, and committed many other excesses.

within the wall is not entirely occupied by houses, many places being covered with ruins, which proves that it has once been much more populous than at present. Directly opposite the Conac where Mr. Jackson stopped was the Court of Justice. The trials here are very short; for in less than five minutes after the prisoner is taken before the court, if he be found guilty, he is conveyed to receive his punishment. The Court of Justice is opened at sun-rise; but it does not continue above two hours; for, as the reader will perceive, they have a method of dispatching business very quickly*. There was not a person in the whole town that understood either French or English.

They left Mosul on the 26th of July, and soon after they had left the town, many of the horsemen, to give their beasts a breathing, exercised with their spears, which to me was one of the finest sights I had ever beheld. The officer wore a scarlet gown and cameline; his cap was nearly two feet high, and shaped like the crown of a hat; his beard was long and black; and he was about thirty years of age. The soldiers were dressed in white, with scarlet caps and turbans, and only wore mustaches. The unsettled state of the country compelled them to travel up the right banks of the Tigris. The country through which they passed is very well cultivated, producing great quantities of corn; and nearly the whole of the way are ruins on both sides of the river, some at a considerable distance, and other close on the banks. This village where they arrived is situated on the top of an almost perpendicular cliff, about a hundred and fifty yards above the river. The road soon became very hilly and rugged; but after having got through some very steep and narrow passes, where only one horse could go at a time, they again came to the banks of the Tigris. The night was dark and the road so very bad, that it was difficult to make any progress. They then turned to the southward, leaving the Tigris on the right, and joined a large caravan going to Diarbekr. It consisted of about two thousand camels, three

I was also told, that it was very dangerous to go even a few miles from Mosul without a strong guard. In consequence of this information, my Tatar waited on the Bashaw, the firman, who immediately ordered a guard of an officer and sixteen horsemen."

thous

ruins of an ancient palace, which appears to have been very lofty, some parts of the building being still of a great height. Some Curds were drawing water from a well in the centre of the inner square, about forty yards deep. The water was very cold and exceedingly clear. The walls of the building are of astonishing thickness; a stone staircase remains almost entire; and some parts of the walls, which have been undermined, are so strongly cemented, that in their fall they still adhere together.

About twelve miles westward of the first ruins is another heap, among which a very lofty arch remains entire. Near these ruins, and a little out of the road towards the mountains, were some young Curd women milking their goats. The features of these women were much handsomer than those of the Arabs, and they are nearly as fair as the women in England.

Being now again exposed in the middle of the day, the excessive heat of the sun was very troublesome. The hot winds too began to collect; but before they had acquired strength enough to be dangerous, the travellers passed the village called Arin, and ascended the side of the mountain towards Mardin, when they were out of their reach, these winds never prevail in elevated situations; and whenever they shape their course towards a mountain, they soon subside*. Though there is much cultivation and some fine pasture in the vale below, the people are obliged to drive their flocks towards the mountains, whenever and so long as those winds prevail.

Mardin, situated at the top of a very lofty and rugged mountain, is a city of considerable size, and very populous. The greater part of the inhabitants are Armenians, who are very industrious, and carry on several manufactories. The city is surrounded by a strong and lofty wall built with hewn stone; and on the summit of the mountain is a strong fort, on which a few cannon are mounted. The city is built on the south side of the mountain, at a part where it is extremely steep. The houses are well built. The streets run East and West, and have steps communicating from one to another. The bases of the houses in the upper street are even with the tops

* From near the top of these mountains, Mr. Jackson had an opportunity of observing the progress of the hot winds, which was nearly similar to what he had observed of them when on the banks of the Tigris, with this differ-

ence only, that this being a mountainous situation, and other quite level, they here lost their force by approaching the mountains, and in the other case by crossing the river.

of the houses in the street below. The city is very well supplied with water, and of good quality. The inhabitants, who seem to be a hospitable well-disposed people, enjoy a pure air, have as fair complexions as the people in England, and in general appear ruddy and healthy. Many of the women are very beautiful, and expose their persons nearly as much as the ladies in Europe. Provisions, and vegetables in particular, are plentiful, good, and cheap; they have also most kinds of fruits, and of the finest quality, the climate being exceedingly hot in the valleys, and temperate on the mountains. This city, by its situation, may be said to be impregnable; and some historians affirm, that Tamerlane laid siege to it for three years, without being able to reduce it. Finding that it would be dangerous travelling to Diarbekr without protection, the Tatar waited on the Bashaw with the firman, who immediately gave orders for a guard.

On the 30th they left Mardin, accompanied by one of the Diarbekr Tatars and his attendants, and descended the north side of the mountain on which the city is built; of which, though very steep and rocky, every little patch of ground capable of cultivation bore proofs of the industry of the Armenians, in abundance of grapes, apples, pears, plums of various sorts, cucumbers, melons, and almost all kinds of European fruit and vegetables. The Curd women here labour in the fields as well as the men, and resemble much the peasantry of England. Among the hills they continued travelling for near twenty miles, when they gradually diminished in the descent, and cultivation re-appeared. Some people were sowing, and others reaping. They have cattle and horses in abundance, very few sheep, but a great number of goats, which seem better adapted to the situation. The hills in general were thickly planted with trees.

Here are a great number of small sheds made of the branches of trees, having their door-way toward the North. The people live in these in preference to houses at this season of the year, and they were very full of inhabitants, who appeared to be all diligently employed. The

ence only, that this being a mountainous situation, and other quite level, they here lost their force by approaching the mountains, and in the other case by crossing the river.

women dress differently from both the Arabs and
Turks. They wear a cap like that of an Hussar,
seven or eight inches deep, covered with a white
cloth, and bound with a shawl or handkerchief
round the forehead: Part of the white cloth
protects the neck from the sun; but the face
below the forehead is entirely exposed. Over
their under dress, they wear a loose gown with
short wide sleeves, tied round the waist by a
sash. They wear no stockings, but have yellow
Turkish slippers: They spin with a rock and
spindle, and some of them weave. They appear
to be as happy people as exist in the world,
and, indeed, content appears in every counte-
nance.

Among the hills in this part lions are very
numerous, and destroy many of the flocks be-
longing to the industrious inhabitants.

At Mardin, and to the southward of that ex-
tensive range of lofty mountains, the Arabic is
the prevailing language. To the northward, the
Turkish language is more common.

On the 31st, after fording the Tigris, which
was here very broad, they entered a fine level
well-cultivated country; and travelling at the
rate of four miles an hour, again forded the
Tigris at Diarbekr. They had to wait till sun-
rise, however, before the gates could be opened.

Diarbekr is a large populous city, and the
capital of an extensive province of the same name.
It is pleasantly situated on an eminence upon the
western banks of the Tigris, and surrounded by
a strong lofty wall built with hewn stone. On
the land-side it has once been protected by three
walls and two ditches, part of which are still to
be seen. Toward the river, which runs nearly
half round the city, nature has strongly fortified
it by a solid rock about twenty feet perpendicular.
On the walls are several towers, in which a guard
is constantly kept. They have also some cannon
here, chiefly brass field pieces of a small calibre,
and a few brass mortars; but very few of either
are serviceable. The city commands an extensive
and delightful prospect over a fertile country,
and the winding streams of the Tigris add much
to the beauty of the scene. It is well watered by
means of a canal from the Tigris, which is cut
several miles above, and in some places through
very rough ground. A branch of this canal runs
on the outside of the walls, on the western side of
the city, and soon after falls into the river. On

this branch are several corn mills; and it being
very steep where those mills are built, the water
falls upon the wheel, and by this means a small
body of water acquires great power. They are
something like the over-shot mills in England.

The houses are built with hewn stone, and the
streets all paved. Many of the public edifices
are very elegant. The Armenian cathedral is a
large and handsome structure, about the length
of Westminster-hall, but not so wide. The roof
is supported by two rows of pillars, and the
whole of the floor is covered with carpets, for
even the Turks on entering it pull off their shoes.
The Armenian mode of worship is nearly similar
to that of the Roman Catholics; they have their
crucifixes and burning lamps. In the court be-
fore the cathedral is a very handsome fountain,
which throws its water to a considerable height.
They manufacture copper, iron, wool, cotton,
silk, and several other staples. Some of their
wool is very fine, and the weavers are numerous.
People of the same trade usually live together;
thus, one street contains nothing but weavers;
another street, shoe-makers; another, smiths, &c.
Their leather is very good, and they work it ex-
ceedingly well. Here are a great many dyers,
and the waters of the Tigris are said to be pec-
uliarly adapted to the purposes of that trade.
In some branches, these people are equal, if not
superior, to many European; but the weavers are
very inferior to the English; and the cloth they
make, whether of woollen, cotton, or silk, is
always very narrow. They entertain a very high
opinion of the British manufactures, and the
very name of an Englishman is sufficient to gain
the greatest respect. The superfine broad cloth
worn by the principal people is of English manu-
facture, as are also their watches, of which latter
a great many have Arabic characters. People
of all descriptions seem here to enjoy much
liberty. The various sects of Christians have
their chapels and churches, and each follows his
own mode of worship without molestation.
The city has two gates to the westward, which
are the only ones ever opened. There is one to
the eastward, but it is always kept shut, and
people are in consequence obliged to go round
the greater part of the city, which covers about a
square mile, all the walls, except to the south-
ward, being quite straight, and about a mile
long. Above the walls, on the east side of the
city,

city, is a path cut through the solid rock, and another leading across the hill towards the river. On the side of this path are many holes cut out of the rock, large enough to hold half a dozen people, and into many of these the water falls from the rock perpendicularly. The lofty trees near the rock form an agreeable shade, and make it a pleasant cool retreat, so that the Armenian women and children may be frequently seen bathing. The women are as fair as any in England; but they walk much better than the fair sex in Europe, their loose dress allowing more free action to the body, to which Europeans are entire strangers. Though Diarbekr is a populous city, provisions plentiful, good, and cheap, every inhabitant enjoying full liberty, and that it is in many other respects a desirable place to live in, yet there is one thing which is both disagreeable and dangerous, and reflects great disgrace on its government: the circumjacent country, to a considerable extent, is so much infested with banditti, that no one can travel to or from the city without a strong military guard.

On the 1st of August they left Diarbekr, and arrived the next day at Argeenah, which is a large and populous town built in a most extraordinary situation. The mountain on which it is founded, is much steeper than that of Mardin, and cannot be ascended in front. There is, therefore, a road up each side of the mountain; and across the front of it are little narrow tracks, so very steep that a false step would be inevitable destruction both to horse and rider. What could induce the building of a town in such a situation it is difficult to conjecture. There is an extensive plain below, with plenty of water; yet this is left wholly without cultivation, except a little below the Argeenah mountain*. Above Medan is a mountain which is commonly called Argeenah Medan. It is a considerable smelting-place, and had between twenty and thirty smelting-houses at work†. They collect from the surrounding mountains iron, copper, and silver ore, and some gold. These they do not dig out of mines, as is

* The mountain appears at a distance like a barren rock, incapable of producing any vegetation; and, indeed, there is no spontaneous product; but the industry of the inhabitants amply repairs the deficiency. In many places they have gardens, producing various kinds of fruits and vegetables, and in others they even carry mould to make little artificial gardens. They have plenty of good water, and

the case in most countries, but collect it from the surface. A great number of men and boys are employed in breaking pieces off the rocks; but the mountains are so steep, that they are obliged to carry the ore on the backs of asses and mules. There is scarcely any vegetation. The poor labouring people are very numerous, and go almost naked.

Having passed many dreadful precipices, the paths being frequently not more than a foot broad, and saw several skeletons of horses that had fallen down those dangerous places, they came into a very pleasant valley, through which the Tigris runs. This is the most western branch of the Tigris, which rises among some hills at the head of this valley, and here several streams uniting form a tolerably large river.

On the other side of this valley there is a considerable salt-water lake, fifteen miles long and about four broad. Though several small rivulets run into this lake, none run out of it. Towards the west end of it is a small island called Gurgeik, from which the lake takes its name. The island is entirely covered with houses; and here are great numbers of boats, the inhabitants receiving water and every necessary from the shore.

After quitting the lake they got again among some lofty mountains, and arrived at a large town called Germilly, and on reaching the Conac, they received every attention that their situation required; but as their beds were on the top of the Conac in the open air, they could not sleep after sun-rise. After riding about eight miles over a very beautiful and well cultivated country, they reached another considerable town called Kessireek. They remained here all day under some trees by the side of a pleasant stream, and at night slept upon the ground in the open air. While Mr. Jackson staid at this place several people belonging to the town brought their spinning machines, and began spinning under the shade of the trees, by which they made considerable progress with a very simple machine. By these machines one man spins two threads, twice

the mountain abounds in iron ore, in the extracting of which a great many people are employed.

† The officer who superintends the smelting houses usually esteemed the most confidential servant in the Turkish government, and is perfectly independent of the Bashaw of Diarbekr, though Medan is within his Pachalic.

the two threads he has spun before, and turns the wheel at the same time.

On the 5th they arrived at a large smelting-town, called Gaban Medan. It is extremely populous, and great numbers of its inhabitants are employed in collecting ore from the neighbouring mountains, as at Argeenah Medan. Here is also a very handsome mosque, and a lofty minaret, both built with hewn stone. The town is seated near the bottom of a steep mountain, a river running below it in a very deep channel, which soon after joins the Euphrates.

The banks of the Euphrates are about a mile from the Gaban Medan. The river here ran in a very deep channel, and the way to it was down a narrow path cut through the solid rock. They then crossed in a ferry-boat, capacious enough to carry fifteen or twenty horses. The river is at this place much larger than might be expected at so great a distance from its mouth. Mr. Jackson drank the water, and found it had a peculiar taste, wholly unlike that of any other water that he had ever tasted. After crossing the Euphrates, they entered a strait path between two lofty mountains, by which they continued ascending for nearly two hours. On the top the ground is highly cultivated. A little farther are some higher mountains, on which are no signs of culture. From these, however, there is a most extensive prospect. To the northward is a chain of exceedingly lofty mountains, ranging N. W. and S. E. having their tops covered with snow. Running along the bases of these lofty mountains, the Euphrates receives many very large streams that flow from them; and this it is that gives it the appearance of extraordinary amplitude near its source. On the left, to the southward, are many stupendous mountains which supply the other branch of the Euphrates; for in this way it receives almost the whole of its contents, no large rivers joining it till it meets the Tigris.

Many of the people in this country, during the sultry summer months, leave their towns and villages, which lie chiefly in vallies, and encamp upon some lofty hills, taking their flocks with them. On the mountains they enjoy a cooler purer air, and in general appear as fair and budy as the country people in England.

Leaving this encampment, they descended some rugged passes by a road so very bad, that

it was sometimes with much difficulty they could make their way. At length they reached a small town called Emir, situated on the west side of a pleasant and well cultivated valley, with a very fine stream of water running to the North.

From Emir they passed a very hilly and woody country, with seldom any track to direct them. On this account they often lost their way; the Tatar's guide not being well acquainted with the country. Great numbers of people were here employed in making charcoal for the use of the smelting-houses at Gaban Medan. They carry it from this place on mules in panniers, and sometimes go fifty or sixty in a drove. Many of the peasantry here fix their dwellings by the side of a hill, the top of the house being even with the ground; and Mr. Jackson says, that he has often ridden over the top of a house without knowing it, and has with difficulty avoided falling through.

On the 6th they arrived at the encampment of Hassan Chillaby; for here also the inhabitants, having quitted the town, which was about two miles distant, had encamped on a hill. The people belonging to the tent wherein they rested were very attentive. The whole of the cattle belonging to these encampments are driven every morning into such of the vallies as contain the greatest plenty of water and vegetation, where they are watched all day by two or three persons employed for that purpose, and in the evening are brought back again. The tents are always pitched in a circle, and the cattle remain all night in the centre. The people rise at dawn of day, and the first employment of the women is to milk their cows and goats, which are immediately sent off again to pasture. The women then put the milk into a sort of bottle made of a goat's skin, every part of which is sewed up, except the neck; but when they are churning, the neck is tied with a string close and tight enough to prevent the milk running out. They then fix three strong sticks in the ground, in a form something like what we often use in raising weights, only on a smaller scale. From these they suspend the goat's-skin tied by each end, and continue shaking it backward and forward till it becomes butter; and they easily know when it is ready by the noise it makes. They then empty the skin into a large vessel, skim off the butter, put hot water into the skin to clean it, and hang it up to

dry. Beside this employment, they have also to bake bread every morning for the day's consumption; for all this work is performed by the women. The bread is baked on large iron plates, as in many parts of Europe; but should any of the women happen to lie longer than usual in the morning, so as not to be able to get their work done before the sun becomes hot, they not only have to work in the sun, but are heartily laughed at by the better housewives. The principal men who have many wives keep them in tents in a particular part of the encampment.

About four miles from Hassan Chillaby, are neither cultivation nor inhabitants, though there is plenty of good water, and the soil appears favourable for culture. Here they met a caravan going to Diarbekr, which consisted of horses, asses, and mules, camels not being able to thrud many of the steep narrow passes with which this country abounds.

On the 7th they arrived at Hadjee Khan, which is a large village lying in a valley. The land is well cultivated for about half a mile round it; but the inhabitants in general are very poor, and much addicted to thieving.

On this plain, which they passed over the next day, were three encampments, pitched in a triangle. Two of these were near the path. When I got abreast of the first encampment, an officer and six men from the guard came up to me on full gallop, and said that the people in the encampment would cut my throat. They took hold of Mr. Jackson's bridle and wanted him to return; but thinking it useless, as a part of the guard were now in sight, he remained till the whole of our party came up. A few men came from the encampment and conversed with the officer. They were remarkably strong hardy looking fellows, but had a something in their countenances which seemed to indicate that they did not get their livelihood very honestly. Having enquired who I was, says Mr. Jackson, the officer told them that I was an English Consul, that being the title I bore in the firman. The men examined the arms of our guard very at-

tentively, and wished to lay hold of some of them, but the guards would not suffer it. I was not under the least apprehension of their doing me any personal injury, even before the military came up; for in case they had attacked me I should not have attempted to resist; but I thought it prudent afterwards to keep near my Tatar. On our reaching the second encampment, four men, armed with sabres and pistols, stood in the way to oppose our passing; and as we rode up, they seized my bridle, my Tatar's, and those of two other Tatars in company, who were all riding abreast a little before the military. I was perfectly passive, not supposing that they could mean to rob us, as the military were only a few yards behind. A scuffle, however, ensued; but the guard coming up rescued me. The man who had held my bridle in one hand had drawn sabre in the other; but on one of the officers telling him that I was an English Consul, he immediately let go the bridle. I had my pistol ready, and was prepared to have shot my opponent, had any of the Tatars fired; but I did not think it proper to begin, not knowing the intentions of these people. One of the Tatars cocked a pistol to shoot a young man who seemed to be very violent; but the military interfering prevented him. The young man, however, continuing to threaten the Tatar with his sabre, the guard, by order of one of the officers, surrounded him in such a manner with their spears and sabres, that had he moved an inch he must have been killed. In that situation we left them, but they soon after came up with us, and had not put the young man to death as I expected.

This is a very extensive uncultivated plain and contains neither sheep nor cattle but what belong to these banditti. The ground, however, being favourable to tilting, and the horses with the silver travelling very slowly, our guard made several matches. They would sometimes draw out of the ranks half a dozen on each side and throw blunted spears, at which exercise the men are wonderfully dexterous, being able to pick up spears from the ground without quitting their horses. They have also a particu-

lary such a strong guard with them, boldly refused. The young man whom I have just mentioned as having been more violent than the rest, had lately had a brother shot by a Tatar.

* These people seem to be most violent against the Tatars, who frequently pass through the country without paying any tribute; for, being the messengers of government, they think they ought to be exempt. The people here demanded fifteen piastres from each Tatar, who,

of some of them, er it. I was not f their doing me fore the military d attacked me I to resist; but I to keep near my cond encampment, and pistols, stood ng; and as we rode my Tatar's, and upany, who were e the military. method of avoiding their opponents' spears by hanging down on the opposite side of the horse, and thus exposing only one foot, yet at the same time going on full gallop. The horseman makes very little use of the reins on these occasions, and the horse is governed by the motions of the rider's body. If the latter lean towards the right or left, the horse will turn to that side, and if the motion be quick will gallop full speed. If the rider lean forward, the horse gallops straight on; and if the man raise his body upright, the horse, though at that time on full speed, will stop in a moment, without the rider touching the bridle.

At about six miles distance from the second encampment, they approached another, the Chief of which came, and demanded money from the commanding officer, which was refused. He got, however, a few piastres from the Tatar.

They then continued unnolesed till they got within about two miles of Delectetas, when they observed some men armed, on horseback, pursuing them at full speed from the second encampment, where they had the dispute. The Tatars, being much frightened, set out full gallop for Delectetas, and as Mr. Jackson was pressed in the same manner, and thought they might take him for a Tatar, he pushed on with them, leaving the military drawn up to receive them. When the banditti came up with the military, and found that the Tatars had rode off, they returned. These people always keep a number of horses near their tents to be mounted on a short notice, and some of them ready bridled and saddled.

Delectetas is a small town, situated on the side of a mountain, in a barren country, and having little cultivation about it in proportion to the number of its inhabitants. Here is plenty of good water; and in the middle of the town is a large square stone building. Many of the inhabitants have stacks of corn on the tops of their houses. Here also were some stacks of hay.

On leaving Delectetas, were very rough roads along some steep mountains covered with fir-trees. Beyond these is an extensive uncultivated plain, and on the 9th arrived at a town called Ullash, pleasantly situated by the side of a river which flows from the mountains, and runs into

Mr. Jackson informs us, that he went into the Bazar to buy some fruit, and found that he could purchase for the value of a farthing as much as a man could eat of either

the river Casalmack. Between the town and some mountains to the northward are two salt lakes, one about three miles in circumference, the other about two. From Ullash, in the neighbourhood of which there is a great deal of cultivation, we departed in an hour. There are several other lakes of the same kind on the left, which are easily distinguished, their shores being crusted with salt. Shortly after they arrived at Sivas, which is a very large populous town, and is exceedingly well watered, having several fountains and a great many clear streams running through it. It is seated on the west side of a very fertile valley, which is almost surrounded by lofty mountains, having no opening except where the river runs in and out, through a very narrow channel between two steep hills. Here are two stone bridges at about a mile distance from each other. Great quantities of corn grow in this valley, but not much fruit, excepting plums, apples, and pears; but of garden vegetables there is great abundance. In the middle of the town are some very extensive gardens; and on an artificial hill is an old castle now tumbling into ruins. Though the neighbourhood furnishes plenty of good materials for building, the houses in general have a very ordinary appearance, a great quantity of unsquared timber being employed to support an immense weight of stone and clay, with which the houses are covered. The inhabitants appear to enjoy much liberty; nor are the women confined, as in some large cities to the eastward. Sivas is nearly as large as Liverpool, contains as many houses, and is fully as populous. Though most of the private houses are but indifferent structures, many of the public buildings are elegant, and some of the minarets very lofty.

On the 10th, after descending through some narrow passes, they arrived at Tocat, which is about the size of Sivas, but has a much better appearance than any town in the Turkish dominions. The houses are all tiled, and chiefly built with wood. Here was a great abundance of fruits, which were remarkably fine in their kind; the grape vines, in particular, were abundant and excellent*. The Armenians, who are very numerous here, make an excellent red wine, of a flavour something like claret, but much

mulberries, pears, apples, peaches, or apricots; and those, in general, much finer in their kind than he ever saw in Europe.

stronger.

stronger. The town is surrounded by eminences, and is well watered. On the top of a lofty rocky mountain, on the west side of the town, are the remains of an old castle, part of the wall of which has been built on the edge of a very steep rock, and much of it has fallen down the precipice.

They set out on the 11th, from Tocat, and, being all badly mounted, and the greater part drunk, made a curious figure as they rode through the town. The streets being much crowded, the Tatars roared like so many bulls for the people to clear the passage, every one being obliged to give way to them, as in England to the mail coaches; and if they were not very quick in getting out of the road, they were sure to feel some of the Tatars long whips.

On the 12th they arrived at Amasia, a very extensive town, nearly as large as Tocat, and surrounded by many lofty rugged mountains. The faces of some of these mountains have nearly half a mile of almost perpendicular height; and in one of these are several pieces cut in the solid rock, similar to a Hindu Pagoda, and which can only be approached by little narrow passes cut through the rock. The river, Casalmack runs through Amasia, but cannot be seen at one view for more than the length of the town, making a circuitous course among the mountains, and running in a deep narrow channel both above and below the town. It is here a very large river, but much too rapid for navigation. The town is well watered, particularly the lower parts, by means of large wheels, nearly thirty feet in diameter, are turned by the stream, having a great many large buckets fastened to them. As the wheel turns round, those buckets empty themselves into troughs fixed within a few feet as high as the wheel. By this method they are enabled to keep up a continual stream of water, which is conveyed by pipes from the troughs to the hummums, fountains, &c. The houses in Amasia are mostly built with wood, but many with stone, and covered with tiles as at Tocat. The greater part of the inhabitants being Christians, here is only one mosque, and two lofty minarets, all built with hewn stone,

* A Sivas Tatar, named Suliman, who had accompanied us from Sivas, attempted to shoot another Tatar who was returning from Constantinople, but was prevented by the rest interfering. It is impossible to describe the confusion

and very handsome structures. The dome of the mosque is covered with lead. The hummums are very extensive, and built with hewn stone. Before these are some pleasant walks, with several rows of trees, and the whole is surrounded by a lofty wall. The town can only be approached by two narrow passes, one toward the North and another toward the South; and these are so very rugged, narrow, and steep, that they might be easily defended by a very small force. They make here a very good white wine, something like sherry, and very strong. With this and ruckee our whole party again got drunk*.

On leaving Amasia, they ascended a very lofty mountain towards the northern pass, and before they got to the top it became very dark. As they came near a spring of water, the guide said that he wanted to drink. Putting, therefore, the fore-horse's bridle into the Turk's hand, to hold it till he returned, he availed himself of the darkness of the night to run away unperceived. They waited for him some time, but at last suspecting the case, pursued the journey. The Turk leading three horses, they with some difficulty got to the top. Here they soon lost their road, but were fortunate enough to discover a light, which proceeded from a small cucament, where some of the inhabitants of Amasia were employed in getting in their harvest.

At length they got from among these dangerous steep, and on the 13th, descended into an extensive uncultivated vale about fifteen miles over which they crossed at full gallop, and arrived at Marsiwan in the evening. Marsiwan is a town nearly as large as Sivas, and situated near the foot of some woody mountains on the north side of this extensive vale. It is well watered, and abounds with corn, as well as most kinds of fruits, which were now ripe. They have many vineyards near the town, and make a very good red wine similar to that of Tocat.

About twenty miles west of Marsiwan is a town called Ajamque, and about ten miles farther is Osmanjike, which town is built round a steep rocky mount, on the top of which also some houses have been erected. It is a tolerably large place, and stands on the banks of the river Alce,

among these people when they quarrel. Upon the slightest provocation they have immediate recourse to their arms, they are never without a brace of pistols and a dagger at their side.

quarrel. Upon the slight-
est recourse to their arms,
a pair of pistols and a dagger.

They then crossed the river over a neat stone
bridge of fifteen arches, and continuing their
route for thirty miles, over much rough and
woody ground, they arrived at a small town
called Hadjee Hamza.

On the 14th they arrived at Tosia, a neat town
built on the side of a hill, at the foot of which is
a fine fertile country. This stage was twenty-
seven miles. Quitting Tosia, they passed several
vineyards, and then got into a very hilly woody
country. In the evening they reached a small
town called Cojasate, situated in a barren hilly
country. The next town they came to, at the
distance of twenty-eight miles from Cojasate,
was Carachurin, a large straggling place, built
on both sides of a rivulet between two hills. The
houses in general are very mean, and badly built.
They are only one story high, and have flat
roofs.

On the 15th, the roads being very good, they
arrived at Corregelar, being only twelve miles
from Carachurin. This is a small and ill-built
town, containing about two thousand inhabitants,
who are chiefly employed in cultivating the
neighbouring plains. After travelling over a
fine cultivated open country for twelve miles
more, they arrived at Serkees, a small but neat
town, many of the houses being built with hewn
stone.

Leaving Serkees, they rode briskly over a fine
well cultivated country, and got among some very
steep mountains, great part of the road over which
was so dangerous, that one false step of the horse
would have plunged them from the height of at
least three hundred yards into a river. Quitting
at length these dangerous passes, they entered a
fine open country on the right, where was a
small town by the side of a river. They turned,
however, to the left, and arrived at Bander.
This stage was eighteen miles.

Bander is a small town, but stands on an
eminence, and at a distance has a very pretty ap-
pearance. The mosque is an indifferent building,
but the minaret is very handsome and lofty; and
the houses are chiefly built with wood.

* About half way between Jeredare and Boli are some
ruins, of which most of the stone was marble. Much of
it appearing to have been cut in a style of workmanship
superior to Turkish masonry. On one marble column are
several Greek letters, but much defaced. Mr. Jackson
was able, however, to trace the word *Zac*, and
was persuaded, that could he have spared time, he might
have been able to have made out great part of the inscrip-

On the 16th they arrived at Jeredare, which
town is an elevated situation, being almost at the
top of a high hill. The town is large, and has
a good Bazar, well supplied. They excel here
in manufacturing leather, and many other ar-
ticles; and there are also several copper manu-
factories. The houses have a singular appear-
ance, being in general built with large round
trees let into each other at the ends, and the
crevices filled up with clay. Very few houses
are tiled, being chiefly covered with deal boards.

After passing several villages both to the right
and left, they arrived at Boli at the distance of
forty miles*.

Boli is a large town in a fertile situation. It
contains, however, nothing worthy of particular
notice. The mosques, minarets, and hummums,
are all very ordinary buildings. The public
edifices are numerous, and the town is well sup-
plied with good water.

After riding over an extensive forest for twenty-
five miles, they continued till they reached
Duchea, on the 17th. Duchea is a small village
situated in a very fertile country, but entirely
surrounded by large forests. This stage was
thirty-six miles. They departed from Duchea,
and, after travelling twenty-seven miles, arrived
at Hindak, which is an inconsiderable town,
situated in a valley amid large forests, and con-
tains nothing worthy of particular notice.

After they left Hindak they passed upwards of
a thousand buffaloes carrying ship-timber to Con-
stantinople from the forests through which they
had travelled. Some of the timbers were re-
markably fine; and the whole had been squared
and formed in the forests, where they had seen
many sawyers at work. They crossed the river
Zacharea over a wooden bridge about a quarter
of a mile long; but were obliged to dismount
and walk over this bridge; for, instead of planks,
it was covered with half round pieces of wood,
which frequently gave way under the horses' feet,
and it had neither parapet nor railing. After
crossing the Zacharea, they continued in a very
woody country till they reached the lake Sabanja†.

tion. About three miles nearer Boli, on the right side of
the road, are some more ruins, with walls of an extraor-
dinary thickness.

† The lake Sabanja is about six miles long, and nearly of
a triangular form. It is a very fine sheet of fresh water, and
its being situated in a woody country, adds much to its
beauty.

whence, keeping along the western shore, they arrived at the town of the same name. This stage was thirty-six miles.

On the 18th they left Sabanja and rode through a beautiful country, about eight miles, when they reached Ismit, a large town, which has a delightful appearance from the valley before it. The houses are not over-crowded, and the prospect is much enlivened by cypress trees interspersed all over the place. The lower part of the town is washed by the sea. Being built on the slope of a hill facing the South, it is very well supplied with water; and on the side of the hill, both to the East and West, are many vineyards and orchards, but more particularly to the westward, which is entirely covered with gardens, orchards, and vineyards, for five or six miles. The neatness of the town, the garden grounds, the sea, the finely-cultivated country on the opposite shore, and the two rivers, with the corn-fields in the vale before the town, form altogether an exceedingly fine prospect.

Leaving Ismit they continued near the sea of Marmora, sometimes on the beach. About twenty miles West from that place are some ancient ruins close to the sea. Part of the walls, some of which are about ten feet thick, have fallen on to the beach. Seven miles further West is the town of Coushan, very pleasantly situated on the side of a hill sloping gradually to the sea. About this town are many hundreds of acres disposed in vineyards, and gardens for a great variety of other fruits, which were now chiefly ripe.

At Coushan they left the sea and turned northward. After passing the vineyards belonging to the town, they entered a very fine plain, through the middle of which runs a small river that has a neat stone bridge of three arches over it. Continuing to ride briskly they arrived at Gabaza, which is a small but neat town, pleasantly situated on the side of a hill, from the top of which is a very fine prospect of the Archipelago, and part of its numerous islands. From the town to the sea, which is about three miles, is entirely covered with gardens, orchards, vineyards, and corn-fields.

From Gabaza they passed through a very fine country near the sea, sometimes on the beach, and arrived at a town called Maricar, where they remained an hour to refresh; and setting

out again, reached Scutari in a few hours. Here they rode down to the sea-beach, unsaddled their horses, and remained till day-break, when they procured a boat, put into it their baggage, and crossed over to Constantinople to have it examined at the Custom-house. The officer suffered it to pass upon receiving a piastre.

Constantinople having been so often described by travellers, and being so well known to English readers, the author thinks it neither expedient nor proper to swell this volume by accounts that cannot possibly possess either novelty or interest to recommend them. His object has been to describe such parts as he has visited, and which had been but little frequented by former travellers from England.

Having stayed a week at Constantinople Mr. Jackson obtained fresh passports from the Porte, and from the Imperial Minister Baron Herbert de Rathkaal, and set out on the 25th, accompanied by a janizary, who was to be paid three hundred piastres to conduct him to the frontiers. After travelling two or three miles from Constantinople, they entered an open country without the smallest marks of cultivation, and not bearing the least appearance of being in the vicinity of a large city. Even round the city itself the garden grounds and orchards are very small in proportion to the population.

Continuing the route over an open barren hill country, travelling at the rate of five miles an hour; they arrived at a small neat town called Chaque Medja. This town is pleasantly seated at the head of a salt lake about fifteen miles long, but of very unequal breadth. The lake is about two hundred yards from the Archipelago, but has communication with it by a very narrow channel over which is a stone bridge. The ground being swampy, there is a stone causeway of about a quarter of a mile long, for the convenience of passengers.

On the 26th they set out from Chaque Medja and after crossing the bridge and causeway at the head of the lake, ascended some hills, whence a very fine prospect over the Archipelago and the surrounding country, which had a more favourable appearance than in the neighbourhood of Constantinople, it being in high cultivation and almost crowded with villages. In three hours they arrived at Beu Chaque Medja which is a tolerably large town, situated on the

West side of a hill at the head of a salt lake about four miles long, which has communication with the sea. Here too is a stone bridge, and a cause-way about a quarter of a mile long between the lake and the sea. Nearly opposite to Beu Chaque Medja, on the East side of a hill, is a small neat town called Callitratta, behind which are many vineyards.

Continuing their route along the beach twelve miles further, they reached a very neat town called Badus. Here is a considerable building standing on the beach, having part of its walls washed by the sea. It is a square structure and very lofty; the whole is built entirely with hewn stone, has been very well finished, and still remains almost entire.

After passing many vineyards and orchards, they arrived at Killeever, which is a large and populous town, that has once been well fortified, a great part of it being still surrounded by a strong wall. Some of the mosques and minarets are very handsome buildings. The lower part of the town is washed by the sea. Here were several vessels, some of about two hundred tons burden, riding at anchor in a very fine bay, which appeared to be so well sheltered by the high land on each side of it, that ships might, in any weather, ride in safety.

From Killeever they set out on the 27th, and journeyed about eight miles along the sea-shore, sometimes on the beach. They then turned to the right, and, quitting the sea-coast, passed over an open country, with little cultivation and few inhabitants. The first village is Connycluc; after leaving which place they travelled across a very dreary country, in which not a tree nor a stone was to be seen. The soil is very white, but is neither clay nor sand; and what little vegetation there is, is nearly destroyed by innumerable quantities of ground squirrels. The first signs of cultivation they met with were the vineyards belonging to a town called Chouroe, and which are near three miles long. About eight miles beyond Chouroe they crossed a river, over which is a bridge of fifty arches, all built with hewn stone, and neatly turned. So many arches, how-

* The Greeks in general have handsome features; but are particularly attracted his attention. They, as well as the peasantry in general, had a very ridiculous custom of tying all their treasure round their necks; they sometimes wear three or four hundred Venetian sequins per-

ever, did not appear by any means necessary at present, as there was not a great body of water in the river. They now entered a country possessing higher cultivation and more inhabitants, and about a quarter of a mile out of the road, is a town called Carrastran. In a deep narrow valley near this town are three lofty stone pillars, which were to support pipes for conveying water across the valley to the town. In the evening they reached Borgas, and on the 28th they entered a large forest, in which they continued for about twenty miles without seeing either habitation or culture, till they reached a small village called Assibaly. From this place to Kirkleesan, about four miles, the whole way is covered with vineyards. This is a very large and populous town, having ten mosques and minarets, and several hummums. All the public buildings are of hewn stone and marble, and some of them very handsome.

In the afternoon they arrived at a village called Canarea, where they put up at a Greek's house to refresh. The Greeks are a very civil and obliging people, and the host brought out the best refreshments he had in the house. In these small villages there are very few Turks, and if there be one, it is almost certain that he is a barber; but he will strut about and assume as much consequence as a bashaw. In the evening they arrived at a town called Karrapoonar. The distance from Kirkleesan to Karrapoonar is fifty-one miles.

On the 29th they arrived at a village called Benlee, and stopped half an hour at a Greek's house to refresh. The master of the house had two very beautiful daughters*. Continuing their journey, they arrived at Idos, a tolerably large town, and pleasantly situated. Many of the houses are built within a compound, similar to those of the Brahmans and Nairs in India, which makes the town at a distance appear much larger than it really is.

The peasantry here separate the corn from the straw by the same method as in Asia Minor, which is adopted in all countries where the rains are periodical. They make a ring about forty

forated and fastened round their necks with silk strings. This custom, however, is confined to the unmarried part of the sex, wives having no ornament whatever on that part of their persons.

yards

yards round, sometimes of clay, and sometimes paved. They then bring their corn from the field, and throw it in a heap in the middle of the ring. They have a sledge too, which is sometimes drawn by bullocks, sometimes by horses, and some of these have pieces of iron driven into the bottom to cut the straw as it goes round; though in others there are flint stones fastened to the bottom. Upon the sledge is a heavy weight. Beside the person who drives the cattle, another is employed with a fork in tossing the straw from the ring if the grain is extracted, and taking fresh from the heap in the middle. In this manner they are enabled to continue till they have extracted the whole of their corn, without being in any danger of having it spoiled by rain. This is much quicker, and easier too, than the mode of thrashing in England.

On the 30th they arrived at Pravadee, which is a large and well inhabited town, containing many very good buildings. It is situated in a narrow vale running N. and S. between two steep rocky hills. In the afternoon they reached Chumloo, which is a very populous town, and, though not regularly fortified, is of great natural strength from its situation, having a steep mountain behind the town, forming a semicircle, on which the Turks have planted several batteries of cannon*. On the western side of the mountain is a thick forest which is perfectly inaccessible to an army.

On the 31st they arrived at Rochuke, but could not see the town till within half a mile of it, being situated on the banks of the Danube at the foot of a hill, which continues for several miles near the river, and is covered with vineyards. Rochuke is a large populous town about the size of Liverpool. They refreshed at Ergnoff, on the opposite side of the river, and waited near two hours for horses and carts, in which they were conveyed to a village called Copuchen. This was the manner in which they were to travel through Wallachia. These post carts are light, and run very easy upon four wheels. They have not, either about the cart or the horses' furniture, the smallest particle of iron or other metal what-

ever. The horses are small, but run very fast; going, upon an average, rather quicker than the mail coaches in England.

On the 1st of September they reached Bukarest, the capital of Wallachia, and the residence of the Hospodar. Bukarest is a very extensive and populous city, containing three hundred and sixty Greek churches, one Roman and one Lutheran chapel, and a few convents. Here are no Turkish mosques, nor are they permitted to be built in any part of the province. Gentlemen's carriages are here very numerous, and a man is looked upon in no other light than as a servant or a peasant, who does not keep one. A coach, with a pair of horses and a driver, may be all kept here for fifty pounds sterling. The coachmen and footmen are in general Egyptian slaves. There is much intrigue carried on in the higher classes, particularly among the married people. A man never sees his intended bride till they exchange rings, a ceremony that takes place a few days before the marriage; for the parents or guardians of both parties make up the match without asking the consent of either. In a very short time after the marriage ceremony the parties generally discontinue sleeping together, each carrying on their respective intrigues. The ladies usually keep their separate carriages, as a coach, with a proper equipage, is commonly a part of the marriage portion. The unmarried young ladies, however, are kept up as close as in a nunnery, and are not permitted to keep company with any men whatever until the ceremony of exchanging rings with their intended husbands has taken place. There are few people in the world, particularly among those who call themselves Christians; that make more profession of religion than these people, and in reality have less. In some of the churches here they have prayers continually from morning till night, and these are chaunted as in Catholic chapels. Their language is harmonious, something resembling the Greek, and indeed has several Greek characters in it.

Wallachia possesses in general a rich soil, but is rather woody. In the greatest part of the

* During the late war a considerable Russian army appeared in the plains before this town, and defeated the Turkish forces. The latter retreated into the town, and threw up a mud wall with a fosse and paling before the town, and up each side of the mountain. This temporary fortifica-

tion still remains entire. As the Russian army approached the town, the Turks played upon them from their batteries on the mountain. The Russians here lost their general and retreated.

province there is scarcely a hill or stone the natural produce of the country. Their corn is chiefly maize, of which they have a great quantity; yet good wheaten bread is to be had in the larger towns. Provisions of all kinds are very cheap; and a fine fowl may be bought for six Turkish parra, value about three halfpence sterling. The inhabitants in general are Greeks, and they have not many foreigners among them. In the larger towns, however, there are some Jews and a few Germans. They erect crucifixes near the roads; some of these are of stone, but they are chiefly made of wood. All, however, are painted; some having Jesus Christ, some the Virgin Mary, others the Twelve Apostles, some the Ten Commandments, prayers, &c. depicted on them. These Crucifixes are very numerous, and most of the country people make their obedience as they pass them. The province is well watered; the bridges are all built with wood; but they have a very ridiculous custom of laying loose pieces of half-squared timber across the bridges, which frequently give way under the horses' feet.

On the 4th Mr Jackson resumed his journey, and travelled much faster than he could have expected, and even quicker than the mail in England, as will appear by the following distances and towns through which he passed.

which, reckoning twelve English miles to a German post, is two hundred and seventy miles*.

* The above are not the only towns through which he passed; but are specified as being the places appointed for fresh horses, which are always kept ready on purpose to convey the German mails, and are paid for that service by

He arrived at the Rothén Thurn Pass in the afternoon of the 5th September, when his quarantine commenced. He had brought letters from M. de Merkelius to the Director of the Lazaretto, however, which proved of much service; for he was in consequence particularly attended to, had a servant appointed to wait on him, and was supplied with plenty of the best provisions, wine, and fruits. He performed quarantine here ten days.

From the night of the 25th August to the evening of the 31st, he had travelled six hundred and seventy-two English miles, as will appear by the following distances, given me by M. de Merkelius, the Director of the Post.

German Posts.

From Constantinople to Rochuke on the Danube, through Rotalia and Bulgaria 50
From Erguoff on the Danube to Bukarest 6

56;

which, reckoning twelve English miles to a German post, is six hundred and seventy-two miles.

The latter has been accurately ascertained by the German engineers, who had the conducting of artillery to Erguoff in the late war.

On the 14th September Mr. Jackson's quarantine expired, the day on which he arrived being reckoned as one, because he was there before sun-set; and on the following morning he set out in the post-cart, a carriage built on purpose, and with better accommodations and more conveniences than the Wallachian; though both are very light. The road for the first six miles was near the banks of the river Alauta, with very high hills and thick woods on each side. There are many steep narrow passes here, but just broad enough for the carriage, and which have been cut out of the solid rocks. At Boetzhar all his passports, and certificates of having performed the quarantine, were examined. After getting through those passes they entered a fine open country, in which numerous villages and some considerable towns were to be seen, and the greater part of the whole was cultivated. At length he arrived at Herrmanstadt, the capital of Transylvania.

M. de Merkelius, who has great part of the management of forwarding the German post from Constantinople to the frontiers, and through whose hands all the East India Company's dispatches pass, on their way to Vienna.

S D

Herrmanstadt

Herrmanstadt is a tolerably well built city. The promenade is very pleasant, and they have also a very handsome theatre. Their music is excellent, having the advantage of some of the best German performers. The people are very polite, and observe much formality; for no person above the rank of a servant can walk in the streets without a sword by his side. They are also very particular in their dresses; and a native of the province wears a dress similar to what is worn in England upwards of a hundred years ago, viz. a long coat almost reaching to the ground, trimmed all round with fur; a pair of boots like those of our heavy cavalry, with a cocked hat something like a Dutch skipper's. People from every province are known here by their respective dresses; and even every tradesman is distinguished by his apparel. Whoever visits this city, if he can spare two hours, should not neglect seeing Baron Brukenhall's extensive collection of the most valuable paintings, many of which are by the first masters, Guido, Rubens, Rembrandt, &c. His antique coins, medals, and other curiosities, also are well worth seeing. His library is very extensive, and considered of great value. He has likewise a beautiful garden about half a mile out of the city, laid out after the English taste. The Baron is almost eighty years of age; he was many years Civil Governor of this province, and speaks English tolerably well.

Transylvania is, generally speaking, a fine country, but capable of much improvement. It produces great quantities of most kinds of grain, and flax of a very good quality, which is manufactured into linen. The nobility are for the most part very proud, and keep their peasantry in a state of slavery; for out of six days in the week the peasant is obliged to labour four for his master, having only the remaining two days for himself. This province pays to the Emperor in taxes of all kinds one million five hundred thousand florins annually, which is chiefly imposed upon the land, for what the citizens pay is very trifling indeed.

On the 18th he left Herrmanstadt, and travelled post, by day and night, till he arrived at Temeswar, the capital of Banate, where he was detained a few hours to have his passport examined. This being a strong fortification, the officers were very particular in examining all strangers, and he was obliged to go before the

General Commandant, with whom he conversed in Latin. When informed that he was an Englishman he shewed him much attention.

The Banate is a very fine province, the greater part of it being level and well cultivated, except on that side adjoining to Transylvania, which is mountainous and woody. Provisions of all kinds are good and cheap; and their wines are excellent, particularly at a large town called Lugos.

From Herrmanstadt he went to Pest, which is at present the capital of the kingdom of Hungary. It is a large and populous city, and has been much improved within the last six years, great part of the city having been entirely rebuilt. It is seated on the left banks of the Danube. On the opposite side of the river is the city of Offen, nearly as large as Pest, and remarkable for its excellent wines, which are held in much esteem all over the empire.

Offen is situated on the side of a hill facing the South, which is covered with vineyards for about six miles below the city. The wine is red and something like port, but has a stronger body and is very rough.

On the river Danube below Pest, are many floating corn-mills, which are admirably adapted for the purpose. The vessels on which the mills are built are always kept afloat, and at anchor in the middle of the stream; the wheel is turned by the current.

On the 25th September he set out from Pest and arrived at Vienna the same night. The road was in general tolerably good, and he travelled about as quick as does the mail coach in England.

On the 12th October he left Vienna, coming through Bohemia, and remaining two days at Prague to take a view of the city and its environs.

Leaving Prague he came on to Dresden, the capital of Saxony, where he remained two days. There is a degree of elegance in this city and the neighbourhood, superior to most other places. The gallery is supposed to contain the largest and best collection of paintings in Europe, and it has lately received considerable additions; for, on the French entering Italy, many of the best pieces were conveyed to Dresden, as a place of safety.

After leaving Dresden, he travelled through Leipsic, Halle, Halberstadt, Brunswick-Luneburg, and to Hamburg, which he reached on the evening of the 28th October.

GENERAL GEOGRAPHICAL DESCRIPTION

OF THE

WORLD.

EUROPE.

THIS part of the globe is the smallest in extent, yielding considerably to Africa. From the rock of Lisbon in the west, to the Uralian mountains in the east, the length is about 3,300 British miles; and the breadth from North Cape in Danish Lapland to Cape Matapan, the southern extremity of Greece, is about 2,350. The contents in square miles is about 2,500,000.

LIMITS.] On the south the continental part is bounded by the Mediterranean Sea, on the west by the Atlantic, which contains the furthest European isle, that of Iceland, Greenland being regarded as a part of North America*. On the north the boundary is the Arctic Ocean, embracing the remote isles of Spitzbergen and Novaya Zemlia, or the New Land. Toward the east the Uralian mountains is admitted as a boundary.

RELIGION.] The christian religion prevails throughout Europe except in Turkey, where however at least one half of the inhabitants are attached to the Greek church. Wherever the christian faith has penetrated, knowledge, industry, and civilization have followed: among the barbarous tribes in the north the progress was unhappily slow, Scandinavia remaining pagan till the eleventh century; and some Slavonic tribes on the south of the Baltic till the thirteenth; nay, it is not above a century ago since the Laplanders were converted by missions from Denmark. The two grand distinctions are catholics and protestants: the former in the south, where the passions are more warm and the imagination more delighted with splendour; the latter in the north, where the satisfaction of the

judgment predominates. This universality of the christian religion has been followed by another superlative advantage, that of constituting all Europe, as it were, into one republic, so that any useful discovery made in one state passes to the rest with celerity.

CLIMATE.] Europe is chiefly situated in the temperate zone: if such distinctions have not vanished from geography since modern discoveries have evinced, that the climate often depends on local causes; that the Alps in a southern latitude present mountains of ice unknown in Lapland: that the torrid zone abounds with water and habitations, and may perhaps contain mountains covered with snow. Yet freedom from the excessive heats of Asia and Africa has contributed to the vigour of the frame, and the energy of the mind.

INLAND SEAS.] In a general view of Europe one of the most striking and interesting features is the number and extent of the inland seas; justly regarded as chief causes of the extensive industry and civilization, and consequently superior to the other grand divisions of the globe. Among inland seas the Mediterranean is justly pre-eminent, having been the centre of civilization to ancient and modern Europe. The columns of Hercules marked its western boundary; being the mountain or rock of Abyla, now called Ceuta, and Kalpe in Spain, the Gibraltar of modern fame. The length of the Mediterranean is about 2000 miles to its farthest extremity in Syria. On its northern side open two large gulfs, that of Venice and Archipelago. From this last a strait called the Hellespont conducts to the sea of Marmora; and another now styled the strait of

* In the opinion of several geographers, the Azores or Western Isles are clearly European, being nearer to Por-

tugal than to any other continental land, while the Madeciras, for the same reason, belong to Africa.

Constan-

Constantinople, leads to the Euxine or Black sea; which to the north presents the shallow sea of Azof, the utmost maritime limit of Europe in that quarter. This wide expanse of the Mediterranean is beautifully sprinkled with islands, and environed with opulent coasts, abounding with the most sublime and picturesque features of nature: tides are not perceivable except in the narrowest straits; but according to naturalists there is a current along the Italian shore from the west to the east; and toward the African coast in an opposite direction. In the Gulf of Venice the current runs north-west along Dalmatia and returns by the opposite shore of Italy. The Mediterranean abounds with fish, many of which are little known in the more northern latitudes. The chief fisheries are those of the tunny, of the sword fish, and of the sea dog, a species of shark, and the diminutive anchovy. It is also the chief seminary of coral, now known to be the work of marine insects. This supposed plant is of three colours, the red, the vermillion, and the white; and its greatest height is about eleven inches. It is equally hard in the sea and in the air; and is generally brought up by a kind of net from the depth of 60 to 125 feet. To enumerate and ascertain shoals and rocks is the office of the hydrographer; but fishing banks are of general importance, and some are found near Sicily.

The second grand inland sea of Europe is the Baltic, which extensive inlet opens from the German sea by a gulf pointing N. E. called the Skager Rack; and afterwards passes south in what is called the Cattegat, to the S. E. of which is the sound of Elsinore, a strait where vessels pay a tribute of courtesy to Denmark. The Baltic afterwards spreads widely to the N. E. and is divided into extensive branches called the

* Yet this enormous waste is in the hand of Providence a fertile field of provisions for the human race. Here the vast battalions of herrings seem to seek a refuge from numerous foes, and to breed their millions in security. About the middle of winter emerging from their retreat they spread in three divisions; one towards the west, which covers the shores of America as far as the Chesapeake and Carolina, while another more minute squadron passes the strait between Asia and America, and visits the coasts of Kamschatka. The most memorable, the central division, reaches Iceland about the beginning of March, in a close phalanx of surprising depth, and such extent that the surface is supposed to equal the dimensions of Great Britain and Ireland. They are however subdivided into numberless columns of five or

gulfs of Bothnia and Finland, both covered or impeded with ice for four or five months of the winter. The greatest depth of this sea is said not to exceed fifty fathoms. Swedish naturalists pronounce that it loses about four feet in extent in the course of a century. Tides are unknown, and the fish are few.

The third and last inland sea of Europe is that called the White Sea in the north of Russia, more known in Europe, and particularly to English enterprize, before the commerce of Archangel was supplanted by that of Petersburg.

Among the other maritime divisions may be named the German sea, so called because it waters the western shores of ancient Germany; from the Rhine to the extremity of Jutland. It is now often stiled, with sufficient impropriety, the North sea, a term probably adopted by us from the Dutch. It may be regarded as a part of the Atlantic ocean, terminating at the straits of Dover; whence the British Channels extend to the west. The bay of Biscay is another large inlet of the Atlantic. The Bristol Channel is rather the estuary or wide frith of the Severn. Between Great Britain and Ireland are St. George's Channel on the south; the Irish sea in the center, which leads to the North Channel. That part of the Atlantic which passes between Scotland and the extreme range of the western isles from Barra to Lewis has received no distinct appellation.

To the north of Europe is the Arctic Ocean, the dismal and solitary reservoir of myriads of miles of ice, the very skirts of which floating in enormous mountains crowned with brilliant pinnacles of every hue delight the eye and appal the heart of the mariner*.

On the coast of Holland there are many banks which supply excellent fish, as turbot, soal,

six miles in length and three or four in breadth, followed by numerous sea fowl, and perceived by the rippling of the water and a brilliant reflexion like that of a rainbow. In April or May the vanguard of those allotted to the British dominions reaches Shetland, and the grand body arrives in June; towards the end of which month and through that of July they are in the greatest perfection. From Shetland one division proceeds towards the east as far as Yarmouth, where they appear in October. The other brigade passes to the west along both shores of Ireland. A few stragglers are found at irregular periods, having proceeded beyond their powers of return; but it is generally credited that millions regain the Arctic Ocean and deposit their spawn about the month of October.

place, &c. Further to the north is the extensive
Dogger-bank, stretching south-east and north-
west; beginning about twelve leagues from
Flamborough head, and extending nearly seventy-
two leagues towards the coast of Jutland*.

RIVERS AND MOUNTAINS.] The chief rivers of
Europe are described under the respective coun-
tries through which they flow. Of the vast
Volga far the greater part is included in Europe:
the Danube is the next in fame; and is followed
by the Dniester or Nieper, the Rhine, and the
Elbe. The most elevated mountains are the
Alps, which are followed by the Pyrenees and
the extensive ridge which divides Norway from
Sweden. The Carpathian mountains, and the
chain of Emineh or Hæmus, are, with the
Apennines, of inferior extent and height.

GOVERNMENTS.] The kingdoms and states of
Europe may be considered, 1. As despotic mo-
narchies, as those of Russia and Turkey: 2.
Absolute monarchies, as Denmark, &c.: or, 3.
Limited monarchies, as Austria, kingdom of
Great Britain, &c. Since the fall of Venice,
and the subversion of Switzerland and Holland,
scarcely an example occurs of permanent and
hereditary aristocracy, or the hereditary government
of nobles. Of democracy, or, more strictly
speaking, elective aristocracy, a few cities and
some Swiss cantons may preserve a semblance;
while France at the present hour is a military
nation under the name of an empire.

ENGLAND.

EXTENT.] The island of Great Britain extends
from fifty to fifty-eight and a half degrees of
north latitude, being about 500 geographical
miles in length. Its greatest breadth, from the
Land's End in Cornwall to the North Foreland in
Kent, 320 geographical miles. In British miles
the length is about 580, and the breadth 370.

* Between the Dogger and the Well Bank to the south
the Silverpits of the mariners, which supply London
with cod, a fish which loves the deep water near the banks,
while the flat fish delight in the shallows.

The division of South Britain into shires is said to have
been instituted by the great Alfred. These departments are
now styled counties, as having been each governed by a
count in the Saxon times, styled Ealdormau, and after the
Danish conquest called Earl, from the Danish Earl, im-
plying a great man. The dignity and title becoming here-
editary, the government of the county devolved upon the

Vol. II. No. CXIX.

England is bounded on the east by the German
Ocean; on the south by the English Channel; on
the west by St. George's Channel; on the north
by the Cheviot Hills, by the pastoral river Tweed,
and an ideal line falling south-west down to the
Firth of Solway. The extent of England and
Wales in square miles is computed at 49,450;
and the population at nine millions three hundred
and forty-three thousand five hundred and seventy-
eight, the number of inhabitants to a square mile
will of course be one hundred and eighty-eight.

England proper is divided into forty counties,
and the principality of Wales into twelve, thus
making the whole number of counties in South
Britain fifty-two†; of which the following is a
list, together with their respective chief towns.

Number of Inhabitants according to the late Enumeration. Chief Towns.		
Six northern counties	Northumberland	157,101 Newcastle
	Cumberland	117,230 Carlisle

	Surrey	269,043 Guildford
	Kent	207,624 Maidstone
	Sussex	159,311 Lewes

Earl's deputy, the Shire-reeve, sheriff or manager of the
shire. Yorkshire being very extensive it was divided into
three parts, called in Saxon trithings, now corruptly called
Ridings.

It is also generally believed that Alfred founded the sub-
divisions of counties called Hundreds and Tythings, now
seldom mentioned except in legal proceedings and in topo-
graphical descriptions. The Hundred probably contained
one hundred farms, while the Tything was restricted to ten.

* Exclusive of the capital.

HISTORICAL EPOCHS.] Geography has been styled one of the eyes of history, a subservience to which study is undoubtedly one of its grand objects; but it would at the same time be foreign to its nature to render it a vehicle of history. The proper and peculiar subjects of geographical science are so ample, and often attended with such difficult research, that it becomes equally rash and unnecessary to wander out of its appropriated domain.

ANTIQUITIES.] The ancient monuments of a country are intimately connected with the chief epochs of its history, and particularly with the revolutions it has undergone by foreign conquest or new population. The English antiquities fall of course into six divisions. 1. Those belonging to the primitive Celtic inhabitants. 2. Those of the Belgic colonies. 3. Those of the Romans. 4. Those of the Saxons. 5. Reliques of the Danes. 6. Norman monuments. Few of those remains, it must be confessed, throw much light upon history; but many of them being interesting and curious in themselves, they deserve the attention of the traveller and geographer.

Those of the first Celtic inhabitants were probably, as usual among savage nations, constructed of wood, and of course there can be no remains. Some rude barrows and heaps of stones may perhaps belong to the Druidic tribes, but Stonehenge, the large Barrows or tumuli, &c. &c. more probably belong to the Belgic colonies. Stonehenge is situated near the capital of the ancient Belgæ, and there is a similar monument, but said to be of far greater extent, near Vannes, a town on the French coast which was possessed by the Belgæ.

Similar monuments also occur in Denmark and Sweden, and in Iceland even the date of erection is sometimes ascertained, these circles being familiarly known by the name of *Domb-rings*, that is literally Doom-ring, or Circle of Judgment, being the solemn places where courts were held. Stonehenge is a noble and curious monument of early times. There appear to be three principal circles of stones, the outer connected together by an uniform pavement as it were at the top, to which the chiefs might ascend and speak to the surrounding crowd. A second circle consists of detached upright stones about five feet in height, while the highest are eighteen. Within this is a grand oval, originally consisting of five trilithions of two huge stones crossed by another at the top and inclosing smaller stones, which seem to have been seats, and a large flat stone commonly called the altar, but which seems to have been the throne or seat of judgment. There is besides a very high stone, towards the north-east or rising sun, and near this a large flat stone encompassed with a mound, which is probably the real altar on which human victims were sometimes sacrificed. There are also two other stones at a considerable distance to the E. and W. and the whole seems to be in the midst of a very extensive circle, marked by an earthen embankment almost effaced by the lapse of years, and affording sufficient space for all the males of the tribe or nation. The largest stones are of silicious sandstone, but the altar, or rather throne, is a calcareous sand-stone. The smaller stones are of grunstein or hornblend mixed with felspar. On its first erection the appearance must have been striking, the large stones being of pure white and the smaller black.

After the establishment of christianity the circles of judgment, which had been polluted with human sacrifices and other pagan rites, were abandoned, and the great courts were held at what were called Moot hills, or hills of meeting, many of which still exist in the British dominions and in the Netherlands.

The Roman antiquities of England have been repeatedly illustrated. The greatest number of Roman inscriptions, altars, &c. has been found in the north along the great frontier wall which extended from the western sea to the estuary of Tyne. The Roman roads were also striking monuments of their power. A grand trunk,

in Denmark and the date of erection of these circles being of Domb-ring or Circle of Judgment where courts were and curious monuments appear to be three the outer connected as it were at the top and ascend and speak of a second circle composed of about five feet in diameter and eighteen. Within this circle is a small circle consisting of five stones crossed by another circle of smaller stones, which is a large flat stone set out which seems to be of judgment. Then towards the north is a large flat stone which is probably a victims were some also two other stones the E. and W. and in the midst of a very earthen embankment years, and affording males of the tribe of silicious sandstone throne, is a calcareous smaller stones are set with felspar. Of course must have been of pure white and of christianity the had been polluted by other pagan rites, where courts were held on the hills of meeting the British dominion.

of England have been the greatest number of &c. has been found at frontier wall which sea to the estuary of the were also striking. A grand trunk,

It may be called, to anticipate the language of our inland navigations, passed from the south to the north, and another to the west, with branches in almost every direction that general convenience and expedition could require. What is called the Watling-street led from Richborough in Kent, the ancient Rutupia, N. W. through London to Chester. The Ermin-street passed from London to Lincoln, thence to Carlisle and into Scotland, the name being supposed to be corrupted from *Herman*, which means warrior, as the chief wars lay in the north. The Fosse way is supposed to have led from Bath and the western regions N. E. till it joined the Ermin-street. The last celebrated road was the Ikenild, or Ikenild, supposed to have extended from near Norwich S. W. into Dorsetshire.

The Saxon antiquities in England are chiefly edifices, sacred or secular; many churches remain which were altogether or for the most part constructed in the Saxon period, and some are extant of the tenth or perhaps the ninth century. The ruins erected by Grimbold at Oxford in the reign of Alfred are justly esteemed curious relics of Saxon architecture. Mr. King has ably illustrated the remains of the Saxon castles. The oldest seem to consist of one solitary tower, square or hexagonal: one of the rudest specimens is Coningsburg Castle in Yorkshire; but as that region was subject to the Danes till the middle of the tenth century it is probably Danish. Among the smaller remains of Saxon art may be mentioned the shrines for preserving relics, which some suppose to present the diminutive rudiments of what is called the Gothic architecture; and the illuminated manuscripts, which often afford curious memorials of the state of manners and knowledge.

The Danish power in England, though of considerable duration in the north, was in the south brief and transitory. The camps of that nation were circular like those of the Belgæ and Saxons, while those of Roman armies are known by their square form: and it is believed that the only distinct relics of the Danes are some castles to the north of the Humber and a few stones with runic inscriptions.

The monuments styled Norman, rather to distinguish their epoch than from any information that Norman architects were employed, are related to commence after the conquest, and to extend to the fourteenth century; when what is

called the rich Gothic began to appear, which in the sixteenth century was supplanted by the mixed; and this in its turn yielded to the Grecian. In general the Norman style far exceeds the Saxon in the size of the edifices and the decoration of the parts. The churches become more extensive and lofty, and though the windows retain the circular arch they are larger and more diversified; the circular doors are festooned with more freedom and elegance, and uncouth animals begin to yield to wreaths of leaves and flowers. The solitary keep or tower of the Saxon castle is surrounded with a double wall, inclosing courts or dwellings of large extent, defended by turrets and double ditches, with a separate watch-tower called the Barbican. Among others the cathedrals of Durham and Winchester may be mentioned as venerable monuments of Anglo-Norman architecture, and the castles are numerous and well known. What is called the Gothic or pointed arch is generally supposed to have first appeared in the thirteenth century, and in the next it became universal in religious edifices. The windows diffused to great breadth and loftiness and divided into branching interstices, enriched with painted glass, the clustering pillars of excessive height spreading into various fret-work on the roof constitute, with decorations of smaller note, what is called the rich Gothic style, visible in the chapel of King's College, Cambridge, and many other grand specimens in this kingdom. The spire corresponds with the interior, and begins about the thirteenth century to rise boldly from the ancient tower and diminish from the sight in a gradation of pinnacles and ornaments.

RELIGION AND ECCLESIASTIC GEOGRAPHY.] The church of England is established upon a peculiar basis, and characteristic of a moderate and judicious nation. As in the political system extremes, the usual concomitants of inexperience, are carefully avoided, and despotism or anarchy from whatever source, monarch, nobles, or people, prevented as far as human wisdom can devise; so in the church, while the papal power and other catholic chains are proscribed, the other extremes tending to loose democracy are equally avoided. It is the only reformed church which has retained the episcopal form in its ancient splendour; the bishops are peers of parliament and have the style and importance of nobility. Yet the creed of the church of England is rather Calvinistic than Lutheran.

Lutheran. But the special tenets of the English church are sufficiently explained in the thirty-nine articles; and a brief idea of its government will be more pertinent to the present purpose.

The king is the supreme head of the national church. Next in dignity and power are the archbishops of Canterbury and York, the first being styled Primate of all England, and the second, Primate of England. The archbishop of Canterbury precedes all persons except the royal family; he has the power of probate of all testaments within his province and of granting several dispensations concerning benefices; he has also four courts of judicature, that of Arches, of Audience, of Prerogative, and of Peculiars. In other respects the archiepiscopal office is rather a dignity than a jurisdiction, and the primates rarely interfere in any dioceses except their own. They are appointed by the king in the same manner as the bishops, by what is called a *Congé d'Elire*, or leave to elect.

Upon any vacancy in an episcopal see, the dean and chapter apply to the king, who returns a *Congé d'Elire*, naming the person to be chosen. A chapter of the prebendaries is then summoned by the dean, and they are constrained under the penalty of a *præmunire* to elect the person nominated. The solemnity is completed by the royal assent under great seal, and by the confirmation and consecration performed by the metropolitan or in his name. The prelate afterwards pays homage to the king for his temporalities, or the baronies connected with the see: and compounds for the first fruits, that is, the revenue of the first year, which is paid to the corporation for increasing the benefices of the poor clergy. The omission of consecration is the only difference when a bishop is translated to another see; and when an archbishop is nominated, the king appoints four or more bishops to officiate at the confirmation.

The bishop alone may ordain deacons and priests, dedicate churches and burial grounds, and administer confirmation. In former times episcopal jurisdiction extended to the licensing of physicians, surgeons, and schoolmasters, and to the conjunction of small parishes. At present it chiefly embraces questions of births, marriages, deaths, and testaments, and any delinquencies of the clergy; to which body indeed their attention is now chiefly confined, and they rarely, except

in parliament, interfere in secular subjects. The bishop of Sodor and Man has no place in parliament. All the other bishops are barons and peers of the realm by three different claims; in right to the baronies attached to their sees, as barons summoned by writ, and as barons by patent, a form which accompanies their consecration. Their privileges approach the regal; they are sole judges in their own courts, and issue writs in their own names, not in the royal style used by other courts. They can depute their authority, which no other judge can; and their episcopal power of conferring orders, &c. may be exerted in any Christian country, while lay peers are only acknowledged in the country whence they derive their dignities. To pass other more minute privileges, the bishop of London, as presiding over the capital, has the precedence of all the others. The see of Durham constitutes a county palatine, with great power and prerogatives: the authority and patronage of the bishop are of course very extensive, and even the king's judges only sit in his diocese by his permission. The bishop of Winchester is the third in dignity, but esteemed the first in opulence, as the large civil list of Durham, while it adds power, diminishes revenue. These three bishops precede all the rest, who take place according to the seniority of consecration.

To every cathedral in England belong several prebendaries as canons, and a dean, so styled, as is said (*Decanus*) because he anciently presided over ten canons. The dean and chapter of prebendaries assist the bishop in ecclesiastical affairs. The prebendaries are so styled or *pars prebendæ*, a portion of land or income allotted to them; and with the dean, from a body, college, or corporation: and they have several privileges superior to the common or minor canons. At the reformation their salaries were mostly converted into money, but those of Durham preferred the ancient portions of land; which having prodigiously increased in value, they are now styled golden prebends, being worth from eight hundred pounds to twelve hundred pounds a year, while the bishop out of nine thousand pounds a year has to support a great and unavoidable expediture.

The next order is that of the arch-deacons amounting in all to about sixty; their office is

inspect the moveables of the churches, to reform
slight abuses, and to induct into benefices.

Of the clergy in general, the lowest order is
that of deacons, whose office formerly was to
superintend the poor; the ancient donations to
the church being always assigned in three
divisions, one to the poor, another for repairs,
and the last for the clergy. At present the
deacon's office is restricted to baptism, to reading
in the church, and assisting the priest at the
communion by handing the cup only. Deacon's
orders cannot be canonically received before the
age of twenty-three years, those of a priest require
twenty-four, and a bishop must be thirty. The
curate is a clergyman appointed to officiate for
another, and is so named from his having the care
of souls. If the predial or great tithes of the
parish be impropriated, or converted into secular
hands, the priest is termed a vicar, a name
originally implying that they were the *vicarii*, or
deputies of the rector; but if the tithes be entire,
the priest is styled rector*. The churchwardens
superintend the repairs and decorations of the
church, and the requisites for divine service, and
collect the alms of the parishioners; they are an-
nually elected at Easter, and have sometimes
pagesmen, a kind of assistants. The sacristan,
corruptly called sexton, originally had the care
of the furniture and plate of the church; and by

* The clergy in general enjoy some peculiar privileges.
Their goods are free from tolls in fairs or markets; they
cannot be compelled to any office civil or military: they are
only amerced according to their temporal estate: nor are
they assailed for a robbery committed in the hundred, or
for watching, warding, highways, &c. &c.

† The ecclesiastical geography of England may be seen in
the following table:

Province of Canterbury.

1. Bishopric of London, containing Essex, Middlesex
and part of Hertford.
2. Winchester.—Surrey, Hampshire, Isle of Wight,
Jessey, Guernsey, and Alderney.
3. Litchfield and Coventry.—Stafford, Derby, and part
of Warwick and Shropshire.
4. Lincoln.—Lincoln, Leicester, Huntingdon, Bedford,
Buckingham, and part of Hertford.
5. Ely.—Cambridgeshire.
6. Salisbury.—Wilts and Berkshire.
7. Exeter.—Cornwall and Devon.
8. Bath and Wells.—Somersetshire.
9. Chichester.—Sussex.
10. Norwich.—Norfolk, Suffolk, and a small part of
Cambridge.
11. Worcester.—Worcester, and part of Warwick.

Vol. II. No. CXIX.

a still greater corruption the appellation is now
applied to the grave-digger, when it ought to
have been conferred on the parish-clerk.

Ecclesiastical courts still retain considerable
power: the convocation, consisting of the arch-
bishops and bishops, with a lower house of one
hundred and fifty members, only meets for the
sake of form; but have not been allowed to de-
liberate since the reign of Anne.

Next in dignity is the court of delegates, acting
by a special commission under the great seal; and
to whom an appeal lies from the highest metro-
politan court. The court of arches is so styled
because it was held in the arches of the church
St. Mary-le-bon, London, but now in the great
hall, Doctors Commons; only doctors of the
civil law are allowed to plead. The court of
audience is always presided by the archbishop
himself, who decides any doubts concerning the
admission to benefices and dispensation of the
banns of matrimony.

The next court is that of prerogative, which
judges of estates fallen by will, or intestate; the
prerogative office is likewise in Doctors Commons.
The court of peculiars refers to several peculiar
parishes exempt from the jurisdiction of the
bishops, but here amenable: the judges are sole
and without jury†.

Those who differ in tenets or forms from the

12. Hereford.—Hereford and part of Shropshire.
13. Rochester.—part of Kent.
14. Oxford.—Oxfordshire.
15. Peterborough.—Northampton and Rutland.
16. Gloucester.—Gloucestershire.
17. Bristol.—The city of Bristol, part of Gloucester-
shire, and county of Dorset.
18. Llandaff.—Glamorgan, Monmouth, Brecknock, and
Radnor.
19. St. David's.—Pembroke, Cardigan, and Caernarther.
20. St. Asaph's.—The greatest part of Flint, Denbigh,
and Montgomery, and some part of Shropshire.

Several changes have taken place in the number and situa-
tions of the bishoprics since Christianity was first established
in this country, but these are not in our province to describe.

S F

established

established church may, in general, be styled Dissenters, though the term be more strictly applied to the Presbyterians and Independents. The other principal classes of the dissidents are the Papists, Methodists, Quakers, the Anabaptists, the Swedenborgians, and the Unitarians; the last class denying the Trinity, and believing only in one God, is now intermingled with the two first, who have considerably relaxed the strictness of their discipline. The Independents assert, that each congregation has a right to regulate itself, while the Presbyterians unite churches under various divisions, provincial and national. The clerical aristocracy of the Presbyterians was obtruded with great haughtiness upon the English nation during the civil war in the last century, and was rendered the more odious, because it admitted no toleration: hence the English found that they had only exchanged one yoke for another, or rather for slavery, as ten presbyters amounted to one bishop, and superadded the petulance and moroseness of individual inquisitors. Milton and other friends of freedom soon began to satirize the whole sect, and to fly for refuge to the Independents, whose benevolence granted universal toleration. To this body Cromwell lent an iron hand; and after annihilating the Presbyterian power in England, in a great measure subverted that of Scotland. The intolerant spirit of the Presbyterians originated with their apostle Calvin, whose cruelty to Servetus was balanced by surprising talents in clerical polity: it rendered their power singularly adverse to letters and taste; and no man of science who had studied the literary history of this country would wish for the revival of such domination. But at present Calvin would not recognise his disciples, as they have abandoned their polemical thistles, and cultivate the most elegant productions of the literary field. The Papists used chiefly to abound in Lancashire, Staffordshire, and Sussex; they had potent chiefs, and were a formidable body; but the passage from superstition to contempt is so natural, that many have fled to the opposite extreme. Those who retain their faith generally display moderation, which has been naturally increased by the late privileges extended to them.

The methodists are extremely numerous and respectable. They seem to allow the propriety of the creed and government of the Church of

England; but inculcate Arminian doctrines rather than those of the establishment. A philosopher may well envy the mild creed and universal charity, or fraternal love of the Quakers; while we must allow with a sigh that a nation of quakers could not exist, except all nations were of the same persuasion. The Anabaptists disown infant baptism, and bathe the adult disciple. The Swedenborgians derive their name from the Baron Swedenborg, a nobleman, who exchanged his native country of Sweden for a residence in England. After having published two folio volumes in Latin upon the art of exploring mines, he was seized with a violent fever, and with great difficulty recovered. In his disordered imagination he seemed to maintain a frequent intercourse with the spiritual world; and he has published twenty or more vast volumes in quarto, also in Latin, replete with curious metaphysical ratiocination, interspersed with visions, which are sometimes narrated with high poetical spirit and elegance. His system is so much adapted to the strongest propensities of human nature, that his disciples increased with great rapidity. His chief tenets are, that there is but one person of the Deity, namely, the Lord Jesus Christ; that the day of judgment is already passed, &c. &c.; but his most alluring tenets partake of Mohammedanism, in representing the connubial pleasures and the other enjoyments of a future world, which he paints as similar to this state of existence, but far exceeding it in the gratifications of every sense whether mental or corporeal.

GOVERNMENT.] It is difficult to give a brief idea of the English constitution, which presents an infinite number of practical ramifications, and is ultimately connected with the spirit and manners of the people. A mere outline must here suffice. It is a limited monarchy, counterpoised by two senates, one of hereditary peers, the other of representatives, who are or ought to be chosen by the people. The stability and real power of the House of Commons depend on a general concurrence with the popular voice, arising partly from the mode of election, and partly from the sympathetic gradation of ranks.

Our lawyers pronounce that the King of England unites in his person the dignity of chief magistrate with the sanctity of a priest; and the title of Sacred Majesty appears to have commenced when he assumed the sanction of Head of

the

the Church. So august is his person that even to
mentation or intend his death is a capital offence,
when in all other cases the deed alone is punish-
able. Fortescue in his old emphatic language
has described the office of the king of England
to be "to fight the battles of his people, and to
judge them with most righteous judgment." At
his coronation he solemnly swears to govern his
people according to parliamentary statutes, and
the law of the country; to maintain the Pro-
testant religion; and to preserve the legal rights
and privileges of the bishops, clergy, and the
Church.

The acknowledged prerogatives of the mo-
narch are chiefly to declare war and to make
peace, a power upon which the whole of public
prosperity may be said to depend; to form
alliances and treaties; to grant commission for
carrying men and arms, and even for pressing
seamen. To the king also belong all magazines,
ammunition, castles, forts, ports, havens, and
ships of war; he has also the special management
of the coinage, and determines the alloy, weight,
and value. The prerogative likewise extends to
the assembling, adjournment, prorogation, and
dissolution of parliament, and to its removal to
any place. The sovereign also enjoys the
nomination of all officers on sea and land; of all
magistrates, counsellors, and officers of state; of
all bishops and other great ecclesiastical dig-
nities; and is not only the fountain of honour
and of justice, as he may pardon any offence, or
mitigate the penalty. As head of the church he
may call a national or provincial synod, and with
the consent enact canons either relating to faith or
practice. The other prerogatives are more
minute and more adapted to jurisprudential
enumeration. The more important exceptions
are, that he cannot enact new laws or impose
new taxes without the consent of both houses of
parliament.

This grand national council claims the next
consideration. Originally both the nobles and
the commons met in one house, and it is not im-
possible that the mere inconvenience of not finding
halls large enough for our then ambulatory par-
liaments might have occasioned the division into
two houses, unknown in any other country, and

The Duke is so styled from the Latin *dux*, a leader or
general; the title of Marquis springs from the Gothic law-
er, and implies the commander of a march or frontier:

which in fact may be regarded as the sole
foundation of English liberty. The House of
Peers may be said to have existed from the earliest
period of our history, but concerning the origin
of the Commons there is a dispute between the
Tory and the Whig writers. The present con-
stitution of the parliament of England may how-
ever be traced with certainty to near the middle
of the thirteenth century; but it remains unknown
at what precise time happened the important
separation of the Commons from the Peers. The
latter are hereditary senators in their several
degrees of duke, marquis, earl, viscount, and
baron*. The various orders of nobility have
been preserved more pure in England than in any
other country; owing partly to the laws of
primogeniture, partly to their senatorial office,
partly to the institution of the college of heralds.
The privileges of the peers are moderate and
uninvidious, there being no exemption from taxes,
&c. as in some countries.

The House of Commons consists of knights,
citizens, and burgesses, chosen by counties,
cities, and burghs, in consequence of royal writs
directed to the sheriff. The members have cer-
tain privileges, as exemption from arrest in civil
causes, on their journey to parliament, during
their attendance, and on their return; nor can they be
questioned out of the house for any sentiment there
uttered. The commons form the grand inquest
of the realm, and may impeach or accuse the
greatest peers; but their chief privilege, and
upon which their whole power depends, is the
levying of money, in which they are deservedly so
jealous, that they will not permit the smallest
alteration in a money bill. Since the union with
Ireland the House of Commons consists of six
hundred and fifty-eight members; but by sickness,
important offices, and indispensable avocations,
there rarely appear above two-thirds of the
number. A Speaker or president is chosen at the
meeting of every new parliament, but is usually
continued from one to another as the office re-
quires a complete and ready knowledge of the
forms, and considerable abilities.

Acts of parliament are first presented in the
form of *bills*, and, after having gone through
various and exact forms generally observed with

the Earl and Baron are also from the Gothic, and merely

the lieutenant of the count or earl.

great

great minuteness, become law on receiving the sanction of the Crown.

The attention of the nation is chiefly bent upon the Parliament, when grand political questions arise concerning war and peace, or affecting the constitutional liberties of the land. On such occasions the utmost powers of eloquence are exerted; and specimens produced worthy of Greece or Rome. Such trials of elocution may either arise in the stages of a bill as before described, or by the special motion of a member for some particular object for address to the throne.

Adjournments may frequently happen in one session, and the business is continued and resumed; but a prorogation terminates the session, and the bills not then passed must recommence their whole progress. By a modern statute the death of the king does not, as formerly, terminate the parliament; which, on the contrary, had it been previously dissolved, may, on that event, resume its functions.

Such are the three great component parts of the English constitution; but perhaps its most beneficial and popular effects arise from the mode of administering justice, and other ramifications. For the sake of connection, however, it is proper first to consider the Privy Council and the other divisions of the government.

The Privy Council formerly possessed great power, but at present is chiefly employed in deliberations on affairs of sudden emergence, on peace and war, and special provinces of the royal prerogative. The members are chosen by the king, and on changes of administration are seldom erased, though those in opposition never attend. They are styled Right Honourable, and are sworn to observe secrecy: the lowest at the board pronounces his opinion first, and the king, if present, concludes with declaring his judgment.

Even at an early period, when the monarch maintained in his own hands a great share of the administration of justice, and of the actual exercise of authority, there were intervals of absence or recreation in which he delegated the chief management of business to some select person, usually an ecclesiastic whose cultivated talents qualified him for such an important trust. To lend more weight to this substitute, he was commonly appointed chancellor or chief administrator of civil justice, was president of the House of

Peers, and supported the royal influence in the great assembly. But in later times, when the management of the House of Commons became the chief object of the crown, the chancellor of the Court of Exchequer, as superintendent of the public revenue, is the officer generally considered as prime minister. The distribution of fifty millions a year, joined with the royal support, has recently carried his power to the highest elevation. Next to him in authority are the secretaries of state, who are followed by the chancellor, the treasurer of the navy, the president of the council, the paymaster of the forces, the commissioners of the treasury, and other persons of high trust.

JUDICATURE AND LAWS.] The judicature of England is worthy of the highest applause with regard to precision and purity; and bribes, so frequent in other countries, being totally unknown, the saving of this expence must be candidly poised against other legal disbursements. The trial by jury is another glorious feature of English jurisprudence, handed down from the Saxon times, and is justly respected as the safeguard of the lives, liberties, and property of the nation. It would be idle and extraneous here to attempt even a brief sketch of the laws of England. The most singular usages are what termed *Borough English*, by which the youngest son, or, in defect of issue, the youngest brother was to enjoy the heritage, as it was to be presumed that his elder brethren had learned the father's business, and that of guerd kind, scarce known except in Kent. In no country are we so much venerated by law.

The forest laws relate chiefly to offences committed in or near the precincts of the royal forests and were formerly regarded as a considerable portion of the national code. But a more vigorous branch of English judicature must not be forgotten: martial law, or the *Lex Castrensis Anglicana*, may be clearly traced to the reign of Henry V. who issued a code of military statutes published by Upton and Grose. The statutes chiefly relate to sacrilege, prisoners, robbery, merchants, &c. &c. and refer solely to the actual exercise of war; the pain of death rarely occurs except in the case of any person who cries *harm* an expression seemingly equivalent to "no quarter." Martial law may be proclaimed by king, regent, or lieutenant-general of the kingdom.

influence in the times, when the Commons became the chancellor of the superintendant officer generally.

The distribution of the royal power to the king in authority are followed by the navy, the president of the forces, treasury, and other

The judicature of the highest applause with integrity; and bribes, being totally unpenance must be exacted from the legal disbursement of the glorious features of the down from the respected as the virtues, and property of the idle and extraneous sketch of the laws of the usages are what by which the youngest brother as it was to be proven had learned the of gravel kind, scarce no country are with

dom; and even in time of peace, though the prerogative be rarely employed except during war. It is in fact a dictatorial power never exerted except on great emergencies. The trials are summary and severe according to the necessity of the case.

Among the courts of law the next in dignity to the House of Lords is the court of King's Bench, so called because the sovereign was understood to judge in person; and its jurisdiction of course extends to the whole kingdom, the presiding judge being denominated Lord Chief Justice of England. The Court of Chancery judges causes in equity to moderate the rigour of the law, and defend the helpless from oppression, and especially to extend relief in three cases, accident, fraud, and breach of trust. The Court of Common Pleas determines, as the name imports, the common suits between subject and subject, and tries all civil causes, real, personal, or mingled, according to the precise precepts of the law. The Court of Exchequer, so termed from the ancient mode of accounting upon a chequered board, decides all causes relating to the royal treasury or revenue. There is also a court for the duchy of Lancaster, having cognizance of the revenues of that duchy annexed to the crown by Henry IV.

The judges perform their circuits in the spring and autumn, and in the mean while more minute cases are determined by the justices of the peace, who may be traced to the fourth year of Edward III. Every three months the justices of the county meet at what is called the quarter sessions, and the grand inquest or jury of the county is there summoned, which inquires concerning crimes, and orders the guilty to jail till the next circuit or assizes. The office of the sheriff is to execute the royal mandate, to impanel juries, to bring persons for trial, and to see the sentences executed; to collect fines and remit them to the exchequer, and to preserve the tranquillity of the shire.

There was formerly a bailiff in every hundred, but the office is now rare. The constables personally assist in the preservation of the peace, and execute the warrants of the justices. The coroner inquires by a jury of neighbours into cases of violent death. The clerk of the market superintends the weights and measures; and it were to

be wished, for the benefit of the poor, that the office were multiplied and strictly enforced.

Such are the chief magistrates and officers in the country. Cities and towns are generally ruled by a mayor and aldermen, or by similar magistrates under different appellations, whose juridical power little exceeds that of justices of the peace.

To enumerate the various punishments inflicted by the laws of England would be an unnecessary task. It has been justly observed that they are too sanguinary, and that their frequency diminishes the intended purpose of impressing terror. If death were only inflicted in cases of murder, the relaxation would be found beneficial to the community; for, as man is an animal reared with considerable difficulty, and may generally be rendered useful, it would certainly be preferable to send criminals for life to the new and distant Asiatic settlements, than by the waste of blood to lessen strength and population.

POPULATION.] The population of England and Wales by the late enumeration amounts to nine millions three hundred and forty-three thousand five hundred and seventy-eight. That of Ireland is generally computed at three millions, while that of Scotland has been lately found to equal one million six hundred and seven thousand seven hundred and sixty.

ARMY.] The army during the late war was supposed to exceed one hundred and seventy thousand, with thirty thousand fencibles, and seventy-eight thousand militia, the volunteers being supposed to be sixty thousand.

NAVY.] But the great rampart and supreme glory of Great Britain consist in her navy, in size, strength, and number of ships, far exceeding any example on record. At the beginning of June, 1810, the following was the state of the British Naval Force: In commission one hundred and fifty-two ships of the line; twenty-two from fifty to forty-four guns, one hundred and seventy-eight frigates, besides sloops, yachts, bombs, fire-ships, brigs, &c. amounting to eight hundred and thirty-four.

For this immense fleet the number of seamen amounts from one hundred to one hundred and twenty thousand, a number which no other country ancient or modern could have supplied*.

The

* The naval power of Great Britain constitutes so striking and important a feature in the national portrait, that it Vol. II. No. CXIX.

merits particular illustration. Even in the Saxon times we find considerable fleets mentioned of the small vessels then

The special superintendence of the navy is committed to the Board of Admiralty, composed of admirals of known skill, and of peers whose impartiality generally regards merit alone in this important service. The recent conduct of maritime war has been crowned with distinguished success.

REVENUE.] In ancient times the royal revenue chiefly arose from the domains, or lands appropriated to the crown, from amerciaements civil and criminal which passed to the fisc or treasury, and from customs on goods imported and exported. As in war each soldier was obliged to maintain himself for a certain time, the expenditure was not much increased. Upon extraordinary emergencies, it appears that a contribution was raised by the consent of the national council. In later periods subsidies were granted to the amount of a fifteenth or a tenth of landed income, and a proportionable rate on moveable goods. As society advanced, taxes began to be imposed on the materials themselves; and from a small plant an enormous tree has risen, with a labyrinth of roots, which in the opinion of some politicians undermine the island, while others believe that they only produce a more firm consolidation.

The excise forms one of the most productive branches of the revenue, amounting to between seven and eight millions. Next stand the customs, which produce about half that sum. The stamps and incidental taxes, as they are termed, arise to an immense sum†. The land tax has recently been rendered perpetual, and sold to proprietors of estates and other individuals. But instead of the land-tax, now appear those on sugar, tobacco, and malt, amounting to two

millions seven hundred and fifty thousand pounds; the other supplies arise from the East India Company, lotteries, &c. In the year 1809 it was supposed that the additional sums raised by loans, and other methods, swelled the national expenditure to near eighty millions sterling. The property tax produces an enormous sum, but it is said to give general dissatisfaction.

Of the permanent taxes the greater part is employed in discharging the interest of the national debt, which after the American war amounted to more than two hundred and thirty-nine millions, while the interest exceeded nine millions. At present, May 1810, the national debt is about nine hundred millions!!!.

To alleviate this growing burthen, a sinking fund was instituted in 1786, by which a small part has been redeemed. The national debt began in the reign of William, and grew into what are called the funds or stocks, only synonymous terms for the public debt.

The civil list, from which are defrayed the salaries of officers of state, judges, ambassadors, &c. together with the expences of the royal family, amounts to one million annually.

POLITICAL IMPORTANCE AND RELATIONS.] With such a prodigious command of national treasure, the political importance and relations of Great Britain may be said to be diffused over the world; for wherever money influences man, there may her power be perceived. The union of Scotland with England delivered the latter country from the perpetual check, exercised by politicians ancient and modern, of exciting an enemy from behind, and thereby dividing the power of an antagonist. That with Ireland, if preserved by

in use. One of the Northumbrian monarchs assembled a numerous fleet near Jarro, the monastery of Beda, in an extensive haven of the time, now become a salt marsh. About the year 882 we find that Alfred directed a powerful fleet against the Danish invaders. The fleet of Edgar is also celebrated, but the armament of Ethelred the second in the year 1009 exceeded any which England ever before had beheld, probably amounting to five hundred of the small ships then known. But the devastation of the Danes and Normans occasioned such a decline in the naval power of England, that Richard I. was obliged to have recourse to foreign vessels for his crusade. In the reign of John we, for the first time, find commemorated a signal victory of the English and Flemings over the French fleet of Philip Augustus, which was computed at one thousand seven hundred ships, or rather boats. The English monarch in the pride of his

triumph was the first who ordered the SALUTE to be paid by foreign vessels to the national flag. The fleet of England thenceforth continued to be always respectable, and more victorious; but the preponderance of the English armaments over those of France only became permanent and decisive a little more than a century ago, after the battle of La Hogue. Spain had yielded the contest since the destruction of her great Armada, and Holland had been greatly reduced in her naval conflicts under Charles the Second; so that no other rival remained, and Great Britain still maintains a superiority over the ocean.

† The stamp duty for the year ending the 15th of January, 1810, amounted to five millions one hundred and nineteen thousand four hundred and sixty-seven pounds eighteen shillings and four pence.

thousand pounds; the East India Company in 1809 it was raised by loans, the national exchequer sterling. The enormous sum, but it action.

ding the 15th of January, ne hundred and twelve y-seven pounds eight

and lenient measures, must also impart additional energy. The most important political considerations are those between Great Britain and France. If this country must not be styled the natural enemy of Great Britain, she has yet for many centuries been a constant and jealous rival, eagerly embracing every opportunity to increase British prosperity and power. Such being the case, it has been regarded as the political interest of England to balance and divide the enmity of France by a strict alliance with some limitane-ous state: but at present (1810) there is not one nation on the continent of Europe in alliance with Great Britain, the whole having been overturned by the gigantic power of France. Even Russia, in strict alliance with the Emperor of France, fight, by no great stretch of oriental power, to attach an army into Hindostan, which, in all probability, would overturn our opulent possessions in that quarter of the world.

MANNERS AND CUSTOMS.] The English are deemed to exceed in the use of animal food; but the introduction of potatoes and other es- sential vegetables, this position may be doubted. The use of heavy malt liquor, deservedly the foreigners, as a singularity in English diet. Our lightest liquors of that sort have not escaped their remark; for a late French traveller observed, that the English commonly drink their meals a sort of medical ptisan, which they call small beer. Our ancestors prided themselves on the variety and richness of their ales; but the most peculiar malt beverage is porter, which is not to be solely composed of brown or high malt, hops, liquorice, and sugar; but it is sometimes debased by other ingredients: that of London is particularly famous, and is an article of exportation, being esteemed a luxury on the banks of the Delaware and the Ganges. The religious consumption of tea is another peculiar feature, the use of that plant being rare in other European countries. The baneful effects of excess in spirituous liquors may be traced in the ruined health and morals of the people.

The simplicity of the English cookery strikes foreigners as much as that of the dress, which among the great is very plain, except on the days of court gala.

The houses in England are peculiarly commodious, neat, and cleanly; and domestic archi-

tecture seems here arrived at its greatest perfection.

The amusements of the theatre and of the field, and various games of skill or chance, are common to most nations. The baiting of bulls and bears, is nearly discontinued: one of the most peculiar amusements of the common people is, the ringing of long peals, with many changes.

Prior to the middle of the sixteenth century, the English and French were regarded as barbarous nations by the more polished Italians. The reign and female blandishments of the court of Elizabeth seem to have had a wonderful effect in civilizing the manners.

The genuine attribute of the English is integrity, which has carried their credit and commerce to an extent before unknown in the history of nations.

LANGUAGE.] Most European languages are derived from the Gothic or the Latin. To the Latin origin belong Italian, French, and Spanish; to the Gothic, the German, Dutch, Flemish, Danish, Swedish, and Norwegian. From the situation of the country, and other causes, the English participates of both those grand sources; and unites in some degree the force of the Gothic with the melody of the Latin dialects. The ancient ground, and native expression, originate from the Gothic divisions of the Belgic, Saxon, and Danish; but particularly from the Belgic, as will appear from comparison with the Dutch and Frisic. The languages of Latin origin have, however, supplied a vast wealth of words, sometimes necessary, sometimes only adopted because they are more sonorous, though not so emphatic as the original Gothic. The construction of the English language is peculiar, and renders the study of it very difficult to foreigners. The German and other Gothic dialects present declensions of nouns, and other correspondencies with the Latin, while in the English all such objects are accomplished by prefixes. Anomalies also abound, and are too deeply rooted, ever to be eradicated by grammatical rules.

EDUCATION.] In a view of any country, education forms one of the most important topics, as its consequences extend to the essence and well-being of the community. The education of the lower classes in England had become extremely neglected, before the benevolent institution of the

the Sunday schools. The middle and higher ranks of English spare no expence in the education of their sons, by private tutors at home, or at what are called day schools and boarding schools. Our most eminent public schools are those of St. Paul's, Westminster, Eton, and Winchester; and from them have arisen some of the most distinguished ornaments of their country. The scholars in due time proceed to the universities of Oxford and Cambridge; foundations, of an extent and grandeur that impress veneration.

Of the two universities, many minute descriptions have appeared. Oxford is the more majestic; from the grandeur of the colleges and other public buildings, and the superior regularity and neatness of the streets: but the chapel of King's College, at Cambridge, is supposed to excel any single edifice of the other university. Both of those magnificent seminaries impress every feeling mind with reverential awe; not only by their architectural dignity, but by a thousand collateral ideas of ancient greatness and science.

CITIES AND TOWNS.] LONDON, the metropolis of England, is situated in an extensive plain or valley watered by the Thames, and only confined on the north by a few small elevations. It now includes Southwark, a borough on the south side of the Thames, and Westminster, another city on the west. London presents almost every variety which diversifies human existence. Upon the east it is a sea-port, replete with mariners and with the trades connected with that profession. In the centre, it is the seat of numerous manufactures and prodigious commerce: while the western or fashionable extremity presents royal and noble splendour, amidst scenes of the highest luxury and most ruinous dissipation. The population of London has been by some exaggerated to a million of souls; but by the late enumeration it does not contain above eight hundred and eighty-five thousand five hundred and seventy-seven. Its length from Hyde-park Corner on the west to Poplar on the east, is about six miles; the breadth unequal, from three miles to one and less; the circumference is about sixteen miles. The houses are almost universally of brick. The cathedral of St. Paul is majestic to a degree of sublimity, but the interior is defective in deco-

ration. Westminster abbey may claim the next rank to St. Paul's cathedral; being not only in itself a grand impressive edifice of the Gothic class, but as being the sanctuary of the illustrious dead of all ranks, periods, and professions, from the victorious monarch down to the humble pedagogue. Adjacent are the two houses of parliament, and Westminster-hall; a vast room, two hundred and thirty feet long and seventy wide with a curious cieling of Irish oak, and apartments on the side, in which are held the principal courts of justice.

The churches and chapels exceed two hundred in number, and a few are of beautiful architecture.

YORK is next to the capital in dignity, though not in extent or opulence; it is not only the chief of a large and fertile province, but may be regarded as the metropolis of the North of England. This venerable city is divided by the river Ouse, and the Gothic cathedral is of celebrated beauty, the western front being peculiarly rich, the choir tower very lofty, and the windows of the finest painted glass. York divides with Edinburgh the winter visits of the northern gentry. Its inhabitants, according to the enumeration in 1801 amount to sixteen thousand one hundred and forty-five.

LIVERPOOL, in Lancashire, is now much nearer to London in wealth and population: being the seat of a vast commerce, which has been continually on the increase since the beginning of this century, when it was merely a village. In 1695, Liverpool was admitted to the honour being constituted a parish. By the enumeration in 1801 it contained seventy-seven thousand and hundred and fifty-three inhabitants.

Bristol is still a large and flourishing city, though much of its commerce with the West Indies and America have passed to Liverpool. This metropolis of the west of England gradually rose to eminence in the Anglo-Saxon period. The hot-wells in the neighbourhood appear to have been known in 1480: but the water was chiefly used externally till about the year 1670, when a baker dreaming that his diabetes was relieved by drinking the water, he tried the experiment and recovered. Since that period its reputation has increased, and many commodious and elegant erections have contributed to reco-

and flourishing city in commerce with the West passed to Liverpool of England gradually in the Anglo-Saxon period the neighbourhood appeared; but the water was about the year 1670 at his diabetes was expert, he tried the experience that period its and many commodities contributed to recon-

istive reader to Dr. H. Envoirs."

mend these wells to invalids. In the adjacent rocks are found beautiful crystals, which, before the introduction of artificial gems, were greatly in fashion for female ornaments. The trade of Bristol is chiefly with Ireland, the West Indies, or North America. Inhabitants in 1801, sixty-three thousand six hundred and forty-five.

BATH, in the vicinity of Bristol, is esteemed the most elegant town in England. The hot-baths, from which it derives its name, were known in the Roman times; nor was their celebrity lost, even in the dark period of Anglo-Saxon history. But the town has been greatly enlarged and decorated in the last century. The waters are used both internally and externally, chiefly in gout, bilious, and paralytic cases. Situated in a vale, Bath is very hot in summer. The houses are constructed of white stone, which abounds in the neighbourhood. Its inhabitants in 1801 amounted to thirty-two thousand two hundred.

Manchester, in Lancashire, was in the Roman times a small station; but it continued in obscurity till the time of Elizabeth, when Camden mentions its manufacture of woollen-cloths. The inhabitants amount to eighty-four thousand and twenty.

Birmingham, in Warwickshire, was originally a village, belonging to a family of the same name, whose monuments remain in the old church. Leland mentions it as a town inhabited by smiths and cutlers, in the time of Henry VIII.; and by workmen, now called bit makers. The extension and improvement of Birmingham originated in a great degree from Mr John Taylor, who introduced the manufacture of gilt buttons, and japanned and enamelled works. The population in 1791, amounted to seventy-three thousand six hundred and seventy.

Sheffield, in the most southern part of Yorkshire, is celebrated for its cutlery and hardware manufactures. In the year 1615, the population only amounted to two thousand one hundred and fifty-two; at present, it is equal to thirty-one thousand three hundred and fourteen.

[EDIFICES.] In a brief enumeration of the principal edifices in England, the royal palaces demand of course the first attention. Windsor castle, situated on an eminence near the Thames, has an appearance truly grand, and worthy of the days of chivalry. The view extends as far as the cathedral of St. Paul's; and the whole scene strongly impresses the circumstances so vividly

VOL. II. No. CXX.

delineated in Gray's pathetic ode on Eton College. This palace contains many noble paintings, particularly the cartoons of Raphael. Hampton-Court is in a low situation, ornamented with aqueducts from the river Colne. This palace is also replete with interesting pictures. The royal gardens at Kew are truly worthy of a great and scientific prince; the ground, through level, is diversified with much art; and the collection of plants from all the regions of the known world, fills the admirer of nature with delight and surprise. They are so disposed, that every plant finds, as it were its native soil and climate; even those that grow on rocks and lava having artificial substitutes.

The royal palace at Greenwich has been long abandoned, but the observatory does credit to science. It is a plain edifice, well adapted to astronomical observations, and at present ably superintended by Dr. Maskelyne. Dr. Herschell's observatory, instead of containing his telescope, is suspended from it in the open air, at Slough, near Windsor, where he is continually extending the bounds of astronomical knowledge.

Among the houses of the nobility and gentry, or palaces, as they would be termed on the Continent, the first fame, perhaps, belong to Stowe, the seat of the Marquis of Buckingham; which, for its enchanting gardens, has been long celebrated. The opinion of artists at the present day, with respect to the comparative elegance of architectural nicety and rural decoration, is greatly at variance; one giving the preference to Stowe, while others extol the simplicity and superb grandeur of the architecture of Tilney House, on Epping Forest; but our limits will not permit an enumeration of these particulars. When Mr. Beckford's magnificent erections at Fonthill are completed, that fame will be far surpassed.

Among public buildings must not be omitted, the noble hospitals for seamen and soldiers, at Greenwich and Chelsea. Many of the county halls have no inconsiderable claim to elegant architecture.

BRIDGES.] The bridges are worthy the superiority of the English roads; and a surprising exertion in this department, is the recent construction of bridges in cast iron, an invention unknown to all other nations. The first example was that of Coalbrook-dale, in Shropshire, erected over the Severn in 1779. This

S 11 bridge

bridge rests on abutments of stone-work, the main rib consisting of two pieces, each seventy feet long; connected by a dove-tail joint fastened with screws. The road over the bridge is made of clay and iron slag, twenty-four feet wide and one deep; the span of the arch, a hundred feet six inches; height from the base line to the centre, forty feet; the weight of iron employed, three hundred and seventy-eight tons ten hundred weight. Another iron bridge has since been erected in the vicinity. A stupendous iron bridge has been recently thrown over the harbour at Sunderland: the height of which is one hundred feet, and the span of the arch two hundred and thirty-six; it is composed of detached pieces, which, if damaged in any of the parts, may be withdrawn and replaced by others. It is supported between two strong and elevated stone piers, and the arch is surmounted at either end by vast hoops, supporting the platform or passage of the bridge, which is thus rendered almost level. When viewed from beneath, the elegance, lightness, and surprising height, excite admiration, and the carriages appear as if passing among the clouds.

INLAND NAVIGATION.] This article is important to the best interests of the country, and demands particular attention. The earliest inland navigation that can be authenticated, is the Sankey canal, leading from the coal-pits at St. Helens, in Lancashire, to the river Mersey, and constructed in order to convey coals to Liverpool. The length of the canal is twelve miles, with a fall of ninety feet. The act of parliament passed in 1755; the original intention was only to render the rivulet called Sankey Brook, navigable: but it was found more advantageous to form a canal along its course. The surveyor was Mr. John Eyes.

But the Duke of Bridgewater is justly venerated as the grand founder of inland navigation: his spirit and opulence were happily seconded by Mr. Brindley, than whom a greater natural genius in mechanics never existed. It was in 1758 that the first act was obtained for these great designs. The first canal extends from Worsley mill, about seven computed miles from Manchester, and reaches that town by a course of nine miles. In this short space almost every difficulty occurred that can arise in similar schemes; but mountains and rivers yielded to the

genius of Brindley. There are subterraneous passages to the coal in the mountain, of near a mile in length, sometimes cut through the solid rock, and occasionally arched over with brick; with air-funnels to the top of the hill, some of them thirty-seven yards perpendicular. This beautiful canal is brought over the river Irwell, by an arch of thirty-nine feet in height, and under which barges pass without lowering their masts. The Duke of Bridgewater soon afterwards extended a canal of twenty-nine miles in length, from Longford-bridge, in Lancashire, to Hempsley, in Cheshire.

After this deserved tribute to the fathers of inland navigation in England, it will be eligible to review the other canals in a geographical manner, proceeding from the north to the south.

First in order is the Lancaster canal, extending from Kendal, in Westmoreland, by Lancaster, to West Houghton in Lancashire, a space of about seventy-four miles.

The canal from Leeds to Liverpool, directed in a northerly course by Skipton, winds through an extent of a hundred and seventeen miles; and from this canal a branch also extends to Manchester, begun in 1771.

From Halifax to Manchester is another considerable canal, commonly called that of Rochdale; length thirty-one miles and a half, begun in 1794.

Another canal extends from Manchester towards Wakefield; and another called the Peak Forest canal, stretches from the former, south-east, about fifteen miles.

Another joins the river Don, several miles above Doncaster, to the river Calder, near Wakefield in Yorkshire.

To pass several of smaller note, the Chesterfield canal extends from Chesterfield, in the county of Derby, to the Trent at Stockwith, a course of forty-four miles and three quarters, begun in 1770.

In Lincolnshire, one canal extends from Lincoln to the Trent, and another from Horncastle to Skeaford. Grantham canal reaches from that town to the river Trent, a course of thirty miles.

The grand design of Brindley was to join, in inland navigation, the four great ports of the kingdom, Bristol, London, Liverpool, and Hull. Liverpool is accordingly connected with Hull by a canal from that long navigable river the Trent

and proceeding north to the Mersey. The canal
which joins these two rivers is styled the Grand
Trunk; and was begun in 1766, under the direc-
tion of that great engineer; but was not com-
pleted till 1777: the length is ninety-nine miles.
It was attended with great difficulties, particularly
in passing the river Dove, in Derbyshire, where
there is an aqueduct of twenty-three arches, the
tunnel through the hill of Haze-castle, in Stafford-
shire, is in length two thousand eight hundred
and eighty yards, and more than seventy yards
below the surface of the ground, and was executed
with great labour and expence. But the utility
corresponds with the grandeur of the design: salt
from Cheshire, coals and pottery from Stafford-
shire, and manufactures from various places, are
transported on this canal.

From the Grand Trunk five or six branches
extend in various directions; among which must
not be omitted that to the river Severn, near
Bewdley, which connects the port of Bristol with
those of Liverpool and Hull; the length is forty-
six miles; completed in 1772.

From the city of Chester one canal extends to
the Mersey, and another to Nantwich; another
proceeds south to Shrewsbury, uniting the Mer-
sey and the Severn; with north-west and south-
east branches of considerable length.

From Coventry, in the centre of the kingdom,
canals extend to the Grand Trunk; to Ashby-de-
la-Zouch, and to the Braunston, or Grand
Junction canal.

What is called the Staffordshire canal, extends
from the Grand Trunk to the river Severn; and
is met by the Kington canal, which reaches to
Kington, in Herefordshire, so as almost to join
the river Trent and Wye. It may be here ob-
served, that in this description the grand courses
of navigation are attended to, rather than the
minute names and divisions of the canals.

Several inland navigations pass by Birmingham.
The Union canal completes a course of forty-
three miles and three quarters, from Leicester to
Northampton, whence the river Nen is navigable
to the sea.

Another canal extends from Gloucester to
Hereford; and the south of Wales presents several
navigations of considerable length, particularly
that from Brecon, in Brecknockshire, to New-
port, in Monmouthshire.

The Severn is not only joined with the Trent

and the Humber, by various courses of naviga-
tion, but is united with the Thames, by a canal
extending by Stroud to Lechlade, a course of
near forty miles.

Other canals branch out from the Thames in
various directions: that of Oxford extends to the
Grand Trunk, or rather joins the Coventry canal,
after a course of ninety-two miles.

The Braunston, or Grand Junction canal,
reaches from Brentford, on the Thames, and
joins the Oxford canal at Braunston, in North-
amptonshire, after a course of ninety miles. It
is styled the Grand Junction, because it may be
said to unite the numerous courses that pervade
the central counties, with the capital of the king-
dom.

On the south of the Thames, a canal proceeds
from Reading to Bath; and another from Wey-
bridge to Basingstoke; and a third from Wey-
bridge to Godalmin.

A small canal or two have been executed in
Devonshire. The Andover canal, in Hampshire,
extends from Andover to Southampton water.
Sussex presents two canals, that of Arundel, and
that of Lewes.

MANUFACTURES AND COMMERCE.] The manu-
factures and commerce of England, form so ex-
tensive a theme, that only a brief account of them
can be here attempted. The earliest staple com-
modity of England was tin, a metal rarely found
in other countries. The Phœnicians first intro-
duced it into commerce, at least five or six hun-
dred years before the Christian æra; and their
extensive trade soon diffused it among the Oriental
nations. The Romans, upon their conquest of
these regions, did not neglect this source of
wealth; but as Cornwall was not conquered by
the Anglo-Saxons, till the reign of Athelstan, we
know not whether the Cornu-Britons carried on
any considerable traffic in this commodity, though
it be probable that it was at least exchanged for
the wines of France. Yet even in the reign of
John, the product was so inconsiderable, that the
mines were farmed to Jews for one hundred
marks; but in that of Henry III., they began
again to yield a large profit, which has gradually
increased. Cornwall, like most countries that
abound with minerals, presents an external aspect
of desolation: a series of barren hills and bleak
heaths pervades its whole length, and the violent
winds from the sea check the vegetation of trees

and shrubs. The tin mines are numerous, and of various descriptions. This metal is either found in the mass in what are called *lodes* and *floods*; or in grains, or bunches, in the rocks; or detached in separate stones, called *shodes* or *strings*; or in a course of such stones called the *beuhey* or *living string*; or in the pulverized shape of sand. After having been pounded in a mill, it is melted into blocks of three hundred and twenty pounds weight. In the ore it is styled black tin; and is sometimes, though very rarely, found in a metallic state*.

Wool had been regarded as a grand staple of England, as early as the twelfth century, but was chiefly exported in a crude state till Edward III. encouraged settlements of Flemish manufacturers. Wool soon became the standard of private property, and the prime article of commerce. Taxes and foreign subsidies were estimated by sacks of this commodity†. Great quantities of raw wool continued to be exported to the Netherlands and Hanse Towns; but in the reign of Elizabeth it began to be chiefly manufactured at home, and the exportation of woollen cloths was then valued at a million and a half annually. The exportation of raw wool was at length prohibited; and the woollen fabrics preserve great importance, though they no longer attract such particular regard, amidst the exuberance of English manufactures.

In recent times the manufactures of iron and copper, native minerals, have become great sources of national wealth; nor must the new and extensive exportation of elegant earthen-ware be forgotten. The cotton manufacture is diffused far and wide, forming a grand source of industry and prosperity. That of linen, except of sail cloth, is not much cultivated in England. The manufactures of glass and fine steel, clocks, watches, &c. are deservedly eminent and extensive.

The English manufactures have been recently estimated at the annual value of sixty-three millions six hundred thousand pounds, and supposed to employ one million five hundred and eighty-five thousand persons. Of these, the woollen manufacture is supposed to yield in round sums, fifteen millions, the leather ten millions, the iron, tin, and lead ten millions, the cotton nine millions.

* Borlase's Cornwall.

† Campbell's Political Survey, vol. ii. p. 151, 152. A

The other chief manufactures, which yield from one to four millions may be thus arranged, according to their consequence; steel, plating, copper and brass, silk, potteries, linen and flax, hemp, glass, paper.

The commerce of England is, at the present period, enormous, and may be said to extend to every region of the globe. The trade with the West Indies is one of the most important, and that with the East Indies alone, would have astonished any of the celebrated trading cities of antiquity.

From the United States of North America, are chiefly imported tobacco, rice, indigo, timber, hemp, flax, iron, pitch, tar, and lumber: from the West Indies, sugar, rum, cotton, coffee, ginger, pepper, guaiacum, sarsaparilla, manioc, mahogany, gums, &c. From Africa, gold dust, ivory, gums, &c. From the East Indies are China, tea, rice, spices, drugs, colours, silk, cotton, salt-petre, shawls, and other products of the loom. From our remaining settlements in North America are imported furs, timber, potash, iron; and from the various states of Europe numerous articles of utility and luxury.

The annual income of Great Britain was estimated in 1799 by Mr. Pitt at a hundred and two millions; and including the money, of which the estimate is far from certain, the whole capital of Great Britain may perhaps be calculated at one thousand two hundred millions.

In the year 1797, the amount of the exports according to Custom-house accounts, was twenty-eight millions nine hundred and seventeen thousand pounds, and of the imports, twenty-one millions thirteen thousand pounds, yielding, it is supposed, clear profits on foreign trade, to the amount of at least ten millions. The number of merchant vessels amounts probably to sixteen thousand; and it is calculated that one hundred and forty thousand men and boys are employed in the navigation.

CLIMATE AND SEASONS.] The climate of Great Britain is perhaps more variable than that of any other country on the globe, as the vapours of the Atlantic Ocean are opposed to the drying winds from the Eastern Continent. The western coast, in particular, are subject to frequent rains: and

work opulent in materials, but of most tedious and unceasing execution.

the Eastern part of Scotland is of a clearer and drier temperature than that of England. The humidity of the climate, indeed, clothes the delicious vales and meadows with a verdure unknown to any other region: but is injurious to the health of the inhabitants, by causing colds and catarrhs, the frequent sources of more deadly disorders.

In consequence of the mutability of the climate, the seasons themselves are of uncertain tenour, and the year might more properly be divided into eight months of winter, and four of summer, than into any theoretic arrangement, originating in the southern latitudes. What is called the Spring dawns in April, commonly, indeed, a mild month; but the eastern winds, prevalent in May, seem commissioned to ruin the efforts of reviving nature, and destroy the promise of the year. June, July, August, and September, are usually warm summer months; but a night of frost is not unknown, even in August, and sometimes a cold East wind will blow for three days together; nor of late years, are summers unknown of almost constant rain*. The winter may be said to commence with the beginning of October, at which time domestic fires become necessary; but there is seldom any severe frost till Christmas, and January is the most stern month in the year. Yet, as our summers often produce specimens of winter, so now and then gleams of warm sunshine illuminate the darker months. March is generally the most unsettled month of the year, interspersed with dry frost, cold rains, and strong winds, with storms of hail and sleet.

FACE OF THE COUNTRY.] From the mouth of the Tweed to Bamfborough, extends a sandy shore; and the most remarkable object is Lindesfarn, or Holy Island, divided from Northumberland by a level, which is dry at low water, but out of which the flowing tide oozes suddenly, to the terror and peril of the unwary traveller. From Bamfborough Castle, to Flamborough Head, are mostly low cliffs, of lime-stone, and other materials; and at Sunderland, of a peculiar stone used in building, and which seems the work of marine insects. Scarborough stands on a vast rock, projecting into the waves; but Flamborough Head is a far more magnificent object, being formed of lime-

stone, of a snowy whiteness and stupendous height, visible far off at sea.

Hence to the Humber are commonly clay cliffs; and near Spurnhead, amber is sometimes found. The extensive coast of Lincolnshire is flat, and, according to Mr. Pennant's opinion, has been gained from the sea; though, in some parts, the sea has in its turn invaded the land, and the remains of a forest are visible under the waves. The county of Lincoln, and part of six others, are the low countries of Britain; and the coast is distinguishable by churches, not by hills. The shores of Norfolk and Suffolk present sometimes loamy or clayey precipices, sometimes hillocks of sand, and sometimes low and flat spaces. Hunstanton-cliff rises to the height of about eighty feet, composed of chalk and friable stone, resting on a base of what is called iron-coloured pudding stone, projecting into the sea. The coast of Essex is generally low; but, to the south of the Thames, arise continued cliffs of chalk, with layers of flint, resembling masonry. The north Foreland is a lofty, chalky promontory; and the cliffs of Dover are known to every reader of Shakespeare.

It is to be regretted that Mr. Pennant did not extend his animated description to the southern and western coasts: cliffs of chalk and clay are interspersed with flat gravel, till the island of Portland presents its bold rocky front. The western shores abound with granite, slate rocks, and lime-stone.

SOIL AND AGRICULTURE.] The soil and agriculture of England are topics which have recently been illustrated in such a multiplicity of meritorious works, that the subject labours under the abundance of the materials. A few very general remarks must here suffice. The soil is greatly diversified, but in general fertile; and in no country is agriculture more thoroughly understood, or pursued in a grander style, except, perhaps, in Flanders and Lombardy. The intermixture of the green crops with those of grain, the use of Turnips, the irrigation of meadows, the regular substitution of crops appropriated to the state of the land, the art of draining conducted on scientific principles, may be mentioned among the recent advances of knowledge. Amidst such topics

* The summer of 1800 was remarkable for dryness and warmth, scarcely any rain falling from the 6th of June to

the 20th of August, when a thunder-storm succeeded.

of just exultation, it is mortifying to reflect upon two circumstances, the deficiency of a proper supply of grain, and the vast extent of waste lands in this industrious country. The cultivated acres in England and Wales are computed at upwards of thirty-nine millions, while those uncultivated are seven million eight hundred and eighty-eight thousand seven hundred and seventy-seven. Of these it is supposed that not above half a million is wholly unimprovable, and perhaps a million is only fit for plantations, while of the remainder one quarter is fit for tillage, and three-fourths for meadow and upland pasture.

Horticulture, or the art of gardening, is also pursued in England with great assiduity and success. The large supply of the capital in vegetables and fruits, and the high prices given for early produce, occasion such a spirit of cultivation, that each acre thus employed is supposed to yield about one hundred and twenty pounds annually, the yearly consumption in the metropolis being computed at more than one million. Of ornamental gardens, laid out with a just attention to the beauties of nature, and free from the uncouth affectations of art, England is deservedly regarded as the parent country.

RIVERS.] England is intersected by four important rivers; the Severn, the Thames, the Humber, and the Mersey. The Severn rises from the mountain Plinlimmon, and, after an easterly course to Shrewsbury, bends its progress almost south to Gloucester, whence it flows south-west into the Bristol Channel, a progress of about one hundred and fifty miles; navigable as far as Welch Pool. Its chief tributary streams are the northern and southern Avons, the Teme, and the Wye.

The Thames originates in Cotswold Hills, Gloucestershire; and maintains a south-easterly direction, to its egress into the German Ocean, after receiving the Cherwell, the Tame, the Kennett, another Wye, the Mole, and the Lee. The Medway flows into the estuary of the Thames, as the Wye into that of the Severn. The course is computed at one hundred and forty miles, navigable to Cricklade.

The Humber is a name almost confined to a large estuary, which receives many considerable rivers that fertilize the central parts of England. Of these the Trent is the most important, which rises at New Pool, in Staffordshire, and, pro-

ceeding north-east, enters the Humber, after a direct course of about one hundred miles, being navigable to Burton in Staffordshire. The other principal rivers that issue into the Humber are the Don, a navigable stream which runs by Doncaster; the Aire, navigable to Leeds; and the Calder, navigable to Halifax; the Warf, navigable to Tadcaster; and the Ouse, which runs by York, and forms another grand branch of the Humber, navigable to Rippon: nor must the Derwent be omitted, which is navigable to New Malton; nor, though last and least, the Hull. The Humber may be regarded as the stem of a venerable oak, which, as usual with that tree, spreads its chief branches in a horizontal direction.

Though the Mersey presents a grand estuary, its course is not of great extent. It arises in the West-Riding of Yorkshire, and runs to the south-west; but the estuary bends towards the north. The direct course is not above fifty miles; and is navigable to Stockport: as the Irewell to near Manchester, and the Weaver to near Northwich, and the mines of rock-salt.

In briefly describing the other navigable rivers of this kingdom, it may be proper to return to the Severn, and, proceeding south-west, pursue the outline of the coast. The Avon is navigable to Bath, the Parret to Ilchester, the Tone to Taunton, the Taw to Barnstaple, and another branch to Biddeford: the Cam of Cornwall, to Wedbridge, while the Plym, Dart, and Ex, can also be pervaded to a considerable height. Another Avon is navigable to near Salisbury, the Itchyn to Winchester, the Arun to Arundel, the Ouse to Lewes: the Rother, which forms the haven of Rye, is yet navigable, though fallen in fame. The Stour admits boats even to Canterbury; but the Medway presents a navigable stream as far as Tunbridge. On the north of the Thames, the Lee is navigable to Bishop's Stortford and Hertford: the Crouch conveys boats from the sea to Hull Bridge in Essex; the Blackwater to Chelmsford, and another branch to Colchester. The Stour is navigable to Sudbury; the Orwell to Stow, the Deben to Woodbridge; the Yare and Waveney present access to Foulsham, Norwich, and Bungay. Next is the estuary called the Wash, which receives the Ouse, the Nen, the Welland, the Witham; all streams of considerable navigation.

the west, the Eden is navigable to Carlisle; the
Lun or Loyne to Lancaster and Hornby; the
Dee to Chester; the Conway to within two miles
of Llanrwst; the Tivey to Llanbedr. Milford
Haven presents branches navigable to Haverford-
west, and to near Wiston; and lastly, the Wye
may be pursued as far as Hay in Brecknockshire.

MOUNTAINS.] The mountains seldom appear
single, but are either disposed in lines or ridges,
called chains. When they can be arranged under
the first form or denomination, as the Alps, for
example, or the Pyrenees, they afford great
clearness to geographical limits and descriptions.
It is not, however, to be conceived, that a chain
of mountains forms one series, as delineated in
maps, for the leading summits diverge on
both sides into extensive ribs, gradually melting
into the champaign country. And the clusters,
if accurately surveyed, will generally be found
to present central elevations, whence smaller
branches irradiate. The mountains of Cheviot
may be said to form a regular ridge, running
from the south-west, where they join those of
Galloway to the north-east. But there is a
central ridge which pervades England from north
to south, beginning at Geltsdale forest, fourteen
miles S. E. of Carlisle, and passing on the west
of Durham and Yorkshire, where it contains
mines of coal and lead. The chief elevations,
such as Kelton-fell, Stanmore, Widehill-fell,
Wildboar-fell, Bow-fell, Home-fell, Bunhill, &c.
arise on the western limits of Yorkshire.
Cumberland and Westmoreland present many
detached mountains, Skiddaw, &c. which can
hardly be reduced to any distinct arrangement;
but those of Craven, in the West Riding of
Yorkshire, as Wharfedale, Ingleborough, and
Pennine; and Pendle, on the east of Lan-
caster, belong to the Central Chain which pro-
ceeds south, through Derbyshire, still abound-
ing with minerals and natural curiosities; but
it seems to terminate, spreading a little into
Sheshire. A central chain, of smaller elevation,
may be traced, in a zigzag line, to near Salis-
bury, with two diverging and irregular branches
to the east, one towards Norfolk, another into
Devon, while a third runs south-west into Corn-
wall. To the first belong the hills of Gogmagog,
Cambridgeshire, &c. to the second the hills

of Hampshire, Surrey, and Kent. Another up-
land tract of considerable elevation, called the
Chiltern Hills, extends from Tring in Hertford-
shire, to Henley in Oxfordshire. Malvern hills,
in Worcestershire, deviate from the central ridge,
while those of Cotswold, in Gloucestershire,
may be regarded as a continuation of it. The
hills of Mendip, Polden, Sedgemoor, Black-
down, in Somersetshire; the Tors and Wilds of
Dartmoor, in Devon; and the hills and upland
downs of Cornwall, extend this chain to the
Land's End: and after passing this last rocky
province, it expires in the islands of Scilly.

Wales is a country abundant in mountains,
especially the northern provinces; but their
orology remains indeterminate, and it would re-
quire the actual survey of an experienced en-
gineer to reduce them to chains or groupes.
To begin with the north, Snowdon commands
the first attention, a mountain of eminent height
and fame. The top is called Y Widdsa, or the
conspicuous, forming almost a point, and pre-
senting a view of the county of Chester, the
mountains of Yorkshire, part of Scotland and
Ireland, and the Isles of Man and Anglesey.

The stone that composes it is petrosilex and
argillaceous schistus, large coarse crystals are
often found in the fissures, and very frequently
cubic pyrite, the usual attendants on Alpine
tracts. From Snowdon, a line of mountains ex-
tends by the sea to Plinlimmon, a boundary of
North Wales, whence issue the noble rivers
Severn and Wye. Of these rivers, Urron Seth,
Caer Idris, and Moel Vadiu, are the most me-
morable. The hills on the east of North Wales
are far from attaining such considerable eleva-
tion, and gradually decline to the hills of Shrop-
shire, of which the Wrekin is one of the most
noted.

A chain proceeds due south to near Cardiff in
South Wales; it is of far inferior height, and a
small branch diverges to the west, consisting of
Cwm Cothy, Mynydd, Carreg, Brille, and
Cwm Kerrun Hills. On the east of South Wales
are the hills of Herefordshire, the Black Moun-
tain, Cusop Hill, Hargest, Stockley Hill, &c.

FORESTS.] Many of the forests were, even in
the Anglo-Saxon times, esteemed royal de-
mesnes; but the Norman monarchs were so
much addicted to the chase, that upwards of
sixty forests at one time appertained to the
crown;

crown; of which the chief now remaining are the forests of Dean, in Gloucestershire; Sherwood, in Nottinghamshire; Windsor, in Berkshire; and the New Forest, in Hampshire. The royal forests constituting so large a part of the kingdom, subject to peculiar regulations, many grievances arose, till the Barons exacted from Henry III. the forest charter; in which several despotic laws were revoked, and more equity extended to the neighbouring proprietors and tenants.

ZOOLOGY.] Of animals, Mr. Pennant enumerates twenty genera, from the horse down to the seal and bat. The bird extends to forty-eight, the reptiles to four, and the fish to forty genera, besides the crustaceous and shell fish.

That noble and useful animal, the Horse, is found in England of many mingled breeds, while most other kingdoms produce only one kind. Our race-horses descend from Arabian stallions, and the genealogy faintly extends to our hunters. The great strength and size of the English draught-horses are derived from those of Germany, Flanders, and Holstein; and other breeds have been so intermingled, that native horses may be found adapted to every purpose of pomp, pleasure, or utility. Those of Yorkshire are particularly celebrated for their spirit and beauty; and the grooms of that county are equally noted for their skill in the management of this valuable animal.

The indigenous horned cattle are now only known to exist in Neidwood forest, in Staffordshire; and at Chillingham castle, in Northumberland. They are long-legged and wild like deer, of a pure white colour, with black muzzles, ears, and tails, and a stripe of the same hue along the back. The domesticated breeds of our cattle are almost as various as those of our horses; those of Wales and Cornwall are small, while the Lincolnshire kind derive their great size from those of Holstein. In the North of England we find kylics, so called from the district of Kyle, in Scotland; in the South we find the elegant breed of Guernsey, generally of a light brown colour and small size, but remarkable for the richness of their milk. Of late years Mr. Bakewell, and others, have brought the breeding of cattle and sheep to a regular system.

The number and value of sheep in England

may be judged from the ancient staple commodity of wool. Of this most useful animal several breeds appear, generally denominated from their particular counties or districts; those of Herefordshire, Devonshire, and Cotswold down are noted for fine fleeces, while the Lincolnshire and Warwickshire kind are remarkable for the quantity. The Teesdale breed of the county of Durham, though lately neglected, continue to deserve their fame. The wool is beautiful, but the length of their legs lessens their value in the eyes of the butcher. The mutton of Wales, on the contrary, is esteemed, while the wool is coarse, yet employed in many useful and salutary manufactures. The most laudable exertions have lately been made by the Board of Agriculture, and by individuals, for the improvement of the English fleece.

The goat, an inhabitant of the rocks, has even in Wales, for the most part, yielded to the more useful sheep; that county being, like Scotland, more adapted to the woollen manufacture. The breeds of swine are various and useful.

England also abounds in breeds of dogs, some of which were celebrated even in Roman times, nor have their modern descendants, the mastiff and bull-dog, degenerated from the spirit and courage of their ancestors.

Of our savage animals the most fierce and destructive is the wild cat, which is three or four times as large as the domestic, with a flat brown face, colour yellowish white, mixed with grey, in streaks running from a black list on the back; hips always black, tail alternate bars of black and white; only found in the most mountainous and woody parts. The wolf has been long extinct, but the fox abounds.

The chief of our birds of prey are, the golden eagle, sometimes found on Snowdon; the black eagle has appeared in Derbyshire; the peregrine falcon breeds in Wales; and many kinds of hawks in England. An enumeration of the other birds would be superfluous. The nightingale, one of the most celebrated, is not found in North Wales, nor any where in the north, except about Doncaster, where it abounds; it does it travel so far west as Devonshire and Cornwall. Our poultry seem to originate from Asia; our peacocks are from India; our pheasants from Colchis; the guinea fowl are from Africa. One of the smallest birds is the golden-crested wren, which

en-crested wren, which

ports on the highest pine trees; and our largest
the bustard, some of which weigh twenty-five
ounds, and are found in the open countries of
the south and east. The most useful of our
water fowl is the mallard, or wild duck, which
chiefly caught in the fens of Lincolnshire; the
numbers sent to the capital almost exceed cre-
dibility.

The reptiles are frogs, toads, several kinds of
ards: of our serpents, the viper alone is ve-
omous; other kinds are, the snake, sometimes
ound four feet in length; and the blind worm,
eldom exceeding eleven inches.

Of fish, the whale but seldom appears near
the English coasts; the porpoise, and others of
the same genus, are not uncommon. The basking
ark appears off the shores of Wales. Numerous
are our edible sea fish. Some of the most ce-
brated are the turbot, doree, soal, cod, plaice,
helt, and mullet. The consumption of her-
ings and mackarel extends to most parts of the
kingdom; but pilchards are confined to the
ish coasts. Our chief river fish are the

mon and the trout, which are brought from
the northern parts in prodigious numbers, ge-
rally packed in ice. It is said that not less
than thirty thousand salmon are brought from
the river, the Tweed, to London, in the course
of a season. The lamprey is chiefly found in
the Severn, the charr in the lakes of West-

reland.
The lobster is found on most of the rocky
islands, particularly off Scarborough; and the
English oysters maintain their Roman reputa-
tion. The green, from Colchester in Essex, and
the juicy white, from Milton in Kent, have the
best reputation.

[MINERALOGY.] The tin mines in Cornwall
have been already mentioned; and they are not
less venerable from their antiquity, but are, it
is supposed, the richest of the kind in the world.

That kind of silver termed by mineralogists horn
silver, is also found in that district; but the pro-
digal secrecy observed in working it forbids any
investigation of the amount. The Huel rock
is of what is called bell-metal ore; and of
this kind.

Cornwall also produces copper at Redruth,
Barnstaple, and the Land's End. The same metal
is found in Yorkshire and Staffordshire; but no
where in such abundance as in the Parrys moun-
tains.

tain, in the north-west of Anglesea. Instead of
descending in veins through various rocky strata,
the usual form of metallic ores, it here forms a
prodigious heap, and is worked in the manner
of a quarry. The mountain is almost bare of
shrubs or grass, and is covered with aluminous
slate, under which, in grey chert, is the ore,
being chiefly the yellow sulphuret, of very va-
riable richness. This valuable mine was disco-
vered about thirty-five years ago.

Lead is found in the Mendip hills, Somerset-
shire; which also produce calamine and man-
ganese. The lead mines in Derbyshire are well
known, not only for that metal, but for the
beautiful veins of fluor which accompany it,
and which is manufactured into several orna-
mental articles. In general, the northern central
ridge of mountains abounds with lead ore. The
lead mines of Alston, on the eastern verge of
Cumberland, employ about one thousand one
hundred men.

No metal is so widely diffused through the
globe as iron; and England not only contains
excellent mines, but excels all nations in the va-
riety of fabrication. The most remarkable mines
of iron are those of Coalbrook-dale, Shropshire,
Dean-forest in Gloucestershire, with some in the
north of England, particularly near Ulverston,
in Lancashire.

Among the minor metals, zinc, in the form of
lapis calaminaris, and blende, is found in Der-
byshire, Denbighshire, Cornwall, and other re-
gions. Nickel and arsenic sometimes appear in
Cornwall; and recently, what is called mena-
chanite. But one of the most important of this
kind is plumbago, or black lead, which is found
in the ridge of Borrodale, near Keswic, in Cum-
berland; the mine is only opened at certain in-
tervals of time.

Gold has been discovered in various quarters
of England, but the metal has never recompensed
the labour and expence. The real gold mines
of England are those of coal, found in the
central, northern, and western parts, but par-
ticularly in the northern, around Newcastle.
The coals of Whitehaven and Wigan are more
pure; and the cannel and peacock coals of Lan-
cashire are so beautiful, that they are suspected
by some to have constituted the *gagates*, or jet,
which the ancients ascribed to Britain. A sin-
gular species of coal is found in Bovey heath,
Devonshire,

gular species of coal is found in Bovey heath,
Devonshire,

S K

Devonshire,

Devonshire, resembling wood impregnated with bituminous matter. Turf, or peat, is common, even in Hampshire, and other southern counties.

The mines of rock salt, in Cheshire, appear to have been known to the Romans. Those of Northwich are the most remarkable: at Namptwich and Middlewich are only salt springs: and others occur at Droitwich, in Worcestershire, and Weston, in Staffordshire. The immense mines on the south side of Northwich were discovered about the beginning of this century. The quarries, with their pillars and crystal roof, extending over many acres, present a beautiful spectacle; the stratum of salt lies under a bed of whitish clay, at the depth of about forty yards. The first stratum is about twenty yards thick, so solid as to be blasted with gunpowder; this salt resembles brown sugarcandy. Next is a bed of hard stone, under which is a second stratum of salt, about six yards thick; in some parts brown, in others as clear as crystal. The Witton pit is circular, one hundred and eight yards in diameter, the roof supported by twenty-five pillars, each containing two hundred and ninety-four solid yards of rock salt; the whole covering near two acres of land. The annual produce of rock salt at Northwich has been estimated at sixty-five thousand tons; of which about two-thirds used to be exported to Flanders and the Baltic.

Marbles, and free-stone, or calcareous sand-stone, of various colours and textures, also occur; the most celebrated of the latter are those of Portland, Purbeck, &c. Fine alabaster appears in Derbyshire; fullers-earth in Berkshire, and some other counties.

MINERAL WATERS.] The mineral waters of Bath have been celebrated since the Roman times. Next to that place may be mentioned the hot-wells of Bristol, those of Tunbridge in Kent, and of Buxton and Scarborough in the North. Those of Cheltenham in Gloucestershire have been esteemed beneficial in scorbutic cases; but to enumerate the springs of inferior note would be infinite, as chalybeate wells, at least, must occur in almost every county, and new waters are daily starting into celebrity.

NATURAL CURIOSITIES.] Among the natural curiosities, those of Derbyshire have always been esteemed the most memorable. Hobbes and others have long since celebrated the wonders of

the Peak, a mountain not equal in height those of Wales, or the more northern parts of England, but perforated with such verticillate chasms, and such surprising caverns, as have deservedly excited admiration.

Other remarkable caverns are found in the northern ridge of English mountains. In the vale of Kingsdale, on the western extremity of Yorkshire, is Yordas Cave, which presents a subterranean cascade. But the most noted is Wethercot Cave, not far from Ingleton. It is surrounded with trees and shrubs, is in form like a lozenge, divided by an arch of lime-stone; passing under which you behold a large cascade, falling from a height of more than twenty yards; the length of this cave is about sixty yards, the breadth thirty.

The lakes of Cumberland form another great scene of attraction: but it would be idle to attempt to depict, in a few words, beauties which have been described by so many authors, and particularly by the glowing pencil of a German. Suffice it to observe, that the three most celebrated lakes are those of Coniston, Windermere, and Derwent. The beauties of the first have been compared to the delicate touches of Claude; the noble scenes of the second, to those of Poussin; while Derwent has much of the lime mildness of Salvator Rosa: but most travellers esteem Ulswater the most truly sublime.

The mountainous regions of Wales may be supposed to present many natural curiosities, and the Parrys mine in Anglesea is in itself a surprising object. The cataracts in Cumberland are rivalled by a remarkable fall of the Tees, the west of the county of Durham, over which is a bridge suspended by chains, seldom passed but by the adventurous miners; nor must we forget the garth force, in Yorkshire, to be passed in silence.

The submarine relics of a forest, on the east of Lincolnshire, may be deservedly classed among the most remarkable natural curiosities. On the N.W. side of the Mendip hills is a considerable cavern, at the bottom of a deep ravine, near the little village of Berrington, or Burrington. There are a number of human bones, gradually incorporating with the lime-stone rock; there is a continual dripping from the roof and sides, which deposits a stalactitic sediment on the bottom. Several nodules contain perfect human figures. At the farther end, where the height is

fifteen feet, there is a large conic stalactite, which nearly meets a pillar rising from the floor. This cave was only discovered about six years ago; and as the matter increases so fast, it is conjectured that it would soon have been closed up. Hence it is probable that these bones are of no remote antiquity, and may perhaps be the remains of some persons who had here taken shelter from the cruelty of Jeffries, after the insurrection of Monmouth.

ENGLISH ISLES.

In the southern, or English channel, first appears the Isle of Wight, of an oval form, about twenty miles in length, and twelve in breadth. This isle is fertile and beautiful, and decorated with many picturesque villas; the principal haven is that of Newport. The chief mineral products are pipe clay, and fine white sand, for the fabrication of pure glass; and at Alum Bay, on the north side of the Needles, are found considerable quantities of native alum. One of the most remarkable buildings is Carisbrook castle, where Charles I. was imprisoned. The lofty white rocks styled the Needles, seem to have been disjoined from the western extremity of the isle by the violence of the waves. There were formerly three; but about the year 1782, the tallest, which rose about one hundred and twenty feet above the low-water mark, was overthrown, and totally disappeared.

At the distance of about seventy miles from Wight, to the S.W. arises the little isle of Alderney, off the Cape la Hogue; which is afterwards followed by the more important isles of Guernsey and Jersey; Sark being a small isle interposed between the two latter. Guernsey, the largest of these isles, is twelve miles long, nine broad, and about thirty-six in circuit. It is a verdant isle, though the soil be hilly, and barren of wood. The only town is that of Port St. Pierre. Jersey is about twelve miles in length, and six in breadth, a well watered and fertile island, producing excellent butter and honey. The winters are milder, but more windy, than those of England. The northern side of the island is high, but the southern subsides into pleasant vales, covered with orchards. The remarkable places are the two towns of St. Helier and St. Aubin, both standing on a bay, opening to the south; and the castle of

Mont Orgueil. The inhabitants of Jersey are computed at twenty thousand, of whom three thousand are capable of bearing arms. In January 1781, St. Helier was surprised by eight hundred French, under Rullicourt, who was killed, while Major Pierson fell on the side of the English. Alderney is a small isle, with a town, and about one thousand inhabitants in all. Sark has about three hundred inhabitants.

Returning to the English shore, we first descry Eddystone light-house, beat by all the fury of the western waves. This edifice has repeatedly been overthrown; but the present erection, by Mr. Smeaton, composed of vast masses of stone, grooved into the rock, and joined with iron, promises alike to defy accidental fire, and the violence of the ocean, though the waves sometimes wash over the very summit in one sheet of foam.

About thirty miles to the west of the Land's End appear the Isles of Scilly. This cluster is said to consist of one hundred and forty-five isles, covered with grass or moss, besides innumerable dreary rocks. The largest isle is that of St. Mary, which is about five miles in circuit, and has a castle and garrison: inhabitants about six hundred. That of St. Agnes is rather fertile: inhabitants about three hundred. The whole inhabitants of the Scilly isles are computed at about one thousand. The cattle and horses small; but sheep and rabbits thrive well. Considerable quantities of kelp are prepared amid these rocks.

On turning to the north, first appears the little isle of Lundy, situated in the Bristol channel, about three miles long, but not a mile broad, with about five hundred acres of good land, some rivulets, and a castle. It was formerly a noted retreat for pirates.

Some small isles lie off the Welch coast of Pembrokeshire and Caernarvon, such as Caldy, Skomar, Bardsey, and others: but the isle of Anglesea deserves more attention: it is about twenty-five miles in length, and eighteen in breadth. The chief towns are Newburgh, Beaumaris, and on the western extremity, fronting Ireland, Holyhead. This isle is so remarkably fertile, that the Welch have emphatically styled it the mother of Wales; and of late has been also productive of rich copper found in the Parrys-mountain, in the N. E. part of the island, near Amlwch, of which an account has been

given

given in treating of the English minerals. Beaumaris is a large town, with a castle built by Edward I. Newburgh is a corporation of smaller moment. Holyhead, originally a fishing town, has become of consequence, by the Irish packets which pass daily, the average time being twelve hours.

The last English isle worth mention is that of Man; it is about thirty miles in length, and fifteen in its greatest breadth. In the midst is a high mountain, called Snafel. The chief mineral productions are black marble, slate, lime stone, lead, copper, and iron. Man is also well stored with black cattle, and sheep; and the population has of late years greatly increased.

SCOTLAND.

EXTENT.] That part of Great Britain called Scotland is about two hundred and sixty miles in length, by about one hundred and sixty as its greatest breadth; it extends from the fifty-fifth degree of latitude, to more than fifty-eight one-half. The superficial contents have been computed at twenty-seven thousand seven hundred and ninety-three square miles, a little exceeding that of England, and considerably more than half that of France. The population being estimated at one million six hundred thousand, there will, of course, be only fifty-seven inhabitants for every square mile, a proportion of about one-third of that of Ireland.

DIVISIONS.] The territory of Scotland is unequally divided into thirty-three counties, which, according to their situations, we shall arrange under three divisions: the first, or the northern, including Inverness-shire, and the country north of the chain of lakes and forts; the second, or the midland division, including the territory north of the Firths of Forth and Clyde, as far as the borders of Inverness-shire; and the third, or southern division, comprehending those counties that lie between the Firths of Forth and Clyde and the English frontier; we shall also add to each county the amount of its population, according to the general enumeration of the island in the year 1801.

ANTIQUITIES.] The monuments of antiquity belonging to the more early epochs, may be considered in the following order. Of the first epoch, no monuments can exist, except those of the tumular kind; and it is impossible to ascertain the period of their formation. The remains of the Roman period in North Britain chiefly appear in the celebrated wall, built in the reign of Antoninus Pius, between the Firths of Forth and Clyde, in the ruins of which many curious inscriptions have been found. Another striking object of this epoch, was a small edifice on the stream of Carron, vulgarly called Arthur's Oven, which seems rightly to have been regarded by some antiquaries, as a small temple dedicated to the god Terminus.

The most northerly Roman camp yet discovered is that near the source of the river Ythan in Aberdeenshire; the periphery of which is about two English miles. A smaller station has also been observed at Old Meldrum, a few miles to the S. E.

Roma

Roman roads have been traced a considerable way in the east of Scotland, as far as the county of Angus, affording some evidence of the existence of the province Vespasiana; but the chief remains are within the wall. The smaller remains of Roman antiquity found in Scotland, as coins, utensils, &c. are numerous.

With the fourth epoch may be said to commence the Pictish monuments of antiquity. The tombs it would be difficult to discriminate from those of the first epoch; but as the Caledonian kings, when converted to Christianity, held their chief residence at Inverness, the singular hill in its vicinity, presenting the form of a boat reversed, may perhaps be a monument of regal sculpture. The places of judgment among the Gothic nations, or what are now styled Druidic temples, are numerous; and there is a remarkable one in the isle of Lewis. Some of these monuments are of small circuit, and such are sometimes found at no great distance from each other; as they were not only erected as temples to Odin, Thor, Freyga, and other Gothic Deities; but every chief, or lord of a manor, having jurisdiction over many servants and slaves, such small courts became places of necessary awe.

The houses seem to have been entirely of wood or turf; but in some spots singular excavations are found rudely lined with stone: these are called *Wecms*, and it is likely that they were always adjacent to the wooden residence of some chief, and were intended as depositories of stores, &c. the roof being too low for comfortable places of refuge. The stations and camps of the natives are distinguished by their round form, while those of the Romans belong to the square.

Under the next epoch it would be difficult to discover any genuine remains of the Dalriads, the houses, and even churches, were constructed of wattle-work: and the funeral monuments were cairns, or heaps of stones.

To the sixth epoch may probably belong a chapel or two, still remaining in Scotland; but it is probable that these sacred edifices, in store were soon followed by the erection of those rude, round piles, without any cement, called *Piks* houses; yet they may more properly belong to the seventh epoch, when the Danes may be in the honour of the erection, for such edifices have been traced in Scandinavia. They

Vol. II. No. CXXI.

seem to have consisted of a vast hall, open to the sky in the centre, while the cavities in the wall present incommensurable recesses for beds, &c. These buildings are remarkable, as displaying the first elements of the Gothic castle: and the castle of Conigsburg, in Yorkshire, forms an easy transition. The engraved obelisks found at Forres, and in other parts of Scotland, have been ascribed to the Danish ravagers, who had not time for such erections. They are, probably, monuments of signal events, raised by the king, or chiefs; and as some are found in Scandinavia, as recent as the fifteenth century, it is probable that many of the Scottish obelisks are far more modern than is generally imagined.

To enumerate the churches and castles erected since the reign of Malcolm III. would be infinite. Some of the most splendid churches derive their foundation from David I. in the twelfth century.

RELIGION.] Since the revolution, 1688, the Ecclesiastical government of Scotland is of the Presbyterian form. The number of parishes in Scotland is nine hundred and forty-one; contiguous parishes unite in what is called a Presbytery, of which denomination there are sixty-nine. The provincial synods, amounting to fifteen, are composed of several adjacent Presbyteries; but the grand Ecclesiastical court is the general assembly, which meets every year, in the spring; the king appointing a commissioner to represent his person, while the members nominate their moderator, or president. To this Ecclesiastical council laymen are also admitted, under the name of Ruling Elders, and constitute about one-third of this venerable body. This court discusses and judges all clerical affairs, and admits of no appeal, except to the parliament of Great Britain. In general, the Scottish clergy deserve the highest praise, as men of enlightened minds, and moderate conduct; and a singular proof of the diffusion of talents among them has recently appeared, in the statistical account of Scotland, published by Sir John Sinclair, in twenty-one volumes; for there are few parishes of which the account is not ably delineated by the clergyman himself.

As whatever establishment is effected in a free country, opposition will always arise, the establishment of the Presbyterian system was, in the space of one generation, followed by the se-

8 L

cession

cession, which took place in 1739. The seceders being the most rigid in their sentiments, and animated by persecution, soon formed a numerous party.

About the year 1747, they were themselves divided into two denominations, called the Burghers, and the Anti-Burghers, because the division arose concerning the legality of the oaths taken by the burghesses of some of the royal boroughs; the former allowing that the oath is proper, while the latter object; the former are the more numerous, the number of their ministers being computed at about one hundred, and at a medium each has a congregation of about one thousand.

Many respectable families in Scotland embrace the episcopal form of the Church of England. The other descriptions of religious professions are numerous. There are but few Roman Catholics, even in the remote Highlands: the scheme of education being excellent, and generally supported with liberality.

GOVERNMENT.] The government of Scotland, since the union, has been blended with that of England. The chief distinction between the original constitution of the two countries was, that Scotland had no House of Commons, the parliament, consisting of all descriptions, assembled in one hall. The most splendid remaining feature of government in Scotland is the General Assembly. Next to which may be classed the High Courts of Justice, especially that styled the Session, consisting of a president, and fourteen senators. The Lords of Session, as they are styled in Scotland, upon their promotion to office, assume a title, generally from the name of an estate, by which they are known and addressed, as if peers by creation, while they are only constituted lords by superior interest, or talents. This court is the last resort in several causes, and the only appeal is to the parliament of Great Britain.

It is to be regretted that the causes are not determined by jury as in England. The judiciary court consists of five judges, who are likewise Lords of Session: but, with a president, styled the Lord Justice Clerk, as he is only understood to represent the formerly great office of Justice General. This is the supreme court in criminal causes, which are determined by the majority of a jury, and not by the unanimity, as in Eng-

land. There is also a Court of Exchequer, consisting of a Lord Chief Baron, and four Barons; and a High Court of Admiralty, in which there is only one judge. The keepers of the great and privy seals, and the lord register or keeper of the records, may also be mentioned under this head.

Laws.] The law of Scotland differs essentially from that of England, being founded, in a great measure, upon the civil law. It partly consists of statute law; but many of the ancient statutes never having been enforced, the chief rule in this sort arises from the decisions of the sessions, which are carefully preserved and published, and afford precedents generally deemed unexceptionable. Of common law there is hardly a trace, while the civil and canon laws may be said to form the two pillars of Scottish jurisprudence. The modes of procedure have, however, the advantage of being free from any of those legal fictions which disgrace the laws of some other countries. The inferior courts are those of the sheriffs, magistrates, and justices of the peace.

POPULATION.] The population of Scotland in 1775, was computed at one million two hundred and sixty-five thousand; according to the documents furnished by Sir J. Sinclair's statistical account, the numbers in 1798 were, one million five hundred and twenty-six thousand four hundred and ninety-two; and by the government enumeration in 1801, the inhabitants appeared to amount to one million five hundred and ninety-nine thousand and sixty-eight.

MANNERS AND CUSTOMS.] The manners and customs of the Scots begin to be much assimilated with those of the English. In their religious ceremonies, attending baptism and marriages, there are variations arising from the Presbyterian form which does not admit of godfathers or godmothers, but renders the parents alone answerable for the education of the child. The clergyman does not attend at funerals, nor is there any religious service, but generally great decency. Among the lower classes the funerals are generally far more numerous attended than in England; nor is black an indispensable colour of dress on such occasions.

In the luxuries of the table the superior classes rival the English; several national dishes formerly served up at the best tables, and of

ing from the French cooking, in the reign of
Mary, being now vulgar or neglected; such as
the haggis, or *hachis*; cock a-leekie, or a capon
boiled down with leeks; crapped heads, or had-
decks stewed; the heads being stuffed with a
kind of forced-meat balls, &c. &c. The diet of
the lower classes passes in a gradual transition
from the north of England. The chief food is
porridge, or thick pottage, formed with oatmeal
and water, and eaten with milk, ale, or butter;
in a hard lumpy form it is called *brose*. With
this the labourer is generally contented twice or
thrice in the day, with a little bit of meat for
Sunday; nor does he repine at the bacon of the
English poor, there being a theological anti-
pathy to swine, which also extends to eels, on
account of their serpent-like form.

The sobriety of the lower classes is in general
exemplary; and the Scottish manufacturer or
labourer, instead of wasting his weekly gains at
a alehouse, is ambitious to appear with his fa-
mily in decent clothes on Sundays, and other
holidays. This may be regarded as a striking
characteristic of the Scottish peasantry, who
prefer the lasting decencies of life to momentary
gratifications. To this praise may be added, that
intelligence, arising from the diffusion of educa-
tion, which is such, that even the miners in the
north possess a circulating library.

The dress of the superior classes is the same
with that of the English. The gentlemen in the
Highlands, especially in the time of war, use
a peculiar dress of that country. Among the
other classes, the Scottish bonnet is now rarely
worn, except in the Highlands; it was the
usual covering for the head all over Europe, till
towards the end of the sixteenth century, when
the hat, formerly only worn in riding or hunting,
came into general use.

The amusements of the rich are on a parallel
with those of the English; but those of the peo-
ple have several diversities, which the reader
may, perhaps, best learn from the poems of
 Burns. That of *curling* consists in rolling large
stones, with iron handles, upon the ice, towards
a fixed mark, a favorite and healthy diversion in
the winter. The English quoits are supplied by
flat stones, round flat stones, which are tossed
in the same manner.

LANGUAGE.] The Scottish language falls under
two divisions, that of the Lowlands consisting

of the ancient Scandinavian dialect, blended with
the Anglo-Saxon; and that of the Highlands,
which is Irish or Erse.

EDUCATION.] The mode of education pursued
in Scotland is highly laudable, and to judge from
its effects is, perhaps, the best practical system
pursued in any country in Europe. The plan
which is followed in the cities is nearly similar
to that of England, either by private teachers,
or at large public schools, of which that of
Edinburgh is the most eminent, and may be
traced from the sixteenth century. But the su-
perior advantage of the Scottish education con-
sists in every country parish possessing a school-
master, as uniformly as a clergyman; at least
the rule is general, and the exceptions rare.
The schoolmaster has a small salary, or rather
pittance, which enables him to educate the chil-
dren at a rate easy and convenient, even to in-
digent parents. In the Highlands the poor chil-
dren will attend to the schools in the summer, and
the school in the winter.

UNIVERSITIES.] The universities of Scotland,
or rather colleges, (for an English university in-
cludes many colleges and foundations,) amount
to no less than four, three on the eastern coast,
St. Andrew's, Aberdeen, and Edinburgh; and
one on the western, that of Glasgow.

CITIES AND TOWNS.] Edinburgh, the capital,
is comparatively of modern name and note, the
earliest hint that can be applied to it, occurring
in the *Chronicon Pictorum*, about the year 955,
where mention is made of a town called Eden,
as resigned by the English to the Scots, then ruled
by Indulf. Holyrood House was the foundation
of the first David.

The population of Edinburgh, including the
port of Leith, was, in 1678, computed at thirty-
five thousand five hundred; in 1755, at seventy
thousand four hundred and thirty; and in 1791,
at eighty-four thousand eight hundred and
eighty-six.

The houses in the old town of Edinburgh are
sometimes of remarkable height, not less than
thirteen or fourteen floors, a singularity ascribed
to the wish of the ancient inhabitants, of being
under the protection of the castle. This part of
the city stands on the ridge of a hill, gradually
descending from the lofty precipice on which
the castle is situated, to a bottom, in which
stands the palace of Holyrood House. Adjacent
to

to this edifice, is a park of considerable extent, replete with mountainous scenery; for the basaltic heights of Arthur's seat, and Salisbury crags, are within its precincts. The new town of Edinburgh is deservedly celebrated for regularity and elegance, the houses being all of free-stone, and some of them ornamented with pillars and pilasters.

[INLAND NAVIGATION.] The most remarkable inland navigation in Scotland, is the excellent and extensive canal from the Forth to the Clyde, commenced in 1768, from a survey by Smeaton four years before. "The dimensions of this canal, though greatly contracted from the original design, are much superior to any work of the same nature in South Britain. The English canals are generally from three to five feet deep, and from twenty to forty feet wide, and the lock gates from ten to twelve feet; but they answer the purpose of inland carriage from one town to another, for which alone they were designed. The depth of the canal between the Forth and Clyde is seven feet; its breadth at the surface fifty-six feet: the locks are seventy-five feet long, and their gates twenty feet wide. It is raised from the Carron by twenty locks, in a tract of ten miles, to the amazing height of one hundred and fifty-five feet above the medium full sea mark. At the twentieth lock begins the canal of partition on the summit, between the east and west seas; which canal of partition continues eighteen miles, on a level, terminating at Hamilton Hill, a mile N. W. of the Clyde, at Glasgow. In some places the canal is carried through mossy ground, and in others through solid rock. In the fourth mile of the canal there are ten locks, and a fine aqueduct bridge, which crosses the great road leading from Edinburgh to Glasgow. At Kirkintulloch, the canal is carried over the water of Logie, on an aqueduct bridge, the arch of which is ninety feet broad. There are in the whole eighteen draw-bridges, and fifteen aqueduct bridges, of considerable size, besides small ones and tunnels." The supplying the canal with water, was of itself a very great work. One reservoir is above twenty-four feet deep, and covers a surface of fifty acres, near Kilsyth. Another, about seven miles north of Glasgow, consists of seventy acres, and is banked up at a sluice, twenty-two feet.

The distance between the Firths of Clyde and Forth, by the nearest passage, that of the Pentlands Firth, is six hundred miles, by this canal scarcely one hundred. On the 28th of July 1790, the canal was completely open from sea to sea, when a hogshead of the water of Forth was poured into the Clyde, as a symbol of the junction. The length of the canal is precisely thirty-five miles, and no work of the kind can be more ably finished.

The general commerce of Scotland, though on a smaller scale, and with smaller capitals, in most respects similar to that of England, and shares in the national prosperity. That of the capital, through Leith its port, has been estimated at half a million yearly. The chief exports are linen, grain, iron, glass, lead, woollen stuffs, soap, &c. &c. The imports are wine, brandy: and from the West Indies and America, rum, sugar, rice, indigo. Glasgow exports cottons of all kinds, muslins, lawny, gauzes, &c. glass, stockings, earthenware, cordage, &c. candles, soap, iron, leather, &c. &c. The chief imports are tobacco, sugar, rum, and cotton from the West Indies; Irish beef, butter, &c. linen; wines from Portugal, and other countries. The fisheries of Scotland, if carried to proper extent, would furnish a very considerable store of merchandize.

The chief manufactures of Scotland are of various kinds, to the amount, it is said, of about seven hundred and fifty thousand pounds annually. Of woollens, the Scottish carpet seems to form the chief branch. The iron manufactures, particularly that at Carron, deserve also to be enumerated among the chief national advantages.

[CLIMATE AND SEASONS.] The climate of Scotland is such as might be expected in a latitude so remote, and a country so mountainous. In the eastern parts, there is not so much humidity as in England, as the mountains on the west arrest the vapours from the Atlantic. On the other hand, the western countries are deluged with rain, an insuperable obstacle to the progress of agriculture. Even the winter is not distinguishable by the abundance of snow, but by the intensity of the frost; but in summer the heat of the sun is reflected with great power in the narrow vales between the mountains. The observations chiefly apply to the north and west.

in the east and south the climate differs but little from that of Yorkshire; and corn sometimes ripens in the vales of Moray, as early as in Lothian.

FACE OF THE COUNTRY.] The face of the country is in general mountainous, to the extent, perhaps, of two-thirds; whence the population is of necessity slender, in comparison with the acmeasurement. But the name of Highlands is more strictly confined to Argyleshire; the west of Perthshire, and of Inverness; and the entire counties of Ross, Sutherland, and Caithness. In proceeding from the south-east, the entrance into the Highlands near Dunkeld, is very impressive, there being a considerable tract of plain; just before what may be termed the gates of the mountains. Even the eastern parts have little of uniform flatness, but are sweetly diversified with hill and dale. The rivers in general are remarkably pure and transparent, and their course rapid.

RIVERS.] The three chief rivers of Scotland, are the Forth, the Clyde, and the Tay. Next in consequence and in fame, is the Tweed, a beautiful and pastoral stream, which, receiving the Tevoit from the south, near Kelso, falls into the sea at Berwick. The Scottish Tyne is an inconsiderable river, which runs by Haddington.

LAKES.] Among the lakes of Scotland, the chief in extent and beauty is that of Lomond, dotted with romantic islands, and adorned with shores of the greatest diversity. The isles are supposed to form part of the Grampian chain, which here terminates on the west. The depth of this lake in the south, is not above twenty fathoms; but the northern creek, near the bottom of Ben Lomond, is from sixty to eighty fathoms.

On the east of Lomond is an assemblage of numerous lakes, the Ketterin, or Cathin, the Conochroin, the Ard, the Achray or Achvary, the Lochmaber, the Lubnaig; exhibiting singular and picturesque scenes, called by the Highlanders the *lochachs*, a word signifying rough, or uneven lands.

Loch Leven, in Fifeshire, attracts observation on its historical fame. There are lakes in the north of Perthshire, and to the east Loch Ern, Loch Tay, and those of Rannoch, Lydoch, and Loch Lomond. That of Tay, in particular, is a grand

and beautiful expanse of water, of such length, as rather to resemble a noble river.

Loch Ness rivals Loch Tay in extent and reputation. The depth is from sixty to one hundred and thirty-five fathoms, the fish excellent trout. Its great depth is the cause why it never freezes. It is remarkable that the bed of this lake and in general of the watery chain which extends to Loch Linney, is filled with pudding-stone, hills of which occur near Dunolla and Dunstaffnage, on the western shores of Argyle.

In the western division of Scotland Loch Awe, in Argyleshire, is the most considerable lake, it is about thirty miles in length, and from one to two in breadth; and is studded with many small, woody isles, one of which bears the ruins of a monastery, and another those of an ancient fortress, the residence of the Campbells of Lochawe, afterwards Dukes of Argyle.

But the chief distinctive feature of Scotland consists in its numerous mountains, which intersect the country in various directions; so that to attempt a particular description of them would be foreign to our plan.

FORESTS.] The forests of Scotland are very rare, in the proper acceptation of the term; and the Sylva Caledonia has long since vanished. The whole county of Selkirk was formerly denominated Ettrick forest. There was also a considerable forest, that of Mar, in the west of Aberdeenshire, where now remains the forest of Abernethy, extending to Cairngorm. In the county of Sutherland was the forest of Sletadale, on the north of Dunrobin, the seat of the earls of Sutherland; and in the north of the same county, are marked Parff-forest, between Ashir and Dunan; to the south of which were Reay forest, or that of Dirrymore; with those of Dirrymore, and Dirrymena, on the north and south of Loch Shin. No other forest occurs till we reach the county of Argyle, which contains Boachlittive forest on the north.

ZOOLOGY.] The small horses of Galloway seem to have been a primitive breed, and, in diminutive size, are exceeded by those of Shetland. The cattle in Galloway are often without horns, a defect which is supposed to be recompensed by the superior quantity and quality of the milk. The kylie, as already mentioned, are a middle-sized breed from the province of Kyle,

and other districts of Ayrshire and Galloway. On the east are found large cattle of various breeds. The sheep are smaller and shorter than those of England; those of Shetland are remarkable for the fineness of the wool, which is, however, interspersed with coarser piles. Goats are not so numerous in the Highlands and Isles as might be expected.

Scotland abounds with fish of all kinds, and contributes great supplies to the English market, particularly in lobsters and salmon. Pearls are found in the rivers Teith and Ythan, in a large kind of mya or muscle. Many beautiful zoophytes, on the northern shores, have been found.

MINERALOGY.] The small quantity of gold found in Scotland has been procured from the Lead hills, which are mostly composed of coarse slate. The silver found in Scotland has hitherto been of little account; the chief mine was that at Alva, which has since only afforded cobalt. Copper has been found at Colvend, in Galloway; at Curry, in Lothian; at Oldwick, in Caithness; and Kissern, in Ross-shire. But the chief minerals of Scotland are lead, iron, and coal. The chief mineral is coal, which has been worked for a succession of ages. Pope Pius II. in his description of Europe, written about 1450, mentions, that he beheld with wonder, black stones given as alms to the poor of Scotland.

MINERAL WATERS.] The mineral waters of Scotland are numerous, but none of equal fame with those of England. The chief are Moffat wells in the south, and those of Peterhead in the north.

NATURAL CURIOSITIES.] Scotland, like other mountainous countries, abounds with singular scenes, and natural curiosities. The beautiful falls of the Clyde, near Lanark, have excited much attention.

SCOTISH ISLES.

The islands that belong to Scotland are numerous and important, and fall naturally into three grand divisions: the Hebudes, or Western Islands; the Orkneys; and the islands of Shetland.

On passing the conic rock, called Ailsa, towards the north, two beautiful islands adorn the

Firth of Clyde, those of Arran and Bute. The first is about twenty-three miles in length, by nine in breadth, and has seven thousand inhabitants. The chief place is the village of Ranza; and Brodie castle is memorable in history. The exports are black cattle and barley. It is a mountainous region; and Goatfell is near three thousand feet in height. The southern parts of the island present low and cultivated grounds.

Bute is about twelve miles long, by four broad; inhabitants about four thousand; the chief town is Rothsay, and in the vicinity of Mount Stuart, the residence of the Marquis of Bute.

To the west of Cantire, begin the Hebudes, or Western Islands, properly so called. The first is Hay, about the same length as Arran, but nearly eighteen miles in breadth. Hay produces many black cattle, which are exported, and sometimes pass as far as England. But the sheep are rare; small horses are much used, and the country is not very mountainous. Inhabitants about seven thousand. Lead mines were here discovered in the sand stone, 1763; the lead is, as usual, mingled with silver.

Jura is divided from the last by a narrow sound; it is about twenty miles long, but its breadth seldom more than five. It is one of the most rugged of the Hebudes, which, in general, are mountainous regions. The papers of Jura, a line of conic hills, present a singular appearance; they are on the western side of the island, and almost bare of vegetation. The crops are potatoes and barley; and the island contains abundance of peat. The cattle are small, but the sheep excellent. The noted gulph or whirlpool of Breacan, or Corryvreckan, is on the northern extremity of Jura.

To the west of Jura are the isles of Orkney and Colonsay; and the strait between them being dry at low water, they may be considered as one island, about ten miles in length. The soil is light and arable.

The next isle of any consequence is that of Mull, one of the largest of the Hebudes, and surrounded with smaller islands. It is about twenty-eight miles long, by a medial breadth about eighteen. Its population is about a thousand.

or Icolm-kill, has beautiful basaltic columns,
and one of the most surprising objects of na-
ture, the vast basaltic cavern, called Ait-ua-vine,
or the harmonious grotto, either from a me-
lancholious sound, produced by the percussion of
the waves at the furthest extremity, or from the
exact order in which the columns are disposed.
Height of the entrance fifty-six feet, breadth
thirty-five, thickness of the exterior vault twenty.
The depth, or length of the cavern is no less
than one hundred and forty feet.

Skey is the largest of the Hebudes, being
about forty-five miles long, and twenty-two
broad. Inhabitants about five thousand two
hundred; chief exports black cattle and small
horses: the land, as usual in the Hebudes, rough
and hilly. The houses are chiefly turf, covered
with grass. The face of the country wild, heathy,
and deluged with continual rains. In Canna is
Compass Hill, which strongly affects the needle.

Leuis, the principal island of the western
chain, is about fifty miles long, by twenty
broad. The face of the country consists of a
heathy elevated ridge full of morasses from the
south-west to the north-east; but near the shores
are several verdant vales capable of cultivation.
The Harris, or south end of this isle, is still
more mountainous, and presents what is called
a forest; because some deer are there found.
James VI. attempted to introduce industry into
the Hebudes by planting a Dutch colony at
Stornaway, in Leuis; but it was soon extirpated
by the inhabitants. Stornaway is, however, now
a considerable and flourishing town, with an ex-
cellent harbour. The seasons in Leuis are op-
pressed with rain, as usual in the western
Highlands and isles; but there is a considerable
fishery.

South of Leuis is North Vist, about twenty-
two miles long, and seventeen broad. The face of
the country corresponds in general with that of
Leuis. Westerly winds, with rain or fog,
surp two-thirds of the year.

The Orkneys form a numerous group around
the Main Land, which is about twenty-five miles
long, by thirteen broad. Kirkwall, the chief
town of the Orkneys, contains about three hun-
dred houses; and has a stately cathedral de-
dicated to St. Magnus. The chief exports of
Kirkwall are beef, pork, butter, tallow, hides,
alf skins, rabbit skins, salted fish, oil, feathers,

linen yarn, and coarse linen cloth, kelp, and
in fruitful years corn. The chief imports are
wood, flax, coal, sugar, spirits, wines, tobacco
and snuff, flour, and biscuit, soap, leather, hard-
wares, broad cloth, printed lincens and cottons.
In most parts of the Main Land the soil is good,
though shallow, with a calcareous bottom. The
horses are small, but spirited; and the cows,
though also small, yield excellent milk. The
Norse language has yielded to the English, and
the manners of the people are singularly civil-
ized for so remote a region. The inhabited
islands of Orkney are computed at twenty-six,
and the people at twenty-three thousand and
fifty-three; the base is chiefly sand stone, as ap-
pears from Mr. Jameson's recent Mineralogy of
the Scottish isles.

The islands of Shetland present another group
similar to those of Orkney; with a main land
or chief island in its centre. The main land is
much intersected by the sea: and is about fifty-
seven miles in length, by about ten or twelve
miles of medial breadth. The other isles are
generally small, yet twenty-six are said to be
inhabited. "On viewing these islands in ge-
neral, a wonderful scene of rugged, bleak, and
barren rocks presents itself to our view. No
tree or shrub is to be seen, to relieve the eye in
wandering over these dreary scenes. Sometimes,
however, a few scanty portions of cultivated
ground catch the eye of the traveller, exciting
emotions of pleasure, and forming a striking
contrast to the barren heath-covered mountains
which skirt them. The western part presents
many scenes as wild and sterile as can well be
conceived; grey rocks rising from the midst of
marshes or pools, and shores bounded by awful
sea-beat precipices, do not fail to raise in the
mind ideas of desolation and danger. The coasts
are in general rugged and precipitous, present-
ing in many places scenes truly grand and mag-
nificent; vast rocks of various heights, dread-
fully rugged and broken, opposing their rude
fronts to all the fury of a tempestuous ocean;
which in some places has formed great detached
pillars, in others has excavated grand natural
arches and caverns that mock all human mag-
nificence; and strike the beholder with that awe
and wonder which must affect every one on
viewing these amazing wrecks of nature*." The
climate of the Shetland isles is variable, and
disturbed

* Jameson's Min. p. 2, 3. 8vo.

disturbed with rains and thick fogs. The frosts are seldom severe, and snow rarely continues long on the ground. The inhabitants are indeed sufficiently wretched without additional evils; and a benevolent government ought to pay a particular attention to those distant prisoners. The corruscations of the Aurora Borealis illuminate the long gloom of winter, and delight the inhabitants, who call them *merry dancers*. The arable land is mostly near the coast, and produces a coarse kind of oats and bigg. Potatoes have lately formed an addition of singular advantage. The chief food of the inhabitants consists of fish, and various kinds of sea fowl, which cover the rocks: the captors of the last shew singular skill and intrepidity, and often meet with a violent fate amidst the stupendous precipices.

The chief exports of Shetland are fish of various kinds, chiefly herrings, cod, ling, and torsk, or tusk. The inhabitants of the Shetland islands in 1798 were computed at twenty thousand one hundred eighty-six, which is more than the country can well support. In this distant region there are neither roads nor bridges, which may be pronounced the first steps in any country towards the progress of industry. The same deficiency occurs in the Orkneys, and even in the northern extremity of Scotland; where however a road has been recently opened between Ullapool and Dornoch*.

IRELAND.

EXTENT.] This large and fertile island is about three hundred miles long, and one hundred and sixty at the greatest breadth. The contents in square miles are about twenty-seven thousand four hundred and fifty-seven; and the population about three millions.

RELIGION.] The legal religion of Ireland is that of the church of England; but it is computed that more than two-thirds of the people are Catholics; and of the remainder the Presbyterians are supposed to constitute one-half.

There are four archbishoprics, in themselves an evidence of the great number of churches formerly existing; and eighteen bishoprics.

Under the archbishop of Armagh are the

bishops of Meath, Kilmore, and Ardagh, Dro-more, Clogher, Raphoe, Downe and Connor, Derry.—Under the archbishop of Dublin, Kildare, Ferns and Laughlin, Ossory.—Under the archbishop of Cashel, Waterford and Lismore, Limeric, Killaloe, Cork and Ross, Cloyne.—Under the archbishop of Tuam, Elphin, Cloyne, Killala and Achonry†.

The Catholics have also a hierarchy nearly similar, but the metropolitans and bishops are considered by the Protestants as merely titular. The Presbyterians being here Dissenters, their form of ecclesiastical government necessarily approaches that of the Independents.

GOVERNMENT.] The government of Ireland was constructed upon the plan of that of England, being vested in the House of Commons, and another of Peers, while the King was represented by a Lord Lieutenant or Viceroy. But no act of importance was considered as valid, till it received the sanction of the King and Council of Great Britain. At present Ireland being united to England, the form of government is of course identically the same. There are some minute variations between the statute and common laws of Ireland and those of England.

CIVIL DIVISIONS.] Ireland is primarily divided into four provinces, viz. Ulster to the north, Connaught to the west, Leinster to the east, and Munster to the south. The subdivisions are counties, of which the following is a list:

Ulster	Donnegal	Leinster	Louth
	Londonderry		Meath
	Antrim		Longford
	Tyrone		Westmeath
	Fermanagh		Dublin
	Monaghan		King's-county
	Armagh		Kildare

amount to two thousand pounds.

ARMY.

ARMY.] Besides large contributions to the British army, Ireland in 1780 raised upwards of forty thousand volunteers, and has recently equipped a considerable militia and yeomanry. If we suppose every eighth person capable of arms, Ireland might raise a force of more than three hundred thousand men. Of mariners Ireland contributes an inadequate proportion, and inferior in skill to the British.

REVENUES.] The public revenues of Ireland were computed by an intelligent traveller* at about one million sterling, or six shillings and eight-pence a head, when those of England stood at one pound nine shillings.

POLITICAL IMPORTANCE, &c.] The political importance and relations of Ireland are great, but intimately blended with those of England; while her western position imparts singular advantages in the commerce with America and the West Indies.

MANNERS AND CUSTOMS.] The manners of the superior classes of people in Ireland now nearly approach to the English standard, except that excess in wine, unfashionable in England, continues to prevail too much in the sister island. The Irish gentry are also seldom addicted to literature or the arts; but amuse themselves with hunting and other robust exercises. Hence an overflow of health and spirits; and the observation of an able writer, that Ireland produces the stoutest men, and the finest women in Europe, must not be confined to the inferior classes. The common people of Ireland still retain too many features of national manners. A funeral is joined by all the men and women of the vicinity, and is accompanied with dreadful howls, and other barbarous ceremonies. Their diet consists chiefly of potatoes and buttermilk; and the rural cottage is a wretched hovel of mud. The favourite liquor is usquebaugh, or the water of life; but more properly the water of death, being an ardent and pernicious distillation from corn.

The English language daily gains ground in Ireland, and might, if proper attention had been bestowed on the national education, have become, ere now, the general idiom of the country. The ancient Irish is a dialect of the Celtic intermingled with many Gothic words, borrowed by the Belgic colonies, by the Scandinavians, and by the English.

VOL. II. No. CXXI.

EDUCATION.] In no quarter of the British dominions, has education been conducted upon a more solid and rational plan than in Scotland; and no where has it been so much neglected as in Ireland. It is to be hoped that one consequence, and not the least important, of the union, will be the introduction of parochial education into Ireland, a sure mean of preventing the ebullitions of ignorant discontent.

UNIVERSITIES.] With four archbishoprics Ireland only possesses one university, that of Dublin. This institution was first projected by archbishop Leech, about the year 1311; but death having interrupted his design, it was revived and executed by Bicknor his successor, and enjoyed moderate prosperity for about forty years, when the revenues failed. In the reign of Elizabeth the university was refounded by voluntary contributions, under the auspices of Sydney the Lord Deputy. It consists of a Chancellor, Vice-chancellor, Provost, Vice-provost, twenty-two Fellows, and thirteen Professors of various sciences. The number of students is commonly about four hundred, including seventy on the foundation. The building consists of two quadrangles, and it contains a library of some account, and a printing office.

At Kilkenny there is an endowed school, or what is called a college; but its institutes seem little adapted to the quiet of an academical life.

The Dublin Society for the improvement of Agriculture and Manufactures was instituted by the efforts of the patriotic Dr. Samuel Madden in 1731, being the earliest of the kind now existing in Europe.

CITIES AND TOWNS.] Dublin, the capital of Ireland, continued little known till the tenth century, when it was mentioned in the Saxon Chronicle; and in the beginning of the next century, we have coins of Canute struck at Dublin. The situation is delightful, in a bottom, between ranges of hills on the south and north. It is pervaded by the river Liffy, and by some rivulets. The inhabitants have been estimated at one hundred and fifty thousand; this capital being justly accounted the second in the British dominions. The circumference of Dublin may be about ten miles, being about two miles and a quarter in length, and as much in breadth. The harbour is incommensurate, being impeded with two banks of sand, called the north and

S N

south

south bulls, which prevent ships of large burden from passing the bar; but some improvements have been made, and others might be carried into execution. A mole has been constructed four miles in length: and the quays are spacious and beautiful. There are six bridges, the chief of which is that called Essex. The castle was founded about the year 1200, and continues, though in great part rebuilt, to be the sanctuary of the public records, as it formerly was the residence of the Viceroy. The parliament house is a superb building, erected at considerable expence. The church of St. Patrick is the cathedral, a venerable building, which was begun in the end of the twelfth century; but the steeple, the highest in the city, was not erected till the year 1370. The Royal Exchange was completed in 1779. Dublin has an ample supply of native provisions; but coals are imported from Scotland and Cumberland.

ROADS.] Though the turnpike roads in Ireland be rather neglected, yet the cross roads are admirable; and Mr. Young has explained at length the principles upon which they are constructed.

INLAND NAVIGATION.] The advantages derived by England from inland navigation soon attracted the attention of Ireland; and, not many years after the example set by the Duke of Bridgewater, a grand canal was begun from the city of Dublin to the river Shannon, and was actually carried on to the bog of Allen, at the expence of seventy-seven thousand pounds. But the engineer's want of ability occasioned great errors in the original plan and survey; and the work was interrupted in 1770. Nor, unhappily, have proper means been adopted to execute the plan, which remains imperfect, after an expenditure of half a million; and an able writer informs us, that even the design was absurd, as the country through which the canal passes is one of the least productive for the Dublin market.

A canal is completed from the town of Newry to the sea, which was, however, intended to have passed that town towards the collieries of Drumglass and Dungannon. This attempt, however, to supply Dublin with Irish coals, has hitherto been only successful in part, though the beds of coals are said to be very abundant.

MANUFACTURES AND COMMERCE.] Though

we find, as has been already mentioned, that Ireland was distinguished at an early period for her manufacture of woollen stuffs, yet the spirit of industry made little progress, and the chief Irish manufactures are of recent institution. But the linen manufacture was not unknown in Ireland in more early times, as appears from the acts of parliament in the reigns of Henry VIII. and Elizabeth. The annual produce of the linen manufacture is computed at about two millions sterling.

But a grand portion of the commerce of Ireland arises from her abundant stores of black cattle, the moisture of the climate rendering the pasturage remarkably luxuriant.

CLIMATE.] Ireland lying nearly in the same parallel with England, the difference of climate cannot be supposed to be very important. The mean temperature of the north is about 48°; of the middle 50°; of the south 52° of Farenheit.

FACE OF THE COUNTRY.] Ireland forms a striking contrast to Scotland, being mostly level, fertile, and abundant in pasturage. The chains of hills, for they can hardly aspire to the name of mountains, are few, and unimportant.

SOIL AND AGRICULTURE.] The soil and agriculture of Ireland are topics which have been ably illustrated by an intelligent writer. He observes, that the quantity of the cultivated land exceeds, in proportion, that of England. The most striking feature is the rocky nature of the soil, stones generally appearing on the surface, yet without any injury to the fertility. The stones, are for the most part, calcareous, and appear at no great depth, even in the most flat and fertile parts, as Limerick, Tipperary, and Meath. The climate being more moist than that of England; the verdure never appears parched with heat. Tillage is little understood, even in the best corn counties; turnips and clover being almost unknown: the wheat sown upon fallow, and followed by several crops of spring corn. The farmers are oppressed by the shocking system of *middle men*, who rent farms from the landlords, and let them to the real occupiers; who, as well as the proprietors, suffer greatly by this strange practice. Lime-stone gravel is a manure peculiar to Ireland; having on uncultivated land, the same wonderful effect as lime, and on all soils it is beneficial.

chief rivers of Ireland

must first be mentioned the Shannon, which
flows from the lake of Allen, and passing through
two other large lakes, Lough Ree, and Lough
Derg, afterwards extends before Limerick, into
a vast estuary or firth, about sixty miles in
length, and from three to ten in breadth. This
noble river is, almost through its whole course,
wide and deep, as to afford easy navigation.
Boate informs us, that the celebrated Earl of
Stafford designed to remove a rock, six miles
above Limerick, which forming a cataract, im-
pedes the intercourse between the upper and
lower parts. The whole course of the Shannon
is about one hundred and seventy miles.

The lakes of Ireland are numerous, and some
of them extensive. The term *Lough*, corre-
sponding with the Scottish *Loch*, is sometimes
applied to an estuary, or to an inlet of the sea,
such as the Swilly, the Foyle, that of Strang-
ford, Down, &c. The chief lake of fresh
water is that of Earn, which exceeds thirty
British miles in length, and twelve in its greatest
breadth; it is divided by a narrow outlet from
the southern part into the northern, of about
four miles in length.

Next in magnitude is Neagh, about twenty-
two miles in length, and twelve in breadth.
Both these lakes are studded with small islands;
and the latter is said to possess a petrifying
quality.

The lake of Corrib, in the county of Galway,
about twenty miles in length, and from two
to five wide. Those of Ree and Derg are less
considerable in size; and there is a smaller lake
so named Derg, in the N.W. which was re-
markable in superstitious times for a little island,
containing what was called the purgatory of St.
Patrick.

Among the lakes of the second magnitude
must be first named the beautiful and interesting
Lough of Killarney in the S. W. abounding with
romantic views, and fringed with the arbutus,
where else a native of the British dominions.
This is almost the only lake in the south of
Ireland; and the observations may be extended
to the east. On the N. W. are the lakes of
Mask, Frierty, Melve, Macnean, and Gilt.
That of Allen, as already mentioned, is a chief
source of the Shannon, into which the Gara
and Key also pour their waters. Further to the
west are two considerable lakes, the Conn and

the Mask; nor must those of Corrasin be for-
gotten.

MOUNTAINS.] The mountainous chains in Ire-
land are neither numerous nor important; but
an upland ridge divides the country from the
N. E. to the S. W. giving birth to several of
the rivers. The Irish hills generally form short
lines, or detached groups. One group of con-
siderable height appears on the west and south
of Lough Lane, or what is called the lake of
Killarney: of these Mangerton is two thousand
five hundred feet above the sea. A small line of
hills extends on the north-west of Bantry Bay,
and passes to the east, under the name of the
Shehy mountains. To the north of this is the
line of Sliebogher and Nagles, followed by the
Galtee mountains; and towards the east, are
those of Knockendown, which bend southward
towards the bay of Dungarvan. A small chain
also appears to the south of Tralee, which, with
a group to the N. E. may be said to complete the
enumeration of the mountains of Munster.

In Leinster is the mountain of Leinster, the
line of Slieb-loom on the S. W. and a consider-
able group to the south of Dublin, styled the
Kippure mountains, or those of Wicklow. The
extent of this group is about thirty English
miles in length, by about twelve in breadth,

In Ulster is a small group, called the moun-
tains of Mourne, in the S. E. corner of the pro-
vince: one of them, Donard, is said to be about
the height of Mangerton. The hills of Slieve-
croob (in the Irish language *sliebh*, signifies a
mountain), form the centre of the county of
Downe; and several hills are sprinkled over the
eastern half of Antrim. On the north-west of
Loughneagh are those of Slievegallan and
Carnogher. Slieve Snaght is a considerable
mountain N. W. of Loughfowl, whence other
lines and groups extend down to Loughern.

The eastern part of Connaught presents nu-
merous marshes; but few mountains, except
those of Baughta on the south. The extreme
western peninsula, is one of the most moun-
tainous regions in Ireland. Among other names
may be mentioned, Mount Nephin, in the county
of Mayo, a solitary hill of two thousand six
hundred and forty feet, and one of the most
considerable in the island. That of Croagh Pa-
trick, on the S. E. of Clewbay, a cone of two
thousand six hundred and sixty-six feet; the
Fernamoor

Fernamoor mountains to the west of Loughmask; and the Twelve Pins, a line of so many small peaks in Ballinahinch; with others to the south of Loughcorrib.

Bogs.] The bogs form a remarkable feature of the country. Boate divides them into several genera and species, forming an elaborate scale of sterility. The dry heaths are generally confined to the mountains. The bogs he subdivides into four descriptions: 1. The grassy, in which the water being concealed by herbage, they become extremely perilous to travellers: some of these are dry in the summer. 2. The pools of water and mire. 3. What he terms *hassocky bogs*, or shallow lakes studded with tufts of rushes, which are chiefly found in the province of Leinster, especially in King's and Queen's counties. 4. The peat moors. Ornaments of gold and other relics of antiquity, have, from time to time, been discovered in the bogs at great depths; and there are other indications that they are of comparatively recent formation. It is hoped that the hand of industry will, in time, remove many of these blemishes; and one of the greatest improvements of modern agriculture is that of reclaiming peat moors, by means of calcareous manure.

The Irish bogs differ from the English morasses in being rarely level, but rising into hills; and there is a bog in Donnegal that is a perfect scenery of hill and dale. The plants are heath, with some bog myrtle, and a little sedgy grass.

MINERALOGY.] The mineralogy of Ireland has been recently ennobled by the discovery of considerable masses of native gold, in the county of Wicklow, to the south of Dublin. These were found in a brook, running west to east, to the river of Avonmore, where it is joined by the river Aghran; and on a declivity of the mountain called Croughan Kinshelly, about seven English miles west of Arklow, and six southwest of the noted copper mines of Cronbane. It is said that a jeweller, who lately died in Dublin, often declared, that gold from that spot had passed through his hands to the value of thirty thousand pounds, the secret being retained for many years, and some pieces weighing to the amount of seventy or eighty guineas. It is now worked for government, and it is said that a very massy vein has been recently discovered,

which, it is hoped, will greatly benefit the country; for mines have, in all ages, ancient and modern, enriched and improved the countries where they were found, and the exception, if such, of Spanish America is to be assigned to causes of a different nature.

The silver found in the Irish mines deserves more attention. Boate mentions a mine of this metal, intermingled with lead, which was wrought in the county of Antrim, and yielded a pound of pure silver from thirty pounds of lead. Another, less productive of silver, was found near the harbour of Sligo, in Connaught; and a third in the county of Tipperary, twelve miles from Limerick. The ores of this last were of two kinds, most generally of a reddish colour, hard, and glittering; the other, which was the richest in silver, resembled a blue marble. The works were destroyed in the Irish insurrections under Charles I.

Copper has been recently found in the county of Wicklow, and at Muccross, in Kerry.

One of the chief mineral productions of Ireland is iron, the mines of which were little known till the time of Elizabeth.

The beds of coal to be seen in various regions of Ireland have not yet been explored to their proper extent. That of Kilkenny, found at Castlecomer, is deservedly celebrated among mineralogists as the purest which has yet been traced in any quarter of the globe.

One of the most beautiful marbles of Ireland is found near Kilkenny, and others have been discovered in various parts of the island. Slate, of various kinds, is also abundant.

NATURAL CURIOSITIES.] The lake of Killarney is an expanse of water about ten miles in length, and from one to seven in breadth: it is divided into three parts, called the upper, lower, and Muckruss lake; and is surrounded by an amphitheatre of mountains, clothed with trees, whose verdure is contrasted with intervening rocks. Cascades, and other features of rural beauty, are not wanting.

What is called the Giant's Causeway must be distinguished among the most remarkable of the curiosities of Ireland. When we recollect that a similar production, the celebrated island of Staffa, remained unnoticed till within these thirty years; we shall be the less inclined to wonder

that the Giant's Causeway is an object of recent observation. The first account is that given by Sir R. Buckley, in a letter to Doctor Lister, 1693. This surprising collection of basaltic pillars is about eight miles N. E. from Coleraine. The adjacent coast is verdant, but precipitous; and from it the Causeway projects into the sea, to an unknown extent. The part explored is about six hundred feet in length; the breadth from two hundred and forty to one hundred and twenty; the height from sixteen to thirty-six feet above the level of the strand. It consists of many thousand pillars, mostly in a vertical position; some of them high, others broken, and, for a considerable space, of an equal height, so as to form a pavement. They are closely compacted together; though the form be various, trigonal, tetragonal, pentagonal, hexagonal, and heptagonal; the most numerous are the pentagonal. The pillars are rarely composed of one entire piece, but mostly consist of short or long joints, either plain or alternately concave and convex. The pillars are from fifteen to twenty-four inches, or more, in diameter. Towards the N. E. is what is called the organ, in the side of a hill, consisting of fifty pillars; that in the middle is forty feet high, the other gradually diminishing. Similar pillars are also found a mile and a half inland, four miles to the west of

The basalt of the Giant's Causeway is of a very compact texture, and the angles of the pillars have preserved their sharpness, though exposed to the sea for perhaps two or three thousand years. The same shore also presents horizontal and bending pillars, like those of Staffa; the attendant minerals are zoolite in the irregular basalt, steatite, and bits of agate, red ochre, and iron ore.

By the conquests made by France since the commencement of the revolution its inhabitants may be estimated at about eighty millions.

The following table exhibits a view of the divisions of France under the Louis's, and the modern departments:

Ancient Provinces.	Departments.	Chief Towns.
Normandie.	Nord.	Douai.
	Pas de-Calais.	Arras.
	Somme.	Amiens.
	Seine Inférieure.	Rouen.

the Giant's Causeway, and at the capes of Bencore and Fairhead*.

FRANCE.

EXTENT.] The extent of France, before the recent acquisitions, was computed at one hundred and forty-eight thousand eight hundred and forty square miles; and supposing the then population to be twenty-six millions, would render one hundred and seventy-four inhabitants to each mile square. The boundaries were, on the west, the Atlantic Ocean; on the south, the Mediterranean and Pyrenees; on the east, Savoy, Switzerland, and Germany; on the north, the Austrian Netherlands, the German Sea, and English Channel. It extends from about the forty-second to near the fifty-first degree of north latitude; from about the seventh degree of longitude west from Paris, to about the fifth on the east; being in length, north to south, about six hundred British miles, and in breadth, west to east, about five hundred and sixty†.

DIVISIONS.] Previous to the revolution, when France was under the ruling power of the Capetian dynasty, that country was divided into provinces; but by the recent alterations which have taken place in France it is now divided into departments†.

Ancien,

ANTIQUITIES.] Several monuments exist in France which are exceedingly ancient. The Greek colony at Marseilles seems to have imparted some degree of civilization to the country, and the rude Gallic coins are evidently an imitation of the Grecian model.

The Roman antiquities in France are numerous, and some of them in excellent preservation. Those at Nismes are particularly celebrated, consisting chiefly of an amphitheatre, and the temple called La Maison Carrée.

The monuments of the Carolingian race are very numerous, and Roman mosaics have illustrated the fame of Charlemagne. Of the

later periods the monuments are so numerous, that it would be vain to attempt to enumerate them. One of the most singular is the suit of tapestry, which was preserved in the cathedral church of Bayeux, in Normandy, representing the beginning and termination of the grand contest between William and Harold, which led to the conquest of England by the Normans. It is said to have been the work of Matilda, wife of William: and bears every mark of that remote antiquity.

RELIGION.] The religion of France is the Roman Catholic; but the Gallican church, since its re-establishment, has been considerably mo-

To these vast acquisitions must also be added, the recent annex of the whole of Piedmont, the Isle of Elba, &c. &c. and the Kingdom of Holland, which last was annexed to the French empire on the 1st of July, 1810.

* In Picardy, and other parts possessed by the Belgians, there are circles, and other monuments of the kind we call Druidic. Near the town of Carnac, on the coast of Vannes, in Bretagne, there is a grand monument of this kind, far exceeding Stonehenge, if the account be not exaggerated, which says, that there about four thousand stones, many as high as eighteen or twenty feet, disposed in the form of a quincunx of eleven rows.

diffused, and rendered wholly independent on Roman influence. The general division of France into archbishoprics and bishoprics remains much the same as before the revolution; but the revenues and power attached to these ecclesiastical offices are now only sufficient to render them respectable, but not formidable.

GOVERNMENT.] The present government of France we are not able to describe. At present, however, it seems to approximate to a military form.

POPULATION.] The population of France was formerly computed at twenty-six millions, but the recent acquisitions would swell it to the formidable extent of near eighty millions. At all events, France is a country teeming with population, and quickly resumes her vigour after stupendous losses, as Europe has repeatedly experienced.

COLONIES.] The French colonies are at present unimportant, notwithstanding the addition of the Spanish part of St. Domingo. The best of them have been convulsed and ruined for a season by intestine commotions.

ARMY.] The political convulsions which have agitated this unhappy country, the enthusiasm, and yet more the despotism, of freedom, have occasionally, within these few years, swelled the French armies to the amazing computation of upwards of a million. But it may safely be doubted whether the real amount at any time exceeded six hundred thousand effective men, the French having swelled their own numbers to intimidate their enemies.

Of the revenues and the political importance and relations of France we are unable to speak with precision: it will therefore be better to defer our observations on those particulars till the close of the present war, when information may be had on the subject.

MANNERS AND CUSTOMS.] The French have long been considered as full of vivacity, gaiety, politeness, a singular disposition towards social enjoyments, and that happy art which enables the adept to dispose of his occupations and pleasures in an agreeable succession, free from listlessness or fatigue.

The ancient and rooted enmity between France and England nourished many prejudices against the French character, which have since very properly disappeared in the reports of more

candid authors. Yet, with travellers accustomed to the elegance of English life, many of the French manners and customs cannot be reconciled to ideas of physical purity; and the looseness of morals, in regard to the sex, has become proverbial.

LANGUAGE.] The French language is the most universally diffused of any in Europe, perhaps in the world. In variety, clearness, and precision, and idioms adapted to life, business, and pleasure, it yields to no modern speech; but it wants force and dignity, and yet more, sublimity. The critics and academicians of the seventeenth century enacted such severe laws of purity, that, like gold reduced to the utmost fineness, it has become soft and almost incapable of deep impressions. The French language is a well known corruption of the Roman, mingled with Celtic and Gothic words and idioms. Even in the tenth century it continued to be called Romance; a name which afterwards passed to the poems and tales of chivalry, as being composed in this dialect. The epoch of classical purity of the French language commences with the reign of Louis XIV. but the recent revolution has introduced such exuberance of new words and phrases, that a neological dictionary is required to explain them.

LITERATURE.] The literature of France has, in modern times, excited great respect and admiration. In the bold exertions of inventive genius, and even in profound productions of philosophy, France may be said to vie with Italy or England; and in the pleasing and beautiful paths of invention, and in books of elegant learning and exact science, she remains almost unrivalled.

EDUCATION.] The state of education in all the Catholic countries was very defective till the Jesuits acquired great estimation by their attention to this important department; to which, if their exertions had been solely directed they would have proved a most useful body of men. National education has justly attracted the attention of the new rulers, and their success appears to have been commensurate to their laudable intentions.

UNIVERSITIES.] France formerly boasted of twenty-one universities; in the north Douay, Caën, Paris, Rheims, Nanci, Strasbourg; in the middle provinces Nantes, Angers, Poitiers, Orleans,

Orleans, Bourges, Dijon, Besançon; and in the south Bourdeaux, Pau, Perpignan, Toulouse, Montpellier, Aix, Orange, Valence. Of these the Sorbonne of Paris was the most celebrated: but it shewed an irremediable tendency to prolong the reign of scholastic theology. The academies and literary societies were computed at thirty-nine. Those of Paris, in particular, have been long known to the learned world, by elegant and profound volumes of dissertations on the sciences, and on the Belles Lettres. Nor have public institutions of this kind been foreign to the consideration of the new government.

CITIES AND TOWNS.] Paris, the capital, rises on both sides the river Seine, in a pleasant and healthy situation, with delightful environs. It is divided into three parts; the town, *ville* on the north, the city in the middle, and that part called the university on the south. The inhabitants probably amount to between six and seven hundred thousand. The houses are chiefly built with free stone. The banks of the Seine present noble quays; and the public buildings are not only elegant in themselves, but are placed in open and commanding situations. The Louvre is arranged among the best specimens of modern architecture; and the church of St. Genevieve, now the Pantheon, is deservedly admired; nor must the Thuilleries, the Palais Royal; and Hospital of Invalids be forgotten. Paris, no doubt, exceeds London in magnificence, but yields greatly in cleanliness and convenience; and the streets, generally without accommodation for foot passengers, loudly bespeak the inattention of the government to the middle and lower classes of men. The recent revolution has little impaired the beauty of Paris; on the contrary, the rapine of several provinces has enlarged and adorned the public collections; and, by enriching numerous individuals, has enabled them to increase their favourite city with new and beautiful streets.

EDIFICES.] Several of the most noble edifices of France are in Paris, and its vicinity. To those already mentioned must be added, the palace of Versailles, rather remarkable, however, for the profusion of expence, than for the skill of the architect; the parts being small and unharmonious, and the general effect rather idle pomp than true grandeur. The bridge of Neuilly, a league from Paris, is esteemed the most beau-

tiful in Europe, consisting of five wide arches of equal size. The ancient cathedrals and castles are so numerous that it would be idle to attempt to enumerate them: and the French nobility were not contented, like those of Spain, with large houses in the cities, but had grand chateaux scattered over the kingdom, to which, however, they seldom retired, except when compelled by formal banishment from the court.

INLAND NAVIGATION.] The inland navigation of France has been promoted by several capital exertions. The canal of Briare, otherwise styled that of Burgundy, was begun by Henry IV. and completed by Louis XIII. opening a communication between the Loire and the Seine, or in other words, between Paris and the western provinces. Passing by Montargis, it joins the canal of Orleans, and falls into the Seine near Fontainebleau. This navigation of forty-two locks, is of great utility in inland commerce.

The canal of Picardy extends from the Somme to the Oise, beginning at St. Quentin, and forming a convenient intercourse to the provinces in the N. E.

But the chief work of this description is the celebrated canal of Languedoc, commenced and completed in the reign of Louis XIV. by Riquet, the engineer, under the auspices of that able minister Colbert. Fifteen years of labour were employed, from 1666 to 1681, and the mechanical ignorance of the period was surprised at a tunnel near Beziers, of only seven hundred and twenty feet, lined with free-stone. This noble canal begins in the bay of Languedoc; and at St. Ferrol is a reservoir of five hundred and ninety-five acres of water: it enters the Garonne about a quarter of a mile below the city of Toulouse. The breadth, including the towing paths, is one hundred and forty-four feet; the depth six feet; the length sixty-four French leagues, or about one hundred and eighty miles. The expence was more than half a million sterling.

The other canals in France are very numerous; but, though of supreme utility, are too minute to enter into this general view of the kingdom.

CLIMATE AND SEASONS.] The climate of this extensive country is, in general, far more clear and serene than that of England; but the northern provinces are exposed to heavy rains, which

which however produce beautiful verdure and rich pastures. France may be divided into three climates, the northern, the central, and the southern. The first yields no wines; the second no maize; the third produce wines, maize, and olives. These divisions proceed in an oblique line from the S. W. to the N. E. so as to demonstrate "that the eastern part of the kingdom is two and a half degrees of latitude hotter than the western, or if not hotter more favourable to vegetation." One great advantage of the climate of France arises from its being adapted to the culture of the vine, which flourishes in spots that would otherwise be waste.

FACE OF THE COUNTRY.] The face of the country is generally plain; and the only mountains are found in the south, in Auvergne and Languedoc, Dauphiné and Provence. Brittany corresponds greatly with Cornwall, and abounds in extensive heaths. In Lorraine are the mountains of Vosges, far inferior to the southern elevations. For beauty the Limosin is perhaps superior to any other province of France: so much of the country is finely diversified with hill and dale, and the rivers, particularly the Seine, are often grand and picturesque.

SOIL AND AGRICULTURE.] The N. E. part from Flanders to Orleans is a rich loam. Further to the W. the land is poor and stony; Brittany being generally gravel, or gravelly sand, with low ridges of granite. The chalk runs through the centre of the kingdom, from Germany by Champagne to Saintonge; and on the S. of the mountainous tract is a large extent of gravel, but even the mountainous region of the south is generally fertile, though the large province formerly called Gascony present many heaths, or level heaths.

In some of the provinces, the plans of agriculture correspond with the natural fertility of the soil; and others display a most laudable industry. A striking instance of the latter is the artificial fertility conferred on some of the barren mountains of the Cevennes. As the waters which run down the sides carry considerable quantities of earth into the ravines, walls of these stones are erected which permit the waters to pass when they are clear; but when turbid their load of earth is gradually deposited against the wall, and affords a space of fertile soil. Excessive ramparts are thus erected to the very
Vol. II. No. CXXII.

top of the mountain; and the water, having no longer a violent fall, only serves to nourish the crops, which are moreover protected by planting fruit trees at certain intervals, so as to lend security and consistence to the new acquisition. By another process calcareous mountains, which generally rise in shelves, are rendered productive by cutting away the rock behind the shelf, which supplies materials for a low wall around the edge. The interval is afterwards filled with earth, and the barren mountain is crowned with luxuriant terraces.

RIVERS.] The principal rivers of France are, the Seine, the Loire, the Rhone, and the Garonne. The first is one of the most beautiful streams of France, rising near Saint Seine, in the modern department of Côte D'or, a portion of ancient Burgundy; it pursues its course to the N. W. till it enter the English Channel at Havre de Grace, after a course of about two hundred and fifty English miles.

The Loire derives its source from Mont Gerbier in the N. of ancient Languedoc; and after a northern course turns to the west, entering the ocean a considerable way beyond Nantes, after a course of about five hundred miles.

The Rhone springs from the Glacier of Fulca, near the mountain of Grimsel in Switzerland; and after passing the beautiful vales of Vallais, and the lake of Geneva, bends its course towards the south, and enters the Mediterranean. The course about four hundred miles.

The Garonne rises in the vale of Arau in the Pyrenes. The course of this river is generally N. W. It extends to about two hundred and fifty miles. After its junction with the Dordogne, it assumes the name of the Gironde.

MOUNTAINS.] Those of Brittany are granitic and primitive, but of small elevation. They divide into branches towards Brest and Alençon. The Vosges, in the department of that name, in the S. of ancient Lorraine, are supposed to be connected with the mountains of Switzerland.

Mont Jura, a vanguard of the Alps, forms a boundary between France and Switzerland. If Mont Blanc be admitted among the French mountains, the other Alps cannot rival its supreme elevation. The ancient province of Dauphiné displays several Alpine branches, which also extend through great part of Provence.

The grand chain of the Cevennes passes from
S P N. to

N. to S. and sends out branches towards the E. and W. In the modern departments of the upper Loire and Cantal, are appearances which, in the opinion of eminent naturalists, indicate ancient volcanoes. The northern part of this branch is styled the Puy de Dome, while the southern is called that of Cantal. The Monts d'Or form the centre, and are the highest mountains in France. The chief elevation is that of the Puy de Sansi, which rises about six thousand three hundred feet above the level of the sea, while the Puy de Dome is about five thousand, and the Plomb du Cantal, the highest of that part, is about six thousand two hundred feet.

The Pyrenees form a vast chain, and may be considered with equal justice as belonging either to France or to Spain; but as the most productive and interesting parts are on the side of France, and her literati have exerted themselves in the description, it seems at least proper to introduce the delineation here. To the surprise of naturalists, the Pyrenees have been found to present calcareous appearances, and even shells and skeletons of animals, near or upon their highest summits, which are in the centre of the chain. Mont Perdu is considered as the highest elevation of the Pyrenees, ascending above the sea one thousand seven hundred and fifty-one French toises, or about eleven thousand feet English. Other noted heights are Marboré, the Pic de Midi, the Nieve Veille, &c. The Pyrenean chain appears at a distance like a shaggy ridge, presenting the segment of a circle fronting France, and descending at each extremity till it disappears in the ocean and Mediterranean. Thus at St. Jean de Luz only high hills appear, and in like manner on the east, beyond the summit Canigou, the elevations gradually diminish. The highest summits are crowned with perpetual snow. To the S. and W. the Pyrenees present nothing but dreadful sterility, but on the N. and E. the descent is more gradual, and affords frequent woods and pastures. Besides the dreadful fall of rocks, undermined by the waters, they are exposed to Lavanges, or the impetuous descent of vast masses of snow, called Avalanches in Switzerland, and have their glaciers and other terrific features of the Alps.

FORESTS.] The forests of France are numerous and extensive; and as wood is the ge-

neral fuel, attention to their growth becomes indispensable. Two of the most remarkable those of Orleans and Ardennes, the former extensive and the numerous troops of handitti used to infest its precincts: the latter for its fame and events of chivalry. The forest of Ardennes extended from Rheims to Toul, and on the N. E. to Sedan in the present department of the Ardennes. To these names may be added the forest of Fontainebleau, and others.

MINERALOGY.] Gold mines anciently existed in the S. of France, and some of the rivers still roll down particles of that metal. The ancient Gallic coins are however of a base mingled with silver, being the metal style the ancients electrum. France can, however, boast of the silver mines at St. Marie-aux-Mines in Alsace, and at Giromagny in the department of the Upper Rhine, near the mountain of Vosges, also a part of ancient Alsace. The same district contains mines of copper, and is not unfrequent in the departments of the Rhine, and those of the Loire, the Lozere, and Ardeche. The duchy of Deux Ponts, a valuable acquisition of France on the west of the Rhine, is celebrated for mines of quicksilver. The mountains which contain this metal embrace a district of ten or twelve leagues length, S. to N. from Wolfstein to Cruz, and seven or eight leagues in breadth, being a reddish brown or grey sand-stone. In this territory, among numerous mines of quicksilver are those of Stahlberg, and Donnersberg, which have been explored for many centuries. The most important and universal of metals found in abundance, particularly in some of the northern departments.

The coal mines of France were at the time estimated at four hundred, some wrought; and two hundred more capable of being wrought. Of these coal mines occur in the provinces which formerly belonged to Flanders, and in the departments of the Moselle, and La Manche. Coal is also frequent in the centre and south of France. Nearly allied to coal is jet, an article formerly of great consumption, chiefly in Spain, where it was made into rosaries, crosses, buttons, black dresses, &c. Besides excellent freestone, the environs of
which contain abundance of gypsum. Alum is
found in considerable quantities at Aveyron. The
pyrennees, in particular supply beautiful marbles.
[MINERAL WATERS.] The chief mineral wa-
ters are those of Barrege, Bagueres, Vichi, and
Camberes. The warm baths of Barrége, in
particular, at the foot of the Pyrenées, have
been long celebrated. The baths of Bagueres
are in the same neighbourhood.

[NATURAL CURIOSITIES.] Among the natural
curiosities of France, the most worthy of no-
tice is the plain of La Crau, which lies in Pro-
vence, not far from the mouth of the Rhone.
This is the most singular stony desert that is to
be found in France, or perhaps in Europe.
The diameter is about five leagues, and the con-
tents from twenty to twenty-five square leagues,
about one hundred and fifty thousand English
acres. It is entirely composed of shingle, or
sand and gravel, some of the stones as large as the
head of a man, and the shingle of the sea shore
not more barren of soil. Beneath is a small
stratum of loam with fragments of stone.

NETHERLANDS.

[EXTENT.] Those provinces of the Nether-
lands which were formerly subject to the house
of Austria, have been recently annexed to the
Austrian dominions. Their length, computed
from the eastern limit of Luxembourg to Ostend,
is about one hundred and eighty British miles;
and about one hundred and twenty in breadth,
from the northern boundary of Austrian Bra-
bant to the most southern limit of Hainault.
The extent is computed at seven thousand five
hundred and twenty square miles, with a popu-
lation of one million nine hundred thousand.

[RELIGION, &c.] The religion of the Nether-
lands is the Roman Catholic; and, till the
French revolution, the inhabitants were noted
for bigotry, a great part of the wealth being in
the hands of ecclesiastics. The metropolitan see
is the archbishopric of Mechlin, or Malines.
The bishoprics were those of Bruges, Antwerp,
Louvain, &c. in number nine or ten. The go-
vernment and laws had some features of free-
dom; but the decline of commerce having les-

sened the consequence of the cities and bur-
gesses, this liberty became the monopoly of the
nobles and clergy, who often opposed the will
of the sovereign, when exerted in the most be-
neficial manner for the good of the community.
The *Joyeuse Entrée* was the Magna Charta of the
Netherlands, a constitutional bond of national
privileges.

[MANNERS AND CUSTOMS.] The manners and
customs of the Netherlands partake of those of
their neighbours, the Dutch and French, the
phlegm of the one being tempered by the vi-
vacity of the other. The lower classes were
fond of religious pageantry, and much addicted
to the superstitious observances of the Catholic
system. The Flemish language partakes of the
German and of the Dutch.

[EDUCATION.] Education was neglected as in
most Catholic countries, where the Jesuits in
vain attempted to bring it to a level with that of
the Protestant states. The universities, which
in no country are of equal importance with the
schools, were, however, numerous, considering
the extent of the country. Exclusive of Tour-
nay, which has been long subject to the French,
there were others at Douay, and St. Omer,
which was much frequented by the English
Catholics; and one of still greater celebrity at
Louvain.

[CITIES AND TOWNS.] The three chief cities in
what were called the Austrian Netherlands, are
Brussels, Ghent, and Antwerp. The capital
city of Brussels contains about eighty thousand
inhabitants, and is beautified by a noble square;
one side of which is occupied with a vast guild-
hall; and by numerous churches and fountains.
It is situated on the small river Sen, or Sehne,
which runs into the Dyle and the Scheldt. It was
known as early as the tenth century, and in the
fourteenth was surrounded with walls. The im-
perial palace, the wonted residence of the go-
vernor of the Netherlands, displays considerable
taste and magnificence.

Ghent contains about sixty thousand souls, and
the circumference of the walls is computed at
fifteen miles, as it is built on a number of little
islands formed by four rivers and many canals,
and includes gardens, and even fields. Some of
the streets are large and well paved, but only a
few churches now deserve attention.

The inhabitants of Antwerp are computed at
fifty

fifty thousand, the sad remains of great population and prosperity. This city being placed upon the noble estuary of the Scheldt*, and formerly the chief mart of Flemish commerce, possesses a strong citadel, erected by the sanguinary duke of Alva. The harbour is excellent, and the supposed impediments found to be fabulous. The streets, houses, and churches, are worthy of the ancient fame of the city. The exchange is said to have afforded the pattern for that of London.

SEA-PORTS.] The sea-coast of Flanders, the maritime province, consists chiefly of sandy hills and downs, and has few inlets, as most of the rivers flow into the Scheldt. There are, however, two ports which deserve particular notice. The Sluys†, called by the French L'Ecluse, derives its name from the sluices, by which the circumjacent country may be laid under water. Guicciardini says, that the haven of Sluys was capable of containing five hundred ships. The port and population now yield greatly to those of Ostend. Many English families were settled here before Ostend fell a prey to the French.

EDIFICES.] In general it may be observed that, even at the present day, every traveller is impressed with surprize, not only at the number, but the great extent of the Flemish cities, towns, and even villages; in which respect the Netherlands exceed every country in Europe; only excepting the United Provinces. The chief edifices are the cathedrals, churches, and monasteries.

INLAND NAVIGATION.] Idle would be the attempt even to enumerate the canals which intersect these provinces in all directions. Some of them date even from the tenth century, and the canal from Brussels to the Scheldt is of the sixteenth. Other important canals extend from Ghent, Antwerp, Ostend, and other cities and towns, especially in the western districts; but, under the Austrian dominations, these important means of intercourse were shamefully neglected.

MANUFACTURES AND COMMERCE.] The ma-

* In the year 1809, one of the most formidable bodies of land and sea forces that ever sailed from the shores of England, went on an expedition to the Scheldt, with a view to destroy the French fleet at Antwerp. They destroyed the Naval Arsenal at Flushing, but could not effect the grand object of the expedition. In the island of Walcheren the British troops suffered so severely from disease, that it

nufactures and commerce of the Netherlands, for a long period superior to any in the west of Europe, have suffered a radical and total decline, owing partly to the other powers entering into competition, and partly to the establishment of freedom in the United Provinces, whence Amsterdam arose upon the ruins of Antwerp. What little commerce remains is chiefly inland to Germany, the external employing very few native vessels. The East India Company established at Ostend was suppressed by the jealousy of England and other powers; and the chief commerce was afterwards carried on by the English established in that city.

CLIMATE AND SEASONS, &c.] The climate of the Netherlands considerably resembles that of the south of England, and is more remarkable for moisture than for warmth; yet the duchy of Luxembourg produces some wine, which probably has the austerity of the Rhenish, with its spirit. The face of the country is in general level, and the semblance of hills can scarcely be discovered, except towards the east, where a few elevations relieve the eye from the general flatness of the other regions. The soil is in general rich sandy loam, sometimes interspersed with fields of clay, but more often with large spaces of sand. Such has been, even in distant ages, the state of agriculture, that the Netherlands were long esteemed the very garden of Europe, a praise which they still share with Lombardy and England.

RIVERS.] The Netherlands are watered by many rivers and canals, that it will be sufficient to mention only a few of the chief streams. The Rhine, the Meuse, or Maas. The chief river is the Scheldt, which receives two other streams, the Lys, and the Scalpe, the latter near M. tagne, the former near Ghent. All these rivers arise in the county of Artois, from no considerable elevation; and the whole course of the Scheldt, cannot be comparatively estimated above one hundred and twenty miles‡. The Dyle rises not far to the N.W. of Namur, and

is said not more than one-third ever returned to the sea.

† Sluys belonged to the United Provinces, but is now mentioned, considering the Netherlands to be the Rhine and appendage of France.

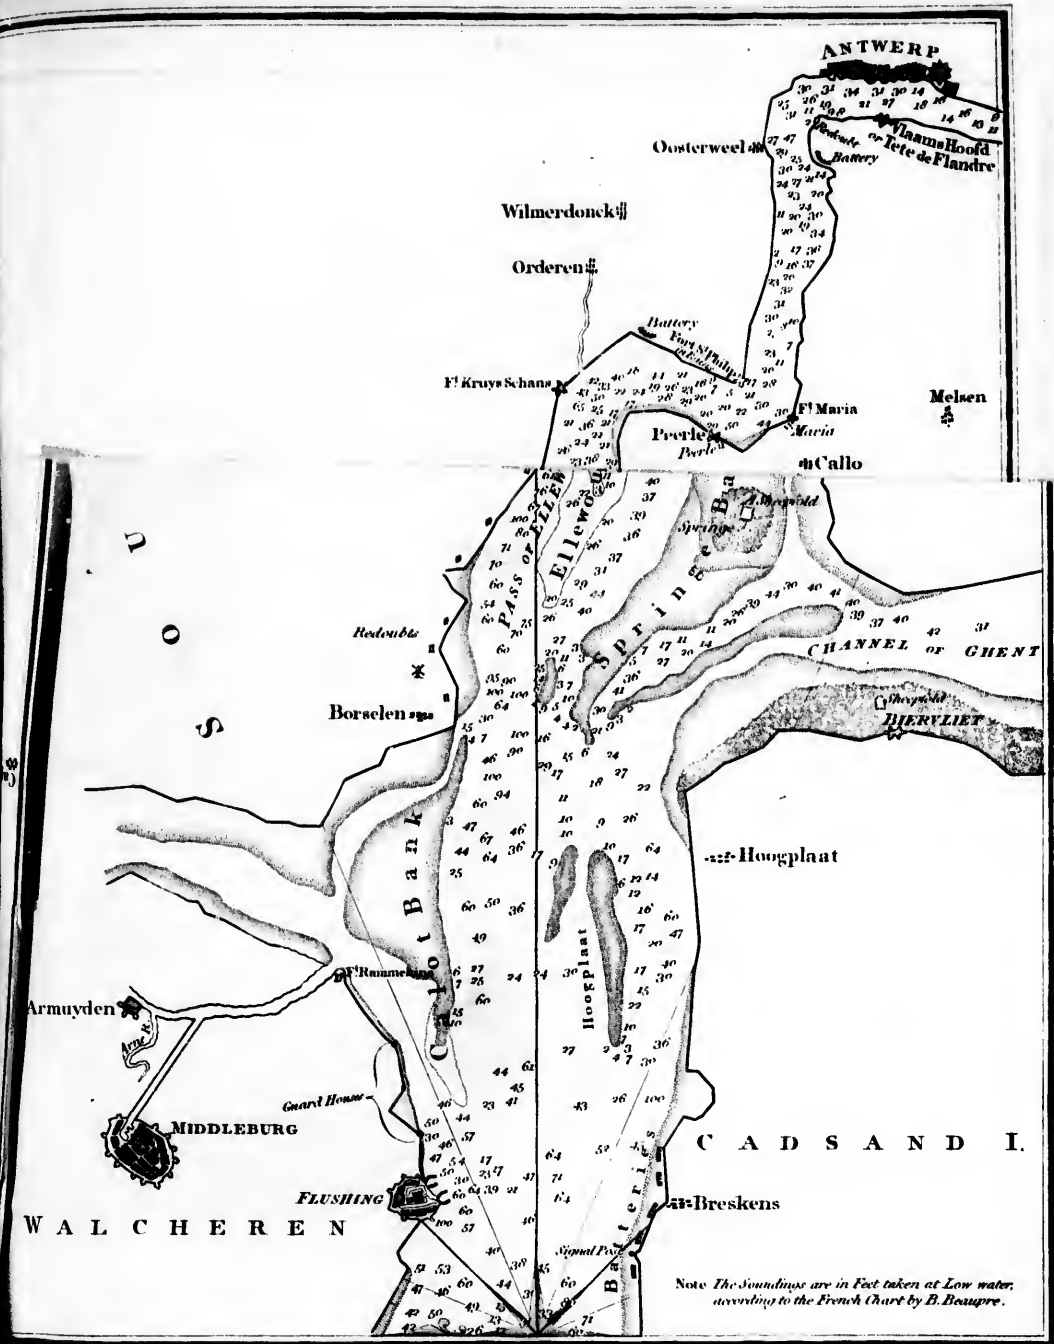

‡ The Scheldt properly rises about eight miles N. of Quintin, in the modern department of the Aisne.

MOUNTAINS, &c.] Though there be little ridges of hills in the counties of Namur and Luxembourg, the traveller must proceed to the distant banks of the Rhine before he meets with any elevation that can deserve the name even of a small mountain. There are, however, several woods even in the centre of Flanders; and in Brabant is the forest of Soigne. Further to the E. and S. are immense forests, which almost pervade Hainault and Luxembourg, from Valenciennes to Treves, forming striking remains of the ancient forest of Ardennes.

MINERALOGY.] Coal is found in several districts, and the ingenuity of the French has been exerted in an improvement of the operations. In the county of Namur are also found lead and copper; and Hainault affords iron and slate. From its iron works Luxembourg derives its chief wealth; and the forest of Ardennes is still renowned for the metal of war. Marble and gabbaster are also found in the eastern districts.

RUSSIA IN EUROPE.

EXTENT.] The Russian empire is, perhaps, the most extensive that ever existed; the length being about nine thousand two hundred English miles, and the breadth two thousand four hundred.

BOUNDARIES.] By the final partition of Poland, European Russia extends from the river Dniester to the Uralian mountains, that grand chain which naturally divides Europe from Asia, a length of about one thousand six hundred miles; and in breadth above one thousand English miles. The extent is computed at about one million two hundred thousand square miles.

PROVINCES.] The principal sub-divisions of European Russia are into military governments; which, though they are often changing, and are seldom mentioned by any except native geographers, it has not been thought right entirely to omit. To the north is the extensive government of Archangel, stretching from the borders of Sweden to the confines of Asia. South of this along the Asiatic frontier are the governments of Vologda, Perm, Viatka Kazan, Simbirsk, Saratow, and the territory of the Don

VOL. II. No. CXXII.

Kozacks, each succeeding the other in a regular progress to the sea of Azof. The government of Ecaterinoslav, with the kingdom of Taurida, is the southernmost province, and contains Little Tartary, with the recent conquests from the Turks. On the west extend the acquisitions by the division of Poland. The governments of Riga, Revel, Petersburg, and Viborg; are situated along the Gulfs of Riga and Finland; and the government of Olonetz on the Swedish frontier completes the circuit. The midland provinces are the following: Novogorod, Tver, Kostroma, and Yaroslav, for the most part to the north and east of the Volga; Polotsk, Pskov, Smolensk, Mosqua, Vladimir, Nizney Novgorod, Moghilev, Calouga, Toula, Riazan, Tambov, Penza, Simbirsk, Orel, Sieverskov, Tchernigov, Koursk, Kiev, Charkov, Voronetz, principally to the west of the Volga.

ANTIQUITIES.] Of ancient monuments, Russia cannot be supposed to afford great variety: Sometimes the tombs of their Pagan ancestors are discovered, containing weapons and ornaments. The catacombs at Kiow were perhaps formed in the Pagan period, though they be now replete with marks of Christianity. They are labyrinths of considerable extent, dug as would appear, through a mass of hardened clay, but they do not seem to contain the bodies of the monarchs.

RELIGION.] The religion of Russia is that of the Greek church, of which, since the fall of the Byzantine empire, this state may be considered as the chief source and power. The patriarch of the Russian church had usurped extraordinary powers, to the great injury of the Imperial prerogative; but the spirit of Peter I. broke these ignominious bonds, and the Patriarchs have since become complaisant instruments of the court. The clergy are very numerous, and have several privileges, particularly exemption from taxes. They have been computed at sixty-seven thousand, secular and regular. The Greek religion permits the marriage of the secular clergy. The cathedrals and parish churches in the empire are computed at eighteen thousand three hundred and fifty; the monasteries at four hundred and eighty; nunneries seventy-four; monks supposed to be seven thousand three hundred; nuns three thousand. The monasteries have not been such favourite

8 Q

resorts

resorts since Peter I. and Catherine II. opened the sources of industry. The bishoprics amount to about thirty.

GOVERNMENT.] The government of Russia appears to have been always despotic, there being no legislative power distinct from that of the sovereign. What is called the senate is only the supreme court of judicature. The whole frame of the government may be pronounced to be military; and nobility itself is only virtually estimated by rank in the army.

LAWS.] Immediately on the fall of the Roman empire, we find the Gothic tribes sedulously collecting and publishing their peculiar codes of laws, but it would be difficult to discover any Slavonic code till the sixteenth century, when they emanated, not from the national council, but from the arbitrary will of the monarch. The first Russian code dates from the reign of Ivan IV. and the late empress had the merit of drawing up a new code with her own hands.

POPULATION.] The population of Russia is so diffuse, and spread over so wide an extent of territory, that very opposite opinions have been entertained concerning it. By most writers it was only estimated at about twenty-five millions; and it was at the same time supposed that the recent acquisitions in Poland might add five millions to the amount: but in 1783, more exact estimates were prepared; and, by the most moderate estimate, the population of the Russian empire at present appears to be thirty-six millions, one hundred and fifty-two thousand.

Of this population. Mr. Tooke assigns only about three millions and a half to Siberia, or Asiatic Russia, which contains the five governments of Perm, Vfa, Kolhyvan, Tobolsk, and Irkutsk; but Perm is itself situated on the European side of the Uralian mountains, so that we might, perhaps, allow even thirty-three millions for the population of European Russia.

NAVY.] The Russian navy consists of several detached fleets, employed in the remote seas on which the empire borders at different extremities. The chief fleet is of course that of the Baltic, which consists of about thirty-six ships of the line. That in the Euxine, or Black Sea, at the harbours of Sevastapol and Kherson, was computed at twelve ships of the line, but not of a high rate, as the Euxine affords no great depth of water; but there are many frigates, galleys,

chebecks, and gun-boats. The fleet of galleys in the Baltic is estimated at one hundred and ten.

REVENUES.] The revenues of Russia are supposed to amount to about fifty millions of rubles; which, valuing the ruble at four shillings, will be equal to ten millions of pounds sterling. The national debt is supposed to amount to little or nothing.

MANNERS AND CUSTOMS.] As the Russian empire comprises so many distinct races of men, the manners of course must be various. The Russian is extremely patient of hunger and thirst, and his cure for all diseases is the warm bath, or rather vapour bath, in which the heat is above one hundred degrees, of Fahrenheit's thermometer. Dr. Guthrie has shewn that the Russians retain many manners and customs derived from their Pagan ancestors, and has given some curious specimens of their songs and music, which seem to be very pleasing. He has also compared their dances with those of the Greeks; and finds in one of them a considerable resemblance of the wanton Ionic, while another resembles the Pyrrhic. He observes that the country girls dress in the *seraphan*, resembling the ancient *stola*, and bind up their hair with the *lenta*, a ribbon like the ancient *vitta*. They tinge their cheeks with the juice of the *echium italicum*. When a marriage is proposed, the lover, accompanied by a friend, goes to the house of the bride, and says to her mother, "shew us your merchandize, we have got money," an expression which is thought to refer to the ancient custom of buying a wife. The Russians show great attention to their nurses, and are so hospitable that they offer to every stranger the *Khlch da sol*, or bread and salt, the symbol of food, lodging, and protection. At a repast some salt fish, or ham, and a glass of brandy, are presented in the first place; and, after dinner cakes made with honey are usually served; the common drink is kvass, an acid, thin, malt liquor. The houses are ornamented with stoves, and among the rich, by flues conducted into every room which is at the same time guarded with double windows. In several instances the Russians form a curious junction of European, and Asiatic manners; many of their ceremonies partake of Asiatic splendour: the great are fond of dwarfs; and some opulent ladies maintain female tellers of tales, whose occupation is to lull their mistresses to sleep.

sleep, by stories resembling those of the Arabian Nights.

LANGUAGE.] The Russian language is extremely difficult to pronounce, and not less difficult to acquire, as it abounds with extraordinary sounds, and anomalies of every kind. The characters amount to no less than thirty-six; and the common sounds are sometimes expressed in the Greek characters, sometimes in characters quite unlike those of any other language. Among other singularities there is one letter to express the *sch*, *sch*, the latter a sound hardly pronounceable by any human mouth.

UNIVERSITIES.] The university of Petersburg, founded by the late Empress Catharine II. is a noble instance of magnificence, and it is hoped will escape the fate of the colleges founded at Moscow, by Peter the Great, which do not seem to have met with the deserved success.

CITIES AND TOWNS.] In considering the chief cities and towns of Russia, Moscow, the ancient capital, attracts the first attention. This city is of very considerable extent in population, though injured by a pestilence in 1771. Prior to this mortality the houses in Moscow were computed at twelve thousand, five hundred and thirty-eight, and the population at not less than two hundred thousand. Moscow is built in the Asiatic manner, in which cities cover a vast space of ground. Petersburg, the imperial residence, is said to contain one hundred and seventy thousand inhabitants; and is the well known, but surprising erection of the last century. It stands in a marshy situation on the river Neva, the houses being chiefly of wood, though there be some of brick, ornamented with white stucco. The stone buildings are few; and Petersburg is more distinguished by its fame, than by its appearance or opulence. The noblest public works are the quays, built of perpetual granite.

INLAND NAVIGATION.] Among other laudable improvements, Peter the Great formed the design of establishing an intercourse by water between Petersburg and Persia, by the Caspian Sea, the Volga, the Mesta, and the lake of Novgorod, &c. but this scheme failed by the ignorance of the engineers. During the long reign of the late empress many canals were accomplished, or at least received such improvements that the chief honour must be ascribed to her administration. The celebrated canal of Vishnei Voloshok

was in some shape completed by Peter, so as to form a communication between Astracan and Petersburg, the course being chiefly afforded by rivers, and it was only necessary to unite the Twertza running towards the Caspian, with the Shlina, which communicates with the Baltic. The navigation is performed according to the season of the year, in from a fortnight to a month, and it is supposed that near four thousand vessels pass annually.

The canal of Ladoga, so called not because it enters that lake, but as winding along its margin, extends from the river Volkof to the Neva, a space of sixty-seven miles and a half, and communicates with the former canal. By these two important canals constant intercourse is maintained between the northern and southern extremities of the empire. Another canal leads from Moscow to the river Don, forming a communication with the Euxine; and the canal of Cronstadt forms a fourth.

MANUFACTURES AND COMMERCE.] By these means the inland trade of Russia has obtained considerable prosperity; and the value of her exports and imports have been long upon the increase. Several manufactures are conducted with considerable spirit. That of isinglass, which is a preparation of the sound, or air bladder of the sturgeon, flourishes on the Volga, the chief seat also of that of kaviar, consisting of the salted roes of large fish. The manufactories of oil and soap are also considerable; and Petersburg exports great quantities of candles, besides tallow, which abounds in an empire so well replenished with pasturage; nor must the breweries and distilleries be forgotten. Salt-petre is an imperial traffic, and some sugar is refined at Petersburg. There are several manufactures of paper, and of tobacco, which grows abundantly in the southern provinces. Linen is manufactured in abundance; the best comes from the government of Archangel. Cotton is little wrought, but the silk manufactories are numerous: coarse cloths, carpets, and hats, are also made in Russia, and leather has long been a staple commodity.

Russia produces vast quantities of flax, which is, however, generally exported unbleached; nor are there wanting fabrics of earthen ware and porcelain. Iron founderies abound; and in the northern government of Olonetz is a grand foundery of cannon.

The

The commerce of Russia was known in the middle ages by the connection between the Hanse towns, in the north of Germany and Novgorod, established about 1276. So wide is now this empire, that it maintains a commerce of the most remote descriptions, on the Baltic and the White Sea, the Euxine, and the Caspian, with Persia, and with China. Russia is supposed to export by the Baltic grain annually to the value of one hundred and seventy thousand pounds, and hemp and flax, raw and manufactured, to the amount of a million and a half sterling.

The commerce of the Euxine or Black Sea, is of inferior moment, its chief exports being furs, salt beef, butter, cordage, sail cloth, kaviar, corn, with iron, linen, and some cotton stuffs. Imports, wine, fruit, coffee, silks, rice, and several Turkish commodities.

The Russian harbours in this sea are Astracan, the chief seat of the Caspian commerce, Gurief, and Kisliar. From Astracan are exported many European manufactures; and the chief imports are raw silk, rice, dried fruits, spices, saffron, sulphur, and naptha. The Hindoo merchants occasionally bring gold, and precious stones. The annual trade is computed at one million of rubles, or two hundred thousand pounds. That of the Euxine is not above one third of this value.

Russia likewise maintains some commerce by land with Prussia. That with Persia is of little moment: the chief imports are silk. There is a considerable trade by land with the Kirguses, who send horses, cattle, and sheep, in return for woollen-cloths, iron, and European articles. That with China, is nearly on a par; each country transmitting to the amount of about two millions of rubles, (four hundred thousand pounds.) Russia exchanges her precious Siberian furs for tea, silk, and porcelain.

The internal commerce of Russia is very considerable; and Siberia is said to afford in gold, silver, iron, copper, salt, gems, &c. to the amount of twelve millions of rubles, (two millions, four hundred thousand pounds,) that between the southern and northern provinces is also of great extent and value. The coin current in the empire, is supposed to amount to about thirty millions sterling, the paper money to about twenty millions of pounds. The Siberian gold and silver supply an important addition to the national currency.

CLIMATE AND SEASONS.] The climate of Russia

in Europe, presents almost every variety from the latitude of Lapland, to that of Italy. But winter maintains the chief sway at Petersburg, the capital, and the Neva is annually frozen from November to March or April. The climate around the Frozen Ocean, and the last European isle upon the N. that of Novaya Zemlia, or the New Land, is of noted severity, the northern side being encompassed with mountains of ice, and the sun not visible from the middle of October till February; while it never sets during June and July. Taurida presents, on the contrary, all the luxuriance of the southern year, while the middle regions are blessed with the mild seasons of Germany and England.

FACE OF THE COUNTRY.] In so wide an empire, the face of the country must also be extremely various; but the chief feature of European Russia consists in plains of a prodigious extent, rivalling in that respect the vast deserts of Asia and Africa. In the south are some extensive *steppes*, or dry and elevated plains, such as that above the sea of Azof, in length about four hundred English miles. The numerous and majestic rivers also constitute a distinguishing feature of this empire.

SOIL AND AGRICULTURE.] The soil is of course also extremely diverse, from the chilling marshes which border the White and Frozen Seas, to the rich and fertile plains on the Volga. The most fertile is that between the Don and the Volga, from Voronetz to Simbirsck, consisting of a black mould, strongly impregnated with salt-petre; that is, a soil formed from successive layers of vegetable remains. In Livonia and Esthonia, the medial returns of harvest are eight or ten fold; and the latter is generally the produce of the rich plains near the Don, where the fields are never manured, but on the contrary are apt to swell the corn into too much luxuriance. Pasturage is so abundant that the meadows are little regarded, and the artificial production of grasses is scarcely known. Some of the meadows are watered, and produce large crops of hay, the dry pastures yield a short but nutritious produce, and in a few of the *steppes* the grass will attain the height of a man, and is seldom mown. Agriculture is hardly known in the northern parts of the government of Olonetz, and Archangel; but in the central parts of the empire has been pursued from time immemorial.

RIVERS.] The majestic Volga forms, through a long space, the boundary between Asia and Europe, belonging properly to the latter continent, in which it arises, and from which it derives its supplies, till at Tzaritzin, about two hundred and fifty miles from its mouth, it turns S. E. into Asia. This sovereign of European rivers derives its sources from several lakes in the mountains of Valday, and government of Tver, between Petersburg and Moscow; and bends its chief course to the S. E.; near its junction with the Kama, an important river, fed by many streams from the Uralian chain, it turns towards the S. W. till it arrives at Tzaritzin. Its comparative course may be computed at one thousand seven hundred miles. This noble river, having no cataracts, and few shoals, is navigable even to Tver. The tributary rivers of the Volga are chiefly from the east, the Kama, which rivals the Volga at their junction, rising in the government of Viatka, and running N. W. afterwards due E. and then S. On the west the chief stream which runs into the Volga is the Oka, which rises in the government of Orel. Next to the Volga, on the west, is the Don, or Tanais, which rises from a lake in the government of Tulan, and falls into the sea of Azof, after a course of about eight hundred miles. The Neiper rises in the government of Smolensk, about one hundred and fifty miles to the south of the source of the Volga, and about one hundred to the S. E. of that of the Duna, or Duina, which flows into the Baltic, by Riga: and after a course of about one thousand miles through rich and fertile provinces, falls into the Euxine. The Bog, or Hypanis, a far inferior stream, falls into the Liman, or estuary of the Neiper. The Niester, derives its source from the north side of the Carpathian mountains, and falls into the Euxine at Akerman, after a course of about six hundred miles.

LAKES.] The chief lakes of European Russia are situated in the N. W. division of the empire. There is a considerable lake in Russian Lapland, that of Imandra; to the south of which the government of Olonetz presents many extensive pieces of water, particularly the large lake of Onega, which is about one hundred and fifty miles in length, by a medial breadth of about thirty. The islands and shores of the Onega are chiefly calcareous, and contain some valuable marbles. To the west is the Ladoga, about

one hundred and thirty miles in length, by seventy in breadth, being one of the largest lakes in Europe. As it has many shoals, and is liable to sudden and violent tempests, Peter the Great opened a canal along its shore, from the Volk to the Neva. The fishery of this lake seems of little consequence; but the northern shores produce the beautiful Finnish marble, which is much used at Petersburg. On the S. W. we find the lake of Peypus, about sixty miles in length by thirty in breadth: the northern part of this lake is styled that of Ishud, the south that of Pzcove. From the Peypus, issues the river Narova, or Narva. To the east is the lake Ilmen, on which stands the ancient city of Novgorod. The Beilo, or White lake, is so called from its bottom of white clay.

MOUNTAINS.] It has already been mentioned that European Russia is rather a plain country, though some parts of it be greatly elevated, such as that which sends forth the three rivers of Duna, Volga, and Nieper. This region which is passed in travelling from Petersburg to Moscow, is by some called the mountains of Valday, from the town and lake of Valday, situated on the ridge; but by the natives it is styled *Vhisokay Plostchade* or elevated ground. In this quarter the ground is strewn with masses of granite, but the hills are chiefly marl, sand, and clay; and what are called the mountains of Valday seem to be a high table land, surmounted with large sand hills, and interspersed with masses of red and grey granite: near Valday is the highest part of the ridge, which seems to be in a N. E. and S. W. direction. Mr. Tooke computes the highest point of the Valday at only two hundred fathoms above the level of Petersburg, about one thousand two hundred feet above the sea: the height is inconsiderable, and gives a striking impression of the gentle and plain level, through which such extensive rivers must pursue their course. The woods on the Valday are chiefly pine, fir, birch, linden, aspen, and alder; the soil in the vale is fertile, mostly clay and marl.

The most important chains of mountains in European Russia are those of Olonetz in the furthest N. and those of Ural, which separate Europe from Asia. The chain of Olonetz runs in a direction almost due N. for the space of fifteen degrees, or nine hundred geographical miles. In the centre, between the mountains of Olonetz

and those of Ural, there seems to be a considerable chain extending from the E. of Mezen to the Canin Nos, a bold promontory which rushes into the Frozen Ocean. The immense Uralian chain extends from about the fiftieth to near the sixty-seventh degree of N. latitude, or about one thousand geographical miles in length, and has by the Russians been called *Semenoi Potas*, or the girdle of the world, an extravagant appellation, when we consider that the chain of the Andes extends near five thousand miles. Pauda, one of the highest mountains of the Uralian chain, is reported by Gmelin to be about four thousand five hundred and twelve feet above the level of the sea.

FORESTS.] European Russia is so abundant in forests that it would be vain to attempt to enumerate them. There are prodigious forests between Petersburg and Moscow, and others between Vladimir and Arzomas. Further to the S. there seems to have been a forest of still greater extent.

MINERALOGY.] The chief mines belonging to Russia are in the Asiatic part of the empire, but a few are situated in the European, in the mountains of Olonetz; and there was formerly a gold mine in that region, near the river Vyg. About 1730 the rich mines began to be discovered in the Asiatic part of the empire. In 1739 gold was first observed in the chain of Olonetz, as already mentioned; and the mines of Vuytzer near the Vyg were opened; but with little success.

MINERAL WATERS.] The most celebrated is near Sarepta, on the Volga, discovered in 1775. The springs are here numerous and copious, and strongly impregnated with iron. In the district of Perekop, and on the isle of Taman, belonging to the government of Taurida, there are springs of Naphtha.

RUSSIAN ISLES.

The small isle of Cronstadt, in the gulph of Finland, is only remarkable for an excellent haven, strongly fortified, the chief station of the Russian fleet. In the Baltic, Russia also possesses the island of Oesel and Dago, which are of a considerable size, but full of rocks, the marble of the first island, is however beautiful. Both isles are chiefly peopled by Esthonians.

There are several isles near the shore of Russian

Lapland; and in the White Sea, but generally barren and uninhabited rocks. Novaya Zemlia, or the New Land, is also uninhabited, and is said to consist of five isles, but the channels between them are always filled with ice. Seals, walruses, arctic foxes, white bears, and a few rein deer, are occasionally hunted by the people of Mezen. To the south of Novaya Zemlia is the sea of Kara (Karskoe) in which the tide flows about two feet nine inches.

The remote and dreary islands of Spitzbergen have been taken possession of by the Russians. The main land of Spitzbergen extends about three hundred miles from the south Cape, lat. seventy-six degrees, thirty minutes, to Verlegan Hook, lat. eighty degrees, seven minutes. In an adjacent small isle are said to be basaltic columns, from eighteen to twenty inches in diameter, and mostly hexagonal. The mountains are of granite and grit; the highest not exceeding four thousand feet; for mountains in general decline in height towards the poles. About the first of November the sun sets, and appears no more till the beginning of February; and after the beginning of May it never sets till August. The only shrubby plant is the Lapland willow, which rises to the height of two inches. Here are found polar bears, foxes, and rein deer, with walruses and seals. There are a few kind of water fowl; but the whale is the lord of these shallow seas. The Russians from Archangel maintain a kind of colony.

AUSTRIAN DOMINIONS.

The dominions subject to the house of Austria embraced, till its late wars with France, many ancient kingdoms and states, which, for the sake of perspicuity, are here brought under one point of view; it having been urged as a reproach to modern geography, that by the obstinate retention of antiquated divisions, and the confused minuteness of separate descriptions, it has not made an uniform progress with modern history and politics, which it ought to illustrate. Hence to use the present instance, many are led to imagine that the power of the house of Austria is chiefly founded on its bearing the imperial title, whereas, if reduced to the regal style of Hungary, its hereditary domains entitle it to

RELIGION.] The preponderant religion of the
Austrian dominions is the Roman Catholic, but
attended with a considerable degree of toleration.
Protestants of various sects are found in Bohemia
and Moravia; nor are Lutherans unknown at
Vienna, though they chiefly abound in Transyl-
vania: nay, in Hungary it is believed that the
Protestants are equal in number to the Catholics.
Vienna did not become a metropolitan see till the
year 1722: the archbishop is a prince of the holy
Roman Empire.

GOVERNMENT.] The form of government is
an hereditary monarchy, and approaching to ab-
solute power. For though Hungary retain its
ancient states, or rather an aristocratical senate,
yet the dominions being so various and extensive,
and the military force wholly in the hands of the
sovereign, no distinct kingdom or state can with-
stand his will: Even Austria has its states, con-
sisting of four orders, clergy, peers, knights,
burgesses; the assembly of Lower Austria being
held at Vienna, and that of the Upper at Linz.
But those local constitutions can little avail
against the will of a powerful monarch, supported
by a numerous army.

Laws.] The laws vary according to the dif-
ferent provinces, almost every state having its pe-
culiar code. The Hungarians in particular have
rigorously defended their laws, though in many
instances, illaudable, the peasantry being in a
state of villanage till 1785. In 1786 Joseph II.
after suppressing villanage in Bohemia and Mo-
ravia, extended the like freedom to Hungary;
and this decree remains uncancelled, though
many of the laws of that well-meaning but in-
judicious monarch expired with their author.
Yet the boasted freedom of Hungary is rather
that of a powerful aristocracy, than of the people
at large. In general the laws may be regarded as
mild and salutary; and the Austrians in particu-
lar are a well-regulated and contented people,
while the Hungarians are often dissatisfied, and
retain much of their ancient animosity against the
Germans.

MANNERS AND CUSTOMS.] Various are the

* In the Hungarian, *Hussar* implies the twentieth, be-
cause twenty peasants are obliged to furnish one horseman

manners and customs of the numerous kingdoms
and provinces subject to the house of Austria.
Vienna, the capital, presents as it were an as-
semblage of nations, in their various dresses. In
Austria Proper, the people are much at their
ease: and the farmers, and even peasantry, little
inferior to those of England. Travellers have
remarked the abundance of provisions at Vienna,
and the consequent daily luxury of food, accom-
panied with great variety of wines. The Austrian
manners are cold, but civil; the women elegant,
but devoid of mental accomplishments. The
youth of rank are commonly ignorant, and of
course haughty, being entire strangers to the cul-
tivation of mind, and condescension of manners,
to be found among the superior ranks of some
other countries, a circumstance more striking to
the English traveller in particular from the vio-
lence of the contrast. An Austrian nobleman or
gentleman is never seen to read, and hence polite
literature is almost unknown and uncultivated.
In consequence of this ignorance, the language
remains unpolished; and the Austrian speech is
one of the meanest dialects of the German, so
that polite people are constrained to use French.
The lower orders, are, however, little addicted
to crimes or vices, and punishments rare: rob-
beries are seldom committed, and murder little
known. When capital punishment becomes un-
avoidable, it is administered with great solemnity,
and accompanied with public prayers, an ex-
ample worthy of universal imitation.

The next people in estimation, and the first in
numbers, are the Hungarians. Their manners
are now considerably tinctured by those of the
ruling Germans, but they remain a spirited people,
and affect to despise their masters. Their dress is
well known to be peculiar, and is copied by our
hussars*. This dress, consisting of a tight vest,
mantle, and furred cap, is graceful; and the
whiskers add a military ferocity to the appear-
ance. The Morlacs, and other inland tribes of
Dalmatia, are honest and sincere barbarians;
and the dress of the Vaivods somewhat resembles
the Hungarian. Dalmatia being divided between
the Greek and Catholic religions, they have grafted
many superstitions upon both.

LANGUAGE.] The languages spoken in these ag-
gregated dominions are numerous and discrepant.

to the cavalry, Busch. iii. 56.

They

They belong chiefly to the three grand divisions, Gothic or German of the ruling nation, the Slavonic of the Poles, part of the Hungarians, the Dalmatians, &c. and also the ancient speech used in Bohemia and Moravia: and lastly the Hungarian Proper, which has been considered as a branch of the Finnic.

UNIVERSITIES.] The universities, like those in other Catholic countries, little promote the progress of solid knowledge. The sciences taught with the greatest care are precisely those which are of the smallest utility. The University of Vienna has, since the year 1752, been somewhat improved. It was founded in 1237, and that of Prague in 1347; that of Inspruck only dates from 1677, and that of Gratz from 1585. Hungary chiefly boasts of Buda, though the Jesuits instituted academies at Raab and Caschau. A late traveller informs us that the university of Buda, by the Germans called Offen, possess an income of about twenty thousand pounds sterling, only four thousand of which are applied to pay the salaries of the professors. "Besides the usual chairs which exist in every university, there are those of Natural History, Botany, and Economy. The collection of instruments for Natural Philosophy, and the models of machines, are good; and the museum of Natural History, which contains the collection of the late professor Piller, besides that of the university, may be ranked among the fine collections of Europe." There is a Calvinist college or university at Debretzin: and the bishop of Erlau has recently established a splendid university at that city.

MANUFACTURES AND COMMERCE.] Manufactures do not seem to be cultivated to a great extent in any part of the Austrian dominions. Vienna perhaps equals any other of the cities in manufactures, which are chiefly of silk, gold and silver lace, cloths, stuffs, stockings, linen, mirrors, porcelain; with silver plate, and several articles in brass. Bohemia is celebrated for beautiful glass and paper. But the commerce of the Austrian dominions chiefly depends upon their native opulence; Austria Proper and the southern provinces producing abundance of horses and cattle, corn, flax, saffron, and various wines, with several metals, particularly quicksilver from the mines of Idria. Bohemia and Moravia are also rich in oxen and sheep, corn, flax, and hemp; in which they are rivalled by the dis-

membered provinces of Poland. The wide and marshy plains of Hungary often present excellent pasturage for numerous herds of cattle; and the more favoured parts of that country produce corn, rice, the rich wines of Tokay, and tobacco of an excellent flavour, with great and celebrated mines of various metals and minerals. The Austrian territories in general are so abundant in the various necessities and luxuries of life, to be found either in the north or south of Europe, that the imports seem to be few and inconsiderable.

CLIMATE AND SEASONS.] The climate of Austria Proper is commonly mild and salubrious, though sometimes exposed to violent winds, and the southern provinces in general enjoy delightful temperature, if the mountainous parts be excepted. The more northern regions of Bohemia and Moravia, with the late acquisitions in Poland, can likewise boast the maturity of the grape, and of gentle and favourable weather. The numerous lakes, and morasses of Hungary, and the prodigious plains, are supposed to render the air damp and unwholesome, the cold of the night rivalling the heat of the day; but the blasts from the Carpathian mountains seems in some measure to remedy these evils, the inhabitants being rather remarkable for health and vigour.

FACE OF THE COUNTRY.] The appearance of the various regions subject to Austria is rather mountainous than level, presenting a striking contrast in this respect to Russia and Prussia. Bohemia and Moravia are almost encircled by various mountains, which on the east join the vast Carpathian chain that winds along the north and east of Hungary and Transylvania, divided from each other by another elevated ridge: the dismembered provinces of Poland, though in the south they partake of the Carpathian heights, yet afford the widest plains to be found within the limits of the Austrian power.

This ample extent of country is also diversified by many noble rivers, particularly the majestic Danube, and its tributary stream the Tiefs, which flows through the centre of Hungary; and scarcely is there a district which is not duly irrigated. The general face of the Austrian dominions may therefore be pronounced to be highly variegated and interesting; and the vegetable products of both the north and south of Europe unite to please the eye of the traveller.

SOIL AND AGRICULTURE.] The soil is upon the whole extremely fertile and productive, in spite of the neglect of industry, which has permitted many parts of Hungary, and of the Polish provinces to pass into wide forests and marshes. Were skill and labour to assume the axe and spade, those very parts might display the greatest exuberance of fertility. The state of agriculture in Moravia is superior to the rest, being improved by Flemish farmers.

LAKES.] The lakes in the Austrian dominions are numerous, and some of them of considerable size. Bohemia presents a few small pieces of water towards its southern boundary: but on entering Austria Proper, the lake of Traun, the Ebersee, and others, are of greater extent. Carinthia contains a large central lake not far from Clagenfurt; and Carniola another, the Cirknitz See.

MOUNTAINS.] Upper Austria, or the western part of this province, contains many considerable mountains, the highest of which is in the maps called Priel, but the proper name is Gressenberg. Towards the N. Austria is divided from Bohemia by a ridge of considerable elevation which passes to the N. E. of Bavaria. On the N. W. Bohemia is parted from Saxony by a chain of metallic mountains, called the Ertzberg, a word that implies hills containing mines. On the W. of the river Eger, near its junction with the Elbe, stands the mountainous groupe of Miesou, supposed to be the highest in the province. On the N. E. the Sudetic chain which branches from the Carpathian, divides Bohemia and Moravia from Silesia and the Prussian dominions.

The Carpathian mountains, that grand and extensive chain which bounds Hungary on the N. and E. have been celebrated from all antiquity. By the Germans they are stiled the mountains of Krapak, probably the original name, which was softened by the Roman enunciation: the Hungarians, a modern people, call them Tatra. This enormous ridge extends in a semicircular form from the mountain of Javornik S. of Silesia towards the N. W. But at the mountain of Trojaska, the most northern summit, it bends to the S. E. to the confines of the Bukovina, where it sends forth two branches, one to the E. another to the W. of Transylvania, which is also divided from Walachia by a branch running S. W. and N. E. The whole circuit may be about five hundred

VOL. II. No. CXXXI.

miles. The highest summits of these mountains, according to Dr. Townson, do not exceed eight or nine thousand feet, and they are for the most part composed of granite and primitive limestone.

FORESTS.] To enumerate the forests in the Austrian dominions would be a task at once laborious and fruitless. Suffice it to observe, that numerous and extensive forests arise in every direction, particularly along the Carpathian mountains, and in the provinces acquired from Poland. Even Bohemia was formerly remarkable for a forest of great extent, a remain of the Hercynia Sylva of antiquity, which extended from the Rhine to Sarmatia, from Cologne to Poland. The Gabreta Sylva was on the S. W. of the same country, where a chain of hills now divides it from Bavaria.

ZOOLOGY.] The domestic animals in the Austrian dominions are commonly excellent, particularly the cattle. Many of the native horses run wild, and are sold in great numbers at the fairs; before they have suffered any subjection. The breed of cattle is mostly of a singular colour, a slaty blue; and the Hungarian sheep resemble the Walachian in their long erect spiral horns, and pendant hairy fleece. In the western parts of the Austrian sovereignty the animals do not seem to be distinguished from those of other parts of Germany. The large breed of wild cattle, called Urus or Bison, is said to be found in the Carpathian forests, as well as in those of Lithuania and Caucasus. Among the wild quadrupeds may also be named the bear, the boar, the wolf, the chamois, the marmot, and the beaver. The Danube boasts of some fishes seldom found in other rivers, among which is a small and delicate sort of salmon.

MINERALOGY.] There is scarcely a province in the Austrian dominions which cannot boast of advantages in the mineral kingdom; and as it were by a destiny attached to the house of Austria, even the acquisitions in Poland contain one of the most remarkable mines in Europe, the saline excavations of Wielitska. The mines of Bohemia have been celebrated from ancient times. Silver is found at Kuttenberg, and at Joachimsthal, on the western frontier, towards Saxony, probably a continuation of the veins of that country, and gold has been discovered at Keonstock. One of the most singular products of this province is tin,

S. S

which

which is found at Zinwald (that is the tin forest), and other western districts of Bohemia: where is also found, at Dreyhacken, a mine of very pure copper. Lead occurs at Bleystadt, in the same quarter. The garnets of Bohemia are among the most beautiful of the kind. They are chiefly found in clay, mingled with mica, at Meronitz, in the mountain of Stiefelberg, whence they are carried to Bilen. The women wash the clay in which the garnets are found; after which they are sifted and arranged according to size; and sold by the pound weight from about three to ten shillings. Many workmen are occupied in cutting and piercing them, for necklaces, and other ornaments: they are polished in facets, with emery on a piece of freestone, and pierced with a small diamond. This branch of commerce is of great antiquity at Carlsbad, and at Walkirk in Suabia, where twenty-eight mills are occupied in this article only. The iron of Stiria supplies the finest steel; there are considerable lead mines near Pegau, on the river Mohr, yielding about five thousand tons yearly. Stiria also affords coal at different places; not to mention minerals of mere beauty or curiosity, among which may be named the singular blue granite, which is found near Krieglach, in Stiria.

The quicksilver mines of Idria are celebrated in natural history, poetry, and romance. They were discovered in the year 1499; and the hill of Vogelberg has annually yielded more than three hundred thousand pounds weight of mercury. The common ore is cinnabar; but sometimes pure quicksilver runs through the crevices.

About forty miles to the S. of the Carpathian hills are the gold mines of Kremnitz: and twenty English miles further to the S. the silver mines of Schemnitz: cities which have arisen solely from these labours, and thence called mining towns. Schemnitz is esteemed the principal.

The salt mines acquired from Poland are situated at Wielitska, eight miles to the S. of Cracow, being excavated at the northern extremity of a branch of the Carpathian mountains.

PRUSSIA.

This kingdom, which only commenced with the eighteenth century, by gradual accessions became so extensive, as deservedly to rank among the first powers of Europe. The dominions of Prussia were small and scattered, till the acquisition

of Silesia, and afterwards of a third part of Poland, gave a wide and stable basis to the new monarchy. But this powerful monarchy was completely overturned by the French emperor Napoleon, in the year 1806, but its final destiny does not appear to be yet determined.

RELIGION.] The ruling religion of Prussia is the Protestant, under its two chief divisions of Lutheran and Calvinistic. But after the recent acquisitions in Poland, it would seem that the greater number of the inhabitants must be Roman Catholic. The universal toleration which has been wisely embraced by the Prussian monarchs, has had its usual effect of abating theological enmity, and the different sects seem to live in perfect concord. Of the present form of government, the state of the army, and its revenues, nothing can be said till its destination shall be determined by the emperor of the French.

MANNERS AND CUSTOMS.] Travellers have remarked, that, in comparison with the Saxons, who are a lively and contented people, the Prussians appear dull and gloomy; a character which they impute partly to the military government, and partly to the general anxiety which must have been excited by the repeated dangers to which their country was exposed, when contending with the powers of Russia and Austria. As to the Poles, they seem full of life and action, but their features and general appearance are rather Asiatic than European. "Men of all ranks generally wear whiskers, and shave their heads, leaving only a circle of hair upon the crown. The dress of the higher orders, both men and women, is uncommonly elegant. That of the gentlemen is a waistcoat with sleeves, over which they wear an upper robe of a different colour, which reaches down below the knee, and is fastened round the waist with a sash or girdle; the sleeves of this upper garment are, in warm weather, tied behind the shoulders; a sabre is a necessary part of their dress, as a mark of nobility. In summer the robe, &c. is of silk, in winter of cloth, velvet, or stuff, edged with fur. They wear fur caps or bonnets, and buskins of yellow leather, the heels of which are plated with iron or steel. The dress of the ladies is a simple polonaise or long robe, edged with fur."

LANGUAGE.] The ruling language of Prussia is the German, which it is probable may in time supplant the Polish, in those parts which are subject to Prussia and Austria.

UNIVERSITIES.]

UNIVERSITIES.] There are, however, several universities, such as that of Frankfort on the Oder, founded by Joachim, elector of Brandenburg, in the year 1516. Konigsberg in Prussia, was founded in 1544. Of the Polish Universities, Posna or Posen became subject to Prussia.

CITIES AND TOWNS.] Among the chief cities of Prussia must first be mentioned Berlin, situated on the banks of the river Sprey, and regularly fortified. It was founded in the twelfth century, by a colony from the Netherlands, and contains one hundred and forty-two thousand inhabitants, being about four miles and a half long and three wide; but within this inclosure are many gardens, and sometimes even fields; the number of houses is six thousand nine hundred and fifty. The city is more remarkable for the elegance of the buildings than for its wealth or industry, many beautiful houses being let in stories to mechanics. Next to Berlin may be mentioned Konigsberg, of which the population is computed at about fifty-two thousand. This city was founded in the thirteenth century, and is well fortified. It maintains a considerable trade by the river Pregel, which flows into the gulph of Dantzick.

MANUFACTURES AND COMMERCE.] If we except the linens of Silesia, the manufactures of the Prussian dominions are of small importance. Yet they afford, for home consumption, glass, iron, brass, paper, and woollen cloth; and Frederick II. introduced a small manufacture of silk.

If we except the ancient staple of grain, so abundant in the level plains of Poland, the commerce of Prussia is comparatively of but little consequence. Amber is by nature constituted a monopoly of the country, but fashion has rendered this branch of commerce insignificant. Yet among the considerable exports may be named excellent timber of all kinds, skins, leather, flax, and hemp; nor must the linens of Silesia be passed in silence, many of which are sent into Holland, and sold under the name of Dutch manufacture. In return, Prussia receives wine, and other products of more southern and favoured countries.

CLIMATE AND SEASONS.] The climate of the Prussian dominions is, upon the whole, cold and moist. Prussia Proper, which, as Busching informs us, has about eight months of winter, the autumn being often deluged with rain. The

northern part of Poland, which fell under the Prussian sceptre, abounds with forests and marshes, which cannot be supposed to render the air salubrious.

FACE OF THE COUNTRY.] In considering the general appearance of Prussia Proper, we must observe that it formerly abounded in woods, and displays superior fertility, a character which may be also extended to Prussian Poland.

SOIL AND AGRICULTURE.] The space between Berlin and Potsdam resembles a wilderness; but that of Prussian Poland is loamy and fertile. Agricultural improvements, however, are little known; but Prussia Proper displays every kind of grain and esculent plant that can flourish under such a latitude; yet the wine is of inferior quality.

RIVERS.] Among the chief rivers of the Prussian dominions may be first mentioned the Elbe, which rises in the S. of Bohemia, and pervades the duchy of Magdeburg. The Sprey, which passes by Berlin, falls into the Havel, a tributary of the Elbe. The Oder, the Viadrus of the ancients, may be regarded as a river entirely Prussian: it rises in the mountains of Moravia, and, after watering Silesia, Brandenburg, and Pomerania, joins the Baltic, after a course of about three hundred and fifty miles. Next appears another noble stream, the Vistula, which, rising in the Carpathian mountains, passes Warsaw, and joins the sea near Dantzick, after a circuit of about four hundred and fifty miles. The Pregel, passing by Konigsberg, springs from some lakes and marshes in Prussian Poland; and the Memel, a superior river, now forms in part the Prussian boundary on the east.

LAKES.] The lakes in the Prussian dominions are numerous, especially in the eastern part, where among others may be mentioned the Spelding See, which, with its creeks, extends more than twenty British miles in every direction. That region contains many other lakes, which supply the sources of the river Pregel. At their estuaries the rivers Oder, Vistula, and Memel, present singular inland sheets of water, in the German language called *Haffs*; that of the Oder being styled *Grass Haff*; that of the Vistula, *Frisch Haff* (with another inland creek called the lake of Drausen); and that of the Memel, *Curisch Haff*. The *Frisch Haff* is about seventy miles in length, and from three to

ten

ten miles broad, being separated from the Baltic by a long slip of land, said to have been thrown up by the tempests and waves about the year 1190. The lake, or bay, is of small depth, and will not admit vessels of much burthen.

The Curisch Haff, so called from its situation in the ancient duchy of Conrland, is about sixty British miles in length, and about thirty in its greatest breadth. A similar ridge of land divides it from the Baltic; and it is full of dangerous shelves, and infested by frequent storms.

MINERALOGY.] A peculiar mineral production of Prussia is amber, which is chiefly found on the Samland shore of the Baltic, near Pillau, on a neck of land formed by the Frisch Haff, which seems to have been the chief seat of this mineral from the earliest ages. It is found at the depth of about one hundred feet, reposing on wood coal, in lumps of various sizes, some five pounds in weight, and is often washed on shore by tempests. It adds about five thousand pounds yearly to the royal revenue.

MINERAL WATERS.] Silesia presents one spring of hot water at Warmbrun, near Hirschberg, which is believed to be the only mineral water worth notice in the Prussian dominions.

SPAIN.

EXTENT.] Spain lies between the thirty-sixth and forty-fourth degrees of north latitude; its western extremity is about nine degrees in longitude W. from London, and its eastern extremity about three degrees. The greatest length from W. to E. is about six hundred miles; the breadth from N. to S. more than five hundred; thus forming almost a compact square (if we include Portugal in this general view of the country), and surrounded on all sides by the sea, except where the Pyrenean chain forms a grand natural barrier against France.

Divisions.] The most recent subdivisions of Spain are into the following provinces:

- | | | |
|------------------------|---|---|
| On the Bay of Biscay | — | 1. Galicia. |
| | | 2. Asturias, including Oviedo and Santillana. |
| | | 3. Biscay, including Biscay, Guipuscoa and Alava. |
| On the French frontier | — | 4. Navarre. |
| | | 5. Arragon. |
| | | 6. Catalonia. |

- | | | |
|---|---|---|
| On the Mediterranean coast | { | 7. Valencia. |
| | | 8. Murcia. |
| | | 9. Granada. |
| On the entrance to the Straits of Gibraltar | — | 10. Andalusia, including Seville, Cordova, and Jaen. |
| | | 11. Estremadura. |
| On the frontier of Portugal | { | 12. Leon, including Leon, Palencia, Zamora, and Salamanca. |
| | | 13. Old Castille, including Burgos, Avila, and Segovia. |
| Midland | — | 14. New Castille, including Toledo or Algarria, Cuenca or La Sierra, and La Mancha. |

ANTIQUITIES.] Of the first epochs it can hardly be supposed that any remains should exist, except a few tumuli, and other rude monuments. Nor are there any certain relics of the Carthaginians in Spain, except coins, which have been found in considerable numbers.

The Roman antiquities are, on the contrary, so numerous, that to enter into details on the subject would be prolix, and foreign to the nature of this work. The aqueduct at Segovia is one of the noblest of the Roman edifices. Morviedo, the ancient Saguntum, presents many curious remains of antiquity. Tarragona, the ancient Tarraco, also contains several interesting monuments.

The Visigothic kings have left few relics, except their coins, which are struck in gold; a metal then unknown to the other European mints; and seemingly native. The churches, &c. of that period were probably destroyed by the Moorish conquest.

Numerous and splendid are the monuments of the Moors in Spain. The mosque at Cordova was begun by Abdurrahman, the first khalif. The second khalif of that name reared the walls of Seville. But these princes were far exceeded in magnificence by Abdurrahman III. who built a town three miles from Cordova, which he called Zehra, after the name of one of his female favourites; and ordered a palace to be constructed by the most skilful architects of Constantinople; then the chief abode of the arts and sciences (A.D. 950). In this palace were reckoned one thousand and fourteen columns of African and Spanish marbles; while Italy had supplied nineteen, and the Greek emperor had transmitted one hundred and forty of surprising beauty.

beauty. The hall was decorated with marble and massy gold; and in the midst of the ceiling was hung the famous pearl which the emperor Leo had sent to the khalif. The palace of Zebra appears to have been annihilated in the barbarous and fanatic wars of the middle ages: and Granada, the last Moorish kingdom, having been subdued after the arts and sciences began to revive, it is natural there to expect the best preserved remains of Moresque antiquity.

The Christian antiquities of the middle ages consist of numerous churches, castles, and monasteries, as usual in other European countries.

RELIGION.] The religion of Spain is the Roman Catholic, which, in this country and Portugal, has been carried to a pitch of fanaticism unknown to the Italian states, or even to the papal territory. The inquisition has, in these unhappy kingdoms, been invested with exorbitant power, and has produced the most ruinous effects, and though the evil has been recently subdued, one fanatic reign would suffice to revive it.

GOVERNMENT.] The present state of Spain will not permit us to say any thing concerning its government: the war carried on in that country, and the detention of the king, afford little doubt of Spain becoming shortly subject to the emperor Napoleon.

POPULATION.] The population of this kingdom is computed at little more than ten million; but in consequence of the war now carrying on with France even that number has been greatly diminished.

COLONIES.] After the discoveries of Christopher Columbus, the Spanish colonies soon became numerous and extensive, in the West Indies, South America, and various isles in the Pacific Ocean. No nation can in this respect rival Spain. But the superior advantages of England, in religious and political freedom, have soon replaced the population thus withdrawn, while to Spain the wound has been incurable, as the causes of depopulation have always increased.

MANNERS AND CUSTOMS.] In speaking of the religion of Spain, one of the most striking of the national customs and manners is the common practice of adultery, under the mask of religion. This disgrace, which is confined to the catholic

system, is said to have been transplanted from Italy. But the Italian *cicisbei* are more commonly gentlemen; while in Spain they are monks and ecclesiastics; and the vice becomes more flagrant, as it is practised by those very men who ought to exhibit examples of pure morality.

Exclusive of this vice, the Spanish character is highly respectable for integrity and a long train of virtues. Conscious of an upright and noble mind, the respect which a Spaniard would pay to those qualities in others, is often centred in himself, as he is intimately sensible that he possesses them. This self-respect is nearly allied to pride; but it is the pride of virtue, which certainly ought not to humble itself before vice and folly. Temperance is a virtue which the Spaniard shares in common with other southern nations. In these countries the body is so much exhausted by the influence of heat, that the siesta, or short sleep in the middle of the day, becomes a necessary resource of nature, and is by habit continued even in the winter.

The chief defect in the character of the Spanish nobility and gentry is, their aversion to agriculture and commerce. Instead of those beautiful villas, and opulent farms, which enrich the whole extent of England, the Spanish architecture is almost confined to the capital; and a few other cities and towns; and till farm-houses are scattered over the kingdom, it will be absolutely impossible for agriculture to flourish in Spain. To import German colonies, as has been done in the Sierra Morena, is to begin at the wrong end, and to suppose that the poor can set an example to the rich. An intimate connexion and intermixture of all ranks of men, and their mutual respect for each other, form a liberal source of the wealth and power of the British dominions; but Spain, perhaps, despises the example of heretics.

Since the accession of the house of Bourbon, a slight shade of French manners has been blended with the Spanish gravity. But fashions have here little sway; and the prohibition of slouched hats and long cloaks led to a serious insurrection. The houses of the great are large and capacious; but the cottages and inns are, on the contrary, miserable. The dress and manners of the lower classes vary much in different provinces.

CUSTOMS OF SPAIN.
The Spaniards are very
superstitious, and
the Pope is the
supreme head of
the church.

The amusements of people of rank chiefly consist in dancing and cards; but the combats with bulls in the amphitheatres have justly been regarded as the most striking feature of Spanish and Portuguese manners. The chief actors in the bull-fests are the picadors, who are mounted on horseback and armed with lances, and the chulos on foot, who relieve and sustain the former; but the chief personage is the matador, who enters amid the profound silence of the whole assembly, and coolly dispatches the furious animal by a blow where the spinal marrow joins the head. The death is bloodless and instantaneous, and deserves imitation, as humanity would wish to save pain to the animals slaughtered for food. Sometimes the bull is pierced in various parts with lances, to which squibs are fastened, which being set on fire, the maddened animal stands pawing the ground, while he draws in and exhales volumes of smoke: sometimes an American is introduced, who, after the manner of hunting the wild bull in his own country, throws a rope round the horns, and entangles the quadruped as in a net, then kills him with perfect safety.

LANGUAGE.] The Spanish language is one of the three great southern dialects which spring from the Roman; but many of the words become difficult to the French or Italian student, because they are derived from the Arabic, used by the Moors, who for seven centuries held dominion in this country. The speech is grave, sonorous, and of exquisite melody, containing much of the slow and formal manner of the Orientals, who seem sensible that the power of speech is a privilege.

UNIVERSITIES.] The universities, or rather academies, in Spain, are computed at upwards of twenty: of which the most noted is that of Salamanca, founded in the year 1200 by Alphonso IX. king of Leon. The students have, at former periods, been computed at sixteen thousand; and, even now the reign of Aristotle in logic and natural philosophy, and of Thomas Aquinas in theology, continues unviolated, so that a student of the year 1800 may aspire to as much ignorance as one of the year 1300. In 1785 the number of students was computed at one thousand nine hundred and nine.

CITIES AND TOWNS.] Madrid, the royal residence, is esteemed the capital of Spain. Philip

II. first established his court at Madrid, and the nobility, in consequence, erecting numerous palaces, this formerly obscure town began to assume an air of grandeur. The central position seems the chief advantage, for the environs can boast of little beauty or variety. The river Mançanares is in winter a torrent, but dry in summer: over it is an elegant bridge, which occasioned a sarcastic remark that the bridge should be sold in order to purchase water. This metropolis contains about one hundred and forty-seven thousand three hundred and fifty inhabitants. The convents are sixty-six; and there are fifteen gates of granite, many of which are elegant. The chief is the Puerta de Alcala, of three arches, the central being seventy feet in height. The churches and monasteries contain many noble paintings, and the royal palaces display considerable magnificence. The new palace presents four fronts of four hundred and seventy feet in length, and one hundred in height, enriched with numerous pillars and pilasters. The foundation was laid in 1737, three years after the ancient palace had fallen a sacrifice to the flames. The audience-chamber is deservedly admired, being a double cube of ninety feet, hung with crimson velvet, and adorned with a sumptuous canopy and painted ceiling.

Gibraltar, so called from a Moorish or Arabic denomination, signifying the mountain of Tarik, who conducted the Moors into Spain, stands on the west side of a rocky mountain called Calpe by the ancients; and to the west of the town is a large bay. In 1462 it was taken from the Moors; and in 1704 fell into the hands of the English. The siege during the American war is of fresh and celebrated memory. The inhabitants of the town are about five thousand; and the garrison generally amounts to as many. The number and strength of the military works, and the vast galleries opened in the calcareous rock, excite admiration. There is a stalactitic cave that of St. Michael, and bones are found in the rock, which seem to have fallen into the cavities where they are enveloped in the exuding petrefaction. The fortress, in the opinion of most military men, is absolutely impregnable.

CLIMATE AND SEASONS.] The climate of Spain has been deservedly praised, as equal if not superior to that of any country in Europe; but in the southern provinces the heat is insalubrious

and malignant fevers sometimes sweep off great numbers. The chains of mountains which pervade Spain at different intervals from east to west, seem to temper the climate; and supply cooling breezes. In the south the sea breeze, beginning about nine in the morning, and continuing till five in the evening, agreeably diversifies the warmth of the summer; and in the northern provinces the severity of winter is allayed by the proximity of the ocean, which generally supplies gales rather humid than frosty.

FACE OF THE COUNTRY.] The face of the country is in most seasons delightful, abounding with excellent and fragrant pasturage, vineyards, and groves of orange trees; and the hills clothed with wild thyme and other odoriferous plants. The rivers and streams are numerous, and the chains of mountains afford a grand variety to the prospect.

SOIL AND AGRICULTURE.] The soil is generally light, and reposes on beds of gypsum, or plaster of Paris, itself an excellent manure. In the more southern provinces the land is almost equally fertile; and the sugar-cane is cultivated with success near Granada. Agriculture is greatly impeded in Spain by the superior attention paid to the large flocks of sheep, which are authorized by a special code, the *mesta*, to travel from one province to another, as the season presents pasturage in the vales, or on the mountains. The Merino sheep, or flocks, thus privileged, are computed at five millions; and one nobleman has sometimes forty thousand. The fleece is esteemed double the value to that of other sheep; but the checks given to agriculture by such privileges, unknown to all other countries, are incalculable.

RIVERS.] Among the chief rivers of Spain are the Ebro, which anciently conferred an appellation on the country. This noble stream rises in the mountains of Asturias, in a small vale E. of Reisona, and pursuing its course to the S. E. enters the Mediterranean Sea, after having run about three hundred and eighty geographical miles. The other rivers running to the east are of less importance, as the Guadalaviar, the Xucar, and the Segura, which enlivens the fertile vales of Murcia. Towards the W. occurs the Guadalquivir. This river originates in the Sierra Morena, and flows into the gulf of Cadiz, after a course of near three hundred geographical

miles. The Guadiana rises in the N. side of the Sierra Morena; pursues a part of its course through Portugal, and falls into the gulf of Cadiz, after a circuit nearly equal to that of the Ebro. But the chief river of Spain and Portugal is the Tajo, or Tagus, which rises in the west of Arragon, near Albarracin, in a spring called Abrega, and holds a course of about four hundred and fifty geographical miles. The Douro springs near the ruins of ancient Numantia; and its course may be computed at three hundred and fifty geographical miles. The Minho rises in the mountains of Galicia; and is more remarkable as forming a part of the boundary between that province and Portugal.

MOUNTAINS.] The Spanish mountains are arranged by nature in several distinct chains. The most northern is regarded as a continuation of the Pyrenees, passing on the south of Biscay and the Asturias in Galicia. This chain is distinguished by different names, as the mountains of Biscay, the Sierra of Asturias, and the mountains of Mondonedo in Galicia. It must be here observed that the term of *Sierra*, peculiar to Spain, implies a chain of mountains whose successive peaks present the resemblance of a *saw*. The gypseous and argillaceous mountains of this country rarely exhibiting any supreme elevation, like those in the granitic chains, naturally suggested this singular appellation. The second chain of Spanish mountains extends from near Soria on the N. E. and pursues a S. W. direction towards Portugal. This chain is called that of Urbia or Guadarama; and also the *Montes Carpentarios*. The third is that of Toledo, running nearly parallel with the last. These two central chains contain great quantities of granite. Next, towards the S. is the Sierra Morena, or Brown Mountains, which are followed by the most southern ridge, that of the Sierra Nevada. On the east there is a considerable chain, which connects the central ridges, and advances towards the Mediterranean in the north of Valencia. There are also several considerable ranges of hills in this part of the kingdom, generally running from N. to S.

A remarkable solitary mountain, not far from Barcelona, must not be omitted. At a distance Montserrat appears like a sugar loaf; but on a nearer approach seems jagged like a saw with pyramidal rocks; it is composed of limestone and

and gravel, united by calcareous cement; and is of such a height that from its summit may be discerned the islands of Majorca and Minorca, at the distance of fifty leagues. Not far from Montserrat, near the village of Cardona, is a hill three miles in circumference, which is one mass of rock salt, used in the dry climate of Spain for vases, snuff-boxes, and trinkets, like our Derbyshire spar.

The Spanish side of the Pyrenees has not been accurately examined; and as the French mineralogists have amply illustrated the part belonging to France, an account of these mountains has been given in the description of that country. According to Townsend, the northern side of the Pyrenees is chiefly calcareous, surmounted with argillaceous schistus; but the southern is granite, and of course barren. The hills to the south of Gerona are also granitic. The highest ridge in Spain, near Daroca, whence originate the Tago and Ebro, seems composed of argillaceous schistus and freestone, probably resting on granite. Near Anchuela the mountains are limestone, with shells; and sometimes contain beds of red gypsum, with crystals of the same colour. In general gypsum is as abundant in Spain, as chalk is in England. The mountains on the north of Madrid, forming part of the central chain, are granite. Those to the north of Leon chiefly marble or limestone, on a basis of argillaceous schistus, rising in bold and rugged rocks which afforded a barrier to the remains of Spanish liberty. In returning towards the south, the soil of La Mancha is sandy, the rock gypsum. The higher regions of the Sierra Morena are granite; the lower argillaceous schistus, with gypsum and limestone. The granite is of two kinds, the red and the white.

Near Cordova the highest hills are covered with rounded masses of granite, grit, and limestone. Near Malaga are branches of the Sierra Nevada, or snowy chain, an appellation which might also be extended to the central range between Old and New Castille, which, according to Mr. Townsend, might at some times be visible at the distance of one hundred miles; these branches present limestone and marble, surmounted by argillaceous schistus. Near Alhama, S. E. of the city of Granada, are found rocks, which on a basis of shingle or round gravel, present sandstone with shells, surmounted with pudding-stone, but in general the rocks are gyp-

seous, with strata of the same substance crystallized. The S. E. part of Spain seems calcareous, and the cathedral of Murcia is built with a sort of freestone resembling the roe of fish. But near Cape de Gata the hills seem to have been volcanic, as French mineralogists have inferred from the singularity of its productions.

FORESTS.] Spain contains many forests, partly arising from the want of cultivation, partly reserved for the royal pleasures of the chase; as that of the Pardo, which extends near thirty miles in length; some of the forests are haunted by smugglers and banditti, who raise contributions from the unwary travellers; and even murders are not unfrequent.

ZOOLOGY.] The glory of the Spanish zoology is the horse, which has been famous in all ages, probably originating from the barb, or beautiful and spirited steed from the north of Africa, the immediate offspring of the Arabian. The Spanish mules are also excellent, and the ass is here no ignoble animal; though not equal to that of Arabia. The breed of sheep has been long celebrated as perhaps superior to any in the world, for the delicacy of the mutton; and the beauty of the fleece. The purity of the air, and aromatic pasture, no doubt contribute to both qualities, which it is to be suspected would degenerate on transportation.

MINERALOGY.] The mineralogy of Spain was anciently of more importance than in modern times. Pliny*, after observing that silver was generally found with galena, or lead ore, proceeds to state that the fairest of all silver was found in Spain; where the pits, begun by Hannibal, lasted to his time, being known by the names of their original discoverers. That called Bobelo had yielded to Hannibal three hundred pounds weight a day, a mountain being pierced for a mile and a half, through which the workmen directed large streams of water; so that the plan pursued seems to have been that called bushing by modern writers. Strabo† informs us that the province of the Turditani, modern Andalusia, was the most productive of precious metals; and gold, silver, brass, and iron, were no where found more abundant, nor of better quality; gold was found in the sands of the rivers and torrents, a known attribute of the Tagus. Polybius informs us concerning the mines of silver near Carthago, which occupied a number of work-

men, and yielded to the Romans twenty-five thousand drachms daily. Other mines of silver were found near the sources of the Batis. This intelligence becomes of the more importance, as Britain and other regions of the west certainly derived their gold and silver from Gaul and Spain, in return for cattle, hides, and other products. At present almost the only silver mines in Spain are those of Guadalcanal, in the Sierra Morena. At Almaden, in La Mancha, are valuable mines of quicksilver, which are chiefly re-mitted to Spanish America, and employed in refining the more precious metals. Calabine appears near Alcavas, cobalt in the Pyrenees; antimony in La Mancha; copper on the frontiers of Portugal*; tin in Galicia: and lead is common in many districts. The iron of Spain is abundant, and still maintains its high character; and coals are found in the district of Villa Franca, in Catalonia, where also occur gold, silver, copper, and lead†. Amber and jet (in Spanish Azabache) are found together in the territory of Beloncia in the Asturias. The other minerals are rather curious than important, such as the beautiful crystallized sulphur found at Conilla, not far from Cadiz, the elastic marble of Malaga, and the green marble resembling the verde antico, found near Grenada.

MINERAL WATERS.] Spain contains many mineral waters, but few are celebrated. The hot springs of Rivera de Abajo are situated not far from Oviedo; and bear some resemblance to those of Bath. Near Alicant are the baths of Buzot, warm springs of a chalybeate nature, rising like the former, among calcareous hills.

SPANISH ISLES.

The chief circumjacent islands belonging to Spain are Majorca, Minorca, and Eviza; or, according to Spanish orthography, Mallorca, Menorca, Ibiza. Majorca is about fifty-five English miles in length, by forty-five in breadth. The N. W. part is hilly; the rest abounds with cultivated land, vineyards, orchards, and meadow; the air is temperate, and the honey highly esteemed: there is generally a considerable military force in the isle. The capital, seated on a fair bay, is an elegant city, and is supposed to contain ten thousand inhabitants. Majorca was re-

conquered from the Moors by James I. king of Arragon, in 1229. Majorca is generally in too strong a state of defence to admit of an easy conquest, but Minorca has been repeatedly seized by the English, to whom it presents an advantageous station for the Mediterranean trade. It is about thirty miles in length, by about twelve of medial breadth. The air is moist, and the soil rather barren, being chiefly calcareous, with lead and fine marble. The wine is praised; and the inhabitants retain a share of their ancient reputation as excellent slingers. Cittadella, the capital, has a tolerable haven, but the population and fortifications are of little consequence. Port Mahon, on the S. E. has an excellent harbour, and received its name from Mago, the Carthaginian general. Eviza is the nearest to Spain, about fifteen miles long, and twelve broad. It is remarkable for its fruits, and abundance of excellent salt.

TURKEY IN EUROPE.

The Turkish empire, once so formidable to Europe, has lately sunk before the power of Russia. Turkey in Europe is computed to contain one hundred and eighty two thousand, five hundred and sixty square miles; an extent which exceeds that of Spain, or even France under the ancient monarchy. It embraces many ancient kingdoms and republics. 1. Moldavia; 2. Budzac, or Bessarbia; 3. Wallachia; 4. Bulgaria; 5. Romelia; 6. The Morea; 7. Albania; 8. Dalmatia; 9. Servia; 10. Bosnia; and 11. Turkish Croatia.

In recent times Turkey has lost the provinces of the Krini, and New Servia, which, with several Asiatic districts, have become subject to Russia; and on the west, Transylvania, Sclavonia, with the Buckovina, part of Moldavia, and a great part of Croatia, have fallen under the power of Austria.

EXTENT.] Turkey in Europe extends about eight hundred and seventy miles in length, from the northern boundary of Moldavia, to Cape Matapan in the Morea. The breadth from the river Unna to Constantinople is about six hundred and eighty British miles. The eastern and

* See Dillon, 195, for an account of the copper-mine of La Platilla, near Molina.

† Towns, iii. 341, 345.

southern boundaries are formed by the Euxine or Black Sea, the Sea of Marmora, the Archipelago, and the Mediterranean. The utmost northern limit is now the river Dniester: but the western often consists of an arbitrary line, and is sometimes supplied by rivers or mountains.

ANTIQUITIES.] The ancient monuments of European Turkey are well known to exceed in number and importance those of any other country. The remains of ancient Athens, in particular, formerly the chosen seat of the arts, have attracted the attention of many travellers, and have been repeatedly described. A venerable monument of antiquity, the church dedicated to the divine wisdom, or vulgarly Sancta Sophia, by the emperor Justinian, in the sixth century, has been fortunately preserved, by being converted into a mosque. The interior is adorned with a profusion of marble columns, of various beautiful descriptions, the purple Phrygian, the Spartan green, the red and white Carian, the African of a saffron colour, and many other kinds. The other antiquities of Constantinople and European Turkey, would occupy many pages in the bare enumeration. Suffice it here to observe, that the French have recently discovered the remains of the ancient sea-port belonging to Sparta, near a barren promontory, which projects from the south of the Morea; and that the antiquities and geography of that part now styled Albania, still present a field of research to the enterprising traveller.

RELIGION.] The religion of the Turks is the Mohammedan; but of their subjects, in this division of the empire, it is probable that two-thirds are Greek Christians. The religion of Mohammed has been recently cleared from many erroneous representations; but its pernicious effects are sufficiently visible in the destruction of art and industry, wherever it has made its appearance. The exclusive attachment to the Koran, the rigid fanaticism, and the contempt for profane knowledge, conspire, with the devout hatred against all unbelievers, to prevent any intercourse with other sects, and thus to erect a barrier against every branch of science and industry. While the Mohammedans regard all other nations as dogs, (to use their own expression), it is no wonder that they themselves should sink into an ignorance and apathy truly brutal. The mufti, or Mohammedan pontiff, pre-

sides at Constantinople; but his power has seldom interfered with the civil government. Next to him in rank are the moulahs, who, though esteemed dignitaries of the church, are in fact rather doctors of the law, while the Koran is also a code of civil observance. From the moulahs are selected the inferior muftis or judges throughout the empire, and the cadesquiers, or chief justices.

GOVERNMENT.] The sultan is a despotic sovereign; but he is himself strictly subject to the laws of the Koran, which, including also the national religion, raise such obstructions to his absolute will, that an intelligent traveller pronounces many Christian sovereignties more despotic. Hence it appears, that the power of the monarch is balanced by a religious aristocracy, which, together with the mutinies of the Janizaries, and the insurrections of the provincial pachas, has greatly weakened the sovereign authority.

The Turkish laws are contained in the Koran; but to supply the defects of this work, successive moulahs of high reputation, using the Koran as a kind of text, have constructed commentaries which have acquired the force of laws. The Turkish empire is chiefly guided by those of Abou Hanife. As a due skill in these commentaries require considerable study, ecclesiastics versed in this science became in some degree a distinct body from those merely dedicated to the priesthood.

POPULATION.] Turkey in Europe has been computed to contain eight millions of inhabitants; but it is probable that this number rather exceeds the truth, when it is considered that these regions are intersected by many mountainous and barren tracts, and that the population even of the best provinces impresses travellers with a striking defect.

REVENUES.] The revenues of the whole Turkish empire are computed at about 7,000,000 sterling, while the usual expence does not exceed five. This revenue is partly derived from the capitation tax on unbelievers, and from the *zechat*, or customs; but principally from the tax on land, amounting to about six shillings an acre, and which is called the *jizie*. The sultan is also supposed to possess a considerable private treasure; which, when called forth by the exigencies of the state, will probably be found of as

power has set-
ernment. Next

more real treasure may be expected from the
arbitrary exactions from the rich, particularly
the Christians.

MANNERS AND CUSTOMS.] The manners and
customs of the Turks are distinguished by the
peculiarity of their religion from those of other
European nations. On the birth of a child, the
father himself gives the name, putting at the
same time a grain of salt into his mouth. Mar-
riage is only a civil contract, which either party
may break, and is managed by female mediation,
the youth seldom seeing his bride till after the
ceremony. The burial-grounds are near the high-
ways, and stones are often placed at the head of
the graves, with carved turbans denoting the sex.
As they never intrench upon a former grave, the
cemeteries are very extensive. In diet the Turks
are extremely moderate, and their meals are dis-
patched with great haste. Rice is the favourite
food, and is chiefly dressed in three ways; the
pilau, boiled with mutton or fowl; the huppa,
or mere boiled rice; and the tchorba, a kind of
broth of the same vegetable. The meal is usually
spread on a low wooden table, and the master of
the house pronounces a short prayer. The frugal
repast is followed by fruits and cold water, which
are succeeded by hot coffee and pipes with
tobacco. The houses of the Turks are seldom
expensive; and the chief furniture is the carpet
which covers the floor, with a low sofa on one
side of the room. In regard to dress, Tourne-
fort observes that the use of the turban is un-
healthy, because the ears are exposed, and its
thickness prevents perspiration. The shirt is of
calico; and the loose robe is fastened by a girdle,
in which is stuck a dagger; while the tobacco
box, pocket book, &c. are worn in the bosom.
The robe is generally of European broadcloth,
trimmed with various furs. The shoes, or rather
slippers, are slight, and unfit for much exer-
cise. The dress of the women differs little from
that of the men, the chief distinction being the
head-dress; that of the fair sex consisting of a
bonnet, like an inverted basket, formed of paste-
board, covered with cloth of gold, or other ele-
gant materials, with a veil extending to the eye-
brows, while a fine handkerchief conceals the
under part of the face. The personal cleanliness
of both sexes is highly laudable; but the Eu-

ropean eye is not pleased with the female custom
of staining the nails with a red tincture. The
amusements of the Turks partake of their indo-
lent apathy, if we except hunting, and those of
a military description. To recline on an elegant
carpet, or in the hot season by the side of a
stream, and smoke the delicate tobacco of Syria,
may be regarded as their chief amusement. With
opium they procure what they call a kief, or
placid intoxication, during which the fancy
forms a thousand agreeable images, but when
the dose is too potent, these are succeeded by
irritation and ferocity. Chess and draughts are
favourite games; but those of chance are con-
sidered as incompatible with strict morals. The
coffee-houses, and the baths, furnish other
sources of amusement; and the bairam, or festi-
val which follows their long lent, is a season of
universal dissipation.

LANGUAGE.] The Turkish language is of far
inferior reputation to the Persian or Arabic,
being a mixture of several dialects, and possess-
ing neither the force, elegance, nor purity of
those two celebrated oriental tongues.

CAPITAL CITIES.] The chief city of European
Turkey, and of the Turkish empire, is Constan-
tinople, so called because founded by Constan-
tine. The advantages of the situation can hardly
be exceeded, and the aspect from the sea is pecu-
liarly grand; but on a nearer approach, the
wooden hovels and narrow streets disappoint the
splendid expectations of the spectator. This capi-
tal forms an unequal triangle, resembling a harp,
being about twelve or fourteen English miles in
circumference, inclosed by walls, and on two
sides by the sea and the harbour called the Golden
Horn. The inhabitants are computed at four
hundred thousand, including the four suburbs,
Galata, Pera, Tophana, and Scutari. Of these
two hundred thousand are Turks, one hundred
thousand Greek, and the remainder Jews, Arme-
nians, and Franks. The most celebrated edi-
fices are the Seraglio, which comprizes a large
space crowded with various buildings of mean
architecture; and the mosque of Sancta Sophia.
The principal entrance of the Seraglio is styled
Capi, or the Porte, an appellation which has
passed to the Turkish court.

CLIMATE AND SEASONS.] The extensive re-
gions comprised within the limits of European
Turkey enjoy, in general, a delicious climate,
pure

pure air, and regular seasons. Ovid, who was banished to modern Bulgaria, has written many elegiac complaints on the severity of the climate; and it seems an undoubted fact, that the seasons have become more genial since Europe has been stripped of those enormous forests, which diffused humidity and cold. The climate of Moldavia, which Ovid would have painted like Lapland, is now little inferior to that of Hungary, though the western part be mountainous; and the eastern present many uncultivated deserts. In Walachia the air is so temperate that vines and melons prosper. In the mountainous parts of the more southern districts the temperature must partake of the cold, universal in such elevated regions; but the products of Macedonia and Greece, rice, vines, and olives, shew that the climate retains its ancient praise.

FACE OF THE COUNTRY.] The general appearance of Turkey in Europe is rather mountainous, but abundantly interspersed with delicious plains and vales; and to the N. W. of Constantinople there is a plain country of vast extent, while the shores of the Euxine present many level deserts. Besides the grand stream of the Danube, many large and beautiful rivers intersect these provinces, and the numerous gulphs of the Archipelago and Mediterranean diversify and enrich the country.

SOIL AND AGRICULTURE.] The soil is generally fertile, the northern parts producing wheat and rich pasture, the middle and southern abundance of rice. But agriculture, like every other art and science, is neglected by the Turks; and that soil must be truly fertile which, under their sway, can support its inhabitants.

RIVERS.] Among the rivers of European Turkey must first be named the Danube, which from Belgrade to Orsova divides Servia from the Banat, and afterwards becomes a Turkish stream. The Maritz, which rising in a chain of moun-

* In its southern part, about a mile and a half from the sea, rises a rugged cavern, with some ancient inscriptions. After proceeding about twenty paces, appears a dark and low passage, whence the traveller, being provided with lights, descends by a rope, and afterwards by a ladder placed by the side of deep abysses. The path now becomes more easy, and conducts to another deep precipice, which is descended by another ladder. After much fatigue, and some danger, the traveller at length arrives in the grotto, which is supposed to be about nine hundred feet from the first opening. Tournefort estimates the height of the grotto at about forty fathoms. The stalactitic marble hangs from

tains anciently called Hæmus, and running towards the E. and S. falls into the Egean Sea.

LAKES.] Budzac and Walachia contain some lakes of considerable extent, as those round Ismail, and that to the E. of Surza, which communicates with the Danube, or forms a part of that river.

MOUNTAINS.] The chains of mountains are numerous and extensive. To the W. of Moldavia and the Buckovine runs N. and N. W. for about two hundred miles, part of the grand Carpathian chain. Besides these, there are other ranges of mountains of great extent.

ZOOLOGY.] The zoology of European Turkey presents few peculiarities. The jackall, frequent in Africa and Asia, is not unknown in these regions; and among the beasts of burthen must be classed the camel. The Turkish horses are celebrated for spirit and form: and those of Walachia deserve particular praise. The breeds or qualities of their cattle have been little explained. The sheep, distinguished by the name of Walachian, have spiral horns of singular elegance; but the fineness of the fleece would be a more useful distinction.

MINERAL WATERS.] The mineral waters are little known or celebrated; and the natural curiosities in the northern parts, and around mount Hæmus, remain undescribed. Of those in the south, the principal is the grotto of Antiparos, one of the islands of the Cyclades to the west of Paros. The whole isle is a rock of fine marble, about sixteen miles in circumference*.

the roof in the most elegant and picturesque forms; and on the floor are large masses of stalagmite, brownish and less pure, produced by the liquified stone dropping from above. A great distinction between this grotto and others of a similar kind in England, and other countries, is the purity of the material, being marble of a snowy whiteness, and the finest calcareous spar. The marble of Paros has been known and celebrated for many ages, as the most pure that the sculptor can employ; but some prefer that of Carrara, as of a finer and closer grain, and more obedient to the chissel, the Grecian having a large crystalline grain, apt to split off more largely than required.

VOL

The islands of ancient Greece have been so repeatedly described, that little more than an enumeration may suffice. The largest is that of Crete or Candia, which is about one hundred and eighty British miles in length, by forty as its greatest breadth. A chain of high mountains, called the White Mountains, from the snow, pervades a great part of its length. The inhabitants are vigorous and robust, and fond of archery. This isle abounds with cattle, sheep, swine, poultry, and game, all excellent; and the wine is balmy and luscious. The siege of Candia by the Turks in the middle of the seventeenth century, is remarkable in modern history, as having continued for twenty-four years, 1646—1670. This island had before flourished under the Venetians.

Next is Negropont, anciently called Eubœa, about one hundred British miles in length, by twenty in breadth, a large and important island, which also belonged to the Venetians to a late period*.

The other isles are generally of a diminutive size, among which are Lemnos, Skyro, and Andro. It must not be omitted, that in 1707 a new island arose from the sea, with violent volcanic explosions, near Santorine, about a mile in diameter.

HOLLAND.

NAMES.] The Seven United Provinces were, in ancient times, chiefly possessed by the Batavi, a people highly celebrated by Tacitus: but the boundaries being modern; there is no ancient appellation which particularly denotes this country. It was lately styled the republic of Holland, from the name of the chief province; but since the stadtholder was driven from his country by the victorious French, it has been erected into a kingdom. This happened in 1795; but on July 9, 1810, the kingdom of Holland was annexed to the French empire.

RELIGION.] The protestant religion, in the Calvinistic form, prevails throughout the kingdom of Holland. The states of Holland, in 1583, proposed that no other form of worship

should be tolerated; but this resolution was wisely rejected; and every religion is permitted, on condition that it do not oppose the fundamental laws, or teach any doctrines subversive of the state.

POPULATION.] The population of this kingdom has been recently computed at two million seven hundred and fifty-eight thousand, six hundred and thirty-two. The population of Holland, the chief province, is calculated at nine hundred and eighty thousand.

COLONIES.] The Dutch, being, for a considerable time, the chief maritime power in Europe, their colonies were numerous; besides some settlements on the coast of Hindostan, and an important establishment in Ceylon, they held, and still retain, the Spice Islands, Batavia, in the island of Java, the Cape of Good Hope, Surinam, and other considerable establishments.

ARMY.] The army was computed at about thirty-six thousand, but it is now incorporated with that of France. The navy, which used to consist of forty ships of the line, has by the events of the last war almost totally disappeared. The Dutch are, however, forming a powerful fleet at Antwerp, which was intended to be destroyed by the English in 1809: to effect which, the most powerful and best appointed armament that ever sailed from the shores of Britain was sent; but, alas! the fatal effects of the Walcheren fever destroyed so many of our troops, that orders were at last dispatched for the speedy return of the remainder to England. This discomfiture of the English forces was made a subject of parliamentary enquiry in 1810.

MANNERS AND CUSTOMS.] On visiting Holland, a stranger is surprized at the extreme cleanliness observable in the houses and streets; even hamlets, inhabited by poor fishermen, displaying a neatness and freshness, which forms a striking contrast with the squalid appearance of the German villages. The air being always moist, and commonly cold, the Dutch dress is calculated for warmth and not for elegance. The people are of a phlegmatic temperament; and their courage at sea is rather obstinacy than ardour; while from the same cause, their labour is rather slow perseverance, than impetuous strength, like

* The isles of Corfu, Cefalonia, and Zante, on the other side of Greece, were, on the fall of Venice, seized by the French, but now constitute an independent republic.

lic, under the protection of Russia; a curious experiment on the genius of modern Greece.

that of the English. In former times their knowledge was chiefly restricted to two channels; affairs of state, on which even the vulgar would converse with propriety; and the arts of getting money. But the latter at length supplanted every noble thought and generous feeling. This striking characteristic has impressed every spectator, from the days of Ray the naturalist, who visited Holland, in 1663, even to the present hour. A late amiable traveller observes, that "the infatuation of loving money, not as a mean, but as an end, is paramount in the mind of almost every Dutchman, whatever may be his other disposition and qualities; the addiction to it is fervent, inveterate, invincible, and universal from youth to the feeblest old age*." The Dutch are commonly low in stature, and the women are taller than the men. Their dress is little affected by fashion. The opulent merchants delight in their villas, thickly planted among the numerous canals; and the smallness of the gardens was compensated by the richness of the miniature selection, in which perhaps one tulip root might cost fifty guineas. In the winter, skating is a favourite amusement, and the canals are crowded with all ranks, from the senator to the milk-maid with her pail, and the peasant with his eggs. But the chief amusements, in so moist a climate, are under the shelter of the domestic roof, in large and expensive collections of paintings and prints, which also have become an article of commerce and avarice.

[LANGUAGE.] The Dutch language is a dialect of the German.

[EDUCATION.] The mode of education pursued in these provinces seems to have been greatly inferior to that used in England. The Dutch youths being chiefly allotted to a seafaring life, there was not indeed opportunity for numerous parochial schools, and consequent diffusion of common knowledge. The most celebrated Latin schools were at Rotterdam, Ureda, Middleburg, Groningen, &c. The universities are, Leyden, Utrecht, Harderwyck, Franeker, and Groningen: with two inferior colleges at Amsterdam and Deventer. There is an academy of sciences at Haarlem.

[CITIES AND TOWNS.] Amsterdam, the chief city of Holland, upon the small river Amstel, is first mentioned in the thirteenth century; but in the fourteenth was reckoned among the com-

mercial towns of Europe. About the middle of the seventeenth century, during the highest prosperity of the republic, it was enlarged by about one half. The haven is not distinguished by natural advantages, but has been improved and secured by art: and the wide forest of masts impressed every traveller with amazement. The population is computed at about two hundred and twelve thousand. The streets are generally narrow, and the canals feculent. The chief edifices are the state-house, founded on piles at an immense expence; the exchange, and the post-office; but some streets along the chief canals display houses of uniform grandeur. Here is the famous Delft Gate, which may be considered as a curiosity.

Leyden is esteemed the next city in population, containing about fifty thousand souls. It is the Lugdunum Batavorum of antiquity, and is distinguished by its university. Here the ancient Rhine almost expires in a number of small channels, which are passed by so many bridges, that the number has been computed at more than one hundred. The meadows and gardens around Leyden are remarkably productive, and there is a daily intercourse, by canals, with the other chief cities and provinces. The fair is still much frequented; but the university has declined.

[INLAND NAVIGATION.] To enumerate the canals of the United Provinces would be infinite for they equal the roads in other countries; and the advantage must be the more perceived during the interruption of maritime commerce, by the increase of the inland trade with Germany, the southern Netherlands and France.

[MANUFACTURES AND COMMERCE.] The chief manufactures of Holland are linens, many of which, however, are made in Silesia, pottery and painted tiles, especially at Delft, leather, wax, snuff, sugar, starch, paper, besides some of woollen, cotton, and silk. But the most precious branch of commerce consisted in spices and drugs, brought from the settlements in the East Indies; and the Dutch East India company was, for a considerable time, the greatest mercantile firm in Europe. The fishery in the Northern Seas, and even on their own and the English coasts, was also an object of great commercial importance. Latterly, perhaps, the chief advantage was derived from Holland being the grand deposit of commerce between Great Bri-

tain and the continent, particularly Germany and France. The inland trade with Germany, by the canals and the Rhine, is almost the only branch which has escaped the ravages of war*.

CLIMATE AND SEASONS. Humidity and cold are the chief characteristics of the climate of Holland. The general face of the country is that of a large marsh which has been drained; the canals, and even the sea, looking pale and discoloured by mud; but the numerous and important cities and towns excite admiration, and the most dignified ideas of the wonderful powers of industry, which seems to have selected a chief seat amidst the greatest natural disadvantages. And even among these marshes the eye is relieved by the groves, gardens, and meadows; and to the east of Utrecht the woods and hills gently swell towards Germany. Yet the east of Dutch Brabant is still disfigured by the large morass of Peal, extending about thirty British miles in length: Over-Yssel, so called from its western boundary of the Issel, which received the canal led by Drusus from the Rhine, is almost wholly composed of enormous marshes and heaths; and the morass of Bouttang rivals that of Peal in extent. The northern provinces of Friesland and Groningen present towards the S. and S. E. extensive heaths; while the parts towards the sea rival the morasses of Holland. Thus the whole country may be said to display an intimate combination of land and water; and the few elevations commonly consist of barrensand.

SOIL AND AGRICULTURE. The agriculture of such provinces cannot be expected to be considerable, the land being mostly under pasturage, except a few crops of madder, and tobacco, which are cultivated with great predilection. The pasturages in the north of Holland supply such quantities of excellent butter, as to become a staple article of commerce. The cows seem to have been originally from Holstein, and the utmost attention is paid to warmth and cleanliness, so that even in summer the animals appear in the meadows clothed with ludicrous cate.

* Of this the most remarkable feature consists in the vast floats of timber, which arrive at Dort from Andornach, and other places on the Rhine, whose copious stream receives the trees of the German forests. The length of these rafts is from seven hundred to one thousand feet, the breadth from fifty to ninety; and five hundred labourers direct the floating island, which is crowned with a village of timber huts for

RIVERS.] The chief rivers of the United Provinces are the Rhine and the Meuse; the latter here receiving at its estuary the Aa, joined with the Demel from the S.; and from the N. that great outlet of the Rhine called the Waal: and near forty British miles farther to the W. the second grand outlet of the Rhine, called the Leck, joins the Meuse, after which but a small stream passes by Leyden to the German ocean. The principal river falling into the Zuyder Zee is the Issel, which rises not far to the S. W. of Munster, and after receiving the canal of Drusus near Duisberg becomes a considerable stream. On the N. of this is the small estuary of Wecht, which rises to the N. of Munster.

DENMARK AND NORWAY.

These countries having been already described (see above pp. 477, 489,) it would be improper to mention any thing in this place that has been before noticed. We shall therefore advert to only a few particulars.

DIVISIONS.] The territories subject to the crown of Denmark are divided into the following provinces: Denmark Proper, 1. Jutland, 2. Isle of Funen, 3. Isle of Zealand, 4. Sleswick, 5. Holstein.—Norway; 6. Christiansand, 7. Aggerhuus, 8. Bergen, 9. Drontheim, 10. Norland, 11. Finmark.—12. The Isle of Iceland, 13. Isles of Ferroë.

ANTIQUITIES.] The ancient monuments of Denmark and Norway are chiefly what are called Runic; though it be not clear at what period the use of the Runic characters extended so far to the north. Circles of upright stones are common in all the Danish dominions; in Iceland their origin is perfectly ascertained, as some were erected even in recent times of the Icelandic republic, being called *Dómhring*, or Circles of Judgment. Monuments also occur of the other forms imagined by our antiquaries to be Druidic. The churches of Bergen and of Drontheim were

their reception. The navigation is conducted with the strictest regularity: and on their arrival at Dort the sale of one raft occupies several months, and frequently produces more than thirty thousand pounds sterling. The other branches of inland traffic are numerous; and the Rhine may be said to supply Holland with insular advantages, secure from the destructive inroads of maritime war.

both

both built of stone in the eleventh century. The residences of the chiefs appear to have been generally constructed of wood, for there are few ancient castles to be found in Denmark or Norway.

ARMY, &c.] The army of this kingdom is computed at seventy thousand men, of which Denmark supplies about forty thousand, and Norway the remainder. The navy, prior to the late engagement with the English off Copenhagen, consisted of thirty-three ships of the line, manned by about eleven thousand seamen, and five thousand marines.

REVENUE.] The annual revenue is computed at about one million and a half sterling, being superior to that of Sweden. Denmark contributes five hundred and forty-three thousand five hundred and fifty-four pounds; Norway two hundred and ninety thousand pounds; Sleswick and Holstein three hundred thousand pounds; the West Indian islands two hundred and sixty-two thousand pounds; the toll levied upon ships passing the Sound one hundred and twenty-two thousand five hundred and fifty-four pounds; Altona three thousand one hundred and fifty pounds. The expences of the state amount annually to about one million and fifty thousand pounds; and it is burthened with a debt of two million six hundred thousand pounds.

MANNERS AND CUSTOMS.] The manners and customs of the superior Danes differ little from those of the same classes in other parts of Europe. The peasantry continue in a state of vassalage; except those of the crown, who have been recently delivered by the patriotism of the heir apparent, and a few other instances. They are of course idle, dirty, and dispirited. In Norway, on the contrary, every peasant breathes the air of freedom, except those of a few noble estates near Frederickstadt. The Norwegian peasants are spirited, frank, open, and undaunted, but not insolent; in the comforts of life they seem to yield to none, except some of the Swiss: their usual dress is of a stone colour,

* This singular race of men is of a small size, generally about four feet, with short black hair, narrow dark eyes, large heads and high cheek bones, a wide mouth and thick lips, and a swarthy complexion. In the southern part of Finmark they are mingled with Norwegians; but the northern wilderness is wholly their own. They call them-

with red button-holes, and white metal buttons; and the women often appear only dressed in a petticoat and shift, with a close collar round their throat, and a black sash. Their usual bread, like that of the Scottish peasantry, consists of flat cakes of oatmeal: which in times of great scarcity is mingled with the white inner rind of trees.

LAPLANDERS.] At the farthest northern extremity of Norway is the region of Finmark, or more properly Lapmark, being a large province possessed by the Danish Laplanders*, and extending even to the east of Cape Nord, towards Russian Lapland.

The sun is here absent for seven weeks; yet from ten in the forenoon to one in the afternoon there is a kind of twilight even in the shortest days, so that one may read without a candle: but the stars are very visible, and the moon, when apparent, shines all the day. In return, the sun never sets for seven weeks of summer; but his beams are dull and remiss in the night, when he assumes a ruddy hue. The rivers supply salmon, and other fish, a considerable part of the Laplandic food; but at a festival are seen mutton, or rein deer, and mead. The men wear conic red caps, lined with fur, and a kind of robe of cloth or skin; the poor sometimes using that of salmon, which appears like a white shagreen. Till recent times they were immersed in paganism, regarding particular mountains and rocks as holy: their chief god was Radien, who dwelled in the starry heaven; in the lower aerial regions were Beivi, or the sun, with Horangalis, or the thunderer, and other divinities. Amidst the conversion of the northern nations to Christianity, the Laplanders have been unaccountably neglected; but since the missionaries have exerted themselves with great success.

The people of Iceland, being of Norwegian extract, have few peculiar manners, but retain more of the ancient dress and customs of their ancestors. They are constrained to prepare flour from various plants described by Von Troil; and

selves *Same*, their speech *Same-giel*, and their country *Same Edna*, being probably of the same race as the Samoides. Towards the shore they build huts; and on the mountains use tents of a flatly conic form, and divided by several rude partitions into apartments for themselves, their servants, and cattle.

their chief animal nutriment is dried fish; the common beverage is syra, or sour whey, kept in casks and left to ferment, beer being scarce.

INLAND NAVIGATION.] The chief inland navigation of Denmark is the canal of Kiel, so called from a considerable town in the north of Holstein. This canal is intended to unite the Baltic with the river Eydar, which flows into the German sea. The extent of this important canal is about twenty British miles and a half; the breadth one hundred feet at top, and fifty-four at bottom; the least depth is about ten feet, so as to admit vessels of about one hundred and twenty tons. It was begun in July 1777, and was finished in 1785.

FORESTS.] There are some woods in the Danish isles and forests in Jutland. The Norwegian mountains are generally clothed with pines and fir; and almost the whole country may be regarded as a forest, which supplies Europe with masts and other large timber.

ZOOLOGY.] The Danish dominions being of such great extent, and variety of climate and aspect, there is a great diversity in the animal productions. The horses of Norway and Iceland are as remarkable for diminutive size, as those of Holstein are for the contrary quality. Among the more peculiar animals may be first named the rein-deer*, common in Finmark and throughout Lapland.

The elk is a more southern animal, and sometimes appears in Norway, which is infested by the bear, the wolf, and the lynx. The lemming, or Norwegian mouse, proceeds from the ridge of Kolen, and sometimes spreads desolation, like the locust. These animals appear in vast numbers, proceeding from the mountains towards the sea, and devouring every product of the soil: it would seem that after consuming every thing eatable in their course, they at last devour each other. This singular creature is of a reddish colour, and about five inches in length. Norway also boasts of eagles, and its falcons are reckoned the boldest and most spirited of any in Europe. The salmon supplies a considerable

* This animal resembles a stag, but is stronger; and the deep division of his hoofs is adapted to tread on the snow, being suited by Providence to a cold climate, as the camel is to the hot desert. The antlers of the rein-deer are longer and more branched than those of the stag, and they also de-

part of the Laplander's food; and vast numbers are transported on rein-deer from the shores of the Tana. Hares are also common in that remote region, as well as the bear, lynx, and fox; nor are the glutton and the beaver unknown. About Roras in Norway the latter animal is sometimes found white.

MINERALOGY.] In gold Norway yields greatly to the Swedish mines of Aldenfors, and only claims the superiority in silver; the mines of Konigsberg, about forty British miles to the S. W. of Christiansa, having been long reputed the richest in Europe; and one mass of native silver in the royal cabinet weighs four hundred and nine marks, being worth three thousand rix-dollars, or six hundred pounds. The veins of metal are from half an inch to more than two feet in thickness. These mines were discovered in 1623 by two peasants. They are worked by thirty-six shafts, and used to yield about seventy thousand pounds annually. They supply the mint with currency, the largest coin being of eight Danish skillings, or four-pence sterling; and it is esteemed a peculiarity of this mine, that it may be little productive during a year or two, when suddenly a rich vein is discovered which amply repays the loss of labour.

Norway also possesses other silver mines at Iarlsberg in the same region, about thirty miles to the N. E. discovered in 1726, but of small account.

The important copper mines of Roras, about sixty-eight British miles S. E. of Drontheim, were discovered in 1644. They are in the southern slope of the chain of Doffra, in a rock of what the Germans call hornschiefer. The veins are from six inches to six ells in thickness; and the ore of a pale yellow. In general the mines of Roras are very productive, and a source of considerable revenue. Other copper mines are at Quickne and Selboe, about fifty miles to the east of Drontheim, and at other places.

The mines of cobalt at Fossum, a recent discovery, must not be passed in silence. This metal yields smalt, or powder blue, used in painting

corate the brows of the female. These animals are still numerous in a wild state, though the Laplanders have reclaimed great numbers, which supply the place of horses and cattle.

pottery, and porcelain, and in colouring starch; and the mine is supposed to produce a clear annual revenue to the crown of about £15,000. Near it is a rich vein of quartz, containing large masses of talc.

But the iron mines of Norway are esteemed the most profitable. They are chiefly situated not far from Arindal, in the southern province of Christiansand; and near Skeen, between Arindal and Konigsberg. Lead appears in the vicinity of Konigsberg; and there are alum works near Christiana. In Iceland are found many volcanic productions, particularly black obsidian. The isles of Ferroe produce agate, jasper, and beautiful zeolites. The magnet is also found in Norway: with curious garnets, especially the green, which are little known in other regions.

NATURAL CURIOSITIES.] The Moskostrom, or Malstrom, is a remarkable whirlpool off the shore of Norland; which will involve boats, and even ships: nay the bellowing struggles of the whale have not always redeemed him from the danger; the bottom is full of craggy spires, and the noise truly tremendous. On the south of the Ferroe isles there is another dreadful whirlpool. The volcanoes of Iceland may also be classed among the grandest features of nature*. The boiling springs of Iceland present a singular phenomenon: that of Geyser, to the north of Skallholdt, is the most remarkable, rising from an aperture, nineteen feet in diameter, and springing at intervals to the height of fifty, or even ninety feet. About twenty miles to the north of Bergen, the rocks abound with singular petrifications. The mountains are sometimes split and engulphed by subterranean waters, of which Pontoppidan relates some instances, more to be credited, as a similar event recently happened in the south of France. The farm of Borre, in the province of Christiana, was in 1703 swallowed up with all its buildings, and there now remains only a chasm full of ruins and sand.

DANISH ISLANDS.

The prime seat of the Danish monarchy having ever been in the isles of Zealand, Funen,

* Among these, Mount Hekla is the most remarkable, being situated in the southern part of the island, about twenty British miles from the sea, above which it rises to the height of about five thousand feet. The summit is covered with snow, except some spots where the heat pre-

Laland, Falster, and the others of that group, they have been considered in the general description of the monarchy. In the east, the farthest isle belonging to Denmark is that of Bornholm, a small but fertile spot, conquered by the Swedes in 1645, and surrendered to them by the treaty of Roskild, 1658; but the inhabitants revolted the same year, and restored their isle to the Danish domination, under which it has since continued.

Off the west coast of Jutland are the isles of Nordstrand, Fora, Sylt, Rom, Fanoa, and others, which with Helgeland, were known to the Romans; and the writers of that nation appear often to have confounded them with some of the Orkneys, and even with the islands in the Baltic.

The Norwegian coast presents one continued series of small and unimportant islands, most of them indeed uninhabited. Among a few worthy of mention may be named Karin, Bommel, Sartar, Hitteren, and others at the entrance of the gulph of Dronheim: the Vikten or Viktor islands are followed by those of Loffoden, the most numerous and extensive, and noted for the whirlpool of Malstrom.

For many years the Norwegians held the isles of Orkney and Shetland, which last was styled by them the Land of Hialt, from an adventurer so called, whence the corrupt names of Zetland, Yetland, and Shetland. The Ferroe isles remain an appanage of the Danish crown: they are seventeen in number, and not unfertile, producing some barley, and abundant pasturage for sheep. Small junipers, stunted willows, and birches, alone bear a diminutive image of trees. They were discovered prior to Iceland, in the ninth century; and export feathers, eiderdown, caps, stockings, salted mutton, and tallow. The inhabitants do not exceed five thousand.

The large and celebrated island of Iceland may be regarded as two hundred and sixty British miles in length, from the most western cape to the most eastern, and about two hundred in breadth, from N. to S. but the inhabitants do not exceed fifty thousand. The government was

dominates. The craters are numerous, but the eruptions rare; there having only been ten from the year 1104 to 1693, after which it remained quiet till 1765, when it emitted flames and lava.

an aristocratic republic for about three hundred and eighty seven years, till in 1261 it submitted to Norway.

SWEDEN.

The kingdom of Sweden having been geographically described above, p. 495, which see, we shall content ourselves with a very brief account of it.

NAMES.] Sweden, in the native language *Swiðeod*, and more modernly *Sweike*, appears to be a very ancient appellation, and is said, by the northern antiquaries, to imply a country whose woods had been burnt or destroyed.

MODERN DIVISIONS.] The provinces of the Swedish monarchy may be arranged in the following manner:

Sweden Proper contains, 1. Upland, 2. Sudermanland, 3. Nerike, 4. Westmanland, 5. Dalarna, or Dalecarlia, 6. West Gothland, 7. East Gothland, 8. South Gothland.

West Norland contains, 9. Jemtland, 10. Angermanland, 11. Medelpad, 12. Halsingland, 13. Gästrikland, 14. Herjedalen, 15. West Bothnia.

Swedish Lapland contains, 16. Åsele Lappmark, 17. Umeå Lappmark, 18. Piteå Lappmark, 19. Luleå Lappmark, 20. Torneå Lappmark, 21. Kemi Lappmark.

East Bothnia contains, 22. Uleaburg, and 23. Wasa.

Finland contains, 24. Kuopio Karelen, or Carelia, 25. Tavastland and Nyland, 26. Åbo and Björneborg, 27. Kymmengård, 28. Swedish Pomerania, in Upper Saxony.

ANTIQUITIES.] The ancient monuments of Sweden consist chiefly of judicial circles, and other erections of unhewn stone, followed by the monuments inscribed with Runic characters, some of which are as recent as the fifteenth century, and none of them can safely be dated more anciently than the eleventh. Not far from Upsal is the *norasten*, or stone on which the king used to be enthroned, as the old Scottish monarchs were at Scone. The ancient temples, called *Skior*, or *Skur*, were of wood, and have consequently perished. Some of the old castles, erected since the use of stone, are remarkable for their re-

semblance to what are called Pictish castles in Scotland.

RELIGION, ECCLESIASTIC GEOGRAPHY.] The religion of Sweden is the Lutheran, and this kingdom has retained an archbishopric with thirteen prelaties. The parishes amount to two thousand five hundred and thirty-seven. The priests are computed at one thousand three hundred and seventy-eight; with one hundred and thirty-four vicars, and one hundred and ninety-two prepositi, or inspectors. Some of the parishes are very extensive, as that of Eastern Bothnia, which is about one hundred and fifty miles in length, by forty-eight in breadth; and another parish in Lapland is still larger.

POPULATION.] The population of the kingdom is thought to exceed three millions.

ARMY.] The Swedish army consists of national troops and of foreign infantry, the latter being computed at about twelve thousand. The total amount of the army may be forty-eight thousand; and the soldiers are of distinguished valour and hardihood, and elated with the former fame of the Swedish arms.

NAVY.] So fatal were the naval operations of 1792, that the Swedish fleet, which consisted of thirty ships of the line, cannot now display above half that number. In the Baltic, which is full of low coasts and shoals, galleys of a flat construction are found more serviceable than ships of war, and of course great attention is paid to their equipment by Sweden as well as Russia.

MANNERS AND CUSTOMS.] The manners and customs of the superior classes in Sweden are so tinged with those of the French, that no striking peculiarity can be observed, and even the peasantry have so much vivacity and address, that they have been stiled the French of the north. The complexion, which in the northern latitudes is generally fair, is here much diversified, being in some provinces extremely brown. The men are commonly robust and well formed, and the women slender and elegant. The natives of the western province of Dalecarlia retain many ancient customs, and have been distinguished for their courage and probity, since the time that Gustaf Wase issued from the mines of that country to break the yoke of Denmark. The Finlanders, on the east of the Bothnic Gulph, are now little distinguishable from the Swedes; and any remarkable

markable peculiarities of manners and customs must be sought in Swedish Lapland. Danish Lapland, however, being more remote, less known, and more recently described; an account of this singular people is given under the article of Denmark.

SWEDISH ISLANDS.

The Swedish isles have been before described. See above p. 504.

PORTUGAL.

The reader who wishes for a further account of Portugal than is here given, is referred to Link's travels in that country, given above, p. 345, &c.

EXTENT.] Portugal extends about three hundred and sixty British miles in length, by one hundred and twenty in breadth; and is supposed to contain about twenty-seven thousand two hundred and eighty square miles, and a population of one million, eight hundred and thirty-eight thousand, eight hundred and seventy-nine.

RELIGION.] The religion of Portugal is the Roman Catholic; and a strict observance of its duties forms one of the national characteristics. There are two archbishoprics, and ten episcopal sees: and there is besides a patriarch. The number of parishes approaches four thousand.

GOVERNMENT.] The present situation of Portugal precludes our observation on its government; for in all probability it will shortly experience the fate of other European nations. The population is estimated at two millions.

COLONIES.] The chief colony from Portugal is that established in Brasil*; and they still retain Madeira and many settlements on the coast of Africa, with Goa and Macao, in the East Indies, the relics of great power and territory.

LANGUAGE.] The Portuguese language is more remote from that of Castille than might be expected from the circumstances. As the royal race was of French extract, it is supposed that many of the words are derived from the Limosin and other dialects of the south of France. It is a grave and solemn speech; but would have been little known among foreigners, had it not

* In consequence of the present war carrying on in Portugal, the Prince Regent and the Queen deserted the throne,

been diffused by the fame of the Lusiad of Camoens.

MANUFACTURES AND COMMERCE.] The Portuguese manufactures are few and unimportant: hats and paper have been lately fabricated at Lisbon; but the chief manufactories are those of woollen cloth at Covilham, Portalegre, and Azeitao.

CLIMATE AND SEASONS.] The climate of Portugal is familiarly known to be most excellent and salutary. At Lisbon the days of fair weather are computed to amount to two hundred in the year; and those of settled rain seldom exceed eighty. The medial heat is generally about sixty degrees.

RIVERS.] The rivers of Portugal have been already enumerated in the description of Spain. The Tajo is here a noble stream, and its estuary near Lisbon affords a capacious haven, from two to nine miles in breadth. Among the native streams may be named the Mondego, which passes by Coimbra; the Soro, which runs into the Tajo; and the Cadaon, which forms the harbour of Saual. Scarcely a lake can be traced in the map of Portugal.

NATURAL CURIOSITIES.] On the north bank of the river Douro is a high massy cliff, with engraved letters or hieroglyphics, stained with vermilion and blue; beneath which is a grotto, supposed to abound with bitumen.

SWISSERLAND.

NAMES.] The provinces known by the collective name of Swisserland, were, in ancient times, distinguished by several appellations. By the Romans they were regarded as a part of Gaul; and the chief possessors were the Helvetii on the west, and the Rhæti on the east. After the fall of the Roman empire, this country may be considered as possessed by the Alemanni on the east; and on the west, as a part of Burgundia. Divided among several lords, secular and spiritual, the inheritances of the former at length chiefly centered in the house of Hapsburg, afterwards the family of Austria; and, on its emancipation, in the beginning of the fourteenth century, first appeared the modern denomination of

and flew to the Brazils, which is now made the seat of government.

VOL.

Swisserland, or Switzerland, either derived from the canton of Schweiz, distinguished in that revolution, or from the general name of Schweitzers, given by the Austrians to this alpine people.

EXTENT.] In length, from east to west, Swisserland extends about two hundred British miles; and in breadth, from north to south, about one hundred and thirty.

DIVISIONS.] The Swiss league, before the French invasion, consisted of thirteen independent confederated cantons, and their subjects and allies*.

The dissolution of the Swiss confederacy by the French invasion took place in 1798.

RELIGION.] The religion of the Swiss countries is in some the Roman Catholic, in others the Reformed: Of the former persuasion are Uri, Schweiz, Unterwalden, cantons which founded the liberty of the country, with Zug, Lucerne, Friburg, Solothurn, part of Glaris, and Appenzel. The reformed cantons are of the Calvinistic or Presbyterian persuasion, being the rich and extensive canton of Berne, with Zurich, Basil, or, according to the French enunciation, Basle, Schaffhausen, the greatest part of Glaris, and some portions of Appenzel. The country of the Grisons is chiefly Protestant: and Vallais, an ally of the thirteen cantons, has been the scene of atrocious persecutions on account of its disaffection from the Catholic faith; but the inhabitants, to the amount of about one hundred thousand, now profess the Roman Catholic system. In general the two persuasions live in the most amiable unity and moderation.

GOVERNMENT.] The government of Swisserland has been a fertile theme of discussion. The most powerful cantons of Berne, Zurich, Lucerne, and Friburg, had retained much of the feudal aristocratic form; and the insurrection of the peasants, in the middle of the seventeenth century, unites, with repeated discontents, to convey no high practical eulogy on the constitution, as these simple and honest vassals were not influenced by theories of sedition, but acted solely from their own feelings of oppression. In the eye of the most candid observers the aristocracy had degenerated into a venal oligarchy,

more intent on procuring the lucrative government of the baillages than on the promotion of the general advantage. The other cantons were more democratic: but the recent subversion of the government by the French, has reduced Swisserland to a dependent province, with new divisions and arrangements. The laws of course partook of the nature of the government of each canton; and under the aristocracies were sufficiently jealous and severe. Yet Swisserland was one of the happiest countries in Europe, and recommended itself to the most intelligent observers equally by moral and physical grandeur and beauty.

POPULATION.] The population of this country is computed at two millions. But a large portion is uninhabitable.

ARMY.] The military force was reckoned at about twenty thousand; but in the late struggle with France, this force appears to have been divided, and little effectual.

POLITICAL IMPORTANCE AND RELATIONS.] The political importance and relations of Swisserland are immersed in those of the French empire.

MANNERS AND CUSTOMS.] Amidst the general corruption of manners, those of the Swiss have long excited applause, from their moral uniformity, and frank independence. The houses are generally constructed of wood, in the most simple form, with staircases on the outside; yet their appearance singularly coincides with the picturesque character of the country. The dress of the lower ranks is little subject to the laws of fashion, and in many cantons there are regulations to prevent idle ornament. Among the superior classes the manners may be considered as partly German, and partly French; but it may be imagined that at present the latter preponderate. In general the Swiss are remarkable for an intense attachment to their native country; and there are few who do not return there to terminate their existence. This impression is almost irresistible, and liable to be awakened by the most minute circumstances. Hence in the French armies the tune called the *Rances des Vaches*,

* The following is a list of them:—1. Canton of Berne, with the Pays de Vaud. 2. Canton of Friburg. 3. Canton of Basil. 4. Canton of Soleure. 5. Canton of Schaffhausen. 6. Canton of Zurich. 7. Canton of Appenzel. 8. Canton of Lucerne. 9. Canton of Zug. 10. Canton of Schweiz. 11. Canton of Unterwald. 12. Canton of

Uri. 13. Canton of Glaris. 14. Principality of Neuchâtel (lately subject to Prussia). 15. Bishopric of Basle. 16. County of Baden. 17. The free Baillages. 18. Turgovia. 19. Tokenburg. 20. The Rhinthal. 21. Lands of the Abbey of St. Gall. 22. Country of Grisons. 23. Val-teline. 24. Italian Baillages. 25. The Vallais.

often sung by the Swiss milkmaids, when they went to the pastures, was carefully interdicted, because it melted the rough Swiss soldier into tears, and seldom failed to produce desertion. This unconquerable passion seems to arise in part from a moral sensibility to the enchanting ease and frankness of the native manners, and in part from the picturesque features of the country, the verdant hills contrasted with Alpine snows, and delicious vales watered by transparent streams; scenes no where else to be discerned in such perfection, and which must powerfully affect the imagination, the parent of the passions. The modes of dress adopted by the Schweitzers are better described by our plates than they could be by words.

LANGUAGE.] The language of Switzerland is a dialect of the German; but the French is much diffused, and is often employed by their best authors. In the most southern parts, bordering on Italy, the Valteline, and other territories acquired from Milan, the Italian is the common tongue. Among the Grisons in Engadina, and in some other parts, is spoken what is called the Romanesh, which seems immediately derived from the Latin. The Vallais, or that part of Switzerland watered by the Rhone, has also a particular dialect: and at the city of Sion the French begins to be spoken, as it is also the prevalent language in that beautiful part of the canton of Berne called the Pays de Vaud. The language called the Vaudois, appears to have been confined to the valleys of Piedmont.

EDUCATION.] Travellers into Switzerland testify their surprise at the knowledge generally prevalent among the peasantry, so that there is reason to infer that this useful province is not neglected. There is an university of some reputation at Geneva, and another at Basil; with colleges at Berne, Zurich, and Lucerne.

The chief cities and towns have been described before, in Count Stolberg's Travels, see above, p. 401.

COMMERCE AND MANUFACTURES.] Commerce and Manufactures do not much flourish in this inland region. Cattle constitute the chief produce of the country; and some of the cheese forms an export of luxury. The chief linen manufactures were at St. Gal. Printed cottons and watches, also form considerable articles of sale, nor are silk manufactures unknown in Switzerland.

CLIMATE AND SEASONS.] The climate of Swis-

serland is deservedly celebrated as salubrious and delightful. From its southern position considerable heat might be expected; but this, though sufficient to mature the grape, is attempered by the cold gales from the Alps and glaciers. When the sun descends beyond Mount Jura, on a summer evening, the Alpine summits long reflect the ruddy splendour, and the lakes for near an hour assume the appearance of burnished gold. The winter is however in some parts extremely severe; and the summer heat, in the deep vales, sometimes oppressive.

FACE OF THE COUNTRY.] The face of the country is generally mountainous, the most level parts being the Thergau, and a part of the cantons of Basil, Berne, Zurich, Schaffhausen, Soleure, and Friburg. Even these present what in some countries would be called mountains, from two thousand to two thousand five hundred feet above the level of the sea. No country in the world exceeds Switzerland in diversity of appearance. The vast chain of Alps, with enormous precipices, extensive regions of perpetual snow, and glaciers that resemble seas of ice, are contrasted by the vineyard, and cultivated field, the richly wooded brow, and the verdant and tranquil vale, with its happy cottages and crystal stream. Count Stolberg, however, as above referred to, gives an animated description of this country, inasmuch that little remains to be said.

ZOOLOGY.] The horses of Switzerland are esteemed for vigour and spirit; and the cattle attain great size. Among the animals peculiar to the Alps, may be first named the ibex, or rock goat. This animal resembles the common goat; but the horns of the male are extremely long and thick. It is more common on the Italian than on the Swiss Alps. The hair is long, and ash coloured, with a black list along the back. The ibex will mount a perpendicular rock of fifteen feet at three springs, bounding like an elastic body struck against a hard substance. In the day he seeks the highest summits, but in the night the nearest woods, browsing on aromatic plants, and dwarf birch, and in the winter on lichens.

Another singular animal is the chamois, which is commonly seen in herds of twenty or thirty, with a sentinel, who alarms them with a shrill cry. The colour is yellowish brown; but they sometimes occur speckled. The food is the lichen, with shoots of pine or fir. The marmot is com-

mon in the Swiss mountains. In summer they feed on alpine plants, and live in societies, digging dwellings in the ground for summer, and others for winter. About the beginning of October, having provided hay, they retreat to their holes, where they remain torpid till the spring. The skin of this little animal is used for furs. The marmot may be tamed, and shews considerable docility. The size is between that of the rabbit and the hare. Among alpine birds may be named the vulture, called also the golden or bearded vulture. It inhabits the highest alps, forming its nest in inaccessible rocks, and preying on the chamois, white hare, marmot, and sometimes on kids and lambs.

MINERALOGY.] The mineralogy of this interesting country is not so important as we might be led to infer from its mountainous nature. Some of the streams wash down particles of gold. Copper and lead are also found: but the chief mines are those of iron, in the county of Sargans. In the canton of Berne there are valuable quarries of rock salt: and it is said that coal and native sulphur are not unknown. But the grand stores of minerals are in Piedmont and the southern sides of the Alps. Rock crystal forms perhaps the chief export of Switzerland, being sometimes found in such large pieces as to weigh seven or eight hundred weight. The calcareous parts of the Alps often present beautiful marbles; and good slates are not uncommon. As to granite and porphyry, the country may be said to consist of them. Among the Alps are also found serpentines, asbestos, with jaspers, agates, and various petrifications. Among the mineralogic curiosities may be named the adularia, or glassy

* Nay, the mountains themselves will sometimes burst, and overwhelm whole towns, as happened in the memorable instance of Flours, near Chiavenna, in which thousands perished, and not a vestige of a building was left: nor are recent instances, though less tremendous, wholly unknown.

† As an example, the account which Bourrit gives of that of the Rhone, may be selected. "At length we perceived through the trees a mountain of ice, as splendid as the sun, and flashing a similar light on the environs. This first aspect of the glacier of the Rhone inspired us with great expectation. A moment afterwards this enormous mass of ice having disappeared behind thick pines, it soon after met our sight between two vast blocks of rock, which formed a kind of portico. Surprised at the magnificence of this spectacle, and at its admirable contrasts, we beheld it with rapture. At length we reached this beautiful portico, beyond which we were to discover all the glacier. We arrived: at this sight one would suppose oneself in another

felspar, on the mountains of Adula, and the tremolite, so called from mount Tremola, near St. Gothard.

MINERAL WATERS.] Of mineral waters, the most remarkable are those of Leuk. To the S. E. are the baths of Alvenew, which are sulphureous, and resemble Harrowgate water.

NATURAL CURIOSITIES.] To enumerate the natural curiosities of Switzerland would be to describe the country. The Alps, the glaciers, the vast precipices, the descending torrents, the sources of the rivers, the beautiful lakes and cataracts, are all natural curiosities of the greatest singularity and most sublime description. Of late the glaciers have attracted particular attention; but those seas of ice, intersected with numerous deep fissures, owing to sudden cracks, which resound like thunder, must yield in sublimity to the stupendous summits clothed with ice and snow, the latter often descending in what are called avalanches, or prodigious balls, which, gathering as they roll, sometimes overwhelm travellers, and even villages*.

The vast reservoirs of ice and snow give birth to many important rivers, whose sources deeply interest curiosity†.

AUSTRIA.

Austria has hitherto been considered as a part of Germany, but by the late wars on the continent between the emperor of Germany and the French, the German empire has been much curtailed and dismembered, insomuch that but little remains under the dominion of the former in

world, so much is the imagination impressed with the nature and immensity of the objects. To form an idea of this superb spectacle, figure in your mind a scaffolding of transparent ice, filling a space of two miles, rising to the clouds, and darting flashes of light like the sun. Nor were the several parts less magnificent and surprising. One might see as it were the streets and buildings of a city, erected in the form of an amphitheatre, and embellished with pieces of water, cascades, and torrents. The effects were as prodigious as the immensity and the height; the most beautiful azure, the most splendid white, the regular appearance of a thousand pyramids of ice, are more easy to be imagined than described. Such is the aspect of the glacier of the Rhone, reared by nature on a plan which she alone can execute: we admire the majestic course of a river, without suspecting that what gives it birth and maintains its waters may be still more majestic and magnificent."

comparison

comparison of his vast territory before those commotions. Bavaria, Wurtemberg, Westphalia, and Saxony, have been made separate kingdoms: the title of emperor of Germany was discontinued by order of the French emperor; and the sovereign of Germany was compelled to take that of emperor of Austria. By the last war even the remains of royalty were threatened with dissolution, and there does not appear to be a shadow of a doubt but that the whole of his dominions would have been wrested from him, had he not timely made a peace with the emperor Napoleon, who has since espoused the daughter of the emperor of Austria. The absolute limits of his present dominions, circumscribed as they are, have not yet fully reached us; the principal part, however, seems to be contained in Bohemia, Moravia, Austria, Hungary, Transylvania, and a part of Poland.

ITALY.

THE country of Italy has been so repeatedly described, that it has become familiar even to the common reader: this description shall therefore be restricted to very narrow limits. Italy being now made a separate kingdom, of which the emperor Napoleon is sovereign, we shall consider it as one nation, without regard to its former divisions.

BOUNDARIES, &c.] The boundaries of this country are deeply impressed by the hand of nature; in the Adriatic and Mediterranean seas, and the grand barrier of the Alps, which divide it from France, Switzerland, and Germany. The length of Italy from mount Rosa, the highest summit of the Italian Alps, to the Cape di Lucca, is about six hundred and seventy British miles; while the medial breadth between the Adriatic and Mediterranean is about one hundred; but from the Adige, the recent limit of Austrian power, to the eastern frontiers of the new French departments of Liman and Mont Blanc (formerly Savoy), the breadth is about two hundred miles. The religion is the Roman Catholic. The present population of Italy, with the islands of Sicily and Sardinia, is about thirteen millions. The manners, customs, and dialects are various and discordant, though the general language be the Italian, esteemed the purest

in Tuscany, while the enunciation is most perfect at Rome.

FACE OF THE COUNTRY.] Italy is decorated with noble architecture, and venerable remains of antiquity, amidst a climate generally serene, though liable to violent rains. In the north the sublime scenery of the Alps is contrasted with the fertile plains, through which many streams flow into the Po. In the centre there are many marshes and standing waters, which occasion what is called the *mal aria*, or a pernicious distemperature of the air; but the varied ridge of the Apennines, and the beautiful prospects of Florence and Tivoli, excite admiration. A great part of Naples is mountainous; but the country beautiful; yet in addition to the fiery eruptions of Vesuvius and Etna, it is exposed to the terrible effects of frequent earthquakes, and the enervating sirocco.

RIVERS.] Italy is intersected with rivers in almost every direction, of which the Po is by far the most large and extensive. This noble river, descending from the centre of the western Alps, passes to the N. E. of Saluzzo, by Cagnan, to Turin; receiving, even in this short space, many rivers, from the S. and from the N. The other southern rivers are of far less consequence, but among them may be named the Trebbia, the river of Parma, and the Banaro, which joins the Po at Stellato, on the western frontier of the former territory of Ferrara. The course of the Po may be comparatively estimated at about three hundred British miles. The bed of the Po has in modern times been considerably raised, so that in many places banks of thirty feet in height are necessary to preserve the country from inundation. In the middle ages maritime combats took place on the Po, between Venice and some of the inland powers. The other rivers of the north of Italy, are the Adige, the Brenta, the Piave, and the Tagliamento.

In the centre first appears the Arno, which rises in the Apennines, and flows by Florence and Pisa into the gulph of Genoa. The Tiber is by far the most considerable in the middle, or south of Italy, rising near the source of the Arno, and passing by Rome, to the Mediterranean, which it joins after a course of about one hundred and fifty British miles.

LAKES.] Italy contains many beautiful lakes, particularly

particularly in the northern part. The Lago Maggiore, Greater Lake, or lake of Locarno, is about twenty-seven British miles in length, by three of medial breadth; and the shores abound with alpine beauties, receiving the waters of some other lakes, among which must be mentioned that of Lugano on the east. Still farther to the east is the lake of Como, which is joined by that of Lecco; the lake of Como is about thirty-two British miles in length, but the medial breadth not above two and a half. Yet farther to the east is the small lake of Iseo, which is followed by the noble Lago di Garda, an expanse of about thirty British miles in length by eight in breadth.

MOUNTAINS.] The most important mountains of Italy are the Alps, already described by Count Stolberg, in a former part of this work.

NAPLES AND SICILY.] This division comprises what was the kingdom of Naples and Sicily; but Naples having been subdued by the French, is considered as part of the kingdom of Italy: Sicily, being an island, is at present under its former sovereign, who has fixed his court at Palermo.

The isles of Malta and Gozo are of far more consequence. They are rocky and barren, not producing grain sufficient for half the consumption of a thin population; but may in the hands of the English prove a valuable acquisition. Malta is about fifty British miles in circumference, and is supposed to contain sixty thousand inhabitants. The isle of Gozo is about half the extent, and is rather fertile, the population being computed at three thousand.

The central part of Italy comprehends what was called the Dominions of the Church, (but the pope is now dethroned), and the grand duchy, now kingdom of Tuscany; with a few diminutive states. The territory belonging to the pope reached from near Pesaro to beyond Terracina.

Tuscany has long been celebrated for the arts; and Florence is regarded as the Athens of modern Italy. Tuscany is about one hundred and twenty British miles in length by ninety in breadth; but in consequence of the French ascendancy in Italy, a prince of Spain wields his tributary sceptre of Etruria under the protection of the French empire. Tuscany is one of the most beautiful and fertile regions of Italy, with a temperate and healthy climate. It

VOL. II. No. CXXV.

abounds in corn and cattle, and produces excellent wines and fruit. The manufactures of silk and velvet were formerly celebrated, and still maintain reputation. The mountains in the Siennese, or southern part of Tuscany, contain valuable ores of antimony, copper which is wrought at Massa, and other metals, with slate and yellow marble. The serpentine of Impruneta, seven miles south from Florence, presents beautiful varieties used in ornamental architecture. The Florentine marble is remarkable for picturesque representations of ruins, &c. caused by the infiltration of iron between the laminae. The Arno receives many small streams; and the Ombrone is a considerable river which pervades the Siennese.

ASIA.

EXTENT.] This great division of the earth extends in length from the Hellespont to the East Cape; that is from twenty-six degrees east from London, to near one hundred and ninety degrees of east longitude; being no less than (taking the degree at a medial latitude) six thousand five hundred geographical miles. From the southern cape of Malacca to the cape of Cevero Vostochnoi, on the Arctic Ocean, the breadth extends from about two degrees of northern latitude to about seventy-seven degrees, or nearly four thousand five hundred geographical miles. If, for the sake of a rude and merely comparative calculation, one sixth part be added for the difference between the statute and geographical mile, the length of Asia in British miles would be about seven thousand five hundred and eighty-three, and the breadth five thousand two hundred and fifty.

Asia is limited, on the east, by a strait which divides it from America, and which, in honour of the discoverer, is called Beering's Strait. The northern and southern boundaries are the Arctic and Indian Oceans, in which last many large islands, particularly that of New Holland, now styled by some *Australasia*, affords a vast additional extent to this quarter of the globe.

ORIGINAL POPULATION.] The population of Asia is allowed to be primitive and original; if we except that of the Techuks or Tchukchi,

9 A

who

who are supposed to have passed from the opposite coast of America. A few colonies have migrated from Russia to the northern parts, as far as the sea of Kamchatka; and there are well known European settlements in Hindostan and the isles to the S. E.; but the first serious attempt to colonize what is esteemed a part of Asia was the recent settlement at Port Jackson. With these and other trifling exceptions Asia presents a prodigious original population.

After the discovery of America and the Cape of Good Hope, the maritime parts and islands of Asia were successively disclosed. Yet the recent voyages of the Russian navigators, of our immortal Cook, and of the unfortunate La Perouse, evince that much remained to be done; and concerning the interior of Siberia scarcely any solid information arose, till Peter the Great, after the battle of Pultowa, sent many Swedish prisoners into that region; and Strahlenberg, one of the officers, published an account of Siberia. This knowledge was greatly improved and increased by the well known genius of Pallas, and others. Yet our knowledge of Asia is far from being perfect, especially in respect to Daouria, and other regions near the confines between the Russian and Chinese empires; not to mention central Asia in general, Tibet, and some more southern regions; nor had even the geography of Hindostan been treated with tolerable accuracy, till Major Rennell published his map and memoir.

SEAS.] Asia is washed by a part of the Mediterranean, the Red Sea, the Arabian Sea, and gulph of Persia; the bays of Bengal and Nankin; and other gulphs, which diversify the coasts.

The Red Sea, or the Arabian gulph, constitutes the grand natural division between Asia and Africa; but its advantages have chiefly been felt by the latter, which is entirely destitute of other inland seas. The Red Sea extends about twenty-one degrees, or one thousand four hundred and seventy British miles.

The Persian Gulf is about half the length of the former, being the grand receptacle of those celebrated rivers the Euphrates and the Tigris.

The Caspian Sea, which is entirely inland, extends about ten degrees, or seven hundred miles in length, and is from one hundred to two hundred in breadth. To the east, this remark-

able sea is supposed to have extended, at no very remote period, to the lake of Aral; the deserts on that side presenting the same features as those to the north, though there be now an elevated level between the Sea of Aral and the Caspian. The northern shores are low and swampy, often overgrown with reeds; but in many other parts the coasts are precipitous, with such deep water that a line of four hundred and fifty fathoms will not reach the bottom. This sea is the receptacle of many important rivers.

About one hundred miles to the east of the Caspian, is the Sea or Lake of Aral, which is about two hundred miles in length, and about seventy miles in breadth, receiving the river Sirr or Sihon, and the river Gihon, the Oxus of antiquity, both streams of considerable course, flowing from the mountains of Belur Tag, or Inaus. The Sea of Aral, being surrounded with sandy deserts, has been little explored; but it is salt, like the Caspian, and there are many small saline lakes in the vicinity.

Another remarkable detached sea is that of Baikal, in Siberia, or Asiatic Russia, extending from about the fifty-first to the fifty-fifth degree of north latitude, being about three hundred and fifty British miles in length, but its greatest breadth not above thirty-five. The water is fresh and transparent, yet of a green or sea tinge, commonly frozen in the latter end of December, and clear of ice in May. The Baikal is, at particular periods, subject to violent and unaccountable storms, whence, as terror is the parent of superstition, probably springs the Russian name of Svetoie More, or the Holy Sea. There are many seals, and abundance of fish, particularly a kind of herring called omuli. Several islands appear, and that of Olchon has sulphureous springs. The chief river flowing into the Baikal is the Selinga, from the south, while from the north it emits the Angara, which joins the prodigious stream of the Yenisei.

Of the other Asiatic seas a minute account would be superfluous; but a few observations may be offered on the remarkable strait which divides Asia from America. This strait, which was discovered by Beering, and afterwards by Cook, is about forty miles in breadth. Beering, a Dane, was employed by Peter the Great, in 1728, and actually passed this strait, probably in the usual fogs of the climate, without discovering

ended, at no very great depth; the desert features as those of an elevated plain, and the Caspian, a swampy, often very shallow, and many other parts of such deep water as is fifty fathoms will be the receptacle

the east of the Aral, which is of great length, and about the river Sirr the Oxus of an- considerable course, of Belur Tag, or being surrounded by the explored; but there are many

ed sea is that of Russia, extending to the fifty-fifth degree of latitude, three hundred and thirty miles, but its greatest depth is 100 fathoms. The water is of a green or sea color. At the latter end of the Bay of De-ay. The Baikal is subject to violent and as terror is the only springs the or the Holy Sea, abundance of fish, called omuli. minute account of few observations of the strait which is this strait, which is afterwards by breadth. Bearing, the Great, in the strait, probably the strait, without dis- covering

covering land to the east; but our great navigator gave the name of the Danish adventurer to these straits, when he afterwards explored them with his usual accuracy. On the Asiatic shore is the East Cape, and on the American that called Prince of Wales. The depth of the strait is from twelve to thirty fathoms. To the north of these straits the Asiatic shore tends rapidly to the westward; while the American proceeds nearly in a northern direction, till, at the distance of about four or five degrees, the continents are joined by solid and impenetrable bonds of ice.

TURKEY IN ASIA.

EXTENT.] Asiatic Turkey extends from the shores of the Egean Sea, or Archipelago, to the confines of Persia; a space of about one thousand and fifty British miles. The boundaries towards Persia are rather ideal than natural, though somewhat marked by the mountains of Ararat and Elwend. In the north the Turkish territories are now divided from the Russian by the river Cuban, and the chain of Caucasus; in the south they extend to the junction of the Tigris and the Euphrates, which last river, for a considerable space, divides the Turkish possessions from those of the Arabs. From the river Cuban to the junction of the Tigris and Euphrates, is about one thousand one hundred British miles.

DIVISIONS.] This extensive territory is divided into nine or ten provinces. Natolia, the most westerly, is followed by Karaman in the south, and Roum, in the north-east. To the north of Armenia are Guria, or Guriel, Mingrelia, and the Abkhas of Caucasus, the ancient Circassians. Armenia is also styled Turcomania; to the south of which are Kurdistan, and Irak Arabi, a part of ancient Persia around the celebrated capital, Bagdad. The ancient Mesopotamia, between the Tigris and the Euphrates, now partly corresponds with the province of Algezira; and the classical name of Syria, or Soria, is still allotted to the celebrated countries along the eastern extremities of the Mediterranean.

ANTIQUITIES.] The most splendid ruins are those of Palmyra, or Tadmor in the Desert, about one hundred and fifty miles S. E. of Aleppo, at the northern extremity of the sandy wastes of Arabia.

Balbec, the ancient Heliopolis, is about fifty miles to the N. W. of Damascus, the most remarkable ruin being that of a temple, supposed to have been dedicated to the sun.

The Turkish empire in Asia is estimated at four hundred and seventy thousand, four hundred square miles, and the population at ten millions; which, allowing eight for the European part, will render the total eighteen millions.

MANNERS AND CUSTOMS.] In general the most striking feature of manners and customs, in the Turkish empire, is, that half the people may be considered as somewhat civilized, while the other half are pastoral wanderers, ranging over extensive wastes. This laxity of government renders travelling in Asia Minor very unsafe, and has proved a great impediment to any exact geographical knowledge of these regions. Under a prudent government, the wandering hordes of Turcomans and Kurds would be expelled; and regular troops and garrisons maintained on the frontiers; when industry and the arts might again visit this territory.

CLIMATE AND SEASONS.] The climate of Asia Minor has always been considered as excellent. There is a peculiar softness and serenity in the air, not perceivable on the European side of the Archipelago. The heat of the summer is tempered by the numerous chains of high mountains, some of which are said to be covered with perpetual snow.

FACE OF THE COUNTRY.] The general appearance of Asiatic Turkey may be regarded as mountainous; but intermingled with large and beautiful plains, which, instead of being covered with rich crops of grain, are pastured by the numerous flocks and herds of the Turcomans. The soil, as may be expected, is extremely various; but that of Asia Minor is chiefly a deep clay; and wheat, barley, and durra, form the chief products of agriculture. But excellent grapes and olives abound; and the southern provinces are fertile in dates. In Syria the agriculture is in the most deplorable condition. The peasants, though not sold with the soil, like those of Poland, are, if possible, yet more oppressed; barley bread, onions, and water, forming their constant fare.

RIVERS.] The principal river of Asiatic Turkey is the Euphrates, which rises from the mountains of Armenia, a few miles to the N. E. of Erzeron: and chiefly pursues a S. W. direction

tion to Semisat, where it would fall into the Mediterranean, if not prevented by a high ridge of mountains*. At Semisat, the ancient Samosata, this noble river assumes a southerly direction; then runs an extensive course to the S. E. and after receiving the Tigris, falls by two or three mouths into the Gulph of Persia. The comparative course of the Euphrates may be estimated at about one thousand four hundred British miles.

Next in importance is the Tigris, which rises to the north of the Medan, about one hundred and fifty miles south from the sources of the Euphrates, and pursues nearly a regular direction S. E. till it joins the Euphrates below Korna, about sixty miles to the north of Basora; after a comparative course of about eight hundred miles. The Euphrates and the Tigris are both navigable a considerable distance from the sea.

The third river in Asiatic Turkey is that called by the Turks Kizil Irmak, rising in mount Taurus, not far from Erekli, but by other accounts more to the east, and pursuing a winding course to the north, nearly across the whole of Asia Minor, till it joins the Euxine Sea on the west of the gulf of Sansoun. The river Sicaria, the ancient Sangarius, or Sangaris, rises about fifty miles to the south of Angora, and running to the N. W. joins the Euxine, about seventy miles to the east of Constantinople.

LAKES.] Asiatic Turkey also contains numerous lakes. That of Van, in the north of Kurdistan, is the most remarkable, being about eighty British miles in length, from N. E. to S. W. and about forty in breadth: it is said to abound with fish.

In Syria what is called the Dead Sea, may be regarded as a lake of about fifty miles in length, and twelve or thirteen in breadth. The lake of Rackama, to the south of Hilla, and the ancient Babylon, is about thirty miles in length, and flows into the Euphrates.

MOUNTAINS.] Many of the mountains of Asiatic Turkey deserve particular attention, from their ancient celebrity. The first rank is due to the Taurian chain of antiquity, which was con-

sidered as extending from the neighbourhood of the Archipelago to the sources of the Ganges, and the extremities of Asia, so far as discovered by the ancients. The Caucasian mountains have been well delineated by the Russian travellers, as forming a range from the mouth of the river Cuban, in the N. W. to where the river Kur enters the Caspian, in the S. E.

Towards the east of Armenia is Ararat, a detached mountain, with two summits, the highest being eternally covered with snow. In one of the flanks is an abyss, or precipice, of prodigious depth, the sides being perpendicular, and of a rough black appearance, as if tinged with smoke. This mountain belongs to Persia, but is here mentioned on account of connexion.

In Syria the most celebrated mountain is that of Lebanon, or Libanus, running in the southerly and northerly direction of the Mediterranean shore, and generally at the distance of about thirty or forty miles. The Anti-Libanus is a short detached chain, running nearly parallel on the east. These mountains are of considerable height, the summits being often covered with snow.

FORESTS.] The numerous mountains in Asiatic Turkey are often clothed with immense forests of pines, oaks, beeches, elms, and other trees. The southern shores of the Black Sea also present many gloomy forests of great extent. The abundance of timber supplies the inhabitants with fuel, nor has pit coal been explored in any part of Asiatic Turkey.

ZOOLOGY.] The best horses in Asiatic Turkey are of Arabian extract, and are sparingly fed with a little barley and minced straw, to accustom them to abstinence and fatigue; but mules and asses are in more general use.

In Asiatic Turkey appears that king of ferocious animals the lion; yet he rarely roams to the west of the Euphrates: but Tournesfort observed many tigers on Mount Ararat. He may mean the small tyger, or perhaps the leopard for the royal or large tyger seems to be restricted to the wastes of Hindostan. The hyæna and the wild boar are known animals of Asia-Minor together with troops of jackals, which raise dreadful cries in the night. The cities and

* In this part of its course the Euphrates is joined by the Morad from the east, a stream almost doubling in length that of Euphrates; so that the latter river might

more justly be said to spring from mount Ararat, at one hundred and sixty British miles to the east of the reputed source.

lages swarm with dogs, which are allowed to
wander, as a constant defence against strangers
or enemies.

The ibex, or rock goat, appears on the sum-
mits of Caucasus. The common antelope is also
an inhabitant of Asia Minor, with numerous
deers and hares. The partridges are generally of
the red legged kind, about a third larger than
the common European.

ISLANDS BELONGING TO ASIATIC TURKEY.

The chief islands in the Archipelago, con-
sidered as belonging to Asia, are Mytilene, Scio,
Samos, Cos, and Rhodes.

Mytilene, the ancient Lesbos, is the most
northerly and largest of these isles, being about
forty British miles in length, by twenty-four at
its greatest breadth. The mountainous appear-
ance of this isle is agreeably diversified with
bays and inlets of the sea, and plantations of
olives, vines, and myrtle. There are hot baths
issuing from cliffs resembling those of St. Vin-
cent near Bristol, and which indicate the isle to
be chiefly calcareous. The climate is exquisite;
and it was anciently noted for wines, and the
beauty of the women.

Scio, the ancient Chios, is about thirty-six
British miles in length, but only about thirteen
in medial breadth. The Chian wine is celebrated
by Horace, and retains its ancient fame. The
town of Scio, on the east side of the isle, is
handsome and convenient. The Greeks here
enjoy considerable freedom and ease; and dis-
play such industry that the country resembles a
garden. This particular favour arises from the
cultivation of the mastic trees, or rather shrubs,
for they are small evergreens which supply the
gum, so acceptable to the ladies of the seraglio.
The whole isle is mountainous. Opposite to Scio,
on the Asiatic shore, is Chesmé, where the
Turkish fleet was destroyed by the Russians, 1770.
The inhabitants of Scio are supposed to be about
sixty thousand.

Samos is about thirty miles long, and ten
broad. This isle is crossed by a chain of hills,
and the most agreeable part is the plain of Cora.
Tournesfort computes the inhabitants at twelve
thousand, all Greeks with a Turkish Aga or
military officer, and a cadi or judge. The pot-

VOL. II. No. CXXV.

tery of Samos was anciently excellent; but at
present most branches of industry are neglected.
Pitch is prepared from the pine trees in the north
part of the island, and the silk, honey, and wax
are esteemed. Most of the mountains are of
white marble, and swarm with game of various
descriptions. The best haven is that of Vati to
the N. W. Some remains are observed of the
celebrated temple of Juno.

Cos is about twenty-four miles long, by three
or four broad; but has been little visited by
modern travellers. Pliny styles Cos a most noble
isle; and from it was first derived the name and
substance of the whetstone. It is now covered
with groves of lemon trees. Its chief trade is in
oranges and lemons; and Cos is the residence of
a Turkish Pasha.

Rhodes is about thirty-six British miles in
length, by fifteen in breadth, an island cele-
brated in ancient and modern times. It is fertile
in wheat, though the soil be of a sandy nature.
The population is computed at about thirty
thousand. The city of the same name, in which
no Christian is now permitted to dwell, stands
in the north end of the isle; and was anciently
noted for a colossus in bronze, about one hun-
dred and thirty feet high.

Along the southern shore of Asia Minor there
are some small isles, among which is that of
Castel Rosso, S. E. of Patira. But they are of
no moment when compared with the large and
celebrated island of Cyprus, which is about one
hundred and sixty British miles in length, and
about seventy at its greatest breadth. The soil
is fertile, yet agriculture is neglected. The
chief products are silk, cotton, wines, turpen-
tine, and timber. The wine of Cyprus is de-
servedly celebrated. The oranges are excellent;
and the mountains are covered with hyacinths
and anemonies, and other beautiful flowers.
Cyprus is supposed to have derived its name
from the abundance of copper ore; and it is
said to have produced gold, silver, and emeralds.
What is called the Paphian diamond is a rock
crystal, found near Paphos; and there is a
quarry of amsanthus, while several hills consist
chiefly of talc. The other mineral productions
are red jasper, agates, and amber. The Cy-
priots are a tall and elegant race; but the chief
beauty of the women consists in their sparkling
eyes. To the disgrace of the Turkish govern-

9 B

vernment

vernment the population of this extensive island is computed at fifty thousand souls! Cyprus is pervaded by a chain of mountains, among which is a third *Olympus*, some primitive name, which seems to have been general for a mountain of great height. There is not one river in the island that continues its course in the summer; but there are many ponds, lakes, and fens, producing a damp and malignant air. The chief cities are Nicosia, the capital and residence of the governor, and Famagusta.

ASIATIC RUSSIA.

EXTENT.] This large portion of the globe extends almost the whole length of Asia, from about the fifty-seventh degree of longitude east of London to more than one hundred and ninety degrees. As the northern latitude is very high, the degree shall only be assumed at thirty miles, and the length may thus be computed at about four thousand geographical miles. The greatest breadth from Cape Cevero Vostochnoi, to the Altaian chain of mountains on the south of the sea of Baikal, may be twenty-eight degrees or one thousand six hundred and eighty geographical miles. In British miles the length may be roughly computed at four thousand five hundred and seventy; and the breadth at one thousand nine hundred and sixty, an extent which will be found to exceed that of Europe.

BOUNDARIES.] The farthest eastern boundary is that of Asia; and the seas of Kamchatka and Ochotsk; while the northern is the Arctic Ocean. On the west the frontiers correspond with those between Asia and Europe. The river Cuban, part of the Caucasian chain, and an ideal line, divide the Russian territory from Turkey and Persia. The boundary then ascends along the north of the Caspian through the stepp or desert of Issim, and the eastern shore of the river Ob, to where it issues from the Altaian mountains, when it meets the vast empire of China; and proceeds along that chain to the sources of the Onon, where it includes a considerable region called Daouria, extending about two hundred miles in breadth, to the south of the mountains called Yablónny; the limit between Russia and Chinese Tatar being partly an ideal line;

and partly the river Argoon, which, joined with the Onon constitutes the great river Amur. Thence the boundary returns to the mountainous chain, and follows a branch of it to a promontory on the north of the mouth of the Amur.

ANTIQUITIES.] The most curious antiquities seem to be the stone tombs which abound in some stepps, particularly near the river Yenesei, representing in rude sculpture human faces, camels, horsemen with lances, and other objects. Here are found, besides human bones, those of horses and oxen, with fragments of pottery and ornaments of dress.

RELIGION.] The Grecian system of the Christian faith, which is embraced by the Russians, has made considerable progress in their Asiatic possessions. Many of the Tatar tribes in the S. W. are Mohammedans; and others follow the superstition of Dalai Lama. But the more eastern Tatars are generally addicted to the Shaman religion, a system chiefly founded on the self-existence of matter, a spiritual world, and the general restitution of all things.

POPULATION.] The population of Siberia cannot be computed at above three millions and a half; so that Europe can in future have little to apprehend from the Tataric swarms. Small Russian colonies have been established in several of the distant provinces and isles.

MANNERS AND CUSTOMS.] The manners and customs of Asiatic Russia vary with the numerous tribes by whom that extensive region is peopled. The Tatars, properly so called, are the most numerous, not only remaining in their ancient kingdom of Sibir, but constituting many other tribes in the west, as the Nogays, the Kirguses or Kaizaks, the Bashkirs, and other tribes as far as the sources of the river Ob. Next in importance are the Moonguls, of whom one tribe, the Kalmuks, are found to the west of the Caspian; while the others, called Burats, Torguts, &c. are chiefly around the sea of Baikal. Yet farther to the east are the Mandshurs, or Tunguses. Such are the three radically distinct divisions of men, whom former European ignorance classed under the general name of Tartars.

The manners of the Tatars, who are the same people with the ancient Huns, are minutely described by those authors who have delineated the

who are the same are minutely de- ve delineated the fall

all of the Roman empire, prior to which period they seem to have been absolutely unknown. The manners of the Monguls of the Russian empire, who are wholly Nomadic, and their herds consist of horses, camels, oxen, sheep, and goats. The women tan leather, dig the culinary roots, prepare the winter provisions, dried or salted, and distil the kounmiss, or spirit of mare's milk. The men hunt the numerous beasts and game that roam through the vast wilds. Their tents are formed of a kind of felt, and in some parts they erect little temples, and the priests have also wooden hovels around the temples. The Kalmpks are divided into three ranks; the nobility, whom they call white bones; the common people, who are bond-men, and termed black bones; and the clergy, descending from both, who are free. In like manner the noble ladies are called white flesh; and the common people black flesh; but the pedigrees are only reckoned by the bones. The power of the *Thidsha*, or chief prince, consists in the number and opulence of his subjects, territory being of no estimation in so wide a region. These subjects form an *Oluss*, divided into *Imaks*, from one hundred and fifty to three hundred families, each *knak* being commanded by a *Saissan*, or noble. If there be a great khan, or emperor, the princes are only guided by him in affairs of general importance. The tribute is about a tenth part of the cattle and other property; but, on the first summons, every man must appear on horseback before the prince, who dismisses those who are unfit for the fatigues of war. The weapons are bows, lances, and sabres, and sometimes fire-arms; and the warriors are clothed in mail of interwoven rings, like that used in Europe till the fifteenth century. But they cannot oppose regular armies, and are apt even to disorder those of their allies.

The Monguls are rather short in stature, with flat visage, small oblique eyes*, thick lips, and short chin, with a scanty beard; the hair black, and the complexion of a reddish or yellowish brown; but that of the women is clear, and of a healthy white and red. They have sur-

* The eye ascending towards the temples, like the Chinese, seems a peculiar feature of the Monguls and

prising quickness of sight and apprehension, and are docile, hospitable, beneficent, active, and voluptuous. Industry is a virtue entirely female, yet great, and accompanied with perpetual cheerfulness. Their religious books are in the dialect of Tangut, or Tibet, and there is a schoolmaster in every imuk, who imparts more knowledge to the boys than would be expected. Animal food is abundant, and sometimes mixed with vegetable, while the general drink is water; but they sometimes indulge in sour milk, prepared after the Tatarian manner, butter-milk, and kounmiss; but mead and brandy are now greater favourites. When pasturage begins to fail, the whole tribes strike their tents, generally from ten to fifteen times in the year, proceeding in the summer to the northern, and in the winter to the southern wilds. The herds, men, women, and children, form a regular procession, and are followed by the girls, singing with harmony and spirit. The amusements of these jovial wanderers consist in running races on horseback, in which even the girls excel; archery, wrestling, pantomime, dances, and the songs of the young women, generally accompanied by the lute, viol, and pipe, the themes of their ditties being gigantic tales of chivalry, and amorous adventures and sentiments; but the melody is harsh and dismal. Cards are not unknown, but chess is the favourite game.

LANGUAGE.] The languages of all these original nations are radically different; and among the Tunguses, Monguls, and Tatars, there are some slight traces of literature: and not a few manuscripts in their several languages.

CITIES AND TOWNS.] In Asiatic Russia the principal city is Astracan, at the mouth of the Volga, which is supposed to contain seventy thousand inhabitants. Astracan is built on several small hills, that rise amid the meadows of the Volga. The fortress on the west is triangular, but the walls of the city are neglected. The wooden houses have exposed it to frequent conflagrations, and attempts have been vainly made to enforce the use of brick. The Armenians, Lutherans, and Papists, have their places of worship; and even the Hindoos have been permitted to erect a temple. The chief trade of

Mandshurs. The Tatar eye is small, but strait, or horizontal.

Astracan

Astracan is in salt and fish, particularly sturgeon and kaviar, from the Volga; and it also attracts some portion of oriental commerce.

MANUFACTURES.] There are some manufactures, particularly in leather, at Astracan; and salt is prepared there, and in several other places in Asiatic Russia. Isinglass is chiefly manufactured on the shores of the Caspian, from the sounds or air bladder of the sturgeon, and the beluga. Kaviar is the salted roe of large fish. There is a considerable fabric of nitre, about forty miles to the north of Astracan. The Tatars and Bashkirs make felts of a large size, some of which are exported. The Russia leather is chiefly fabricated in the European provinces, being tanned with willow bark, and afterwards stained. Shagreen is prepared from the hides of horses or asses, but only a particular part of the back is fit for this purpose; and the grain is given with the hard seeds of the greater orach, pressed into the leather while moist. Pitch is made by the boors from the pines of Siberia. Near the Uralian mountains are several manufactures in iron and copper.

CLIMATE AND SEASONS.] Through the greater part of Siberia, the most southern frontiers being about fifty degrees, while the northern ascends to seventy-eight degrees, the general climate may more justly be regarded as frigid than temperate; being, in three quarters of the country, on a level with that of Norway and Lapland, untempered by the gales of the Atlantic. To the south of the sea of Baikal the climate parallels that of Berlin and the north of Germany, so that the finest and most fertile regions in middle Asia belong to the Chinese. The chains of high mountains, which form the southern boundary of these provinces, also contribute to increase the cold; and the sea of Baikal is commonly entirely frozen from December till May. The finest climate in these eastern parts seems to be that of Daouria, or the province around Nershinsk; and the numerous towns on the Amur evince the great superiority of what is called Chinese Tatar, which is comparatively a fertile and temperate region. The change of the seasons is very rapid; the long winter is almost instantaneously succeeded by a warm spring, and the quickness and luxuriance of the vegetation exceed description.

SOIL AND AGRICULTURE.] Many parts of

Siberia are totally incapable of agriculture; but in the southern and western districts the soil is remarkably fertile. Toward the north of Kolyvan barley generally yields more than twelve fold, and oats commonly twenty fold. Buck wheat, in this black light mould, is apt to run into stalk, but sown in the poorest spots, yields from twelve to fifteen fold.

RIVERS.] Some of the largest rivers of Asia belong to the Russian empire, nearly equalling in the length of their course any others on the globe. The Ob, including its wide estuary, may be said to hold a comparative course of one thousand nine hundred British miles, while that of the Yenesei is about one thousand seven hundred and fifty, and that of the Lena one thousand five hundred and seventy. In the same mode of mensuration the Hoan Ho of the Chinese will, in its wandering progress, exceed the Ob; while the Kian Ku, pervading the centre of China, may be traced, if the Porticho be included, for a length of about two thousand three hundred miles.

LAKES.] In the north of Siberia the most considerable lake is that of Piazinsko. In the south the sea of Baikal is fresh. Between the river Ob and the Irtysh is a large lake, about half the length of the Baikal, or one hundred and seventy miles in length, divided by an island into two parts, called the lakes of Tchany and Soumy. In this quarter there are many smaller lakes, and others to the north of the Caspian, some of which are salt, particularly that of Bogdo.

FORESTS.] Asiatic Russia is so abundant in forests, that particular names have not been assigned to so vast an extent. On the west of the government of Irkutsk an enormous dark and marshy forest of resinous trees extends to the river Kan. The northern and eastern parts of Siberia are bare of wood; the Norway fir not being found farther north than lat. sixty degrees, while the silver fir does not exceed lat. fifty eight degrees. In Europe, on the contrary, the Norway fir forms extensive forests in Lapmark, within the arctic circle.

STEPS.] These are extensive level plains, an appearance of nature almost peculiar to Asia, and some parts of European Russia; but somewhat similar to the sandy deserts of Africa. The steppes are not so barren of vegetation, being mostly

mostly only sandy, with scattered patches of thin grass, and at wide intervals a stunted thicket. Between the mouths of the Don and Volga is a stepp which resembles the bed of a sea; with spots of salt, and saline lakes, being entirely destitute of fresh water and wood.

On the eastern side of the Volga begins an extensive stepp, which reaches about seven hundred British miles from E. to W.; and, including Iasim, nearly as far from N. to S. but on the N. of the Caspian the breadth does not exceed two hundred and twenty.

This stepp of Barabin, N. W. of Omsk, is about four hundred miles in length, and three hundred in breadth, containing a few salt lakes, but in general of a good black soil, interspersed with forests of birch.

MINERALOGY.] The mineralogy of Siberia displays many singular and interesting objects.

The chief gold mines of Siberia are those of Catherinenburg, or Ekaterinenburg, on the east of the Uralian mountains, about lat. fifty-seven degrees, where an office for the management of the mines was instituted in 1719. The mines of various sorts extend to a considerable distance on the N. and S. of Catherinenburg; and the foundries, chiefly for copper and iron, are computed at one hundred and five. But the gold mines of Beresof, in this vicinity, were of little consequence till the reign of Elizabeth. The mines of Nershinsk, discovered in 1704, are principally of lead, mixed with silver and gold; and those of Kolyvan, chiefly in the Schlangenbergl, or mountain of serpents, so called by the German miners, began to be worked for the crown in 1748.

The gold is sometimes found native, but generally mingled with various substances, particularly silver.

Besides the copper mines in the Uralian mountains, there are also some in those of Altai.

THE CHINESE EMPIRE.

THE utmost extent of the Chinese empire may be considered as four thousand nine hundred British miles long, and nearly two thousand and thirty British miles broad.

China Proper extends from the Great Wall in the north, to the Chinese Sea in the south, about one thousand one hundred and forty

VOL. II. No. CXXVI.

geographical, or one thousand three hundred and thirty British miles. The breadth, from the shores of the Pacific to the frontiers of Tibet, may be computed at eight hundred and eighty-four geographical, or nearly one thousand and thirty British miles. In square miles the contents have been estimated at one million two hundred and ninety-seven thousand nine hundred and ninety-nine, and in acres at eight hundred and thirty millions, seven hundred and nineteen thousand, three hundred and sixty. On the east and south the boundaries are maritime, and to the north they are marked by the Great Wall and the desert of Shamo.

ANTIQUITIES.] Among the remains of Chinese antiquity may be mentioned the pagodas, or ornamented towers, sometimes erected in commemoration of great events; many temples, which are low buildings of a different construction from the pagodas; and some triumphal arches, which boast considerable antiquity.

But the chief remain of ancient art in China is that stupendous wall, extending across the northern boundary. This work, which is deservedly esteemed among the grandest labours of art, is conducted over the summits of high mountains, some of which rise to the height of five thousand two hundred and twenty-five feet, across the deepest vales, over wide rivers by means of arches; and in many parts is doubled or trebled to command important passes, and at the distance of almost every hundred yards is a tower or massy bastion. The extent is computed at one thousand five hundred miles; but in some parts of smaller danger it is not equally strong nor complete, and towards the N. W. is only a rampart of earth. Near Koopeko the wall is twenty-five feet in height, and at the top about fifteen feet thick: some of the towers, which are square, are forty-eight feet high, and about fifty feet wide. The stone employed in the foundations, angles, &c. is a strong grey granite; but the greatest part consists of blueish bricks, and the mortar is remarkably pure and white.

RELIGION.] According to Du Halde the ancient Chinese worshipped a supreme being, whom they stiled Chang Ti, or Tien, which is said to imply the spirit which presides over the heavens; but in the opinion of others, is only the visible firmament. They also worshipped subaltern spirits, who presided over kingdoms, provinces,

9 C

cities.

cities, rivers, and mountains. Under this system, which corresponds with what is called Shamanism, sacrifices were offered on the summits of hills.

About A. D. 65, the sect of Fo was introduced into China from Hindostan. The name was derived from the idol Fo, (supposed to be the Boodh of Hindostan,) and the chief tenets are those of the Hindoos, among which is the metempsychosis, or transition of souls from one animal to another. The priests are denominated Bonzes, and Fo is supposed to be gratified by the favour shown to his servants. Many subordinate idols are admitted; but as the Jesuits found the followers of Fo the most adverse to Christianity, they have absurdly enough called them Atheists.

POPULATION.] The population of China has been a topic of considerable debate; but it is probable, from the calculation in Neuhoft's Travels, that the population is about two hundred and thirty millions; and not three hundred and thirty three millions, as calculated by Sir George Staunton.

MANNERS AND CUSTOMS.] In visiting the sea ports of China, foreigners have been commonly impressed with the idea of fraud and dishonesty; but it is to be supposed that these bad qualities are not so apparent where there are fewer temptations. The indolence of the upper classes, who are even sed by their servants, and the nastiness of the lower, who eat almost every kind of animal, in whatever way it may have died, are also striking defects, though the latter may be occasioned by necessity in so populous a country. To the same cause may be imputed the exposition of infants. On the other hand, the character of the Chinese is mild and tranquil, and universal affability is very rarely interrupted by the slightest tincture of harshness or passion. The general drink is tea, of which a large vessel is prepared in the morning for the occasional use of the family during the day. Marriages are conducted solely by the will of the parents, and polygamy is allowed. The bride is purchased by a present to her parents, and is never seen by her husband till after the ceremony. It is not permitted to bury in cities or towns, and the sepulchres are commonly on barren hills and mountains, where there is no chance that agriculture will disturb the bones of the dead. The colour of mourning is white, that personal neglect or forgetfulness

may appear in its squalor; and it ought on solemn occasions to continue for three years, but seldom exceeds twenty-seven months. The walls of the houses are sometimes of brick, or of hardened clay, but more commonly of wood; and they generally consist only of a ground floor, though in those of merchants there be sometimes a second story, which forms the warehouse. The houses are ornamented with columns, and open galleries, but the articles of furniture are few. The dress is long, with large sleeves, and a flowing girdle of silk. The shirt and drawers vary according to the seasons, and in winter the use of furs is general, from the skin of the sheep to that of the ermine. The head is covered with a small hat in the form of a funnel, but this varies among the superior classes, whose rank is distinguished by a large bead on the top, diversified in colour according to the quality. The dress is in general simple and uniform; and on the audience given to Lord Macartney, that of the emperor was only distinguished by one large pearl in his boquet. The chief amusement of the Chinese seem to be dramatic exhibitions, fire-works, in which they excel all other nations: and feats of deception and dexterity.

LANGUAGE.] The language is esteemed the most singular on the face of the globe. Almost every syllable constitutes a word, and there are scarcely one thousand five hundred distinct sounds; yet in the written language there are at least eighty thousand characters, or different forms of letters, so that every sound may have about fifty senses. The leading characters are denominated keys, which are not of difficult acquisition.

CITIES AND TOWNS.] The chief cities of China are Pekin and Nankin, or the northern and southern courts, the former being the Cambula, or city of the Chan, in writings of the middle ages, the capital of Cathay, as Nankin was of Mangi. Pekin occupies a large space of ground; but the streets are wide, and the houses seldom exceed one story. The length of what is called the Tatar city is about four miles, and the suburbs are considerable. By the best information which the recent embassy could procure, the population was computed at three millions. The houses indeed are neither large nor numerous; but it is common to find three generations, with all their wives and children, under one roof, and they

they eat in common, and one roof contains many beds. The neatness of the houses, and various repletion of the shops, delight the eye of the visitor.

Nankin, which was the residence of the court till the fifteenth century, is a yet more extensive city than Pekin, and is reputed the largest in the empire. The walls are said to be about seventeen British miles in circumference. The chief edifices are the gates, with a few temples; and a celebrated tower clothed with porcelain, about two hundred feet in height. Such towers were styled pagodas by the Portuguese, who supposed them to be temples; but they seem to have been chiefly erected as memorials, or as ornaments, like the Grecian and Roman columns.

ENRICES.] The most striking, and peculiar edifices in China are the pagodas or towers, already mentioned, which sometimes rise to the height of nine stories, of more than twenty feet each. The temples, on the contrary, are commonly low buildings, always open to the devout worshippers of polytheism. The whole style of Chinese architecture is well known to be singular, and is displayed with the greatest splendour in the imperial palace at Pekin.

INLAND NAVIGATION.] The canals of China have long excited the wonder of other nations. As the two grand rivers Hoanho and Kianhu bend their course from west to east, the chief object was to intersect the empire from north to south; which was in a great measure accomplished by the imperial canal. This wonderful work, which in utility and labour exceeds the enormous wall, is said to have been begun in the tenth century of the Christian era, thirty thousand men having been employed for forty-three years in its completion.

To enumerate the other canals of China would be infinite, as there is a large canal in every province, with branches leading to most of the towns and villages.

MANUFACTURES AND COMMERCE.] The manufactures of China are so multifarious as to embrace almost every article of industry. The most noted manufacture is that of porcelain, and is followed in trade by those of silk, cotton, paper, &c. The porcelain of China has been celebrated from remote ages, and is chiefly prepared from a pure white clay called kaolin; while the petunsi is understood to be a decayed

felspar. Some writers add soap, rock, and gypsum.

The internal commerce of China is immense, but the external trade is unimportant, considering the vastness of the empire; a scanty intercourse exists with Russia and Japan; but the chief export is that of tea, which is sent to England, to the value of about one million yearly.

MINERALOGY.] Among the metals, lead and tin seem to be the rarest. China possesses mines of gold, silver, iron, white copper, common copper, and mercury, together with lapis lazuli, jasper, rock crystal, load stone, granite, porphyry, and various marbles. According to some, rubies are found in China; but others assert that they come from Ava.

In many of the northern provinces coal is found in abundance. The common people generally use it pounded with water, and dried in the form of cakes. Pekin is supplied from high mountains in the vicinity, and the mines seem inexhaustible, though the coal be in general use.

Mines of silver are abundant, but little worked, from an apprehension of impeding the progress of agriculture. The gold is chiefly derived from the sand of certain mountains, situated in the western part of the provinces of Sechuen and Yunnan, towards the frontiers of Tibet. That precious metal is seldom used except by the gilders, the emperor alone having solid vessels of gold.

Tutenag, which is a native mixture of zinc and iron, seems to be a peculiar product of China, and in the province of Houquang there was a mine which yielded many hundred weight in the course of a few days.

The copper of Yunnan, and other provinces, supplies the small coin current through the empire; but there is a singular copper of a white colour, called by the Chinese *petong*, which deserves particular notice. This metal must not be confounded with the tutenag, an error not unfrequent. It is indeed sometimes mingled with tutenag to render it softer.

CHINESE ISLANDS.

Numerous isles are scattered along the southern and eastern coast of China, the largest being those of Taiwan, also called Formosa, and that of Hainan. Formosa is a recent acquisition of the Chinese in the latter end of the seventeenth century; the natives being

being by the Chinese accounts little better than savages. It is divided from north to south by mountains, and the chief Chinese possessions are in the western part.

The southern part of Hainan is mountainous, but the northern more level, and productive of rice. In the centre there are mines of gold; and on the shores are found small blue fishes, which the Chinese esteem more than those which we call gold and silver fish; but they only survive a few days when confined to a small quantity of water.

CHINESE TATARY.

EXTENT.] This wide and interesting portion of Asia, which has repeatedly sent forth its swarms to deluge the arts and civilization of Europe, extends about three thousand one hundred geographical miles. The breadth, from the northern frontier of Tibet, to the Russian confines, is about one thousand and eighty geographical miles.

RELIGION.] The religion most universally diffused in this part of Asia is what has been called Shamanism. The kalkas were accustomed to acknowledge a living Lama.

MANNERS AND CUSTOMS.] The Mandshurs are little distinguishable in their manners from the Monguls. By the account of the jesuits they have no temples, nor idols, but worship a Supreme Being, whom they style Emperor of Heaven. But probably their real creed is Shamanism, or a kind of rational polytheism.

LANGUAGES.] The three languages of the Mandshurs, Monguls, and Tatars, radically differ from each other; the former of which appears to be the most learned and perfect of the Tataric idioms.

CLIMATE.] Though the parallel of central Asia corresponds with that of France, and part of Spain, yet the height and snows of the mountainous ridges occasion a degree and continuance of cold little to be expected from other circumstances. In climate and productions it is however far superior to Siberia.

MOUNTAINS.] The vast ranges of mountains which intersect central Asia have never been scientifically described, and few of them have even received extensive and appropriate appellations.

On the west the great chain called Imaus by the ancients, the Belar Tag, or Dark Mountains of the natives, runs from N. to S.

MINERALOGY.] The mineralogy of central Asia has been little explored. Gold is found both in the eastern and western regions, and the former are also said to produce tin. As Russian Daouria exhibits so many valuable substances, it is reasonable to conclude that they equally abound in the Chinese territory, if similar skill and industry were exerted in their detection. The mineral waters, and uncommon appearances of nature, have been little investigated.

TIBET.

The account of this interesting country must unfortunately be limited in the topics, as the materials are far from being ample. The recent narrative of Captain Turner's journey shall be selected as the most authentic: but it only embraces a small part, and for the general geography recourse must be had to more antiquated authorities. Tibet, with its numerous independencies, may in fact be still arranged among the *undiscovered* countries in the centre of Asia.

EXTENT.] According to the most recent maps, Tibet may be about one thousand three hundred and fifty geographical miles long; and its breadth maybe about four hundred and eighty geographical miles. The original population has not been accurately examined; but as the people of Boottan, which is regarded as a southern province of Tibet, are said to differ essentially and radically from the Hindoos, and somewhat to resemble the Chinese, it may perhaps be concluded that they belong to that grand race of men which approaches the Tataric, though they cannot be regarded as Mandshurs, Monguls, or Tatars Proper.

RELIGION.] The religion of Tibet seems to be the schismatical offspring of that of the Hindoos. It is reported to have received its earliest admission in that part of Tibet bordering upon Indis, (which from hence became the seat of the sovereign lamas;) to have traversed over Mantchieux Tatory, and to have been ultimately disseminated over China and Japan. It still bears a very close affinity with the religion of Brahma in many important particulars, but differs materially in its ritual, or ceremonial worship. Tibetians assemble in chapels, and unite together in prodigious numbers to perform their religious service, which they

of Tibet
Vol. II

they chaunt in alternate recitative and chorus, accompanied by an extensive band of loud and powerful instruments. There are also numerous monasteries, containing crowds of *gyllongs*, or monks, with a few *annees*, or nuns.

CHARACTER, &c.] Mr. Turner represents the character of the Tibetians as extremely gentle and amiable. The men are generally stout, with something of the Tataric features, and the women of a ruddy brown complexion, heightened like the fruits by the proximity of the sun, while the mountain breezes bestow health and vigour.

The ceremonies of marriage are neither tedious nor intricate in Tibet. Their courtships are carried on with little art, and quickly brought to a conclusion. The priests of Tibet, who shun the society of women, have no share in these ceremonies, or in ratifying the obligation between the parties, which, it seems, is formed indissoluble for life.

It is a remarkable characteristic of the country, that polygamy here assumes a different form from that of other oriental regions: the women being indulged in a plurality of husbands, instead of the reverse. It is the privilege of the elder brother to select a wife, who stands in an equal relation to his other brothers, whatever may be the number.

Such is the respect paid to the lama, that his body is preserved entire in a shrine; while those of the inferior priests are burnt, and their ashes preserved in little hollow images of metal. But in general the dead bodies are exposed to the beasts and birds of prey, in walled areas; and an annual festival is held, as in Bengal and China, in honour of the dead.

A curious idea of the manners and customs of the Tibetians may be formed from Mr. Turner's account of his interview with the lama, then an infant not capable of speech; for in the spirit of the eastern metempsychosis, they suppose that the soul of the lama passes from his late body into another, which they discover by infallible marks.

Upon the whole, the Tibetians appear to have made a considerable progress in civilization; but the sciences continue in a state of imperfection; the year, for instance being lunar, and the month consisting of twenty-nine days.

CITIES AND TOWNS.] Of the cities and towns of Tibet little is known. The capital is Lassa;

VOL. II. No. CXXVI.

and several other names in the southern part assume the character of towns in the maps, though probably mere villages. There being little commerce, there is no middle class of people; but the transition is rapid, from the miserable hut to the stone palace or monastery.

CLIMATE.] The climate of Bootan may be said to be temperate, when compared with that of Tibet Proper; yet the winters are very severe even in the former country. The spring is marked, from March to May, by a variable atmosphere; heat, thunder storms, and occasionally with refreshing showers. From June to September is the season of humidity, when heavy and continued rains fill the rivers to their brim, which run off from hence with rapidity to assist in inundating Bengal. From October to March a clear and uniform sky succeeds, seldom obscured either by fogs or clouds. For three months of this season a degree of cold is felt, far greater perhaps than is known to prevail in Europe. Thus the distinguishing characteristic of the climate is that extreme dry, and parching cold which, under the latitude of twenty-six degrees, rivals that of the Alps in latitude forty-six degrees.

RIVERS.] The chief river of Tibet is, beyond all comparison, the Sampoo or Burhampooter, which rising in the western region, from the same lofty mountains that give source to the Ganges, proceeds in an E and S. E. direction for about the space of one thousand English miles, to the confines of Tibet and Asam, where it bends S. W. and flows into the estuary of the Ganges, after a farther course of about four hundred British miles.

LAKES.] These Alpine regions contain, as usual, many lakes, the most considerable being represented under the name of Terkiri, about eighty British miles in length, and twenty-five broad.

MINERALOGY.] The mineralogy is better known from the account appended to Mr. Turner's Journey in 1783, from which it appears that Bootan does not probably contain any metal except iron, and a small portion of copper; while Tibet Proper, on the contrary, seems to abound with rich minerals. Gold is found in great quantities, sometimes in the form of dust, in the beds of rivers, sometimes in larger masses, and irregular veins. There is a lead mine, two days journey

9 D

from

from Teshoo Lumboon, the ore being galena. Cinnabar, rich in quicksilver, is also found; and there are strong indications of copper. Rock salt is another product of Tibet. But in general the metals cannot be worked, as there is a complete deficiency of fuel; and coal would be far more precious than gold.

JAPAN.

The Japanese islands may in some measure be compared with Great Britain and Ireland, forming a grand insular power near the eastern extremity of Asia, like that of the British isles near the western extremity of Europe.

EXTENT.] The length of Kiufin from N. to S. is about two degrees, or one hundred and forty British miles; the greatest breadth about ninety. Sikokf is about ninety British miles in length by about half the breadth. The grand isle of Nippon is in length, from S. to N. E. not less than seven hundred and fifty British miles; but is so narrow in proportion, that the medial breadth cannot be assumed above eighty, though in two projecting parts it may double that number. These islands are divided into provinces and districts, as usual in the most civilized countries.

To the N. of Nippon is another large isle, that of Jesso, or Chicha, which having received some Japanese colonies, is generally regarded as subject to Japan; but being inhabited by a savage people, is rather considered as a foreign conquest than as a part of the civilized empire.

RELIGION.] The established religion of Japan is a polytheism, joined with the acknowledgment of a Supreme Creator. There are two principal sects, that of Sinto and that of Budsdo. The first acknowledge a Supreme Being, far superior to the little claims and worship of men, whence they adore the inferior deities as mediators, the idea of a mediator being indispensable in almost every form of religion. They abstain from animal food, detest bloodshed, and will not touch any dead body.

The priests are either secular or monastic; the latter alone being entrusted with the mysteries. The festivals and modes of worship are cheerful, and even gay; for they regard the gods as beings who solely delight in dispensing happiness. Be-

sides the first day of the year, and three or four other grand festivals, the first day of the month is always kept as a holiday. There are several orders of monks and nuns, as in the Roman Catholic system; but human nature is every where the same.

The sect of Budsdo was imported from Hindostan, being the same with that of Budha or Budh, reported to have been in Ceylon about one thousand years before the birth of Christ. Passing through China and Corea it has been mingled with foreign maxims, but the tenet of the metempsychosis remains; wicked souls being supposed to migrate into the bodies of animals, till they have undergone a due purgation.

LAWS.] The superiority of the laws of Japan over those of Europe has been loudly proclaimed by Kämpfer. The parties themselves appear, and the cause is determined without delay. Thunberg informs us that the laws are few, but rigidly enforced, without any regard to persons, partiality, or violence. Most crimes are punished with death, but the sentence must be signed by the privy council at Jeddo. Parents and relations are made answerable for the crimes of those whose moral education they ought to have superintended. The police is excellent, there not only being a chief magistrate of each town, but a commissary of each street, elected by the inhabitants to watch over property and tranquillity. Two inhabitants in their turn nightly patrol the street to guard against fire. The best proof that the laws are salutary is that few crimes are committed, and few punishments are inflicted. The brief code is posted up in every town and village, in large letters, in a spot surrounded with rails.

MANNERS AND CUSTOMS.] The people of this nation are well made, active, free and easy in their motions, with stout limbs, although their strength is not to be compared to that of the northern inhabitants of Europe. They are of a yellowish colour all over, sometimes bordering on brown, and sometimes on white. Ladies of distinction, who seldom go out in the open air, without being covered, are perfectly white. It is by their eyes, like the Chinese, these people are distinguishable. These organs have not that rotundity which those of other nations exhibit; but are oblong, small, and are sunk deeper in the head, in consequence of which these people have almost the appearance of being pink eyed. eyes are dark brown, or rather black; and the eye-lids form in the great angle of the eye a deep furrow, which makes the Japanese look as if they were sharp sighted, and discriminates them from other nations. The eyebrows are also placed somewhat higher. Their heads are in general large, and their necks short: their hair black, thick, and shining, from the use they make of oils. Their noses, though not flat, are yet rather thick and short.

This highly civilized people display great diversity of character, but the virtues far preponderate over the vices: and even their pride is useful, as it prevents them from stooping to the mean tricks of the maritime Chinese. The Japanese use great varieties of food and sauces. The master or mistress of the house is not harassed with the trouble of carving, the meat being previously cut into small pieces, served up in basons of porcelain, or japanned wood. The general drink is sack, or beer made of rice: which last article also supplies the place of bread. They use many kinds of vegetables and fruits. The use of tea is also universal; but wine and spirituous liquors are unknown.

The houses of the Japanese are of wood, coloured white, so as to resemble stone; and though roomy and commodious, never exceed two stories in height, the upper serving for lofts and garrets, and seldom being occupied. Each house forms but one room, which may be divided into apartments at pleasure, by movable partitions sliding in grooves. They use neither chairs nor tables, sitting on straw mats, the meal being served apart to each on a small square wooden salver. In Jeddo the houses are covered with tiles; but the general fabric is a frame work of wood, split bamboos, and clay.

The dress consists of trowsers: and what we call night gowns, or loose robes of silk or cotton, are universally worn by both sexes. These are fastened by a girdle; the number being increased according to the coldness of the weather. Stockings are not used; and the shoes are commonly of rice straw. The men shave the head from the forehead to the nape, but the hair on the sides is turned up, and fastened at the crown of the head: conical hats made of grass are worn on journeys, but the fashion of wearing the hair forms the economical covering of the head.

CLIMATE AND SEASONS.] 'The heat of summer

is in Japan extremely violent, and would be insupportable, were not the air cooled by the sea breezes. Equally severe is the cold in the winter, when the wind blows from the north or north-east. The weather is changeable throughout the year; and there are abundant falls of rain, especially in the satsuki, or rainy months, which begin at midsummer. This copious moisture is the chief cause of the fertility of Japan, and its consequent high degree of population.

VOLCANOES.] Near Firando there is a volcanic island, nor are others unknown in the surrounding seas. In the province of Figo there is a volcano which constantly emits flames; and another, formerly a coal mine, in the province of Tsikuser.

THE BIRMAN EMPIRE,

COMPRISING THE KINGDOMS OF AVA AND PEGU.

BEFORE the appearance of a recent interesting publication, scarcely any thing was known concerning this new empire; and geographers were constrained to detail the old accounts, which are little satisfactory; but since we have given an account of Mr. Symes's embassy above, p. 547, nothing remains to be said in this place. The Birman empire derives its name from the Birmahs, who have been long known as a warlike nation in the region formerly styled INDIA BEYOND THE GANGES; the capital city of their kingdom being Ava. Pegu is by the natives styled Bagoo; being the country situated to the south of the former, and justly inferred to have been the Golden Chersonese of the ancients.

MALACCA.

THE peninsula of Malacca is situated on the south of the Birman empire. The Portuguese are regarded as the first discoverers of it, in 1509, to which they were led by the vain idea of finding the golden Chersonese of the ancients. In 1511 the Portuguese conquered the peninsula.

EXTENT.] Malacca is about five hundred and sixty British miles in length, by about one hundred and fifty miles of medial breadth, a territory sufficiently ample for a powerful monarchy, had its native productions corresponded with its extent.

LANGUAGE.] The Malayan language has been justly,

justly called the Italian of the east, from the melody of frequent vowels and liquids. The Arabic character is made use of; and an influx of words of that language has followed the adoption of the Mohammedan religion. They write on paper, using ink of their own composition, and pens made of the twigs of a tree. The purest Malay is still supposed to be spoken in the peninsula, and has no inflection of nouns or verbs.

CHARACTER.] The Malays are restless, fond of navigation, war, plunder, emigration, colonies, desperate enterprises, adventures, and gallantry. They talk incessantly of their honour and their bravery, whilst they are universally considered by those with whom they have intercourse as the most treacherous, ferocious people on the face of the globe; and yet they speak the softest language of Asia. This ferocity is so well known to the European companies who have settlements in the Indies, that they have universally agreed in prohibiting the captains of their ships, who may put into the Malay islands, from taking on board any seamen of that nation, except in the greatest distress, and then on no account to exceed two or three. It is nothing uncommon for a handful of these savages suddenly to embark, attack a vessel by surprise, poignard in hand, massacre the people, and make themselves masters of her. Malay barks, with twenty-five or thirty men, have been known to board European ships of thirty or forty guns, in order to take possession of them, and murder with their poignards great part of the crew. The Malay history is full of such enterprises, which mark the desperate ferocity of these barbarians.

SIAM.

EXTENT AND BOUNDARIES.] THE extent of the Siamese dominions has been recently restricted by the encroachments of the Birmans, nor can some of the limits be accurately defined. The length of the kingdom is about seven hundred British miles; but of this about one half is not above seventy miles in medial breadth.

RELIGION.] The religion of the Siamese, like that of the Birmans, resembles that of the Hindoos; and the transmigration of souls forms an essential part of the doctrine; but they imitate the Chinese in their festival of the dead, and in some other rites of that singular nation.

NAVY.] The navy is composed of a number of vessels of various sizes, some of which are richly decorated. Hence, as in the Birman history, naval engagements are not uncommon; and the large rivers of exterior India are often reddened with human gore. Both the Birman and Siamese vessels frequently display a singular fantastic elegance.

MANNERS AND CUSTOMS.] There is a considerable similitude in the manners and customs of all the states between the vast countries of China and Hindostan. The women are under few restraints, and are married at an early age. The espousals are concluded by female mediation; and on the third visit the parties are considered as wedded, after the exchange of a few presents, without any further ceremony civil or sacred. Polygamy is allowed; but is rather practised from ostentation than any other motive, and one wife is always acknowledged as supreme.

The Siamese funerals considerably resemble those of the Chinese. The body is inclosed in a wooden bier or varnished coffin; and the monks called Talapoins, (perhaps from their *talapan*, or peculiar umbrella,) sing hymns in the Bali tongue. After a solemn procession the body is burnt on a funeral pile of precious woods, erected near some temple; and the spectacle is often rendered more magnificent by the addition of theatrical exhibitions, in which the Siamese excel. The tombs are in a pyramidal form, and those of the kings large and lofty. Mourning is not prescribed by the laws, as in China; and the poor are buried with little ceremony.

The common nourishment of the Siamese consists in rice and fish, both which articles are abundant. They also eat lizards, rats, and several kinds of insects.

The houses are small, and constructed of bamboos upon pillars, to guard against inundations, so common in this country. They are speedily destroyed and replaced; and a conflagration, if a common, is at the same time a slight calamity. Even the palaces only exceed the common habitations by occupying a more extensive space, and being constructed of timber, with a few ornaments; they are also of a greater height, but never exceed one floor.

PRODUCE.] The productions of the country are prodigious quantities of grain, cotton, benjamin; sandal, aguallo, and sapan woods; antimony, tin, lead, iron, load-stone, gold, and silver;

ed of a number

silver; sapphires, emeralds, agates, crystal, marble, and tombac.

CLIMATE AND SEASONS.] The two first months of the Siamese year, which correspond with our December and January, form the whole winter of this country; the third, fourth, and fifth, belong to what is called their little summer; the seven others to their great summer. Being on the north of the line, their winter of course corresponds with ours; but is almost as warm as a French summer. The little summer is their spring; but autumn is absolutely unknown in their calendar. The winter is dry; the summer is moist; the former is distinguished by the course of the wind, which blows almost constantly from the north, refreshed with cold from the snowy mountains of Tibet, and the bleak wastes of Mongolia.

RIVERS.] The grand river Meinam, which signifies the *mother of waters*, reigns supreme among the Siamese streams. It is very deep and rapid, always full, and, according to Kämpfer, larger than the Elbe. He adds, that the inhabitants suppose its source to be in the mountains which give rise to the Ganges, and that it branches through Cambodia and Pegu. The inundations are in September, after the snows have greatly melted in the northern mountains, and the rainy season has commenced. In December the waters decline, and sink by degrees to their former level. The water, though muddy, is pleasant and salutary.

The other states of exterior India, are Laos, Cambodia, Siampa, Cochin-China, and Tunquin; countries unimportant in themselves, and concerning which the materials are so very imperfect, that no European could give a just account of them.

HINDOSTAN.

NAME.] THE native name of this celebrated country is said to be, in the ancient Sanscrit language, *Bharata*. That of Hindostan seems to have been imposed by the Persians, and derived from the great western river, with the Persian termination *Stan*, which signifies a country*.

* The term Hindostan, however, seems to be wholly Persian; for *Hindoo*, in that language, signifies *Black*, and *Stan*, a country; so that, if this derivation be exact, *Hindostan* signifies *The Country of Blacks*.

BOUNDARIES.] This portion of Asia extends from Cape Comorin, in the south, to the mountains of Cashmir, in the north; being nearly equal to one thousand eight hundred and ninety British miles. From the river Araba, on the west of the province of Sind, to the mountains which divide Bengal from Cassay and the Birman dominions, its breadth is about one thousand six hundred British miles.

RELIGION.] The religion of the Hindoos is artfully interwoven with the common offices of life; and the different casts are supposed to originate from Brahma, the immediate agent of creation under the Supreme Power, in the following manner: *Brahmin* from the mouth (wisdom): To pray, to read, to instruct. The *Chelteece*, from the arms (strength): To draw the bow, to fight, to govern. The *Brice*, from the belly or thighs (nourishment): To provide the necessaries of life by agriculture and traffic. The *Sooder*, from the feet (subjection): To labour, to serve.

POPULATION.] The population of this extensive part of Asia is supposed to amount to sixty millions, of which the British possessions may now perhaps contain a quarter, especially as frequent recent conflicts have thinned the population in many other parts of Hindostan.

MANNERS AND CUSTOMS.] The manners and customs of the Hindoos are intimately blended with their religion, and are universally similar, with a few exceptions in mountainous and other districts. One of the most singular begins to expire, that of giving the living widow to the same flames with her husband's corpse. The ancients represent the Bramins as accustomed to terminate their own lives on funeral piles lighted by themselves. But by what refinement of cruelty this custom was extended to involuntary and helpless females has not appeared; perhaps the cause was to enforce the preservation of their husband's health by making their life depend on his.

As soon as a child is born, it is carefully registered in its proper cast, and astrologers are consulted concerning its destiny; for the Hindoos, like the Turks, are strict predestinarians. A Bramin imposes the name. The infant thrives by what we would call neglect; and no where

dostan signifies *The Country of Blacks*; which perfectly describes the people, especially if compared with the natives of Persia.

are seen more vigour and elegance of form. The boys are generally taught reading and writing by Bramins, but the girls are confined at home till their twelfth year. Polygamy is practised, but one wife is acknowledged as supreme. It is well known that the Hindoos are extremely abstemious, and wholly abstain from animal food and intoxicating liquors; yet if we judge from the fanatic penances, suicides, and other superstitious frenzies, no where on earth is the mind so much disordered. The houses are built of earth or bricks, covered with mortar, and sometimes with excellent cement, having small apertures, which serve for windows. There is generally only a ground floor, inclosing a court, with a small gallery supported by slight wooden pillars. The amusements consist of religious processions; but though dancing girls abound, yet theatrical exhibitions do not seem so common as in the countries farther to the east.

LANGUAGES.] The general ancient language of Hindostan is believed to have been the Sanscrit, an original and refined speech, compared by Sir William Jones with the Greek and Latin. The more common dialects are chiefly the following: 1. That of Kandi, in the interior of Ceylon. 2. The Tamulic, used in the Deccan. 3. The Malabar language. 4. The Canarin. 5. The Marashda language. 6. The Talenga. 7. The Bengallee; a wretched dialect. 8. The Devanagaric or Hindostanee. 9. The Guzaratic. 10. The Nepaulic.

MANUFACTURES.] The manufactures of Hindostan have been celebrated from early antiquity, particularly the muslins and other fabrics from cotton. Piece goods, as we call them, are mentioned by the author of the *Periplus*, and other ancient writers, who praise the manufacture and the beautiful colours with which it was dyed. The Hindoos, in the time of Strabo, were also noted for elegant works in metals and ivory. Nor is Hindostan celebrated at this day for any manufacture, except those of muslins and calicoes, the other exports consisting of diamonds, raw silks, with a few wrought silks, spices, drugs, &c. The shawls of Cashmir are also deservedly esteemed; being there woven from a material chiefly supplied by Tibet. Painting is in its infancy; and they are strangers to shade and perspective. Sculpture is as little advanced as painting, the design and execution being alike bad;

yet the temples are sometimes majestic and solemn. In most trades very few tools are employed. The simple loom is reared in a morning under a tree, and carried home in the evening.

CLIMATE AND SEASONS.] The climate and seasons are considerably diversified by difference of latitude and local situation. Yet in general, though the northern Alps of Tibet be covered with perpetual snow, there is some similarity of climate through the wide regions of Hindostan. In Bengal the hot, or dry season, begins with March, and continues to the end of May, the thermometer sometimes rising to one hundred and ten degrees: this intense heat is sometimes interrupted by violent thunder storms from the north-west, the seat of the grand Alps of Asia. The rainy season continues from June to September: the three last months of the year are generally pleasant: but excessive fogs often prevail in January and February. The periodical rains are also felt in Sindetic Hindostan, except in Cashmir, where they seem to be excluded by the surrounding mountains. In the rest of Hindostan they almost deluge the country, descending like cataracts from the clouds, and the Ganges and other rivers spread to a wide extent, the inundation ceasing in September. By the latter end of June the Ganges has risen fifteen feet and a half, out of thirty-two, which is the total of its overflow. In the mountains the rainy season begins early in April; but rarely in the plains till the latter end of June. By the latter end of July all the lower parts of Bengal, contiguous to the Ganges and Burram-pooter, are overflowed, and form an inundation of more than one hundred miles in width; nothing appearing but villages and trees, excepting very rarely the top of an elevated spot (the artificial mound of some deserted village) appearing like an island.

In the southern division, the chain of the Gauts, or mountains of Malabar and Coromandel, supporting the high table land in the centre, intercept the great mass of clouds; and the alternate S. W. and N. E. winds, called the Monsoons, occasion a very rainy season on one side of the mountains only, that is on the windward side. Yet it appears that during the first part of the rainy monsoon, in May and June, on the coast of Malabar, a considerable quantity of rain falls in the upper region, or table land of Mysore. The monsoon is from the N. E. from October to

om October to
April;

April; and from May to September in the oppo-
site direction. The rainy season on the coast of
Coromandel is with the N. E. monsoon; and on
that of Malabar with the S. W.: in general,
March, April, May, and June, are the dry
months. Hence, in the whole extent of Hindos-
tan, except in Cashmir, there can hardly be said
to be a vestige of winter, except the thick fogs of
our November; and excessive rains, or exces-
sive heats, form the chief varieties of the year.

RIVERS.] The Ganges must be considered as
the sacred sovereign of the Hindoo rivers, an
attribute not infringed by the recent discovery of
the Burrampooter. It receives such a number of
important tributary streams, that its magnitude
exceeds what might have been expected from the
comparative length of its course; which may,
however, be estimated at about fourteen hundred
British miles, while the Hoan ho of China has
been computed at two thousand, and the Kian
ku, at two thousand two hundred. The source
of the Ganges remains a curious object of investi-
gation; nor can much reliance be placed on its
delineation in the map of Tibet by the Chinese
Lamas, published by Du Halde, and followed
by all succeeding geographers. Tiesfenthaler has
lain down the latitude of the noted Gangoutra,
or Cow's mouth, in lat. thirty-three degrees, be-
ing a celebrated cataract, where the Ganges is
said to pass through a vast cavern in a mountain,
falling into a large bason which it has worn in
the rock. At Hudwar, about two hundred and
eighty miles to the south of the Cow's mouth, (if
this last be not a dream of the fabling Hindoos),
the Ganges enters the wide plains of Hindostan;
and pursues a south-east direction by the ancient
city of Canoge, once the capital of a kingdom,
by Allahabad, Benares, Patna, &c. till dividing
into many grand and capacious mouths, it forms
an extensive delta at its egress into the gulf of
Bengal. The extreme mouths of the Ganges are
intersected with isles, called the Sunderbunds,
overgrown with tall bamboos and other luxuriant
vegetation, the impenetrable haunts of the royal
tiger, and other beasts of prey. On the western-
most outlet of the Ganges, called the Hoogley,
stands Calcutta, the capital of British Hindostan.
This, and the most eastern, which receives the
Burrampooter, are the widest and most important
branches.

The noblest tributary stream of the Ganges is

the Burrampooter, being the Sampoo of the Ti-
betans. The course of the river, and its junction
with the Ganges, was first ascertained by Major
Rennell. This noble river runs for four hundred
miles through the British territory; and for the
last sixty miles before its junction with the
Ganges is from four to five miles wide. On their
union before Luckipour, they form a body of
running fresh water, resembling a gulph of the
sea, interspersed with islands, some of which
rival in size and fertility our Isle of Wight. In
the mouths of the Ganges, and the Burrampooter,
the sudden influx of the tide will rise instantane-
ously to the height of from five to twelve feet.

The Indus is by the natives called Sindch. It
is also called Nilab, or the Blue River. The
source, like that of the Ganges, remains un-
known.

The Kistna, a sacred river, rises at Balisore
not far to the south of Prona, and forms a delta
near Masulipatam, after a course of about five
hundred British miles. This river rivals any In-
dian stream in the fertility diffused by its inunda-
tions; and the richest diamond mines in the world
are in the neighbouring hills to the north. The
chief tributary streams in that quarter are the
Beema; passing near the diamond mines of Visia-
pour, and the Muzi, or Moussi, by those of
Golconda.

MOUNTAINS.] The mountains chiefly cele-
brated by the Hindoos may be said to be only
visible from their country, being the northern
chain of the Tibetan Alps, covered with per-
petual snow. Hence they are called Himmala,
from a word denoting snow.

The sandy desert of Agimere, on the east of
the Indus, extends in length between four and
five hundred British miles, and in breadth from
sixty to a hundred and fifty.

FORESTS.] Of this extensive portion of Asia a
great part remaining in primitive wildness, there
are large forests in different quarters, particularly
near the mouth of the Ganges, and in the wide un-
explored regions on the west of the Sircars. These
forests surpass in exuberance of vegetation any
idea which Europeans can imagine; creeping
plants of prodigious size and length, extended
from tree to tree, forming an impenetrable gloom,
and a barrier, as it were, sacred to the first myste-
ries of nature.

ZOOLOGY.] The numerous cavalry which
form

form the armies of the Hindoo princes imply great numbers of horses; and the breeds most celebrated are those of Lahore and Turkistan, but the grandees are supplied from Persia and Arabia. The inferior breeds, though ugly, are active. The horses of Tibet, generally pyed, are often used in Gangetic Hindostan. The animal called the wild mule, and the wild ass, sometimes pass in herds to the northern mountains, from the centre of Asia, and the desert of Cobi.

The Arabian camel, or that with a single hump, is not unfrequent about Patna. The elephant has been frequently described; the usual height of this intelligent animal is about ten feet. Apes and monkeys abound in various regions of Hindostan; and the orang outang is said to be found in the vast forests on the west of the Sircars. The other animals are wild boars, bears, wolves, foxes, jackalls, hyenas, leopards, panthers, lynxes: in the north, musk weasels, and many other quadrupeds of inferior size.

The royal tiger of Bengal is a far more terrible animal than the stoutest lion. Such is their size and strength that they are said to carry off bullocks, the height of some being said to be five feet, and the length in proportion*.

MINERALOGY.] The mineralogy of Hindostan may be opened by its most distinguished and peculiar product, celebrated in all ages of the world, that of diamonds, which are indeed also found in Brazil, but of far inferior quality†.

The chief and most celebrated diamond mines are those near Visiapour and Golconda, both near streams that flow into the Kistna, Golconda being in the territory of the Nizam, while Visiapour belongs to the Mahrattas‡.

Next in value to the diamond are the sapphire and the ruby, which are chiefly found in the Bir-

* Parties of pleasure on the isles at the mouth of the Ganges, have often been shockingly interrupted by the sudden appearance of the tiger, prepared for his fatal spring, which is said to extend a hundred feet, not improbable when compared with that of the cat. Such is the nature of the animal, that if disappointed in this first leap, he couches his tail and retreats.

† This substance is the most hard, transparent, and brilliant of all minerals; and is commonly colourless, but is found occasionally of a citron yellow, grey brown, or black. It is found in beds of torrents, or in yellow ferruginous earth, under rocks of quartz or sand stone.

‡ Colore, another diamond mine, is on the southern bank of the Kistna, not far from Condavir.

§ "Generally speaking," says Major Rennell, "the de-

man territories; but the ruby also occurs in Ceylon, which likewise produces an inferior kind of sapphire, the topaz, and other precious stones.

Among the metals gold is found in the rivers which flow from Tibet into the Ganges and Indus; but no gold mines seem ever to have been known in Hindostan, which has rather been celebrated for attracting this metal in commerce from other countries.

CITIES AND TOWNS.] The chief city of Bengal, and of all the British possessions in Hindostan, is Calcutta. The latitude is $22^{\circ} 33'$ north, and the longitude $88^{\circ} 28'$ east from Greenwich §.

In Calcutta, the quarter inhabited by the English is composed entirely of brick buildings, many of which have more the appearance of palaces than of private houses; but the remainder of the city, and by much the greater part, is built as described in the note. Calcutta is the emporium of Bengal, and the seat of the Governor-General of India. It is a very extensive and populous city, being supposed at present to contain at least five hundred thousand inhabitants. Calcutta is situated on the western arm of the Ganges, at about one hundred miles from the sea; and the river is navigable up to the town for the largest ships that visit India. It is a modern city, having risen on the site of the village of Govindpour, about ninety years ago. The citadel is superior in every point, as to strength and correctness of design, to any fortress in India; but on too extensive a scale to answer the useful purpose intended, that of holding a post incase of extremity. In this grand capital of British Asia the mixture of people and manners presents a picturesque and interesting scene. The black Hindoo, the olive-coloured Moor or Mohammedan, con-

scription of one Indian city is a description of all; they being all built on one plan, with exceedingly narrow, confined, and crooked streets; with an incredible number of reservoirs and ponds, and a great many gardens interspersed. A few of the streets are paved with brick. The houses are variously built, some of brick, others with mud, and a still greater proportion with bamboos and mats: and these different kinds of fabrics, standing intermixed with each other, form a motley appearance: those of the latter kind are invariably of one story, and covered with thatch. Those of brick seldom exceed two floors, and have flat terraced roofs. The two former classes far outnumber the last, which are often so thinly scattered, that fires, which often happen, do not sometimes meet with the obstruction of a brick house through a whole street."

trasted with the fair and florid countenances of
the English; and the charms of the European
damsel receive a foil from the dark Hindoo beau-
ties. To the luxuries of the Asiatic are added
the elegance and science of the English life.

Patna is the capital of the province of Bahar,
situated about four hundred miles N. W. from
Calcutta.

Benares is a rich, populous, and compact
city, on the northern bank of the Ganges, about
four hundred and sixty miles from Calcutta.
Benares, anciently called Kasi, was the most
early seat of Braminical knowledge in the north.

Allahabad, in the province so called, at the
confluence of the Jumna and the Ganges, a city
belonging to the Nabob * of Oude, but of little
consequence. Not far to the S. W. of Allahabad
are the diamond mines of Penna, in the small de-
tached province of Bundelcund.

Lucknow is the present capital of Oude, hav-
ing superseded Fyzabad, a city on the Gogra.

The chief city of Guzerat is Amedabad.

ISLAND OF CEYLON.

EXTENT AND NAME.] This island approaches
to the size of Ireland; being about two hundred
and sixty British miles in length, by about one
hundred and fifty in breadth; but in the wide
continent of Asia, territory is on so large a scale,
that what in Europe would constitute a king-
dom is here scarcely a province.

This island is important in a commercial
view, from its celebrated products of cinnamon
and gems. The harbour of Trincomalee on the
east, is to us of great consequence, because there
is none on the eastern coast of Hindostan: and it
has even been suggested that in case any revolu-
tion should expel us from the continent of Hin-
dostan, this island might afford an extensive and
grand asylum, where the British name and com-
merce might be perpetuated.

MANNERS AND CUSTOMS.] The natives of

* The term *Nabob* is a corruption. *Naib* is a *viceroys*,
in the singular: *nazaub* is *viceroys*, in the plural.

† The village of Condatchey is then crowded with a mix-
ture of thousands of people of different colours, countries,
casts, and occupations; with numerous tents and huts, and
bazars, or shops; while the sea presents many boats hasten-
ing to the banks, or returning with the expected riches.
The divers are chiefly Christians or Moslems, who descend

Vol. II. No. CXXVII.

Ceylon, called Singalese, either from a native or
Portuguese term, are not so black as those of
Malabar, and have a few manners and customs
distinct from other Hindoos. It is said that sever-
al brothers may have one wife in common, but
the polygamy of males is also allowed. In gen-
eral chastity is little esteemed in the oriental coun-
tries; and the morality of many nations is so lax
in this respect, that the intercourse of the sexes is
considered as far more indifferent than the use of
certain foods. The language is rather peculiar;
but some of the natives understand both the Ta-
millic and that of Malabar.

TOWNS.] The native town Kandī, in the centre
of the isle, seems to be of small size and conse-
quence, and probably only distinguished by a pa-
lisade and a few temples.

CLIMATE.] The climate and seasons corres-
pond in some degree with the adjacent continent;
yet the exposure on all sides to the sea renders the
air more cool and salubrious. High mountains,
prodigious forests, full of aromatic trees and
plants, and many pleasant rivers and streams di-
versify this country, which by the Hindoos is
esteemed a second paradise. The vales are of a
rich fat soil; and, when cleared, amazingly fer-
tile in rice, and other useful vegetables.

MOUNTAINS.] The chains of mountains run
N. and S. They seem granitic; and are pecu-
liarly rich in precious stones, imbedded in primi-
tive quartz. What the Mohammedans have
termed Adam's Peak, is esteemed the highest.

PEARLS.] The pearl fishery commonly begins
on the N. W. shore about the middle of Febru-
ary, and continues till about the middle of April,
when the S. W. monsoon commences †.

IRAN OR PERSIA.

NAME.] The general name of Persia spread
from the province of *Pars* or *Fars*; but the na-
tives, both in ancient and modern times, have
termed their country *Iran*, under which deno-
mination were included all the wide regions to

from five to ten fathoms, and remain under water about two
minutes, each bringing up about a hundred oysters in his
net. These pearls are always formed like the coats of an
onion, around a grain of sand, or some other extraneous
particle. The yellow, or gold coloured, are most esteemed
by the natives; and some are of bright red lustre, but the
dull grey and blackish are of no value.

the S. and W. of the river Oxus, or Jihon, the Amu of the Russians and Tatars; while the countries subject to Persia beyond that celebrated river were in antient times styled *Aniran*.

EXTENT.] Persia extends more than one thousand two hundred miles in length, and about one thousand in breadth.

PROVINCES.] 1. Georgia, or more properly Gurgestan, in which may be included Daghistan and Shirvan. 2. Erivan. 3. Aderbijan. 4. Ghilan. 5. Mazenderan. 6. Irac Ajemi. In this province is Ispahan, the modern capital of Persia. 7. Kushestan. 8. Pars, Fars, or Persia Proper. 9. Kerman. 10. Laristan. 11. Mekran. 12. Segistan. 13. Khorasan*.

ANCIENT MONUMENTS.] Of these the ruins of Persepolis are the most celebrated and remarkable. They are situated at the bottom of a mountain, fronting S. W. about forty miles to the north of Shiraz. They command a view of the extensive plain of Merdasht; and the mountain of Rehnumt encircles them in the form of an amphitheatre; the nature of these ruins may be seen in the plates; and it would be an idle attempt to describe in few words the grand portals, halls, and columns, and numerous relieves and devices. There are many inscrip-

tions in a character not yet explained, the letters of which resemble arrow heads, disposed in various directions; and although we be able to make out the Persepolitan alphabet, yet the language of that remote period appears to be locked up in impenetrable obscurity.

RELIGION.] The religion of Persia is the Mohammedan, which was introduced by the sword, and has been followed by its usual effects, the destruction and depopulation of the country. Yet the Persians adopt a milder system of this creed than is followed by the Turks and Arabs †.

The priests of the Mohammedan religion, or Mullas, are in Persia often styled *Akonds*, which signifies readers: and they not only preach in the mosks, but are often schoolmasters. The Pechnamas are superior Mullas, or vicars of the Imams ‡. The Fakirs and Calenders are wandering monks, or rather sturdy beggars; who, under the pretext of religion, compel the people to maintain them in idleness.

MANNERS AND CUSTOMS.] The manners and customs of the Persians, in the seventeenth century, have been amply detailed by Chardin, Thevenot, Sanson, and other travellers. More modern ideas of Persian manners may be derived from the travels of Gmelin in Ghilan §.

Marriages.

* Besides these provinces, and exclusive of Asiatic Turkey, on the W. the ancient Persian empire comprised Bactriana, or Balk, which may be termed a wide and well-watered kingdom of between three hundred and four hundred British miles square; and on the other side of the Oxus, Sogdiana, or the country on the river Sogd, which passes by modern Samarkand. This province, adjoined on the west to Khawaresm, with the small territory of Khiva.

† Of the Parsees, or ancient worshippers of fire, there seem to be no remains in Persia, except perhaps a few visitors of the fiery eruptions of Vaphsa, near Baku, on the western shores of the Caspian. These innocent idolaters have been almost extirpated by Mohammedan fanaticism, which has propagated every scandal that malice could invent, representing them as devourers of children, and familiar with other atrocities. Mr. Hanway informs us that these Guebers, or infidels, particularly worship the everlasting fire near Baku, an emblem of Ormuzd, or the Supreme Ineffable Creator; while the evil principle, believed to have sprung from matter, was styled Ahriman. But the chief worshippers of the fire of Baku came from Hindostan, to which the Parsees retreated when Shah Abbas expelled them from his empire; and they still abound near Bombay, where their singular mode of sepulture excites attention, as they expose their dead in inclosed areas to be devoured by birds of prey, a custom which has been propagated to some other oriental nations. Mr. Hanway says that there were still

some worshippers of fire, at a place, thence styled Gueberabad, near Ispahan; and that there are still fire worshippers in the neighbourhood of Surat is clear, from Anquetil du Perron, whose instructor in the Zend and Pehlavi was a person of that description.

‡ The chief prelate is styled Sheikas Salhaum, or head of the faith; also Sada Cassa, or High Priest.

§ The Persians still pride themselves in universal politeness, and are hospitable, not however without the expectation of presents in return. They seem to consider themselves as more wise and sagacious than other nations, yet are passionate; and the recent commotions have imparted a taint of cruelty to the national character. Of a sanguine temperment, both rich and poor are generally gay; and immoderate withal will succeed the most violent quarrels. They are extremely attached to the fair sex, and not averse to wine. The general complexion is fair, somewhat tinged with olive; but those in the south about Shiraz of Candahar, and the provinces towards India, are of a dark brown. They are commonly fat, with black hair, high forehead, aquiline nose, full cheeks, and a large chin, the form of the countenance being frequently oval. The men are generally strong and robust, and inclined to martial exercises, but they are particularly subject to disorders of the eyes. They generally shave the head, and wear high crimson bonnets; but the beard is sacred, and tended with great care. They often wear three or four light dresses, one above the other, fastened with a belt and sash; and they are fond of large cloaks

Marriages are conducted by female mediation; and the pomp and ceremonies somewhat resemble the Russian. Polygamy is allowed; but the first married is the chief wife. The tombs of the rich are often grand, as are the cenotaphs of the twelve Imams, or vicars of the prophet, regarded by the Chias as his only lawful successors.

LANGUAGE.] The language of Persia is perhaps the most celebrated of all the Oriental tongues, for strength, beauty and melody. In general the Persian literature approaches nearer to the European in solid good sense, and clearness of thought and expression, than that of any other Asiatic nation.

CITIES.] The capital city of modern Persia is Ispahan. Including the suburbs, its circuit is computed by Chardin at about twenty-four miles, and the inhabitants at six hundred thousand. The walls are of earth, and ill repaired, with eight gates, and the streets narrow, devious, and badly paved. The suburb of Yulfa, is very large, and possessed by the Armenians.

The second city, at least in fame, is Shiraz. This capital of Farsistan is situated in a fertile valley; the circuit of the city is about four miles, surrounded with a wall twenty-five feet high, and ten thick, with round towers at the distance of eighty paces. The city is built of brick. The mosk of the late Kerim Khan is splendid but unfinished. The climate of this celebrated city is delicious, particularly in the spring, when numerous flowers perfume the air; and the Bulbul, or oriental nightingale, the gold-finch, linnet, and other warblers, delight the ear.

The celebrated Persian gulph has been always more remarkable for the factories of foreigners, than for native establishments. Bender Abassi was a port opposite to the isle of Ormus; or rather on the coast between Ormus and Kishinish, or Kishma, and is now more commonly known by the name of Gombroon.

CLIMATE.] Persia has been said to be a country of three climates; but even in the south the

cloaks of thick cloth. The women wrap around their heads pieces of silk of different colours; and their robes are rather shorter than those of the men. The Persians eat twice or thrice a day, dining about noon, but the chief repast is the supper. The most usual dish is boiled rice variously prepared. The meat is boiled to excess, and the

high mountains contribute to alloy the extreme heat.

RIVERS.] The noble streams of the Euphrates* and the Tigris can scarcely at any period be considered as strictly Persian, though Ctesiphon, the capital of the Parthian monarchy, and Seleucia, stood on the latter river. The river of Ahwaz rises in the mountains of Elwend, and pursues a southern course till one branch enters the Tigris above its junction with the Euphrates, while the main stream flows into the estuary of these conjunct rivers.

In the N. E. the large river of Jihon, rather belongs to Independent Tatory, with its numerous tributary streams.

ZOOLOGY.] According to Chardin, the Persian horses are the most beautiful even in the east; but in speed they yield to the Arabian, which are less distinguished by elegance of form. The Persian steeds are rather taller than the saddle horses in England; the head small, the legs delicate, and the body well proportioned; of a mild disposition, very laborious, lively, and swift. The camel is also common, but not admitted into the province of Mazenderan, where they eagerly eat the leaves of box, though to them a rank poison. The Persian cattle resemble the European, except towards Hindostan, where they are marked by the hunch on the shoulders. Swine are scarce, save in the N. W. provinces. Of the large tailed sheep, that appendage sometimes weighs more than thirty pounds, enlarging at the bottom in the form of a heart.

NATURAL CURIOSITIES.] Among the chief natural curiosities must be named the fountains of naphtha, or pure rock oil, in the neighbourhood of Baku, on the western coast of the Caspian, particularly in the adjoining promontory of Ashberon. The land is dry and rocky, and there are several small ancient temples, in one of which, near the altar, a large hollow cane is fixed in the ground, and from the end, issues a blue flame, seemingly more pure and gentle than that produced by ardent spirits. From an horizontal gap in an adjoining rock there also issues a similar flame.

meal is enlarged with pot-herbs, roots, and fruits, cakes, hard eggs, and above all sweetmeats, of which they are extremely fond. They are remarkable for cleanliness, both in their persons and habitations.

* The Forat of the Arabians and Persians.

INDEPENDENT

Sketch of a KALMUCK of Emmeria.

Dissertation.

INDEPENDENT TATARY.

NAME.] The title of Independent Tatory is now confined to the bounds of Uzbeks and Kirguses; for their country must still be regarded as independent of the great neighbouring powers, China, Russia, and Persia.

EXTENT.] The extent of territory possessed by these tribes may be measured from the Caspian Sea to the mountains of Belur, a space of not less than eight hundred and seventy British miles. From the mountains of Gaur, in the south, to the Russian boundaries on the north of the desert of Issim, may be near one thousand five hundred British miles; but of this length a great part is desert.

RELIGION.] The prevailing religion is the Mohammedan, for the Kalmuk conquerors, though they retained their idolatry, were tolerant.

MANNERS AND CUSTOMS.] They are said to be polite and benevolent. The dress of the men does not reach below the calf of the leg, with girdles like the Polish. The female raiment is similar, with long ear-rings; the hair is also worn in very long tresses, decorated with ribbons. They tinge their nails with hinna. Both sexes wear trowsers, with light boots of Russia leather. The head-dress resembles the Turkish. The houses are generally of stone, decorated with Chinese articles. They are cleanly in their food, which often consists of minced meat; and, like the Russians, they preserve their victuals frozen for a considerable time. Tea is the general drink. The wives are purchased; and the ceremonies of marriage, &c. differ little from those of other Mohammedans, the mullahs or priests having great influence. They have small copper coins; but weigh gold and silver like the Chinese. They are not warlike, but use the lance, sabre, and bow, while the rich have coats of mail. The country is very productive of many kinds of fruits, and particularly wine.

KIRGUSES.] About one half of Independent Tatory is occupied by the Kirguses in the north, a people of undoubted Tataric origin, and the Uzbeks in the south. They are considered as faithless, pusillanimous, yet restless; but the Great Hord, defended by mountains on the S. and E. asserted their independence in repeated contests with the Kalmuks of Soongaria. The Middle and Little Hords have acknowledged the

Russian sovereignty; but this subjection is merely nominal, for the Russians are obliged to fortify themselves against these allies.

The manners of the Kirguses are common to the Tatars. Their tents are of a kind of felt; their drink kumiss, made of acidulated mare's milk. They lead a wandering life, from the borders of the Upper Sirr, or Syrt, near Tashkunt, to the stepp of Issim.

As the Kirgusians regard each other as brethren, they are obliged to employ slaves, being captives whom they take in their incursions. Their dress is the common Tataric, with large trowsers, and pointed boots. The ladies ornament their heads with the necks of herons, disposed like horns. They appear to be Mohammedans, though rather of a relaxed creed. They are extremely fond of the Kalmuk women, who long retain their form and charms; and often marry them if they will adopt the Mohammedan religion. There is an annual festival in honour of the dead.

KHWAREZM.] This country extends from the Jihon or Amu, to the Caspian Sea, bounded on the N. and S. by wide deserts, the chief town being now Khiva. This country is about three hundred and fifty British miles in length and breadth, and in the time of Jengis Khan, was a powerful kingdom, but at that time included Khorasan, and a part of Great Bucharia. At present this state is almost restricted to the district of Khiva, the circuit of which may be performed on horseback in three days: but there are five walled cities, or rather towns, within half a day's journey of each other.

GREAT BOKHARA.] By far the most important part of Independent Tatory, is comprised under the name of Great Bokhara, generally supposed to have originated from the city of Bokhara, the first which the Persian merchants entered on visiting the country. It is part of the Touran of the ancient Persians.

EXTENT AND BOUNDARIES.] Great Bokhara extends more than seven hundred British miles in length, from N. to S. by a medial breadth of about three hundred and fifty.

RELIGION. The religion of the Uzbeks and Bokharians, is the Mohammedan, of the Sunni sect, and the government of the khans is despotic.

MANNERS AND CUSTOMS.] The manners and customs of the Uzbeks are similar to those of the

other

other Tatars: but they are supposed to be the most spirited and industrious of these barbarians. Though many reside in tents in the summer, yet in winter they inhabit the towns and villages.

CITIES.] The chief city of Great Bokharia is Samarkand, on the southern bank of the river Sogd, which, at the distance of above a hundred miles, after washing the walls of Bokhara, passes through a considerable lake, and is supposed to join the Oxus.

CLIMATE.] The climate in general appears to be excellent, the heat even of the southern provinces being tempered by the high mountains capped with perpetual snow; and though situated in the parallel of Spain, Greece, and Asiatic Turkey, the proximity of the Siberian deserts, and the lofty alps, render the summer more temperate.

LAKES.] The most considerable lake is the sea of Aral, or of eagles. The lake Tengris, Balcash, or Palkati, is near one hundred and forty British miles in length, by half that breadth being the largest lake in Asia, after the seas of Aral and Baikal.

ARABIA.

BOUNDARIES. The boundaries on the W. and S. are marked by the Red Sea, or Arabian Gulf, and the Indian Ocean: while the Persian Gulf extends a considerable way on the E. and this boundary is considered as continued by the deserts to the west of the Euphrates. The northern limits are less strongly marked; but both in ancient and modern times rise to an angle about one

* This early civilization will excite the less surprise, when it is considered that even the modern Arabians are a most sagacious and intelligent race of men, remarkable also for spirit and valour, whose country alone has never been subdued by any invader, and who alone, of all Asiatic nations, have preserved the sacred flame of freedom, which their progenitors kindled in their inaccessible mountains. In comparatively modern times they have vindicated the fame of their ancient pre-eminence, by giving religion and laws to half of Asia and Africa, and a great part of Europe. The Arabian khalifs in Spain, Africa, and Egypt, as well as at Baghdad, cultivated the arts and sciences; and shewed a great superiority to the barbarous powers of Europe at that period. From Samarkand to the centre of Africa, the Arabian language and manners are held in veneration.

VOL. II. No. CXXVII.

hundred miles to the E. of Palmyra, which is not included in Arabia. Thence the line proceeds S. W. to the S. E. angle of the Mediterranean, a northern boundary of Arabia Petrea.

From the cape of Bab el Mandeb to the extreme angle on the Euphrates, the length is not less than one thousand eight hundred British miles; while the medial breadth is about eight hundred.

POPULATION.] The population is original and indigenous, the Arabians being the same race with the Assyrians of remote antiquity, the probable fathers of the Syrians, Egyptians, and Abyssinians, whose languages are intimately allied, as is that of the Hebrews; being totally different in form and structure, from that of the Persians, their powerful neighbours in the E. By all accounts, sacred and profane, the Assyrians were the most ancient civilized and commercial people*.

RELIGION.] The religion of Arabia is Mohammedan. Besides the Sunnis, there is here a considerable sect called the Zeidites, who in most points agree with the former, but seem rather more lax in their faith and practice.

MANNERS AND CUSTOMS.] The manners and customs of the inhabitants are for the most part similar to those of the other Bedouins, so frequently described by the numerous travellers. Those of the country of Yemen have been accurately delineated by Niebuhr; and this province will probably, after the utmost discovery, continue to be regarded as the most interesting portion; representing the Arabia Felix of antiquity. In Yemen murder is punished with death, but more often left to private revenge, which occasions family feuds, that pest of society†.

DRESS.]

† In politeness the Arabs vie with the Persians, and there are still remains of their ancient hospitality. The common salutation is the *Salam Alekum*, or Peace be with you: in pronouncing which words they raise the right hand to the heart, but this form is seldom addressed to Christians. On meeting in their wide deserts, the salutations are multiplied; and the hand of a superior is kissed in token of respect. The houses, though of stone, are meanly constructed; the apartments of the men being in front, those of the women behind. Of a middle stature, thin, and dried as it were by the sun, the Arab is moderate in his food, the common people seldom exceeding a repast of bad bread made from durra, a kind of millet, mixed with camel's milk, oil, butter, or grease, the only drink being water. This bread of durra, custom has taught them to prefer to that of barley, which, though pleasant, they

9 G

think

DRESS.] The dress, like that of the Turks and Hindoos, is long, often with large trowsers, a girdle of embroidered leather, and a knife, or dagger. Over the shoulder is worn a large piece of fine linen, originally designed to keep off the sun. The head-dress seems oppressive, consisting of several bonnets, from ten to fifteen, some of linen, others of cotton and woollen, the outmost being often richly embroidered with gold; and around this multitude of bonnets is wrapped what they call a sash, being a large piece of muslin, with fringes of silk or gold, which hang down behind. The women stain their nails red, and their feet and hands of a yellowish brown, with henna: the eye lashes are darkened with antimony, as in many other oriental countries; and every art is exerted to render the eyebrows large and black. Polygamy is confined to the rich; and throughout the whole Mohammedan regions, is far less general than is commonly supposed in Europe.

LANGUAGE.] The language of the Arabs was, even in ancient times, divided into several dialects, as may be suspected from its wide diffusion. Even in Yemen there are subdivisions; and polite people use a different enunciation from the vulgar. The language of the Koran is so different from the modern speech of Mecca, that it is taught in the colleges there, as the Latin is at Rome.

CITIES AND TOWNS.] The most celebrated cities are Mecca and Medina; but being sacred ground, the infidels are not permitted to approach; and we are obliged to trust to the inaccuracy and exaggeration of oriental writers. Mecca has not, in the most flourishing period, exceeded the size and populousness of Marseilles. The government of this holy city is vested in a sheref, who is a temporal prince; and his revenue is increased by the donations of Mohammedan sovereigns.

Medina stands about two hundred British miles N. of Mecca, being, as well as the latter, about a day's journey from the shores of the Red Sea. It is, according to Niebuhr, a small town,

think unsubstantial. Meat is little used, even by the rich, who deem it unhealthy in a hot climate. The orientals in general being water-drinkers they are very fond of pastry. The most noted drink is coffee, which they prepare like the Turks, by burning it in an open pan, and then bruising in a stone or wooden mortar. In Yemen it is rarely used, as in their opinion it heats the blood; but of the shells, or

surrounded with a paltry wall, little remarkable except for the tomb of Mohammed.

EDIFICES.] Among the chief edifices of Arabia must be named Kaaba, or temple of Mecca, which is an open square, encompassed with a colonnade, and ornamented with minarets. In this open space there are five or six houses of prayer, or chapels; while in the centre is a small square edifice, peculiarly styled the Kaaba, in which is fixed a black stone, the early object of Arabian adoration.

CLIMATE AND SEASONS.] In the mountains of Yemen there is a regular rainy season, from the middle of June to the end of September: but even then the sky is rarely covered with clouds for twenty-four hours at a time; and during the remainder of the year a cloud is scarcely to be seen. At Maskat, and in the eastern mountains the rainy season extends from the middle of November to the middle of February; and in Omon there is rain from the middle of February to the middle of April. In the plains of Yemen rain is sometimes unknown for a whole year; and in July and August the thermometer will be 98°, while at Sana in the mountains it is 85°. In general the wind from the sea is moist, and that from the interior deserts is dry, in the northern parts of which are chiefly perceived the disastrous effects of the burning wind called Samiel.

RIVERS.] In the defect of rivers strictly belonging to Arabia, the Euphrates and Tigris, which pass through Irak Arabi, have been claimed by some geographers; and the Euphrates may be considered as an Arabian river. But in Arabia Proper what are called rivers are mere torrents, which descend from the mountains during the rains, and for a short period afterwards. The most important river is probably that which rises near Sana, and joins the Indian sea below Harjiah.

MOUNTAINS.] In the division called Arabia Petraea, is the celebrated Mount Sinai, which presents two sublime summits of red granite.

DESERTS.] From Omon to Mecca, the greater part of Nejd is one prodigious sandy desert, interrupted towards the frontiers of Hejaz and

hills of the coffee, they prepare a liquor in the manner of tea. Spirituous liquors, though forbidden, are not absolutely unknown; and they sometimes smok a plant, resembling hemp, which produces intoxication; nor is tobacco neglected, which is smoked either in the Turkish or Persian manner.

Yemen by Kerjé, containing the district of Surfa, and some fertile spots and towns. The N. W. part of Nejd presents almost a continued desert, a prolongation as appears of the other, with an *oasis* Ared on the W. of Lahfa, including Jabrin, and some other places mentioned by the same author. In this desert there is also the *oasis* of mount Schamer.

ZOOLOGY.] The horse is the glory of Arabian zoology. According to Zimmerman this animal is found wild in the extensive deserts on the N. of Hadramaut. They are here divided into two great classes, the *Kadishi*, or common kind, whose genealogy has not been preserved: and the *Kochlani**, or noble horses, whose breed has been ascertained for two thousand years, proceeding, as they fable, from the stalls of Solomon. These will bear the greatest fatigues, and pass whole days without food, living on air, to use the Arabian metaphor. There is also in this country a superior breed of asses, approaching in form and qualities to the mule, and sold at high prices. There are also antelopes, and wild oxen, with wolves, foxes, and wild boars, and the large and small panther. The tiger seems utterly unknown; and the lion only appears beyond the Euphrates. A little slender serpent, called baetan, spotted with black and white, is of a nature remarkably poisonous, the bite being instant death.

This region, or Africa, seems to be the native country of the camel, emphatically styled by the orientals the ship of the desert; being, by the expansion of its feet, the faculty of bearing thirst and hunger, and other qualities, peculiarly adapted by the Author of nature to perambulate the sandy wastes which would otherwise remain unpassable.

ISLES.] Socotra, about two hundred and forty British miles from the southern coast of Arabia, appears in all ages to have belonged to that country, and to have been celebrated for the production of aloes, still esteemed superior to any other. The inhabitants are clearly of Arabian extract. There are two bays, and some secure harbours; and the isle is also said to produce

* The Kochlani are neither large nor beautiful, nor is their figure at all regarded; their race and hereditary qualities being the sole objects of estimation. They are chiefly reared by the Bedouins, in the northern deserts between Persia and Syria. The preservation of the breed is carefully

frankincense, while ambergris and coral are found in the neighbouring seas.

The isle of Bahrein is in the Persian gulf, near the Arabian coast, and remarkable for the great pearl fishery in its neighbourhood.

ASIATIC ISLANDS.

THE ISLES OF SUNDA.

SUMATRA is a large island, being about nine hundred and fifty English miles long, and two hundred broad. The English settlement of Bencoolen, in the S. E. part of this island, is a valuable possession. A chain of mountains runs through the whole island, the ranges being in many parts double and treble; but their height is not so considerable as to retain snow. Mount Ophir, immediately under the equinoctial line, is thirteen thousand eight hundred and forty-two feet above the level of the sea. There seem to be many mines of gold, though mostly neglected; and the copper is mingled with that metal. There are excellent ores of iron and steel; and that rare mineral, tin, is one of the chief exports, but principally found near Palimbang. The gold found near Bencoolen is of inferior quality. Mr. Marsden says, there are inland races, of whom the Googoo, are covered with long hair, and are little superior to the Orang Outangs of Borneo. The most abundant article of trade is pepper, the object of the British settlement; it is produced by a climbing plant resembling a vine. The white pepper is procured by stripping the outer husk from the ripe grains. Laws are unknown, the chief rendering judgement according to custom. Most crimes are compensated by money, murder not excepted. The kingdom of Acheen, in the N. W. extremity of the island, carries on a considerable trade with the coast of Coromandel.

JAVA is about six hundred and fifty English miles long, and one hundred broad. This island is remarkable for the city of Batavia, long the capital of the Dutch possessions. Batavia is strongly fortified with walls, and a citadel to-

and authentically witnessed; and the offspring of a Kochlani stallion with an ignoble mare, is reputed *Kadishi*. The Arabian steeds are sometimes bought at excessive rates by the English at Mocha.

wards

wards the sea. The town is large and well built. In this town are an assemblage of people of all nations. The air is extremely unwholesome from fetid fogs and other causes; so that dysentries and putrid fevers destroy prodigious numbers. The existence of the Upas, or Poison Tree, is now sufficiently refuted.

BORNEO, long reputed the largest island in the world, is about nine hundred miles long, and six hundred broad. The interior parts of this great island are but little known, and the greater part of the northern side next the sea, consists of swamps covered with forests of trees of numberless species, and great sizes, which penetrate for scores of miles towards the centre of the island. The natives in the interior are blacks, with long hair, of a middle stature, feeble and inactive; but their features are superior to those of negroes. European settlements have been unsuccessful, the adventurers having generally been massacred. Pepper abounds in the interior, with the gum called Dragon's blood, camphor, and sandal wood. Gold is found in this island, and also diamonds, but these are inferior to those of Golconda. The Ourang Outang abounds. The natives, who bring the gold dust down to the coast, are tattooed blue, with a small wrapper about the loins. The chiefs extract one or two of the fore teeth, substituting others of gold; and strings of the teeth of tigers, a real badge of courage, are worn round the neck. The town called Borneo, on the N. W. consists of about three thousand floating houses. The Chinese frequent this town for the sake of trade.

THE MANILLAS, OR PHILIPPINE ISLES,

Were discovered by Magelhaens in 1521, who called them the Archipelago of St. Lazarus: they were afterwards styled Philippines, in honour of Philip II. of Spain.

LUZON, the largest, is about five hundred miles long, by one hundred broad. Spanish jealousy has hitherto prevented much knowledge of this island. Gold, copper, and iron, are among the certain products; and the soil is reported to be uncommonly fruitful. The natives, who are of a mild character, are called Tagals, and seem of Malay origin. The houses are of bamboo, covered with palm leaves, raised on pillars to the height of eight or ten feet. The chief food is rice and salted fish. There are several volcanoes, and

earthquakes are not unknown. The city of Manilla is well built and fortified. The Manilla ships, or galleons, were formerly of great size; but latterly smaller vessels have been used.

Next in size is MINDANAO, a beautiful and fertile island, of large extent.

The other chief Philippines are Pulawin, Mindora, Pani, Buglas, or Isles of Negroes, Zebu, Leita, and Samar.

THE CELEBEZIAN ISLES.

CELEBEZ is about six hundred miles long, but on account of its various indentions cannot be reckoned above sixty miles broad. This island is lofty and mountains; and the natives, called Macassars, often degrade themselves by acts of piracy, attacking vessels with surprising desperation.

THE SPICE ISLANDS AND THE MOLUCCAS:

GILOLO, the largest of the Spice Islands, is about two hundred and thirty miles long, but variously indented by bays of the sea, so that its breadth seldom exceeds forty miles. The breadfruit tree is frequent here, together with the jago. The natives are industrious, particularly in weaving.

CERAM is about one hundred and ninety miles long, by forty broad. Here are vast quantities of clove trees, and whole forests of jago, which form a considerable article of export.

Bouro is about ninety miles long, and fifty broad. The interior mountains are so lofty as to be sometimes descried at the distance of twenty-eight leagues. Green ebony, and a kind of iron wood, are mentioned among the trees. The other Spice Islands are Mortray, Mysol, and Oubi; but of these little is known.

The MOLUCCAS, strictly so called, are in the western extremity of this groupe, and Amboyna and Banda in the south. The Moluccas are Ternat, Tidore, Motir, Makian, and Batchian. The Dutch and English formerly shared the produce of these islands, the former having two-thirds, and the latter one-third of the trade; but the Dutch, not liking a competitor in the benefits arising from the sale of the commodities, forged a plot of the English against their lives and liberties, and put them to death by the most exquisite tortures that hell itself could invent. The clove abounded in Makian, but the growth

was afterwards confined by the Dutch to Amboyna. The islands of Amboyna and Banda were taken without resistance in February and March, 1796, by the English admiral Rainier; when it was found that the annual produce was about one hundred and sixty-three thousand pounds of nutmegs, and forty-six thousand pounds of Mace*.

NEW HOLLAND.

THIS amazingly large island, if it be so, is about two thousand seven hundred and thirty English miles long, from E. to W. and one thousand nine hundred and sixty miles broad, from N. to S. The eastern coast having been carefully explored by Captain Cook, and justly appearing of great importance, was formally taken possession of in the name of the king of Great Britain in 1770. On the close of the American war, it being difficult to select a proper place of transportation for criminals sentenced to that punishment by the laws of their country, this new territory was at length preferred, in 1786, and the first ship sailed from Spithead, on the 30th of January, 1787, and arrived on the 20th of the same month in the following year. Botany Bay being found to be a station of inferior advantages to what were expected, and no spot appearing proper for the colony, it was immediately resolved by Governor Philip to transfer it to another excellent inlet, about twelve miles farther to the north, called Port Jackson, on the south side of which, at a spot called Sidney Cove, this settlement is now fixed. Port Jackson is one of the noblest harbours in the world, extending about fourteen miles in length, with numerous creeks or coves. Difficulties with regard to subsistence, and some unexpected misfortunes, attended the new colony, the sheep being stolen, and the cattle wandered into the woods. A space of about fifty miles around the colony had been explored, and two rivers called Nepean and Lawkesbury, and some mountains, had been discovered. The cattle were found grazing in a remote meadow, in 1795, after they had been lost for seven years, and had increased to a surprising degree. The most recent accounts seem to au-

* From 1796 to 1798, the English East-India company imported eight hundred and seventeen thousand three hundred and twelve pounds of cloves, ninety-three thousand seven hundred and thirty-two pounds of nutmegs, and

thenticate the flourishing state of the colony. The mode of cultivation has been improved, coal and rock salt discovered; and there is room to expect that this wide territory will not be found deficient in the usual riches of nature. From the account of the various navigators, there is room to infer that this extensive tract is peopled by three or four races of men, those observed in the S. W. being described as different from those in the N. and both from those in the E. with whom alone we are intimately acquainted. These are perhaps in the most early stage of society which has yet been discovered in any part of the globe. They are merely divided into families, the senior being styled Be-ana, or Father. Each family or tribe has a particular place of residence, and is distinguished by adding *gal* to the name of the place; thus the southern shore of Botany Bay is called Gwea, and the tribe there Gwea-gal. Another tribe, numerous and muscular, has the singular prerogative of extracting a tooth from young men of other families, the sole token of government or subordination. No religion whatever is known, though they have a faint idea of a future existence, and think their people return to the clouds, whence they originally fell. They are of a low stature, and ill made; the arms, legs, and thighs being remarkably thin, perhaps owing to their poor living on fish, the only food of those on the coast, while a few in the woods subsist on such animals as they can catch, and climb trees for honey, flying squirrels, and opossums. The features of the women are not unpleasant, though approaching to the negro. The black bushy beards of the men, and the bone or reed which they thrust through the cartilage of the nose, gives them a disgusting appearance; which is not improved by the practice of rubbing fish oil into their skins, as a protection from the air and muskitoes, so that in hot weather the stench is intolerable. They colour their faces with white or red clay. The women are marked by the loss of the two first joints of the little finger of the left hand, as they were supposed to be in the way when they coiled their fishing lines. It is however not improbable that this practice, and the extraction of a tooth from the boys, may be

forty-six thousand seven hundred and thirty pounds of mace, besides private trade, amounting to about a third part of the above statement.

mere initiations, rude lessons, that they may learn to bear pain with apathy. The children are seldom disfigured except by accidents from fire; and their sight is surprisingly acute. Some are nearly as black as African negroes, while others exhibit a copper or Malay colour, but the hair is long, not woolly like the African. Their noses are flat, nostrils wide, sunk eyes, thick brows and lips, with a mouth of prodigious width, but the teeth white and even.

Other large islands are PAPUA, or NEW GUINEA, about one thousand two hundred miles long, and three hundred broad; NEW BRITAIN, NEW IRELAND, the SOLOMON ISLES, NEW CALEDONIA, the NEW HEBRIDES, NEW ZEALAND. Besides these are, 1. The PELEW ISLES. 2. The LADRONES, so called because the natives manifest great propensity to thieving. 3. The CAROLINES. 4. The SANDWICH ISLES. 5. The MARQUISAS. 6. The SOCIETY ISLES, so called in honour of the Royal Society of London. 7. The FRIENDLY ISLES.

AFRICA.

THIS Continent is, after Asia and America, the third in size; but in political estimation, is the last and meanest of the four great divisions of the earth. From the southern extremity to the Mediterranean, are about four thousand two hundred geographical miles, and the breadth, at the equator, is about four thousand one hundred and forty geographical miles. The actual population of Africa does not, according to the most authentic accounts, exceed thirty millions. In the central parts on the south, the population appears to be indigenous and peculiar, these being the native regions of the negroes, whose colour, features, and hair, distinguish them from all the other races of mankind. In the northern parts the Egyptians and Abyssinians are of Arabian extract. The original inhabitants of the northern parts appear to have been, in all ages, radically distinct from the negro race, from whom they were divided by the Desert of Zaara; and in the eastern parts the latter were still farther repelled by the Arabian colony which settled in Abyssinia. Africa has the Mediterranean on the N. the Red Sea, and the Indian Ocean on the E. and the Atlantic on the W.

The chief river hitherto discovered is the Nile, which rises in the *Jebel el Keemr*, or mountains of the Moon, in a district called Donga, N. lat. 8°. Its comparative course is about two thousand British miles. In its course the Nile forms some considerable cataracts, the principal being that of *Geanadil* in Nubia, before it gains the level of Egypt, after passing some rapids to the S. of Syene. The water is muddy; when it overflows, of a dirty red; and cloudy even in April and May. The river begins to rise about the 19th of June, the Abyssinian rains having begun in April, and it ceases in October. It abounds with fish. The crocodile is at present restricted to the south of Assiut. The other chief rivers are the Niger and the Gir, the course of each being about one thousand English miles. That of Senegal is also considerable. In the southern parts *Zabiror Barbela* of Congo, and the *Zambezi* of *Mocaranga*, are the most considerable yet known.

The mountains of Atlas attracted the particular observation of the ancients, who fabled that they supported the firmament; and derived from them the celebrated appellations of the Atlantic Ocean, and the Atlantic Isles. From the accounts of some French mineralogists, who have visited the Atlantic range, the structure is granitic and primitive. The mountains of the Cape of Good Hope seem principally of blue slate, siliceous sand-stone, and granular quartz, interspersed with large masses of granite.

But the most striking feature of Africa consists in the immense deserts which pervade many parts of that continent. Of these the chief is that called *Zaara*, or the Desert, and stretches from the Atlantic Ocean, with few interruptions, to the confines of Egypt, a space of about two thousand five hundred geographical miles, by a breadth of seven hundred and twenty.

The principal states of Africa have been described in a former part of this work*; so that little remains, but that we give a description of the Cape of Good Hope, the islands of Madagascar, Bourbon, Mauritius, and a few others.

THE CAPE OF GOOD HOPE.

Little was known by the English of the extent of the territory belonging to this colony, till their recent conquest of it, when it was found to be five hundred and fifty English miles long, and

and two hundred and thirty-three broad. To the S. E. of Cape Town are some small vineyards, which yield the noted wine called Constantia; and even in remote districts there are plantations of various kinds: but large tracts are irrecoverably barren. The country is more fertile towards the Indian Ocean, than towards the Atlantic, a character which seems to apply to Africa in general. The chief resorts of trading vessels are False Bay, on the S. and Table Bay, on the N. W. which opens to Cape Town. There are some wolves and Hyenas, and various kinds of antelopes; and, among birds, eagles, vultures, kites, crows, turtle doves, &c. More inland are all the wild and ferocious animals of Africa, and hippopotami abound in the rivers.

MADAGASCAR.

This noble island is about eight hundred and forty geographical miles long, by about two hundred and twenty broad, being esteemed one of the largest islands in the world. The scenery is strikingly grand and picturesque, diversified with precipices, cataracts, and immense forests. Many of the most valuable minerals occur, among which are beds of pure rock crystal, often used for optical purposes, and erroneously called Brazil pebble; and it is said three kinds of gold ore, with topazes, sapphires, emeralds, and spotted jaspers, commonly called blood stones. The French settlement of Fort Dauphin is in the S. E. extremity of the island, and the French are chiefly acquainted with the southern part. Almost all the villages are built upon eminences, and surrounded by two rows of strong palisades, within which there is a parapet of earth, four feet in height, and sometimes there is a ditch, ten feet broad, and six deep. Their chiefs are only known by their red caps, worn by the common Moors. Their authority is inconsiderable, yet they are sometimes regarded as proprietors of the land, and receive a small quit rent.

MAURITIUS, OR ISLE OF FRANCE.

The island of Mauritius, long known as a

* An Ice Island was seen from the ship *Æolus*, at 3 P. M. July 9, 1809, in lat. $51^{\circ} 36'$ S. and lon. 130° W. The island was between two and three hundred feet above the level of the sea, and about three miles in circumference. Although at the time it blew a violent gale of

French settlement, is situated to the E. of Madagascar, and is well known in the commercial world. It has a tolerable port, and is the centre of the oriental force and commerce of the French. It was first possessed by the Dutch, who abandoned it in 1712, and the French settlement began to acquire some stability under Bourdonnais, in 1734. There are two crops every year of wheat and Indian corn, but manioc is the food of the negroes.

ISLE OF BOURBON.

This island, colonized in 1654, is likewise on the E. of Madagascar, and is about one hundred and fifty miles in circumference, of a circular form, rising to high mountains in the centre. There is a noted volcano, difficult of access, at the summit of a mountain a league from the sea: the eruptions are frequent and continual. It produces sugar canes, and the cattle are numerous. In 1766, M. Poivre was governor of the isles of Mauritius and Bourbon: he was of great benefit to the settlement, by the introduction of the bread-fruit tree, and also of the nutmeg and cinnamon. The isle of Bourbon was, since the French Revolution called Reunion; but of late has been called the Isle of Bonaparte. This island was taken by the English in July, 1810, with one hundred and twenty pieces of cannon, besides a large quantity of shot, shells, cartridges, and powder.

AMERICA.

The length of America, from the 72^{d} degree of N. latitude, to Cape Horn*, the southern point of land in Terra del Fuego, or the 56^{th} degree of S. latitude, is a space of one hundred and twenty eight degrees, or seven thousand six hundred and eighty geographical miles, or about eight thousand eight hundred and ninety-six English miles. The breadth of North America is about three thousand eight hundred and forty geographical miles, or four thousand four hun-

wind, with a tremendous hollow sea, it seldom broke over the lowest part of it, the island was therefore about five hundred feet under the water. It had a grand, though awful appearance.

drawn

dred and fifty English miles; and that of South America is about two thousand eight hundred

and eighty geographical miles, or three thousand three hundred and forty English miles *.

NORTH

* The first discovery of America is generally ascribed to Christoval Colon, or, as he is commonly called, Christopher Columbus. In 1492 he sailed from Spain, in quest of the new world, on Friday the 3d of August. On the 1st of October he was, by his reckoning, seven hundred and seventy leagues W. of the Canaries. His men began to mutiny, and he was forced to promise to return in three days, if land did not appear. Fortunate presages arose, as land birds, a cane newly cut, a carved piece of wood, and the branch of a tree with fresh red berries. These and other symptoms induced Colon to order the ships to lie to in the evening of the 11th of October, in the certainty of seeing land on the approach of day-light. The night was passed in gazing expectation; and a light having been observed in motion, the cry of *land! land!* resounded from the head-most ship. With the dawn of Friday, October 12, a beautiful isle appeared, two leagues to the north. *Te Deum* was sung with shouts of exultation, and every mark of gratitude and veneration to the admiral. Colon was the first who landed, to the great amazement of the natives, who regarded their visitors as children of the sun, the astonishment on both sides being indescribable. This first discovery of Colon he called San Salvador, but it is now better known by the native name of Guanahani (the Cat island of our mariners) being one of the groupe called the Bahama isles. Colon soon afterwards discovered Cuba and St. Domingo. After visiting the Azores on his return, he arrived at Lisbon on the 4th of March, 1493.

1493. The second voyage of Colon, 25th September. Steering more southerly, he discovered several of the Caribbee islands, founded a town in St. Domingo, being the first European settlement in the new world, and did not return till 1496.

1498. Third voyage of Colon toward the south-west, where he expected to find the Spice Islands of India. On the 1st of August he discovered an island, which he called Trinidad, not far from the mouth of the river Oroonoko. From the estuary of this river he judged that it must flow through a country of immense extent; and he landed in several places on the coast of the continent now called Paria. He then returned to Hispaniola, or St. Domingo: and in October, 1500, was sent back to Spain in chains!

1499. Ojeda, an officer, who had accompanied Colon in his second voyage, sails to America with four ships, but discovered little more than Colon had done. One of the adventurers was Amerigo Vespucci, a Florentine man of science, eminently skilled in navigation, who perhaps acted as chief pilot. On his return, Amerigo published the first description that had yet appeared of any part of the new continent: and the caprice of fame has assigned to him an honour above the renown of the greatest conquerors, that of indelibly impressing his name upon this vast portion of the earth.

1500. On his voyage to the East Indies, Cabral, the Portuguese admiral, discovered Brazil.

1502. Fourth voyage of Colon, in which he discovers a great part of the continent, and particularly the harbour of Porto-bello.

1513. Vasco Nunez de Balboa descried, from the mountains of the isthmus, the grand Pacific Ocean; and he after-

wards waded into the waves, and took possession of it in the name of the Spanish monarch. This discovery seems to have terminated the vain expectation that America formed part of Asia.

It seems unnecessary to trace with minuteness the other epochs of discovery in this quarter. In 1515 the continent was explored as far as Rio de Plata; but even in 1518 little was known concerning its western parts; and twenty-six years had elapsed since the first voyage of Colon, before the existence was rumoured of the empires, or kingdoms of Mexico and Peru. Hispaniola and Cuba still continued to be the chief seats of the Spanish power. In 1519 Cortez, with eleven small vessels, containing six hundred and seventeen men, proceeded to the conquest of Mexico, which was accomplished in 1521. Magalhaens, at the same time having explored the Pacific Ocean, the discovery of the western coast of America became a necessary consequence. After many reports concerning the riches of Peru, that country was at length visited in 1526 by Pizarro, in a vessel from Panama. In 1530 the conquest of Peru was begun by Pizarro, at the head of thirty-six cavalry, and one hundred and forty-four infantry: and in ten years that empire was divided among his followers. In 1543 the first Spanish viceroy appeared in Peru.

In North America the epochs of discovery were more slow.

1497. Giovanni Gaboto, a Venetian, called by the English John Cabot, who had received a commission from Henry VII. In 1495, in the view of tracing a nearer passage to India, discovered Newfoundland, so called by his sailors; and inspected the American shore as far as Virginia: but, this land forming merely an obstacle to his wishes, he returned to England.

1500. Corteale Real, a Portuguese captain, in search of a north-west passage, discovered Labrador.

1513. Florida was discovered by Ponce, a Spanish captain.

1534. Francis I. sending a fleet from St. Maloes, to establish a settlement in North America, Cartie the commander, on the day of St. Laurence, discovered the great gulph and river, to which he gave the name of that saint. In the following year he sailed about three hundred leagues up this noble stream to a great cataract, built a fort, and called the country New France.

1578. Sir Humphrey Gilbert obtained a patent for settling lands in America. In 1583 he discovered and took possession of the harbour of St. John, and the country to the south, but was lost on his return.

The voyage of Drake round the world served to kindle the enthusiasm of the English; and Raleigh obtained a patent similar to that of Gilbert.

1584. Two small vessels dispatched by Raleigh unfortunately bent their course to that country now called North Carolina, instead of reaching the noble bays of Chesapeake or Delaware. These vessels returned to England, with two of the natives; and Elizabeth assigned to this region the name of Virginia, an appellation which became lately applied to the British settlements in North America, till it was confined to a different country from the original Virginia.

NORTH AMERICA.

THE UNITED STATES.

THE territories of the United States are classed under three grand divisions, the Northern, the Middle, and the Southern.—The Northern States are, Vermont, New Hampshire, Massachusetts, Connecticut, and the small province of Rhode Island. The district of Maine, in this quarter, belongs to the province of Massachusetts Bay.—The Middle States are, New-York, New Jersey, Pennsylvania, Delaware, and the territory on the N. W. of the Ohio.—The Southern States are, Maryland, Virginia, Kentucky, North Carolina, Georgia, and Tennessee, or the country south of Kentucky.—Louisiana is now regarded as a part of the United States.

The United States are bounded on the E. by the Atlantic Ocean, and on the W. by the Mississippi. On the N. an ideal line, pervading the great lakes of Canada, is continued along the river St. Lawrence to lat. 45°. not far S. of Montreal, when it passes due E. and follows a chain of mountains N. E. and afterwards diverges S. E. to the river St. Croix. On the S. an arbitrary line, about lat. 31° divides the United States from West and East Florida. The greatest length of the United States, (not including Louisiana) is about one thousand three hundred English miles, and its breadth about one thousand. The square acres are computed at six hundred and forty millions, and those covered with water

1585. Raleigh sent a small colony, under the command of Sir Richard Grenville, who settled in the isle of Roanoke, a most inconvenient and useless station, whence they returned in 1586. Raleigh made several unsuccessful attempts to colonize the country, and afterwards resigned his patent to some merchants, who were contented with a petty traffic. At the death of Elizabeth, 1603, there was not one Englishman settled in America; and the Spaniards and Portuguese alone had formed any establishment on that vast continent.

The venerable Hakluyt, anxious that his countrymen should partake of the benefit of colonies, procured an association of men of rank and talents for this purpose; and a patent was granted by James I. April 10, 1606. The bay of Chesapeake was discovered in 1607, and the first lasting settlement was founded at Jamestown, in modern Virginia. Captain Smith, who afterwards published an account of his voyages, displayed remarkable spirit and enterprize; yet the colony was about to return to England when Lord De La War arrived in 1610; and though he remained only a short time, yet his prudent conduct firmly established the settlement.

In 1585, John Davis, an experienced navigator, visited the western coast of Greenland, and explored the narrow

being supposed fifty-one millions, so that there remains five hundred and eighty-nine millions of acres of land.

The religion of the United States is Christianity, and every sect is universally tolerated. It would be useless to enumerate the various denominations; but about four-fifths are moderate independents.

The government, by the constitution of 1789, is vested in a president and two councils. The president is chosen for the term of four years; and the senate or superior council consists of two senators from each state, chosen every six years. The president commands the army and navy, and can pardon offences, except in cases of impeachment.

The population was estimated in 1790, at three millions nine hundred and thirty thousand, exclusive of the inhabitants N. W. of the Ohio, supposed to be then twenty thousand. The population is supposed to be doubled every twenty years, in which case it now (1810) amounts to upwards of seven millions.

Their manners and customs differ little from those of their British ancestors, except in a few particularities. They are, however, generally reserved.

The language of the United States is English, with the admixture of some words from other languages, brought in by people who have migrated from different countries. The American writers sometimes adopt expressions and idioms

sea, called Davis's Strait. On another voyage he proceeded as far north as the island of Disko, and the opposite shores of Greenland, which he named London coast. He also discovered Cumberland Strait; and upon the whole the three voyages of this navigator are of great consequence. His farthest point of discovery appears to have been Sanderson's Hope, lat. 72°; whence turning to the west, he was impeded by fields of ice.

In 1607, Hudson made his first voyage; and is said to have proceeded along the coast of Greenland as far as lat. 82°. On the voyage of 1610 Hudson discovered the Straits which bear his name; and that inland sea, which has been called Hudson's Bay.

In 1616 some public spirited gentlemen sent Captain Bilot to attempt a N. W. passage. William Baffin sailed with him as pilot: and this voyage is one of the most singular in the whole circle of geography. Far exceeding the utmost stretch of Davis, they discovered Horn Sound, Cape Dudley Diggs, Hakluyt Island, Sir Thomas Smith's Sound, Cary's Islands, Alderman Jones's Sound, and Sir James Lancaster's Sound; all of them totally unknown to any preceding or succeeding navigator; so that he was suspected to be an impostor.

unknown to the British classics; and it is supposed that in the course of eighty or one hundred years, it will be a different language.

The manufactures of the United States may be considered as still in their infancy, as the people were accustomed to be supplied from Great Britain; but the recent commotions in Europe have driven many able manufacturers to America, where machinery is particularly valuable, as the price of labour is very high, it is presumed they are rapidly advancing in the arts.

The climate is remarkable for sudden transitions from heat to cold, and the contrary. In the northern states the winter is longer and more severe than in England, but the summer heat more intense.

There are several large rivers, particularly the Mississippi, Ohio, Illinois, Wisconsin, Chipaw, St. Croix, the Great and Little Miami, the Wabash, the Great Kenaway, the Kentucky, the Green River, the Cumberland, the Tennessee, the Penobscot, Kenebec, Saco, Merimac, Connecticut; the Delaware, the Susquehanna, the Chesapeake, the Potomac, and James River.

There are many great lakes, particularly those which form the northern boundary: and several of less extent. The forests are so numerous and large, that they do not appear to have distinguished them by particular names.

In the province of Vermont is a curious stalactitic cave, in which, after a descent of one hundred and four feet, there opens a spacious room about twenty feet in breadth, and one hundred in length, with a circular hall at the farther end, at the bottom of which boils up a deep spring of clear water. Near Durham in New Hampshire, is a rock so poised on another, as to move with one finger; a natural remain of a ruined hill, though in England it would be called Druidical.

In the province of New York a rivulet runs under a hill about seventy yards in diameter, forming a beautiful arch in the rock; and there is a stalactitic cave, in which was found the petrified skeleton of a large snake. In the territory on the N. W. of the Ohio, the savannas, or rich plains, extend for thirty or forty miles without any tree; they are crowded with deer, wild cattle, and turkeys, and often visited by bears and

* Rhode Island, which gives name to the state, is about thirteen miles in length, by four in breadth, with a con-

wolves: but this district is chiefly remarkable for a number of old forts, of an oblong form, with an adjoining tumulus or tomb. As the Mexicans have a tradition that they passed from the north, these forts may perhaps be remains of their first residence, or of some nation which they subdued. The natural bridge is a sublime and striking curiosity, being a rock covered with soil and trees, across a chasm, appearing to have been opened in the course of ages by a brook, which now runs between two and three hundred feet beneath. The breadth of this bridge is about sixty feet; and the thickness of the mass about forty.

The chief islands belonging to the United States are Long Island, (the province called Rhode Island, being continental, with two or three small islands attached *,) and a few insular strips of land near the shores of North Carolina. The others, scattered along the coast, and in the various bays and lakes, are of little consequence.

BRITISH POSSESSIONS.

THESE are Canada, New Brunswick, Nova Scotia, Cape Breton, Newfoundland, and the Bermudas.

Those parts of North America which still belong to Great Britain, are extensive, and of considerable importance, though so thinly peopled as not to contain above two hundred thousand souls, of which by far the greater part are French and natives; and in such a disadvantageous climate, that they sink into insignificance, when compared with the Spanish colonies, or with the United States.

CANADA is computed to be one thousand two hundred geographical miles long, by two hundred medial breadth. Its capital, Quebec, was conquered by Wolfe, in 1759, and Canada was ceded to Great Britain by the treaty of Paris, in 1763. The manners and customs of the settlers in Canada are considerably tinged with the French gaiety and urbanity. The principal exports are furs and peltries, with some fish, potash, and American ginseng. Coal abounds in the island of Cape Breton, but this valuable mineral has not been discovered in Canada. The chief natural curiosities seem to be the grand lakes, rivers, and cataracts. Among the latter, the celebrated falls of Niagara are chiefly on

siderable town called Newport: before the American war it was a beautiful and highly cultivated district.

the side of Upper Canada, the river being there six hundred yards wide, and the fall one hundred and forty-two feet. A small island lies between the falls: and that on the side of the United States is three hundred and fifty yards wide, while the height is one hundred and sixty-three feet. From the great fall a constant cloud ascends, which may sometimes be seen at an incredible distance; and the whole scene is truly tremendous.

NEW BRUNSWICK formed part of Nova Scotia till 1784, when that province was divided into two parts, of which New Brunswick was the largest portion. The river of St. John affords navigation for vessels of fifty tons, about sixty miles, and for boats about two hundred. Its capital is Frederick-town. The chief products are timber and fish.

NOVA SCOTIA, is about three hundred miles long, by eighty of medial breadth. There are several considerable rivers, among which that of Annapolis is navigable fifteen miles for ships of one hundred tons. The bay of Fundi, between New Brunswick and Nova Scotia, extends fifty leagues inland; the ebb and flowing of tide being from forty-five to sixty feet. The capital is Halifax, on the Bay of Cheburto, well situated for the fishery. During a great part of the year the air is foggy and unhealthy; and for four or five months intensely cold.

The Island of CAPE BRETON, is attached to the province of Lower Canada, though divided from Nova Scotia by a strait of one mile in breadth. It is about one hundred miles long. The climate is cold and foggy. The chief towns are Sidney and Louisburg; and the number of inhabitants do not exceed one thousand upon the whole island. The fur trade is inconsiderable, but the fishery very important, this island being esteemed the chief seat; and the value of this trade, while in the possession of the French, was computed at 1,000,000^l sterling.

The Island of ST. JOHN is at no great distance from Cape Breton, being about sixty miles long, and thirty broad. It is attached to Nova Scotia.

NEWFOUNDLAND, an island discovered by Sebastian Cabot, in 1496. It is about three hundred and twenty miles long, by as many broad, and

as scarcely been penetrated above thirty miles from the shore. The great fishery on its banks begins about the 10th of May, and continues till the end of September. The cod is either dried for the Mediterranean, or barrell'd up in a pickle of salt for the English market. The fishery is computed to yield about three hundred thousand pounds per annum, from the cod sold in the Catholic countries. The chief towns are St. John, in the S. E. with Placentia in the S. and Bonavista in the E.

The BERMUDAS, or SOMER ISLES, are four in number, viz. Bermuda, St. George's, St. David's, and Somerset, with several islets, and numerous rocks. The inhabitants are chiefly occupied in building light ships of their cedars, in which they trade to North America, and the West Indies. They are also frequented by whale fishers,

SPANISH DOMINIONS IN NORTH AND SOUTH AMERICA.

THE extent of the Spanish possessions in North America is very great, being about one thousand nine hundred and twenty geographical miles long, by about four hundred of medial breadth. Of this wide empire the chief part is distinguished by the name of MEXICO, or NEW SPAIN; the provinces, in ascending from the south to the north, being Veragua*, Costa Rica, Nicaragua, Honduras, (with the Musquito shore, claimed by the English,) Guatemala, and Verapaz, Chiapa, Tabasco, and the peninsula of Yucatan, Guaxaca, Mexico Proper, New Galicia, Biscay, and Leon. The provinces farther to the north are Cinaloa and others on the gulf of California, with that large Chersonese itself. Louisiana† and the Two Floridas complete the chief denominations.

The Spanish possessions in South America are of prodigious extent, from the Caribbean Sea to the most southern promontory, according to the Spanish Geographers; but the English do not allow them so great an extent; so that what remains to the Spanish government, is about three thousand three hundred and sixty geographical miles long, by about nine hundred medial breadth. The whole length of the Spanish possessions in America may therefore be com-

the females of Old and New Spain.

† Louisiana was lately restored to France; and by France transferred to the United States.

* On the coast of Veragua is Conception Bay; where the dresses of the inhabitants are light and airy; the women wearing large bell hoops, form a curious contrast between

puted at more than five thousand geographical miles. The grand divisions are, the viceroyalty of Buenos Ayres; that of Peru, which includes Chili; and that of New Granada, in the north. The number of mines at work in the viceroyalty of Buenos Ayres alone, amounts to thirty of gold *, twenty-seven of silver †, seven of copper, two of tin, and seven of lead ‡.

The ancient Mexicans worshipped the sun, but they had no image of that luminary in their temples: they had, however, a great many idols, among whom Haloch, or Tescapuca, held a distinguished place. He seems to have been their god of war. They are said to have offered human sacrifices to their idols; and the dress of their chief priest was a long robe and a crown; and when about to perform a sacrifice, he was always accompanied by a priest of an inferior order.

At the commencement of a century the Mexicans manifested the greatest joy; and dances were exercised all over the country, in which the rejoicings exceeded every thing that the Europeans were acquainted with.

The Peruvians acknowledged one Almighty Being, whom they called Pachá-Camac; but as they did not see him, they seldom erected temples, or offered sacrifices to him: they worshipped him in their hearts as the unknown God. They offered sacrifices to the sun; and these sacrifices consisted of lambs, and other sorts of cattle, fowls, and corn, and even their best and finest

cloathes; all which they burned in the place of incense. One of their great feasts, called Raymi, was held in the month of June, immediately after the summer solstice. This was also held in commemoration of their feast Inca, called Manca Capac, and Coya Mama Ocla, his wife and sister. At this festival all the viceroys, generals, governors, and other officers, were assembled, and the emperor, or Inca, officiated as high priest. So fond were the Peruvians of consecrated vessels, that the Inca never drank out of a vessel which had not been presented to the sun, and was thus supposed to have been blessed by that luminary; the performance of the ceremony of consecrating the Inca's vessel being attended with great solemnity.

PORTUGUESE POSSESSIONS.

The dominions in South America held by the Portuguese, extend from the frontier of Dutch Guiana to Port St. Pedro, a space of two thousand one hundred geographical miles; and the breadth, from Cape St. Roque to the farthest Portuguese settlement on the river of Amazons, called St. Paul de Omaguas, equals that extent. This vast territory, rivaling the empires of antiquity, is still more unknown than the Spanish possessions, partly from the want of science and curiosity, partly on account of the thick forests which cover the extensive plains of the Marañon, and its auxiliary streams. Though long in al-

* The celebrated mountain of Potosi has presented, for two centuries and a half, inexhaustible treasures of silver; while the gold seems thinly scattered by nature, and has no where been discovered in such enormous masses. This mountain, of a conic form, is about twenty English miles in circumference, and perforated by more than three hundred rude shafts, through a firm yellow argillaceous schistus. There are veins of ferruginous quartz, interspersed with what are called the horn and vitreous ores. Of a peculiar dark reddish colour, this mountain rises void of all vegetation, blasted by the numerous furnaces, which in the night form a grand spectacle. This surprising mine was discovered 1545, by Huallpa a Peruvian, who in pursuing some chamois goats, pulled up a bush, and beheld under the root that amazing vein of silver afterwards called *la rica*, or the rich. He shared this discovery with his friend Huanca, who revealed it to a Spaniard his master; and the mine was formally registered 21st April, 1545.

† Another celebrated mine is that of mercury, indispensable in amalgamating the precious metals. While Mexico is supplied from Spain, Peru has the native product of Guancavelica, a district and town not far to the S. W. of Lima, near the great bend of the old Marañon. The cinnabar had

been used by the Peruvians as a red paint; and the quicksilver was first detected about 1567.

‡ Platina is chiefly found in the mines of Choco and Barbacoas, in the vice royalty of New Grenada. Tin, according to Helms, is found at Chayanza and Paria; and there are also several mines of copper and lead. The chief copper mine was at Aroa; but the colonies are mostly supplied from the mines at Cuba. In the time of the Incas, emeralds were also common, chiefly on the coast of Manta, and in the government of Atacames, where it is said that there are mines which the Indians will not reveal, as they must encounter the labour of working them. The river of Emeralds flows from the Andes to the north of Quito; and others of inferior quality are found near Santa Fé de Bogota, where are the chief modern mines of Peruvian emeralds, justly preferred to all others, since those of Egypt have been neglected. Those found in the tombs are worked into spheres, cylinders, cones, and other figures, and pierced with great precision; but in what manner this was accomplished remains unknown. According to Ulloa, rubies have also been observed in the jurisdiction of Cuenca.

liance with Portugal; we have little precise knowledge of Brazil, and still less of the interior country called Amazonia. The chief city of Brazil was formerly Bahia, or San Salvador, which has since yielded to Rio Janeiro *.

WEST INDIAN ISLANDS.

THESE islands, so important to commerce, are Cuba, St. Domingo, Jamaica, and Porto Rico, all of considerable extent; and followed by the distinguished groupe called the Antilles, Caribbee, or Leeward Islands. To the south of this groupe is Trinidad, a recent English acquisition. In the N. E. are the Bahama Islands, which are narrow and barren strips of land, formerly frequented by pirates, till subjected by England.

CUBA is not less than seven hundred English miles long, but the medial breadth does not exceed seventy. Such is the fertility of Cuba, that it may be regarded as a most important and flourishing possession. The quantity of sugar is considerable; and the tobacco is esteemed of more exquisite flavour than that of any other part of America. Among the products must also be reckoned ginger, long pepper, mastic, cocoa, manioc, and aloes. There are mines of excellent copper, and gold is not unknown in the rivers. The forests abound with wild cattle and swine; and among the trees are green ebony and mahogany. Havanna is the capital.

ST. DOMINGO, or HISPANIOLA, or HAYTI. This island is about four hundred English miles long, by one hundred broad. Under the name of Hispaniola, it was the first Spanish settlement in the New World. The French colony derived its origin from a party of buccaneers, mostly natives of Normandy, towards the middle of the seventeenth century; and the western part was formally ceded to France by the peace of Ryswic.

* To this place the royal family of Portugal, assisted by the English, migrated, when the French made their appearance in great force at Lisbon, at the close of 1807.

The harbour of Rio Janeiro is capacious and excellent; and surrounded by a fertile country. It is protected by the castle of Santa Cruz, erected on a huge rock of granite. On the west is the city of St. Sebastian, commonly called Rio de Janeiro, built on a tongue of land, the hills and rocks behind being crowned with woods, convents, houses, and churches. On a small isle are a dock yard, magazines, and naval store-houses; and there are several other isles in the harbour behind the town. The streets are generally

So flourishing a state was the French colony in before the Revolution, that its exports amounted to four millions seven hundred and sixty-five thousand one hundred and thirty pounds sterling. The National Assembly of France passed some decrees concerning the mulattoes, or people of colour, which gave them great offence; and after many absurd struggles between the whites and the mulattoes, three thousand negro slaves, supported by the mulattoes, entered the city of Cape Francois, on the 21st of June, 1793, and perpetrated an universal massacre of the white men, women, and children. At length the people of colour obtained so great advantages, that they proclaimed the island the empire of Hayti, and Christophe has been declared emperor; but at present, (October, 1810,) the affair is not terminated, and Petion is still master of a part of the island.

JAMAICA, the third island in size in this archipelago, is about one hundred and seventy English miles long, and sixty broad. In 1655, during the protectorate of Oliver Cromwell, it was taken by the English, by whose industry it has become one of the most flourishing of the West India settlements. It is divided into three countries, viz. Cornwall, in the W. Middlesex in the centre, and Surrey in the E. St. Jago, or Spanish Town, is regarded as the capital; while Kingston is the chief sea port. The principal exports are to Great Britain, Ireland, and North America, in sugar, rum, coffee, indigo, ginger, and pimento, valued in 1787 at two millions sterling. The climate, though tempered by the sea breezes, is extremely hot; and the days and nights are nearly of equal duration. What is called the Blue Mountain Peak, rises seven thousand four hundred and thirty-one feet above the level of the sea; and the precipices are interspersed with beautiful savannas. The bread fruit tree has been introduced by the exertions of

straight and well paved. Water is supplied by an aqueduct on the Roman plan. Yet the situation of this beautiful city is said to be unhealthy, owing to the exhalations from the primitive inland forests. There are manufactories of sugar, rum, and cochineal; and several districts produce cotton, indigo, coffee, cacao or chocolate, rice, pepper, and the noted Brazilian tobacco. The red or Brazil wood, is the property of the crown. The natural history has been little explored: the circumjacent rocks are granitic, white, red, or deep blue, the last being of a close and hard texture.

Sir Joseph Banks, than which none can be more beneficial, or worthy of applause.

PORTO RICO is about one hundred and twenty English miles long, and forty broad. It is a fertile, beautiful, and well watered island; the principal trade of which is in sugar, ginger, cotton, hides, with some drugs, fruits, and sweat-meats. In the northern part are said to be mines of gold and silver.

THE CARIBBEE ISLANDS. This range extends from Tobago, in the south, to the Virgin Islands, in the north. The Caribbees are of remarkable fertility and commercial advantage. Their names are, Barbadoes, Antigua, St. Christopher's, St. Vincent, Dominica, Grenada, Montserrat, Nevis, Martinique, Guadaloupe, St. Lucie, Tobago, St. Croix, St. Thomas, St. John, St. Bartholomew, and St. Eustatius. The products and exports of all these islands are similar, consisting, generally, of sugar, rum, coffee, cocoa, indigo; and cotton.

THE BERMUDAS, OR SOMER ISLANDS.

THESE islands are situated in thirty-two degrees, twenty minutes, north latitude, and sixty-five degrees, west longitude from London. Their distance from the Land's End in Cornwall, is computed at one thousand five hundred leagues; from the Madeira's, about one thousand two hundred; and from Carolina, in North America, three hundred. They are difficult of access, being, as Waller says, "walled with rocks;" they lie in a cluster, nearly in the shape of a shepherd's crook, and contain about twenty thousand acres. No part of the world enjoys a purer air, or more temperate climate, or is more remarkable for health, and for plenty of flesh, fish, poultry, fruits, herbs, and roots. This groupe of islands received their name from John Bermudas, a Spaniard, who discovered them in 1503; and were afterwards called the Somer Islands, from Sir George Somers, who lost his ship on their rocks, in the year 1609, in his passage to Virginia.

THE LUKAYO'S, OR BAHAMA ISLANDS.

THE Bahama Islands are situated to the south of Carolina, between seventy-three and eighty-one degrees of west longitude, and twenty-one and twenty-seven degrees of north latitude. They are very numerous, and twelve of them are pretty large. These were the first lands which Columbus discovered in America, in the year 1492. Some of them, however, are mere rocks.

The island of Providence has been planted and fortified by Great Britain some years, and is situated in the seventy-eighth degree of West longitude, and the twenty-fifth degree of North latitude: it is two hundred miles east of the continent of Florida. None of the other islands are inhabited; but the English have plantations upon some of them. The soil exactly resembles that of Carolina.

These islands, as above-mentioned, were the first fruits of Columbus's discoveries; but the English were unacquainted with them till Captain Seyle was driven among them, in his passage to Carolina, in 1667. He then gave his own name to one of them; and when he was afterwards driven upon it a second time, he called it Providence. This island, for a long time, was the resort of American pirates, after the English had made a fruitless attempt to plant it, and the rest of the Bahamas, in the reign of Charles II. In 1718 these pirates were dislodged by Captain Woodes Rogers, who was sent out by government, and who erected a fort, and made a settlement in Providence, which has since improved very considerably. The Bahamas were taken by the Spaniards in the American war, but were restored to the English at the treaty of peace, in 1783. Before the articles, indeed, were signed, Colonel Devaux had fitted out two privateers at his own expence, and had exerted himself so vigorously, that he compelled the island to surrender. The returns of his captures were five galleys, eighteen pieces of artillery, and five or six hundred troops.

Brief View of Voyages of the principal Navigators not already mentioned.

As we have before, p. 846, given an account of the voyages of Christopher Columbus, we refer our readers to that page, and shall proceed with

SEBASTIAN CABOT'S VOYAGE TO AMERICA.

SEBASTIAN CABOT, who was born at Bristol, in 1467, was employed by Henry VII. of England, together with his brother John, to make a voyage for the discovery of a N. W. passage to India. They sailed from Bristol in the Spring of 1494, and saw Newfoundland, to which they gave the name of Prima Vista, or First Seen. Going ashore on a small island on the coast, they gave it the appellation of St. John's, from its being discovered on the day dedicated to St. John the Baptist. They then returned to England with three of the natives on board, made a report of their discoveries, and met with a gracious reception.

Sebastian Cabot set sail again on the 4th of May, 1497, and sailed as high as $67^{\circ} 30'$ N. latitude, proceeding from thence down as low as 56° , and then explored the coast of America as low as 38° . This part of the continent, he expressly says, was afterwards named Florida. His provisions beginning to fail him, he sailed back; and, touching at Newfoundland*, returned to England with a full cargo of the productions of the countries he had visited.

VOYAGE OF AMERICUS VESPUTIUS.

AMERICUS VESPUTIUS was born at Florence, in 1454, and was employed by the king of Spain to sail on a voyage of discovery. He set sail from Cadiz on the 20th of May, 1497. He arrived on the coast of Paria, and sailed along it as far as Terra Firma and the Gulf of Mexico: and, after an absence of eighteen months, he returned to Spain. Claiming to himself the honour of having discovered the continent, he gave name to the New World, which of right belonged to Columbus.

After a lapse of some months Vesputius sailed

* Newfoundland was certainly the first of the English plantations; and the spirit of enterprize, to which the discoveries of Cabot gave rise, paved the way to the naval power, the commerce, and the glory of this kingdom.

† The inhabitants of this island were small in stature, ill-

on a second voyage. He proceeded to the Antille Islands, and thence to the coasts of Guiana and Venezuella; and returned safely to Cadiz in November, 1500; bringing back with him many precious stones, and other valuable commodities, discovered in the course of this voyage. He was ungratefully treated by the Spanish court.

Emanuel, king of Portugal, afterwards took him into his service, and Vesputius set sail from Lisbon in May, 1501. In this voyage he discovered the Brazils, and explored the coast as far as Patagonia to the south. He then returned to Lisbon, after a voyage of sixteen months.

His Portuguese majesty was so elated with this success, and so grateful to its author, that he gave him the command of six ships, and sent him again to prosecute his discoveries. His intention was to find a passage by the west to the Molucca Islands, but being detained five months on the coast of America by contrary winds, and his provisions beginning to grow short, he was obliged to return to Portugal. He died at Terceira, in 1514.

**VOYAGE TO THE EAST INDIES,
BY VASQUEZ DE GAMA.**

DON VASQUEZ DE GAMA, a Portuguese nobleman, was employed by the king of Portugal to sail on a voyage for the discovery of the East Indies. He therefore sailed from Belem on the 8th of July, 1497. After encountering various storms, in which they frequently despaired of being saved, they entered a large bay on an island, to which they gave the appellation of St. Helena, from its being discovered on the day dedicated to that saint†.

From St. Helena they sailed on the 16th of November, and in two days came within sight of the Cape of Good Hope, which they doubled on the 20th. Having run seventy leagues beyond the Cape, the admiral entered a bay, to which he gave the name of Angra de San Blas. The

favoured, and black. When they spoke, they fetched their breath as it were sighing; they were clothed in the skins of wild beasts; and armed with stakes hardened in the fire, and pointed with the horns of beasts.

country

country in the vicinity of this bay appeared very fertile, and abounded with elephants and buffaloes.

On leaving this place, they were soon overtaken by a violent storm. On Christmas-day they saw land, to which they gave the name of Terra de Natal. They then proceeded to a river called De los Reyes. They prosecuted their voyage along a low flat coast, covered with large and lofty trees, as far as Cape Corientes; missing a sight of Sofala, which lay in their way. On the 24th of January they visited the country now called Cuama: to a large river on the coast, he gave the name of the River of Good Signs; because from the calico they produced for sale, he apprehended he should soon reach the treasures of the East. Prosecuting their voyage about a month longer, they discovered four islands, the inhabitants of which spoke Arabic; they informed him that their island was called Mosambique, and was subject to the king of Quiloa; and that it contained a town peopled with merchants who traded to India, and imported its valuable productions. After encountering various dangers, from the treachery of the Mohammedan natives, he arrived at Melinda, where he found some Christians, and met with a more favourable reception. On the 22nd of April he left Melinda, and instead of sailing along the coast, as he had hitherto done, resolved to trust himself to the ocean. He crossed a sea of seven hundred leagues in twenty-three days; and, on the 17th of May the coast of India opened to his view. This was the grand object of his pursuit; and the hills of Calicut were pointed out by the pilot. De Gama was soon introduced to the zamorin of Calicut, and a good understanding prevailed between them for some time, and a treaty of commerce was on the point of being agreed upon; but by the machinations of the Mohammedans the scheme was frustrated. After this he was visited by a person who said he was an Italian, and spoke the Italian language. This person being represented as a pirate, De Gama ordered him to be whipped, in order to obtain a confession of his situation and intentions. This punishment having no effect, he inhumanly ordered him to be hoisted up by a pulley, in a most indecent and execrating form. After he had been lifted up in this manner the fourth time, he confessed that he was a Polish Jew; and that Sabay, the sove-

reign of Goa, meditating an attack on the Portuguese ships, had sent him to learn their strength and mode of fighting. He then carried him to Portugal, and he afterwards rendered essential services to the Portuguese.

On the 5th of October, De Gama left the coast of India, and directed his course for Melinda, where he experienced the same friendly reception as he had done in his passage out. Nothing happened worthy of remark till the 26th of April, when they again doubled the Cape of Good Hope, that grand barrier which had hitherto been regarded as the *ne plus ultra* of navigation. De Gama at length arrived safely at Belem in Portugal, in September, 1499, after a long voyage of two years and two months, with the loss of more than half his men. On his landing, every mark of honour was paid him, every demonstration of joy attended his discoveries: he was permitted to quarter the royal arms, and had an annual pension of three thousand ducats assigned him.

DE CABRAL'S VOYAGE TO THE EAST INDIES.

PEDRO ALVAREZ DE CABRAL was shortly after employed by the king of Portugal to undertake a voyage to the East Indies, the way by sea being now discovered by De Gama. Accordingly, on the 9th of March, 1500, he set sail from Portugal with a fleet of thirteen vessels. Prosecuting his voyage, to avoid the coast of Guinea, he sailed towards the Brazils, where he staid a short time, and then sailed towards the Cape of Good Hope; but in his passage had the misfortune to be overtaken by a violent storm, by which he lost four of his vessels, and all hands on board. On the 13th of September he cast anchor near Calicut. The admiral De Cabral, on his admission to the zamorin, was seated in a chair next his majesty, which was the highest honour that could be shewn him. He then delivered his letters of credence, written in Arabic, which being read, he next communicated his message, importing, that the king of Portugal was anxious to cultivate a friendship with the zamorin, and to be permitted to settle a factory at Calicut, which should be constantly supplied with European commodities; and requested that, either by way of exchange, or for money, he might be allowed to lade his ships with spices. of this embassy appeared highly flattering to the zamorin; and he informed the admiral that his master should be welcome to whatever his city supplied. In consequence a factory was established, and the Portuguese flag, by the emperor's direction, was placed on the top of it. In consequence of the jealousy of the Arabian merchants, however, hostilities commenced, and many lives were lost. De Cabral then left Calicut, and proceeded to Cochin, a city nineteen leagues south of Calicut, where his ships were laden with dispatch. Leaving Cananore, he proceeded to cross the sea that separates India from Africa, doubled the Cape of Good Hope on the 22nd of May, and arrived at Lisbon on the 31st of July, 1501.

De Cabral, on his return to Europe, impressed the king with an idea, that without the application of force, it would be impossible to form settlements in India: the king, therefore, sent out three squadrons in March, 1502; the first of these consisted of ten ships, and was placed under the guidance of Vazquez de Gama; the second of five, under Vincent de Sodre; and the third of as many, under Stephen de Gama. The three fleets, however, were to be under the command of Vazquez de Gama, to whom the king delivered the flag with great solemnity in the cathedral at Lisbon, and conferred on him the title of Admiral of the Eastern Seas. Having been joined by the other vessels, and having reached the coast of India, he fell in with a large vessel belonging to the sultan of Egypt, which was richly laden, and had many principal Moors on board, who were going on a pilgrimage to Mecca*.

After committing many depredations on the shores of India, and destroying the town of Ca-

* This ship he attacked, and took after a vigorous resistance; and on going on board, commanded the Moors to produce their merchandize, on pain of being thrown into the sea. They pretended that all their effects were left at Calicut; but one of them having been bound hand and foot, and thrown overboard, the rest were so intimidated at this dreadful example, that they produced their property. The children were then carried into the admiral's ship, and the remainder of the plunder distributed among the soldiers. Not satisfied with this, the vessel, with all her passengers, was ordered to be set on fire. But the Moors having broken up the hatches, under which they were confined, and quenched the flames, which began to rage around them, Stephen de Gama was ordered to lay them on board. Desperate with the imminence of their danger, the passengers received him with great resolution, and even attempted to burn the other ships. Night coming on, gave a respite to the work of horror; but so inveterate was the rage of De

licent, De Gama obtained a house for the erection of a factory at Cananore; and having regulated the price of spices, according to the standard fixed on at Cochin, he left twenty-four men to superintend the trade. He then sailed for Europe, leaving De Sodre with six ships to assist the king of Cochin, in case the zamorin of Calicut made war against him. De Gama arrived at Cascais on the 1st of September, and was graciously received by king Emanuel, who conferred on him the title of Count Videgueyra. Thus we perceive, that it was by treachery, piracy, war, and cruelty, that the Portuguese first gained a settlement in India.

VOYAGE OF MAGELHAENS ROUND THE WORLD:

THE VOYAGE OF FERDINAND MAGELHAENS round the world deserves to be particularly noticed. He was a native of Portugal, born a gentleman, and bred a soldier; in which capacities he had been employed in those expeditions which succeeded De Gama's discovery, and which terminated at length in the reduction of Malacca, Goa, and Ormuz, under the dominion of Portugal. Columbus went in search of a passage he never found, and found what he little expected. The passage from the Atlantic to the Pacific Ocean was still a desideratum in navigation; and Vazquez de Nunez de Balboa having discovered the last mentioned sea from the mountains of Panama, Magelhaens conceived the idea of the circumnavigation of the globe, which at that period was not generally allowed to be round. Not meeting with sufficient encouragement at the court of Portugal, he applied to Charles the Fifth, king

Gama, that he ordered the ship to be closely watched, that none might, by the favour of the darkness, escape to the shore, and elude his vengeance. During this dreadful night, the poor Moors, with unavailing prayers, invoked the assistance of the prophet. The morning found the Admiral relentless and un pitying. His brother boarded the vessel, and setting fire to it, drove the Moors, who still made an ineffectual struggle, into the poop. Some of the sailors disdained to quit the ship till she was half consumed, and the Moors, when the flames were rapidly approaching them, leaped into the sea with hatchets, and swimming, attacked their inhuman pursuers. To finish this melancholy tale, of three hundred persons, among whom were thirty women, not one escaped the fire, the sword, or the waves. Can humanity read this without a tear! can Christianity hear it without a blush! Yet by such cruel and base transactions did the Europeans first gain their settlements on the shores of Hindostan.

of Spain, who, entering into his views of discovering the Banda and Molucca Islands by a western navigation, ordered a squadron of five ships to be fitted out, with the utmost expedition, and gave the command of it to Ferdinand Magellhaens. He set sail from Cadiz on the 10th of August, 1517, and after touching at Teneriffe, he sailed for Rio Janeiro, on the coast of Brazil. While on the coast of Brazil, he met with some chagrin from the dissatisfaction of some of his officers; but by an act of severity he allayed the mutinous disposition of the crews, and proceeded on his voyage. At length he fell in with the passage he had been so long in search of, in lat. 32° S. and entered those straits which will make his name immortal. In a transport of joy, he named the point of land, from which he had his agreeable prospect, Port Desire. Much was now accomplished, but much remained to be done. It required all his caution and skill to sail through the newly discovered passage, and before they could enter the great South Sea, which was on the 28th of December, one year, four months, and eighteen days had elapsed, since their departure from Spain. On this amazingly wide ocean they wandered between three and four months, without seeing land, except two desert islands. Here they were reduced to a state of famine, and driven to the miserable expedient of eating the hides that covered the ships' rigging. From the gentleness of the breezes, and placidness of the sea, they gave it the name of the Pacific Ocean. On the 6th of March, they fell in with the Ladrões, or Isles of Thieves. Leaving the Ladrões, they landed at Zamul, about thirty leagues distant; from which place they sailed to Humuna, a pleasant island, inhabited by a humane race of people. After sailing among several islands, the fleet arrived at Zubut on the 7th of April. Leaving Zubut, he proceeded to the isle of Mathan. From the two kings who governed this island the Spaniards demanded tribute, which was justly refused, and an open rupture ensued. Magellhaens was wounded by a poisoned arrow, and pierced in the head with a lance, which terminated his life and exploits: even his body was never recovered. After the death of Magellhaens, they held on their course towards the Moluccas, of which the admiral had received some intelligence before his catastrophe. They then proceeded to Borneo:

thence they proceeded to the Moluccas, and reached Tiridore on the 8th of November. Thus one object of the voyage was accomplished, to sail to the Moluccas by the west. At length they reached the port of St. Lucar, on the 7th of September, under the conduct of John Sebastian Cano, after circumnavigating the globe in three years and thirty-seven days. Of the whole squadron, only one ship returned to Spain, and of two hundred and thirty-four officers and seamen, the complement at setting out, only thirteen Spaniards reached their native land.

VOYAGE ROUND THE WORLD, By SIR FRANCIS DRAKE.

SIR FRANCIS DRAKE was the first English circumnavigator. Having once had a prospect of the great South Sea, he formed the project of sailing round the world, but it was not till the year 1577, that he had collected a force sufficient to man five vessels, and, by a pretended royal authority, appeared as admiral of the squadron. The fleet consisted of the Pelican, the flag ship, of one hundred tons burden; the Elizabeth, John Winter, vice-admiral; the Marygold, commanded by captain Thomas; the Swan, of fifty tons, captain John Chester; and the Christopher, of fifteen tons, which was committed to the charge of one of his carpenters. These ships, partly fitted out at his own risk, and partly at the expence of others, and manned with one hundred and sixty-four chosen seamen, sailed from Plymouth on the 15th of November, 1577. On the 5th of April, 1578, they descried the coast of Brazil, and sailing southward, he entered the Straights of Magellhaens on the 20th of August. In this intricate and dangerous navigation, they discovered an island, to which they gave the name of Elisabeth, in honour of the queen. On the 6th of September, after a passage of sixteen days, Drake entered the great South Sea, intending to hold his course towards the equinoctial line. At length, after having sailed to different parts of the Pacific Ocean, and taking a great deal of plunder, he espied the Moluccas on the 3d of November. The desires of the people were now for returning home, and he was compelled to steer for the Cape of Good Hope, which he doubled on the 15th of June, and

and entered Plymouth harbour on September 26, 1580. Drake had spent two years, ten months, and a few days, in this undertaking, and returned with immense riches. The queen paid him a visit on board his ship at Deptford, and conferred on him the honour of knighthood*.

VOYAGE ROUND THE WORLD, By THOMAS CAVENDISH.

CAPTAIN THOMAS CAVENDISH was the second English circumnavigator. Cavendish fitted out three ships, and having procured her Majesty's commission, left London on the 10th of July, 1586; he embarked at Harwich, arrived at Plymouth on the 18th, and three days after sailed on his intended voyage. Cavendish, like Drake, was a voyager of fortune; but as it is not within our plan to relate the numberless piracies committed by our early navigators, we shall content ourselves with remarking only the principal discoveries they made. He entered the great South Sea on the 24th of February, 1587, and then sailed from one part of the western coast of America to another, committing innumerable acts of piracies on the seas, and burning the towns, and plundering the inhabitants on the shore. Having coasted along Manilla, where he found it impracticable to carry on his predatory excursions, he sailed for Java, and obtained some information relative to the policy, manners, and customs of the people of that island. He left Java on the 16th of March, 1588, and sailed for the Cape of Good Hope. He made St. Helena on the 8th of April, where he took in wood and water; after which he set sail for England, and arrived at Plymouth on the 9th of September, 1588.

Not satisfied with the riches he had acquired by plunder, Cavendish meditated another voyage, in which he hoped to amass greater wealth. Accordingly he again set sail from Plymouth on the 26th of August, 1591, and held his course towards the Brazils: here he did much damage on the coast, without much benefit to himself, and then proceeded towards the Straights of Magelhaens. On attempting a passage through the Straights, they experienced all the calamities of cold and hunger; and while the passage re-

mained doubtful, all the sick were put on shore in the woods, to remove useless incumbrances, an instance of inhumanity that would have reflected disgrace on savages. The general voice of the seamen was now to return to Brazil; and Cavendish was compelled to submit to their desires. One calamity now followed another in quick succession. He lost several of his ships, and thirty of the crew of one of them going ashore, were attacked by the Portuguese and Indians, and massacred to a man. He afterwards thought of taking the town of Spirito Sauto, but found several obstacles: his men, however, landed, and went forward to attack the town in the face of an enemy well prepared for their reception. Disgrace and defeat were inevitable, and captain Morgan, with two-thirds of the party, were put to death. He then set sail again, still wishing to visit the South Seas, where he had committed so many robberies on his first voyage; but the men declared they would sail for England; whither it appears Captain Cavendish never reached.

COMMODORE ANSON'S VOYAGE ROUND THE WORLD.

Towards the close of 1739, a war with Spain appearing inevitable, the English government wisely conceived; that the most effectual step it could take to distress the enemy was to attack them in their distant settlements, and thus cut off their supplies of money, which are the principal sinews of war. Accordingly George Anson, Esq. was appointed commodore of the intended expedition, and set sail from St. Helen's on the 18th of September, 1740. The squadron under his command consisted of the Centurion, of sixty-four guns, and four hundred men, George Anson, Esq. commander and commodore; the Gloucester, of fifty guns, and three hundred men, captain Norris; the Severn fifty guns, and three hundred men, the hon. captain Legg; the Pearl, of forty guns, two hundred and fifty men, captain Mitchel; the Wager, twenty-eight guns, one hundred and sixty men, captain Kidd; and the Tryal sloop, of eight guns, and one hundred men, the hon. captain Murray. Two victuallers, one of them

* This ship was preserved many years at Deptford, as a singular curiosity; and when almost entirely decayed, a

chair was made out of its materials, and presented to the university of Oxford, where it is still to be seen.

of four hundred, and the other of two hundred tons, attended them.

He reached Madeira in thirty-seven days, where he remained about a week, taking in water, wine, and other refreshments. Sailing westward, they discovered the coast of Brazil about the middle of December, and two days after anchored off the island of St. Catharine. On the 18th of January, 1741, the expedition proceeded from the last amicable port it was intended to touch at, to encounter the danger of boisterous seas. On the 4th of March they came in sight of Cape Virgin, and on the 7th began to open the Straights, when Statenland appeared in view. It seemed entirely composed of inaccessible rocks, terminating in ragged points, rising to an amazing height, and every where enveloped in snow. Here they experienced the most dreadful tempests, which were rendered more mischievous from the manner of their approach; for, if at any time a momentary calm tempted them to spread their sails, so sudden was the return of the wind, that it tore the sails to pieces before they could be furled. To increase the calamity, great quantities of snow and sleet generally accompanied these storms, which freezing on the rigging, made the cordage brittle and insecure; at the same time that the limbs of the seamen were numbed by the intensity of the cold, and not a few had their toes and fingers mortified. After encountering a variety of violent storms, in which the fleet suffered materially, they reached Cape Noir, though they imagined they were ten degrees more westerly. The currents had deceived them so much, that they had not advanced more than half the way they reckoned. They then steered to the southward, and again had the misfortune to encounter the most dreadful storms. Three days before the discovery of land, the Severn and Pearl had separated, and were never seen afterwards; whence they concluded they must have dashed on the shore in the night. On the 24th of April, the wind again blew a perfect storm, and four other ships of the squadron separated, nor did any of them rejoin the commodore till his arrival at Juan Fernandez. In this tempest the Centurion had her sails rent to pieces, and most of her rigging broke. Their evils seemed to be

increasing till the 22d of May, when the fury of all the storms they had hitherto experienced, seemed to be united, and to have conspired for their destruction. A boisterous sea gave her such a prodigious shock, that the ballast and stores shifting, threw her on one side, and they were in dread of immediately foundering; but the wind abating, they were driven ashore on the island of Chiloe. This was the last storm they met with in this climate. At length they again saw the island of Juan Fernandez, but there were not more than ten foremast-men in a watch that were capable of doing their duty. Between seventy and eighty men fell martyrs to this protracted course at sea; and it was with the utmost difficulty a sufficient strength could be mustered to bring the ship to anchor. Three months before, the Centurion had between four and five hundred men in health and full vigour; but, by the distresses they had undergone, scarcely enough remained to man the ship*.

It was not long after the Centurion had been secured in her destined station, before they discovered the Tryal sloop, and the commodore sent some hands to assist her in coming to anchor. Her commander informed him, that he had lost thirty-four men out of his small complement, and that only himself, his lieutenant, and three men were able to stand by the sails. He now erected tents on shore for the reception of the sick, when one hundred and sixty-seven persons were landed, besides twelve or fourteen who died in the boats before they could reach the shore. For the first ten or twelve days, they seldom buried fewer than six daily. On the 26th of June they descried the Gloucester, and as there could be no doubt of her distressed situation, a boat laden with refreshments, was sent to her assistance. Never, indeed, was a crew in more forlorn circumstances. Already had they committed to the deep two-thirds of their complement, and scarcely one was capable of duty, save the officers and servants. The captain was under the necessity of detaining the boat's crew, as he had not sufficient strength to navigate the ship; yet, with all their exertions they were a fortnight in attempting to come in, without being able to fetch the road. On the 9th of July she was observed sailing to

the east, and did not again appear for a week, and it was apprehended she had foundered. On the 16th she was again seen making signals of distress, when the long boat was sent off with water and refreshments, with positive orders to return immediately; but the weather proving stormy, it was three days before they had a sight of her again, when with difficulty she was towed into harbour by the cutter. The commodore now received the affecting news that the Gloucester had scarcely a man in health on board, except the few he had sent at first sight of her, and that the mortality was extreme. The Gloucester, however, was unable to fetch the bay, and she once more disappeared. At last, on the 23d of July, she was seen advancing towards the bay with a flowing sail; when the commodore dispatching all his boats to her assistance, she was within an hour anchored by the Centurion. Her crew was by this time reduced to eighty, and the greater part of those were deplorably ill.

On the 16th of August, after giving her wholly up for lost, the Anna Pink, their victualler, was discovered coming in. Each ship's company was immediately restored to a full allowance of bread, which had been suspended, from a presumption that they had no resources of this kind to expect. Only three ships were now missing, the Severn, the Pearl, and the Wager store-ship. The Wager was wrecked.

On the 12th of September, a sail came in sight, which proved to be the Nuestra Senora del Monte Carmelo, laden with sugar, cloth, cotton, and tobacco; besides some trunks of wrought plate, and a considerable quantity of specie in dollars. This was captured by the Centurion on the first fire. On the 25th, the Centurion saw two sail to the eastward, and giving chase, came close up to one, and hailed the chase in Spanish, on which Mr. Hughes, lieutenant of the Tryal, answered in English; and informed him that this vessel was a prize to the Tryal, taken some days ago; that she was about six hundred tons burden, and had nearly the same kind of lading as the Carmelo. The Tryal sprung her main-mast, and was in other respects in great distress. The Tryal being looked upon as incapable of being repaired, her crew was put on board the Spanish prize, and the stores and valuables being like-

wise put on board her, the Tryal was scuttled and sunk. This new accession to the squadron was called the Tryal's Prize.

On the 5th of November, they captured the Santa Teresa de Jesus, a vessel of three hundred tons, bound from Guayaquil to Callao. Her cargo was not valuable to the English. On the 10th of November, the commodore being off Lobos, saw a sail, and sent Lieutenant Brett to attack her: she struck on the first volley of small shot, and proved to be the Nuestra Senora del Carmin, deeply laden with steel, iron, cedar, pepper, cinnamon, and other valuable commodities, the prime cost of which was more than four hundred thousand dollars. From the passengers they learned that a considerable quantity of money was in the custom-house at Paiza, which was to be shipped and sent off with all expedition. He therefore determined to surprise that place the same night*. He selected fifty-eight men to act against the force the Spaniards might bring to oppose them. Having landed, they marched to the governor's house and fort; and the vociferation of the sailors, the noise of the drums, and the darkness of the night, all served to make the enemy think their force much greater than it was: they therefore sought refuge in flight; and the English sailors, in less than a quarter of an hour from their first landing, were in possession of the place, with the loss of only one man killed, and two wounded. The next morning some of the treasure was sent on board the Centurion, and every exertion was made to collect and secure the whole. Many warehouses were likewise filled with rich commodities, which could not be received on board. On the fourth morning they conveyed the remainder of the treasure on board, together with several valuable effects; after which lieutenant Brett set fire to the town, and retired with his detachment on ship board. The commodore immediately prepared for sailing. At coming out of the bay he found six of the enemy's vessels at anchor, one of which being reputed a prime sailor, he resolved to take with him. The rest were scuttled and sunk. The command of the new vessel was given to Mr. Hughes, the lieutenant of the Tryal. The squadron, now augmented to six sail, weighed and stood out for sea. The wrought plate and

* Paiza was defended by an inconsiderable fort, and a garrison, which consisted of only one weak company;

and the town was not able to arm above three hundred men.

coin amounted to thirty thousand pounds sterling, besides rings, bracelets, and jewels, whose value could not be determined. The plunder that became the property of the immediate captors, was also very great; and, on the whole, this was the most important acquisition they had made. Soon after they fell in with the Gloucester, whose captain informed them, that during his absence he had taken only two prizes, one of which had about seven thousand pounds in specie on board, while the other, though no more than a launch, carried treasure to the amount of twelve thousand, in double doubloons and dollars, curiously concealed in cotton.

After this they resolved to proceed to the north, to cruise for the Manilla galleon, which was known to be at sea; which they did not doubt of being able to intercept. Two of the prizes which had been added to the squadron, proving heavy sailors, were ordered to be stripped and burned.

Commodore Anson left Quibo, where he took in wood and water, on the 9th of December, and next day took a small bark, laden with rock salt and oakum. The squadron then endeavoured to get to the northward of the harbour of Acapulco, and at ten at night, on the 28th of January, the Tryal's Prize made a signal for seeing a sail; but this proved an illusion. He likewise learned that the Manilla ship he had been in quest of, was got into harbour at Acapulco on the 18th of January, but that her departure was fixed for the 14th of March. Some time after, the Gloucester having lost her main-mast, sailed so heavily, that it was found impossible to keep her company without risking the lives of all. It was therefore determined to transfer her crew and treasure on board the Centurion, and then set the former on fire. She blew up when the commodore was about four leagues distant, and with her an immense quantity of valuable goods was lost, which could not be carried off.

At length, after encountering the most imminent dangers from storms, and various other circumstances, for many months, they discovered Cape Espiritu Santo, on the 20th of May in the following year, near which it was the commodore's intention to cruise, in expectation of meet-

ing with the Manilla ships. He cruised on this station for about six weeks, without being able to discover the object of his search; however, on the first of July, at sun-rise, a sail was descried from the mast head. The Centurion immediately stood towards her, and, to the commodore's surprise, the galleon did not change her course, but bore down upon him. At one in the afternoon they were within gun-shot of each other, when Anson, perceiving that the Spaniards had not yet finished clearing the ships for action, immediately ordered some of the chase guns to be fired, to interrupt them in their engagements. The galleon returned the fire, and on the Centurion's making some dispositions for boarding, the Spaniards, by way of bravado, did the same. They were now within pistol shot, when the engagement commenced in earnest; nor did the galleon shew the least symptom of fear. Soon after, the mats, with which she had stuffed her netting, taking fire, and blazing violently, filled the enemy with the utmost terror, and also alarmed the commodore, lest the should be consumed. The Spaniards, however, at last, tumbled both the flaming netting and mats into the sea, to escape the horrors of a general conflagration. This accident had a fatal effect on the galleon's crew, and in the mean time, the English plying them from their tops with small arms, which did amazing execution, killing or wounding most of the officers; they began to fall into confusion, and to desert their quarters; and the officers having in vain tried to rally the crew, at last submitted*.

At the very moment of exultation, the commodore was secretly informed by one of the lieutenants, that the Centurion was on fire near the powder-room; and without apparent emotion, he gave orders for preventing the dreadful catastrophe, and providentially the fire was got under without material damage.

He then proceeded to Canton in China, where he victualled his ship, and then sailed for Macao, where he sold the galleon for six thousand dollars. On the 15th of December, the Centurion got under sail, and after wooding and watering at Prince's Island, they stood for the Cape of Good Hope, where they anchored on the 11th

seven men killed, and eighty-four wounded; while the Centurion only lost two, and had a lieutenant and sixteen men wounded, all of whom recovered, except one. The property on board this prize amounted to a million and a half of dollars.

* This valuable prize was named the Nostra Senora do Cabadonga, commanded by Don Jeronimo de Montero, a Portuguese officer of skill and courage. She carried five hundred and fifty men, and thirty-six guns, mounted for action, besides patereroes. In the action she had sixty-

of March. Leaving the Cape in the beginning of April, they came in sight of St. Helena on the 19th of that month, and did not land, but continued their voyage, and cast anchor at Spithead on the 15th of June, 1744. Thus, after a series of the most extraordinary adventures, and dreadful scenes of distress, they completed the circumnavigation of the globe in three years and nine months.

The treasures taken by the Centurion were conveyed in many waggons, adorned with Spanish flags, from the sea coast to the metropolis, and safely lodged in the Tower, attended by the loud acclamations of the multitude. The commodore was loaded with honours, and the humblest sailor was enriched.

VOYAGE OF THE HONOURABLE COMMODORE JOHN BYRON ROUND THE WORLD.

His present Majesty, George the Third, having, early after his accession to the throne; shown a love for science, and a zeal for discovery, an expedition was projected for the latter purpose to the South Seas; and Captain Byron was selected as a proper person to conduct it. This gentleman was appointed to the command of the Dolphin ship of war, in quality of commodore; and the Tamar frigate, Captain Mousitt, was commissioned to attend him. Those vessels being equipped, set sail from the Downs on the 1st of June, 1764; but before they cleared the Channel the Dolphin ran aground, without, however, receiving any material damage; so that the commodore was able to prosecute his voyage by the 3d of July. He then shaped his course for Madeira, and anchored in Funchiale Bay on the 30th; which place he left on the 19th of August, and anchored in Port Praya on the 30th of the same month. He afterwards sailed to Rio Janeiro, which he quitted on the 16th of October, and a few days after, explained to the crews the nature of their voyage, and the objects in view, of which they had hitherto been ignorant*. A violent storm overtook them on the 29th, dur-

ing the fury of which they were obliged to throw four of their guns overboard. On the 11th of November they had to encounter another violent storm, which nearly overset the Dolphin, and damaged the Tamar.

After this they steered for Cape Blanco, which they came in sight of on the 17th, and in four days more entered the harbour of Port Desire. Proceeding higher up the harbour, they came to an island where they killed fifty seals, and found some of them nearly as heavy as English oxen†.

On the 20th of the same month they ran close in shore to Cape Virgin, and came to anchor. Next day they sailed again, and observing a smoke on the shore, they came to an anchorage nearly opposite to it, at the distance of two miles from the beach. Here they descried a number of men on horseback, riding to and fro, and waving a white ensign, which was construed into an invitation to land; and as he was anxious to have some intercourse with the natives, the commodore went in a boat, well armed, while the first lieutenant followed in another. When they approached the shore, they calculated that the horse and foot amounted to about five hundred; but though they did not appear to have any weapons, nor to be hostilely disposed, the commodore thought it prudent to make signs to them to withdraw a little, while the party was landing, which they readily understood and complied with. The English being mustered on the beach. Mr. Byron singly advanced, and made signs to the Indians, that one of them should do the same. Accordingly one of their chiefs came forward, who was nearly seven feet high. One of his eyes was encircled with a streak of black paint, and the other with white; the rest of his face was painted of various colours; and the skin of a beast, with the hair turned inwards, depended from his shoulders. The commodore and the Indian having made their respective compliments; which were mutually unintelligible, they walked together towards the main body of the natives, few of whom were shorter than the chief, nor were the women of inferior proportion. Mr. Byron made signs for them to be seated, which being

* As a reward and a stimulus to good behaviour, such as distinguished themselves were, by order of the lords of the admiralty, to receive double pay, and other emoluments.

† Among a variety of birds that they killed, was one that had an eagle's head, with a large comb on it, and a

white ruff like a tippet round its neck. The plumage on the back was of a glossy blackness: the legs and talons were like those of an eagle, and the expansion of the wings was twelve feet from one extremity to the other.

done, they chaunted in a most plaintive and melancholy tone. The commodore distributed some white and yellow beads among them, which they gladly accepted. He then took a piece of ribbon, and putting the end of it into the hands of the first Indian, continued it along the line, as far as it would reach. This done, he cut it between every two with a pair of scissors, and tied the portion of each round his head, which no one attempted to remove. And though the presents were insufficient to allow each a share, no one attempted to press forward, or seemed to envy the superior good fortune of his neighbour. The inoffensive Patagonians wished the commodore to go with them to their huts, but he pointed to the ship, intimating that he must return; whereupon they appeared greatly concerned; and when he took his leave, not one rose or offered to follow him.

On the 23d of December they entered the Straights of Magelhaens; and on the 25th, saw a point of land near St. George's Island, which they named Porpoise Point. Having cast anchor here, the commodore went in quest of wood and water, which they found in abundance. A fine champaign country lies over the point, the soil of which appeared to be very luxuriant. In a walk, however, of twelve miles, they found no place proper to land a boat, on account of a strong surf. On the 26th, they steered for Port Famine, and next day anchored close to the shore. Here they discovered drift wood enough to have supplied a thousand vessels. The commodore proceeded four miles up the river, when he found his course impeded by trees that had fallen across the stream. The banks of this river were clothed with the noblest trees, which were sufficient to supply masts for the whole British navy. Some of them were so large, that four men, joining hand in hand, could not grasp them.

On the 4th of January, 1765, both ships having taken in their wood and water, sailed in quest of Falkland's Islands; but the wind dying away, they were obliged to stop till the 6th. No sooner had they again set sail, than the Dolphin struck on a bank; but it being a perfect calm,

they fortunately got off with the return of the tide. On the 14th they discovered a flat island, covered with large tufts of grass: and the next day explored a most commodious harbour: soon after this they entered another harbour, to which Mr. Byron gave the name of Port Egmont*, in honour of the nobleman who then presided at the board of admiralty. The commodore took possession of the harbour and the surrounding islands, for the sovereign of Great Britain, under the appellation of Falkland's Islands. On the 27th of July they left Port Egmont, and the same day saw a remarkable head land, which they distinguished by the name of Cape Tamar; and soon after they passed a rock, which they called the Eddistone, near another point, denominated Cape Dolphin. The distance between the two capes is about eight leagues, and forms the northern entrance of the straight between the two principal islands. The commodore computed the whole circumference of Falkland's Islands to be little less than seven hundred miles.

On the 6th of February they arrived at Port Desire, at the mouth of which they anchored, where they had the pleasure to find the Florida, an expected store-ship from England. The master of the Florida going on board the Dolphin, acquainted the commodore with the bad condition of his ship, on which it was resolved to attempt unloading her in the harbour. The following night proved very tempestuous; the Tamar and Florida were both driven from their moorings, and made signals of distress. As the harbour was found inconvenient for unloading the store-ship, all hands were set about repairing her, that she might proceed to the Straights of Magelhaens. On the 13th, the Florida being prepared for sea, was ordered to make the best of her way to Port Famine, and next day the Dolphin and Tamar followed. The three succeeding days they observed a strange vessel pursuing the same track, at an equable distance; a circumstance that occasioned much speculation. Byron being obliged to lie by for the Florida, imagined the stranger would speak with him, and therefore made the necessary dispositions to give her a proper reception. But when he came to

the coasts. Indeed it is not unusual for the sailors to knock down seventy or eighty geese at a time with stones; so that they were almost surfeited with delicacies of this kind.

* This harbour is represented as one of the finest in the world, and sufficiently capacious to contain the whole navy of England in perfect security: every part of it supplies fresh water; and many choice species of wild fowl occupy

anchor, she did the same. Next morning she got under way, and approached the *Dolphin*, on which the commodore ordered some guns to be got ready. Neither party shewed any colours; but the *Florida* about this time running aground, the strange vessel hoisted French colours, and dispatched two boats to her assistance. The commodore now sent two of his boats to the relief of the store-ship, with orders to make proper acknowledgements for the stranger's civility, but on no account to suffer them to board her. The store-ship being gone off, they proceeded till night, when they again cast anchor, and the French ship did the same; but in a situation that shewed her ignorance of the channel. On the 19th they proceeded on their voyage, the French vessel following them. On the 20th they reached Port Famine, and having taken out of the *Florida* as much provision as they could stow, they immediately dispatched her for England, and determined to navigate the other ships through the Straights of Magelhaens. On the 28th they passed the French ship as she lay in a small cove; and it was not till the commodore's return to England that he found this suspicious vessel was the *Eagle*, commanded by M. Bougainville.

The commodore was seven weeks and two days in sailing through the Straights of Magelhaens, and then bore away for the island of Masasucro, but could not effect a landing by reason of the violence of the surf. They, however, found a bank where they might anchor, and as the island abounded in goats, they killed a great number, whose flesh they deemed equal to the finest venison.

On the 9th of June they discovered a low-lying island, covered with various kinds of trees, among which was the cocoa-nut. The shore was begirt with a rock of red coral. The natives having first kindled large fires, ran along the shore armed in vast multitudes. The vessels now brought to at a small inlet, opening into a salt water lake of some extent. The ships advancing to the mouth of the inlet, some hundreds of the natives, preceded by an officer, carrying a pole, with a piece of mat instead of a flag, ranged themselves up to the waist in water, making a

hideous noise; while a number of canoes were brought down from the lake. Two boats having been sent out in quest of soundings, the natives approached, and attempted to draw them on shore, though the crews made every demonstration of friendship. Several of the Indians swam towards the ships; one of them sprang into the *Tamar's* boat, and snatching up a jacket, immediately jumped into the sea; another attempted to steal a hat, but lost his prize through ignorance, pulling it downwards instead of upwards.

They then sailed westward, and soon discovered another island, distant four leagues. The Indians pursued their course in two double canoes, each carrying thirty armed men, and as the ships' boats were greatly exposed to their insults, the commodore made a signal for them to begin the attack, when the natives instantly rowed away, being pursued by the English. They then armed themselves with stones and clubs, as if determined, like brave men, to defend their country against invasion; but the boats' crews firing, killed two or three of them, one of whom did not fall till he had received three balls through his body. The boats then brought off the two canoes as trophies of their victory*.

On the 12th of June they sailed from this inhospitable island to another; and as they coasted along it, the natives in arms observed their motions. The boats being near the beach, the crew made signs that they were in want of water, on which the natives pointed farther along the shore. When they arrived at the spot, they saw a number of houses, and many Indians. As the boats were close in with the shore, and the ships at a small distance, a venerable old man, with a white beard, advanced to the beach with a young attendant. Having made a signal for the other Indians to retire, he came forward, pressing his beard to his breast with one hand, and extending the branch of a tree in the other. In this attitude he began a kind of musical oration, during which the people in the boats threw some trifling presents, which he would not deign to touch till he had finished his harangue. This being done, he threw the branch towards the boat's crew, and then picked up their presents. Most of the na-

* These vessels consisted of planks sewed together, with a strip of tortoise-shell fixed over each seam; their bottoms were sharp and narrow; and being double, they were fastened with timbers so as to leave a space of six feet be-

tween the two canoes; while a sail, formed of a mat, reached between a mast fixed in each. The cordage appeared to be composed of the external covering of the cocoa-nut, and was exquisitely made.

tives having consented to lay down their arms, one of the midshipmen swam on shore, where he was soon surrounded by the Indians, who admired his dress, and seemed particularly pleased with his waistcoat. To gratify them, he made one of them a present of it; but another untying his cravat and running away with it, he thought it prudent to retreat. The natives soon followed him in an amicable manner, bringing each a cocoa-nut, or some water in a shell. Both this and the last-mentioned island, the commodore named, out of respect to his sovereign, King George's Island.

The next day they discovered another island, which was well peopled, and appeared beautifully verdant and fertile; but a violent surf beat on every part of the coast. This they named the Prince of Wales's Island. On the 24th of June they discovered another island, which they named the Duke of York's. This island had a most alluring aspect, but appeared to be uninhabited.

On the 2d of July they discovered a low flat island, abounding with cocoa-nut and other trees, and affording a most agreeable prospect. To this place the officers gave the name of Byron's Island, in honour of the commodore*. On the 28th of July they came in sight of Saypan, Tinian, and Aguigan; and about noon on the last day of that month, anchored at Tinian, in the same station Anson had done before. Saypan is larger and more pleasant than Tinian. He left Tinian on the 30th of September, and anchored off Timooan on the 5th of November, which is inhabited by Malays. He next came to anchor in the harbour of Pulo Toupon. On the 19th he fell in with an English snow, bound from Bencoolen for Malacca and Bengal. By this time their biscuit was rotten and filled with worms, and the beef and pork were putrid. The master of the snow being apprized of this misfortune, sent the commodore two gallons of arrack, a turtle, twelve fowls, and a sheep, which it is conjectured was half his stock, and he generously refused to accept the smallest return. The same

* Above sixty canoes advanced from this island, and formed a circle round the ship, which after they had leisurely surveyed, one of the Indians jumped out of his boat, swam to the vessel, ran up its side, and having gained the deck, began laughing most violently. He then set about pilfering whatever he could lay his hands on; but was hindered from carrying on his design. Being dressed in a jacket and trowsers, he played as many antic tricks as a

day they dropped anchor in the road of Sumatra, and on the 27th reached Batavia; the inhabitants of which are a motley group of Dutch, Portuguese, Chinese, Persians, Moors, Malays, Javanese, and others. On the 10th of December he directed his course to Prince's Island, where he staid a few days, and then sailed for the Cape of Good Hope. On the 7th of March he left the Cape, and crossed the equinoctial line on the 25th. An accident happening to the rudder of the Tamar, the captain was ordered to sail for Antigua. The Dolphin now proceeded to England, and anchored in the Downs on the 9th of May, 1766; having circumnavigated the globe in about one year and ten months.

THE VOYAGE OF THE HONOURABLE CAPTAIN PHIPPS TOWARDS THE NORTH POLE.

THE Honourable Constantine Phipps, in the Race Horse, and Captain Skeffington Lutwyl, in the Carcase, set sail from Sheerness on the 3d of June, 1773, for the purpose of sailing towards the North Pole, that they might discover whether there were a possibility of reaching the North Pole, or whether the regions adjoining it were land or water. On the 15th they reached Brasse, one of the Shetland Isles, and purchased some fish from the Shetland boats at a very cheap rate. On the next day they sailed from Shetland; but were soon enveloped in a fog of pitchy darkness, during the continuance of which guns were fired and drums beat, to enable the Carcase to keep company, while the consort ship was obliged to repeat the signals, lest, in the deep gloom, they should run foul of each other. When the mist vanished, they found themselves, by observation, in sixty deg. fifty-two min. north lat. and immediately steered a N. E. course.

Being arrived in latitude sixty-five deg. nine min. north, the cold began to be very sensibly felt, and additional clothing was delivered out to the officers and men. On the 20th they pursued

monkey; and at last swam off with the habit with which he had been furnished. He devoured some biscuits with great eagerness, and upon joining his companions, others were induced, from the reception he had met with, to come on board, and shewed the same disposition to theft, by seizing on some petty prize, with which they made off by their dexterity in swimming.

their course to the eastward; they were now within the Polar Circle; at midnight they had an observation of the sun, and found they were in latitude sixty-six deg. fifty-two min. north *. On the 22d, being in the seventieth degree of north lat. the weather began to be piercing cold; and the rain fell down in torrents, and froze as it fell, and the air was thick and unpleasant. On the 24th, the commodore changed his course to the E. N. E. and amidst fogs, gales, sleet, and piercing cold, they advanced till they were in lat. seventy-four deg. seventeen min. N. On the 27th they had light airs from the southward, and felt it much warmer than the preceding day †. On the 29th, being in lat. seventy-eight, deg. N. and lon. six deg. twenty-nine min. E. they came in sight of land; when a consultation was held concerning their future course. The appearance of the land lay from E. S. E. to N. E. Falling in with the Marquis of Rockingham, Greenlandman, she presented each of the ships with some venison, which was found very well flavoured, but not burthened with fat. By this ship, which had just come from the ice, they learned, that three whalers had the day before been crushed to pieces by some floats of ice suddenly closing on them. Pursuing their course next morning, they saw Black Point, so called from its dark appearance, bearing eastward, distant seven or eight leagues. Soon after, standing to the E. they sounded, and found ground at one hundred and fifteen fathoms depth.

On the 1st of July they had light breezes and clear weather at midnight, the sun shining as bright as at noon. Early this morning they made Charles's Island. Next day they lay to and took the altitude of a mountain, which they named Mount Parnassus. It was found three thousand nine hundred and sixty feet above the level of the sea, wholly covered with snow, and at a distance resembled an antique building, crowned with a turret. Here they shot some sea-fowl, which had a very oily taste. July 3d, they doubled Cape Cold, anchored about three miles from the

land, and sent the boats ashore for water, which they found in abundance, pouring from the rocks. The 4th, by observation, the latitude was seventy-nine deg. thirty-four min. N. and the longitude eight deg. 10 min. E. The thermometer stood at forty-seven. On the 5th a dreadful crackling was heard at a distance, which proved to be the dashing and grinding of loose pieces of ice against each other; the report of which is conveyed from a great distance. Next day the island of ice began to appear; by altering their course they lost sight of it; but the next morning descried it again. On the 10th they sailed between numberless pieces of ice; and it was the opinion of every officer on board, that the discovery of a passage to the Pole, in that direction, was impracticable. Next day, the mass of ice extended as far as the eye could reach from the mast head. Early in the morning they saw land, which proved to be Cloven Cliff, in lat. seventy-nine deg. fifty-six min. N. At noon on the 13th, they found themselves in lat. eighty deg. two min. N.

On the 14th, they came to anchor in Smearingburgh harbour, where they remained several days, to take in fresh water. The country is described as awefully romantic, and full of mountains, precipices, and rocks ‡. The plants in Spitsbergen arrive at maturity in a very short space. Till the middle of May the whole country is locked up in ice; about the beginning of July, the plants are in blossom, and by the latter end of that month, or the commencement of the next, they have perfected their seed. The water-fowl are so numerous as sometimes to darken the air when they rise in flocks, and they scream so horribly, that the rocks ring with their noise. The other tenants of this country are white bears, deer, and foxes. It is seldom that the air continues clear many days together in this climate.

The ice began to set in apace, yet the weather was hot. The thermometer from fifty-six in the cabin, rose to ninety in the open air. It was still ten degrees higher on the top of a mountain to which it was carried. Having watered, and

changes from temperate to severe cold almost in an instant.

† Of the ice hills formed in this country, the Seven Icebergs attract particular notice. When the sun shines full upon them, the prospect is inconceivably brilliant, assuming all the various hues and tints that the reflection of the solar orb on their rude surfaces can convey. Their lustre is too dazzling for the eye, and the air is filled with astonishing brightness.

* Here the Race Horse sounded with a lead of one hundred weight, and a line of seven hundred and eighty fathoms, to which was appended a thermometer of lord George Cavendish's construction. They found no bottom; but it was ascertained, that the water was eleven degrees colder at that depth than on the surface.

† The vicissitudes of heat and cold are much more frequent here than in the more southerly latitudes. It often

finished

their

finished some astronomical observations, which were made on Marble Island, the ships prepared to depart: On the 19th, the commodore made the signal to weigh; and at two in the afternoon the ships were under sail. At three they tacked and steered northward, and before four were again entangled in loose ice, through which they sailed, directing their course along the main body, which lay from N. W. to S. S. E. Next day they continued their course along the ice, but could discover no opening, though they searched every creek, and left no bay or turning unexamined. On the 21st the severity of the weather increased. They now experienced the rigours of this northern climate in all its horrors, loose pieces of ice closed about them in all directions; and notwithstanding the most unremitted exertions of the crews of both the ships, they were utterly unable to extricate themselves from their icy prison. At length, by the changing of the wind, the ice began to separate with a noise like the loudest thunder. On the 12th of August

* This day they observed what the sailors call a mock sun, a phenomenon well enough known in this climate.

+ While the crew of the boat, ten in number, with their officer at their head, were examining Muffin's Island, on the 26th of July, after having rounded the shores, they observed two white bears making towards them, one upon the ice, the other in the water. The officer, who it seems was not distinguished for his courage, seeing the bears approach very fast, especially that which came in the water, ordered his men to fire, while yet the enemy was at a distance, as he did not think it prudent to hazard the lives of his little company in close fight. All of them pointed their muskets, and some of the party obeyed orders; but the greater part, judging it safer to depend upon a reserved fire, when they had seemingly discharged their pieces, pretended to retreat. The commander being very corpulent, endeavoured to waddle after his companions; but being soon out of breath, and seeing the bear that came in the water, had just reached the shore, thought of nothing now but falling the first sacrifice. His hair already stood on end, and looking behind him, he saw the bear at no great distance, with his nose in the air snuffing the scent. He had all the reason in the world to believe it was him that he scented, and he had scarcely breath enough left to call to his men to halt. In this critical situation he unfortunately dropped his gun, and in stooping to recover it he stumbled against a goose-nest, fell squashed upon his belly into it, and had well nigh smothered the dam upon her eggs. Before he could rise, the enraged gander came flying to the assistance of his half smothered consort, and making a dart at the eye of the assailant, narrowly missed his mark, but discharged his fury upon the commander's

they cleared the ice, and bore away for the harbour of Smearburgh, in which they had before cast anchor.

On the 19th of August the ships unmoored, and next day cleared the harbour, with a view to return home. On the 22d they were in lat. eighty deg. fourteen min. N. lon. five deg. forty-four min. E. Next day the Carcase lost sight of the commodore, but rejoined on the evening, and they pursued their voyage till the 11th of September, when a violent gale separated them, and they did not come in sight of each other till they arrived off Harwich. In this storm, the Carcase was in imminent danger, and the Race Horse lost her boats, and was obliged to throw all her guns overboard, save two. Both ships anchored safely at Deptford September the 30th.

Thus ended a voyage, which seems to have determined the question concerning the navigation to the North Pole, and to have proved the impracticability of finding a passage into the South Sea in that direction.

The danger being now pressing, and the battle serious, the bear rose, and the gander ready for a second attack, the men, who had not fled far, thought it high time to return to the relief of their leader. Overjoyed to see them about him, but frightened at the bear just behind him, he had forgotten the gander that was over his head, against which one of the men having levelled his piece, fired, and he fell dead at the major's feet. Animated now by the death of one enemy, he recovered his gun, and faced about to assist in the attack of the second. By this time the bear was scarcely ten yards from him, and beginning to growl the officer dropped his accoutrements, and fell back. The crew in an instant had brought down the bear, and now it was time for their leader to do something great. Having recovered his arms, and seeing the poor beast grovelling on the ground, and growling out his last, he thrust his lance full four feet deep into the dying bear's belly. The cowardice of the chief was very entertaining to his party; he took to the boat, while a few of them remained to dispatch the other bear.

Here they found four Dutch Greenlandmen lying in readiness to depart. These Dutchmen acquainted the commodore, that all the English fishing ships set sail on the 10th of July, the day to which they are obliged, by contract to stay, to entitle their owners to receive the bounty-money allowed by parliament for the encouragement of that fishery. The Dutch vessels, however, take it by turns to wait till the severity of the weather obliges them to return, in order to pick up such men as may by accident have lost their ships in the ice; and who, notwithstanding, may have had the good fortune to save their lives by means of their boats.

V

TRAVELS IN LOWER AND UPPER EGYPT, DURING
THE CAMPAIGNS OF GENERAL BONAPARTE.

BY VIVANT DENON.

M. DENON accompanied general Bonaparte in his expedition to Egypt, together with several other gentlemen, at the desire of the French government, for the purpose of making observations, and of gaining information relative to that country. They departed from Toulon on the 15th of May, 1798, and took Malta on the 13th of June. The French fleet escaped, in a fog, the English squadron under the command of admiral Nelson. They landed in Egypt, near Alexandria, on the 2d of July, which they took, and afterwards fought a battle, called the Battle of the Pyramids, on the 22d of the same month. M. Denon gives a description of the naval action at Aboukir, which happened on the 1st of August, and afterwards prosecuted his travels in the Delta; from the 11th till the 23d of September; on which day they arrived at Cairo, where an insurrection took place on the 22d of October. In November he prosecuted his researches in Upper Egypt, and on the 25th of January, 1799, made a visit to Tentyra (Dendera); on the 27th he had a view of Thebes; on the 29th he went to Latopolis, and on the 30th to Apollinopolis. On the 25th of February they visited the cataracts; and on the 3d of April, made a fresh journey to Thebes, which they again explored on the 29th of June, and made several discoveries. They quitted Upper Egypt on the 5th of July, and returned to Cairo on the 20th; on the 26th of which month they fought a battle against the Turks at Aboukir. On the 24th of August, they left Alexandria on their return to France, and arrived at Frejus on the 1st of October.

In the progress of his travels, M. Denon has favoured the world with a description of the Sphinx, which he took great pains in examining; and made a profile drawing of it, which was certainly the best point of view in which he could exhibit it. The Sphinx, which, M. Denon says, merits a particular description, stands near the pyramids, but it is rapidly falling to decay, for only the head and shoulders appear, and these are about thirty feet high. Some have imagined that it was hewn out of the rock on which it stands, and that there never was any more of it

than is at present remaining; but from the examination which M. Denon made of it, that does not appear to be the fact. He says, that the proportions are colossal, the outlines of which are rather docile than pure: the expression of the head is sweet, gracious, and tranquil, the character of an African; but the mouth, whereof the lips are at a distance, has a softness in the movement, and a fineness of execution truly admirable: from a distant view it has the appearance of being clothed with flesh, and endowed with life: and from the exquisite workmanship, it appears that the art of sculpture was in a high degree of perfection at the remote period when this monument was erected.

Speaking of Esné, the ancient Latopolis, M. Denon informs us, that it was a port or quay on the banks of the Nile, but that it is now in a most deplorable state. He says, that there is in the town the portico of a temple, which he believes to be the most perfect monument of ancient architecture. It is near the market place, in a fine situation, and would be an incomparable ornament, if the inhabitants were susceptible of its value: but, alas! it is falling fast into ruins. The portico is extremely well preserved, and is a monument of the finest sculpture: it is composed of eighteen columns, which are ornamented with hieroglyphics, that have a fine effect; among which are the principal productions of the country, such as the lotus, the palmyra, the vine, &c.

Gebel Silsilis, which is among the mountains that border the Nile on both sides of the river, is situated between Edfou and Ombos. Here are innumerable monuments, the receptacles of the dead, which are covered with hieroglyphics, representing all the oblations of bread, fruits, liquors, poultry, &c. On one of them is the figure of a woman in the attitude of sadness; she represented a widow who had survived her spouse, and who had come to the place of his interment to bewail her loss.

The temple of Hermontis, (which town is at the present day called Ermenté,) was built with extremely large and ponderous stones, as appears from the ruins which remain of this stupendous religious edifice. The representation which M. Denon has given of this temple is a side view, taken from an ancient basen, which received the waters of the Nile, at the time of an inundation, or overflowing of its banks. The sanctuary is

at present in a state of preservation, but the other parts of the building are now in ruins. The panels of the whole edifice are filled with hieroglyphics.

GROENLAND, OR GREENLAND.

THIS northern country is divided into East and West Greenland. West Greenland is supposed to be joined to the continent of America. The coast abounds with inlets, bays, and large rivers, and has innumerable islands of different dimensions about it. The principal river, called Baal, falls into the sea in the 61th degree of N. latitude, where the first Danish lodge was built in 1721, and has been navigated above 40 miles up the country. West Greenland was first peopled by Europeans in the eighth century. At that time a company of Icelanders, headed by one Erikk Rande, were by accident driven on the coast. On his return he represented the country in such a favourable light, that some families again followed him thither, where they soon became a thriving colony, and bestowed on their new habitation the name of Groenland, or Greenland, on account of its verdant appearance. A considerable commerce was carried on between Greenland and Norway, and a regular intercourse maintained between the two countries till 1406. From that time all correspondence has been cut off, and all knowledge of Greenland has been buried in oblivion. It is supposed the colony was destroyed by the natives called Schrellings.

Greenland is seldom visited by thunder and lightning, but the Aurora Borealis is very frequent and bright. At the time of new and full moon, the tide rises and falls upon the coast about three fathoms; and it is worthy of notice, that the springs and fountains on shore rise and fall with the flux and reflux of the ocean. The soil of Greenland, like all other mountainous countries, is extremely various. The hills are very barren, being frozen throughout the year; but the vallies and low grounds, especially near the sea, are rich and fertile.

The people who now inhabit the western coast of Greenland, and who, without doubt, are the descendants of the ancient Schrellings, who exterminated the first Iceland colony, bear

a near resemblance to the Samoiedea and Laplanders in their persons, complexions, and way of life. They are short, brawny, and inclined to corpulency, with broad faces, flat noses, thick lips, black hair and eyes, and a yellowish tawny complexion. They are for the most part vigorous and healthy, but remarkably short lived. They are subject to a weakness in the eyes, occasioned by the piercing winds, and the glare of the snow in the winter time. The leprosy is known among them; but is not contagious. Those that dwell in the northern parts are miserably tormented with dysenteries, rheums, and pulmonary disorders, boils, and epilepsy. In their dispositions the Greenlanders are cold, phlegmatic, indolent and slow of apprehension; but very quiet, orderly, and good-natured. They live peaceably together; and are said to have every thing in common, without strife, envying, or animosity. They are civil and hospitable, but slovenly beyond even the Hottentots themselves. All the Greenlanders hitherto known, speak the same language, though different dialects prevail in different parts of the country. They are employed all the year in fishing or hunting. At sea they pursue whales, morsees, seals, fish for eating, and sea fowl. On shore they hunt the rein deer in different parts of the country. Their canoes are rather strongly built, and they manage them with great dexterity. The country is but thinly inhabited. In winter the people dwell in huts built of stone or turf; but in summer they dwell in tents made of long poles fixed in a conical form, covered on the inside with deer skins, and on the outside with seal skins, dressed so that the rain cannot pierce them. The inhabitants clothe themselves in the skins of beasts, which serve in a great measure to counteract the rigorous effects of the climate.

THE GRECIAN ARCHIPELAGO

Consists of a great number of islands, some of which deserve a particular description. Their names are,

1. Negropont, the ancient Eubœa, a very fruitful island; where it is observed, that the tides between this island and the continent in the Euripus, are very uncommon; for from the three last days of the old moon, to the eighth day

of the new moon, they are regular; but on the ninth day they begin to be irregular, and flow twelve, thirteen, or fourteen times in twenty-four hours, and ebb as often.

2. Lemnos, or Stalimene, famed for a mineral earth called Terra Lemnia. The poets feigned that Vulcan fell from heaven into this island.

3. Tenedos is a very small island.

4. Skyros, or Scirio, has a rugged and uneven surface. Here stood the famous temple of Pallas, some ruins of which still remain.

5. Lesbos, or Mytelene, a large island, famous for being the birth place of several of the ancient sages and poets; but its inhabitants led a life of debauchery.

6. Scio, or Chios, is another large island, which is well inhabited. The women are reckoned the greatest wits, as well as beauties, in this part of the world; and are subject to no control.

7. The island of Samos is celebrated for the numerous remains of antiquity, which abound in it. The temple of Juno, who was patroness of this island, was much celebrated.

8. The isle of Patmos lies south of Samos, and is celebrated for the convent of St. John, about three miles south of Scala. The hermitage of the Apocalypse, which depends on the convent, has a very mean appearance. The chapel is about eight paces long, and five broad. On the right of it is St. John's Grotto, which has a square pillar in the middle.

9. The islands of the Cyclades are very small, and are about fifty in number.

10. Delos, the center island of the Cyclades, is not above six miles in circumference; but it was the birth place of Apollo and Diana, to whom magnificent temples were erected. The island is now destitute of inhabitants, and is only remarkable for its noble ruins.

11. The island of Paros is one of the least of the Cyclades. It was anciently famous for its extraordinary white marble and celebrated statues. The valuable monument of antiquity, called the Chronicle of Paros, which was purchased by the earl of Arundel from M. de Peiresc, in 1627, was styled the Arundelian marbles, as having been presented by that nobleman to the university of Oxford in 1667. There are still many remains of antiquity in this island; the inhabitants of which are remarkably fond of dancing, and indulge themselves frequently in that exercise. The Romeca is their favourite dance.

12. Cerigo, or Cytherea, is a mountainous rocky island, and is remarkable only for being the birth place of Venus and of Helen, who was the occasion of the famous siege of Troy.

13. Santorini, the ancient Caliste, that is, Beautiful Isle, the inhabitants of which are principally Greeks, and though subject to the Grand Signior, abuse their own magistrate. Their chief trade is in wine; and while their husbands are abroad on commercial affairs, the women cultivate the vineyards at home. The dress of the women is extremely neat and decent, and gives them an elegant appearance.

14. Rhodes is a large island, being about fifty miles long, and twenty-five broad. It abounds in good wine, fruit, and provisions of every kind but corn, which is imported from the neighbouring islands. At the mouth of the harbour of Rhodes, said to be fifty fathoms wide, stood the Colossus of brass, esteemed one of the wonders of the world. One foot was placed on one side of the harbour, and the other foot on the other, so that ships passed between its legs: the face of this figure represented the sun, to whom the image was dedicated. The height of it was seventy cubits, that is, about one hundred and thirty-five feet. It held in one hand a light-house, for the direction of mariners.

15. Candia, the ancient Crete, is about two hundred miles long, and sixty broad: it is remarkably fertile. The Turks invested Candia in 1645; but the garrison did not surrender till September, 1669, when they obtained honourable terms. The Venetians lost eighty thousand men, and the Turks one hundred and eighty thousand, during the siege.

16. Cyprus is a large island, being one hundred and fifty miles long, and seventy broad. In time of peace, its trade is very considerable, as consuls from almost every European nation reside here. It had formerly eight hundred or one thousand villages, but at present it is so thinly inhabited, that half the lands lie uncultivated.

17. The island of Nio is in the neighbourhood of Santorini, and is about thirty-five miles in circumference. It is well cultivated, and is not so steep as the generality of the other islands of the Archipelago. The wheat of this island is excellent, but oil and wood are scarce. The inhabitants,

bitants are very personable men; and the women, as well as those of Santorini, are remarkably handsome; their dress is extremely neat and showy. The ancients pretend that the Grecian poet Homer died in this island, and assert that his tomb was erected here.

18. Argentierra, or Kimoli. The French give it the name of Argentierra, from the silver mines discovered in it; but these have been long shut up, and the natives deny all knowledge of such metal being in the island, from an apprehension that the Turks might compel them to labour in the mines. It is a barren spot, destitute of all water but what can be saved in cisterns, and has but one village in it, the habitations of which are an assemblage of miserable cottages. The dress of lower class of women is inconceivably ridiculous, consisting of an enormous load of linen, which they wear till it is extremely dirty. The better sort, however, are a little more tidy, and set off their persons to the best advantage. Their under petticoat is only their short shift, embroidered with red, that leaves their legs exposed; the thickness of which is esteemed a principal article of female beauty: those ladies, however, whom nature has not bestowed this mark of handsomeness upon, endeavour to supply the deficiency by three or four pair of thick stockings. When the leg is so uniformly thick all the way as to be truly perfect according to their standard, some of the ladies add a pair of half-boots of cut velvet, frequently decorated with some small silver buttons.

19. The island of Cephalonia is about eighty miles long, forty broad, and one hundred and thirty in circumference. This island was subdued by the Thebans, under the conduct of Amphitryo, who is said to have killed Pterelas, who then reigned in the island. At this time, according to ancient story, one Cephalus, a man of

great distinction at Athens, having accidentally killed his wife Procris, in shooting at a deer, fled hither to Amphitryo, who pitying him, not only received him kindly, but made him governor of the island, which henceforth was called Cephalonia. It fell in time under the power of the Macedonians, then of the Ætolians, and was at length reduced by M. Ful. Nobilior, who, mastering the metropolis after a four months siege, sold all the citizens for slaves, and added the island to the demesnes of the Roman republic. This island is agreed on all hands to be very fertile, especially in red wines, excellent muscadine raisins and currants, and fine oil; in all which the people here carry on a very advantageous commerce. It is chiefly inhabited by Greeks. Its bishopric is subject to the metropolitan of Corfu, and united to that of Zante. The island is divided into twenty districts, and is altogether mountainous, there being scarcely a plain of any extent. It is situated between the island of St. Maura on the N. and Zante on the S. about twelve miles from the former, and twenty from the latter, and not above twenty-four from the coast of the Morea. The chief town, Cephalonia, is a small city and fortress, and is situated on a hill about six miles from Argostoli, the principal port of the island, and residence of the governors; which said port is large and well sheltered on all sides; but the anchorage is not very good. At its entrance is a large village, where the raisin merchants mostly reside. There are two other ports, one at Pescarda, another at Lucksuri, the former for small, the latter for large vessels. Another fortress is called Asso, which, with Cephalonia, are the only places of strength. The other islands are small, and, not being remarkable for any thing, do not merit a particular description.
