Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

- ☐ Coloured covers/
Couverture de couleur
- ☐ Covers damaged/
Couverture endommagée
- ☐ Covers restored and/or laminated/
Couverture restaurée et/ou pelliculée
- ☐ Cover title missing/
Le titre de couverture manque
- ☐ Coloured maps/
Cartes géographiques en couleur
- ☐ Coloured ink (i.e. other than blue or black)/
Encre de couleur (i.e. autre que bleue ou noire)
- ☐ Coloured plates and/or illustrations/
Planches et/ou illustrations en couleur
- ☐ Bound with other material/
Relié avec d'autres documents
- ☒ Tight binding may cause shadows or distortion
along interior margin/
La reliure serrée peut causer de l'ombre ou de la
distortion le long de la marge intérieure
- ☐ Blank leaves added during restoration may
appear within the text. Whenever possible, these
have been omitted from filming/
Il se peut que certaines pages blanches ajoutées
lors d'une restauration apparaissent dans le texte,
mais, lorsque cela était possible, ces pages n'ont
pas été filmées.
- ☒ Additional comments:/
Commentaires supplémentaires:

- ☐ Coloured pages/
Pages de couleur
- ☐ Pages damaged/
Pages endommagées
- ☐ Pages restored and/or laminated/
Pages restaurées et/ou pelliculées
- ☒ Pages discoloured, stained or foxed/
Pages décolorées, tachetées ou piquées
- ☐ Pages detached/
Pages détachées
- ☒ Showthrough/
Transparence
- ☒ Quality of print varies/
Qualité inégale de l'impression
- ☐ Includes supplementary material/
Comprend du matériel supplémentaire
- ☐ Only edition available/
Seule édition disponible
- ☐ Pages wholly or partially obscured by errata
slips, tissues, etc., have been refilmed to
ensure the best possible image/
Les pages totalement ou partiellement
obscurcies par un feuillet d'errata, une pelure,
etc., ont été filmées à nouveau de façon à
obtenir la meilleure image possible.

Irregular pagination: i - 482, 475 - 812, 809 - 812, 817 - 839, 839 - 839,
840 - 870 p.

This item is filmed at the reduction ratio checked below/
Ce document est filmé au taux de réduction indiqué ci-dessous.

10X	14X	18X	22X	26X	30X
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
12X	16X	20X	24X	28X	32X

The copy filmed here has been reproduced thanks to the generosity of:

University of British Columbia Library

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol \longrightarrow (meaning "CONTINUED"), or the symbol ∇ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

University of British Columbia Library

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole \longrightarrow signifie "A SUIVRE", le symbole ∇ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

The Author and Proprietor beg Leave to return their Thanks to the Public, for the very liberal Encouragement they have met with in the Sale of this Work; A New Edition of which, is now in the Press, and considerable Progress made in the Printing. Such of the Plates as have been in any Manner injured by the Number of Impressions taken off, are restored to their original Perfection, others have been newly engraved; and where any Alteration, or Emendation could be made, it has not been omitted; so that the New Edition will in every Respect be fully equal to that now completed.

VOYAGE ROUND THE WORLD

DURING

The Years 1785, 1786, 1787, and 1788,

BY LA PEROUSE.

THE publications of various circumnavigators, especially those of the immortal Cook, have excited an almost universal interest in the perusal of Voyages and Travels. The voyages of different English navigators, in extending human knowledge, claimed the admiration of the whole world. All Europe therefore held in the highest estimation Captain Cook's great talents, and the firm disposition of his mind. But in so vast a field there will be room to acquire fresh knowledge for centuries to come—coasts to survey; plants, trees, fish, and birds to describe; minerals and volcanoes to observe; nations to study, and perhaps to render more happy; since a farinaceous plant, or a new species of fruit, must be an inestimable benefit to the inhabitants of the islands in the South Sea.

These reflections suggested the project of a voyage round the world, and scientific men of every class were enrolled in the expedition. M. Dagalet, of the Academy of Sciences, and M. Monge embarked in the character of astronomers; the former on board the Boussole, and the latter on board the Astrolabe. M. de Lamanon, a member of the Academy of Turin, undertook the department of geology. The Abbé Monges superintended the progress of the different branches of physics. M. de Jaissau was selected for the botanical department. Messieurs Prevost, uncle and nephew, were engaged to paint every article belonging to natural history. M. Dufresne, a great naturalist, was added by the controller-general of the finances. And lastly, M.

Duché de Vancy was engaged to embark, in order to depict the dresses and scenery of the different countries the navigators might visit. All the learned bodies in the kingdom were, on this occasion, anxious of manifesting their zeal for the progress of the Arts and Sciences.

The mareschal De Castries, minister of the marine, who recommended La Prouse to his Majesty for the command, ordered the different ports to furnish the vessels with whatsoever might contribute to the success of the expedition. Having been empowered to appoint his own officers, he chose for the command of the Astrolabe, M. de Langle, a post captain, who had distinguished himself in the Astree, in the expedition to Hudson's Bay. Officers innumerable offering themselves to La Prouse and M. de Langle, they soon selected from among them such a number of distinguished professional talents as they required.

Having received his instructions, La Prouse sat off for Brest on the 1st of July, where he arrived on the 4th, and found the equipment of two frigates in great forwardness. By the 10th, the whole quantity of things contained in the Boussole was incredible. M. de Clouard, La Prouse's second captain, had stowed her with great zeal and ingenuity: the Astrolabe was furnished with the same articles as the Boussole. On the 11th, the frigates were in the road, and had a favourable season for their departure. M. D'Ilecor ordered them to anchor there with harbour moorings, that, when the wind should permit

permit them to sail, they might have nothing to do but to slip the cables*.

But the object of their putting in at Madeira could not be attained: the price of wine having been raised to such an excessive height, La Perouse found it almost impossible to purchase a supply, he therefore ordered every thing to be prepared for sailing on the following day, which was the 16th of August. But, before his departure, he received an additional present from Mr. Johnston, consisting of rum, preserved citron, and a barrel of dry wine, a hundred bottles of Malmsey Madeira, and an immense quantity of fruit.

After only three days' run, La Perouse anchored at Teneriffe on the 19th in the afternoon. This island, which is not embellished with a single tree, seems entirely parched up, and formed of different strata of lava, and other volcanic matter. Soon after his arrival at Teneriffe, he caused an observatory to be erected on shore; the particulars resulting from which are too minute to be specified in this place. Several observations were made relative to the latitude and longitude at Santa Cruz in Teneriffe, the position of which they think may be fixed at $18^{\circ} 36' 30''$ west longitude, and $28^{\circ} 27' 30''$ north latitude.

On the 30th of August La Perouse sailed with a fresh breeze from the north-east, having taken sixty pipes of wine on-board each ship, which came from Oratava, a small town situated on the otherside of the island. The Marquis de Branciforte, governor-general of the Canary Islands, paid the navigators the greatest attentions during his continuance in the road of Santa Cruz. The run, as far as the line, was attended by no remarkable circumstance; but a few days after La Perouse's departure from Teneriffe, he lost that clear sky which is only to be found in the temperate zone.

At sun-set on the 16th of October, La Perouse got sight of the island of Trinidad; and at ten the next morning, he was only two leagues

* This voyage, which is highly interesting in its present state, would have afforded a complete body of valuable information, had not the tragical catastrophe occurred. If any hope remains, it appears to be fallacious, and will daily become more so.

The westerly wind detained the vessels in the road till the 1st of August, on which day they sailed from Brest Road to Madeira, where they arrived on the 13th. Before they were well at anchor, Mr. Johnson, an English merchant, sent a boat laden with fruit on board La Perouse's ship.

distant from the south-east point, which bore north-west. Seeing the Portuguese flag flying in the midst of a small fort, surrounded by five or six wooden houses, his curiosity was excited, and he resolved to send a boat ashore to learn the particulars of its evacuation or cession by the English: he saw, from its appearance, that Trinidad would neither afford him the wood or water which he required. He hailed the Astrolabe, and consulted with M. De Langle on the propriety of sending a boat to enquire what supplies the island could afford them. In consequence of which M. De Langle dispatched the pinnace, commanded by lieutenant De Vaujuas, M. De La Martiniere, and Father Receveur accompanied that officer. They landed, with much difficulty and danger, at the head of the creek, between two rocks. M. De Vaujuas saw about two hundred men at this post, fifteen of whom were in uniform, and the rest in their shirts. No satisfactory information could be obtained on any subject that was agitated, the commandant thinking himself justifiable in disguising the truth in every particular. He pretended that his garrison consisted of four hundred men, and that his fort was defended by twenty guns; though not a single one mounted appeared in the neighbourhood of the establishment. The officer, was so much ashamed or afraid of exposing the miserable state of his settlement, that he would not suffer any one to leave the beach in search of plants: After many external tokens of kindness and civility, he advised M. De Vaujuas to return on board, assuring him that the island could not furnish him with any thing; that provisions were sent every six months from Rio Janeiro, and that they could not procure a sufficient quantity of wood and water for the garrison. His detachment readily assisted in putting off the pinnace.

From the report of Messieurs de Vaujuas and Boutin, it was apparent that the island of Trinidad could not furnish a sufficient supply of

After having paid his respects to the governor, La Perouse went to dine with Mr. Johnston, from whom he had received such polite and hospitable treatment. On the following day he breakfasted at the delightful country-seat of Mr. Murray, the English consul. His eyes could only be drawn off from gazing at this enchanting villa, by the captivating charms of the consul's three nieces, who came to prove to him that nothing was wanting to add perfection to that enchanting abode.

wood and water. La Perouse therefore determined to steer immediately for the island of St. Catherine, on the coast of Brazil; where Fre-

zier, and Admiral Anson found ample means of gratifying all their wants*.

SECTION II.

Description of the Island of St. Catherine, &c. Departure from—Arrival at Concepcion.

THIS island is extremely fertile, producing all sorts of fruit, vegetables, and corn, almost spontaneously. It is covered with trees of everlasting green, but they are so curiously interwoven with plants and briars, that it is impossible to pass through the forests without opening a path with a hatchet: to add to the difficulty, danger is also to be apprehended from snakes whose bite is mortal. The habitations are bordering on the sea. The woods are delightfully fragrant, occasioned by the orange trees and other odoriferous plants and shrubs which form a part of them. But amidst all these advantages, the country is extremely poor, and totally destitute of manufactured commodities: the peasants are ragged, and almost naked. The soil, which is well calculated for the cultivation of sugar, remains untilld; as they are too poor to purchase slaves for that necessary purpose. The whale-fishery is indeed successful, but it belongs to the crown, and is farmed by a company at Lisbon, which has three large establishments on the coast. They kill about four hundred whales annually, the produce of which is sent to Lisbon by the way of Rio Janeiro. The inhabitants derive no advantage from this fishery, as the government does not grant them such franchises and immunities as to invite commerce to their shores; one of the finest countries in the universe will perhaps remain miserable, and useless to the mother country.

The arrival of the two frigates here spread

* On the 25th of October our navigators were overtaken by a most violent storm: at eight in the evening they were literally in the centre of a circle of fire: the lightning flashed from every point. The flame called *Corposanto*, otherwise named Jack with a lantern, settled upon the point of the conductor. The Astrolabe had also a *Corposanto* at her mast-head. From that day the weather continued bad till the arrival of the frigates at the Island of Saint Catherine. On the 6th of November La Perouse anchored between Saint Catherine's and the Main, in seven fathoms water.

great terror through the neighbourhood. The different forts fired several alarm guns, which induced La Perouse to anchor earlier than he intended, and to send an officer on shore to state his pacific intentions. M. de Pierrevert, who was employed on this business, found the little garrison of the citadel, all under arms. It consisted of forty men, commanded by a captain; who sent off an express to the governor Don Francisco di Baros, brigadier of infantry. This circumstance, confirmed by the Lisbon Gazette, produced immediate and positive orders that the ships and their crews should be furnished with whatever they required, at the lowest price; and an officer was appointed to attend on each of the frigates.

On the 9th of November La Perouse hauled in towards the fortress: and on the same day he went ashore with M. de Langle, and several officers, to pay his respects to the commandant, who saluted him with fifteen guns. An equal number was returned by La Perouse's ship. The next day he dispatched his Lieutenant Boutin, accompanied by several respectable gentlemen engaged in the Voyage of Discovery, to the town of Nostra-Senora del Destero, to return thanks to the governor, for the abundance, which, owing to his care and attention, they enjoyed. The boats of the Boussole and Astrolabe came back the following day at eleven o'clock, and announced a speedy visit from Don Antonio Di Gama, major-general of the colony. He did

After a navigation of ninety-six days, not a person was sick on board. Neither rain, nor fogs, nor the change of climate had impaired the health of our crews. Provisions of an excellent quality had indeed been provided, and every precaution taken that prudence could suggest. To keep up the spirits of the ships' companies, dancing from eight to ten was enjoined them every evening, when the weather permitted.

not come, however, till the 13th, when he brought La Perouse an obliging letter from his commanding officer.

The inhabitants of the island of St. Catherine are mild, gentle, obliging, and hospitable: but they are superstitious, and so prone to jealousy, that their wives are never permitted to appear in public. The officers killed several birds in this island, of the most beautifully variegated plumage; and among others a fine *rollier*, a species not described by Buffon, though very common in this country.

La Perouse purchased at St. Catherine's a sufficient quantity of oxen, hogs, and poultry, to feed the ship's company at sea for a month. His gardener was also provided with kernels of oranges and lemons; and with the seeds of the cotton shrub, and Indian corn: as well as with all the vegetables which the inhabitants of the islands of the South Sea are known to be in want of. On the day of departure, La Perouse gave the Astrolabe new signals, on a more extensive scale than those which had before been adopted. They were destined to navigate in the midst of fogs, and in tempestuous seas; circumstances which required additional precautions. It was also agreed between the two respective commanders, that, in case of separation, their first rendezvous should be the harbour of Good Success, in Lemaire's Straits, if they should not have passed its latitude on the 1st of January; and the second, Point Venus, in the Island of Otaheite. It was also agreed that his researches in the Atlantic Ocean should be confined to *Isle Grande de la Roche*, not having sufficient time to seek a passage to the southward of Sandwich Land.

The weather continued fine till the 28th of November, when a violent gale of wind rose from the eastward. After variety of calculations, and a fruitless search of forty days, during which time five gales of wind were experienced, the

* La Perouse had preferred the island of Saint Catherine to Rio Janeiro, to avoid the fogs observed in large cities, which occasion much loss of time; and experience taught him that it combined many other advantages. Provisions of all kinds were abundant: a large ox cost only eight dollars; a hog, weighing one hundred and fifty pounds, half that sum; two turkeys were purchased for a dollar; five hundred oranges were sold for less than half a dollar; and vegetables were extremely reasonable. To procure fish, it was only necessary to cast the net, and almost instantly to haul it up full of the aquatic tribe.

† During his run through the Straits of Lemaire, at half

idea of the existence of *Isle Grande de la Roche* was abandoned. La Perouse expressly said, "I am fully persuaded that *Isle Grande*, like Pepy's Island, is the creation of fancy: the account of La Roche, who pretends to have seen lofty trees upon it, being entirely destitute of foundation."

On the 14th of January the navigators struck ground on the coast of Patagonia; and on the 21st they got sight of the north point of Gallegos river on that coast. On the 22d at noon they set the Cape of the Virgins, bearing west, four leagues distant.

On the 25th, at two o'clock, La Perouse took bearings a league to the southward of Cape San Diego, forming the west point of the Straits of Lemaire. At three he entered the Straits, and saw some breakers which extended about a mile: he also perceived others much further in the offing, which induced him to steer to the south-east to avoid them. He soon discovered they were produced by the currents, and that the reefs of Cape San Diego were not far off. Blowing a fresh breeze from the north, he ventured to approach Tierra del Fuego, and ranged along it within half a league of the land. After some deliberation, as the wind was fair, he abandoned the idea of putting in at the harbour of Good Success, and resolved to stand on, without losing a moment, to double Cape Horn. He considered that if he steered for the island of Juan Fernandez, he was certain of procuring wood and water, with refreshments far superior to the Penguins of the Straits†.

On the 9th of February he was abreast of the Straits of Magellan, and steering for Juan Fernandez. He had passed over the pretended land of Drake, without bestowing much time in the search of it, being convinced that it did not exist. Examining the quantity of provisions he had on board, La Perouse discovered that he a league distance from Tierra del Fuego, he was surrounded by whales; as they had never been molested, they were not in the least alarmed at the ships, but swam majestically and securely within pistol-shot of them. They will probably remain sovereigns of these seas till the fishermen commence hostilities against them as at Greenland or Spitzbergen. An additional motive for giving up the idea of touching at the Bay of Good Success, was, that the author had long been projecting a new plan for his voyage, concerning which he could not absolutely decide, till after having doubled Cape Horn.

had

CONCEPTION BAY.

With the Governors of the Colony.

W. H. P.

Drawn

had very little flour and bread left in store; having been obliged, as well as M. de Langle, to leave a hundred barrels at Brest. The worms had also taken possession of the biscuits, and consumed or rendered useless a fifth part of them. Under these circumstances, La Perouse preferred Conception to the island of Juan Fernandez. Knowing that this part of Chili abounded in corn; that it was remarkable cheap there; and that he should find every other article of food, in abundance, and on reasonable terms, he resolved to alter his course a little to the westward.

The Bay of Conception is about three leagues wide, from east to west, and the same depth

from north to south. Bottom is found upon the coast from the island of Santa Maria to the entrance of the Bay. Endeavours were made with glasses to find the city of Conception, which, according to Frezier's plan, should have been at the bottom of the Bay; but nothing could be discovered. In the evening some pilots came on board, who said the city had been destroyed by an earthquake in 1751. Continuing to ply to windward, at nine in the evening the frigates anchored in nine fathoms water, at about a league from the anchorage of Talcahuana. It is remarkable that the two ships, after having doubled Cape Horn, arrived at Chili without having a single man indisposed in either of them.

SECTION III.

Description of Conception, its Inhabitants, &c.—Manners and Customs of the Inhabitants—Arrival at Easter Island.

THE Bay of Conception is a most excellent harbour: the water is smooth, and almost without any current, though the tide rises six feet three inches. The bay is sheltered from every point but the north, which, in these climates, blows only from the end of May to October, which is also the rainy season. The weather is constantly wet while that Monsoon continues.

The new city of Conception, after the destruction of the old one by an earthquake in 1751, was not resolved on till 1763: the bishopric, the cathedral, and the religious houses, were all transferred to the new town, which is of considerable extent; the habitations being only one story high, the better to resist the earthquakes which happen annually. The new town, which contains about ten thousand inhabitants, is the residence of the bishop, and of the major-general, who governs in the military department*.

But notwithstanding all these advantages, this

colony makes but little progress in prosperity or population: the influence of the government counteracts that of the climate. The productions of this kingdom, under proper management, would suffice for the food and manufactures of half Europe, and yet the country is destitute of commerce. A few small vessels indeed arrive here yearly from Lima, with tobacco, sugar, and some articles of European manufacture, which the wretched natives can only purchase at second or third hand; heavy duties having been imposed upon their first at Cadiz, then at Lima, and afterwards on their entering Chili. They can only give in exchange wheat, which is of little value, hides, tallow, and a few planks; so that the balance of trade is always against Chili. It seems evident that if Spain does not change its system, Chili will never reach that pitch of popularity which might be expected from its climate, soil, and situation†.

The women wear a kind of plaited petticoat, formed

* There cannot be a more fertile soil than that of this part of Chili. Corn produces sixty for one; the vineyards are wonderfully productive, and the plains are covered with flocks, which multiply beyond imagination. A fat ox may be purchased here for eight dollars, and a sheep for three quarters of a dollar. A great number of oxen are annually

§ The gold annually collected in the bishopric of Conception, is estimated at about two hundred thousand dollars.

VOL. II. NO. LXIV.

killed, of which the hides and tallow only are preserved, and sent to Lima. This island is also remarkable for the longevity of its inhabitants: many of the natives of conception have completed a century.

† This country produces a small quantity of gold: § most of the rivers being auriferous, an inhabitant can earn about

There are single plantations in St. Domingo which produce us large a quantity.

formed of antique gold and silver stuffs. These petticoats, however, are never summoned upon duty but on gala days, and may be entailed in a family; descending, in regular gradation, from the grandmother to the grand-daughter. A small number of females, however, are thus gorgeously habited, the majority have barely sufficient to conceal their nakedness.

Sloth and superstition, have peopled this country with nuns and monks; the latter of whom are the greatest profligates in America. The common people of Conception have a great propensity to thieving; and the women are far from being difficult of access. They are, in general, a mongrel race; but the true-bred Spaniards are polite and obliging in the extreme.

La Prouse was hardly at anchor abreast of Talcaguana, when a letter was brought him from M. Quexada, commandant *pro tempore*, informing him that he and his suite should be received like fellow-countrymen. This letter was accompanied by a large quantity of refreshments, which poured in from every quarter. Obligated to attend to the refitting of the ship, and some other pressing emergencies, La Prouse could not go immediately to the governor to thank him for his flattering epistle, yet resolved to take the earliest opportunity of acquitting himself of that duty; but the governor was too expeditious, and came on board the *Boussole*, attended by the principal officers of his colony. The following day La Prouse returned the visit, accompanied by M. de Langle, and many of the principal officers. They were preceded by a detachment of dragoons. M. Quexada, M. Sabatero, commandant of the artillery, and the town-major, went to meet them at a league's distance from Conception; and they all entered the house of M. Sabatero, where an elegant dinner was provided for them; and at night a splendid ball was given, to which the principal ladies of the place were invited.

half a dollar a-day by washing the earth; but, provisions being abundant, he has few incitements to labour. Unacquainted with luxury and arts, he has no energy to oppose to sloth. The ground lies waste and uncultivated; a few hours devoted to the washing of the sand of their rivers, exempts them from the necessity of learning any trade or employment, where industry or ingenuity is required.

* It is well known that they sometimes bleed their horses and oxen, and drink the luscious beverage.

† As La Prouse conceived himself under obligations to

The dress of these ladies had a very singular appearance: a plaited petticoat, exposing half the leg, tied below the waist; stockings, striped with white, red, and blue; and short shoes so constructed as to give the foot the appearance of being circular, are the peculiarities of the ball-dress of the ladies of Chili. They wear no powder in their hair, which is divided in braids, extending down their backs. Their corset is usually composed of gold or silver stuff, and covered with two short cloaks of muslin and wool, of various colours. When in the streets, and the weather is cold, they cover the head with their woollen cloaks: when sitting in a room they generally place them on their knees. With the muslin cloak, the ladies of Conception display infinite grace by the judicious shifting of that article of apparel. They are beautiful, and in some degree fascinating: foreign navigators are no where received with so much kindness and civility as in the city of Conception. The ball concluded about midnight.

The Indians of Chili are converted, by the increase of horses, oxen, and sheep, into a nation of Arabs, resembling those that inhabit the deserts of Arabia. Continually on horseback, they regard an excursion of two hundred leagues as a moderate journey. In their peregrinations they are accompanied with their flocks and herds, and are supported by their flesh and milk, and often by their blood*. Of the skins of these animals they form their bucklers, curiasses, and helmets. The introduction of two domestic animals, has greatly influenced the manners of the tribes from St. Jago to the Straits of Magellan: their old customs, dress, and manners, are laid aside, and they now resemble the Tartars, more than their ancestors who existed two centuries ago†.

But in the midst of these diversions and amusements, the principal object was not to be forgotten. On the day of his arrival La Prouse had

all the inhabitants, his gratitude induced him to give a general entertainment before his departure, and to invite all the ladies of Conception. A large tent was pitched near the sea, and a dinner provided for one hundred and fifty persons who should condescend to partake of it. After the repast, a dance ensued; which was followed by a brilliant display of fire-works, and a balloon. On the following day the crews of both the frigates were liberally entertained in the same tent. La Prouse and M. de Langle were at the head, and each officer, down to the lowest sailor,

had signified that he should sail on the 15th of March, and that if the vessels should be ready before that time, every man should be permitted to go and amuse himself on shore. Though he apprehended this promise would create dispatch, he feared the consequences might be pernicious: he knew that wine was very common at Chili, and he also knew that every house in Talcahuana was a tavern: he knew also that the lower classes of the women were as compliant as the ladies at Otaheite. No disaster, however, succeeded their voluptuous revels.

At day-break on the 15th, La Perouse made the signal to prepare to sail; but the wind had settled at north. On the 17th, about noon, a light breeze sprung up, with which he got under way. It was so very faint that it only carried him two leagues out of the bay, where he remained becalmed in a heavy swell. Whales surrounded him during the night, and came so close to the vessels that they threw water on board from their spiracles. On the 8th of April,

about noon, La Perouse saw Easter Island, which bore west 5° south, distant twelve leagues. During the night he ranged along the coast of that island, at three leagues distance. At day-break he steered for Cook's Bay, which is well sheltered from easterly winds. At eleven he was only a league from the anchorage. The *Astrolabe* let go her anchor, and the *Boussole* did the same; but a sudden shelving of the bottom permitted neither of them to hold. They were therefore obliged to heave them up, and make two boards to regain the anchorage. The ardour of the Indians was not restrained by this accident. They swam after the ships and came on board smiling, supposing themselves in perfect security. They were not in the least apprehensive of being carried away from their native land, though they were naked and unarmed; a bundle of grass girt round their loins with packthread, to preserve decorum, constituted the whole of their clothing.

SECTION IV.

Easter Island—Occurrences in that Island—Manners and Customs of the Inhabitants.

EARLY in the morning every preparation was made for landing. This part of Easter Island rises about twenty feet from the sea. La Perouse expected to find many friends on shore, having loaded with presents all those who had come from thence the preceding night; but from the knowledge he had acquired of other navigators, he thought it might be necessary to prevent their usual depredations, by operating

upon their fears. He therefore ordered the landing to be conducted with some military parade. It was accordingly effected with four boats and twelve armed soldiers. M. De Langle and himself were followed by all the passengers, and such officers whose presence was not absolutely necessary on board the two frigates, amounting in the whole to about seventy persons*.

The Indians, as before observed, were unarmed,

sailor, was seated according to his rank on board. Wooden bowls were substituted for plates and dishes.

The major-general then gave a *fete*, to which all the officers and respectable inhabitants were invited.

* About five hundred Indians, all unarmed, waited to receive the navigators on shore: a few of them were clothed in white or yellow, and the rest were naked: the faces of some of them were painted red; and not a few of them were tattooed. With countenances expressive of joy, they advanced to tender their hands to facilitate their landing. That business being accomplished, an inclosure was formed with armed soldiers, ranged in a circle, leaving a space void, in which a tent was afterwards pitched. La Perouse then ordered the different animals to be brought on shore, as well as the several articles he intended to bestow as presents. He

had strictly enjoined his people not to fire at the Indians, but to endeavour by mild and civil treatment, to prevent rapacity and outrage; but this clemency soon increased the number of these troublesome islanders to about eight hundred, among whom there were one hundred and fifty women. The features of these females were alluring, and their favours were to be purchased by a moderate present.

While the attention of the men was attracted by these seducers, they were plundered of their hats and handkerchiefs. The whole groupe were evidently accomplices in the robbery, for as soon as they had accomplished their views, they all fled at the same instant. Finding, however, that the French visitants did not make use of fire-arms, they instantly returned, renewed their caresses, and eagerly sought

armed, except a few of them who had a kind of slight wooden club. Some of them assumed an apparent superiority over the others, which induced La Perouse to consider the former as chiefs, and therefore distributed some medals among them, hanging them round their necks by a chain; but he soon discovered that these selected persons were the most notorious offenders; and, though they pretended to pursue others who had been accused of larcenies, it was easily perceived that they never intended to overtake them.

Having but a few hours to remain upon the island, and wishing to employ his time to the best advantage, La Perouse left the care of the tent, and other particulars, to his first lieutenant M. D'Escures. A division was then made of the persons engaged in the adventure: one part, under the command of M. De Langle, was to penetrate into the interior of the island to encourage and promote vegetation, by disseminating seeds, &c. in a proper soil; and the other division undertook to visit the monuments, plantations, and habitations, within the compass of a league of the establishment. The largest of the rude busts upon one of the terraces, is fourteen feet six inches in height, and the breadth and other particulars appeared to be proportionate.

With respect to the population of this country, some difficulties seem to arise. Out of twelve hundred persons who collected to greet the arrival of the navigators in the Bay, not more than three hundred women appeared. Perhaps many of them, either from delicacy, or a due attention to their children and domestic affairs, had remained in their humble mansions.

The monuments which now exist, appear to be very ancient: they are situated in *Morais*, (or burying places) as generally supposed, a large quantity of bones being always to be found near them. The form of their present government has so far equalized their conditions, that they have no idea of erecting a colossal statue to perpetuate the memory of any particular chief.

sought for opportunities to commit new depredations. After due inspection of the tricks and fallacies put in practice to rob the enamoured Frenchmen, La Perouse ordered them, to prevent dangerous consequences, to restore to the soldiers and sailors the articles that they had been pilfering.

* The busts of colossal size, which have already been

Those pompous images are now superseded by small pyramidal heaps of stones, the uppermost of which is white-washed. These species of mausoleums are usually erected on the sea-shore. A native signified that one of these stones covered a tomb, by falling prostrate on the ground; and afterwards, elevating his hands towards the sky, wished to convey an idea that they believed in a future state*.

A small part of this island is under cultivation. It is, however, generally agreed, that three days' labour of an Indian will procure him subsistence for a year. From the ease with which the necessaries of life are procured, La Perouse supposed the productions of the earth were in common. He was convinced, indeed, that the houses were common, at least to a whole village or district. One of these habitations near his tent was three hundred and ten feet in length, ten feet in breadth, and ten feet in height towards the middle. The whole erection is capable of containing two hundred people. It forms a kind of hamlet of itself, but is totally unfurnished. Two or three small houses appear at a little distance from it. La Perouse does not pretend to decide whether the women are common to a whole district, and the children to the republic; but he asserts that no Indian seemed to exercise the authority of a husband over any one of the females. If they are private property, it is a kind of which the possessors are very liberal.

Some of the houses are subterraneous; others are built with reeds, which are methodically arranged, and form a sufficient defence from the rain. The building is supported by pillars of compact lava, resembling stone. It seems clear, as Captain Cook observes, that there is a strong affinity between this people, and those of the other islands of the South Sea: they have the same language and features, and their cloth is fabricated of the bark of the mulberry tree.

Perhaps these islanders formerly enjoyed the same productions as those of the Society Islands. The fruit trees must have perished with drought,

noticed, demonstrate that small progress has been made here in sculpture. They are formed, by a Volcanic production, known by the name of *Lapillo*; so soft a stone that Captain Cook's officers supposed it to have been composed of a kind of mortar hardened in the air.

as well as the dogs and hogs, water* being essential to their existence; but man can reconcile himself to any thing: in Hudson's Straits he can make the oil of the whale his beverage, and drink the sea-water like the Albatrosses at Cape Horn.

Returning about noon to the tent, with the intention of going on board, in order to permit the next in command to come on shore, La Perouse found almost every man without either hat or handkerchief; so much had forbearance encouraged the audacity of the thieves, that he also experienced a similar depredation. An Indian, who had assisted him in descending from a terrace, rewarded himself for his trouble by taking away his hat. La Perouse, however, did not order him to be pursued, that he might be punished for his transgression: but at the hour of two he returned on board, and M. de Elouard, his next in command, appeared on shore.

Two officers of the *Astrolabe* arrived soon after to inform La Perouse that the Indians had been perpetrating new outrages, from which serious consequences might ensue. Some of them had dived under water, cut the small cable of the *Astrolabe's* boat, and taken away her grapple. The discovery was not made till the plunderers had proceeded a considerable way into the interior of the island, when two officers and some soldiers went immediately in pursuit of them, but they were saluted by a shower of stones. A musket, loaded only with powder, and fired in the air, created no intimidation among them. It was therefore thought necessary to fire another piece charged with small shot; some grains of which perhaps annoyed the Indians, for the stoning instantly ceased, and

* In times very remote the inhabitants were so imprudent as to prohibit the salutary shade, by cutting down all the trees, and thus exposing their country to the rays of the sun, and rendering it destitute of streams and springs: they knew not that in small islands encompassed by an immense ocean, the coolness of land covered with trees can alone stop and condense the clouds, and attract to the mountains abundant rain to furnish springs and rivulets on all sides. Islands deprived of this advantage experience a most dreadful drought, which, by gradually destroying the shrubs and plants, renders them almost uninhabitable.

† These people cannot have the same idea of theft which civilized nations have, for they hardly appear to be ashamed of such practices. They were, however, convinced that they had committed an improper or unjustifiable action, or

the officers were enabled to restore peace to their tent, but it was found impossible to take the robbers. They quickly returned, appeared among the multitude as usual, recommenced the offers of their women, and were as friendly as they had been when they first presented themselves. About six in the evening, every thing was re-embarked, the boats had returned on board, and a signal had been made to prepare for sailing. M. De Langle gave La Perouse an account of his tour into the interior part. He also furnished another striking trait of the portrait of these islanders, in the following anecdote. A sort of chief, to whom M. De Langle made a present of a male and female goat, received the animals with one hand, and robbed him of his handkerchief with the other †.

They endeavoured to allure the Frenchmen by forcing young girls of thirteen or fourteen years of age to come for the purposes of violation, for which they claimed a stipulated reward. La Perouse declares that "not a single Frenchman made use of the barbarous right that was given him; and if there were some moments dedicated to nature, the desire and consent were mutual, and the women made the first advances."

The arts of the Society Isles were exercised in this country, though in an inferior degree, for want of raw materials. Their coast appeared not to abound in fish, and the inhabitants feed principally on vegetables. Their chief sustenance is derived from potatoes, bananas, yams, sugar canes, and a small fruit resembling grapes, growing on the rocks on the sea-shore. A few fowls are sometimes seen upon the island, but they are not sufficiently abundant to be reckoned among the articles of provision.

The natives cultivate the fields with care and why should they have fled to avoid punishment, which they feared, and perhaps thought they merited. Had the navigators continued long in the island, they would certainly have inflicted such chastisements on these depredators as were commensurate to their crimes, as lenity in the extreme might have been productive of disagreeable consequences. The most consummate rogues of Europe are not greater hypocrites than these islanders; all their caresses and civilities are feigned; their countenances never express a single sentiment of truth. It was necessary to be most distrustful of that Indian to whom we have been kind and liberal, and who appeared to be so much under the influence of gratitude as to be eager to return for it a thousand little services.

SECTION V.

Observations of M. De Langle, on the Manners, Customs, &c. of the Inhabitants of Easter Island—Cultivation of the Soil, &c.—Departure from Easter Island—Arrival at Sandwich Island, &c.—Departure—APRIL, MAY, JUNE, 1786.

M. DE LANGLE, accompanied by Messrs. Dagelet, and several others, went about two leagues from the shore to the westward, and, proceeding from house to house, visited many plantations of yams and potatoes. The soil of these premises was judged proper for the propagation of their seeds, and the gardener who attended them, sowed carrots, cabbages, beets, maize, and pumpkins; signifying to the Islanders, as well as they were able, that they would germinate and produce roots and fruits for their support. They perfectly understood the benevolent intention of their visitors, and pointed out the particular spots where they were desirous of seeing these new productions.

M. de Langle met with no small shrubs, except the paper mulberry tree, and the mimosa. After proceeding about two leagues to the east, he returned southward towards the shore, and perceived, by the assistance of telescopes, a great number of monuments, many of which were overthrown, and in a perishable state. One of the largest measured sixteen feet ten inches in height, consisting of a light porous lava; its breadth over the shoulders was six feet seven inches, and its thickness at the base two feet seven inches.

Perceiving a small village, M. de Langle directed his course towards it: one of the houses it contained was constructed in the form of a

* The navigators could not quit the island without some oblique censures on the conduct of its inhabitants. "We landed among them," said they, "merely with a view of rendering them service; we loaded them with presents; we caressed their children; we disseminated useful seeds to enrich their country; and gave them sheep, hogs, and goats, that they might replenish the land. We demanded nothing in return.—But how were we rewarded for our generosity? They threw stones at us, and robbed us of every thing that

canoe reversed, and measured three hundred feet in length: the ruins of several other habitations were visible. The monuments and terraces here were numerous; and on some of the stones, of which those terraces were composed, rude sculptures of skeletons were exhibited. Holes were observable, which were stopped up with similar substances, whence it was supposed that they might now form a communication with the caverns containing the bodies of the dead. An Indian, by very expressive signs, signified that they were first deposited there, and afterwards ascended to Heaven. Several pyramids of stones were ranged upon the sea-shore, and in the vicinity of these pyramids some human bones were scattered. In the morning seven different terraces were visited, upon which many statues were seen, some upright, and others defaced and injured by time. A mannikin of reed, representing a human figure ten feet in height presented itself: from its neck hung a net, resembling a basket, covered with white stuff, which seemed to be filled with grass. By the side of this bag the figure of a child was represented, about two feet in length. This mannikin which, from its appearance, could not have existed many years, was perhaps a model of some statue intended to be erected to the memory of some chief†.

Though these islanders were hospitable, and frequently

could be taken away." Under other circumstances it would perhaps have been imprudent to shew them so much lenity; but as La Perouse had resolved to go in the evening, he hoped they would attribute his sudden departure to a disapprobation of their proceedings, and be induced to act with more integrity on future occasions.

† At the south end of the island was seen the crater of an old volcano, the size, depth, and regularity of which excited our surprise. Grass having sprung up on the sides,

the volcano has been extinct for several ages.

quently gave the party potatoes and sugar-canes, they never lost an opportunity of robbing them, when they could do it safely. Hardly a tenth part of the soil is cultivated, and the lands which are cleared are without any kind of enclosure: the remainder is covered with a coarse grass, even to the summit of the mountains. It being the rainy season when the party were there, the earth appeared to be moistened about a foot deep. Some holes on the hills contained fresh water, but they no where saw the least appearance of any kind of stream, nor did they observe among the people any kind of instrument for the cultivation of their grounds*.

The navigators took their departure from Cook's Bay, on Easter Island, the 10th in the evening. They lost sight of it the following day about two o'clock, being then about twenty leagues off. The weather was remarkably clear till the 17th, and then shifted to the north-east; when the crew began to catch bonetas, which attended the frigates to the Sandwich Islands, and furnished provisions for the ships' companies for about six weeks. This salutary food preserved all of them in good health. Not a sick person was to be found on board either of the two frigates. They traversed unknown seas; their course being nearly parallel to that of Captain Cook in 1777, when he sailed for the north-west coast of America; but they were about eight hundred leagues more to the eastward. La Perouse flattered himself, that in a distance of about two thousand leagues, he should make some discovery; to facilitate which, sailors were perpetually at the mast-head, and a pe-

swamps appearing at the bottom, and the fertility of the adjacent lands, sufficiently demonstrate that the subterraneous fires have been long extinct. Night obliging the party to return towards the ships, they saw near a house a considerable number of children, who fled at their approach. Perhaps this habitation was the abode of all the youth of the district; as they could not possibly all belong to two women who appeared to have the care of them: the little difference in their ages seemed farther to countenance this observation. On their return to the tents, they presented to three of the natives the three different species of animals which they had destined for them.

* The most probable conjectures respecting the government of these people are, that they compose a single nation, which is divided into as many districts as there are morais; the villages being erected near those places of interment. The products of the earth seem to belong to all the respective inhabitants of the district. As the men, without any regard to delicacy, offer their women indiscriminately

cuniary reward offered to the fortunate mariner who should first discover the land.

After M. Dagelet, in this run, had made many lunar observations, which agreed extremely well with the time-keepers of M. Berthoud, La Perouse discovered on the 7th of May, a great number of birds of the petrel species, man of war, and Tropic birds; the last two species of which are remarked for not appearing at any great distance from land. Many turtles were also observed passing alongside. The Astrolabe caught two of them, which were said to be delicious. On the 20th La Perouse passed through the midst of the supposed cluster of Los Majos, without perceiving the least appearance of an island; on the 28th he saw the mountains of Owhyhee, covered with snow, and afterwards those of Mowee, which are less elevated. At nine he beheld the point of Mowee. He also perceived an island bearing west which the English had not seen, and which was not to be found in their chart, and which in this particular is very defective; though whatever is laid down from their own observations merits the highest encomiums†.

About a hundred and fifty canoes were seen putting off from the shore, laden with fruit and hogs, which the Indians proposed to exchange for pieces of iron of the French navigators. Most of them came on board of one or the other of the vessels, but they proceeded so fast through the water that they filled alongside. The Indians were obliged to quit the ropes we had thrown them, and leaping into the sea swam after their hogs; when taking them into their arms, they

to strangers, it cannot be supposed they belong to any one, in particular. It also appears that, when the children are weaned, they are committed to the care of other women, who, in every respective district, undertake the task of rearing them. The whole population may be estimated at about two thousand people; but it may reasonably be supposed that the population was more considerable, before the trees were destroyed. It does not appear that life is long extended in these regions, for not a single man in the island appears to exceed the age of sixty-five.

† The island of Mowee, which he coasted along at about a league distance, had an enchanting appearance: cascades were beheld, falling from the summits of the mountains, and descending to the sea, after having lavied the numerous habitations of the natives. The trees which crowned the mountains, the verdure, and the bananas which embellished the cabins, all contribute to operate so forcibly on the senses of the beholders, that they experienced the most exquisite sensations.

emptied

emptied their canoes of the water, and resumed their seat. Upwards of forty canoes were thus successively overset; but though the commerce was agreeable to both parties, no more than fifteen hogs, and a small quantity of fruit could be procured. The navigators were deprived of the opportunity of bargaining for upwards of three hundred more hogs, by this ludicrous and unexpected accident*.

La Perouse stood west and north-west to gain the anchorage where the *Astrolabe* had already brought up, about a third of a league from shore. They lay sheltered from the sea breeze by a high bluff, capped by clouds. The Indians of the villages eagerly came alongside in their canoes, bringing hogs, bananas, potatoes, and stuffs, forming certain particulars of dress, as articles of commerce. Not choosing they should come on board till the ship was completely at anchor, they were informed that she was *taboo* †, which they seemed perfectly to understand. M. de Langle, who had not adopted the same expedient, had his deck instantly crowded by them; but they were so docile and obedient as to be easily prevailed on to return to their canoes. When permitted to come on board, they manifested a fear of giving offence, and in all their commercial dealing gave proofs of their fidelity. They were much pleased with pieces of old iron hoops, and had sufficient address to procure them on the most advantageous terms.

The night was calm, with the exception of a few gusts, which were of short duration. At day-break the long-boat of the *Astrolabe* was detached, with M. de Vanjuas and others, to sound a deep bay, where it was supposed better anchorage might be found, but this new anchorage did not appear to be preferable to that which they occupied. At eight in the morning four boats of the two frigates were in readiness

* Each of these canoes contained from three to five men: the size was generally about twenty-four feet in length, one in breadth, and one in depth. One of these dimensions weighed about fifty pounds. With these fragile vessels the inhabitants of the islands traverse channels twenty leagues across, like that between Atooi and Wohao, where the sea runs extremely high; but they are such expert swimmers that no dangers by water can deter them. As the navigators advanced, the mountains seemed removed to the interior of the island; and they no longer saw any cascades: the trees were thinly scattered in the plain, the villages consisted of only ten or twelve cabins each, and those were very remote from each other. They regretted

to set off; the two first contained twenty armed soldiers, commanded by a lieutenant: M. de Langle, accompanied by all the passengers and officers not on actual duty, were in two others. This preparation alarmed the natives, who from the dawn of the day had been alongside in their canoes. They continued their traffic, as usual, but did not follow the party on shore. About one hundred and twenty persons, including both sexes, waited for them on the beach. The officers and soldiers were first landed: the latter fixed their bayonets, selected a certain space of ground, and made such dispositions as would have been necessary in the presence of an enemy. These forms did not seem to deter the inhabitants; the women, by the most expressive gestures convinced them that they were disposed to grant them any act of kindness they could require: and the men were anxious to know the motive of their visit, that they might anticipate their wants. Two Indians, who seemed invested with authority over the others, gravely addressed them in a long harangue, the purport of which they could not comprehend, and each of them presented a pig. M. de Langle, in return, gave them medals, hatchets, and several pieces of iron. His liberality had a wonderful effect; the women redoubled their caresses, but they were far from being alluring; their features wanted softness and delicacy; and some traces were discovered of the ravages of a certain disease which they had not long been acquainted with.

After having visited the village, M. de Langle gave orders that six soldiers, with a serjeant, should accompany him: the others were left upon the beach, under the command of M. de Piervert, the lieutenant: to them was committed the protection of the ships' boats, from which not a single sailor had landed ‡.

The party re-embarked at eleven o'clock in very

the country they had left behind them, and found no shelter till they saw before them a rugged shore, where torrents of lava had formerly flowed.

† A word which, in their religion, signifies a thing they cannot touch, or a consecrated place, into which they are not permitted to enter. Dixon gives a vocabulary of the language of the Sandwich Islands, in which the word *taboo* signifies embargo: though, in his plural, he explains the ceremony of lying under *taboo* in the same manner as Captain Cook has done.

‡ The soil of this island is principally formed of a decomposed lava, and other volcanic matters: the water which the inhabitants drink is brackish, drawn from shallow wells,

very good order, and arrived on board about noon; where M. de Clonard had received a visit from a chief, of whom he had purchased a cloak, and a helmet adorned with red feathers: he had also purchased a hundred hogs, a quantity of potatoes and bananas, plenty of stuffs, mats, and various other articles. On their arrival on board, the two frigates dragged their anchors: it blew fresh from the south east, and they were driving down upon the island of Morokinne, which was however at a sufficient distance to give them time to hoist in their boats. La Perouse made the signal for weighing, but before they could purchase the anchor, he was obliged to make sail, and drag it till he had passed Morokinne, to hinder him from driving past the channel.

As he did not entirely get his anchor till five in the afternoon, it was too late to shape his course between the island of Ramai and the west part of Mowee: till eight the breezes were so light that he could not run above half a league. At length the wind settled at north-east, when he stood to the westward. At the dawn of day he stretched towards the south-west extremity of the island of Morotoi. This island seemed to be uninhabited in this part, though, according to the English account, it is very populous on the other side. It is remarkable that in these islands the most healthy, fertile, and populous parts are always to wind-ward*.

SECTION VI.

Departure from the Sandwich Islands—Sundry Occurrences—Description of the Bay of Port des Français—Manners, Customs, &c. of the Inhabitants—Traffic with them—JUNE, JULY, 1786.

THE fresh stock that had been procured at the Sandwich Islands, afforded an agreeable and salutary subsistence to the companies of the two frigates for about three weeks. The hogs, however, could not be preserved alive for want of water and food. The crew were obliged to follow Captain Cook's method of salting them; but the greater number of them were so small that salt only tended to corrode them, which rendered it necessary to consume them as soon as possible.

On the 6th of June the trade winds no longer

wells, one of which will hardly furnish half a barrel of water in a day. Three or four villages presented themselves, which contained about ten or twelve houses each; they are covered with straw, and the roofs have two declivities: the height of the door is about three feet and a half, and the habitations cannot be entered without stooping: it is shut by a simple hatch, which can be opened with the greatest facility. The furniture consists of mats, which form a very neat covering, upon which they lie down: their kitchen utensils are large calabashes, which they mould to any shape they please while they are green: they also varnish and ornament them. Sometimes they glue them together, and form very large vessels of them: and their glue possessed the quality of resisting water. Their stuffs, of which they have great plenty, were made of the paper mulberry-tree. At their return they were harangued by some women, who presented them several pieces of stuff, which were paid for with hatchets and iron nails.

VOL. II. No. LXV.

accompanied our navigators: of this they were convinced from several circumstances: the wind shifted to south-east, and the sky became dull and whitish. They were much afraid they should soon have cause to regret the loss of the fine weather, which had hitherto preserved them in so excellent a state of health. La Perouse's apprehensions of fogs were quickly realized. They began on the 9th of June, and they had no clear weather till the 14th. The humidity was extreme; the fog, or rain, had penetrated through all the sailors' cloathing: not a ray

* On the first of June, at six in the evening, he had cleared all the islands, and had not employed more than forty-eight hours in examining them, and fifteen days in elucidating a very important point in geography, as it expunges from the French charts five or six islands which have no existence. The fishes, which had followed us from Easter Island, now disappeared. It is certain that the same shoal of these aquatic animals followed the frigates fifteen hundred leagues: several, which had been wounded by the French harpoons, retained a mark on them by which they were perfectly known: the people daily saw and recollected, the same fish that we had seen the preceding night. Had they not stopped at the Sandwich Islands, they would probably have followed them two or three hundred leagues, or till they could come to a temperature which suited them.

E

of

of, the sun appeared to dry them. Being of opinion that cold wet weather was the principal cause of the scurvy, La Perouse ordered stoves, filled with burning coals, to be placed under the half deck, and between the decks where the people slept: he returned to every sailor their flannel under waistcoats and breeches, which he had kept in reserve for them from their departure from Cape Horn. He also distributed to every seaman and soldier a pair of boots. His surgeon likewise proposed that a slight infusion of bark should be mixed with their grog at breakfast, which might have salutary effects without destroying the relish of the beverage. This mixture was directed to be prepared secretly, as the crews might otherwise refuse to drink their grog: but as none of them perceived what had been done, no murmuring arose concerning this new regimen*.

A fair wind accompanied the navigators from their departure from the Sandwich Islands, till they landed at Mount St. Elias. As they advanced to the northward, they saw sea-weeds pass by, such as they never had beheld till then; a head, of the magnitude of an orange, terminated a stalk of about forty feet in length. Whales and wild geese convinced them that they were approaching land. Early in the morning of the 23d they descried it: a sudden dispersion of the fog opened to them the view of a long chain of mountains covered with snow. They distinguished Behrin's Mount Saint Elias, the summit of which appeared exalted.

The sight of land, though generally agree-

* Many other precautions were attended with the greatest success; a carpenter constructed, from a plan of M. de Langle, a corn-mill, which proved infinitely serviceable. The pursers, convinced that kiln-dried corn might be preserved better than flour and biscuit, proposed to take a quantity of it on board. Mill-stones were provided, and four men were required to keep them in proper motion. At length, however, it appeared that the grain was only broken, and not ground, and that the whole day's labour of four men, relieved every half hour, produced only twenty-five pounds weight of imperfect flour. The corn forming half our store of provision, the crews would have been much embarrassed, had not M. de Langle, assisted by a sailor that had formerly been a miller's boy, adapted to the mill-stones the movement of a wind-mill. He first contrived sails to be turned by the wind, which he found to be a kind of improvement; but he afterwards introduced a handle, which rendered the project in some degree complete. By this new method perfect flour was obtained, and about

2

able after a long voyage, afforded them little satisfaction. Immense heaps of snow, covering a barren land without trees, had no charms for them. A black rock, of immense height, destitute of all verdure, formed a striking contrast to the whiteness of the snow. A thick fog enveloped the land during the 25th, but on the 26th the weather became very fine, and the coast appeared at two in the morning, with all its windings. At two o'clock in the afternoon a calm rendered it necessary for La Perouse to come to an anchor. At six in the morning he had dispatched his long-boat, under the command of M. de Bontin, to reconnoitre this bay or channel. Messrs. de Monti and de Vanjuas quitted the Astrolabe for the same purpose: and they brought up to wait the return of these officers: the general opinion was that it was supposed the woody point of the island was either a channel, or formed the mouth of a great river. About nine in the evening the three boats, however, returned, and three officers unanimously declared, that there was neither channel nor river; that the coast only formed a semicircular hollow in the north-east, and that there was no shelter from the most dangerous winds. As M. de Monti's landing was attended with great difficulty, and as he was the commander of this little division, La Perouse gave the Bay the appellation of *Monti Bay*†. He then made the signal for getting under way, and as the weather appeared formidable, he embraced the advantage of a breeze to run, to the south-east, and gain an offing‡.

This

two hundred weight of corn could be daily ground with ease.

† Monti Bay is neither more or less than the anchorage of Dixon on the 23d of May; an anchorage sheltered from all winds, by the corner of an island which forms a kind of jetty, to which he gave the name of Port Mulgrave.

‡ On the 1st of July, about noon they were near enough to distinguish men, had there been any upon the shore, by the assistance of their perspective glasses; but they saw breakers which rendered a landing impossible. At two in the afternoon a falling in of the coast was perceived, which appeared to be a fine bay. La Perouse dispatched the jolly boat, commanded by M. de Piervert to reconnoitre it. The Astrolabe also sent two boats for the same purpose, commanded by Messrs de Flassean and Bouterwilliers. The report of the gentlemen last mentioned was so favourable that La Perouse resolved to shape his course towards the passage. He soon perceived Indians, who shewed signs of friendship by hanging up skins and white cloaks; and

This port, which had never been discovered by any other navigators, is situated thirty-three leagues to the north-west of that of Los Remedios, and about two hundred and twenty-four leagues from Nootka. The calmness of the interior of the bay we found extremely delightful, and the place was honoured with the name of *Port de Francais*. La Boussole came to anchor in the bay at half a cable's length from the shore: the Astrolabe did the same. M. Boutin having been afterwards sent to sound the bay, found an excellent bed of sand; afterwards both the frigates gained a good anchorage.

While the navigators were compelled to stay at the entrance of the bay, they were continually surrounded by the canoes of the Indians. In exchange for iron* they were offered fish, and variety of skins; as well as sundry articles of dress, and the natives displayed much ability in their commercial dealings, but iron was more eagerly coveted than any other medium of barter. They indeed consented to take some pewter pots and plates, but they received them with indifference. Iron was their favourite metal: a dagger of it hung from the necks of many of them. Seeing the Frenchmen examine these daggers with great attention, they intimated to them that they never used them but against bears, and other beasts of the forests. Some of them were formed of copper, a metal not uncommon among them, though chiefly used for collars, bracelets, and other ornaments. The points of their arrows are also tipped with it. Some of their toys were composed of brass, a well-known composition of copper and zinc; a circumstance which induced the French traders to suppose the metals they produced came from the Russians, the factors for the Hudson's Bay Company, or

several canoes of them were fishing in the bay. At seven they were before it: the wind was light, and the ebb-tide so strong that it was impossible to stem it. The Astrolabe was rapidly driven out with it, and the Boussole came to an anchor, to prevent being drifted away by the current, of the direction of which La Perouse was then ignorant, but when he found that it set towards the offing, he weighed anchor and rejoined the Astrolabe.

* Virgin, or native iron, though very rare, has been found in Sweden, Germany, at Senegal, in Siberia, and at the island of the Elbe. La Perouse said he found it at Erba-longa, a village two leagues to the northward of Bastia, the capital of Corsica; it was spread with great profusion in the mass of a rock, situated on the sea-shore, and constantly under the octaedral form. The existence of native iron is still further proved, by the examples which

from the Spaniards. The love of gold is not more prevalent in Europe than that of iron is in this part of America†.

When the navigators had established themselves upon this island, they were visited by almost all the Indians of the Bay. The report of their arrival having spread itself to the adjacent parts, several canoes arrived filled with otters' skins, which the natives bartered for knives, hatchets, and bar-iron. The sea-otter is supposed to be more common here than in any part of America. The Astrolabe caught one, which probably had escaped from the Indians, as it was severely wounded. It weighed seventy pounds, and perhaps had attained its full growth. The sea-otter is an amphibious animal, remarkable for the beauty of its skin. The Indians of Port Francais call it *skeeter*. Some naturalists have noticed it under the denomination of *saricovienne*, but the description of that animal in Buffon has no affinity with this, which has no resemblance of the otter of Canada, nor that of Europe.

On their arrival at their second anchorage, the navigators established an observatory on an island within a musket-shot of the ships: there they pitched tents, and formed a settlement for the time they supposed they should continue in this port. As all the Indian villages were on the continent, they thought they should be perfectly secure upon this little island, but they were soon convinced of their mistake. They indeed knew the Indians were all thieves, but they did not suppose they were such adepts in thievery as to be able to carry on the most difficult projects in the art. They watched every night for a favourable opportunity of committing their depredations; and though an excellent guard was kept on board, they often deceived their vigilance.

exist in the greater part of the cabinets of natural history, and by the opinion of Stahl, Linnaeus, Margraff, &c.

† On the day of their arrival they received a visit from the chief of the principal village: but before he attempted to come on board, he seemed to address a fervent prayer to the Sun: he afterwards delivered an elaborate speech, which terminated with melodious songs; the Indians in his canoe accompanied him by repeating the same air in chorus. Most of them then appeared on board, and danced to the sound of their own voices for about an hour. La Perouse made the chief several presents, which induced him to become so troublesome, that he every day continued five or six hours on board: and if these presents were not frequently repeated, he went away dissatisfied, muttering some threats, which indeed were not much regarded.

Nothing.

Nothing was reclaimed that had been stolen, in order to prevent quarrels, and their disagreeable consequences*.

Messrs. de Langle, de Monti, and Dagelet, with several other officers, were anxious to ascend the glacier: with inexpressible fatigue, they attained the distance of about two leagues, in

the course of which they were obliged to leap over clefts of an astonishing depth: yet they were unable to descry any thing but a continuation of glaciers and snow, which seemed to have no other termination than at the summit of Mount Fair Weather.

SECTION VII.

Continue at Port des Francais—A melancholy Accident occurs—Particulars of Departure—Port des Francais described—Its Productions—Natural History—Manners and Customs of the Inhabitants—Their Propensities—Language—JULY, 1786.

ON the following day the chief came again on board the Boussole; better attended and dressed than usual; and, after variety of singing and dancing, offered to sell to La Perouse the island on which the observatory had been placed; meaning, it is presumed, to reserve to himself and his associates the right of plundering from it. Without questioning his right of transferring the property to another, or mentioning a doubt whether he could execute a legal instrument of conveyance, he accepted the chief's offer; and gave him, as a valuable consideration for the land, several yards of red cloth, knives, hatchets, nails, and bar-iron. At the same time he complimented his suite with several presents. The bargain being thus completed, he sent to take possession of the island with the usual formalities.

Having taken in as much wood and water as was required, the navigators esteemed themselves the most fortunate of men in having arrived at such a distance from Europe without having a sick person among them, or any one afflicted

with the scurvy; but a lamentable misfortune now awaited them. The following inscription, composed by M. de Lamanon, will briefly relate the particulars of this melancholy event.

"On the 14th of July, 1786, the frigates Boussole and Astrolabe, which sailed from Brest the 1st of August 1785, arrived in this port. From the care of M. de la Perouse, commander in chief of the expedition, of the viscount de Langle, commander of the second frigate, of Messrs. Clonard and de Monti, second captains of the two ships, and of the other officers and surgeons, none of the diseases which are incident to long voyages had afflicted our ship's companies; M. de la Perouse found himself happy in the reflection, as did all the others, of having been from one end of the world to the other, through every kind of danger, and of having visited people reputed to be barbarous, without losing a single man, or shedding a drop of blood. On the 13th of July, at five o'clock in the morning, three boats set off for the purpose of laying down the soundings upon the draught which

* This excess of lenity rendered the islanders extremely insolent, but La Perouse endeavoured to convince them of the superiority of the French arms. Experiments shewing the efficacy of cannon and musquet-balls were exhibited, and expert marksmen killed the birds flying over their heads. Not intimidated, however, by any thing that could be done or threatened, they pursued their former courses, and compelled La Perouse to take away the settlement he had made upon the island; but before they could accomplish their intention, they contrived, in spite of centinels, to carry off many of the effects; and had the address to introduce themselves into M. Lauriston's tent, where he slept, and took away an ornamented musquet, as well as the clothes of two officers, who had placed them under their bolster. They were unperceived by twelve soldiers upon

guard. In this last robbery, the loss of an original memorandum book was much regretted, in which was written all the astronomical observations since their arrival in the Port des Francais.

To form a conception of this bay, let us suppose a basin of water of an unfavourable depth in the middle, bordered with excessive high mountains covered with snow, without a blade of grass, and condemned to perpetual sterility. Not a breath of air ruffles the surface of this water; though sometimes a tremendous noise is occasioned by the falling of enormous pieces of ice from five different glaciers. The air here is generally so calm, and the silence so profound, that a man's voice may be heard the distance of half a league, as well as the noise of some sea-birds, who build their nests in the cavities of these rocks.

had been made of the bay. They were com-
manded by M. d'Escures, lieutenant of the navy,
and a chevalier of St. Louis. M. de la Perouse
had given him instructions in writing, which ex-
pressly charged him not to approach the current,
but at the moment he conceived himself at a suf-
ficient distance from it, he found himself drawn
in by it. Messrs. de la Borde, brothers, and de
Flassa, who were in the boat of the second fri-
gate, were not afraid of exposing themselves to
danger, by flying to the assistance of their com-
panions, but they, alas! shared the same un-
happy fate. The third boat was under the
orders of M. Boutin, lieutenant of the navy.
This officer, contending with courage against the
breakers during the space of several hours,
made the most vigorous but useless exertions to
assist his friends, and was only indebted for his
own safety to the superior construction of his
boat, to his own enlightened prudence, joined
with that of M. Lapraise Monton, lieutenant
of the frigate, his second in command, and to the
activity and ready obedience of his crew, con-
sisting of Jean Marie, cockswain, Lhostir, le
Bas, Corentin Jers, and Moners, all four sailors.
The Indians seemed to participate in our sorrows,
which were extreme. Moved, but not discon-
raged by our misfortunes, we sailed the 30th of
July, to continue our voyage.

"The names of the officers, soldiers, and
sailors, who were lost on the 13th of July, at
a quarter past seven o'clock in the morning.

poral and cockswain; Prieuf, Fraichot, Ber-
rin, Bolet, Fleury, Chaub, all seven soldiers;
the oldest not thirty-three years of age.

"THE ASTRCLABE.

"Officers—Messrs. de la Borde Marchain-

* Upon this lamentable event, M. de la Perouse declared
that his sorrows have since been frequently accompanied by
his tears; that time could not assuage his grief; and that
every object recalled to his mind the loss they had sustained,
in circumstances where such a catastrophe could not be
dreaded or apprehended.

+ Our travellers also saw a morai, by which they were
convinced that these Indians were accustomed to burn their
dead, and to preserve only the head. This monument con-
sists of four stakes, which support a little wooden cham-
ber, where the ashes of the dead are deposited in coffins;

"At the entrance of this harbour perished
twenty brave seamen.

"Reader, whoever thou art, join thy tears to
ours."*

By continuing at the entrance of the bay,
more knowledge of the manners and customs of
the Indians was acquired than could have been
expected at the other anchorage: the ships lay
near their villages, which they daily visited.
Almost every hour furnished fresh cause of
complaint against them; though they continued
to experience from the navigators the most evi-
dent proofs of benevolence and generosity. They
brought some pieces of the wreck of the boats,
which had been driven upon the eastern coast,
and intimated, by signs, that they had buried
one of the unfortunate sufferers on the shore.
M. de Clonard, and two other officers, on re-
ceiving this intelligence, directed their course
towards the east, accompanied by these Indians,
to whom they had been extremely liberal. The
officers were conducted over a very frightful
road, by their guides, who demanded a fresh
payment every half hour, or threatened to re-
turn. At length they fled with precipitation
into the woods, when the officers were convinced
that the report was fabricated merely to extort
presents from them. In this journey they saw
immense forests of large fir-trees; some of which
were five feet diameter, and seemed to exceed a
hundred and forty feet in height. They were
not surprised at the manoeuvres of the Indians,
as, upon all occasions, they had manifested con-
siderable address in stealing †.

This

they opened these coffins, examined a packet of skins which
enveloped the head, and carefully replaced every article,
adding several valuable presents. The Indians who were
present at this visit, seemed rather disconcerted, but in-
stantly seized the presents which the travellers had left.
But if these people reluctantly permitted the travellers to
visit their tombs, they would not suffer them to approach
their cabins, till they had previously removed all their
women, who were objects of extreme disgust.

Strange canoes daily entered the bay, and whole villages
quitted it, yielding their places to others. These Indians

F

are

This canoe had timbers and whales like the French boats: the wood-work was extremely well executed, and had a covering of seals' skin, serving as a kind of sheathing, so ingeniously formed that the best European artist could with difficulty imitate the work. This covering was deposited in the morai, near the coffins with the ashes; and the frame, elevated upon stocks, remained bare near this monument.

On the 30th of July, at four in the afternoon, La Perouse got under way: the horizon was so clear, that he perceived Mount Saint Elias, distant at least forty leagues, bearing north-west. At eight in the evening, he was three leagues to the southward of the bay.

This bay or harbour, to which La Perouse gave the name of *Port des Francais*, is situated in 58° 37' north latitude, and 139° 50' west longitude. In different excursions, he says, he found the high-water mark to be 15 feet above the surface of the sea. The climate of this coast is infinitely milder than that of Hudson's Bay, in the same degree of latitude. Pines were seen of six feet diameter, and a hundred and forty feet in height. Vegetation is vigorous during three or four months of the year. Plenty of celery, endive, sorrel, lupine, the wild pea, and yarrow were found, which were eaten in soups, ragouts, and sallads; all which perhaps contributed to keep the crews in perfect health. The woods abound with strawberries, raspberries, and gooseberries; the dwarf willow, elder, and different species of briar; the gum poplar tree, the poplar, and superb pines, proper for the masts of the largest ships.

The rivers abound with trout and salmon, but in the bay were taken some *fletans**, some of

are so much in dread of the channel that they never entered it but at slack water. By the aid of glass it appeared, that when they were between the two points, a chief or elder rose up, and extended his arms towards the sun, in the attitude of addressing prayers to it, whilst the others continued paddling with great earnestness. The meaning of this custom being required, it appeared that seven large canoes had been lost there a little time before, and the eighth had been with difficulty saved: the Indians who escaped this misfortune, consecrated it either to their God, or to the memory of their sufferers.

* A flat fish, not unlike the turbot, but longer, the back covered with black scales: those in Europe are much smaller.

A fish similar to cod, but generally larger. It is easily taken, from its greediness.

† This fish resembles the whiting, but is larger: the

which exceeded a hundred pounds in weight. There were also ling, the single thornback, plaice, and some *capelans*†. The navigators preferring salmon and trout to all these fishes, were furnished with greater quantities of them than they could consume. They had little angling, and that only with the line: they had not leisure to haul the seine, which required twenty-five men to draw it ashore. Muscles were profusely scattered over that part of the shore which is uncovered at low water, and small limpets are abundant upon the rocks. In the hollows of these rocks were observed several species of whelks and other sea snails. Large cockles were also found upon the sand of the beach‡.

Nature has furnished inhabitants to this frightful country, who differ from those of civilized countries, as the scene in contemplation differs from the cultivated plains of France: as rude and barbarous as their soil is rocky and barren, they inhabit this island to destroy its population: eternally hostile to the animals, they despise the vegetable substances which surrounds them. Their arts indeed are somewhat advanced, and civilization has made some progress, but their ferocity requires much softening, and their manners much polishing. Their mode of life excluding all subordination, they are constantly agitated by revenge or fear. Irritable, and prone to anger, bloody quarrels frequently arise. Perishing for want in winter, because they cannot then be successful in the chase; they fatten on abundance in the summer, as an hour employed in fishing will support a whole family for a day: the remainder of which is devoted to idleness or gaming, to which they are as

flesh of it is soft, pleasant, and easy of digestion: it is common on the coast of Provence, and is named the *poor priest*.

‡ The hunters discovered in the woods, plenty of bears, martens, and squirrels; and purchased from the Indians the skins of the brown and black bear; as well as of the beaver, the ermine, marten, little grey squirrel, Canadian marmot, and the red fox. There is no great variety of birds, though the individuals are numerous: the thickets swarm with nightingales, black birds, and yellow hammers. In the pairing time their singing was delightful. The white-headed eagle was seen towering in the air, and the large species of the raven. A king-fisher was killed, and a beautiful blue jay. Several sea-birds were also observed, such as gulls, cormorants, wild geese, and the red-footed guillemor.

much addicted as the inhabitants of great cities.

La Perouse says he has been a witness of the injustice and deceptions of these people, who have been described as good, because they are nearly in a state of nature; but this same nature is only admirable in her masses, she is negligent of all details. We cannot traverse woods which the hand of civilized man has not rendered passable; or, in other words, we cannot form society with a man who is in a state of nature; because he is barbarous, wicked, and deceitful. In this opinion he acknowledges himself to have been confirmed by his own melancholy experience. But he never exercised the force which had been intrusted to him for repelling the injustice of these savages, and he did not recollect that men have certain established rights, which are not to be violated with impunity*.

None of the ships' companies ventured on shore, without being well armed and in force: the Indians were so terrified by their firelocks, that eight or ten Europeans could keep a whole village in awe. The surgeon-majors of the two frigates, imprudently hunting by themselves, were attacked by the Indians, who attempted to force their muskets from them, but without success. La Perouse gave the name of village to three or four wooden sheds of twenty-five feet

* Indians, in their canoes, continually surrounded the frigates; passing two or three hours in observation before they began to exchange fishes for otters' skins. They embraced every opportunity of robbing us, and tore off such iron as might be conveniently conveyed away: and they were particularly engaged in forming projects for committing depredations in the night. La Perouse solicited some principal persons among them to come on board his frigate, and was extremely liberal to them; yet these very men who had been so favourably distinguished, could not depart without pilfering a nail or an old pair of breeches.

When he caressed their children, and made them small presents, the parents did not seem delighted with his benevolence; they were only induced, by seeing these favours conferred upon their offspring, to ask to accompany them when they came on board. He often saw the father take advantage of the moment of his fond assiduities to please the child, to seize and conceal under his garment whatever lay within his reach. When he had loaded the Indians with presents, he sometimes expressed a desire for a few of their articles of trifling value; but these trials of their generosity were always made in vain. If these people had any

in length, and fifteen in breadth; sheltered only to windward with planks or bark of trees. A fire appeared in the middle, and flat fish and salmon were drying in its smoke. Eighteen or twenty persons inhabited each of these sheds; the men on one side, and the women and children on the other. Every cabin seemed to form an independent colony: each of them had its canoe, and a kind of chief†.

During the summer the Indians wander in the different bays, seeking their provision like seals; and in winter they visit the interior country, hunting beavers and other animals. Dogs are their familiar friends and associates: three or four of them are usually seen in every cabin: they are small, and not unlike the shepherd's dog of Buffon: they seldom bark, but hiss like the Bengal jackal. Compared to other dogs, they are as savage as their masters are to civilized people. The men wear different small ornaments pendant from the ears and nose, scarify their arms and breasts, and file their teeth close to their gums; using, for the last operation, a sandstone: formed into a particular shape. They paint the face and body with soot, ochre, and plumbago, mixed with train oil, making themselves most horrid figures. When completely dressed, their flowing hair is powdered, and plaited with the down of sea-birds: but perhaps only the chiefs of certain distinguished fa-

virtues, he had not sufficient penetration to perceive them: eternally quarrelling among themselves, indifferent to their children; and above all, tyrants to their women, who are destined to the most laborious and disagreeable employments.

† He ventures to assert that this bay is inhabited only in the favourable season, and that the Indians desert it on the approach of winter, as he never saw a cabin that was sheltered from the rain. The canoes were constantly entering and quitting the bay, accompanied with their houses and furniture, which consisted of a number of small boxes: these boxes are arranged at the entrance of their cabins, which abound with nastiness and stench. For the performance of the most necessary occasion, they never remove farther than about two steps, and they neither consult privacy nor shade: should such urgencies happen during a repast, they coolly take their places again after the completion of the business§. Their wooden utensils in cookery, which are never washed, serve for dish, plate, or kettle. As these vessels will not endure fire, they heat the water with red-hot flint-stones, which are perpetually changed for others equally hot, till the food is ready to be served up.

§ The inside of these dwellings exhibits a complete picture of dirt and filth, indolence and laziness: in one corner are thrown the bones, and remaining fragments of victuals left

at their meals, in another are heaps of fish, pieces of stinking flesh, grease, oil, &c. Dixon's Voyage, 173.

milies are thus decorated. Their shoulders are covered with a skin, and the rest of the body remains naked, except the head, on which is generally worn a little straw hat, plaited with great taste and ingenuity. Sometimes indeed the head is decorated with two horned bonnets of eagles' feathers. Their head-dresses are extremely various, the grand object in view being only to render themselves terrible, that they may keep their enemies in awe. Some Indians have skirts of otters' skin. A great chief wore a shirt composed of a tanned skin of the elk, bordered by a fringe of beaks of birds, which, when dancing, imitated the noise of a bell. A common dress among the savages of Canada, and other nations in the eastern parts of America*.

The stature of these Indians is hardly different from the French: their features are various, and their eyes have some expression, but never beam forth a sentiment of tenderness. Their skin is brown, from their exposure to the air; but their children when infants, are as fair as those of France. The frame of their body is feeble; a weak sailor would overcome the strongest of them in wrestling. Many of their legs seemed swelled, and none of them appeared to have attained any considerable age. La Perouse says he saw only one woman who seemed to have reached the age of sixty.

The Indians in this part of the world, have made greater progress in the arts than in morals, and their industry exceeds that of the inhabitants of the South Sea Islands. The Americans of *Port des Français* are capable of forging iron, of forming copper, and of spinning the hair of different animals; with the aid of a needle, they can fabricate, with yarn, a tissue not inferior to French tapestry. And they can

* The chief, who always conducts the vocal concert, puts on a large cloak made of the elk-skin, tanned, round the lower part of which is one, or sometimes two rows of dried berries, or the beaks of birds, which make a rattling noise whenever he moves, *Dixon's Voyage*, 212.

This custom appears general among the colonies, which inhabit the north-west coast of America. It is extended even to the inhabitants of Fox Islands, and the Aleutian Islands. See *Coze's Translation of New Discoveries by the Russians*.

La Perouse never saw any tattooing here, except on the arms of a few women; but many of them are addicted to a custom which renders them more hideous. The lower lip of all of them is slit at the root of the gums, as far as the mouth extends; they wear something like a wooden

improve this tissue by ingeniously intermixing it with narrow stripes of otters' skin, which gives a glossy appearance to their cloaks resembling the finest silk shag. They plait hats and baskets with reeds with inimitable skill, and figure on them very tolerable designs; they even engrave figures of men and animals in wood and stone with some degree of accuracy; and inlay boxes with mother of pearl with great elegance. To their ornaments of serpentine, they give the polish of marble. Their hostile weapons are the dagger already mentioned, a lance made of wood or iron, and a bow and arrows. Among their trinkets were seen pieces of yellow amber, but it was not known whether they were the produce of their own country, or whether, like the iron, they received it from the old continent by the attentions of the Russians.

The seven canoes mentioned to have been lost at the entrance of the harbour, were thirty-four feet in length, four in breadth, and six in depth; dimensions well appropriated to long voyages. The passion of these Indians for gaming is astonishing, and they pursue it with great avidity. The sort of play to which they are most devoted, is a certain game of chance: out of thirty pieces of wood, each distinctly marked like the French dice, they hide seven: each plays in succession, and he who guesses nearest to the whole number marked upon the seven is the winner of the stake, which is usually a hatchet or a piece of iron. This gaming, however, creates a kind of gloomy melancholy.

La Perouse says he has frequently heard these people sing; and when the chief honoured him with a visit, he generally paddled round the ship singing, and crossing his arms as a token of amity: he then ventured on board, and re-

howl resting against the gums, to which this lower cut lip serves for a support; the lower part of the mouth consequently projects two or three inches. These women, who were extremely disgusting, covered with skins stinking and untanned, excited desires in some of our people of eminence: they at first appeared coy, started difficulties, and by their gestures signified they ran the risk of their lives; but their scruples being overcome by proper presents, they did not object to the Sun's being a witness to their amours, and peremptorily refused to retire into the wood. This planet is probably the God of these people, to which they frequently address their prayers: but no priests nor temples were to be seen, nor the least trace of any worship.

heard a kind of pantomime, representing com-
bats, disasters, and death. The air which
ushered in the dance was agreeable, and not des-
titute of harmony: French characters cannot
express the language of these people: they have
indeed some articulations similar to those of the
French, but they are wholly strangers to many
of them. The frequency of the letter *k*, and
the double consonants, render this language ex-
tremely rough; but it is considerably less gut-
tural among the men than the women, who find
it difficult to pronounce the labials, the piece of
wood fixed on their under lip operating as an
impediment. There seems to be a great affinity
in sound between this language and that of
Nootka sound; in both the *k* is the prevailing
letter, and appears in almost every word.

Though La Perouse admits that he saw no
proofs or traces to convince him that these
Indians are cannibals; but the practice alluded
to is so general among the Indians of America,
that he should probably have had this trait to
add to their picture, had they been at war, and
captured any prisoners*.

What immediately follows, as La Perouse
very justly observes, can only be interesting to
navigators and geographers. At length, after a
very long run, on the 11th of September, at
three in the afternoon, the navigators got sight
of Fort Monterey, and two three-masted vessels
which lay in the road. Contrary winds obliged
them to come to an anchor two leagues from
the shore, in forty-five fathoms, and the next
day they brought up in twelve fathoms, two
cables' length from the land. The commander
of these two ships, having been informed by the
viceroy of Mexico, of the probable arrival of
the two French frigates, sent us pilots in the
course of the night. It is remarkable that,
during the whole of this long run, encompassed
with the thickest fogs, the *Astrolabe* always con-
tinued within hail of the *Boussole*, and was
never at a greater distance from her, till La
Perouse ordered M. de Langle to reconnoitre the
entrance of Monterey,

SECTION VIII.

*Description of Monterey Bay--Of the Two Californias--Manners and Customs of the independent
Indians--Grain, Fruits, and Pulse--Quadrupeds, Shells, &c.--Military Constitution--Missions.*

THIS bay is formed by New Year Point to
the north, and Cyprus Point to the south:
it has an opening of eight leagues, and nearly
six of depth to the eastward. The sea breaks
there with a roaring sound which is audible at
the distance of a league. The number of whales
which are seen here creates surprise, as much as

their familiarity. They frequently spouted at a
small distance from the ships, and the water
thus scattered emitted an offensive stench†.

These Indians are small and feeble, but ma-
nifest a desire of liberty and independence; their
colour resembles that of the negroes whose hair
is not woolly, they are skilful in managing the

* Captain J. Meares has sufficiently proved, in the nar-
rative of his voyages, that the inhabitants of the north-west
coast of America are cannibals.

Variety of considerations induced La Perouse to deter-
mine, in case of a separation, to give M. de Langle a new
rendezvous. He had previously fixed on the ports of Los
Remedios and Nootka, and proposed not to go into har-
bour but at Monterey; the last port being preferred be-
cause it was the most distant, and a greater quantity of
water would be required there. The disaster at *Port des
Francais* occasioned some changes in the staff establishment.
M. Darbaud, a midshipman received orders to act as en-
sign, and M. Broudou, a spirited young volunteer, was
appointed lieutenant.

† The coasts of Monterey Bay are generally enveloped
in fogs, which render it difficult to approach them. With-

out this inconvenience, few would be more easy to land
upon. Plenty of pelicans were seen in the sea: they are
a species of birds that seldom appear more than five or six
leagues from land. Though our navigators first saw them
in Monterey Bay, they are very common over the whole
coast of California. A lieutenant colonel, resident at
Monterey Bay, is governor of the Californias, including an
extent of more than eight hundred leagues in circumference;
but his subjects consist of only two hundred and eighty two
cavalry, who garrison four or five small forts, and furnish
detachments to each of the twenty-five missions or parishes
in the two Californias. So inconsiderable is the force to
restrain about fifty thousand wandering Indians in this ex-
tensive part of America; among whom about ten thousand
are supposed to have embraced christianity.

bow. Their perseverance in hunting the larger animals is remarkable. Our navigators saw an Indian, with a stag's head fixed upon his own, proceed on all fours, and imitate the manners of the animal he meant to represent: in this manner the natives perform their parts, till they arrive within a convenient distance of herds of stags, and then terminate their existence with a flight of arrows.

Loretto, the only presidency of Old California, is situated on the east coast of this peninsula, and has a garrison of fifty-four troopers, who furnish detachments to fifteen missions; the duties of which are performed by Dominican friars. About four thousand Indians, converted and residing in these fifteen parishes, are the sole produce of the long labours of the different religious orders, which have succeeded each other. By Vénéga's History of California it appears that the progress of these missions have been very slow. Spanish piety has hitherto maintained these missions and presidencies at a vast expence, for converting the Indians of these countries. A new branch of commerce would be more advantageous to Spain than the rich mines of Mexico; and the climate and soil, together with the abundance of all kinds of poultry, would give this part of America a preference to Old California; the barrenness and insalubrity of which would be poorly compensated by the few pearls collected at the bottom of the ocean*.

The land is inexpressibly fertile; farinaceous roots and seeds succeed wonderfully in it; corn, pease, and maize, can only be equalled by those produced in Chili: the medium produce of corn is more than seventy to one. The climate is very suitable to fruit trees, though they are rarely found there. Among the forest trees are the ever-green oak, the stone-pine, the cyprus, and the occidental plane tree: there is no under-wood, a smooth verdant carpet beautifully covers the ground. Vast savannas, or meadows, abound with game of every denomination. The

* Prior to the Spanish settlements, the natives of California cultivated only maize, and were principally supported by hunting and fishing: fish and game of every denomination are extremely plenty in this country: stags, hares, and rabbits are numerous: otters and seals abound in it; to the northward, during the winter, bears, wolves, foxes, and wild cats are the common spoil. The thickets and plains contain large quantities of small grey tufted partridges, which are fat and deliciously flavoured. The trees are teeming by a great variety of birds; among which are tit-

land is light and sandy, and is supposed to derive its fertility from the humidity of the air, it being very partially watered: the nearest stream to the presidency is distant about two leagues. This rivulet approaches the mission of Saint Charles, and is called by the old navigators Carmel River.

La Perouse, after his digression respecting the missions, proceeds to inform his readers, that, on the evening of the 14th of September, he anchored at two leagues from the shore, in view of the presidency and the two ships in the road. Guns had been frequently fired to point out the anchorage, lest the fogs should conceal it. At ten in the evening, the captain of the corvette *La Favorite* came on board the *Boussole*, and offered to pilot the two French frigates into the port. La Princesse, the other corvette, had also dispatched a pilot on board the *Astrolabe*. It appeared that these were two Spanish ships, commanded by Don Estevan Martinez. A small navy was established by the Spanish government in this port, under the orders of the viceroy of Mexico, consisting of four corvettes of twelve guns, and one goletta. They are destined to supply with necessaries the presidencies of North California; and they are sometimes dispatched as packet boats to Manilla, when the orders of the court require the utmost expedition.

The navigators weighed anchor at ten, and anchored in the road about noon: they were saluted with seven guns, which they returned; and La Perouse sent an officer to the governor with the Spanish minister's letter, which had been forwarded to him in France before his departure. It was addressed to the viceroy of Mexico, whose authority extends to Monterey, a hundred leagues, over land, from his capital. M. Fages, commandant of the two Californias, had received orders to receive the French navigators with great civility and attention, and those orders were punctually obeyed; they did not confine themselves to personal civilities; oxen, vegetables, and milk were sent on board in great abundance.

mice, sparrows, speckled wood-peckers, and tropic birds. Those of prey are the great and small falcon, the goshawk, the sparrow hawk, the white-headed eagle, the black vulture, the raven, and the large owl. The ponds and sea-shore exhibit to view different species of gulls, the wild-duck, the grey and white pelican with yellow tufts, herons, small sea-water hens, curlews, cormorants, and ring plovers. A bee-eater was taken here, which some ornithologists affirm to be peculiar to the old Continent.

Continent.

The same eagerness to oblige was manifested by the commanders of the two corvettes, and the commandant of the fort; each of them seemed to claim an exclusive right to administer to the wants of the navigators; and, after adjusting accounts between these Spaniards and Frenchmen, the former could hardly be prevailed on to receive any money as a consideration for the articles they had been supplied with. Vegetables, fowls, and milk, were absolutely furnished *gratis*, and the oxen, sheep, and corn were so moderately rated, that they might in a great degree, be considered as *given* instead of *sold*. To these acts of generosity may be added, the obliging demeanour of M. Fages; his house, with all his servants, was solely at the disposal of the French navigators*.

The company were received with all possible politeness and respect: the president of the missions, in his sacerdotal vestment, with the holy water in his hand, waited to receive them at the entrance of the church, which was splendidly illuminated as on their highest festivals: he then conducted them to the foot of the high altar, where *Te Deum* was sung in thanksgivings for their arrival. Before they entered the church they passed a range of Indians: the parish church, though covered with straw, is neat, and decorated with paintings, copied from Italian originals. A picture of Hell is there represented, in which the imagination of Callot is absolutely

* The holy fathers of the mission of Saint Charles soon arrived at the presidency, and invited the officers of the fort and the two frigates to dine with them. The latter eagerly accepted their invitation, and a day was agreed on for that purpose. M. Fages requested to be of the party, and undertook the task of providing horses. After passing over a small plain, where herds of cattle were seen, and in which only a small number of trees had been provided to shelter these animals from rain and excessive heat, the party ascended the hills, and were surprised with the sound of bells announcing their arrival; the monks having received intelligence from a horseman detached for that purpose.

† These cabins are wretched in the extreme: they are round, four feet in height, and six in diameter: the timber-work consists principally of stakes, and eight or ten bundles of straw over the whole forms a pretence of defending the inhabitants from wind and rain: more than half the cabin continues open in fine weather. The Indians, however, are happy to have two or three bundles of straw in reserve, in case of accidents: the exhortations of the missionaries could never induce them to alter their mode of architecture: they say they delight in plenty of air, and that it is often necessary to set fire to their habitations, when they are in danger of being devoured by myriads of fleas. It is matter,

exceeded; but the senses of new converts must be struck with the most lively impressions. A representation of Paradise, placed opposite to that of Hell, is supposed to produce less effect on them. In returning from church, they re-passed the same row of Indians, male and female, who had never deserted their post during the *Te Deum*: the children had removed a little, and formed groups round the missionary's house, which is opposite the church. The village, which is on the right, consists of about fifty cabins, which form dwelling places for seven hundred and forty persons, including men, women, and children, which compose the mission of Saint Charles †.

The colour of these people resembles that of the negroes: their store-houses are built of brick, and pointed with mortar; their horses, oxen, and many other particulars, give this country the appearance of a habitation of Saint Domingo, or some other West-India colony. The people are collected together by the sound of a bell; and conducted to their work, and all their exercises by one of the religious. Unfortunately the picture is still more perfect: men and women were seen loaded with irons, others were fixed in a frame resembling the stocks; and the noise of the strokes of a whip assailed the ears of all present, a proof that this punishment is also admitted here, though it is said not to be exercised with severity ‡.

indeed, of no great importance, for they can build another in the course of a few hours. The independent Indians, as hunters, find it often convenient to change their places of abode.

‡ The monks give the following account of the government of the religious community among the missionaries; for no other name can be applicable to them: they are superiors in temporal as well as spiritual affairs; and the products of the land are under their control. Seven hours in the day are appropriated to labour, and two to prayers. On Sundays and festivals four or five hours are devoted to prayer, and the remainder of their time dedicated to rest and divine worship. Corporal punishments are inflicted on all those Indians who neglect pious exercises, and many of their sins incur the chastisement of chains or the stocks. In a word, from the moment a new convert is baptized, he is considered as if he had pronounced eternal vows; if he should escape, with a view of returning to the independent villages, he is three times summoned to return; and, on his refusal, they claim the assistance of the governor, who dispatches soldiers to force him from the protection of his family, § and conduct him to the missions, where he is sentenced to suffer flagellation with a whip.

The

The

§ As these people are hostile to their neighbours, they cannot remove themselves further than twenty or thirty leagues.

The Indians, as well as the missionaries, rise with the sun, and devote an hour to prayers and mass; during which time a species of boiled food is prepared for them: it consists of barley meal, the grain of which has been roasted previous to its being boiled. It is cooked in the centre of the square, in three large kettles. This repast is called *atole* by the Indians, who consider it as delicious, it is destitute of salt and butter, and must consequently be insipid to a Frenchman. A person is deputed from every cabin, to receive the portion for all its inhabitants, in a vessel formed of bark: no disorder or confusion arises in the distribution of the allotments; when the coppers are empty, they give what remains at the bottom to those children who have most distinguished themselves in their lessons of catechism. Three quarters of an hour being exhausted in this meal, the partakers return to their labours; some to plough, others to dig, and others to be employed in their respective domestic occupations, but always under the inspection of one or more of the religious.

The women have little more to attend to than their housewifery, their children, and the roasting and grinding of several grains: the latter operation is long and laborious, as they employ no other means than that of crushing it in pieces with a cylinder upon a stone. M. de Langle, however, seeing this operation, gave the missionaries his mill, with which four women could, in one day, perform the work of a hundred; and sufficient time would then remain for them to open the wool of their sheep, and to manufacture their stuffs. But the religious, almost wholly occupied in their heavenly interests, are so regardless of their temporal welfare, that they have neglected to cultivate the common arts. So

* The rewards given are small distributions of grain, of which the little cakes are made, which are baked on burning coals; and on grand festivals the ratio is beef, which by many of them is eaten raw, especially the fat, which the natives prefer to the most excellent butter and cheese. They are very expert in skinning animals; and, when they perceive they are fat, they express a kind of voluptuous pleasure by cawing like ravens. Sometimes they are permitted to hunt and fish upon their own account, when on their return, they usually make the missionaries a present of a part of what they have procured. The women rear fowls in the environs of their cabins, with the eggs of which their children are fed. These fowls, as well as the cloaths of the Indians, are their own property: they are also entitled to little articles of household furniture, and those peculiar to the chase. No instances are related of their hav-

ing great is the austerity of their practice, that they will not indulge themselves with a chimney in their apartments, notwithstanding the severity of the winter in that country. At noon, when the dinner was announced by the bell, the Indians quitted their employments, and sent for their proportions as at breakfast: but this second meal was more substantial than the former, being improved with corn and maize, and pease and beans; the Indians call it *poussola*. After this meal, they again return to their labour, till four or five: afterwards they pass an hour at evening prayers, and a new *atole* is provided like that at breakfast.

The Indian women, having no earthen or metallic vessels for this operation, perform it in baskets made of bark, over some lighted charcoal: they turn them with that rapidity, that they facilitate the swelling and bursting of the grain, without setting fire to the basket. The best roasted coffee is not prepared with that address and ingenuity which these women display in the preparation of their corn. It is regularly distributed to them every morning, and the most trivial dishonesty, when detected, is punished by whipping: but the women never receive this species of correction in public, but in a distant and enclosed place, imagining perhaps that their cries might create too much compassion, and induce them to revolt. The latter receive their punishment exposed to public view, to serve as an example. Before the strokes are given, they usually ask pardon, which has considerable effect in weakening the force of them, but they never recede from their stipulated number*.

The converted Indians preserve those ancient usages which are not prohibited by their new religion; the same cabins, games, and dresses.

ing robbed each other, though they have no other fastening than a bundle of straw placed across the entrance. The reader will, however, reflect that there is no furniture in these habitations.

In the missions, the men have sacrificed more to Christianity than the women, as they were habituated to polygamy, and permitted to espouse all the sisters of a family. The women have acquired the exclusive right of receiving the caresses of one man only. At the expiration of an hour, after supper, they confine, under lock and key, all those whose husbands are absent, and all young girls exceeding the age of nine years. But these precautions were often found ineffectual, men being frequently seen in the stocks, and women in irons, for having deceived the vigilance of these indefatigable females.

The

The dress of the richest consists of an otters' skin cloak, to cover their loins, and descend below the groin: the most indolent are satisfied with a simple piece of linen cloth, furnished by the mission to conceal their nakedness; a cloak of rabbits' skin, tied under the chin, serves as a veil for their shoulders: the rest of the body remains absolutely naked; except the head, which is sometimes ornamented with hats of straw, curiously matted or plaited. The women have a cloak of deer skin, tanned; those of the missions make a small bodice, with sleeves, of the same material. This, with a small apron of rushes, and a petticoat of stag's skin, which descends to the middle of the leg, is the whole of their apparel. Girls under the age of nine years have only a simple girdle, and boys are completely naked.

The Indians of the *rancheries*,* or independent villages, are accustomed to paint their bodies red and black, when they are in mourning; but the missionaries have prohibited the former, though they tolerate the latter, these people being singularly attached to their friends. The ties of family are less regarded among them than those of friendship: the children show no filial respect to the father, having been obliged to quit his cabin as soon as they were able to procure their own subsistence: but they are infinitely more attached to the mother, who has reared them with the greatest tenderness, and never corrected them but when they have exhibited marks of cowardice in their little engagements with children of their own age. The aged men of the *rancheries*, who are become incapable of hunting, are supported at the joint expence of the village, by the individuals of which they are highly respected. The arms of the independent savages are the bow and arrow, pointed with a flint very curiously worked †.

The Indians, under the control of the missionaries, believe their superiors have an immediate

* The independent villages are so called.

† They neither eat their prisoners, nor their enemies which they have slain in battle: but when they have vanquished and killed eminent chiefs, or other courageous men, they have sometimes eaten pieces of them, less to gratify their revenge than to pay homage to their valour; fully convinced also that such food would inspire them with additional courage. In the Canadian style, they scalp the vanquished, and pluck out their eyes, which they preserve in excellent perfection as tokens of their vic-

communication with God, and that they daily prevail on him to descend upon the altar. Protected, under this opinion, the fathers live in perfect security in the villages; not having even their doors shut whilst they are asleep. Homicide is hardly known among the independents, and when it does happen it only incurs contempt; and if a man loses his life from the blows of several persons, he is supposed to have deserved his fate, by having drawn so many enemies upon him.

A Spanish commissary at Monterey, named M. Vincent Vassadre y Vega, brought orders to the governor to collect all the otter skins of his missions and presidencies, government having reserved to itself the exclusive commerce of them; and M. Fages assured La Perouse that he could annually furnish twenty thousand of them. The Spaniards were ignorant of the importance of this valuable peltry till the publication of the voyages of Captain Cook: that excellent man has navigated for the general benefit of every nation; his own enjoys only the glory of the enterprize, and that of having given him birth ‡.

New California, though extremely fertile, cannot boast of having a single settler: a few soldiers, married to Indian women, who dwell in the forts, or who are dispersed among the different missions, constituting the whole Spanish nation in this district of America. The Franciscan missionaries are principally Europeans; they have a convent at Mexico. The viceroy is now the sole judge of all controversies in the different missions. Don Bernardo Galves having united all the powers, Spain allow four hundred piasters to each missionary, two of which are appropriated to a parish: supernumeraries receive no salary. Money indeed is useless in a country where nothing can be purchased: beads are considered as the only money of the Indians. The convent of Mexico, instead of piastres, sends the value in effects; such as wax church-candles,

tory. They burn their dead, and deposit their ashes in morais.

‡ The otter, an amphibious animal, is common over the whole western coast of America. The Indians, who are not so good seamen as the Esquimaux, and whose boats at Monterey are formed of reeds, catch them on the land with snares, or felt them to the earth with large sticks. But to ensure success in this mode of attack, they must carefully conceal themselves behind the rocks, as, on the least noise, the timid animal plunges into the water.

H

wine,

wine, oil, sugar, and chocolate. The salary of the governor is four thousand piastres; of the lieutenant governor four hundred and fifty. The captain inspector of the two hundred and eighty-three cavalry has a salary of two thousand piastres. Eight piastres is the price of a good horse; an ox is worth five piastres.

La Perouse having received favours from the soldiers, sent them a present of a piece of blue cloth. He also made presents to the missions of stuffs, coverlits, iron tools, beads, and sundry little articles, which might be necessary or convenient for them. The president did not neglect to inform the whole village, that it was bestowed on them by their ancient and faithful allies, who professed the same religion as the Spaniards. This intelligence operated on their generosity so effectually that each of them brought a bundle of hay or straw on the following day, for the accommodation of the sheep and

oxen which were destined to be taken on board*.

On the evening of the 22d, every thing was on board, and leave had been taken of the governor and missionaries. The navigators carried away large quantities of provision, and transferred the poultry-yard of M. Pages, and that of the religious to the hen-coops of the two frigates. They also received from the religious large supplies of grain, pease, and beans: their offers of payment were obstinately resisted, accompanied with the following reply—"They were the administrators, not the proprietors of the property of the missions."—On the morning of the 24th, they sailed.

This section is followed by an account of some astronomical observations; remarks on the accuracy and use of time-keepers, and a vocabulary of the language of the different colonies adjacent to Monterey.

SECTION IX.

Monterey—Discover Necker's Island—In Danger of perishing on a 'Sunken' Rock—Sail after the Isles de la Mira and des Jardins—Description of the Island of Assumption—Anchor in the Road at Macao—Arrival at Macao—Description of it—Departure from it—Landing on the Island of Luconia—Enter Manilla Bay—Anchorage at Cavite—SEPTEMBER, 1786—JANUARY, FEBRUARY, 1787.

THE object of La Perouse's voyage being new discoveries, and the progress of navigation in seas not much known, he avoided the frequent tracks. He was obliged, however, to keep in the zone of the trade winds, as, without their assistance, he could not reach China in six months; and consequently could not pursue the ultimate design of his voyage. Since the taking of the Manilla Galleon by Admiral Anson, and even during the course of two ages, no progress has been made respecting the knowledge of this sea till the discovery of the Sandwich Islands; the Resolution, the Discovery, the Boussole, and the Astrolabe being the only ships which have departed from the tracks followed by the galleons for a period of two hundred years.

* Of wood and water a competent supply was procured; the botanists lost no opportunity of endeavouring to increase their collection of plants, but the season was very unfavourable. The mineralogists were as zealous and almost as unfortunate as the botanists: they found blocks of

Calms and contrary winds detained La Perouse two days in sight of Monterey. Afterwards, noting the longitude assigned to the Island Nostra Señora de la Gorta, he entertained less hope of meeting with it, than of blotting it out from the charts; for islands improperly determined respecting latitude and longitude, had better remain in oblivion till accurate observations have actually been made.

On the 3d of November the frigates were surrounded with noddies, terns, and man-of-war birds; and on the 4th they made an island which bore west. At five in the morning of the 5th, they were only three leagues from the island, and La Perouse hailed the Astrolabe to make sail ahead, and prepare to anchor.

granite, some fragments of porphyry, but no trace of metal. Shells are not abundant: oysters were found, the pearls of which equal in size and beauty those of Ceylon, or the Gulph of Persia.

This

This small island is little more than a rock of about five hundred toises in length. Not a tree is to be seen on it, but a great deal of grass is visible on the top: the rock is much disfigured by the dung of various birds: the extremities of it are perpendicular like a wall, and the sea broke around it with such violence as to render it impossible to think of landing. La Perouse named it Isle Necker: during the day men were continually occupied in looking out at the mast head: the weather was squally, with rain: at sun-set it was fine: birds innumerable were moving around them in different directions. At the close of the evening, the moon being at full, it was so light that they thought they might venture to stand on. From the time of quitting Monterey to the present moment they had not known a finer night or a smoother sea; but these flattering appearances had almost occasioned the destruction of our navigators. About an hour past one in the morning La Perouse saw breakers at two cables' length a-head of the ship; the sea being so smooth, the sound of them was hardly heard: the Astrolabe perceived them at the same time, though at a greater distance from them than the Bouissole: both the frigates instantly hauled to port; with their heads to the south-east. La Perouse gave orders for sounding: they had nine fathoms, rocky bottom; soon after ten and twelve fathoms, and in a quarter of an hour got no ground with sixty fathoms. They had just escaped the most imminent danger to which navigators can be exposed: happily no disorder or confusion arose; for the slightest negligence in working the ship, to remove ourselves from the breakers, must have accelerated our destruction. For almost an hour they saw the continuation of these breakers; but they stretched away in the westward, and lost sight of them in about three hours*.

* Had not this rock been more particularly reconnoitered, doubts would perhaps have remained with respect to the reality of its existence; but La Perouse, anxious that navigators should no longer be exposed to it, made a signal, at day-break, to tack and find it once more. At eight in the morning he saw it in the north-north-west; he crowded sail to near it, and soon perceived an inlet or split-rock, the diameter about fifty toises, and near twenty-five fathoms in height: it was situate upon the north-west extremity of this reef of rocks, the south-east point of which had so nearly proved fatal: it extended about four leagues in that point of the compass. He perceived, between the islet and the south-east breakers, three sand banks, not elevated more than four feet above the level of the sea; a

After some judicious observations on the knowledge, use, and existence of the trade winds, La Perouse observes that he had directed his course with an intention to pass between Mira Island, and Desert and Garden Islands; but he declares that their names occupy spaces on the charts, where no land ever was, and thus impose upon navigators. The island of Assumption, to which the Jesuits have attributed six leagues of circumference, from the angles now taken was reduced to half, and the highest point is about two hundred toises above the level of the sea. A more horrid place cannot be conceived. It was a perfect cone, as black as a coal, and very mortifying to behold, after having enjoyed, in imagination, the cocoa nuts and turtles expected to be found in some one of the Maiane Islands. Some few cocoa-nut trees indeed appeared, which occupied a very small part of the island, in a hollow of about forty toises, where they were sheltered from the east wind: this is the only place where ships can possibly come to an anchor, in a bottom of thirty fathoms, black sand, extending about a quarter of a league. La Perouse's boat was sent on shore, under the command of M. Bontio; as well as that of the Astrolabe, in which M. de Langle himself embarked: fortunately the boats returned at two, and the Astrolabe got under way. M. Bontio assured La Perouse that the island was infinitely more horrible than it appeared at a little distance: torrents of lava formed ravines and precipices, bordered by a few stunted cocoa trees. Several persons were employed from nine in the morning till about noon in picking up about a hundred cocoa-nuts; and they experienced much difficulty in taking them to the sea-shore, though the distance was very inconsiderable. The lava from the crater covers the whole side of the cone almost to the sea: the summit never was visible,

greenish kind of water, not seeming to be above a fathom deep, separated them: rocks nearly level with the water, on which the sea broke with great violence, encircled this shoal, and defended it from the fury of the waves. He coasted along it at about the distance of a league on the east, south, and west side: on the north only a bird's eye view could be obtained from the mast-head; the length of it from the south-east to the north-west is about four leagues. It is twenty-three leagues distant to the west-north-west from Necker's Island. It may be approached with safety within the distance of four leagues. As this dangerous rock had nearly terminated his voyage, La Perouse gave it the name of *Basse des Frigates*.

being

being always capped with a heavy cloud; but smoke could not be perceived, the sulphur which powerfully saluted the nose, sufficiently proved that it was not quite extinct, or that the last eruption of it was at no remote period.

Fortunately no supply of water was required till we reached China: the sailors saw none of this valuable fluid but in the hollows of the rocks, where it was preserved as in a vessel, and the most capacious of them did not contain two gallons. During the night an immense quantity of birds surrounded the two frigates; which were supposed to be the inhabitants of the Mangs and Uracs, which are only rocks. Most of them were species of man-of-war birds, and noddies, with some terns, gulls, and tropic birds. The Boussole now, for the first time, made a little water, which La Perouse attributed to the decay of the oakum about the sea of the water-line. It was not possible for the caulkers to regulate this work at sea, but it became their first employment after the arrival of the ships in Macao road.

La Perouse did not mean to touch here, the Bashees having before been often visited, and having nothing particularly interesting. Having determined the position, he continued his course towards China; and on the first of January, 1787, he found bottom in sixty fathoms: a num-

* From every circumstance it appeared that neither human creature, nor quadruped, has ever sought an asylum on this island. A few large crabs were indeed perceived, one of which was taken on board; it is more than probable that this crustaceous animal has forced the sea-birds from the island, by devouring their eggs, which they always lay upon land. At the anchorage we only saw three or four noddies, but M. de Langle, while upon Assumption Island, killed a bird of a black colour, not unlike what is generally termed a black bird.

The naturalists found several fine shells in the cavities of the rocks: several plants were also collected, and three or four different species of the banana trees. No other fishes were seen than the red ray, the small shark, and a sea-serpent about three inches in diameter. The cocoa-nuts and the few objects of natural history we had procured, had exposed the boats and their crews to serious dangers. M. Boutin, who was under the necessity of throwing himself into the sea, to debark and get on board again, had been wounded in the hands by leaning on the sharp edged rocks, which he could not possibly avoid. M. de Langle also got the better of several imminent risks inseparable from landings on such small islands, especially of so circular a form.

† On the 28th our navigators made the Bashees Islands, of which Admiral Byron has given an erroneous account respecting longitude: that of Captain Wallis is more correct.

ber of fishing boats surrounded him the next day; but their attention was diverted from our navigators by extremely bad weather. Besides, their manner of fishing would not permit them to gratify their curiosity by a transient visit: they were using very long nets, which they dragged over the bottom, and which required two hours to haul it up with dexterity. On the 2d of January our navigators made the White Rock. In the evening they anchored to the northward of Ling-ting Island, and the following day in Macao Road.

Cloudy weather had prevented us from perceiving the town, but at noon it cleared up: and the navigators made it from the west a degree south about three leagues. La Perouse sent a boat on shore, commanded by M. Boutin, to inform the governor of his arrival, and that he intended to continue in the road in order to refresh the ship's companies. M. Bernardo Alexis de Lemos, governor of Macao, received this officer with great politeness, and promised him every assistance within his power. He immediately sent a Malay pilot on board, to conduct them to the anchorage at Typa. At day-break they got under way, and at eight brought up in three fathoms and a half, the town of Macao bearing north-west five miles.

The Chinese trade with the Europeans to an immense

They passed within a league of the two rocks which are most to the southward: they ought rather to be called islets, without regarding the authority of Dampier; the least of them being half a league in circumference; and though not woody, it contains plenty of grass on the east-side.

‡ The navigators came to an anchor alongside of a French flute, commanded by M. de Richery, ensign in the navy, which had come from Manilla. M. de Richery had the preceding evening, accompanied the Malay pilot, and brought a plentiful supply of fresh meat, pulse, fruit, and other seasonable refreshments. As soon as the ship was moored, La Perouse went on shore with M. de Langle, to thank the governor for his kindness to M. Boutin, and entreat permission to have his establishment on shore, that he might erect an observatory. M. de Lemos received them as countrymen; and every favour they requested was instantly complied with. He offered them his house; and, as he was unacquainted with the French language, his wife, an amiable young Portuguese, obligingly undertook the office of interpreter. Donna Maria de Saldagnabad, twelve years before married M. de Lemos at Goa; soon after which La Perouse, then commander of the flute la Seine, happened to be in that city: she kindly reminded him of this circumstance, which was strongly impressed on his memory, and pleasantly remarked that, "He was an old acquaintance." Then

immense amount; upwards of one third of which is paid in silver, the rest in English cloth, Batavian tin, opium from Patan, cotton from Bengal and Surat, and in sandal wood and pepper from the coast of Malabar. Many articles of luxury are also carried from Europe. In exchange for these the Chinese give nothing but their black and green tea, and some chests of raw silk for the European manufactures. Their China ware, with which they ballast their ships, and from which they derive very little profit, is too unimportant to be noticed. There is not a nation in the world that carries on so advantageous a commerce with strangers as the Chinese, nor one that imposes such hard conditions, vexations, and restraints: every cup of tea, drunk in Europe, has created some kind of humiliation to those who purchased it at Canton, and who have sailed over half the globe to bring this fascinating leaf into their markets. The following genuine fact will illustrate the Chinese character. An English gunner, making a salute by order of his superior officer, killed a Chinese fisherman, who had imprudently, and without the knowledge of the gunner, placed himself within the range of the musket. The Governor of Canton demanded and obtained the gunner, on a promise that he would do him no injury, declaring he could not be guilty of such injustice as to punish an involuntary homicide. Relying on this assurance, the unfortunate man was delivered up, and about two hours afterwards he was hanged.

Macao, situate at the mouth of the Tigris, is capable of receiving a sixty-four gun ship into its road, at the entrance of Typa; and in its port, below the city, ships of seven hundred tons half laden. The entrance of this port is defended by a fortress consisting of two batteries, and three small forts. These fortifications,

Then, calling all her children into her presence, she assured him that it was thus she always presented herself to her friends; that their education was the object of all her cares; that she was proud of calling herself their mother, a pride which she trusted he would forgive, as she was resolved to introduce herself to her friends with all her faults. The whole universe could not exhibit a more enchanting picture: the finest of children, saluted and caressed by a mother of the most amiable deportment. To her personal charms and private virtues, she added a firm character, and an elevated mind. The administration of M. de Lemos at Goa, would have been highly advantageous to that colony, had government continued him in that distinguished office

which are in a neglected state, would not be regarded by Europeans, though they are sufficient to awe the whole maritime forces of the Chinese. A mountain also commands the country, on which a detachment might hold out a very long siege. The Portuguese of Macao, thinking more of their religious than their military duties, have erected a church on the ruins of a fort which crowned this mountain, and formed a post almost impregnable.

The Portuguese limits extend no farther than about a league from the city: they are bounded by a wall, and guarded by a few soldiers, under a mandarin. This mandarin is indeed the real governor of Macao, and the person to whom the Chinese owe obedience. He has not the privilege of sleeping within the enclosure of the limits, yet he may visit the place, inspect the custom-houses, &c. And on these occasions the Portuguese must salute him with five guns. But no European is permitted to set a foot on the Chinese country beyond the wall: an attempt of that kind would subject any person to the mercy of the Chinese: for such an indiscretion large sums might be demanded of him, or he might suffer detention as a prisoner. Some of the officers of the frigates wantonly exposed themselves to this risk, but it fortunately happened that no serious consequences arose from their levity*.

The viceroy of Goa appoints all the military and civil officers at Macao. The governor, and the senators are nominated by him. He has lately appointed the garrison to consist of one hundred and eighty Indian seapoys, and one hundred and twenty militia: the soldiers are armed with staves, the officer only, being permitted to wear a sword; but, on no occasion to use it against a Chinese. If a robber of that nation is detected in breaking open a door, or

for a longer term than three years, and given him time to accustom the Chinese to a resistance of which they had even lost the recollection.

* The population of Macao is estimated at twenty thousand, of which about one hundred are Portuguese by birth; two thousand Portuguese Indians, of half blood; about the same number of Caffre slaves, who act in the capacity of domestics: the rest are Chinese employed in commerce or different occupations. But though most of them are mulattoes, they would deem it disgraceful to exercise any mechanical art for the maintenance of themselves and families. Their feelings, however, are not injured by earnestly and continually soliciting charity from passengers.

purloining any effects, he must not be arrested without the greatest precaution: if a soldier, in his own defence, should unfortunately kill him, he is delivered over to the governor, and hanged in the market-place. But if a Chinese kill a Portuguese, he is examined by the judges of his own nation, who make a pompous parade of fulfilling all the formalities of justice, but always connive at the evasion of it. The Portuguese, however, have lately made a spirited effort, which reflects honour on them. A seapoy having killed a Chinese, they shot him themselves in the presence of the Mandarin, and would not submit the decision of the affair to those of his own country*.

This is a handsome city, and has several fine remains of its ancient opulence: the principal houses are now occupied by the super-cargoes of different companies, who are obliged to pass the winter in Macao: the Chinese compel them to quit Canton on the departure of their last vessel, and will not suffer them to return thither till the arrival of the European ships in the following monsoon. Macao is an agreeable residence during the winter, principally on account of the super-cargoes who inhabit it, who are generally men of distinguished merit, and are enabled from their situation to be liberal and obliging. The navigators, from the object of their mission, experienced the most flattering reception: had they possessed no other title than that of Frenchmen, they might have been considered as orphans, the French East India Company having no representative there at that period.

To M. Elstockenstrom, the principal agent of the Swedish East India Company, La Perouse acknowledges great obligations to be due. He

* The senate of Macao consists of a governor, who presides, and three *veredores*, who audit the city accounts. Two judges of orphans are next in rank, who take charge of the property of minors, the nomination of tutors and guardians, the regulation of testaments, and successions: but appeals from their sentence may be prosecuted at Goa. The other causes, civil or criminal, are tried in the first instance, by two senators, named judges.

The Procureur of the city is the medium of communication between the governments of Portugal and China; he is answerable for all strangers who reside at Macao during the winter, and receives and transmits the reciprocal complaints of the respective governments: he is the only per-

§ When Captain Dixon was desirous of procuring fresh provisions for the ship's company, no time was lost in making necessary enquiry for that purpose; but he found it impossible to avoid a number of impositions; and that every vessel was supplied with whatever provisions they wanted by an

readily undertook, at his departure, the sale of all his peltry. The value of these articles was ten times less than at the period when captains Gore and King arrived at Canton; six expeditions having this year been undertaken by the English on the north-west coast of America. Some difficulty now arose with respect to the landing of the peltry, and their warehousing at Macao: the senate, to whom the French consul addressed himself, refused permission; but the governor, understanding it was the property of the sailors, who were employed on an expedition for the general benefit of mankind, ventured, in this instance, to depart from the general rules which had been prescribed to him†.

The climate of the road of Typa is, at this season of the year, precarious: most of the crews were afflicted with colds, accompanied with a fever; which yielded to the salutary temperature of the island of Luconia, when they approached it on the 15th of February. The north winds enabled La Perouse to stand to the eastward, and he would have made Piedra Blanca, had they not speedily come round to the east-south-east. From the instructions he had received at Macao, respecting the best track to follow to Manila, a diversity of opinions prevailed: the easterly winds, blowing with violence, induced him to haul close to the starboard tack, and to shape his course to leeward of *Bank de Pratas*, which all the charts had erroneously laid down till Captain Cook's third voyage: Captain King, by accurately fixing the latitude of it has been highly serviceable to navigators who coast from Macao to Manila.

Our navigators sailed along the Ilhoco coast, at the distance of two leagues, and perceived, in

son who is not removeable at pleasure from his situation. That of the governor is held for the term of three years: the other magistrates are changed annually. An appeal lies to Goa from all decrees of the senate; their known inability renders this law extremely necessary.

† La Perouse having received proofs of the knavery of the *Crompador*§, an officer usually employed to procure provisions, he was dismissed; and the commissary of provision went daily to market, as in every European city, to purchase every article that was required: in consequence of this the expence of a whole month was less than the extravagant imposition of the first week.

the port of Santa Cruz, a small two-masted vessel, which was probably taking in a cargo of rice for China. On the 20th they doubled Cape Buliano, and on the 21st saw Point Capones, which bore east; they worked up to gain the anchorage, which does not extend more than a league from the shore. They saw two Spanish vessels, which appeared to be afraid to open the entrance of Manilla Bay, out of which the easterly wind blew strong, remaining under the shelter of the land. They made a stretch to the south of Marivella Island, in hopes of entering the north channel; but, after several tacks, they resolved to bring up in the port of Marivella, to wait for a fair wind, or a more favourable current. They came to an anchor there in eighteen fathoms; the town bore north-west by west, and the Hogs (*les Pores*) south by east. This port, which is open only to the south-west winds, is good holding ground.

Wanting wood, which he knew was dear at Manilla, La Perouse came to a resolution of remaining twenty-four hours at Marivella to procure some; and early the next morning all the carpenters of the two frigates were sent on shore with the longboats: the rest of the ships' company, with the yawl, were reserved for a fishing party, but they were unsuccessful, as they found nothing but rocks and very shallow water. About noon La Perouse went on shore to the village, consisting of about forty houses, built of bamboo, covered with leaves, and ascended by a ladder: all the materials of such a house, including frame and roof, could not exceed the weight of two hundred pounds. A large edifice of hewn stone fronts the principal street; and, though in a ruinous state, two brass guns appear at the windows, which serve for

* This reverend shepherd was a young mulatta Indian, who inhabited the decayed mansion already described: some earthen pots, and a small wretched bed were the principal articles of his furniture. He said his whole parish, consisting of about two hundred persons, were ready, at the least warning, to hide themselves in the woods to escape the outrages of the Moors, who frequently make descents upon these coasts: they are so daring, and many of their crimes so negligent, that they often penetrate as far as the extremity of Manilla Bay. While our navigators were at Cavite, seven or eight Indians were taken away in their canoes at a small distance from the entrance of the port: even the passage boats from Cavite to Manilla, were captured by these same ferocious Moors. They undertake these enterprizes in light row boats; and are opposed by the Spaniards with an armament of galleys, which are so

embrasures. This parish is so miserably poor, that only a small hog, and a dozen fowls could be purchased in it. The curate, however, procured a young ox, which he positively asserted was the eighth part of the only herd in the parish*.

The curate had three small antelopes, which he refused to sell, alledging that he intended them for the governor of Manilla: there would have been, however, no probability of keeping them alive, they were so small and delicate, not exceeding a rabbit in size: the male and female represented the stag and the hind in miniature. Some beautiful birds, with varied vivid plumage, were seen in the woods, but the forests were rendered so impenetrable by being incumbered with climbing shrubs, that little game could be procured. In the village some *stabbed* turtle-doves were offered for sale: they obtained this name from having a red spot on the breast, resembling a wound given by the cut of a knife.

On the approach of night our navigators embarked, and prepared for sailing the next day. La Perouse hired as a pilot, an old Indian, who had been sent to him by the captain of one of the Spanish ships; the terms agreed on were fifteen piastres to pilot him to Cavite. Early on the 25th he sailed; and, though it is only seven leagues from Port de Marivelle to that of Cavite, he was three days in making this run. Though M. Depres's plan is incorrect, he would have been a better guide than the Indian pilot, who nearly ran aground upon the bank of St. Nicholas. The water in this bay is so smooth that the shoals in it cannot be discovered; but, in working into it, it is always necessary to keep the island de la Monha open with the north channel of Marivelle, and to put about when

very slow in their motions that they have never taken any of them.

The officer next in dignity, after the curate, is the alcade, who enjoys the honour of bearing a cane with a silver head: his authority over the Indians is so great, that they dare not sell a fowl without his permission, or till he has ascertained the price: he has also the privilege, on account of government, of being the sole vender of tobacco for smoking, of which the Indians are extravagantly fond. This tax, which has lately been imposed, is thought an intolerable grievance by the poorest class of the people, and has occasioned several revolts: La Perouse observes, that he should not be much astonished if it produced consequences, as extraordinary as the duty upon tea and stamp-paper did in North America.

this

this island begins to be shut in. On the 28th the navigators came to an anchor in the port of Cavite, in three fathoms, at two cables' length from the town. Twenty days elapsed in their

run from Macao to Cavite, but had they followed the ancient custom of the Spaniards and Portuguese, in passing to the northward of Bank de Pratas, they would have been much longer.

SECTION X.

Arrival at Cavite—How received by the Commandant—M. Boutin dispatched to the Governor General at Manilla—His Reception—Details respecting Cavite—Description of Manilla—Penances during Passion Week—Duty on Tobacco—Continuance at Manilla—Departure from Cavite—Encounter a Bank in the Channel of Formosa—Particulars of the Pescadore; or Pong-hou Islands—Run along Kumi Island—The Frigates enter the Sea of Japan, and run along the Coast of China—Run along the Coast of Corea—Quelpert Islands—Dagelet Island, &c.—APRIL, 1787.

THE navigators were hardly anchored at the entrance of the port of Cavite, when an officer from the commandant came on board to request them not to go on shore till orders were received from the Governor General, to whom he should dispatch a Courier, when he knew the motives of their arrival. They informed him that they wanted provision, and permission to refit their ships, to enable them to continue their voyage without delay: but, before the Spanish officer had left them, the commandant of the Bay, having perceived their ships, arrived from Manilla*. He told our navigators that he had been informed of their arrival in the Chinese seas, and that the Spanish minister, in his letters, had long announced them. After some farther conversation he permitted M. Boutin, La Perouse's lieutenant, to accompany him in his boat to mention their arrival to the governor-general, and to solicit his orders that their several demands might be fulfilled before the 5th of April; the nature of their voyage requiring that the two frigates should be under sail the tenth. M. Busco, governor-general of Manilla, received the officer with great politeness, and issued positive orders that nothing should retard their departure.

He also ordered the commandant of Cavite to procure them every convenience in his power: proper houses were provided for them for salting

their provision, and repairing their sails. They were indeed excellently accommodated, and found in the market and the arsenal every thing that could be required in one of the best ports in Europe. Cavite, situate, three leagues to the south-west of Manilla, was formerly a place of importance; but at the Philippines, as in Europe, the large towns are, in some degree, swallowed up by the little ones: it has now the commandant of the arsenal, a contador, a few other officers, and a hundred and fifty men in garrison. The other inhabitants consist of Mulattoes or Indians employed at the arsenal, and with their numerous families, form a population of about four thousand, including the city and the suburb of Saint Roch. There are two parishes, and three convents of men. The Jesuits had a handsome house here, which is now in the hands of government. The whole place is now almost a heap of ruins†.

Two days after the arrival of our navigators at Cavite, M. de Langle, accompanied by several officers, embarked for the capital. They made this trip in their boats, well armed on account of the Moors who infest Manilla Bay. They visited the governor, who detained them to dine with him, and afterwards sent an officer to conduct them to the residence of the archbishop, the intendant, and the several oidors. This proved a very fatiguing day: the heat was

* The commandant of the bay, in Spain, is the principal of the custom-house officers, with military rank: that of Manilla has the rank of captain.

† Having no hopes of meeting with a port more commodious than this, the captains of the two frigates resolved

to overhawl their rigging completely, and strap their lower masts. This resolution was attended with no delay, as they were obliged to wait a month for the provision, for which they had applied to the intendant of Manilla.

excessive, and they were on foot in a city where none of the inhabitants ventured out without a carriage; but none were to be hired, as at Batavia: had not M. Sebir, a French merchant, who accidentally heard of their arrival, sent them his coach, they would have been under the necessity of relinquishing the several visits they had engaged to make*.

Manilla is erected on the bay which also bears its name, and lies at the mouth of a river, being one of the finest situations in the world: all the necessaries of life may be procured there in abundance, and on reasonable terms; but the cloths, and other manufactures of Europe, are extravagantly dear. The great possessions of the Spaniards in America, have not permitted the government to attend minutely to the Philippines. La Perouse confidently asserts, that a great nation, without any other colony than the Philippines, which would establish a proper government there, might view all the European settlements in Africa and America without envy or regret.

These islands contain about three millions of inhabitants, and that of Luconia consists of about a third of them. These people seem not inferior to Europeans; they cultivate the land with skill, and among them have ingenious goldsmiths, carpenters, joiners, masons, blacksmiths, &c. La Perouse says he has visited them at their villages, and found them affable, hospitable, and honest. The Spaniards indeed speak contemptuously of them, but the vices they attribute to the Indians, may with more propriety be placed to the government established among them†.

* The city of Manilla, including its environs, is extensive, and the population is estimated at thirty-eight thousand, not more than twelve hundred of which are Spaniards; the rest are composed of Mulattoes, Chinese, or Indians. The most inconsiderable of the Spanish families are not without a carriage. The neighbourhood of Manilla is truly delightful, seated on a beautiful river, branching into different channels, the two principal of which are received by the Lagoon, or Lake of Bahæa, seven leagues within the country, surrounded by more than a hundred Indian villages, and in the midst of a fertile territory.

† Some streams producing gold-dust, in the neighbourhood of the Spice Islands, were certainly the temptations which occasioned the settlement of the Philippines; but the produce has not answered the expectations that had been formed of it. Enthusiasm superseded avarice, and multitudes of religions, of every order, were sent thither to disseminate christianity. So earnest and successful were these pious labourers, that these islands, in a very short time contained eight or nine hundred christians. Had this

Many oppressive distinctions are here supported and established with the harshest severity: the number of horses to draw carriages is fixed for persons of every rank; those who have the greatest number take precedence of all others travelling on the same road; they being compelled to submit to the mortification of keeping in a line behind their carriages. But the vices and vexations resulting from this government have not totally destroyed the advantages of the climate: the peasants display an air of happy cheerfulness, beyond what is generally observed in European villages; their habitations, shaded by luxuriant fruit-trees which require no cultivation, are singularly neat and picturesque. A late impost on tobacco is considered as a terrible scourge upon the people: their fondness for this narcotic is so excessive, that hardly a man or woman is to be seen without a *segur*† in the mouth; even infants are permitted to contract this habit. The tobacco produced in the island of Luconia is the best in Asia: it is cultivated round every house, for the consumption of its inhabitants, and is transported, by permission or stealth, into every part of India.

The prohibitory law lately promulgated respecting this favourable plant, confines the cultivation of it to particular districts, where the advantages resulting from it are to be appropriated to the use of government. The price has been fixed at half a piastre a pound, in consequence of which the pay of a day-labourer will not permit him to procure a sufficient quantity of tobacco for the consumption of his own family. Insurrections were menaced in every

zeal been tinctured with prudence and philosophy, good consequences might have been expected, but the people were subjected to the most ridiculous and extravagant practices; every sin was punished with whipping, in proportion to the priest's idea of its enormity; the punishment for non-attendance at prayer or mass, was indiscriminately inflicted on men and women, by order of the curate, at the church-door. The holidays, and the practice of particular devotions consume much of their time; La Perouse says he has seen, during passion week, masked penitents dragging chains in the streets, having their waists and legs surrounded with a girdle of thorns, receiving in certain situations several severe strokes of discipline, and submitting to the most rigorous penances. These practices, which must have a greater tendency to make enthusiasts, than create true devotion, have lately been forbidden by the archbishop of Manilla; but some confessors continue to recommend them, though they will not venture to command them.

† A roll formed of a leaf of tobacco, which they smoke without a pipe.

part of the island, and troops were employed to suppress them: an army of custom-house officers were appointed to prevent smuggling, and to compel the consumers to purchase it at the national offices. Many of them have indeed been massacred, but speedy vengeance for their deaths was the certain retaliation: fewer formalities are required in the conviction of the Indians, than in that of other citizens*.

Coffee, sugar-canes, cotton, and indigo, grow there without cultivation, and it is generally believed that their spices would not be inferior to those of the Moluccas: a general liberty of commerce for all nations would command a sale which would encourage the cultivation of them all; and a moderate duty on all articles exported would soon defray the expences that government might sustain.

The navigators remained only a few hours at Manila, and the governor, having taken leave of them immediately after dinner, to indulge in his afternoon's nap, they visited M. Sebir, from whom they had received the most essential services, during their continuance in Manila Bay. About eight in the evening they returned to their frigates; but being apprehensive that it would be necessary to send an officer to take up his abode at Manila, to accelerate the repair of the frigates, to procure necessaries, &c. they nominated M. Vaujaus, lieutenant of the *Astrolabe* for that purpose; but M. Gonsoles Carmagnal, intendant of the Philippines, generously took that task upon himself, daily inspecting the progress of the workmen, and every other matter of importance, with care, vigilance, and activity. He even opened his cabinet of natural history to the officers of the frigates, and bestowed on our navigators a complete double collection of the shells which are found in the Philippine seas†.

The labours at Cavite being finished, the boats built, the sails repaired, the rigging overhauled, and the salt provision barrelled up, &c. objec-

tions were made to the last mentioned article: La Perouse was unwilling to trust to the victualing agents of Manila; he knew that the salt provision of the galleons would hardly keep good for three months; and confidently relied on Captain Cook's method; a copy of which was remitted to every salter; and they were superintended by several officers. They had salt and vinegar on board which they brought from Europe, and they purchased hogs from the Spaniards on very reasonable terms.

Before they sailed the navigators thought it their duty to wait upon the governor-general, to thank him for the great dispatch with which his orders had been executed; and still more to express their obligations to the intendant, who had rendered them the most essential services. These duties performed, they consumed about two days in visiting the ports adjacent to Manila, to which they were occasionally conveyed in carriages. They were not captivated with the view of palaces, parks, or gardens; but nature is there so fascinating, that a simple Indian village, on the bank of a river, and a house in the European style, might vie with a magnificent mansion. Such is the dwelling of the most opulent citizens; and this would be one of the most enchanting spots to live in, if a more rational and moderate system of government were established. The fortifications of Manila have been much improved, under the direction of M. Sauz, an eminent engineer; but the garrison is far from numerous.

On the 9th of April, according to the French manner of reckoning, and the 10th as the Manillese reckon, our navigators sailed, and got to the northward of the island of Luconia. They flattered themselves with finding under Formosa the same variations of wind as under the island of Luconia. On the 21st they made the island of Formosa; and experienced, in the channel which divides it from that of Luconia, some very

* The picture which might be drawn of the state of Manila, in a very short time, would be very different from that of its present state, should the Spanish government adopt a better constitution for the Philippines: the land is capable of producing the most valuable articles; a proper number of persons in the island of Luconia, with due encouragement, might cultivate it to infinite advantage. "The climate" says La Perouse, "will allow the produce of ten crops of silk in a year, whilst that of China gives but a faint promise of two."

† The ship's companies began to experience the disagreeable consequences of the excessive heats of Manila: some

of the sailors were seized with colics, which were not however of an inveterate kind: but Messrs. de Lamanon and Daigremont, who had received the first attacks of a dysentery at Macao, grew daily worse; and M. Daigremont died on the 25th. He was the second person who had been deprived of life by sickness on board the *Astrolabe*. Disregarding the advice of his physicians, and without the knowledge of his friends and associates, he was determined to cure his disease with burnt brandy, pimento, and other medicines: but, relying on the strength of his constitution, of which he entertained too high an opinion, he fell the victim of his own imprudence.

violent currents. On the 22d they set Lamay Island, at the south-west point of Formosa, about three leagues distance. They sounded twenty-five fathoms, sandy bottom, and in three or four minutes afterwards only nineteen fathoms. From this sudden shoaling of the water they supposed they were near a bank which had not been laid down upon the charts: they continued to sound, and soon after found only twelve fathoms: they tacked, and stood towards the island of Formosa, when the bottom still continued very irregular. The Boussole then came to anchor, and made a signal for that purpose to the Astrolabe. In the morning they got under way, and stood towards the continent of China: at nine they had again twenty-one fathoms by the lead, and a minute afterwards only eleven. Judging it imprudent to continue so hazardous a survey, as their boats were not in a condition to assist them, they came to the resolution of running out upon the opposite point of the compass, and fixed the course at south-east by east. They ran thus six leagues over an uneven bottom from twenty-four fathoms to eleven: the soundings then grew deeper, and at ten in the evening they could get no ground, when about twelve leagues from the point from which they had put about in the morning. Perhaps this bank may not be dangerous, the shallowest water having been eleven fathoms; but the inequality of its bottom renders it very suspicious. It may be necessary also to observe, that these shoals in the Chinese seas have frequently points level with the water, which have occasioned many shipwrecks.

The tack they then stood on conveyed them upon the coast of Formosa, near the entrance of the bay of Old Fort, Zealand, where the city of Taywan, the capital of that island, is seated.

* The land and sea breezes enabled the navigators, the next day, to get ten leagues to the northward, when they perceived the Chinese army at the mouth of a great river: they came to an anchor abreast of this river, in thirty-seven fathoms. It was impossible to ascertain the number of these vessels; some of them were under sail, others at anchor on the coast, and a great number of them in the river. The admiral, covered with a multiplicity of flags, was the farthest in the offing. He came to an anchor at a league to the eastward of the French frigates: night arriving, he hung out lights on all his masts; those vessels which were obliged to pass by the frigates, in order to join their commander, were cautious of coming within the reach of their guns, not knowing whether they were friends or enemies.

Having been informed of the revolt of that Chinese colony, and that an army of twenty thousand men under the santog of Canton, had been dispatched against it, La Perouse resolved to sacrifice a few days to learn the particulars of this event, and came to an anchor to the westward of the bay. He thought it imprudent to send his boat on shore, as suspicious might arise in the state of war in which this Chinese colony was then engaged; he therefore drew alongside some Chinese boats, which were sailing within his reach. As a powerful temptation, he shewed them some piastres, but the inhabitants of these islands were not permitted to have any communication with strangers. Only one man could be prevailed on to come on board; whose fish were instantly purchased at his own price, to induce him to give a favourable account of our navigators, should he venture to acknowledge that he had communicated with them.

No person could guess at the meaning of any of the answers given by these fishermen to the questions which had been proposed to them, which they certainly did not comprehend. The language of these people bears not the least resemblance to that of the Europeans, but a kind of pantomimic jargon, accompanied with inclinations of the head, and other emotions. Convinced of the impossibility of having his curiosity gratified, La Perouse resolved to get under way the following day, with the land breeze. Several fires appearing upon the coast, he supposed they were meant as signals, and that he had created an alarm*.

Thus circumstanced, and convinced that the channel between the islands, and the banks of Formosa, did not exceed four leagues in width, it would have been dangerous, in such dreadful

The weather becoming extremely bad, accompanied with a fog, the Chinese admiral ran before the wind into the river, and La Perouse flattered himself that he should be able to double the Pescadores, or Pong-hou Islands, by keeping the ship's head to the north-west; but, to his great astonishment, he perceived, at nine in the morning, several rocks, part of a group of islands, bearing north-north-west: the breakers which surround them were hardly distinguishable from those occasioned by the sea. He tacked, and stood towards Formosa; and at noon the Astrolabe, which was ahead, made a signal for twelve fathoms: the Boussole sounded, and found forty: hence it appears that, in the distance of a quarter of a league, there was a shoaling of forty fathoms to twelve.

* The weather, however, cleared up, and the admiral

weather, to ply to windward during the night, and in so rough a sea; La Perouse determined to bear up, that he might run to the eastward of Formosa.

These islands consist of a heap of rocks, assuming a variety of shapes; one of which exactly resembles the tower of Cordouan, at the entrance of Bourdeaux river. Among these islets five islands were enumerated of a moderate height, having the appearance of sandy downs, without any trees upon them. The next day a violent squall of wind was experienced, which only lasted till ten o'clock in the evening, having been preceded by an abundant rain. During the night the sky was continually in a flame; the most vivid lightning darted from every point of the horizon; but only one clap of thunder was heard. The whole of the next day a dead calm occurred, in mid-channel, between the Beshee Islands, and those of Botol Tabacoxima*.

La Perouse made each of them a present of some medals, and a piece of nankin; but it was very apparent that these islanders did not quit the coast with an idea of traffic, for they had nothing to offer in exchange for these presents: they only fastened to a rope a bucket of fresh water, making signs that they still considered themselves indebted to him for the favours they had received, but that they were going ashore to get provision, which they signified by putting their hands into their mouths. Before they approached the frigates, they placed their hands upon their breasts, and elevated their arms towards the sky. These gestures being repeated by the ships' crews, they ventured to come on board, but their countenances indicated a want of confidence in the persons who had invited

* The wind permitting him to come within two miles of this island, La Perouse distinctly saw three villages on the southern coast, and a canoe seemed to direct its course towards him. Approaching Botol Tabacoxima he sounded several times, and, till within half a league from the land, found no bottom: hence it appeared that if there was any anchorage it must have been extremely near the coast. This island, on which no one has yet been known to land, is about four leagues in circumference, and is separated by a channel from a large rock or islet, on which some verdure, and a few shrubs were seen. The island, however, contained many inhabitants; three large villages having presented themselves within the space of a league. A considerable part of it is woody, and the summit seemed to be capped with very large trees. In many places the land was cultivated, and exhibited a most beautiful green; though furrowed by the impetuosity of the torrents which descend from the high mountains.

them: they intimated, however, that if their benefactors would come on shore, they should want for nothing. Their canoes, which were made of hollow trees, were managed very indifferently.

It is probable that vessels might provide themselves in this island with provision, wood, and water; but as it does not exceed three or four leagues in circumference; its population may not perhaps amount to more than four or five hundred. La Perouse preserved the name of *Kumi Island*, which Father Gambil gives it in his chart; in which he makes it part of a group of seven or eight islands, of which this is the westernmost: and this separated from those supposed to be eastward of it, by channels of eight or ten leagues.

At one in the afternoon he crowded sail to the northward, without waiting for those islanders who had signified they would return with provisions: he continued his course to the northward, and before sun-set lost the sight of *Kumi Island*. At day-break he made an island in the north north-east, and farther east saw several rocks or islets; he ranged along it at a third of a league distance without finding any bottom, (or discovering any trace of a habitation); it was so steep that he supposed it uninhabitable, and its circumference did not seem to exceed two leagues: when he came abreast of it, he perceived another island, which was woody, but nearly of the same size and form, though not quite so high; and between these islands five groups of rocks appeared, which were surrounded by birds innumerable. He continued to this last the appellation it had received of *Hoapirua Island*, and to that most to the north-east *Tiaoyu-*

On the 5th of May, at one in the morning, our navigators made an island: after standing off and on, under an easy sail, at day-break, they ran along the west coast of this island, at the distance of half a league. They sounded several times, but found no bottom: they were convinced the island was uninhabited, as they saw fires in several places, and herds of cattle grazing on the sea shore. When they had doubled its west point, which was the most populous and beautiful, several canoes set off from shore to observe them. They seemed, however, much afraid: their curiosity impelled them to advance within musket-shot, but their timidity induced them speedily to depart. But language, gestures, and tokens of peace and amity, accompanied with the display of some stuffs, at length prevailed on two of the canoes to come alongside of them.

In the night of the 25th our navigators passed
the strait of Corea, sounding very frequently,
and as the coast of Corea appeared more eligible
to follow than that of Japan, they approached
within two leagues of it, and shaped a course
parallel to its direction. The channel between
the coast of the continent and that of Japan is
about fifteen leagues wide: following the con-
tinent very near, they saw, on the tops of moun-
tains, some fortifications which had the ap-
pearance of European forts: hence it seems to
appear that the greatest objects of defence, on
the part of the Coreans, are directed against the
Japanese. This country is mountainous, and
seems very much parched: the snow, in certain
channels, was not entirely melted, and the earth
had not the appearance of being prolific. Their
habitations are numerous; no less than a dozen
champanis or junks also presented themselves as
they sailed along the coast: they hardly differ,
in any respect, from those of China; and, like
those, their sails were made of mats. The ap-
pearance of the ships did not seem to create
fear among the natives, but they had not courage
enough to speak to our navigators: they con-
tinued their course without regarding them, and
the sight of the vessels, though very new, did

* Father Gaubil, in his chart, gives a third island to the
north-west of *Hoapinsu*, under the name of *Pongkiechan*,
and about the same distance from it as *Tiaoyu-su*. Should
this island really exist, it is astonishing, from the course of
La Perouse, that he did not discover it. *Lettres Edifiantes*,
28th collection.

The navigators were now got out of the archipelago of
the islands of *Liquoe*, and were about to enter a more ex-
tensive sea between Japan and China. On the 19th of
May they made the signal for getting under way, and shaped
their course north-east by east towards the island of *Quel-*
baert. This island, known to Europeans by the wreck of
the Dutch ship *Sparrow Hawk*, in 1635, was then under
the dominion of the king of Corea. No island can pos-
sibly afford a finer aspect: a peak of about a thousand
poises is visible at the distance of twenty leagues, and oc-
cupies the middle of it; the land slopes gradually towards
the sea, whence the habitations appear as an amphitheatre;
the soil appeared in high cultivation; and, by the aid of
lasses, the division of fields was clearly seen, which plainly
demonstrated that the population was great: but unfor-
tunately the inhabitants are prohibited from all commu-
cation with strangers; and those are detained in slavery who
have the misfortune to be shipwrecked on these coasts.

VOL. II. No. LXVII.

not attract their attention. At eleven, how-
ever, two boats set sail to reconnoitre, and
came within a league of the frigates; they after-
wards followed them for two hours, and then
returned into the harbour they had quitted in
the morning. It is therefore probable that they
had created an alarm on the coast of Corea, as,
in the afternoon, fires were seen on all the pro-
montories†.

On the 27th he made the signal to bear up,
and steer east, and soon perceived in the north-
north-east, an island not laid down upon any
chart, at the distance of about twenty leagues
from the coast of Corea. He named it *Iste*
Dagelet, from the name of the astronomer who
first discovered it. The circumference is about
three leagues. La Perouse ran along it, and
nearly made its circuit at about a third of a
league, and found no bottom. M. Boutin was
then ordered in a boat to sound as far as the
shore, and found bottom in twenty fathoms,
but not till near the edge of the surf. This
island, though steep, is embellished with fine
trees, from the edge to the very summit: a ram-
part of bare rock, almost perpendicular, en-
circles the whole of it, seven little sandy creeks
excepted, where it is practicable to land. In
these creeks some boats of a Chinese construction
were seen upon the stocks; but the workmen
were intimidated by the sight of the French
ships, and fled into a wood. A few huts were

Some of the crew of the *Sparrow-hawk*, after a captivity
of eighteen years, and receiving many bastinadoes, con-
victed to take away a bark, and cross to Japan; after-
wards they were conducted to Batavia, and from thence to
Amsterdam. Knowing this circumstance, they were not
inclined to send a boat on shore: they had seen two canoes
put off from it, but they never came within a league of
the frigates, their object was probably to watch the pro-
ceedings of their new visitors, and give the alarm on the
coast of Corea.

† On the 26th, the men who were looking out at the
mast-head, called down to inform the crews that they felt
burning vapours as if proceeding from the mouth of an
oven, which passed like puffs of wind, regularly succeed-
ing each other in about the space of half a minute. All the
officers repaired to the mast-head, and experienced the same
extraordinary heats. During the night a gale of wind from
the north continued for about seven or eight hours, but the
sea was very high. The next day La Perouse approached
within three leagues of the continent: notwithstanding the
violence of the wind, he had gained a little to the north-
ward, and explored the most interesting coast of Corea.
He then shaped his course for the south-west point of
Nippon Island.

L

seen,

seen, but nothing like a village; and the land was wholly uncultivated. Hence it was conjectured that the Corean carpenters come hither during the summer, for the purpose of building boats, which they dispose of upon the continent; and that conjecture was afterwards ascertained; for the workmen belonging to another dock-yard, who were so situated as not to be able to see the frigates, were surprised by these French visitors, in the very act of fashioning their timber, and constructing their boats; but not approving of the appearance of interlopers, they instantly quitted their labour, and fled into the forests, with the exception of only two or three, who seemed not in the least degree, to be astonished or afraid. La Perouse wished he

could have found an anchorage, that he might have an opportunity of convincing these people, by the exercise of friendly and benevolent offices, that he and his suite were not their enemies: the strong currents, however, drove from the land, night approached, and fearing the boat which he had dispatched under M. Boutin, might not be able to rejoin him, La Perouse ordered him by a signal to return on board, at the very moment he was on the point of landing on the beach. He hauled towards the Astrolabe, which was farther west, having been drifted by the currents, and a perfect calm ensued; the height of the mountains of Dagelet Island having occasioned it by intercepting the sea-breeze.

SECTION X.

Route to the North-West Part of Japan—Cape Noto, and of the Island Jootsi-sima—Particulars of this Island—See several Japanese and Chinese Vessels—Return towards the Coast of Tartary—Remain at Baie de Ternai—Its Productions—Some Account of the Country—Depart from it—Anchor in Baie de Suffren—Proceed to the Northward—Anchor at Baie de Langle—Manners and Customs of the Inhabitants—Continue to proceed to the Northward—Put in at Baie d'Estaing—Departure—Banks in the Channel—Arrival at Baie de Castrics, on the Coast of Tartary—MAY, JULY, 1787.

ON the 30th of May, La Perouse shaped his course east towards Japan, and on the 2d of June he saw two Japanese vessels, one of which passed within hail of him. It had a crew of twenty men, all habited in blue cassocks resembling those worn by French priests. This vessel was about a hundred tons burthen, and had a single high mast stepped in the middle. The sail, which was very large, was of linen, the breadths of which were laced lengthwise; and two jibs, with a sprit-sail, composed the remainder of her suit: a small gallery projected from each of the sides of this vessel, and extended along her gun-wale to about two-thirds of her length. The boat placed athwart her bows exceeded the breadth of the vessel by seven or eight feet. These vessels did not appear to be intended to go any considerable distance from the coast, as they could not be safe in a high sea during a squall of wind: the Japanese have probably other vessels to brave the bad weather.

Our navigators passed so near this vessel, that

they particularly observed the countenances of individuals, in which they saw no appearance of fear or astonishment. They had a small Japanese white flag, whereon some words were seen, written vertically: the Astrolabe hailed her as she passed; but neither the question nor the answer was comprehended: she continued her course to the southward, to give the earliest intelligence of two foreign vessels having appeared in seas, where no European navigator had ever ventured. At different times of the day seven Chinese vessels, of a smaller construction, were seen, which were better calculated to encounter bad weather.

All these junks ran close to the wind, and were doubtless at no great distance from the land. In the morning, on the following day, two other Japanese vessels were perceived; and on the 6th our navigators made Cape Noto, and the island of Jootsi-sima, separated from it by a channel about five leagues in width. Though distant about six leagues from the land, they could distinguish particular objects on it. Some

the land, they
cts on it. Some
2 lands,

islands, rocks, and other impediments, pre-
vented their nearer approach to the coast: at
this distance they had soundings at sixty fa-
thoms. At two they saw the island of Jootsi-
sima in the north-east. They were soon obliged
to haul the wind, in order to weather the
breakers, that are extremely dangerous in the
fog, which, at this season generally conceals
the northern coasts of Japan. This island is
about two leagues in circumference, flat, and
well wooded. It also appeared to be well in-
habited, and some considerable edifices were
observed between the houses. Near a sort of
castle, at the south-west point, some gibbets
made their awful appearance*.

During the seventy-five days, since our na-
vigators sailed from Manilla, they had run along
the coasts of Quelpert Island, Corea, and Japan;
but as these countries were inhabited by people
inhospitable to strangers, they did not attempt to
visit them. On the contrary, they well knew
that the Tartars were hospitable, and that they
had a force sufficiently formidable to over-awe
any small tribes that might be met with on the
sea-shore. They were extremely impatient to
reconnoitre this land, and it was the only part of
the globe which had escaped the activity of
Captain Cook.

The geographers who had drawn the strait of
Tessoy, erroneously determined the limits of
Jesso, of the Company's Land, and of Staten
Island: it therefore became necessary to ter-
minate the ancient discussions by indisputable
facts†. The latitude of Baie de Ternai was the

* Some satisfactory observations of latitude and longitude,
which will be interesting to geographers, but cannot be en-
tertaining to the general reader, are not here particularized.
After some very essential scientific information, La Pe-
rouse proceeds to inform his readers, in his narratives, that
on the 23d of June, the wind became settled at north-east;
he therefore determined to stand in for a bay he had seen to
the west-north-west, where it was probable he might find
good anchorage: at six in the evening he dropped anchor
here, in seventy-four fathoms, half a league from the
shore. He named it *Baie de Ternai*. Though it is open to
the easterly winds, he supposes they never blow in upon
the coast there, and that they follow the direction of the
land: the bottom, which is sandy, gradually diminishes to
six fathoms within a cable's length of the shore.

† Many of the geographers have pointed out an island to
the north of Japan, under the several names of Jeco, Yeco,
or Jesso, which they have separated from Tartary, by a
strait which they have named Tessoy. This imaginary strait

same as that of Port Acqueis, though the
description of it is very different‡.

Fresh provision is truly desirable to every
man, and even that which is the least relishing
is infinitely more wholesome than salt meat: the
prospect of a plentiful fishery induced La Pe-
rouse to order the salt provisions to be locked
up, and preserved for less fortunate periods: he
also directed casks to be prepared and filled with
fresh limpid water, of which there was great
plenty; he even sent into the meadows to pro-
cure pot-herbs, where onions, celery, and sor-
rel were found in abundance. The plants which
France produces, carpeted the whole soil. Roses,
lilies, and all European meadow flowers were
beheld at every step. Pine trees embellished the
tops of the mountains; and oaks, gradually di-
minishing in strength and size towards the sea,
adorned the less elevated parts: birch, willow,
and maple trees form agreeable borders to the
banks of the rivers, and the rivulets; and on
the skirts of forests, there was a profusion of
apple, medlar, and hazle-nut trees.

Traces of men were frequently perceived by
the havoc they had made, some small baskets,
formed of the bark of birch-trees, sewed with
thread like those of the Canadian Indians, were
also found; and several rackets for walking on
the snow. By these, and many other corobo-
rating circumstances, the navigators were clearly
of opinion, that the Tartars approach the borders
of the sea, when invited thither by the season
for fishing and hunting; that they assemble for
those purposes along the rivers; and that the

appears on all the old charts; and its pretended existence
may have originated from the real strait which divides Se-
galien Island from the continent, and which William de
Lisle also gave the name of Strait of Tessoy on a chart
of Asia, published in 1700.

‡ Never did any country exhibit gradations of colour of
so varied and strong a green as that which was now beheld;
and though neither a single fire nor a canoe could be seen,
it could not be imagined that a country so near China, ap-
parently so fertile, should be entirely uninhabited. Before
our navigators had landed their boats, their glasses were
directed towards the shore, but they saw only bears and stags
passing deliberately along the sea-side. The impatience of
the crews to land was much increased by this circumstance.
Arms were prepared with as much activity as if an enemy
had menaced the most alarming hostilities; and while all
these preparations were making, the sailors were employed
in fishing, and had taken ten or twelve con-fish with their
lines, in a very short space of time.

mass

mass of people reside in the interior of the country, to attend to the multiplication of their flocks and herds*.

M. de Langle, with several other officers, who had a passion for hunting, endeavoured to pursue their sport, but without success: yet they imagined that by silence, perseverance, and posting themselves in ambush in the passes of the stags and bears, they might be able to procure some of them. This plan was determined on for the next day, but, with all their address and management it proved abortive. It was therefore generally acknowledged that fishing presented the greatest prospect of success. Each of the five creeks in the Baie de Ternai, afforded a proper place for hauling the seine, and was rendered more convenient by a rivulet, near which they established their kitchen. They caught plenty of trout, salmon, cod-fish, harp-fish, plaice, and herrings.

In one of these fishing parties they discovered, on the bank of a rivulet, a Tartarian tomb, erected near a small ruinous house, and almost hidden in the grass: curiosity induced them to open it, and they observed two persons in it, placed on the side of each other; a cap of taffeta covered their heads; their bodies were wrapped up in a bear's skin; and they had also a girdle of the same, from which several small coins, and different copper trinkets were pendant. Blue beads were scattered in this tomb, and ten or twelve silver pendants for the ears, were also found: a knife, an iron hatchet, a wooden spoon, a comb, and a small bag of nankeen, full of rice, were

afterwards discovered. The construction of this monument was inferior to that of the tombs of *Port des Francais*. Great care was taken to cover these articles up again, after preserving a small part of each to authenticate the discovery†.

The Chinese coins, as well as the other articles, make it manifest that these people have regular commercial dealings with that nation, and it is also probable that they may be subjects of that empire. The rice, in a blue nankeen bag, countenances the Chinese opinion, that there will be a succession of wants in the life to come: the hatchet, knife, comb, &c. have a marked resemblance to those among the American Indians; and if they have never had any communication with each other, it may fairly be suggested, that people in the same degree of civilization, and under the same latitudes, may probably adopt the same customs.

This delightful country, the east part of Tartary, presented to the view nothing interesting to the botanists and mineralogists of the two frigates. The plants were the same as those in France; sea and land-birds are scarce, though some turtle-doves, ravens, quails, swallows, albatrosses, gulls, bitterns, and wild-ducks, made their appearance; but the view was not enlivened by those innumerable flights of birds, which swarm in other uninhabited countries. At the Baie de Ternai those aerial visitors were seldom seen, and in the interior of the woods the most gloomy silence was seldom interrupted by their vocal melody‡.

* At half past six three boats, filled with officers from the two frigates, landed at Bear's Creek, and at seven they had fired several musket-shots at different wild beasts, which rapidly fled into the woods. Three young fawns were the only victims of their inexperience: the boisterous joy of those who had just landed accelerated the departure of these intimidated animals. The meadows, though delightful to behold, were almost impassable: thick grass of five or six feet high, impeded the progress of the adventurers, and almost buried them in their luxuriance. They also dreaded the noxious company of serpents, many of them having been seen on the banks of the rivulets, though their venomous quality had not then been experienced. The sandy flats on the shore were the only places that could be walked on with security and ease.

† It seemed clear that the Tartarian hunters made frequent landings on this bay; a canoe, found near the monument, indicated that they came thither by sea, from the mouth of some river not then ascertained.

‡ On the morning of the 27th, after having buried dif-

ferent medals in the earth, with a bottle in which the date of their arrival was registered, the navigators set sail, and ran along the coast fifty leagues, with the finest weather. They continued to run along near the coast, the direction being the north by east. On the 1st of July, a thick fog surrounding them near the land, La Perouse made the signal to anchor, in thirty fathoms: till the 4th it continued so thick that no bearings could be taken, nor could the boats be sent on shore; but upwards of eight hundred cod-fish were caught, and the surplus beyond the immediate consumption was salted and put into barrels. They also procured a great quantity of oysters, the shell of which was so extremely fine that they were supposed to contain pearls, though they had only found two, half formed. Hence some credit is due to the account of the Jesuits, who say there is a pearl fishery at the mouth of several rivers of East Tartary: but this is probably to the southward, at the places adjacent to Corea, for towards the north the country is too destitute of inhabitants to engage in such enterprizes: our navigators having run down

On the 4th, at three in the morning, there was a fine clear sky, and the navigators saw, upon their right beam, at the distance of two miles from them, in the west-north-west, a great island into which a river discharged itself. A boat from each frigate was armed and manned to reconnoitre it; the landing was found easy, and the water shoaled gradually towards the shore. The country resembled that at Baie de Ternai, and though three degrees more to the northward, the productions of the earth differed very little from it.

It was here apparent that the traces of the inhabitants were more discernible than in many other places: branches, separated from trees with a sharp-edged instrument, the leaves of which had not lost their verdure, were frequently seen: two elk-skins, methodically stretched upon pieces of wood, were left at the side of a small cabin, which was not sufficiently capacious to accommodate a family, but might perhaps conveniently shelter two or three hunters: a small number might probably have been at that time in possession of it, who, from the alarm occasioned by the intrusion of unknown visitors, might have fled into the woods. M. de Vanjuas, who had been dispatched in one of the frigates, took away one of the elk-skins, but not without leaving, in exchange for it, some hatchets, and other iron instruments of infinitely more value. That officer's representation, nor that of the naturalists, did not encourage La Perouse to continue any longer in this bay, on which he thought proper to bestow the name of *Baie de Suffren*.

La Perouse got under way from Baie de Suffren, with a light breeze at north-east, hoping to gain a distance from the coast. In the course of his departure the dredge was several times employed, and oysters were taken to which little shell-fish, named Poulattas were attached: also large whelks, sea hedge-hogs, and a great quantity of star-fish. The calm and fog compelled him to anchor in forty-four fathoms, a league farther from the shore: but on the 6th, notwithstanding the fog, he set sail. At eight in the morning of the seventh, he made an island which seemed of great extent: he supposed at first, that this was Segalien Island, the south part of which some geographers had

own two hundred leagues of this coast, and always at a short distance from the land, without seeing houses or towns, and when they went on shore they saw only the

placed two degrees too far to the northward. The aspect of this land was extremely different from that of Tartary: nothing was to be seen but barren rocks, the cavities of which retained the snow; but the distance was too great to admit a satisfactory view of the low lands, which like those of the continent, might probably be clothed with verdure. To the highest of these mountains La Perouse gave the appellation of *Peak Lamanon*, on account of its volcanic form, the naturalist of that name having particularly applied himself to the study of volcanic productions.

He was obliged, by the southerly winds, to ply to windward with all sails set, to weather the southern extremity of the new land, the end of which he had not perceived. He waited for a clear sky with the greatest impatience, and on the 11th of July at noon he obtained one, though in these foggy seas a horizon of vast extent is very seldom seen: at two in the afternoon, he took bearings of the land from the north by east, to the north by west. Perplexed with the different opinions of his officers, he thought it eligible to endeavour to find a port, and procure satisfactory proofs of the natives of the country. On the 12th he was within a league of the coast of the island, which ran directly north and south. On a nearer approach to it, he found the coast as woody as that of Tartary; and in the evening he neared the land, and dropped anchor in fourteen fathoms, two miles from a small creek, into which a river flowed. M. de Langle, who had come to anchor some time before him, came instantly on board his ship, having already hoisted out his long-boat and small boats. He submitted to La Perouse whether it would not be proper to land before night, in order to reconnoitre the country, and gather some necessary information from the inhabitants. By the assistance of their glasses, they perceived some cabins, and two of the islanders hastening towards the woods.

La Perouse approved of the proposal of M. de Langle, and requested him to receive into his suite M. Boutin and Abbé Mongés. After the frigate was brought up, and the boats hoisted out, he manned his pinnace, commanded by M.

tracks of some hunters, who perhaps only visited these places.

de Clonard, and gave him and his associates orders to join M. de Laugle, who had already landed on the beach. They found only two small houses on this bay, and they had been recently abandoned, for the fires in them were not extinguished, and none of the furniture had been removed. A litter of puppies, of so tender an age that they had not yet the faculty of seeing, was also left behind; and the motlier, which they heard barking in the woods, induced them to suppose that the owners of these cottages could be at no great distance: M. de Langle then deposited hatchets, several other iron tools, glass beads, and many other articles which he supposed might be useful or agreeable to these islanders; imagining that, on his re-embarking, they would return to their humble mansions, and be convinced, by these presents, that their disturbers were not enemies. He then had the seine hauled, and procured at two casts of the net, a greater quantity of salmon than were sufficient for the consumption of the ships' companies for at least a week*.

M. de Langle made them several presents, and manifested by signs, that he was obliged, by the approach of night, to return on board, but that he entertained a hope of seeing them there again, on the following day, and having the pleasure of making them additional presents. They, in their turn, signified that they reposed in the vicinity, and would punctually give them the meeting.

It was generally supposed they were proprietors of a warehouse for fish, that they had been seen on the bank of the small river, erected upon stakes at four or five feet above the

* When he was preparing to return on board, he saw seven men land on the shore from a canoe, who did not seem in the least intimidated by the numbers they beheld. They run their boats aground upon the sand, and seated themselves upon mats, among the French sailors, with an air of perfect security, which induced a strong prepossession in their favour. Among these were two aged men, with long white beards, apparelled with a stuff, manufactured of the bark of trees, resembling the cloths of Madagascar: two of these islanders were clad in dresses of blue nankeen quilting, the fashion of which differed but little from that of the Chinese: a long robe was worn by others, closed by a girdle, and some small buttons, rendering it unnecessary for them to be encumbered with drawers. The head was naked, with this exception, two or three of them were seen with a bandeau of bear's skin encircling their heads. The crown of their head, and their

level of the ground. M. de Langle, in a respectful visit like that to the abandoned cabins, found in it dried salmon and herrings; salmon skins manufactured like parchment, and some vessels filled with oil. It was almost eleven at night when the boats returned on board; and the report which La Perouse received, greatly excited his curiosity. Before sun-rise he was on shore with the longboat and barge, and the natives soon afterwards made their appearance in the creek. Among these Islanders were the proprietors of the cabins, in whom confidence had been inspired by the bounty of M. de Langle; but not a single woman appeared among them, which seemed to intimate a trait of jealousy: dogs were heard barking in the woods, which induced our navigators to suppose that those animals remained there with the women. Some persons in their suite wanted to penetrate those recesses, but the pressing remonstrances of the natives prevailed on them to relinquish their curiosity†.

They were extremely poor, though a few of them wore pendant ear-rings, decorated with blue glass beads, perfectly similar to those which were found in the tomb at Baie de Ternai; their little copper ornaments also resembled those deposited in the tomb. Their pipes, and their steels for the purpose of striking fire, were evidently of Chinese or Japanese manufacture. Pointing to the west, they informed their visitors, in the same pantomimic mode, that the blue nank., the beads, and the steels came from the country of the Mantchou Tartars. They were anxiously desirous of getting possession of the hatchets and stuffs which they had seen, and were not backward in asking for them; but they

faces were shaved; the hair behind was ten or twelve inches in length. They had all boots, which were made of seal-skin, the feet of which were neatly manufactured in the Chinese style. The eldest of these inhabitants, to whom the others paid great deference, had weak eyes, and wore a shade round his head to preserve them from the too resplendent lustre of the sun. Their weapons consisted of pikes, bows and arrows tipped with iron. The manners of these islanders was noble, dignified, and striking.

† M. de Langle, with several of his principal officers, arrived on shore soon after La Perouse: presents of various kinds were liberally bestowed on the inhabitants, before the conversation with them began: they manifested their good sense by their partiality for useful articles; iron and stuffs were held in high estimation among them; they perfectly understood the quality and value of metals, and preferred silver to copper, and copper to iron.

ever presumed to take any thing that had not
been actually presented to them; and from the
whole of their conduct it evidently appeared
that their ideas of theft was perfectly conso-
nant to those of the most conscientious Euro-
peans. They were so delicate, in this respect,
that they could hardly be prevailed on by the
most earnest entreaties, to pick up a single sal-
mon from the shore, from among the thousands
that were scattered there in the fishery the pre-
ceding night.

Our navigators were successful in making
them comprehend that they requested a descrip-
tion from them of their country, and that of
the Mantehons, one of the old sages rose up,
and with great perspicuity, pointed out the most
essential and interesting particulars with the
aid of his staff. His sagacity in guessing the
meaning of the questions proposed to him was
astonishing; though, in this particular, he was
surpassed by another islander of about thirty
years of age. The last-mentioned native in-
formed our navigators that they had a commer-
cial intercourse with the people who inhabit
the banks of Segalian River, and he distinctly
marked, by strokes of a pencil the number of
days it required for a canoe to sail up the river
to the respective places of their general traffic.
La Perouse and M. de Langle thought it of im-
portance to discover, whether the island they
had run along was the same as that which geo-
graphers have named Segalian Island: the two
frigates were therefore ordered to be in readiness
for sailing the next day. The bay in which
they lay at anchor was named *Baie de Langle*,
as captain de Langle was the first who discovered
it, and first landed on its shore.

They spent the remainder of the day in visiting
the country and its inhabitants, when their cu-
riosity and admiration were particularly excited.
They were surprised to find among a people
composed of hunters and fishermen, who were
strangers to the cultivation of the earth, and

* The inhabitants of this island seem to form a well-re-
gulated society, but extremely poor. Only two marten's
skins could be purchased: a very few skins of bears and
seals were displayed; but the peltries of these islands would
be inconsiderable. All the silver trinkets which ornamented
twenty-one of these natives did not weigh two ounces;
a medal, with a silver chain, with which the captain de-
corated the neck of an old man, was thought inestimable
by these people. Each of the inhabitants wears a large

without flocks or herds, such gentle manners,
and such a superiority of intellect. The atten-
tion of the inhabitants of the *Baie de Langle*
was attracted by the arts and manufactures of
the French; they judiciously examined them,
and debated among themselves the manner of fa-
bricating the several articles. They were not
unacquainted with the weaver's shuttle: a loom
of their construction was brought to France,
whence it appeared that their methods of making
linens was similar to that of the Europeans;
but the thread of it is formed of the bark of the
willow tree. Though they do not cultivate the
soil, they convert the spontaneous produce of
it to the most useful and necessary purposes.
In their cabins were displayed several roots of
the yellow lily, or *saranna* of *Kantschatka*,
which they dry and preserve for their winter's
provision: these were accompanied by a quantity
of garlic and angelica root, with which the
skirts of the woods abound.

From the short continuance of our navigators
on this spot, they could not learn whether these
islanders have a form of government; on that
head they could not hazard their conjectures;
but they particularly remarked, that the greatest
deference and respect was manifested to old men,
upon all occasions; their manners are mild, and
would have conveyed a striking idea of the
manners and customs of the patriarchs, had they
been shepherds, and possessed of numerous
flocks. They are, in general, of a strong habit
and constitution, and a prepossessing counte-
nance: they are rather below the middle size,
few of them exceeding five feet five inches in
height, and several of them were under five
feet. They readily permitted the French painters
to draw their pictures, but obstinately refused to
suffer any person to take the measure of their
bodies, supposing, it is presumed, that was a
magical operation, the idea of magic being ex-
tensively prevalent in Tartary and China*.

Desirous of knowing whether the agreeable
sensation

ring on his thumb, consisting of horn, lead, or ivory:
they suffer their nails to grow, like the Chinese, and like
them salute by kneeling and prostrating themselves on the
earth; like them too, they sit down on their mats, and eat
with little sticks. Some Chinese, on board one of the
frigates, did not understand a syllable of the language of
the Islanders, though they perfectly comprehended that of
two Manchou Tartars, who a short time before passed
from the continent for the supposed purpose of buying fish.

The

sensation of smells, like those of taste, depended on custom, La Perouse gave one of the old men a bottle, filled with perfumed water; when, on placing it to his nose, he manifested as much disgust as La Perouse had shewn to his oil. These people were continually smoking, and their tobacco which was used in great leaves, was of an excellent quality; it was understood to have been procured from Tartary, but it was evident that their pipes was the manufacture of Japan. The commodore could not persuade any of them to take snuff; which was a fortunate circumstance, as it would have been injurious to them to introduce a new want among them.

At day-break, on the 4th of July, La Perouse made the signal for getting under way: early on the 19th, he saw the land of an island from north-east by north, as far as east-south-east; but so thick a fog prevailed that none of the points could be particularly discovered: he stood on to approach it, but almost instantly lost the sight of it; he continued to run along it by the lead till two in the afternoon, when he dropped anchor to the westward of a fine bay, in twenty fathoms, two miles from the shore. At four the fog, in a great degree, dispersed, and the navigators took bearings of the lands astern to them to the north by east. This bay, which La Perouse says is the best in which he had anchored since his departure from Manilla, he named *Baie d'Estaing*. At four in the afternoon the boats belonging to the frigates landed there, at the foot of ten or twelve cabins irregularly placed, and at a considerable distance from each other. They were constructed like those already described, but ra-

The cabins of these islands display skill and ingenuity, and every precaution to prevent the admission of cold into them: they are formed of wood, covered with bark: over which other timber-work is erected, covered with dry straw, resembling the thatch of European peasants' houses: the door is low, and the hearth is in the centre, under an aperture in the roof for the smoke to evaporate: little banks, of the height of eight or ten inches, encompass it, and the inside is strowed with mats. The cabin, just described, is situate in the midst of a clump of rose-trees, about thirty yards from the sea-shore: these shrubs, being in full flower, exhaled a most delicious odour, but not sufficient to overpower the stench of the fish and oil, which doubtless have been triumphant over all the perfumes of Arabia.

* Some of the officers belonging to the frigates met with two women, who had fled and concealed themselves in the grass. When the canoes landed in the creek, the women

ther larger, and divided into two apartments: the inner contained the furniture, &c. of the family; the outer was entirely empty, and seemed appropriated to the purpose of receiving visits: strangers being perhaps excluded from being permitted into the presence of the women *.

M. de Langle, who first landed in the island, found the islanders assembled round three or four canoes, laden with smoked fish: he was there informed that the men who composed the crews of the canoes were Mantchous, and had quitted the banks of the Selagian river to become purchasers of these fish. In the corner of the island, within a kind of circus planted with stakes, each surmounted with the head of a bear, the bones of these animals lay scattered. As these people use no fire arms, but engage the bears in close combat, their arrows being only capable of wounding them, this circus might probably be intended to perpetuate the memory of certain great exploits†.

Having entertained conjectures relative to the proximity of the coast of Tartary, La Perouse at length discovered that his conjectures were well founded; for when the horizon became a little more extensive, he saw it perfectly. In the evening of the 22d he came to an anchor in thirty-seven fathoms, about a league from the land. He was then abreast of a small river, to the northward of which he saw a remarkable peak: its base is on the shore, and its summit on all sides preserves a regular form. La Perouse bestowed on it the title of *Peak la Martiniere*. Having seen no hut or habitation along the coast of the island from *Baie d'Estaing*, he was anxious for information on that subject: he therefore armed four boats, belonging to the two

set up the most shocking shrieks, as if they expected to be devoured; though they were under the protection of a native, who safely conducted them to their habitations, and strove to allay their fears. M. Bloudet drew several sketches of these women, which were strong likenesses: upon the whole their countenances are tolerably agreeable: they have small eyes, and large lips; the upper one being painted blue; and a long linen shift enfolded their legs: their figures at full length were not very elegant; their hair was lank, not being curled by art: it was permitted to grow on the upper part of their heads, though such a practice was prohibited among the men.

† The productions of the soil of *Baie d'Estaing* differs little from those of *Baie de Langle*: salmon was equally abundant there, and every cabin had its storehouse. The frigates' boats departed at eight in the evening, after having liberally gratified the Tartars with valuable presents.

frigates,

frigates, under the command of M. de Clonard, and sent him to reconnoitre the creek. He returned at eight in the evening, and astonished the commodore with such a quantity of salmon as to fill all the boats; though the crews were wholly unprovided with nets or lines. The officer informed him that he had landed at the mouth of a small narrow rivulet, and not exceeding a foot in depth; that he found so completely filled with salmon that the bed was covered with them, and that the sailors had killed twelve hundred of them in an hour, by beating them with sticks which they had procured. He could only farther relate, that he had seen two or three deserted huts, which he imagined to have been built by the Mantchou Tartars*.

On the 28th, in the evening, our navigators found themselves on the coast of Tartary, at the

opening of a bay which presented a safe and convenient anchorage. Being in want of wood, as well as of a speedy supply of water, they put in here, and came to an anchor at the north point of this bay, at five in the evening, in eleven fathoms. M. de Langle reported to La Perouse that there was excellent shelter behind four islands: he had landed at a village of Tartars, where he was kindly received, and where he discovered a watering place, abounding with the most limpid element. These islands, the good anchorage of which was not farther distant than three cables' lengths, were covered with wood. From M. de Langle's report, La Perouse gave orders to prepare for anchoring in the bottom of the bay, and at eight in the morning they brought up in six fathoms. This bay was named *Baie de Castries*.

SECTION XI.

Description of Baie de Castries, and of a Tartarian Village—Manners and Customs of the Inhabitants—They create Confidence—Their extreme Tenderness for their Children—Productions, and Natural History of Baie de Castries—Departure from Baie de Castries—Strait dividing Jesso from Ocu-Jesso—Stay at Baie de Crillon—Manners and Customs of the Inhabitants—Staten Island—Uries Strait—Company's Land—Island of the Four Brothers—Maréckan Island—Kurile Islands, AUGUST, SEPTEMBER, 1787.

BAIE DE CASTRIES is situate at the bottom of a gulph, at the distance of two hundred leagues from the strait of Sangeor, the only certain passage from the Japanese seas. As soon as the frigates were moored, particular duties were assigned to their boats, long-boats, &c. by La Perouse and M. de Langle, to be invariably attended to during their stay. The pinnaces enabled the superior officers to superintend the different labours, and to convey themselves and the naturalists to the Tartarian village, to the different islands, or on any other necessary pursuit.

Of all the bays on the coast of Tartary, which

* Celery and cresses grew in abundance on the banks of this river: juniper-berries were also extremely plentiful: the botanists collected several scarce plants. Fir trees and willows were more numerous than the oak, the maple, or the birch: strawberries, raspberries, and gooseberries, were in full flower, and promised a delicious harvest. While the crews of the boats visited the shore, those on board caught a considerable number of cod-fish: so that

our navigators had visited, that of de Castries was the only one which really merited that denomination: it ensures a shelter to ships in bad weather, inasmuch that it would be possible to pass the winter in it. It has a muddy bottom shoaling gradually from twelve to five fathoms in approaching the coast, which is surrounded by a flat, three cables' lengths from the shore. Beds of sea-weeds, or *fuei* abound in this quarter. Salmon were seen leaping, as they came out of a rivulet, the water of which loses itself among these weeds: two thousand of these fish were taken in a day. The inhabitants saw the success of the fishery without emotion or concern,

this anchorage, in the course of a very few hours, supplied the whole ships' companies with fresh provision for a week. La Perouse named this river *Ruisseau du Saumon*, and at day-break got under sail. He ran along at a small distance from this island, and saw a few habitations here and there upon the shore. Not thinking it necessary to reconnoitre this bay more particularly, he only sailed across it, and named it *Baie de la Jonquiere*.

being well assured that the quantity of them was inexhaustible. The day after their arrival in the bay, they landed at the village, where M. de Langle, who had been there first, had procured them friends by his generosity.

A tribe of better men cannot be found in the universe than what this country can produce. The chief, or oldest man among them, advanced to receive the navigators on the beach, accompanied by several of the inhabitants. He prostrated himself to the earth, the usual Chinese salutation, and afterwards conducted the visitors to his cabin, where his wife, children, and grandchildren were attending. Ordering a mat to be spread, he invited them to sit down on it, and a small grain, with which they were wholly unacquainted, was put with some salmon into a copper on the fire, in order to be presented to them. This grain is considered among them as the most delicious food, and they intimated that it came from the Mantchou country. They informed their new visitors, by signs, that they were themselves of the nation of the Orotchys; and shewing the four strange canoes, which had that day arrived in the bay, they called the crews of them *Bitchys*; they signified that these last reside farther to the south; for these nations, like the Canadians, change their name and language at every village. These strangers had kindled a fire at the edge of the sea near the village of the Orotchys, where they cooked their fish. They were come from the river Segalian, and brought back grain and nankeens, which they had probably received in exchange for dried fish. Except elks and bears, which are not numerous in this country, squirrels and dogs were the only quadrupeds that were seen by our Europeans*.

Every cabin was encircled with a place for drying salmon, which are exposed upon poles to the heat of the sun, after having been several days smoked round the fire in the cabin. The

* The village of the Orotchys consisted of four cabins, substantially built with the trunks of fir-trees neatly carved at the angles; a frame, formed of the bark of trees, supported the roof: a wooden bench encompassed the apartment, similar to those of the cabins of Segalian Island: and the hearth, and aperture for expelling smoke were nearly on the same plan. Our navigators supposed, from variety of corroborating circumstances, that these four houses were occupied by four different families, who live together in the most perfect harmony and friendship. One of these families, during the temporary abode of the French

women superintend this operation, and when the fish appear to have been sufficiently penetrated with the smoke, they take them into the open air to acquire solidity. In carrying on their fishery, however, their conduct was highly offensive to beholders of the least delicacy. With disgusting avidity they devoured the snout, the gills, and the small bones of the salmon. But they dexterously strip off the skin and eat it as delicious food, greedily sucking up the mucilage of particular parts, as Europeans swallow a savoury oyster.

In this bay the French navigators first discovered the use of the circle of lead or bone, which these people, and the inhabitants of Segalian Island, wear on the thumb like a ring: it greatly assists them in cutting and stripping the salmon with a knife, which is always hanging to their girdle. Their village was built upon low marshy land, which must doubtless be uninhabitable during the winter; but on the opposite side of the gulph, another village appeared on a more elevated situation. It was seated at the entrance of a wood, and contained eight cabins, larger and better constructed than the first. Not far from these cabins, they visited three yourts, or subterranean houses, exactly resembling those of the Kamtschadales, described in the third volume of Captain Cook's last voyage; they were sufficiently capacious to accommodate the inhabitants of the whole eight cabins during the severity of the inclement season. On the borders of this village several tombs presented themselves, which were larger and more ingeniously fabricated than the houses: each of them contained three, four, or five biers, decorated with Chinese stuffs, some pieces of which were brocade. Bows, arrows, and the other most esteemed articles of these people, were suspended in the interior of these monuments, the wooden door of which was closed by a bar, supported at each end by a prop†.

It

visitors in that quarter, were so fully convinced of the fidelity and integrity of these people, that they left their sacks, full of iron tools, beads, and stuffs, and every other article of barter, in the middle of their cabins, without lock or key, or any other seal of security than their own probity; and in no instance was their extreme confidence abused; and, on their departure from the bay, they were firmly of opinion, that they did not suppose such a crime existed as that of theft.

† The houses of these people, like their tombs, were filled with effects; nothing was taken away: their arrows, pikes,

It might have been conjectured by the number of tombs which were found in all the islands, creeks, &c. that some recent epidemical disorder had made great ravages in this country; but it seems very apparent that the different families, of which this nation is composed, were dispersed in the neighbouring bays, where they were occupied in catching and drying their salmon, and that they assembled only in the winter, carrying with them their harvest of fish to subsist on till the sun resumes his salutary influence. Some persons, indeed, have supposed, that the religious respect entertained of the memory of their worthy ancestors by these people, induces them to support and repair their tombs, to perpetuate the good fame of the deceased, and the gratitude of the descendant.

No external difference was observable among the living inhabitants, but the ashes of the dead repose in a style of greater or less magnificence, according to their imaginary wealth. The bodies of the indigent are exposed in the open air, on a bier supported by stakes of about four feet in height; but these humble monuments, though they display no escutcheons, are adorned with bow, arrows, and nets of the deceased, together with some pieces of stuff, which it would perhaps be sacrilegious to take away*.

The women are wrapped in a large robe of

skins, &c. remained in the deserted village, in which they never reside but in the winter; they pass the summer on the other side of the gulph, where they now lived; and on which they saw the French visitors enter their cabins and their tombs, without manifesting any apprehensions of seeing their property taken away. The boats' companies, as well as the officers, were so impressed with this striking mark of confidence, that not one of them ventured to disgrace himself by basely condescending to commit the most significant theft.

*These people, like those of Segalian Island, seem to have no chief; nor are they subject to any regular form of government. Their mildness and suavity might remove all the inconveniences of anarchy; no instances were known of their engaging in the slightest quarrel; their reciprocal affection, and their endearing tenderness for their children, could afford exemplary lessons to the European natives. But with all these interesting truths, candour must certainly admit, that the senses were disgusted with the fetid smell of their salmon, with which the houses and adjacent premises were infected: the bones and blood were scattered and read about the hearth, and hungry dogs devoured the remainder. The nastiness and stench of these people are beyond conception; and, with respect to their forms, no race of human beings can be more feebly constituted, or possess features less entitled to the appellation of beautiful. Their common stature is about four feet ten inches; they have

nankeen, or salmon's skin, curiously tanned, descending as low as the ankle-bone, sometimes embellished with a border of fringe manufactured of copper, and producing sounds like those of little bells. Those salmon which furnish a covering for the fur, weigh thirty or forty pounds, and are never caught in summer; those which were taken by the French visitors did not exceed three or four pounds in weight; but that disadvantage was fully compensated by the extraordinary number, and the extreme delicacy of their flavour.

Nothing can, with certainty, be said of the religion of these people; no temples or priests having been seen among them: some rudely carved figures were, however, suspended from the ceiling of their cabins, representing children, &c. These images might possibly be taken for idols by some; but is it probable they were meant only to call to remembrance a child devoured by bears, or some hunter wounded or injured by any of those animals. It is not in the least improbable that persons of so weak a frame should be superstitious.

They perhaps supposed our navigators to be sorcerers, for they answered their questions with visible uneasiness, though with great politeness: the motions of the hand in writing they construed into signs of magic, and intimated that

high cheek bones, a flat nose, small bleary eyes, placed diagonally, a large mouth, a short chin almost beardless, and an olive-coloured complexion, varnished with oil and smoke. Their bodies are lank, and their voices thin and weak. They permit their hair to grow, and tie it up in the Parisian style: that of the women flows loosely over the shoulders. The figure and features of the men so nearly resemble those of the women, that the portrait above drawn would answer for either sex, were it not for a slight difference in dress.

The women are solely occupied in cutting and preparing their apparel, in exhibiting their fish to be dried, and in the management of their children, who have free access to the breast till they are three or four years of age. Great deference is paid to the tender sex by their obedient consorts; they never conclude any bargain of importance, without consulting their wives; the pendent earrings, and other ornamental trinkets, are exclusively appropriated to their wives and daughters. The men, and little boys have a waistcoat of nankeen, or the skin of a dog or fish, formed like a waggoner's frock. All of them wear seal-skin boots in the winter; and men of all ages, and at all times, wear a leather girdle, with the following appendages:—a bag to contain tobacco, a knife in a sheath, a steel for the purpose of striking a light, and a pipe to smoke with.

such

such a practice was evil. They were so incapable of vanquishing their prejudices, that even the most valuable presents, on such occasions, were bestowed on them in vain. Supposing that greater delicacy might be required in the manner of conferring favours on them, La Perouse sat down in one of their houses, and calling two little children to him of three or four years old, tenderly caressed them, and gave them, from his pocket, a piece of rose-coloured nankeen. The highest satisfaction in the countenances of the whole family was immediately evinced; but he was clearly of opinion, that had it been offered directly to themselves, they would have refused this present.

The husband quitted the cabin, and almost instantly returned with a most beautiful dog, entreating La Perouse to accept of it. He politely declined the intended favour, alledging that it would be more useful to its present master. Finding his urgent solicitations ineffectual, he caused the two children who had received the present to approach, and placing their little hands on the dog's back, signifying that he ought not to refuse his children*.

To obtain a satisfactory account of the geography and other essential particulars of these regions, La Perouse had intended to remain in the bay till the 2d of August, at which time he would certainly depart. Till then he was employed in reconnoitering some part of the bay, and the different islands of which it is formed. The naturalists made several excursions in search of objects peculiar to their department. M. de Lamanon, though in a debilitated state of health, requested he might attend on these excursions. M. de Martiniere visited the courses of rivers, to search for unexplored plants on their banks; but he found only the same species he had seen in the bays of *Ternai* and *de Suffren*. The conchologists were more fortunate: they found very fine foliated oysters, of a black and various colour, but adhering so close to the rock that great dexterity was required to remove them: the scales of their covering were so thin, that they could with difficulty be preserved entire.

* Dogs are of great importance in this country; they yoke them to light sledges, like those of the Kamschatkians.

† Though the natives cultivate no plants, they are fond of vegetable substances: the grain of the Manchous, which is similar to small shelled millet, is one of their greatest

Some whelks of a beautiful colour were taken, with various kinds of the kima cockle, and small common muscles.

The hunters killed some wild-ducks, water hens, black and white wagtails, cormorants, guillemots, and a small fly-catcher of an azure blue; but all these species were extremely scarce. The nature of all living creatures in these frozen climates appears to be in a state of torpidity: a gloomy solitude prevails over the whole seashore; and the woods, enlivened only by the croaking of ravens, serve as a retreat for eagles, and other birds of prey. Cormorants and gulls pass a solitary life on the tops of rocks and precipices. The martin, and the sand martin seem, exclusively of all other birds, to be in their proper country; nests and flights of them are to be seen on all the rocks on the sea-shore†.

On the 2d of August, as La Perouse proposed, he sailed with a light breeze; and on the 9th, after experiencing variety of weather, our navigators attained the latitude of Baie de Langle, which they had left on the 14th of July. A bank, on which the soundings are regular, and no danger is to be apprehended, extends ten leagues from north to south, opposite Baie de Langle, and runs out about eight leagues to the west. After reconnoitering it minutely, La Perouse continued to run along the coast the next day, at two leagues distance, and perceived in the south-west a small flat island, which, with that of Segalian, formed a channel of about six leagues. He called it *Isle Monneron*, an officer employed in this expedition being so named. Directing his course between these two islands, he never found less than fifty fathoms water. Soon afterwards he made a peak of about ten or twelve hundred toises in height, consisting of a bare rock, with snow in its cavities; but neither verdure nor trees were perceived on it. He named it *Peak de Langle*. Segalian Island terminating in a point, a distant horizon of mountains was no longer seen: many circumstances announced that he was approaching its southern extremity, and that the peak was upon another island. On this supposition, which was realized

the next day, the anchor was let go in the even-
g, as the calm rendered it necessary to anchor
the south point of Segalian Island.

This point, which was named Cape Crillon by
Pérouse, is situate in 45° 57' north latitude,
and 140° 34' east longitude: it terminates this
land, which, from north to south is of im-
ense extent, separated from Tartary by a chan-
nel terminated by sand-banks to the northward,
between which no passage for ships is to be
found. This same island is Oku-Jesso. Chica
land, abreast of our navigators divided by a
channel from that of Segalian, and from Japan
the strait of Sangaar, is the Jesso of the Ja-
nese, extending to the south as far as the strait
of Sangaar. The chain of the Kuerile moun-
tains is more to the eastward, and with Jesso and
Oku Jesso, forms a sea which communicates
with that of Ochotsk*.

The persons of the islanders which were seen
at Crillon Bay were well sized, strong, and vi-
gorous; their features were expressive, and their
heads descended to their breasts: their arms,
legs, and backs, were also covered with a pro-
fusion of hair. Their middle stature is sup-
posed to be about an inch lower than that of
the French. Their skin is tawny, like that of
the Algerines, and other nations on the coast
of Barbary†.

But if these islanders are deficient in point of
bravery, they are abundantly supplied with
bodily strength and industry: all their dresses
are woven with their own hands; their houses
spacious, in elegance and neatness, many on the
continent; their furniture is composed of the
best materials, and manufactured by ingenious
artisans, many articles of which are furnished by
the Japanese. They have also an important
article of commerce, unknown to the narrow
sea of Tartary, from the exchange of which

* At Cape Crillon the navigators received the visits of
several islanders on board: they at first manifested some
symptoms of fear and distrust, but those apprehensions
speedily vanished: they seated themselves familiarly in a
circle on the quarter-deck, and cheerfully smoked their
pipes. Presents of nankeen, tobacco, silks, iron instru-
ments, and beads, were liberally conferred upon them; but
presently appeared that tobacco and brandy were held in
higher estimation than any other articles, and these had
been but sparingly distributed among them; because the
tobacco was required for the ships' companies, and dis-
agreeable consequences might arise from the incautious use
of brandy.

† Grave in their manners, they expressed their thanks by

VOL. II. No. LXVIII.

arises all their wealth. Of the whale oil they
make a most plentiful harvest, though their
manner of extracting it may not be consistent
with economy: they cut the flesh of the whale
into little pieces, and expose it to the air and
sun, to rot upon a kind of slope; and the oil
which flows from it is received into vessels made
of bark.

These islanders who came on board, retired
before night, after answering, as well as they
could, such questions respecting the geography
of the country and its environs. On their de-
parture they promised, by signs, to return the
next day: that promise was punctually perform-
ed, for at the dawn of day they appeared on
board, with a quantity of salmon, which they
exchanged for hatchets and knives: they also
sold a sable on board, and a linen habit of the
construction of the country; and beheld with
regret that the frigates were preparing to sail.
They earnestly solicited the ships' company to
double Cape Crillon, and to stay in a small bay,
which they called *Tabouoro*.

A light breeze having sprung up from the
north-east, La Pérouse made a signal for getting
under way, and at first directed his course to the
south-east, which is terminated by a rock, to-
wards which the tide strongly sets in. Having
doubled it, a second rock was discovered from
the mast-head, about four leagues from the
point towards the south-east. He named this
La Dangereuse, from its being level with the
surface of the water, and might probably be
covered at the height of the tide. The sea
broke very much upon it, but whether from the
effect of the tide, or the sand-banks which sur-
round it is uncertain. The next day he saw
Cape Aniva bearing north-west, and perceived
the eastern coast, receding to the northward to-
wards Cape Patience. The weather continued

noble and solemn gestures; but their importunities for ad-
ditional presents were most pressingly enforced; though
they had not the gratitude to offer, in return, any of the
salmon with which their canoes were laden: many of which
they carried with them on shore, because they could not
obtain the extravagant prices for them that they demanded.
They had, however, received, without any consideration,
plenty of instruments, beads, linens, stuffs, &c. With
respect to gratitude, how much did these islanders differ
from the Orochys of Baie de Castries, who, instead of
imploping presents, frequently and obstinately refused
them, unless the giver would accept of a requital from
them.

O

very

very fine; but the south-south-east winds, which blew continually for four days, retarded his progress to the Staten and the Company's Islands. No land was now to be seen, nor was any bottom to be found with a line of two hundred fathoms.

On the 17th he approached Staten Island, of which he had a perfect view. On the 19th Cape Troun was perceived to the southward, and Cape Uries to the south-east by east; its proper direction, according to the Dutch chart: their situation could not possibly have been determined with more precision by modern navigators. On the 20th he saw the Company's Island, and reconnoitered the strait of Uries, though it was very foggy: he ran along the south coast of the Company's Island, at the distance of three or four leagues: it appeared to be barren, without trees or verdure, and even without inhabitants. At six in the evening, he was abreast of the north-east point of this island, terminated by a steep cape, which he denominated *Cape Kastri-cum*, from the name of the vessel to which he owe the discovery. Beyond it were seen four small islands, and to the northward a large channel, open to the east north-east, which formed the separation of the Kuriles from the Company's Island.

On the 29th, after a series of foggy weather, our navigators reconnoitered Mareckan Island, considered by some as the first of the southern Kuriles: its extent is about ten leagues, from north-east to south-west, and each extremity is terminated by an eminence; a peak or volcano rising in the middle. They saw two other islands to the north-east, which seemed to have a channel between them and the first. At day-light they perceived at about two leagues distance, the south-west point of Mareckan, which they called *Cape Rollin*, the name of the surgeon. Being driven by the current towards the middle of the channel, where we were not able to strike the ground, they advanced about five

* The navigators intended to approach the islands situate to the north, but impenetrable fogs opposed the design: for the space of ten days, only twenty-four hours of clear weather had been experienced. A fog returning with obstinacy, and the season rapidly advancing, La Perouse resolved to abandon the exploring of the northern Kuriles, and to shape his course for Kamtschatka. He had determined the most southerly of them: he therefore thought it would have been imprudent to sacrifice to an unimportant enquiry the health of the ships' companies, which began to require rest. He therefore stood north north-east, and

leagues to the westward. The night was extremely fine, the winds settled at east north-east and they entered the channel by the light of the moon: La Perouse honoured it with the name of *Canal de la Boussole*; it being the finest between the Kuriles*.

On the 5th of September, though the fog continued obstinate, the navigators crowded sail in the midst of darkness, and at six in the evening of the same day, it cleared up, and enabled them to see the coast of Kamtschatka; the whole of which appeared hideous: the eye surveyed with terror enormous masses of rocks, which in the beginning of September were enveloped in snow. The next day they approached the land, and found it agreeable to behold when near; and the base of these enormous summits, crowned with eternal ice, was carpeted with the most beautiful verdure, finely diversified with trees.

In the evening of the 6th, they made the entrance of Avatcha Bay, or Saint Peter and Saint Paul. The light-house, erected by the Russians on the east point of the entrance, was not kindled during the night; as an excuse for which the governor declared, the next day, that all their efforts to keep it burning had been ineffectual: the wind had constantly extinguished the flame, which was only sheltered by four planks of wood, very indifferently cemented; and was not modelled after any of the light-houses of Italy, Egypt or ancient Greece.

At two in the afternoon of the 7th, they entered the bay; when the governor came in his canoe five leagues to meet them; though the care of the light-house had occupied his attention during the night, he took the blame on himself of not having succeeded in his endeavours to render it perfect. He informed them that they had been long expected there, and that he believed the governor-general of the Peninsula, who was expected at Saint Peter and Saint Paul in a few days, had letters for them.

gave up his project of coming to an anchor at one of the Kuriles, to observe the nature of the land, and the manners and customs of the inhabitants.

He further observes that the aspect of the southern islands, close to which he ran along, is extremely dreary, and he expresses his opinion that the Company's Islands, those of the Four Brothers, Mareckan Island, &c. are uninhabitable rocks, without verdure and vegetable earth, and can only serve as a miserable refuge to persons shipwrecked.

SECTION XIII.

Bay of Avatska—Obliging Reception there—Arrival of Mr. Hasloff—Great Attention of the Governor—A Ball of the Kamtschadales—A Courier brings Letters from France—Departure.—SEPTEMBER, 1787.

THE French navigators were hardly moored before the harbour of Saint Peter and Saint Paul, when they received a visit from the Toyon, chief of the village, with several other inhabitants; all of whom made them presents of fmon or skate: they also made them a tender of their services in hunting bears, or in shooting ducks which abounded in their ponds and rivers. Their offers were gladly accepted, and wild fowl was never wanting during their continuance in the Bay of Avatska. They required no reward for their labours, but the grateful Frenchmen insisted upon being permitted to make them proper compensation.

The government of Kamtschatka had been materially changed since the departure of the English, and was now only a dependency of that of Okhotsk. These particulars were communicated to our navigators by lieutenant Kaboroff, governor of the harbour of Saint Peter and Saint Paul, having a serjeant and forty soldiers under his command. He told them that Mr. Kasloff, a Breton, the governor of Okhotsk, was expected at Saint Peter and Saint Paul in a few days. M. de Lessops, who acted as interpreter, and who perfectly understood the Russian language, wrote a letter, in La Prouse's name, to the governor of Okhotsk, to whom La Prouse also wrote in French himself. He told him that the narrative of Cook's last voyage had spread abroad the fame of the hospitality of the Kamtschadale government; and he flattered himself that he should be as favourably received as the English navigators; as his voyage, like theirs, was intended for the general benefit of all maritime nations.

As Mr. Kasloff's answer could not possibly ar-

rive for some days, the lieutenant informed La Prouse, that he only anticipated his orders, and those of the empress of Russia, by requesting that he would, in the mean time, consider himself at home, and indulge freely in every thing the country would afford. The serjeant, and all the soldiers manifested the strongest inclinations of rendering every service in their power; and Mrs. Kaboroff, on her part, was infinitely obliging. Every one was anxious of conferring favours upon these French visitors; and, spite of their determination not to receive any, it was impossible to be inattentive to the solicitations of the lieutenant's lady, who prevailed on La Prouse, M. de Langle, and their officers to accept a few skins of sables, rein-deer, and foxes, which were certainly more useful to them, than to persons who were destined to return towards the tropics. The visitors, however, were permitted to discharge the obligation, by presenting them with such articles as were not to be found in Kamtschatka.

A commodious house in the village was kindly offered them for the purpose of accommodating the astronomers, who had hardly erected their observatory, when the naturalists, equally zealous with themselves in the pursuit of science, resolved to visit the volcano at the distance of about eight leagues. A mountain, almost covered with snow, presented a crater at the summit; the mouth of which turned towards the bay of Avatska, emitting constantly thick clouds of smoke; and once, during the night, faint blue and yellow flames were perceived, which rose to a considerable height*.

Their guides had only undertaken to conduct them to the bottom of the peak, an antient pre-

* M. Kaboroff's zeal was much excited in favour of the naturalists: eight Cossacks were immediately ordered to accompany M. Bernizet, and two other gentlemen, to assist in a laborious undertaking for the advancement of Science. One of the learned, who had travelled in Kamtschatka, never ventured upon so difficult an enterprize. From the aspect of the mountain, La Prouse supposed it to be inaccessible. No verdure was perceptible—it was only a bare rock, of which the declivity was wonder-

fully steep. The intrepid adventurers, however, entertained hopes of surmounting these obstacles. The Cossacks were the bearers of their baggage, which consisted of a tent, several skins, and a quantity of provision: the naturalists undertook to carry the barometers, the thermometers, and the other articles required for making accurate observation, not choosing to risk such fragile instruments in other hands.

judice having induced both Kamtschadales and Russians to believe, that the mountain emits a vapour which would instantly suffocate the rash adventurer who would dare to ascend it. They perhaps supposed that the natural philosophers, like themselves, would stop at the foot of the volcano. Full of this idea they set off in high spirits, without halting till they came to the middle of the woods, at the distance of six leagues from Saint Peter and Saint Paul. The ground they had passed over presented no serious obstacles to oppose them, though covered with shrubs and trees: the pines were stunted and appeared like dwarfs. Berries of every kind, and of every colour, continually presented themselves; the taste of which was generally acid, though highly palatable with sugar.

At sun-set the tent was pitched, the fire kindled, and every thing prepared for the accommodation of the enterprising party; but the greatest care imaginable was taken to prevent the fire from extending to the trees of the forest, as such an accident would inevitably have put the sables to flight, and no more of them would be found during the winter, which is the hunting season. The skin of these animals, which may be deemed the only riches of the country, is given in exchange for all the commodities the inhabitants require, and serves to pay the annual tribute to the crown; great must therefore be the enormity of the crime that deprives the Kamtschadales of advantages so important. Influenced by this consideration, the Cossacks carefully cut down the grass round the fire-place, and, before their departure, dug a hole to receive the ashes, which they extinguished with moistened earth. During the progress of this day, they saw no other quadruped than a hare,

which was almost white: not a single bear, reindeer, or argali*, having made its appearance, though these animals are common in that country.

Rising at the dawn of the next day, they proceeded on their journey: a great quantity of snow had fallen during the night, and what was more distressing, a thick fog obscured the volcanic mountain, the foot of which was not reached by the philosophers till three in the afternoon. Their guides, adhering to their stipulation, stopped on their arrival at the limits of the vegetative earth, pitched their tents, and lighted a fire. A night's rest was found a necessary preparative to the fatigues of the ensuing day†.

While this experiment was making, the navigators caused their casks to be filled with water, and their hold with wood: they also cut a quantity of grass, and dried it for the consumption of the cattle they expected, for they had now only one sheep left alive. The finest grass grows in natural meadows at Kamtschatka to the height of about four feet, and an immense quantity of hay might be provided for the winter, which in this climate continues upwards of seven months: but the Kamtschadales prefer their present mode of living upon the produce of their hunting and fishing. The Cossacks, and the Russians, who are more expert soldiers than farmers, have adopted the same method.

The lieutenant and the serjeant were the only persons who had inclosed little gardens for the cultivation of turnips and potatoes; their example had no influence over their neighbours, who did not dislike those edible roots, but they were not inclined to be at any trouble to produce them: had they grown spontaneous, like *suranne*, garlick, and the berries from which their

crystallized sulphur were found at the summit; but the latter was inferior to that of the Peak of Teneriffe. All the other stones they found here, were less beautiful than those of that ancient volcano, which has not erupted for a century past; though the Kamtschadalian mountain had an eruption in 1778, while Captain Clarke was in the bay of Avatscka. According to the calculations of the natural philosophers, the travellers ascended about fifteen hundred toises, an amazing height considering the difficulties they had to surmount. Their views having been frustrated by a fog, they resolved to go over the same ground again the succeeding day; but a prodigious fall of snow, and other adverse circumstances intervening, induced them to abandon all idea of engaging in a repetition of the ascent, and they returned to the village of Saint Peter and Saint Paul.

* The mountain sheep, or *capra ammon* of the Linnæan system. It is supposed to exist in no other parts of Europe than Corsica and Sardinia, and to be the same of which a living specimen existed a few years ago in the prince of Condé's collection at Chantilly. It was there called *mouflon*, and was considered by M. Buffon as the parent stock whence all the varieties of domestic sheep are sprung.

† At six in the morning the natural philosophers began to ascend the steep, and continued their progress till three in the afternoon, when they approached the very edge of the crater. They had often been under the necessity of crawling upon their hands and knees, to facilitate their passage among the broken rocks, and to avoid some dangerous precipices. The mountain is principally composed of lava, more or less porous. Gypseous stones, and

single bear, relative to its appearance, is common in that

most agreeable beverage was procured, they would gladly have indulged in them:

In the midst of their labours, our navigators devoted intervals to pleasure, and engaged in several hunting parties on the rivers Avatscka and Paratounka, expecting to be able to shoot a few rein-deer, bears, or other quadruped inhabitants of that climate. They were obliged, however, to content themselves with a few ducks or teal, an inferior sort of game, which were considered as a poor compensation for their laborious excursions. But if their own endeavours were not so successful as their sanguine expectations had predicted, their friends among the Kamtschadales made ample amends for the disappointment. During their stay they had received from the inhabitants of the village, an elk, four bears, and a rein-deer, with such a quantity of divers, and other wild fowl, that they found it necessary to distribute a considerable part of them among their crews. This was rendered the more necessary as they had been cloyed by a super-abundance of fish: a single cast of the net, alongside of the frigates, would have procured sufficient sustenance for half a dozen ships; but there was little variety of species, cod, salmon, herrings, and plaice, were almost the only produce of the net.

Mr. Kasloff, on his arrival at Saint Peter and Saint Paul, after having taken a tour through the provinces, politely informed the navigators, that he had perceived by the public papers, that several able naturalists had embarked on board their frigates; and that he should be happy to avail himself of so fortunate a circumstance, that he might learn the nature of the minerals of the peninsula, and thus become a naturalist himself. As he spoke French, and was well informed of the object of their research, it may easily be conceived that an intimacy must have been immediately formed.

The day after his arrival he went to dine with

* On the following day the governor, with all his suite, dined on board the *Astrolabe*, where he also was honoured with the discharge of thirteen guns; but he earnestly requested that he might receive no more compliments of that kind, and that they might see each other on friendly and familiar terms. It was impossible to prevail on him to accept of the value of the oxen, though repeatedly urged in the most pressing terms that could be devised: he only contented that he could not furnish his friends with a greater number. He invited them to partake of a ball, to be given the succeeding day on their account, to all the women of

La Perouse on board the *Bonissolle*, in company with Mr. Schenaleff, and the vicar of Paratounka. By La Perouse's order, he was saluted with thirteen guns. Mr. Kasloff, after reciprocal compliments, expressed the utmost concern at his inability to procure more than seven oxen before the time of his departure; as there was no resource but that of waiting for their being brought from the river of Kamtschatka, a hundred leagues distant from Saint Peter and Saint Paul*.

The ball commenced with Russian dances, the tunes of which were pleasing. The Kamtschadale dances, which followed, resembled those of the *Convulsionnaires* at the well-known tomb of Saint Medard†. The Kamtschadale females, by their convulsions and contracted motions, create disagreeable sensations in the spectators, which are aggravated by a pitiful cry unnaturally drawn from the pit of their stomachs, and which is the only music to regulate the steps of these wonderful performers. The violent fatigue of this exercise excites such profuse perspiration, that many of the party sink motionless on the ground, losing for a time the power of rising. The exhalations from their bodies perfumed the apartment with the delicious odour of oil and fish, to which European noses are too little accustomed to form a judgment of its fragrance.

The dances of these nations having ever been imitative and pantomimical, La Perouse requested to know what two of the most active of the women meant to express, in their most violent exertions. He was respectfully informed, that they had given the representation of a bear-hunt: the women who rolled on the ground had performed the part of the animal; and the other was the accomplished hunter. But never were bears more awkwardly represented!

This dance, equally fatiguing to the beholders and the performers, was hardly finished, when a

St. Peter and St. Paul; informing them that, if the assembly was not numerous, it would at least be curious: thirteen women, clad in silk, ten of whom were Kamtschadales, were sitting round the room on benches: the latter were rendered remarkable by their broad faces, little eyes and flat noses; the other three were Russians. All the ladies had silk handkerchiefs tied about their heads, seemingly in imitation of the Mulatto women in the French West-India Islands.

P

joyful

joyful exclamation announced the arrival of a courier from Oekhotsk. He was the bearer of a large trunk filled with packets for the French voyagers. The ball was interrupted, and each of the females dismissed with a goblet of brandy, a refreshment well calculated for such votaries of Terpsichore. Mr. Kasloff, perceiving the impatience of the French navigators to learn the news of what could not fail of being highly interesting to them, entreated them not to defer that pleasure, and conducted them into his own apartment, that the different effusions produced by the relation of different events, might not be improperly restrained*.

La Prouse expressed his surprise at finding the aged Ivashchkin in Kamtschatka, the English accounts having stated that he had obtained permission to go and reside at Okhotsh. He could not avoid feeling much concern for the fate of this unfortunate man, when he was informed, that some indiscreet expressions respecting the empress Elizabeth, was his only crime; and those were uttered at the breaking up of a convivial party, when his reason was disordered by wine. He was then under twenty, and an officer in the guards. He belonged to a Russian family of distinction, and could boast of a handsome face and figure. He was banished to the interior of Kamtschatka, after having received the punishment of the knout, and endured the slitting of the nostrils. The empress Catherine granted this unfortunate man a pardon many years ago; but the bitter recollection of his ignominious punishment, and his resentment of so flagrant a sentence for so trivial an offence, rendered him insensible to a tardy act of justice, and he seemed determined to end his days in Siberia. He pointed out the grave of M. de la Croyere, of the

* The intelligence contained in these packets was generally satisfactory, particularly to La Prouse; who, by a degree of favour to which he did not presume to aspire, had been promoted to the rank of commodore. The compliments he received on this event, soon reached the ears of Mr. Kasloff, who ordered a discharge of all the artillery of the place upon this joyful occasion. Innumerable, indeed, were the favours conferred by this gentleman, as well on M. de Langle as himself; and, among others, a great quantity of sable skins. They gratefully offered, in return, every thing that they supposed might be agreeable to him, but they had nothing worthy such a benefactor; they were rich only in commodities for the savage market. They entreated him, however, to accept The Narrative of Cook's Third Voyage, with which he was highly gratified, especially as, in his *suite*, the following personages were

Royal Academy of Sciences at Paris, who died here in 1741, deservedly regretted by his country. An inscription, engraved on copper, does honour to his memory†.

Though M. Kasloff was no stranger to the sciences of chemistry and mineralogy, he evaded a discussion on those subjects with M. Blondela, alleging that, instead of those sciences, it was the part of a wise administration, first to endeavour to procure the inhabitants bread, by training them to agricultural labours: the rapidity of vegetation here sufficiently proved the fertility of the soil, and he was convinced that abundant crops of rye and barley might be produced; and that wheat might be prevented from shooting by the severity of the winter. He requested them to remark the promising appearance of several fields of potatoes, the seed of which had been brought from Irkoutsk a few years before; and proposed to adopt measures of making farmers of the Russians, Cossacks, and Kamtschadales.

The Kamtschadales are of an imitative genius, and fond of adopting the customs of their conquerors. They have already abandoned the *yourts*, in which they were formerly accustomed to burrow like badgers, breathing foul air, during the whole of the winter. The most opulent among them now build *isbas*, or wooden houses, like those of the Russians: they are divided into three small rooms, and are conveniently warmed by a brick stove. The inferior people pass their winters and summers in *balagans*, resembling wooden pigeon-houses, covered with thatch, and placed upon the tops of posts twelve or thirteen feet high; to which the women, as well as men, find a ladder necessary for their ascension. But these latter buildings will pro-

introduced. Mr. Shmaloff, the good vicar of Paratouka, and the unfortunate Ivashchkin. To them he translated the passages which related to them, the truth of which they readily admitted, on hearing the particular repeated.

† Mr. Kasloff's permission was then requested to engrave upon a plate of the same metal the inscription over the grave of Captain Clerke, which had then been only written by a pencil upon wood, and was too perishable to perpetuate the memory of so estimable a navigator. The governor did more than comply with the prayer of this petition: he promised to erect, without delay, a monument more worthy of those two celebrated men, who died in the midst of their arduous undertaking at so great a distance from their native land.

bly soon disappear; for the Kamtschadales
mitate the manners and dresses of the Russians*.
It is curious to see, in their little cottages, a
quantity of cash in circulation; and it may be
considered as still a greater curiosity, because
the practice exists among so small a number of
inhabitants. Their consumption of the com-
modities of Russia and China are so few, that
the balance of trade is entirely in their favour,
in consequence of which it is necessary to pay
them the difference in rubles. The Kamtscha-
dales, says La Perouse, appeared to me to be the
same people as those of the Bay of Castries, on
the coast of Tartary: they are equally remark-
able for their mildness and their probity; and
their persons are not very dissimilar.

The bay of Avatscka is one of the completest
and safest that can be met with in any part of
the world. The entrance is narrow, and ships
would be under the necessity of passing under
the guns of the forts that might be easily erected.
Two vast harbours, one on the eastern, and the
other on the western side, are capable of con-
taining all the ships of the French and English
navy. The rivers of Avatscka and Paratounka
fall into this bay, but they are choked up
with the sand-banks, and can only be entered at
the time of high water†.

He related a number of particulars respecting
the Kuriles, of which he is also the vicar, and
of which he makes an annual tour. The Rus-
sians have substituted numbers to the ancient
names of those islands, concerning which au-
thors are much divided in their opinions. They
are now known by the names of Number 1, 2,

* It may be affirmed, in honour of the Russians, that,
though they have established a despotic government in this
remote climate, it is so tempered with mildness and equity
that its inconveniencies are imperceptible. The taxes
which are levied on the Kamtschadales are so very moderate,
that they can only be considered as a mark of gratitude to-
wards the sovereign, the produce of half a day's hunting
being sufficient to discharge the imposts of a year.

† On a selected spot Mr. Kasloff purposes laying down
the plan of a city, which may hereafter become the capital
of Kamtschatka; and perhaps the centre of an extensive
trade with China, Japan, the Phillippines, and America.
He prudently observed, however, that bread and hands
are required, and that their stock of them was very small:
he ventured to give orders which announced a speedy
colon of the other *ostrogs* to that of Saint Peter and Saint
Paul, where it was his intention speedily to erect a church.
The Greek religion has been established among the Kamts-
chadales without difficulty, persecution, or violence.

The vicar of Paratounka is the son of a Kamtschadale

&c. as high as 24, which last terminates the
pretensions of Russia. Of these twenty-four
islands belonging to Russia; four only are in-
habited, the first, the second, the thirteenth, and
the fourteenth. The last two may indeed be
considered as one, the inhabitants passing the
winter upon No. 14, and return to No. 13 to
pass the summer months. The others are un-
inhabited, though they are occasionally visited
by the islanders, who come in their canoes for
the pleasure and emolument of hunting foxes
and otters. Several of these last mentioned
islands are little better than large rocks, and not
one among them is embellished with a single
tree. The currents being very violent and dan-
gerous between the rocks, the vicar never made
the voyage from Avatscka to the Kuriles in any
thing but a canoe; and even then had several
times been nearly lost, or perishing with hunger,
having been driven out of the sight of land: he
attributed his preservation to his cassock and his
holy water. The population of the four in-
habited islands does not exceed fourteen hundred:
the inhabitants live upon seals, fish, and the
produce of the chase; the males are remarkably
hairy, and wear long beards. These people are
poor, inoffensive, and hospitable, and have all
embraced the Christian religion.

The approach of winter now warned our na-
vigators to depart: the ground, which on their
arrival on the 7th of September, was adorned
with the most beautiful verdure, was as yellow
and parched up on the 25th of the same month,
as it is in the environs of Paris at the conclusion
of December. La Perouse therefore gave pre-

father, and a Russian mother. He performs his sacred
functions with an accent and feeling highly gratifying to his
auditors, who reward his cares and endeavours with of-
ferings and alms, but pay no tithes. The canons of the
Greek church permitting priests to marry, appears to be a
kind of security for the morals of the country clergyman.
La Perouse, however, believes them to be very ignorant,
and supposes they will long continue so. He admits that
the daughter, the wife, and the sister of the vicar, were
the best dancers among the women, and seemed to enjoy a
perfect state of health. The worthy priest knew that the
navigators were good catholics, which procured them an
ample aspersion of holy water; and he also enjoined them
to kiss the cross which was carried by the clerk. These
ceremonies were performed in an uninclosed part of the
village, where a tent was his parsonage-house, and his altar
the open air: but the usual place of his abode was at Pa-
ratounka; he appeared at Saint Peter and Saint Paul only
as a visitor.

paratory orders for their departure, and on the 29th got under way. Mr. Kasloff came to take a final leave of him, and dined on board. He accompanied him on shore, with M. de Langle, and several officers, and was liberally entertained with a good supper, and another ball.

At day-break the next morning, La Perouse made the signal for sailing; soon after which he heard a discharge of all the cannon of Saint

Peter and Saint Paul. He ordered a return to be made to this salute, which was repeated at the mouth of the bay, the governor having sent a detachment of soldiers to pay him the honours of departure. It was with considerable regret that they parted with M. de Lesseps, whose good qualities had endeared him to all who had the happiness of approaching him.

SECTION XIV.

Account of Kamtschatka—Bay of Avatscka—Make the Island of Navigators—Receive Visits from several Canoes—Barter with the Indians—Anchor at the Island of Maouma—Manners, Customs, &c. of the Islanders of Maouma—The Beauty of the Country contrasted with the Ferocity of its Inhabitants—M. de Langle goes on Shore to water his Ship, with Four Boats manned and armed—M. de Langle, and Eleven other Persons murdered—SEPTEMBER, OCTOBER, and DECEMBER, 1787.

THE Russians, as earnest after peltry as the Spaniards are after gold and silver, have long undertaken the most tedious and difficult journeys by land, to obtain the valuable spoils of the sable, the fox, and the sea-otter: but assuming the character of soldiers rather than hunters, they thought proper to impose a tribute upon the natives of the country they had subdued, instead of sharing with them in the fatigues of the chase. The peninsula of Kamtschatka was discovered by them near the close of the seventeenth century, the first expedition against the liberty of its wretched inhabitants being undertaken in 1696. The authority of Russia was fully acknowledged throughout the peninsula in 1711.

The court of Russia has several times changed the form of government in this country: that which the English found established in 1778, was totally altered in 1784; Kamtschatka being then a province of the government of Okhotsk, which is itself a dependency of the sovereign

court of Irkoutsk. The Ostrog of Bolcheretsk formerly the capital of Kamtschatka, when Major Behm resided when the English arrived there, is now governed by a serjeant named Martinoff, and the other places by persons respectively appointed. These commandants are not responsible to each other, but severally render their own account directly to the governor of Okhotsk, who has established an inspector with the rank of major, and with a particular command over the Kamtschadales*.

In some respects the French navigators were less chilly than the Russian and Kamtschadale inhabitants of the ostrog of Saint Peter and Saint Paul. They were clothed with the thickest skins. The heated air deprived the French voyagers of respiration, and obliged the lieutenant to open the windows whenever they were in his apartment. The population of the Kamtschadales is now estimated at four thousand, scattered over the whole peninsula; and from its extent it is calculated that there are several

* Russia has been at very little expence in extending her dominions: commercial houses fit out vessels at Okhotsk, which are from forty-five to fifty feet long, with a single mast in the middle, carrying from forty to fifty men, who are all more expert as huntsmen, than as seamen. They sail from Okhotsk in June, pass between the point of Lopatka, and the first of Kuriles, steer eastward, and run from island to island for three or four years, till they have bought or killed a sufficient number of otters to pay the expence of fitting out, and yield the merchants a profit of cent. per cent. upon the capital advanced.

It is now generally known that furs fetch a high price at Kiatcha, on the frontiers of China and Russia. Twenty-five vessels, the crews consisting of about a thousand men, had been sent this year in quest of furs to the eastward of Kamtschatka; long experience having taught them, that the otters hardly ever frequent the latitudes farther north than the 60th degree. When these vessels return, they sometimes put in at the bay of Avatscka; but always repair ultimately to Okhotsk, the usual residence of their owners, and of the merchants who trade directly with the Chinese on the frontiers of the two empires.

square leagues for each individual. They cul-
ivate no production of the earth; and, as they
prefer dogs to rein-deer in drawing their sledges,
they no longer breed hogs, sheep, rein-deer,
horses, or oxen, supposing those animals would
be devoured before they could acquire strength
and activity to defend themselves. Fish is the
common aliment of their draught dogs, which
travel about twenty-four leagues a-day, and
are never fed till they have completed their
journey.

The bay of Avatscka resembles that of Brest,
but affords much better holding ground: its en-
trance is also narrower, and more easily to be
defended: no mineral or vegetable substances
were found upon its shores, but such as are ex-
ceedingly common in Europe. The north wind,
which favoured the navigators at sailing out of
the bay of Avatscka, deserted them when they
were two leagues in the offing. It shifted, and
blew with such obstinacy, that they abandoned
their plan of reconnoitering, and laying down
the latitude and longitude of the Kuriles, as far
as the isle of Marikan. While our navigators
were searching for a large, rich, and well-
peopled island, said to have been discovered by
the Spaniards in 1620, they met with a real mis-
fortune: a seaman fell overboard from the As-
solabe, in the act of furling the mizen-top-gal-
lant-sail. Whether he was wounded in the fall,
or could not swim, they could not ascertain,
but he never rose again.

Signs of land were seen on the 18th and 19th:
lights of ducks, and other birds that frequent
the shore were observed. Indeed the signs of
land were too frequent, and of too decided a
nature to admit of any further doubt. On the
1st of November, after experiencing several
vicissitudes of weather, a great number of birds
were seen; and, among others, curlews and
plovers, two species which are never observed at
any considerable distance from land. Some large
clouds remaining constantly fixed towards the

* On the 6th of November they fortunately caught eight
bonetas, which furnished a good repast to the whole crew,
and to the officers. The rain and storms ceased, and the
heavy sea subsided about the fifteenth, when fine weather
accompanied our navigators beyond the equator, which
they crossed on the 21st of November, for the third time
since their departure from Brest. On the 23d they caught
two sharks, which supplied the crew with two meals, and
on the same day they shot a lean emaciated curlew. As

south, induced La Prouse to imagine that there
was land in that point of the compass, and he
steered his course accordingly, continuing to
see birds for two or three successive days. By
degrees, however, these harbingers deserted him,
and he began to enjoy a serene sky.

About this time the navigators caught several
doradoes, and a couple of sharks, upon which
they fared deliciously; all the crew having been
reduced to salt pork, which had received some
injury from the influence of a burning clime.
Having at length reached the tropic, the sky
became still clearer, and the horizon was of
great extent; but no land was perceived, though
birds were every day met with which are never
seen far distant from the shore. On the 4th of
November they caught a golden plover which
appeared to be moderately fat, and therefore
could not have been long at sea; on the 5th
they crossed their own track from Monterey to
Macao; and on the 6th that of Captain Clerke
from the Sandwich Islands to Kamtschatka, when
the birds had entirely disappeared. A heavy
swell from the east, like that from the west in
the Atlantic ocean, constantly prevails in this
vast sea: they saw neither bonetas nor doradoes,
nor any thing but a few flying fish; a distressing
circumstance as their fresh provision was entirely
consumed. The sea was smooth, and the breezes
moderate; but the sky was covered with thick
clouds, and it began to rain almost incessantly
during the day, though the nights were tolerably
fine: the heat was suffocating, accompanied with
great humidity*.

Black goelettes, and others entirely white,
were so extremely plenty, that they killed more
of them than of noddies, or man of war birds:
and yet the latter flew round the ships in such
numbers, especially during the night, that they
almost stunned the people on the quarter-deck,
who could not, without difficulty, hear each
other speak; but, to punish their insults, many
of them were killed and devoured.

they advanced in the southern hemisphere the noddies and
tropic birds, flew more frequently round the ships, which
they fondly imagined were the harbingers of some island.
In the intervening calms several sharks were captured,
which were preferred to salt provision; even the sea-birds,
which now frequently became the sailors' prey, though
lean and highly impregnated with a fishy smell and taste,
were thought as delicious as partridges or woodcocks.

Induced by a western gale, La Perouse attempted to reach the parallel of Bougainville's Navigators Islands, a discovery due to the French, where fresh provision might probably be procured. On the 6th of December, at three in the afternoon, he saw the most easterly island of the Archipelago, and stood on and off during the rest of the evening and night. Meaning to anchor if he met with a proper place, La Perouse passed through the channel between the great and the little islands that Bougainville left to the south: though hardly a league wide, it appeared perfectly free from danger. He saw no canoes till he was in the channel, yet he beheld several habitations on the windward side of the island, and a group of Indians sitting under the shade of cocoa-nut trees, who seemed delighted with the prospect afforded by the frigates*.

At length they made sail, in order to stand away from the coast, and get out of the region of calms. All the canoes came immediately alongside: they sail tolerably well, but row very indifferently; as they frequently overset, they would be useless to those who are not such excellent swimmers as these islanders are. After such a trivial accident, they take the canoe on their shoulders, pour the water out of it, and then get in again, expecting a speedy repetition of the same operation. The general height of these islanders is about five feet, seven or eight inches: their colour resembles that of the Algerines or the other nations of the coast of Barbary: their hair, which is long, is tied up on the top of their heads, and their cast of countenance is displeasing. La Perouse saw only two of their women, and their features were not more delicately formed. By the sores and ulcers on their legs, it seemed probable that the leprosy was prevalent among them. They ap-

* This island, of about two hundred toises elevation, is steep, and covered to the top with large trees, many of which appeared to be of the cocoa-nut kind. The houses extend about half way down the declivity, affording the natives a cooler air than if erected nearer the shore. Several spots of ground appeared to be cultivated; but, upon the whole, the island seemed far from fertile. Two little islands, which form the western side of the channel, through which we passed, have also their inhabitants. Five canoes were observed to set out from them, and join eleven others that came from the eastern island. After having paddled several times round the ships, and displayed strong appearances of distrust, they ventured to approach, and

proached the navigators without arms, and were apparently as peaceable as the inhabitants of the Society and Friendly Islands.

The French visitors supposed these islanders had entirely taken leave of them, and, from their apparent poverty, did not regret their absence; but in the afternoon the same canoes accompanied by several others, came two leagues into the offing, to have fresh traffic with them. They were now more richly laden than before; having five fowls, a small hog, ten gullinules, several curious articles of dress, and a most beautiful turtle-dove: the body of this charming bird was white, its head purple, its wings green, and its breast chequered with red and black spots like the leaves of the anemone. As it died in our passage, its feathers could only be preserved, and they lost all their splendour. As the *Astrolabe* was constantly a-head in this day's-run, the canoes began their traffic with *M. de Langle*, who purchased two dogs, which were thought voluptuous food.

It is remarkable that none of these islanders could be prevailed upon to accept, in exchange, any French hatchets, or other instruments of iron: they preferred a few useless glass beads to all the hardware and other articles that were offered them. Expecting to meet with a more considerable island farther west, the navigators flattered themselves they should soon find a shelter, if not a port, and therefore deferred making more extensive observations, till they arrived at that island, which, according to *M. de Bougainville's* plan, they now approached. At break of day they were surprised not to see the land to leeward; nor was it to be discovered till six o'clock in the morning, the channel being infinitely wider than is represented on the chart which was delivered to La Perouse as a guide. They found themselves opposite the

began to negotiate; but their articles were of so trivial a nature that the French visitors could only obtain about twenty cocoa-nuts, and two blue gallinules. These islanders, like all those of the South Sea, have no idea of honour or honesty in their dealings; and when they received the price of their cocoa-nuts beforehand, seldom failed to paddle away without performing their part of the agreement. The amount of their thefts, however, were of little importance; a few bead necklaces, and some remnants of red cloth were hardly worth demanding a restoration of. They sounded several times in the channel with a line of a hundred fathoms, but got no ground, though not a mile from the shore.

north-

north-east point of the island of Maouna at
ve in the evening. Being visited by two or
ree canoes, which came alongside to exchange
ogs and fruit for beads, they conceived an
xalted opinion of the riches of the island.

The next morning they approached the land,
nd stretched along it at the distance of about
half a league: a number of creeks were observed,
which appeared to be formed by several small
projections of the coast, and might probably be
ufficiently capacious to admit canoes, barges,
nd long-boats to enter. A number of villages
resented themselves at the bottom of each
creek, whence innumerable canoes were con-
tinually issuing with hogs and fruit, which were
bartered for a rateable quantity of glass ware.
his prospect of abundance increased the desire
of anchoring; and having found, at four o'clock,
a mile from land, and in thirty fathoms water,
a bank composed of rotten shells and coral,
they let go their anchors; but they were tossed
about by a heavy swell that set in shore. They
immediately hoisted out their boats; and the
same day M. de Langle, and several officers,
with three boats manned and armed, landed at
a village, where they were hospitably received
by the inhabitants. Night coming on when
they reached the shore, the Indians made a large
fire, to light the place of debarkation, and
brought down a quantity of hogs, birds, and
cocoa-nuts. After an hour's stay, the boats re-
turned on board. Every person, however, was
under some concern to see the frigates anchored
in so bad a road, where they rolled as if they
were in the open sea. Alarm for the con-
sequences which may probably happen, as they
were then situated, embittered the night with
disagreeable reflections, especially as a storm was
gathering to the northward, whence the wind
was blowing fresh; but happily, the land breeze
prevailed.

Charmed with the beautiful dawn of the fol-
lowing morning, La Perouse resolved to recon-
noitre the country, take a view of the inhabitants

The women, many of whom were pretty, were liberal
of their favours as well as of their fowls and fruit, to those
who were willing to give beads for them; and soon attempt-
ed to pass through the line of soldiers, who feebly resisted
their endeavours. These fair savages presently succeeded
in breaking the ranks; the men then ventured to approach,
and confusion was becoming general; when some Indians,
which the navigators supposed to be chiefs, made their ap-

at their own homes, fill water, and immediately
get under way; prudence warning him against
passing a second night at that anchorage, which
M. de Langle also thought too dangerous for a
longer stay. It was therefore agreed on to sail
in the afternoon, after appropriating the morning
in exchanging baubles for hogs and fruit. At
the dawn of day the islanders had surrounded
the two frigates, with two hundred different
canoes laden with provision, which they would
only exchange for beads: our axes, cloth, and
other articles of traffic were treated by them with
contempt.

While a part of the crew was occupied in
keeping them in order, and dealing with them,
the rest were dispatching empty casks on shore
to be replenished with water. Two boats of the
Boussole, armed, and commanded by Messrs.
de Clonard and Colinet, and those of the As-
trolabe, commanded by Messrs. de Monti and
Bellegarde, set off with that view at five in the
morning, for a bay at the distance of about a
league. La Perouse followed close after Messrs.
Clonard and Monti, in his pinnace, and landed
when they did. It unfortunately happened that
M. de Langle had formed a resolution to make
an excursion in his jolly-boat to another creek,
at the distance of about a league from their
watering place: from this excursion a dire mis-
fortune ensued. The creek, towards which the
long-boats steered, was large and commodious:
these, and the other boats, remained afloat at
low water, within half a pistol shot of the
beach, and excellent water was easily procured.
Great order was observed by Messrs. de Clonard
and de Monti. A line of soldiers was posted
between the beach and the natives, who amounted
to about two hundred, including many women
and children. They were prevailed on to sit
down under cocoa-trees, at a little distance from
the boats: each of them had fowls, hogs, pigeons,
or fruit, and all of them were anxious to dis-
pose of their articles without delay, which
created some confusion*.

While

pearance, armed with sticks, to restore order. Every one
now returned to his post, and traffic began afresh, to the
satisfaction of both purchasers and sellers.

In the mean time an act of hostility had occurred in La
Perouse's long-boat, which he was desirous of repressing
without effusion of blood: an Indian had taken a mallet
from the stern of the boat, and aimed several blows at the
arms and back of one of the sailors. La Perouse ordered
four

While matters were thus passing with perfect tranquillity, and the casks expeditiously filling with water, La Perouse ventured to visit a charming village, situated in the midst of a neighbouring wood, the trees of which were loaded with delicious fruit. The houses formed a circle of about one hundred and fifty toises in diameter, leaving an interior open space, beautifully verdant, and shaded with trees, which rendered the air delightfully cool and refreshing. Women, children, and aged men attended him, and earnestly importuned him to enter their houses: they even spread their finest mats upon a floor, decorated with chosen pebbles, and raised a convenient distance from the ground, to prevent offensive humidity. La Perouse condescended to enter one of the handsomest of these huts, which was probably inhabited by a chief, and was astonished to behold a large cabinet of lattice-work, in which as much taste and elegance were displayed as if it had been produced in the environs of Paris.

This enchanting country, blessed with a fruitful soil without culture, and enjoying a climate which renders cloathing unnecessary, holds out to these fortunate people an abundance of the most estimable food. The trees invite the natives to partake of the bread-fruit, the banana, the cocoa-nut, and the orange; while the swine, fowls, and dogs, which partake of the surplus of these fruits, afford them a rich variety of viands. The inhabitants of this enviable spot, were so rich, and so entirely free from wants,

four of his sailors to throw him into the sea, and his command was instantly obeyed. The other islanders, disapproving of the conduct of their countryman, manifested no appearance of resentment, and no ill consequences were apprehended. To intimidate these islanders, (who were formidable by their muscular limbs and colossal proportions, their general height being also about five feet ten inches,) La Perouse thought it expedient to give them a specimen of the force of his fire-arms: he therefore purchased three pigeons, which were thrown up into the air, and instantly shot them with the musket, to the great amusement of the whole multitude.

* Thrice happy are these islanders! exclaimed many of their European visitors.—Surrounded by their wives and children, they pass their blissful days in innocence and repose.—But alas! they were deceived—this delightful country was not the abode of innocence!—Though the navigators perceived no arms, the bodies of the Indians, mutilated and distorted with scars, proved them to be a hostile race; and their features announced a ferocity which manifested a delight in turbulence, quarrelling, and inhumanity,

that they looked with disdain on the cloth and iron tendered by the French visitors, and only designed to become customers for beads. Abounding in real blessings, they languished only for superfluities!*

No disagreeable consequences attended the first visit: there had indeed been slight commotions between individuals, but they had prudently been appeased. Stones had been thrown at M. Rollin, the surgeon-major; and an Indian, pretending to admire M. de Moneron's sabre, had attempted to snatch it from him; but finding the scabbard in his hand, without a sheath, he ran away terrified at the sight of the naked weapon. As it was sufficiently evident that these islanders were turbulent, and little under the subjection of their chiefs, La Perouse congratulated himself on his not having punished with severity the little instances of molestation he had met with. Towards noon he returned to the ship in his barge, being closely followed by the long-boats. He found it difficult to get alongside, the frigates being surrounded by canoes, and the market continuing much crowded†.

The boats of the Boussole now arrived loaded with water, and La Perouse made every preparation to get under way. M. de Langle, at the same instant returned from his excursion, and mentioned his having landed in a noble harbour of boats, at the foot of a delightful village, and near a cascade of transparent water. He spoke of this watering place as infinitely more commodious than any other, and begged La Perouse

among themselves. This ferocity of countenance, however, was much less perceptible in the features of the women.

† When La Perouse went ashore, he had entrusted M. Boutin with the command of the Boussole, with full liberty to establish what police he thought proper during his absence. On his return he found seven or eight Indians on the quarter-deck, the oldest of whom was presented to him as a chief. M. Boutin declared, that he could not have prevented their coming on board by any other means than firing upon them; that on comparing their bodily strength with that of the French visitors, they laughed at their threats, and made a mockery of their sentinels. He added, that since the chief had come among them, they appeared more orderly and docile. Having made several presents to the chief, and shewn him many tokens of kindness and attention; he wished to inspire him with an exalted opinion of their power, and ordered many experiments of the use of French weapons to be performed in his presence. But their effect did not materially excite his curiosity.

o permit him to take the lead of the first party, assuring him, that in three hours he would re- turn on board with all the boats full of water. Entertaining the highest opinion of M. de Langle's sound judgment and capacity, La Pe- ouse was induced to assent to the measure pro- posed, and promised M. de Langle to stand off and on all night, and that in the morning he would dispatch two long-boats and two barges, armed as he thought proper, which should be wholly under his command. Thinking it full time to get under way, they found, on heaving up the anchor, one strand of the cable cut by the coral, and in two hours more the whole cable would be cut through. Not getting under sail all four in the afternoon, they postponed their departure till the next day.

At eleven o'clock the following morning, La Perouse was about a league distant from the land, when he dispatched his long-boat and barge, commanded by Boutin and Monton, on board the Astrolabe, to receive M. de Langle's orders: those who had any symptoms of the scurvy were taken into them, with six armed soldiers, and the master at arms at their head. The two boats contained twenty-eight men, with twenty empty casks in order to be filled at the watering-place. Lamanon and Colinet, though indisposed, were among those who set off from the Boussole. M. de Langle also set off in his barge, with M. Vaujuas, a convalescent. La Gobien, midshipman, commanded the long-boat, and de la Martiniere, Lavaux, and father Beeceveur, armed a part of the thirty-three persons sent by the Astrolabe. Among these sixty-one individuals, were the choicest men of both crews. M. de Langle's people were armed with muskets and cutlasses, and he ordered six swivels to be mounted upon the long-boats.

Though La Perouse, from the appearance of things at this time, had no great apprehensions of danger, he was averse to sending boats on shore, without the greatest necessity, especially among an immense number of people, unsupported and unperceived by the ships. The boats set off from the Astrolabe at half past twelve,

Among them was a considerable number of women, and very young girls, who offered their favours to us in a most indecent manner. *Narr. of M. de Vaujuas.*

† M. de Langle, still hoping to check hostilities, without vision of blood, gave no orders, all this time, for firing. Vol. II. No. LXIX.

and arrived at the watering place soon after one; when to their great astonishment, M. de Langle, and his officers, instead of finding a large commodious bay, saw only a creek full of coral, through which there was no other passage than a winding channel of about twenty-five feet wide. When within, they had no more than five feet water: the long-boats grounded, and the barges must have been in the same situation had they not been hauled to the entrance of the channel at a great distance from the beach. M. de Langle was now convinced that he had examined the bay at high water only, not supposing that the tide at those islands rose five or six feet. Struck with amazement, he instantly resolved to quit the creek, and repair to that where they had before filled water: but the air of tranquillity and apparent good humour of the crowd of Indians, bringing with them an immense quantity of fruit and hogs, chased his first prudent idea from his recollection.

He landed the casks on shore from the four boats without interruption, while his soldiers preserved excellent order on the beach, forming themselves in two lines, the more effectually to answer their purpose. Instead of about two hundred natives, including women and children, which M. de Langle found there at about half after one, they were, at three o'clock increased to the alarming number of twelve hundred*. M. de Langle's situation became every instant more embarrassing; he found means, however, to ship his of water; but the bay was almost dry, and he had not any hopes of getting off the long-boats till four in the afternoon. He and his detachment, however, stepped into them, and took post in the bow with his musket and musketeers, forbidding any one to fire without his command; which he knew would speedily be found necessary. Stones were now violently thrown by the Indians, who were up to their knees in water, and surrounded by the long-boats at the distance of about six feet; the soldiers, who were embarked, making feeble efforts to keep them off†.

At five o'clock the officers and crew of the Boussole

a volley of musketry and swivels; but, shortly after, a shower of stones, thrown with incredible force, struck almost every one in the long-boat. M. de Langle had only fired two shot, when he was knocked overboard, and massacred with clubs and stones by about two hundred

R

Indians.

Boussole were informed of this disastrous event: they were at that moment surrounded with about a hundred canoes, in which the natives were disposing of their provisions with security, and perfectly innocent of the catastrophe which had happened. But they were the countrymen, the brothers, the children of the infernal assassins, the thoughts of which so transported La Perouse with rage, that he could with difficulty confine himself to the limits of moderation, or hinder the crew from punishing them with death.

SECTION XV.

Quit the Island of Maouma—The Island of Oyolava described—Make the Island of Poula—New Details respecting the Manners, Customs, &c.—Fall in with Cocoa-nut and Traitor Islands—Departure from Navigators Island—Route towards the Friendly Islands—Fall in with that of Vacao, and several others—Inhabitants of Tongataboo—Norfolk Island, Description of—Arrival at Botany Bay—DECEMBER, 1787—JANUARY, 1788.

ON the 14th of December La Perouse stood for the island of Oyolava, which had been observed before they had arrived at the anchorage which proved so fatal. This island is separated from that of Maouma, or of the Massacre,

Indians. The long boat of the Boussole, commanded by M. de Boutin, was aground near the Astrolabe, leaving between them a channel unoccupied by the Indians. Many saved themselves by swimming: they fortunately got on board the barges, which keeping afloat, forty-nine persons were saved out of the sixty-one of which the party consisted. M. Boutin was knocked down by a stone, but fortunately fell between the two long-boats, on board of which not a man remained in the space of about five minutes. Those who preserved their lives, by swimming to the two barges, received several wounds, but those who unhappily fell on the other side were instantly dispatched by the clubs of the remorseless Indians.

The crews of the barges, who had killed many of the islanders with their muskets, now began to make more room by throwing their water-casks overboard. They had also nearly exhausted their ammunition, and their retreat was rendered difficult, a number of wounded persons laying stretched out upon the thwarts, and impeding the working of the oars. To the prudence of M. Vanjuas, and the discipline kept up by M. Mouton, who commanded the Bou-

by a wide channel, and vies with Otahite in beauty, extent, fertility, and population. At the distance of about three leagues from the north-east point, he was surrounded by canoes, laden with bread-fruit, bananas, cocoa-nuts,

sole's barge, the public are indebted for the preservation of the forty-nine persons of both crews who escaped. M. Boutin had received five wounds in the head, and one in the breast, and was kept above water by the cockswain of the long-boat, who had himself received a severe wound. M. Colinet was discovered in a state of insensibility upon the grapnel rope of the barge, with two wounds on the head, an arm fractured, and a finger broken. M. Lavaux, surgeon of the Astrolabe, was obliged to suffer the operation of the trepan. M. de Lamanon, and M. de Langle, were cruelly massacred; with Talie, master at arms of the Boussole, and nine other persons belonging to the two crews. M. le Gobien, who commanded the Astrolabe's long-boat, did not desert his post till he was left alone; when, having exhausted his ammunition, he leaped into the channel, and, notwithstanding his wounds, preserved himself on board one of the barges. A little ammunition was afterwards found, and completely exhausted on the infuriated crowd; and the boats at length extricated themselves from their lamentable situation.

§ M. de Langle, was the first victim of the ferocity of these barbarians, who had received nothing but favours at his hand. It is impossible to describe the consternation occasioned by this fatal event on board the two frigates. The death of M. de Langle, who enjoyed the confidence and

esteem of his crew, was matter of the deepest regret to every one. The general affliction which prevailed on board, is the best panegyric that can be pronounced on him. Narr. of M. de Vanjuas.

sugar-

sugar-canes, pigeons, and a few hogs. The inhabitants of this island resemble those of the island of Maouna, whose treachery had been so fatally experienced. Some exchanges were conducted with these islanders with more tranquillity and honesty than at the island of Maouna, as the smallest acts of injustice received immediate chastisement*.

The presence of the women and children, who were among them, seemed to intimate that no hostile intentions were entertained, but the navigators were sensible of the necessity of relying no longer on appearances, and prepared effectually to repel the least menace or appearance of aggression. La Perouse supposed the French were the first who had ever traded with them; they knew nothing about iron, and refused to deal for any article composed of that metal, preferring a single bead to an axe. Rich in the blessings of nature, they wished only for superfluities, and articles of luxury. Among the considerable number of young women two or three were observed with alluring features, and captivating countenances: their hair was decorated with flowers, confined by a negligent foliage of green ribbon, like a bandeau: and curiously variegated with plaited grass and moss. Their figures were elegant, their arms graceful and well proportioned, and their eyes, countenances, and gestures, manifested an amiable gentleness of disposition; while the countenances of the men indicated nothing but surprise and ferocity.

In the evening the author stood on, abreast of the island, all the canoes returning to the shore: the next day a flat calm prevailed, followed by lightning, thunder, and rain. On the 17th, he approached the island of Pola, but not a single

* At four in the afternoon La Perouse brought to abreast of a very large village, supposing to exceed in magnitude any thing of that description in any island of the South Sea, situated on an inclined plain, and covered with houses from the summit of the mountains to the water side. The smoke appeared in clouds in the interior of the village, as issuing from the midst of a large city; while the sea was covered with an immensity of boats endeavouring to approach the frigates: several of these had nothing to sell, being mere idle gazers to enjoy the novel spectacle which the French visitors had afforded them.

† These islanders, are tall, robust, and well made, and their general height from five feet nine, to five feet eleven inches. The bodies of the men are painted or tatowed, which give them the appearance of being clad, though they are almost naked: a girle of sea-weeds encircles their loins, descending to their knees, like the river Gods in Pagan Mythology. Their hair, which is remarkably long, is

canoe came off, perhaps the natives had been intimidated by hearing of the event which had taken place at Maouna. Pola is a smaller island than that of Oyolava, but equally beautiful and is only separated from it by a channel four leagues across. The natives of Maouna informed our visitors, that the navigators islands are ten in number, viz: Opouni, the most easterly; Leoné, Fanfoué, Maouna, Oyolava, Calinasse, Pola, Skika, Ossamo, and Ouera. These islands form one of the finest archipelagoes of the South Sea, and are as interesting with respect to arts, productions, and population, as the Society and Friendly Islands, which the English navigators have so satisfactorily described. In favour of their moral characters, little remains to be noticed: gratitude cannot find a residence in their ferocious minds, nothing but fear can restrain them from outrageous and inhuman actions†.

The huts of these islanders are elegantly formed; though they disdain the fabrications of iron, they finish their work with wonderful neatness, with tools formed of a species of basaltes in the form of an adze. For a few glass beads, they bartered large three-legged dishes of wood, so well polished as to have the appearance of being highly varnished. They keep up a wretched kind of police; a few who had the appearance of chiefs, chastised the refractory with their sticks; but their assumed power seemed generally disregarded: any regulations, which they attempted to enforce and to establish, were transgressed almost as soon as they were promulgated. Never were sovereigns so negligently obeyed, never were orders enforced with such feeble shadows of authority‡.

Their canoes are small, usually for the ac-

often twisted round their heads, and heightens their native ferocity of countenance, always strongly depicting anger or surprise. They are irascible, and soon provoked to give the most tremendous blows with sticks, clubs, or paddles, and seem fearless of the consequences: the multitude of scars, which remain on their bodies, as trophies of victory or vengeance, manifest their propensity to individual quarrels.

§ Well are these islands denominated the *Navigators' Islands*, for they pass not on foot from one village to another, but perform all their visits and journeys in canoes: their villages are situated in creeks on the sea-side, and no paths are seen to penetrate into the interior of the country. The islands are covered to the very summit with fruit-trees, which are inhabited by pigeons, and turtle-doves of various colours; beautiful parrots, partridges, and a species of blackbird unite in this aerial society.

commodation

commodation of five or six persons, though a few of them are sufficiently capacious to contain about fourteen. They are undeservedly celebrated, by some navigators for their swiftness. These Indians are such expert swimmers, that they only consider their canoes as occasional resting places; from which, upon the least false motion, they are obliged to leap into the sea, and taking up their sinking vessels upon their shoulders, pour out the water.

They fish with a hook and line, and sweep-net.

Imagination cannot figure to itself more agreeable situations than those of their villages. All the houses are built under fruit trees, which render them delightfully cool: they are seated on the borders of streams, leading down from the mountains. Though the principal object in their architecture is to protect them from offensive heat, the islanders never abandon the idea of elegance. Their houses are sufficiently spacious to accommodate several families; and they are furnished with blinds, which are drawn up to the windward to prevent the intrusion of the potent rays of the sun. The natives repose upon fine comfortable mats, which are cautiously preserved from all humidity. Nothing can be said, by our travellers, of the religious rites of these natives, as no morai was perceived belonging to them*.

These islands are fertile, and their population is supposed to be considerable. Opun, Leone, and Fanfoe, are small; but Maoune, Oyolava, and Pola, may be classed among the largest and most beautiful in the South Sea. Cocoa Island is lofty, and formed like a sugar loaf; it is nearly a mile in diameter, covered with trees, and is separated from Traitors island by a channel about a league wide. At eight in the morning

* The inhabitants of these islands have an ample supply of hogs, dogs, fish, fowls, and birds: cocoa-nut, guava and banana trees are numerous: another tree, bearing a large fruit that is generally eaten roasted, and much resembles that of a chestnut, is frequent in this cluster. Sugar-canes grow spontaneously on the banks of the rivers, but they are not deemed excellent.

Though danger was to be apprehended from making an excursion into the interior of the island, De la Martiniere and Collignon, yielded to the impulse of zeal, rather than to that of prudence: and, when the landing proved so fatal to many of their countrymen, advanced some distance upon land to make botanical discoveries. The Indians exacted a glass bead for every plant taken from the ground by M. de

La Prouse brought to the west-south-west at two miles from a sandy bay in the western part of the Great Island of Traitors, where he expected to find an anchorage sheltered from easterly winds. About twenty canoes instantly quitted the shore, and approached the frigates in order to make exchanges: several of them were loaded with excellent cocoa-nuts, with a few yams and bananas: one of them brought a hog, and three or four fowls. It evidently appeared that these Indians had before some knowledge of Europeans, as they came near without fear, traded with honesty, and never refused, like the natives of the Archipelago of Navigators, to part with their fruit before they were paid for it. They spoke, however, the same language, and the same ferocity appeared in their countenances; their manner of tatowing and the form of their canoes were the same; but they had not, like them, two joints cut off from the little finger of the left hand: two individuals, had, however, suffered that operation.

Every island which was observed, revived some trait of Indian perfidy. All these atrocities which had been committed at the Recreation Islands, Traitor's Island, and that of Maoune, appeared in evidence against these savages, and changed the mode of acting with such monsters: the smallest acts of injustice was now repressed, or the most trivial thefts. This conduct had a more salutary effect than moderation; prudence recommends the necessity of compulsion, against the man who would certainly be our assassin were he not restrained by fear†.

The hogs procured at Maoune were but a temporary resource, as they were too small for salting, and proper food was wanting to support them till they were of a proper magnitude for that purpose. La Prouse, therefore, served

la Martiniere, and menaced him with a blow when he withheld the stipulated reward. Pursued by a multiplicity of stones at the instant of the massacre, he swam to the barges, with his bag of plants upon his back, and conveyed them safe on board.

† La Prouse, in speaking of the scurvy, pertinently observes, that, "of all the known preservatives against that disease, melasses and spruce beer are, in my opinion, the most efficacious. Our ship's companies continued to drink them in the hot climates; a bottle per day being distributed to each person, with half a pint of wine, and a small glass of brandy, diluted with a great deal of water; which served to render their provision more palatable."

out

out fresh pork twice a-day to his crew; in consequence of which the swelling of the legs, and all the other symptoms of scurvy disappeared. This new regimen had the same invariable effect upon the health of the people while they continued in port; plainly demonstrating that land-air is not so essential as salubrious aliments.

On the 27th of December, Vavao was perceived, an island which Captain Cook had never visited, but was no stranger to its existence, as one of the archipelago of the Friendly Islands: it is nearly equal in extent to that of Tongataboo, and is particularly fortunate in having no deficiency of fresh water. The two small islands of Hoongatonga, are no more than two large uninhabitable rocks, which are high enough to be seen at the distance of fifteen leagues. Their position is ten leagues north of Tongataboo; but that island being low, it can hardly be seen at half that distance. On the 31st of December, at six in the morning, an appearance like the tops of trees, which seemed to grow in the water, proved the harbinger of Van Diemen's Point. The wind being northerly, La Perouse steered for the south coast of the island, which may, without danger, be approached within three musket-shots. The sea broke furiously over the coast, but the surf was close in shore; and, beyond it, the most delightful orchards rejoiced the eyes of the beholders, and the most vivid verdure displayed itself in the surrounding fields, which appeared to be in the highest state of cultivation. It was then, however, in the rainy season, and though great were the charms which presented themselves, it was probable that, during a considerable part of the year, a drought must be the certain consequence in so low an island. Not the semblance of a hill is to be seen; a calm sea cannot present a more level surface to the eye.

The huts of the natives were scattered irregularly over the fields, and not socially collected into a conversable neighbourhood. Seven or eight canoes were launched from these habitations, and directed their course towards the vessels; but these islanders were awkward sea-

men, and did not venture to come near, though the water was smooth, and no obstacle impeded their passage. At the distance of about eight or ten feet, they leaped overboard and swam near the frigates, holding in each hand a quantity of cocoa-nuts, which they were glad to exchange for pieces of iron, nails, and hatchets: from the honesty of their dealings a friendly intercourse ensued, between the islanders and the navigators, and they ventured to come on board. A young islander declared he was the son of Feenou, an assertion which, whether true or false, procured him several presents; on the receipt of which he vociferated a cry of joy; and endeavoured to convince the persons present, by signs, that if they would go and anchor upon the coast, plenty of provision would be at their service, but their canoes were too small to convey them into the ocean. They had, indeed, neither hogs nor poultry with them, their whole cargo consisting of a few bananas and cocoa-nuts.

Though a hundred and fifty islands compose this archipelago, the greater part of them are uninhabited rocks: Ovolava exceeds in population, fertility, and soil strength, all the other islands put together. Norfolk Island, which we had seen on the 13th of January, is very steep, but does not exceed eighty toises above the level of the sea. It is covered with pines, which appear to be of the same species as those of New Caledonia, or New Zealand, Captain Cook having declared that he saw many cabbage trees in this Island, heightened the desire of the navigators to land on it. Perhaps the palm which produces these cabbages, is very small, for not a single tree of that species could be discovered. This island, being uninhabited, is covered with sea-fowl, particularly tropic birds with red feathers: several boobies and gulls were also seen, but not a single man-of-war bird. While the frigates lay at anchor, they caught some red fish upon the bank, which extends three or four leagues to the northward and eastward of the island, of the kind called *capitaine*, or *farde*, which were found very delicious*.

On

* On the 17th the navigators were surrounded by gulls, which induced them to suppose that they were near a rock or an island. They were followed by these birds, till they were within eighty leagues of New Holland. From Norfolk Island till they came within sight of Botany Bay, they

sounded every evening, with two hundred fathoms of line, and did not find any bottom till within eight leagues of the coast, in ninety fathoms water. They saw it on the 23d of January, and found it to be of a very moderate elevation, hardly to be seen at more than the distance of twelve

On the 26th, at nine in the morning, La Perouse let go the anchor at a mile from the north coast, in seven fathoms water. An English lieutenant, and a midshipman, were sent on board his ship by Captain Hunter, commander of the *Sirius*. They offered him, in Captain Hunter's name, all the services in his power; but circumstances would not permit him to supply them with provision, ammunition, or sails. An officer was dispatched from the French to the English captain, returning thanks, and adding that his wants extended only to wood and water, of which he should find plenty in the bay.

The journal of La Perouse proceeds no further. La Perouse, according to his last letters from Botany Bay, was to return to the isle of France in 1778. For two years France in vain impatiently expected his return: perhaps the apprehensions of his countrymen may have been more agonizing than his actual sufferings; perhaps he has been cast away upon one of the islands of

leagues. The wind became variable, and, like Captain Cook, they were every day drifted by currents fifteen miles to the southward of the reckoning; therefore they passed the whole of the 24th in plying to windward in sight

the South Sea, whence he stretches out his arms towards his country for protection. We have not now even the consolation to doubt that he has experienced some dreadful calamity: we cannot reasonably hope that his vessels are still ploughing the surface of the seas: it is indeed much to be apprehended that this navigator and his companions are no more; or thrown upon some frightful shore, lost in the immensity of unknown seas, and, confined in the extremities of the world, to struggle against the climate, against wild beasts, against men, and against nature. The information we are in possession of concerning the fate of our navigator, is so imperfect and unsatisfactory, that even the idea of his existence is improbable. As we know the route which he had intended to perform, and as he possessed a number of medals, struck on occasion of his voyage, these medals may, at some future period, point out to us nearly in what spot his misfortune interrupted it.

of Botany Bay, without being able to double Point Solander. A new sight now presented itself to their view,—an English fleet at anchor in Botany Bay, the colours and pendants of which they could distinguish.

A VOYAGE

IN SEARCH OF

LA PEROUSE,

UNDERTAKEN BY ORDER OF THE CONSTITUENT ASSEMBLY OF FRANCE,

AND PERFORMED

In the Years, 1791, 1792, and 1793,

IN THE

RECHERCHE AND ESPERANCE, *Ships of War;*

UNDER THE COMMAND OF

REAR-ADMIRAL BRUNI D'ENTRECASTEAUX,

FROM THE FRENCH OF M. LABILLARDIERE,

*Correspondent of the ci-devant Academy of Sciences, and One of the Naturalists
engaged in the Expedition.*

THREE years having elapsed, and no tidings having been received of the *Boussole* and *Astrolabe*, the two ships under the command of La Perouse, the Society of Natural History of Paris, early in the year 1791, awakened the attention of the Constituent Assembly respecting the fate of that navigator, and his companions in misfortune.

The hope of finding, at least, some wreck of an expedition, undertaken for the advancement of the sciences, induced the assembly to send two other ships in the track which the navigators were to have followed, after their departure from Botany Bay. Some of them might possibly have escaped shipwreck, and be sequestered in a desert island, or thrown on coasts inhabited by savages; perhaps they were yet living in those distant climes, and continually directing their eyes towards the sea, hoping their country would at some future period, send them that assistance which they had reason to expect.

A Decree to the following effect passed the National Assembly on the 9th of February, 1791. That the king be requested to give orders that all ambassadors, consuls, &c. of the courts of the different powers, that they do, in the name of humanity, and of the arts and sciences, engage the respective sovereigns at whose courts they reside, to charge all navigators and agents

whatsoever, who are subject to their control, in whatsoever part of the globe they may be, to make every enquiry in their power, after the French frigates the *Boussole* and *Astrolabe*, under the command of M. de La Perouse, as well as after their crews; and endeavour to obtain every information that may ascertain their existence or their shipwreck; to the end that, in case M. de La Perouse should be found or heard of, all possible assistance may be rendered them; the National Assembly engaging to indemnify and reward whoever shall afford assistance to these navigators. That the king be requested to direct that one or more ships, on board of which may be embarked some men of science, naturalists, and draughtsmen; and that the commanders employed in the expedition, be charged with the double mission of searching after M. de la Perouse, agreeable to the documents, instructions, and orders that may be given them, and, at the same time, independently of the search after M. de la Perouse, or even after having met with him, or procured intelligence of him, to render this expedition useful to navigation, to commerce, and to the arts and sciences.

(Signed) DUPONT, *President.*

LOIRE, }
BOUSSON. } *Secretaries.*

Admiral

Admiral D'Entrecasteaux being appointed to the command of this expedition, he applied to the government for two store-ships of about five hundred tons burthen. That in which the admiral embarked, was named *La Recherche*;

and the other, commanded by Captain Huon Kermadec, was called *Esperance*. The *Recherche* had on board 113 men, at the time of her departure, the *Esperance* had only 106.

SECTION I.

Departure from Brest—Arrival at Santa Cruz—A Sailor almost drowned, and restored—His Clothes are stolen—Two Naturalists prevented by Illness from ascending the Summit of the Peak—English Ships in the Road of Santa Cruz—A new Volcano to the south-west of the Peak.

OUR adventurers arrived at Brest* on the 10th of September, 1791. The finest ships of France, such as the *Majestueux*, the *Etats de Bourgogne*, the *Amerique*, &c. were then in the harbour. The ships' companies were mustered in the harbour on the 21st of September; and, on the 25th, the two chosen ships went into the road. On board the *Recherche* were six eight pounders, two thirty-six pound carronades, six swivels of demi-kilogram, twelve swivels of double hectogram, forty-five musquets, thirty-five pistols, fifty sabres, three pole-axes, ten musketoons.

The *Esperance* had nearly the same articles, which were thought sufficient for protecting themselves against any enterprize on the part of the savages. The two ships were also furnished with a quantity of such essential things as were proper to be distributed among the natives of the South Seas. Iron tools, and stuffs of different colours formed a considerable part of their stock for traffic. Among the stuffs, red was the commanding colour.

Each of the ships carried eighteen months' provisions. They were ready to sail, and waited only for a fair wind, when a tolerably fresh breeze from the eastward permitted them to get under way, about one in the afternoon of the 28th of September. Having been detained by the intrusion of two sailors and a boy, the commodore ordered them to be put on shore; the *Esperance* continuing her course, had got ahead of the *Recherche*, but the latter joined her again before night, she being the most rapid sailer.

They took their departure about six in the evening, being then in the latitude of $48^{\circ} 13'$ north, and in the longitude of $70^{\circ} 15'$ west. The course ordered to be steered was west-north-west: and afterwards, about midnight, the ship was kept west. On the 29th, Commodore E'Entrecasteaux was informed by dispatches, which he had been interdicted from opening till he was at sea, that Captain Huon Kermadec, commander of the *Esperance*, was made post, and that he himself was promoted to the rank of rear-admiral. This intelligence was instantly communicated, by the aid of the speaking trumpet, to the *Esperance*. The ensigns were also immediately hoisted, with the distinctive emblem of the rank with which the commodore had been recently honoured.

From their departure till the 5th of October, the winds were faint and changeable; they afterwards blew pretty fresh, varying from north-east to north till their arrival at Teneriffe. The *Esperance* made the signal for land on the 12th, about eight in the morning. About noon they reckoned themselves at the distance of fourteen myriameters from the Peak of Teneriffe, which was beheld to the south-east, by south, majestically rearing its head above the clouds. On the approach of night, they were only at the distance of two myriameters from the north-east point of the island. In the morning between nine and ten on the 13th they cast anchor at Santa Cruz, in ten fathoms water. Citizen Fonspertuis, the French consul, immediately came on board, and offered his services to the admiral for procuring such necessities as were required by the two ships.

* Brest is more remarkable as being the chief maritime arsenal of France in the north, than for its extent or po-

pulation, which does not exceed 30,000 souls. *Pinkerton's Modern Geog.* i. 263.

uls. Pinkerton's
Going

Going on shore in the afternoon, M. Labillardiere, our naturalist, remarked among the plants growing in the environs of Santa Cruz, a woody melissa, known under the name of *melissa fruticosa*; the *saccharum Teneriffe*, &c. The beautiful tree, called the fair poinciana, constituted the ornament of some of the gardens*.

On the 14th at sun-rise, reciprocal salutes were given and received by the vessels and the forts.

Our adventurers having formed the project of undertaking, the next day, a journey to the Peak, and of visiting successively the high mountains of the island, the French consul gave them a letter of recommendation for M. de Cologant, an opulent merchant residing at Orotava.

Early in the morning of the 15th, a party consisting of eight; namely Develle, one of the officers of the admiral's ship, Pirou, Deschamps, Lahave, three servants, and myself repaired to the Mole. One of the servants was sufficiently acquainted with the Spanish language to undertake the task of their interpreter. On the landing place, they saw some of the mules which had been provided for their conveyance; but upwards of an hour elapsed, before their guides thought themselves sufficiently equipped for the journey. M. de Cologant, apprised by the French consul of the object of their journey, invited him to stop at his house at the harbour of Orotava. This town is three myriameters and a half from Santa Cruz, and is one of the best places to halt at in going to the Peak,

* This evening Citizen Ely, astonished at the strange garb of some women who were inhabitants of the town, took the liberty of taking a sketch of them. A sentry observing him thus employed, interrupted him, supposing he might be taking a plan of the road. In vain he shewed him that he was only copying an absurd dress; the soldier would not permit him to complete his delineation.

† The inhabitants of this island imbibe strong religious prejudices from their infancy. Children came out of their houses to know if our adventurers were of their religion. These unfortunate beings, whose fanaticism and monastic intolerance are so predominant over every other consideration, were only entitled to their pity. On approaching the harbour of Orotava, they descended by gentle declivities: it was no longer the barren mountains of the environs of Santa Cruz, whose succulent plants announce sterility; but charming hillocks, covered with vines forming the principal wealth of the island. It was five in the afternoon when

situated at the foot of the mountain nearest to it.

They were three hours in travelling to Lagouna, a town about a myriameter from Santa Cruz, ascending a very fatiguing hill. The houses are ill built, and thinly inhabited. The convents are very numerous, and the monks are supposed to constitute about half of the population. In their way to Lagouna, they crossed the arid mountain, where they saw a few succulent plants; among which they remarked the Canary leafless *euphorbia*, and the species of Indian fig to which botanists have given the name of *cactus opuntia*. These vegetables, which principally live at the expence of the atmosphere, thrive extremely well on the sterility of those deep declivities.

All the stones they had hitherto met with had undergone the action of fire: in the midst of these volcanic fragments, our adventurers experienced great heat; and their guides were more incommoded by it than themselves†.

As it does not produce a sufficient quantity of corn for the consumption of the inhabitants, part of the produce of the wines, which are sold in foreign countries for Madeira, is employed in the purchase of that article of the first necessity. The olive-tree, which thrives well here, is however little propagated. The papaw-tree, and the date-tree, are cultivated in some of the gardens, as objects of curiosity.

They set out early the next morning on their journey towards the Peak. But it was a festival, and none of the guides would stir without having first been at mass; some of them had heard three;

they arrived at Orotava, where they were respectfully received by M. de Cologant. Two ships were then lying in the road, for the purpose of taking in a cargo of wine. The landing-place is even more inconvenient than that of Santa Cruz: and the roadstead is less frequented.

The cellar of M. de Cologant naturally excited their curiosity. Among the different qualities of wines which this island produces, and which this wealthy merchant deals in, there are two distinct sorts; the dry wine, and that which is denominated malmsey: In the making of the latter, great care is taken to concentrate strongly the saccharine part of the grape. A pipe of the best was then sold for one hundred and twenty piastres; a pipe of the most inferior quality, produced but half that sum. When the fermentation of these wines is well advanced, it is usual to mix brandy with them to make them keep. This island is said to furnish thirty thousand pipes of wine annually.

on their remonstrating about this waste of time, they were informed that they ought to deem it a very particular favour for them to think of travelling on so solemn a day. They were, however, ready to depart about nine in the morning.

Soon after they had quitted the town; they ascended by steep irregular roads, whence they perceived enormous heaps of mountains piled one upon another, rising in the form of an amphitheatre, as far as the base of the peak. The guides were surprised at seeing some of the party perform the journey on foot, as they were acting very differently from most of the travellers who came to visit the peak. For a long time they entreated the party to mount the mules, which had been brought for their accommodation. Having crossed some beautiful plantations of vines, they found themselves in the midst of chestnut-trees, which grow in the most elevated regions.

In the cavities they met with the Virginian polipodium, and several new species of laurel, among which was that known by the name of Indian laurel.

About noon they reached the clouds that diffused a heavy dew on the shrubs, through which they had to pass. The abundance of rain, with which the disposition of the air is impregnated on these heights, might be expected to produce a number of springs; they were, however, extremely scarce*. After passing through these heavy mists, they enjoyed the finest sight which imagination can pourtray. The clouds that had been accumulated beneath them, mingled themselves in the distance with the waters of the sea, concealing from them the view of the island. They beheld the clearest sky; the peak appearing like an island, the base of which appeared to be immersed in an immense ocean.

Hardly had he got out of the clouds, when our admiral saw for a moment a phenomenon which he had several times seen on the high mountains of Kefrouan, in Asia Minor. With additional surprise, he perceived all the colours of his body traced in the beautiful colours of the rainbow, on some clouds that were below him, on the side opposite to the sun.

They passed over prodigious heaps of pumice-stone, among which they remarked some languid

* When high mountains are strongly heated by the rays of the sun, they become a kind of focus, above which rises the surrounding air; whence results the abundance of

vegetables. Brooms were the only shrubs that prospered at such an elevation. In walking over these volcanic fragments, they sunk into them half way up the leg. Some blocks of *puzzolana* were here spread at a considerable distance from each other. At nine in the evening, they took up their quarters for the night in the midst of the lava, some large fragments of which were their only shelter against a strong easterly wind then blowing pretty strong. The cold was very intense at this height, and nature, not consulting the wants of travellers, was very sparing of her wood: all the firing they could possibly enforce, was insufficient to procure a comfortable night.

At length the day began to appear, when our party left some of their guides in the place where they had passed the night, and pursued the road to the peak, the summit of which they were speedily to reach. They walked for an hour over heaps of fragments and greyish lava; among which they saw scattered blocks of *puzzolana*, and large masses of compact glass, resembling black bottle glass. The cavern, on the brink of which they arrived, is called *La guera del ama*. It is a meter and a half wide at its mouth: as its depth exceeds two meters, in an almost perpendicular direction, they could descend to it only by means of a rope. They found some water, the surface of which, as they naturally expected at this elevation, was covered with ice about half a decimeter in thickness. It was immediately broken, and they quenched their thirst with very good water. They did not experience any unpleasant sensations in the throat, as has been remarked in the French Alps, when water has been drank from the foot of the Glaciers.

Piron had been indisposed for several days, and found himself too much fatigued to think of proceeding farther. Deschamps did not choose to proceed beyond the cavern; the other members of the party continued to ascend towards the summit of the peak. Having arrived at its base, which forms the cap of the highest mountains, they saw it rise in the form of a cone to a surprising elevation. Their prospect now soared above all the mountains, which constituted so many flights of steps, which they had been

obliged

obliged to ascend to arrive at this elevated spot. This place, called *La Ramblette*, presented to their curiosity a few apertures in the rock; whence issued a watery vapour, without smell.

They now arrived at the place, the most difficult to climb up, for the peak is extremely steep. Having reached about a third of its elevation, though the surface of the ground was not heated, beyond what is commonly experienced at such a height, Labillardiere was induced to dig a hole, about a double decimeter in depth, whence immediately issued, a watery and inodorous smell.

The *spartium supranullum* was the last shrub met with, before our botanist arrived at the foot of the cone; but there is an herbaceous plant, which, with great apparent delicacy, vegetates at a still greater elevation. This is a violet, with elongated leaves, and slightly toothed at the edges. The vapours of the atmosphere, being incapable of rising to this height, the sky displays itself in all its brightness, shining with an azure more brilliant than in the most refulgent days in our climates. A few clouds, scattered far below their feet, did not conceal the prospect of the neighbouring islands*.

The declivity of the mountain favouring their return, they descended much quicker than they had ascended. The day was far advanced when they arrived at the spot where they had passed the preceding night. The total privation of the sun, which they had almost experienced, had cancelled every wish of making it again their resting place. Their guides not choosing to stir before the rise of the moon, by her feeble light descended over the pumice-stones; but, after walking about for four hours, the shrubs, which were very numerous, so accommodated them, that they found it necessary to halt till day-light. They were not destitute of wood, and therefore caused a comfortable fire to be

* The summit is terminated by a brow, the greatest elevation of which is towards the north-west. Close to its point are seen several apertures, whence issues a very hot vapour. In the advanced season of the year, when the snow whitens the summit of the peak, that which comes near these apertures cannot long withstand such a degree of heat. Beautiful crystals of sulphur, of various forms, adorn the brinks of these funnels. The decomposition of the sulphur, and of the volcanic productions, produces here an alluminous salt, like very fine needles, which covers the surface of the earth.

kindled. While they were warming themselves, the conversation naturally turned upon what was next to be done. Many of the party, fatigued by this laborious exertion, expressed a desire to proceed to Santa Cruz by the shortest road; but, after stating a diversity of opinions, it was at length agreed that the naturalist and the gardener should persevere in their researches, and all the others might return on board. Their guides wished earnestly to be taken among the latter; which was admitted, after one of them had been prevailed on to accompany the exploring party. Among the plants which bedecked the declivity of the rocks, the beautiful campanula, with gold-coloured flowers presented itself.

Water being very scarce on these heights, the adventurers directed their steps towards a small dwelling, near which they supposed some rivulet might flow. There they fortunately discovered a delicious limpid spring, which lost itself in the bosom of the earth, after having appeared an instant on its surface. Apple-trees, laden with fruit, adorned and enriched the gardens of these peaceable inhabitants. At the approach of night, they were far from any habitation: near the hour of nine in the evening, they arrived at a village, the inhabitants of which were not signalized by their hospitality; it was with much difficulty that they could obtain the indulgence of shelter. As they were unacquainted with the Spanish language, they could only express their wants by signs. Passing from door to door, hoping to procure a place to sleep in, they began to be hopeless of success, when, knocking at a friendly door, the two worthy occupiers kindly afforded them an asylum†.

The next day Labillardiere, the naturalist, went on board, fraught with volcanic productions, and some curious plants. The birds called Canaries are numerous in the lower regions of these mountains; their plumage is a

† A frugal repast was instantly set before them, illuminated with Alpine torches, manufactured of resinous fur stuck in the wall, affording an equal quantity of light and smoke, the worthy hosts were assiduously employed, in furnishing successive bits of wood, as fast as they were consumed. Preferring rest to food, sleep was received with welcome, and was rendered the more delightful by their being no longer disturbed by the severity of the frigid mountains.

mixture of brown, and several other colours, but they are less beautiful than those in a domestic state*.

Citizen Riche and Blavier undertook a journey to the peak, but they found themselves incapable of ascending to the summit; at a considerable distance from it, they found their lungs could not endure so rarefied an atmosphere; a spitting of blood compelled them to renounce their enterprize.

The country, in the environs of Santa Cruz, is in general very sterile, and the population of the town is thin, though its roadstead is the most frequented of the island. The governor-general of the Canaries makes Santa Cruz his usual residence. There are several convents for men and women; also a parish church, with a profusion of false taste in the gilding, and ornamented with a very indifferent choice of pictures.

The square contains a handsome fountain, to which water was conveyed from a considerable distance across the mountains, by wooden pipes. The streets are ill paved, and most of the windows are destitute of glass: though the latter are closed with Venetian blinds, the women frequently draw them up, when urged by curiosity, or some other motive, to let themselves be seen.

The women of the superior class are dressed in the French taste; the others cover their shoulders with a sort of coarse woollen cloak, which seems a very improper cloathing under a warm sky: a broad-brimmed felt hat shelters them from the rays of the sun; their skin is sullied by a mixture with the natives of the

*A fresh breeze having increased the sea, it threw upon the beach the boat belonging to the *Esperance*, by which accident a sailor received so much injury, that he apparently seemed dead; but, by employing the means usually resorted to on those occasions, he was restored to life. The

island; and their features in general, are not very alluring. The multiplicity, of religious customs among them, did not hinder them from making overtures to many of the sailors; several of whom had too much reason to remember the seductive influence of their charms.

Water, which is very good at Santa Cruz, is easily procured when the swell is not too heavy. This is indeed an excellent refreshing-place, as all the vegetables of Europe are easily obtained here, with the exception of cabbages, which are very small, though very dear. All the fruits of Europe may also be purchased here.

No volcanic eruption had happened on the island of Teneriffe for ninety-two years, till such an event occurred in June, 1798, a new volcano breaking out on the south-west side of the peak. The following account is given of it by Citizen Le Gros, Consul of the French Republic.—“On the 21st Prairial, 6th year, (June 9th, 1798,) the inhabitants of Santa Cruz heard some hollow and repeated noises, which resembled the report of cannon fired at a great distance; in the night there was a slight earthquake; and it was known the next day that a volcano had broken out on the south-west side of the peak. At the beginning of the eruption they reckoned fifteen craters; these were soon reduced to twelve, and at the end of a month there was to be seen only two, whence continually issued large rocks, which vomitted forth with the lava, and followed their projectile motion, frequently for fifteen seconds, before they again fell to the ground.

people of the garrison, however, were so earnest in re-animating the poor fellow, that they forgot to return the clothes which they had taken from him, under the pretence of hanging them up to dry.

SECTION II.

Leave Teneriffe to proceed to the Cape of Good Hope—Observations—Shining Phenomenon in the Sea—An Experiment—Four of the Teneriffe Sheep thrown overboard, and the Cause—Faint Degree of Heat close to the Line—Method of sweetening fresh Water, when beginning to putrify—A thick Fog occasions an Elevation of the Mercury in the Barometer—A lunar Rainbow—Arrival at the Cape of Good Hope—Continue at the Cape of Good Hope—Depositions of the Two French Captains, that some Natives of the Admiralty Islands appeared dressed in the Uniform of the French Navy—Captain Bligh sent from England to procure the Bread-fruit Tree at the Society Islands—Violence of the South-east Winds—A Slave Ship—Various Excursions to the Mountains in the Vicinity of the Town—Impudence of the Fiscal,

BEING retarded in shipping their supplies, the adventurers were not ready to sail till the 23d of October. They crossed the tropic of Cancer about one o'clock in the afternoon, in the longitude of 20° west. The first fish that came and bit at the hook of one of the fishermen, was a very fine dolphin. Nothing more was necessary to set the whole ship's company in motion; but the fisherman, hauling with too much impetuosity, had the mortification to find only a part of the jaw on the end of his hook. A common swallow, lately arrived from Europe, followed them for some time, without venturing to alight on their ship: it soon directed its course towards the coast of Africa, where it was certain of finding the insects on which its subsists.

Little wind being then experienced, considerable numbers were seen, on the surface of the water, of the medusa, known to naturalists by the name of *medusa caravelle*. This species should be handled with caution; for, like many other sea-nettles, it occasions blisters, preceded by a painful pricking*.

They had the mortification to find, that the

* A fish, known by the name of remora, or suck-fish, usually follow the shark, to which it attaches itself, from finding the means of subsistence in the excrements of that voracious animal. It is not, however, wholly occupied in his attendance on the shark; for it follows other large fishes, and even ships; to the bottom of which he adheres securely, when tired of swimming.

In the course of the night, they fell in with an assemblage of dolphins, which followed their vessel: as they made a more rapid progress than our adventurers, they several times took a circuit round the ship, swimming with great velocity. It was easy to pursue them with the eye, though the night was extremely dark, for they left behind them a luminous trace. This phosphoric light, produced by the agitated sea-water, became more brilliant as the darkness increased, and as the fish advanced with increased velocity.

On the 30th they were in the seas inhabited by the ra-

vegetables and fruits purchased at Teneriffe, did not keep; the heats and humidity, experienced in this region of calms, rapidly promoted their decomposition.

A small shark not exceeding a meter in length, became a victim to its voracity. Nothing is refused by this animal when pressed with hunger. When it was hauled upon deck, it was presently cut up into pieces, and every man was entitled to his bit. The shark, however, is not good eating; and, without adverting to the repugnance which its fondness for human flesh naturally inspires, it is difficult of digestion; but as there is not much choice of food at sea, fresh provisions of almost any sort is preferred to that which has been salted. The mouth of the shark being situated beneath an elongated rostrum, subjects it to the necessity of turning almost on its back, to snap at the object which it perceives above it: its whitish belly, which is then apparent, even at a great depth, on account of the transparency of the sea-water, informs the fisherman when he ought to draw in the line, in order to make sure of this rapacious

venous fishes; as the bonito, the tunny, and others of the same genus, which there find an abundant subsistence in pursuing the flying fish, and many others. The bonitoes suffered themselves to be taken with a bait thrown out by the fishermen, consisting only of a few feathers, but so ingeniously disposed, that they exhibited to the eyes of this animal the appearance of a flying fish, and at the same time concealing the hook.

A vast quantity of bonitoes continued to follow them day and night; which excited great astonishment among the crews, at their being so long able to follow them without a resting-place. On-board the *Esperance*, the fishermen were very successful; but the fish seemed to disregard the lines thrown out by the *Recherche*. The *moteux* of Buffon (*motacilla alba*) a well-known bird of passage, fatigued with having crossed the seas, came and submitted itself to be caught, without resistance.

animal. Nature has taken especial care that this creature should not let its prey escape; for, besides several rows of teeth, curiously arranged, and fit for cutting the hardest substances, the inside of its mouth is furnished with asperities, that counteract the retreat of the bodies which it has previously seized.

On the 12th they were surrounded by grampuses, which were followed, in their slow progress, by sharks. One of the latter, preceded by some fishes known by the name of pilot-fish, came near the vessel and was caught: several remoras, or suck-fish, supposing themselves in safety by being fastened to the body of this animal, continued sticking to it for some time after it had been hauled in*.

The heat had been oppressive during the day. They were abreast of the opening of the immense gulf, which forms the bight of the countries of Upper Guinea, the coast of which extends about three hundred myriameters to the eastward. The sea is more phosphoric in the vicinity of the coasts lying under the tropic than in any other part, nature having there distributed more profusely the animalcules on which its phosphorescence depends.

A faint breeze from the south-east, induced them to hope that they were getting out of those calms, which are here more prevalent than in any other part of the sea: in going to India the contraries of winds and calms are the greatest; they appear to depend on the vicinity of the coast, which navigators approach much nearer in going to the Cape of Good Hope, than in the route from the Cape to Europe; consequently

* It being now extremely hot, and the water perfectly smooth, the desire of bathing got the better of every other consideration; Piron and Saint Agnan jumped overboard a few hours after, not being intimidated by the sharks which were known to be attendant on the vessels.

Almost the whole of the day it continued calm; but about eight o'clock in the evening, the sky was loaded with thick clouds in the east, menacing a very violent storm. The night was extremely dark, when a luminous column of great extent issued from beneath the clouds; and, in its descent, alighted on the surface of the water: the sparkling sea continued to be shaded with many dark intervals, when suddenly it appeared like a sheet of fire, extending towards our adventurers: compelled by a strong wind it furrowed the waves; they saw themselves surrounded by a sea of fire, and enjoyed the sight of the most brilliant phenomena of nature. It did not continue long in this state; but, during the rest of the night, the sea was uncommonly luminous in all the places where it was agitated, particularly

the passages from the Cape to Europe, are generally much shorter than those from Europe to the Cape†.

The calms met with to the northward of the equator are owing to the configuration of the coast of Africa, which to the north, a few degrees from the line, projects, about three hundred myriameters towards the west; while the great distance at which the ship is from this land when to the southward of the equator, prevents the general winds of these seas from undergoing thence any change‡.

Winds from the south-south-east, which began to blow on the 21st of November, at length carried them out of the calms, which at this season of the year so generally prevail some degrees more to the south, before the ships get into the general winds.

The man-of-war bird became an object of attention: two of the winged animals, known by that appellation, were perceived hovering at a prodigious height, watching attentively for their prey, and waiting till it appeared on the surface of the water. It is astonishing that they can perceive, from such a distance, the diminutive fishes on which they most commonly feed; but so penetrating a sight depends more upon the disposition of the humours of the eye, than on the great sensibility of the retina. Though nature has given to flying fishes, the faculty of living in the water, and coming out of it at pleasure, they have many difficulties to encounter: if they escape the voracity of the bonitoes, tunnies, and dolphins, by rising out of the water, the man-of-war bird waits for them in the air:

in the wake of the ship, and towards the upper part of the waves.

† It has been observed, by many skilful seamen; that, in going to the Cape of Good Hope, there is an advantage in crossing the equator farther to the westward than is usually done.

‡ The naturalists had preserved a few bottles of water, taken up the evening before during its phosphorescence, to inspect the little luminous bodies which are the cause of this phenomenon. This water, poured in a glass, was set in motion in the dark. He instantly saw some luminous globules, resembling those which he had remarked when the sea was agitated. From a variety of experiments, he was convinced that the animalcules was the most ordinary cause of the phosphorescence of sea-water; but they alone have not the property of rendering the sea luminous; several species of crabs, some very large moleculas, &c. often quit the bottom of the waters to come and illuminate their surface.

during

during a conflict of this kind, some of the contending parties leaped into the ship*.

On the 17th of December they passed the tropic of Capricorn, in the longitude of 28° west. On board the *Esperance*, upwards of a hundred bonitoes were taken daily; whilst all the most expert fishermen in the *Recherche*, never caught more than ten in a day; and generally a much smaller number.

On the 3d of January 1792, our adventurers enjoyed the sight of a rainbow, produced by the rays of the moon: this planet was, about ten at night, surrounded by two concentric circles; they exhibited all the colours of the rainbow, in an order opposed to each other. As this phenomenon, produced by the decomposition of the light of the moon, appeared between her and them, the colours of the iris must consequently present themselves in the reverse order of those which the sun display.

On the 9th of January, the crews of both the ships began the exercise of firing with ball. A prize of small value was the stipulated reward of those who hit the mark, which was fixed at the end of one of the fore-top mast studding sail booms: it was not a matter of indifference, on such an expedition, in which they might sometimes find it necessary to defend themselves against the savages, that each should learn how to use the arms that were on board.

The captain of the *Esperance*, having made fast to a buoy half a very fine tunny, which he intended for the admiral, the line was too far for them to reach it: a sailor, however, jumped overboard to swim after it, though a shark had been caught that very morning, on board the *Esperance*; and the little wind which then blew must have increased the apprehension of meeting with another.

The well-known sea-nettle, named *medusa telella*, took advantage of the calms to appear and float, in great numbers, on the surface of the sea. This species differed, in no respect,

* The south-east and south winds blew with so much obstinacy, that our adventurers were unable to cross the equator till the 28th. Seamen are accustomed to christening in their mode, the persons who cross the line for the first time, by a singular ceremony of ducking: but the Admiral, fearing that every one would not equally relish the farcical operation, prohibited the usual ceremony.

+ Some seals, of the species which Buffon has denominated *petit phoque*, approached their ship, to seek their

from what our botanist had frequently met with in the Mediterranean.

The albatrosses of the Cape of Good Hope, which appeared in large numbers, announced to our adventurers the vicinity of the southern extremity of Africa. They saw land on the 16th of January, about eight in the morning; being then at the distance of four myriameters from Table Bay. The proximity of the land had also been signified to them, by a change in the colour of the waters of the sea, occasioned by the elevated bottom on which they repose†.

Our adventurers had not a sick man on board, though the length of their passage had reduced them to a very slender allowance of water; but they had exerted themselves to compensate for this privation by a liberal use of various kinds of antiscorbutics; a sort of punch, equally wholesome and pleasant, composed of brandy, vinegar, sugar, and water, had been daily served out to the ships' companies towards the conclusion of the passage. The ship had also been regularly fumigated twice a-day; and strict injunctions were given to the sailors to change their clothes, whenever they got wet. It was satisfactory, at length, to discover, that such salutary precautions had not been employed in vain.

Two officers of health came from Cape Town to visit the ships, to satisfy themselves that no contagious disorders attended them: it is the small-pox that they principally dread; for that malady, which is not endemical in this country, makes dreadful ravages here, and throughout all India, when introduced from abroad.

A captain of a merchant ship who arrived from Bourdeaux a few days before them, came also to inform them, that the Commander of the naval forces in the Isle of France, after having received information respecting the fate of La Perouse, had dispatched a frigate to the Cape, to bring the particulars of it to the commander of the expedition, sent in search of that un-

subsistence in the great heaps of sea-weed which were seen floating on the surface of the sea: these animals frequently fled, after having raised themselves by sudden springs above the water; then, drawing their two hind feet together, in the form of fins, they were supported in the water; the surface of which was to them what a vast plain is to an active quadruped. About seven in the evening they were a myriameter and a half from the mountain of Mount Bay.

fortunate

during

fortunate navigator. The frigate had sailed a few days before to proceed to the Isle of France.

Admiral D'Entrecasteaux instantly sent an officer to the Governor of the Cape, in order to settle the salute. This officer received from the French *Charge d'Affaires*, the dispatches which Citizen Saint Felix, commander of the French naval forces in the Indian seas, had sent to Admiral D'Entrecasteaux by the Atlantic frigate,

** Substance of a Letter from Saint Felix, Commander on the India Station, to Admiral D'Entrecasteaux.*

Private letters inform me, that you do not mean to touch at the Isle of France, till you return from the important expedition you are on the point of undertaking. Deprived of the hope of seeing you, I hasten to transmit to you at the Cape of Good Hope, two accounts relative to the object of your mission, delivered to me by the captains of two French ships that arrived from Batavia. You will there see by what accident a Dutch ship, having on board Commodore Hunter, commander of the English frigate *Syrius*, as well as his crew, had seen, near the Admiralty Islands in the South Seas, men covered with European clothes, and particularly some clothes which he supposed to be French uniforms. You will also perceive that the Commodore had no doubt of their being the remains of the wreck of *M. de la Prouse*, whom he had seen at Botany Bay.

Thinking the knowledge of these reports would be interesting to you, and judging them sufficiently important to be communicated to you, I now send a frigate to the Cape solely for that purpose. Captain Bolle, who commands her, will, if he does not find you there, leave any dispatch with the French *Charge d'Affaires*, that it may be delivered to you on your arrival. Though no official accounts of your expedition authorize me to send a frigate on this service, I am certain his Majesty will approve of the step which I have taken in this respect. It was reserved for you to acquire claims to the gratitude of the whole nation, by accepting the command of an expedition, which does equal honour to the sovereign who orders it, and the officer by whom it is executed. Whatever route you may take, you will be followed by my wishes for your success, and by the inviolable and perfect attachment, with which I am, &c.

Isle of France, Nov. 9, 1791.

SAINT FELIX.

Account given to the Chief de Division Saint Felix, Commander on the Indian Station, by Captain Prieaudet, commanding the Ship Jason, arrived from Batavia.

The English frigate *Syrius*, commanded by Commodore Hunter, bound for New Holland, was lost in Norfolk Island, in the South Sea, towards the end of 1790. The crew were taken up by the sloop of war which was following in her mission, and has returned to Botany Bay, where Commodore Phillip freighted a small Dutch vessel to convey to England the shipwrecked crew, with their commander, commodore Hunter.

Having left Botany Bay in this vessel, and wishing to touch at Batavia, Commodore Hunter was thwarted by the winds and currents, and carried to the eastward as far as

Captain Bolle, who had almost instantly sailed again to return to the Isle of France.

The following is the letter addressed to the Admiral, with the depositions of the two Captains of the merchant vessels, who were at Batavia while Commodore Hunter continued there, on his return from Botany Bay in a Dutch ship, after having been cast away on Norfolk Island*.

As

the 167th° of longitude from the meridian of Greenwich, Wishing to pass through St. George's Strait, he got sight of the Admiralty Islands, situated in the 147th° of longitude from the meridian of Greenwich, and in 3° 25' south latitude. Near that lying most to the eastward, he saw several boats filled with men covered with European stulls, and pieces of cloth; he could even distinguish the uniform of the French navy. These people made signals with white flags for the ship to approach. For this Commodore Hunter had the strongest desire; but it was impossible to effect it, on account of the contrariety of the currents and winds, and the danger of numerous shoals.

Commodore Hunter had seen La Perouse at Botany Bay, and was particularly intimate with him. He had learnt from him that it was his intention, on leaving Botany Bay, to pass through St. George's Strait, in order to get to the northward. He had no doubt that it was on these islands that the *Astrolabe* and *Boussole* were lost, in consequence of the calms and violent currents which prevail in that quarter. He told me that he himself was carried to the eastward six hundred miles in ten days by the strength of them, as was proved by repeated observations of the longitude, by time-keepers, and the sight of land. In a word, Commodore Hunter, who was at Batavia, and whom I saw in the voyage I have recently made, appears to me to be fully persuaded, that the European clothes, which he observed in the boats that came from the Admiralty Islands, are the remains of the shipwreck of the vessels under the command of La Perouse.

Commodore Hunter is now on his passage to return to England, whence France will probably receive from him more circumstantial details on this subject.

After what the English commander has experienced on approaching the Admiralty Islands, he thinks, that a vessel wished to go thither, ought to take the precaution to get into their latitude in good time, in order to prevent her from being carried away by the currents, which set to the eastward with wonderful rapidity. Done at the Isle of France, 6th of November, 1791.

Signed Prieaudet.

Captain of the Ship Jason

Account from Piere Magon Lepinay, Captain of the Ship Marie Helene, arrived from Batavia, to the Chief de Division Saint Felix, Commander on the Indian Station.

The commander and officers of the English frigate *Syrius*, after that ship was wrecked on Norfolk Island, were conveyed to Botany Bay, whence they sailed in a small Dutch vessel, which brought them to Batavia at the end of September in that year, after a passage of six months.

Officers of the English
wrecked on Norfolk
whence they sailed
at them to Batavia
after a passage of six

As Commodore Hunter, returning from Batavia, with his officers, to proceed to England, was at the Cape when our adventurers arrived there, they naturally expected to receive all possible information respecting what had been seen at the Admiralty Islands. They were not, however, a little surprised to hear that the commodore set sail for Table Bay, two hours after they had dropped anchor. He probably knew the object of their mission, for they were expected at the Cape, and the admiral's flag might inform him that these ships were dispatched in search of La Perouse. It appeared extremely extraordinary that he was not anxious to communicate to them that information which the Captains Préaudet and Magon Lépinau had collected from him and his officers at Batavia. Nothing really indicated that the details left at the Cape by Captain Bolle, came from Commodore Hunter himself.

Captain Bligh, commander of the Providence, an English sloop of war, sent to procure the bread-fruit tree from the Society Islands, anchored at Table Bay a short time after the departure of the Atlante. This gentleman had received no information from Hunter relative to the depositions of the two French Captains, but he assured Colonel Gordon that he should make enquiries in these seas, where it was asserted that La Perouse had been lost, and endeavour to save some remains of his unfortunate expedition.

This was the second time of Captain Bligh's visiting the Society Islands, in quest of the bread-fruit tree; for during the first voyage to procure this valuable tree for the English colonies in the West-Indies, he had been turned out of his ship, in consequence of a mutiny

One or two days after having weathered St. George's Channel, early in the morning they got sight of both the Admiralty Islands, to which they were very near; they also sounded without finding bottom.

They saw come out from the islands two large canoes, containing about a dozen men, who would not come on board the vessel, though they approached pretty near her. It was then very moderate weather. The vessel had against her rather a strong current, which drove her off the island; besides, the Dutch captain was not very fond of going near the land. It was remarked, that two of the men who were in the canoes had sashes, similar to those worn by officers in Europe; they made signs as if they wished to be shaved; several of them had on their clothes pieces of red and blue cloth, which proved that they had some communication

breaking out on board, a narrative of which he published on his return to England.

Our adventurers were informed that the Pandora, commanded by Captain Edwards, had since been at the Society Islands, and took into custody fourteen of the mutineers. She lost four of them on running aground on the reefs of Norfolk Island. Christian*, the master of Captain Bligh's ship, and the ring-leader of the mutineers, had, accompanied with nine sailors, taken refuge in another island, having been joined by several of the natives. An officer of the Pandora declared, at the Cape, that Bligh had behaved very improperly to Christian, and that an abuse of his authority drew on him his misfortunes. If this is a true representation, Bligh could not be sincere in asserting that he had always behaved to him with the greatest kindness.

At sun-rise our adventurers saluted the citadel with thirteen guns; this salute was instantly returned with an equal number.

The commodore of the expedition went on shore at nine o'clock; on which occasion a salute with thirteen guns was given and received. The governor had sent a band of musicians, to wait for Admiral D'Entrecasteaux, at the landing-place, whence, accompanied by martial sounds, he repaired to the government mansion, attended by some officers. He was received by the council, in full assembly, who expeditiously returned the visit at the house of the French *Charge d'Affaires*, where he had alighted.

Table mountain was now enveloped in thick clouds, which covered its summit; and though they appeared stationary on the summit of that mountain, even when the wind blew with

with Europeans. As Captain Hunter, commander of the Sirius, had, before his departure from Botany Bay, learned from La Perouse himself, that his plan was to pass through St. George's channel, the officers of that frigate are all persuaded, that he had unexpectedly fallen in with these islands, and been there lost.

I, the underwritten, do certify, that this account is conformable to what I have gathered from different conversations with the officers of the Sirius frigate, who, after that frigate was wrecked, arrived at Batavia, in a small Dutch vessel that was there in the month of October.

(Signed) MACON LÉPINAU.

Isle of France, October 31st, 1791.

* This is clearly a mistake; Christian was only master's mate.

X

violence,

violence, they were incessantly shifting: the impulse, however, which they received on quitting that height, rendered them so dissoluble that they dispersed in the air. Soon after, the south-east wind began to come down from the heights of this mountain towards Cape Town with such impetuosity, that it was almost impossible to walk against the blast; for it drove before it, to the height of a man, small stones upwards of a centimeter in thickness, with such extreme violence, that the people were obliged to repair for shelter to their houses.

The Biscayan* of the Esperance, which the force of the wind had broke adrift during the night, from the stern of the ship, was lost; to replace which, a whale-boat was purchased from an American vessel. Though the south-east wind continued to blow with impetuosity, our commander went into the environs of the town. The pretty shrub, known to naturalists by the name of *brunia paleacea*, adorned the first hills by which the ascent commences. It will readily be believed, that with such a wind, as they had experienced, the insects had entirely disappeared.

Labillardiere visited the Company's garden, which had been spoken of with rapture by many travellers: it is, however, nothing more than a vast enclosure, where some avenues of tolerably fine oaks are to be seen. Some of the beds are encompassed with myrtles, in the midst of which are cultivated different sorts of vegetables, and a few exotic flowers. There have been some European fruit-trees planted here: A plantain-tree was also introduced here; but its leaves were unable to resist the violence of the wind, which had cut them into shreds†.

A slave-ship had lately arrived here from Mozambique, from which its cargo, consisting of four hundred negroes, were landed. It was a melancholy sight to behold most of these miserable creatures greatly afflicted with the scurvy, after a very short passage, crowded together in three small apartments, whence they were to be conveyed on board, to go and support, by the sweat of their brow, the luxury of some rich West-Indian.

* A Biscayan is a long narrow boat, sharp at each end, calculated for going through a swell. It acquired this appellation from the province of Biscay, on the coast of which it is much used, and is there usually called *barca longa*.

† The managerie, at the end of the garden, contains a small number of scarce animals: the ostrich, the zebra, the porcupine, and a few birds.

On the 22d, our naturalist visited Lion Mountain. This eminence, which acquired its name from the figure which it exhibits at the distance of a few myriameters at sea, affords a soil little favourable to vegetation. On the following day he visited the Devil's Mountain. The impetuous south-east winds, the force of which is greater at the declivity of this mountain than any where else, has justly entitled it to that appellation. The delightful valley, which separates it from Lion Mountain, is decorated with the beautiful species of *protea*, with silvery leaves: these leaves are covered with a down, which are the thicker as they are exposed to the action of the air. The same observation applies to most of the plants buffeted by the winds; whence it seems apparent that this down secures them from the injury they might thence receive.

The sterility of Lion Mountain had no appearance here; vegetable productions presented themselves in great abundance. The tulip of the Cape embellished the gradual slopes, and a great variety of species of *cricea* issued from the rocks. Being required to pass much of his time, in the preservation of the plants he had collected the day before, he could not undertake a long excursion on the 24th; he therefore amused himself in strolling about the environs of the town. The bastard aloe, known under the denomination of *agave vivipara*, was still in flower. He admired the lightness with which the titmouse called the saccharine juice exuding from the glands at the bottom of the corollas. It was not without regret that he killed some of these charming birds that he might preserve their skins.

He employed the 25th in visiting Table Mountain, so named from the horizontal plane, which its summit presents when beheld at a distance. Having reached the middle of the mountain, he found the *thesium strictum*. He clambered up acclivities formed of a very hard freestone, above which were blocks of quartz of a beautiful white‡.

Having reached the top of Table Mountain, they

‡ Fire-wood is very scarce at the Cape of Good Hope. The mildness of the climate, indeed, requires no artificial heat to protect the inhabitants against the inclemency of the weather; but fire is necessary for dressing their aliments. Slaves are dispatched to procure what little wood they have occasion for at a considerable distance beyond Table Mountain. Our adventurers met several negroes, carrying branches

they began to make an attack upon their provisions, when some of the people belonging to the *Esperance*, advanced towards them, who had made an excursion thither without furnishing themselves with food; with them they had the pleasure of sharing in a frugal repast. False Bay was very perceptible from the top of this mountain, every part of which our naturalist successively visited. He returned with an abundant collection of vegetables, by the track in which he had ascended.

Beyond the head of the bay a vast plain of sand presents itself, on which he was astonished to behold a great quantity of vegetables. He crossed several rivulets, the waters of which descended from the neighbouring mountains, and are partly lost in the sands before they arrive at the sea. In such moist spots grows the beautiful lilaceous plant known by the name of *gethyllis spiralis*. Holes made in the sand are resorted to by snakes, which are often found asleep on their edges, but glide into them on the approach of human visitors.

He had hitherto found only a small number of insects, as they delight not in places so much exposed to the wind.

He had already collected most of the vegetable productions to be found at this season, in the neighbourhood of the Cape. He could not promise himself a more abundant harvest, without going to a distance. Some mountains mentioned by the Dutch under the name of *Frenche Hoec*, situated to the eastward, at a greater distance than its appearance seemed to indicate. Expecting to find there a great variety of specimens, he was resolved to visit them. He set out on the 9th of February, taking with him the gardener belonging to the expedition: a Hottentot led a horse, that carried their baggage; and a young negroe, who hardly knew a word of French, was chosen interpreter.

A passport, with which they were obliged to be provided, was obligingly sent to Labillardiere by Mr. Berg; and Colonel Gordon, the com-

mander of the troops at the Cape, had given him letters of introduction to several of the inhabitants. Colonel Gordon is the celebrated traveller who first furnished Buffon with just ideas respecting the giraffe, or camelopard, an animal little known till then. To make discoveries in natural history, this gentleman penetrated into the interior of Africa, as far as the 21st degree of south latitude.

They met several waggons, drawn by three or four oxen: they were returning empty, each conducted by a Hottentot, who, standing in the middle of the carriage, with a long whip in his hand, directed his cattle with infinite skill. The Hottentot amused himself occasionally with smoking his pipe, and cramming himself with Hottentot's figs, *mesembryanthemum edule*, which grow on the road-side, in the midst of sands, without paying any attention to the load of their horse, which he had made follow him. Their baggage fell off several times, and would certainly have remained on the road had not the smoker been vigilantly watched. It was sometimes found necessary to terrify him by threats, to rouse him from his apathy, and render him more attentive.

Having arrived at places somewhat more elevated, they saw a few antelopes, but they were at too great a distance to be fired at.

About two hours after dark they arrived at Bottelary, the house of M. Bosman. The letter of recommendation to him, from Mr. Gordon to his worthy cultivator, procured them a very friendly reception. On the 10th, when the day began to dawn, they rambled over the environs of this delightful habitation. When the sun appeared in the horizon, M. Bosman's young daughters, seeing them employed in picking up insects, wished to contribute towards enriching their collection. They ran about the garden with great spirit and agility, and frequently brought them a very good choice among the species, the colours of which were the most brilliant.

proach the habitations, to procure by stealth, and at the risk of life, some casual relief. It would be dangerous to go alone, and unarmed, near the caverns in which these wretches driven by despair, conceal themselves from the light of day, in order to escape slavery. Some salutary drops of water, which in these heights ooze between the strata of a micaceous schistus, afford the traveller the means of moderating his thirst.

Being

Being shortly to sail from the Cape, they had little time left to visit the mountains of Franche-Hoec; they were therefore under the necessity of quitting their amiable entertainers. Arriving at Stellenbosch, they stopped at the house of M. Hoffman. The manner in which they were received at Stellenbosch, was very different from that which they experienced at Bottelary: they were in a very pleasant village, but they saw none of that frank urbanity which so much characterises the cultivators of the Cape. After a deliberate perusal of their passport, M. Hoffman coolly asked them to stop at his house. There are no inns at Stellenbosch, any more than at Cape town; but the Dutch supply the wants of travellers, for a price which prevents the host from being out of pocket. At M. Hoffman's house, our adventurers were nearly on the same footing*.

After it was dark they got to Franche-Hoec, and were civilly received at the house of M. Gabriel Deprat, to whom our naturalist had a letter of introduction. He being absent, one of his neighbours, named Jacob de Villiers, invited them to take up their quarters at his house.

From the names of these colonists, they expected to find persons capable of conversing with them in their own language; but, though of French extraction, as they were obliged to speak Dutch, they retained no more of their mother tongue, than the names of their progenitors. The only person, who then understood French, was a woman of fourscore†.

These mountains, in a great degree, consist of granite, and a very hard free-stone: the vegetable mould, which covers them, goes to fertilize the vallies, where the inhabitants reside;

* They set out on the 12th, with an intention of reaching Franche-Hoec in the evening. This place, the name of which indicates the abode of some Frenchman, is an asylum to a few protestant families, who, having been persecuted in Europe for their religious opinions, crossed the seas in 1675, to fix their abode in this part of Africa, where they were well received by Simon Vander Stel, the governor, who enabled them to establish in Agriculture.

† This is a pleasant valley, where the rays of the sun, being concentrated by the surrounding mountains quickly ripen the grape, which forms the principal wealth of the inhabitants. Wheat is also cultivated here.

‡ This territory, upon the recent English conquest, was found to be of more considerable extent than was supposed, being 550 English miles in length, and 233 in breadth, comprehending an area of 121,150 square miles. The

thence they must traverse the sands, with which they are environed, in order to convey to the town the produce of their culture: this situation is common to all the settlements at a distance from the Cape. Negro slaves, though employed in the hardest labours, are, in general, kindly treated. It is remarkable that the Spaniards always endeavour to make proselytes of them; but the Dutch permit the slaves to remain in the most perfect ignorance of their religion.

Our adventurers saw, several times, snakes upon the trees, at which the country people seemed greatly terrified: they were watching the birds, which often became their prey.

The zebra is common in these heights, but runs off with great rapidity at the sight of a man. The monkey, called *magot* by Buffon, sometimes approached the habitation where our adventurers now sojourned. These animals seem very severe in the punishment of their young: a large monkey was seen followed by a very young one; the former, supposing himself unseen, seized the little one with one of his fore paws, and, holding it up from the ground, struck it several times with his other paw. If monkeys are just in proportioning guilt to punishment, the little ape's crime must have been very atrocious, for it was unmercifully chastised.

The near approach of the period of their departure from the Cape, obliged them to hasten from Franche-Hoec. They took leave of the worthy Jacob de Villiers on the 14th, at ten at night, and set out on their return. All the houses in Cape Town are built with flat roofs, which gives them a tolerably handsome appearance.

The ‡ Cape of Good Hope is a part of the globe

white inhabitants, exclusive of Cape Town, do not exceed 15,000; and the whole may be about 20,000. *Barrow's Travels*, 1801, 4to. *Pinkerton's Mod. Geog.* II. 753.

For a more minute account of this interesting colony, the only European settlement in Africa that deserves that name, the reader is referred to *Barrow's Travels*, a most excellent performance, which forms a striking contrast with the gasconades of *Le Vaillant*. Mr. Barrow's account terminates with part of the country of the little *Nemakias*, included in the colony: beyond which are the Copper Mountains and Sandy Deserts; and he ridiculed *Vaillant's* supposed excursions in this quarter, while he never passed the orange river. The preposterous vanity of *Vaillant* greatly injures the credibility of his narrative, and his map of the colonial possessions cannot be compared with the actual survey by Mr. *Barrow*.

globe which ought to be attended to by a commercial people. From its situation it forms a necessary refreshing place for ships bound to the East Indies. The provision which it furnishes are abundant; but the prohibitory re-

gulations daily diminish the number of ships; many endeavour to arrive at their place of destination, without touching at this roadstead. Others go to St. Helena, where they can be victualled on more moderate terms.

SECTION III.

Departure from the Cape of Good Hope—Death of the Carpenter of the Recherche—Make the Island of St. Paul—Its Forests on Fire—Vast Quantity of Insects issuing from the Biscuits—The Admiral is much hurt—Luminous Sparks at the Extremity of the Conductors—Large Phosphoric Molecules—Diminution of the Phosphorescence of the Sea-Water—Direction of the Currents—Warmth required in the Place where the Time-keepers are deposited—Anchor in Port D'Entrecasteaux.

OUR adventurers were waiting for a fair wind to quit the Cape, when, on the 16th of February, at ten in the morning, a favourable breeze sprang up, and induced them to weigh anchor. Hardly were they under sail before a squall came down from the mountains, and blew with such violence, that they were in danger of running foul of several vessels then lying at the anchorages; but they quickly passed them all, and gained an offing.

On the 18th in the morning, they lost their carpenter, Louis Gorgan: he died in consequence of the excesses to which he had abandoned himself during his continuance at the Cape. This loss was the more to be regretted, as a skillful carpenter is one of the most useful men*.

At this season of the year, it is uncommon to pass across the Straits of Mozambique, at a little distance from land, without meeting with violent storms. A gale now blew with almost incredible fury; the electric matter, with which

the clouds were charged, was so abundant, that the lightning fell several times at the distance of a few meters from the ship. On the 1st of March the wind had raised so heavy a sea, that their consort was concealed by the height of the waves. On the 3d, they were convinced, that they had passed the Straits of Mozambique; for though the wind blew nearly with equal force, the sea was hardly ruffled, as they were now sheltered by the land of Madagascar. About five in the afternoon, they were surrounded by whales, which approached them within the distance of a hectometer. The Americans frequently visit these seas to procure these enormous fishes; the oil which they extract from them being thought an ample compensation for their labour and expence.

On the 7th, about nine in the evening, the wind brought our adventurers a strong smell from the sea. In seas less known, the vicinity of land might have been apprehended: it is not

There are few places whose natural history has been so fully explored, as the territory of the Dutch colony at the Cape of Good Hope, and the country adjacent; nor does it seem to have better repaid the labour of research. The country of Southern Africa is more rich and peculiar than that of any other country, and most of the singular and beautiful inhabitants of our stoves and green-houses have been hence procured. The class of bulbous-rooted plants alone might be selected as peculiarly characteristic of the Cape; for no where else are they found so abundant, so various, or so splendid; nor is it only at one season of the year that this splendid scene is exhibited, every month has its peculiar beauties.

* Two persons, who had concealed themselves on board the time of their departure from the Cape, did not ap-

pear on deck till it was too late to send them on shore; in consequence of which they were permitted to go with the expedition. One of them was a soldier, who had deserted from the garrison of the Cape; the other a German, who had exercised his trade, as a mathematical instrument maker, nine years in England. The English, he said, were conveying him to Botany Bay, with a number of other persons, transported under the denomination of convicts. He declared he was banished there for debt, but seizing an opportunity of escaping from the ship in which he was confined, he had taken refuge in the mountains. He there passed the day in a cavern, and in the evening went into Cape Town to procure subsistence, waiting for the departure of the other persons under sentence of transportation.

impossible that this odour proceeded from a heap of sea-weed, detached from the coast of Madagascar, and conveyed to a great distance by the currents*.

It was not till the 28th of March that the wind began to blow strong at north-north-west. A great number of various species of mews and boobies announced to our adventurers the proximity of land; as these birds are never seen far distant from it. At about half after one in the afternoon, they saw it in the south-east: it was the island of St. Paul, from which they were now distant about four myriameters. It was discovered by Captain Valming in 1696, and named the island of Amsterdam; and that which is more to the southward, received the name of the island of St. Paul. Captain Cook, who surveyed it in his last voyage, has adopted a contrary denomination, by calling the island of Amsterdam that which is the southernmost, and the island of St. Paul that which is the northernmost†.

On the 14th the mercury in the barometer having fallen from 28 inches 3 lines, to 27 inches 7 lines, unced tempestuous winds: they blew from the east and south-west, raising a dreadful sea, which often broke on board: there came one, about five o'clock, which struck the ship's quarter with such violence, that many of the seamen thought they had touched upon a rock.

A violent shake threw the admiral against one of the angles of a bird-organ, intended as a present for some chief among the savages. At first, the surgeon supposed the short ribs had been fractured; the pain was so acute, that the admiral, in sneezing, fainted away; but soon after recovered.

Towards morning a heavy sea broke over the gangway, and filled the vessel between decks. The

* On the 15th, one of the sailors, in the height of intoxication, jumped overboard; it being calm, he was fortunately picked up. This immersion, however, served only to increase his inebriation; for, in his delirium, he would have jumped overboard a second time, had he not been prevented.

† The island of St. Paul appeared, in the distance, covered with clouds, above which soared the summits of the mountains: flames were soon observed in different points, and the forests were in a blaze. They observed a thin smoke issue in puffs from a small subterraneous aperture, at a little distance from the shore: they knew not whether these forests had been set in flames by the sub-

commander was awaked suddenly by the water with which his cabin was overflowed, and, for a moment, imagined the ship was sinking down. It required some time to get rid of so large a body of water: three or four such waves, would probably have sent them to the bottom. They might not have incurred this danger, had the hatchways been properly secured.

On the 19th it was announced to the Espérance, that, in case of separation, the rendezvous would be Cape Diemen, in Adventure Bay. At half after nine, on the 20th, they observed a very pointed rock, known by the name of the *New Stone*: some other rocks and lands were discerned in the eastern quarter. They soon after arrived at the entrance of a bay open to the south-east. The admiral intended to go and anchor in Adventure Bay. His accident would not yet permit him to leave his cabin: he could direct the course only by the bearings that were given him as soon as they were taken. An incorrect bearing, communicated by Citizen Willaumez, occasioned him to give orders for manœuvring so as to enter the bay on their larboard hand. They looked for Penguin Island, thinking they were in Adventure Bay, but they were actually in Storm Bay; so named by Tasman in November 1742, from his having experienced a storm there in which great danger was imminent.

Being already high up in this bay, they were perfectly sheltered from the westerly wind; the depth of water being from fifteen to twenty fathoms, over a bottom of broken shells. The admiral was on the point of leaving it, to pass the night in the offing; he determined, however, to dispatch two boats in search of a place of shelter. One of the boats returned with intelligence that a cove had been found where their ships could enter, the bottom being good

terraneous fire, or by the hand of man. If they could have rendered any assistance, they saw nothing to apprise them that this island was inhabited; besides, it would have been impossible for them to put in there, for they could seek a shelter only to the leeward of this land, where they would be in danger of suffocation from the intolerable smoke; the smell of which plainly indicated that vegetables only were on fire. They were at a small distance from the island, when night came on. At that time the land appeared perfectly in a blaze, except where the smoke seemed to imbeib its brightness, when it communicated a copper-coloured tint, as at the approach of a storm. The island of St. Paul is about two myriameters in circumference

holding ground; and that wood and water might easily be procured there. The boats crew observed remains of some huts, close to which were remnants of shell-fish that had been broiled by the natives.

As it was too late to reach this anchorage before it was dark; and, as the weather was fine, it was decided, about five o'clock, to let go the anchor in Storm Bay, in ten fathoms water. The night continued to be fine, though the air was charged with great humidity. They were sheltered from the wind, except some light squalls from the south-west, a small portion of which they experienced. They caught, with a hook and line, a great many fishes, and of very diversified species; among which the most numerous was a species of *gadus**.

An officer having been sent on shore, in the morning, to sound towards the head of the harbour, found a few huts, and near them some remains of broiled fish, which had evidently formed a repast for some of the natives.

It being almost calm, they weighed anchor

before day-light on the 23d, in order to warp a-head. The calm continuing, it was thought expedient to tow the ship, and the boats soon brought them into the harbour. They let go the anchor about eight o'clock, after having proceeded about three quarters of a kilometer up the harbour, which was denominated *Port D'Entrecasteaux*. The nearest shore to the eastward of them, was at the distance of a demi-kilometer. In this solitary haven, situated at the extremity of the globe, they found a secure shelter, after having been so long buffeted with impetuous winds.

The same boats were occupied in towing the *Esperance*; and about one o'clock in the afternoon, she anchored to the southward of the *Recherche*, at about three hectometers distance. An attempt was made to approach the shore, without having taken exact soundings; but they soon got aground on the mud, and were obliged to heave quickly at the capstern to bring the ship off again.

SECTION IV.

Continuance at Port D'Entrecasteaux—Indications of its being visited by Savages—Excursions to the Interior—Trees of an extraordinary Height—Excellence of the Soil—Black Swans—Large Trunks of Trees, excavated by Fire—A Retreat for the Natives—Tracts of wild Beasts at Cape Diemen—Sheds and Huts—A violent Squall—Get aground on the Mud—Meet with a young Savage—Signs of wild Beasts at Cape Diemen—Huts appearing to have been recently inhabited—Broiled Human Bones found—The Sail-maker of the Recherche loses himself in the Woods—Utensils of the Savages—Leave Port D'Entrecasteaux—Several Fires—Natives seen on the Beach—Excursion to the neighbouring Country—Natives surprised close by the little Fires, preparing their Food—Various meetings with the Savages.

PORT D'Entrecasteaux, situated at the head of Storm Bay, is almost an oval basin, extending a demi-myriameter towards the north-north-east; the greatest breadth of which is about a kilometer and a half, the large forests which surrounded them, and the neighbouring

* A boat which had been sent a fishing had, at the single cast of a net, brought back fish enough to supply every one with a portion, which was immediately served out. They were not a little surprised to see, among those caught with hook and line, some sharks of about two meters long; they were of the species denominated *squalus cinereus*. This shark, which seldom quits the bottom of the sea, is not supposed to be dangerous to man; the sailors often

mountains which sheltered more than half of the circumference of this harbour, added greatly to the security of the anchorage. The most tempestuous weather did not deter the seamen from crossing it. A muddy, bottom of three fathoms and a half, exempts a vessel from in-

bathed, and never found them offensive. This fish finds such an abundance of food to satiate his voracity, that he does not attack men. Some mountains, the perpendicular height of which seemed to be about a kilometer, were seen to the north. Their summits were covered with large trees, whose verdure added beauty to the grand prospect which they afforded.

jury

jury if she should happen to get aground. A hundred ships of the line might anchor here in safety, and find as much wood and water as they required.

Some sheds, hastily built of the bark of trees, indicated to our adventurers that they were frequented by the natives. A fire lighted towards the south, at the distance of a myriameter, also convinced them that there were resident savages not far from them; though they never had seen any of them*.

But the trees of this forest were not so huddled together, as to prevent the adventurers from entering it. In some places, where the waters had been occasionally obstructed in their course, they formed marshes. On visiting their banks, they found rivulets of good water. An excellent vegetable mould, of about four decimeters in depth, was almost general. Sometimes they met with clayey, or argillaceous earth, which imbibed the water with such facility as to form quagmires. Besides, this clay, conducted by the waters that filtrate through the lands, has left cavities and small pools, the surface of which being covered with plants, conceals the danger. A moment's inadvertence would occasion a person to fall in. A circumstance of this kind really happened to the surgeon of the *Esperance*. Taking the diversion of shooting, he supposed he was setting his foot on solid ground, when he instantly sunk into a very deep pond; he disappeared in an instant, but fortunately he could swim †.

One of the party shot, on the lake, a bird of singular plumage: it was a new species of the swan somewhat larger than the common sort. It had the same elegant shape; but its colour was a shining black: it had but six white feathers in each wing; a character which our naturalists constantly remarked in several others that were

* The naturalist went on shore, in the afternoon, with the gardener, and two others, to penetrate towards the north-east. They were struck with admiration at the sight of these ancient forests, which the hatchet had not before mutilated. The eye was astonished at the immense height of the trees; some of the family of the *myrti* were upwards of one hundred and fifty feet high: their bushy tops were crowned with a foliage of perpetual verdure; several of them, bending from age, were supported by their neighbours, and gradually fell to the ground in the last stages of their decay. The most vigorous vegetation here forms an admirable contrast with this state of decline; and here is beheld, in all its grandeur, the exact picture of

killed afterwards. The bill of the upper mandible is red, with a transversal whitish stripe towards the extremity. A swelling, forming two protuberances, is observed on the base of the male's bill, which is hardly perceptible in that of the female. The lower mandible is red on the edges, and whitish underneath. The feet are of a dark grey.

On the 24th, at ten in the morning, our naturalist went to visit the country, situated to the eastward of their anchorage. After having several times gone a little way into the woods, he was obliged to return towards the beach, they were so difficult to penetrate. Not only the underwood obstructed the passage, but it was also greatly impeded by large trees fallen to the ground. The direction, which they have generally taken in their fall, proves that they had been blown down by the violent south-east winds. The roots of these trees being nearly horizontal, they take little hold of the soil. The finest trees in this country are species of *eucalyptus*; they are frequently eight meters and a half in circumference.

Many of the large trees near the sea, have been excavated by fire towards their root. These apertures, which are generally to the north-east, form a shelter against the south-west wind, which is the most prevailing and impetuous. These excavations are doubtless the work of man; for had the trees been set on fire by accident, as by the combustion of shrubs growing in the shade of these forests, the tree would probably have suffered in every part of its circumference. These excavations in trees afford shelter to the inhabitants, who came hither to make their meals: not only the fragments of their food was found here; but the ashes of small fires, which had been kindled for dressing their provisions. Some of the thickest trees, excavated by fire through-

nature, who, when left to herself, destroys only to renovate.

† Not far from the shore they met Citizen Riche's servant, highly pleased with having killed a few birds, which he was carrying to his master. This servant had for some time been under the care of the surgeon of the *Esperance*, who thought he was entitled to the game killed by his patient; but neither the threats of purgation, nor even those of being put upon a low diet, could procure him a single bird. The doctor put his menaces in practice: he obliged him to submit to a regimen, and to swallow a powerful purgative. The poor fellow was taught, by sad experience, the danger of resisting the surgeon of a ship.

out their whole length, formed a kind of chimney; but even in that state they continued to vegetate.

After having followed the sea shore, which extends to the south-east, he killed some birds of the *motacilli* genus, and several parrots; among which he remarked the new Caledonian parrot, described by Latham*.

After having crossed a tongue of land, they proceeded with difficulty in the midst of the moving sands of a vast beach, the skirts of which the sea had lately overflowed. On their return, by a more direct path, they observed some skeletons of cabins. It appeared, however, that the human species here is very scarce or very shy; though many persons belonging to the two ships had sauntered about, and visited several quarters, they had not met with a single inhabitant.

On the 27th, at day-break our adventurers set out with a view of proceeding as far as they could. They landed to the south-east, pursued a path along the shore, frequented by the natives, and crossed the forest that lay to the south. Though the wind was faint, the sea broke with violence, and overflowed a considerable extent of beach. On a little hillock, projecting towards the sea, a pretty species of banksia was procured, which Gartner designates under the name of *banksia gibosa*†.

The hope of meeting with some of the savages, induced them to determine to advance further into the woods, and to pass the night in exploring them. They walked about an hour towards the east, opening to themselves a very difficult road, till they arrived at a large plain extending to the sea-shore. Here they saw a fine species of *mimosa*, with long single leaves of an oval form. This tree bears semicircular pods, and its height is from eight to ten meters.

Night obliging them to seek a shelter, they

* One of the officers found a young kangaroo on the shore: after this animal had run about a hundred meters on the sand, it leaped into the water, and was killed. As it comes out of its burrow more by night than by day, nature has given it a membrane, known to zoologists under the denomination of *membrana nictitans*, situated at the interior angle of the eye, and capable of extending over the whole ball. These animals, perhaps, find some food on the sea-shore, as the marks of their feet are frequently to be seen on the sands.

† Proceeding across the forest, not far from the sea,

had recourse to a pole-axe, which one of them had the precaution to provide himself with. Some branches, cut on the spot, enabled them to erect a hut on a piece of ground, the hardness of which was moderated by a bed of fern. Being on the skirts of the shore their view was extensive, but they could perceive nothing that indicated the presence of any natives. The cold being intense, they kindled a fire.

As they had taken with them only one day's provisions on their leaving the ship, their stock began to be much impaired, but they were not much alarmed on that account, knowing it was customary for sailors never to travel without a portion of biscuit; and consequently that they could produce a quantity among them: but, with this supply, they were greatly distressed for want of water, which could not possibly be had but at two kilometers distance. It therefore required a good appetite to be satisfied with such a supper.

As they were seven persons in the party, they had not much to fear from the natives; but they so arranged their business, that each of them should keep watch in his turn, to attend to their motions if they should be inclined to pay them a visit. Urged by extreme cold they quitted the hut that they might indulge themselves by the fire.

On the 28th, at the appearance of day, a party of them employed themselves in shooting, hoping to procure a breakfast by their skill as marksmen: a crow and an oyster-catcher were the only birds which fortune had thrown in their way. These victims of their hunger were immediately broiled and eaten, with as much glee as if they had been the most voluptuous of food.

It had been thought necessary, the preceding evening, to limit themselves to a very moderate allowance, that something might be reserved for the next day; but, on examination, it unfortunately appeared that our provisions had

one of the party saw a young native, who ran away much terrified at the report of a musquet, which had been fired at a bird. This circumstance having been mentioned to the rest of the company, they ran towards the spot to which he had fled, hoping they should obtain an interview with some of the inhabitants of this country; but their endeavours were ineffectual; the young savage had disappeared, darting precipitately into the closest thickets, at the risk of tearing his skin, which was his only covering. They found, at the place from which he ran, a shed to keep off the sea breeze; and near it, a spring of clear water.

been confided to unsafe hands: only four of the biscuits now remained, though the stock would have consisted of six, if integrity had not been abandoned. A greater breach of confidence would have obliged them immediately to return on board, and they would have been deprived of the advantages of extending their researches farther. They were not long in reaching the banks of a large lake, which communicates with the sea; but their endeavours to ford it were vain; the depth towards the middle being too profound.

Among the number of plants which grew in the neighbouring woods, they found the *schefflera repens*, and several species of a new genus of the family of the *pedicularcs*, and nearly allied to the *polygala*. Among the shrubs, not far from the sea, they remarked a fine species of the single-leaved *minos*, the legume of which was shaped in the form of an S.

They saw a numerous quantity of black swans which swam away from them. They remarked, towards the shore, opposite to a lake, some islets covered with shrubs: they shot various species of snipes, when they advanced to the south-east, in order to reach the extremity of the lake the farthest from the sea. This lake is strewn with a prodigious quantity of shells, which have been partly destroyed by time. They saw on its banks the *crithmum marinum*, and near it a new species of parsley, that our botanist denominated *apium prostratum*, from the disposition of its stem, which is always prostrate on the ground. Supposing this a salutary article of food, they carried on board an ample stock of it, where it was received with joy by the navigators; who saw the necessity of counteracting, by the use of vegetables, the ill effects of salt provisions, on which they had lived in their passage from the Cape of Good Hope to Cape Diemen. In a limpid rivulet, to the westward of the lake, they soaked the little biscuit they had now remaining.

It was difficult, after so long a walk, to return to their ships, passing through forests which till then they had never visited. The sun, proceeding in its course, served to direct them:

* Their people went out regularly with the seine every evening, and brought back a considerable quantity of fish. On the first of May, they went to the westward, on the other side of the harbour: the shallowness of the water kept the boat at so great a distance from the beach, that they were obliged to step into the sea to reach the shore.

very thick underwood then impeded their progress. The inequalities of the ground, having obstructed the passage of the waters, they were often obliged to cross the marshes; but the numerous plants which they contained induced them to forget the difficulties that occurred in the road. Among those which they collected, were two new species of the *rosa solis*; one of which is remarkable for the singular form of its leaves: they consist of two long points, situated at the extremity of each petal, which proceeds from the root of the plant.

After two days' hard travelling, they arrived at the northern extremity of the harbour where their ships were lying, and saw them at a considerable distance. The difficulty of the road had deprived them of every hope of getting so far that evening, but opportunely a boat presented itself, and they were conveyed on board.

Crétiu, one of the officers of the ship, had been sent by the admiral into the launch, accompanied by a geographical engineer, to reconnoitre Storm Bay. On their return, they related that, after having proceeded several myriameters into a channel, which our adventurers had left on the starboard hand, when they entered the bay, every thing concurred in justifying the opinion that this was a strait. Our naturalist did not go out of the ship the two following days, having been employed in describing and preparing the abundant collection which he had made in his last excursion*.

Some mountains of gradual declivity, situated to the westward, formed a beautiful valley. They followed a difficult road, intending to repair to the place where water is procured for the ships: the night overtook them half way; and, to complete their misfortunes, a heavy fall of rain obliged them, like the savages of New Holland, to seek a shelter in excavated trunks of trees. Imagining the weather would render useless the signals they were to make for a boat to be taken to them, they were preparing to pass a disagreeable night in the midst of these forests, when they were agreeably disappointed. Hearing the voice of some sailors, who had been sent

They followed their course to the northward, keeping along the skirts of the beach; some hollows, formed in the sand like a funnel, concealed each a small globular crab, which had fabricated this hole; and when the water had retired it regained its habitual abode; these holes might also serve them as snares to entrap their prey.

in search of them, they joyfully attended to their summons to go on board*.

On the 3d of May, they traversed a glade situated to the north-east, which conducted them towards the great lake. In a preceding excursion they had seen the south part of it, and they thought it necessary to visit its northern side. Its banks were often steep, and of difficult access, and various species of single-leaved mimosa were growing under the shade of the large trees. It appeared to our adventurers, that the natives occasionally take up their abode on the banks of this lake, the shell-fish of which afforded them a supply of food. Advancing a little further, they perceived a hut, constructed a few yards from the water-side; it almost exhibited the form of a demi-oval, fifteen meters in height, by sixteen in breadth at its base. Stakes were driven into the ground at each end, bent into a semi-circle, which supported each other in such a manner as to form a tolerably compact frame, which was covered with bark. About ten o'clock they found no difficulty in getting on board†.

This tree, which is one of the most lofty in nature, some of them being a demi-hectometer in height, bears flowers only near its summit. They were obliged to cut down one of these trees to procure its flowers. This very beautiful tree, of the family of the *myrti*, is covered with a smoothish bark; the branches are a little angulated as they rise; towards their extremity they are adorned with alternate leaves, slightly bowed, about two decimeters long, by a demi-decimeter broad. The flowers are solitary, and grow from the axilla of the leaves. The bark, the leaves, and the fruit, are aromatics, which might be had recourse to in lieu of those which the Moluccas have for a time exclusively supplied mankind.

The day was far spent when they arrived on the banks of a rivulet, where they took up their quarters for the night. They observed, at this southern extremity of New Holland, several spe-

* Two boats had been dispatched, a second time, to reconnoitre the north-east part of Storm Bay, as far as Tasman's Head: at the end of four days they returned, and the result of their discoveries appeared to be, that Tasman's Head, and Adventure Bay, made a part of an island separated from Van Diemen's Land.

† At low water they found, on the sea-shore, a great variety of *neritæ* and whelks: and here they procured some very excellent oysters.

The naturalist had not yet been able to procure the flowers

cies of *ancistrum*, analogous to those of the southern extremity of America. They were surrounded by delightful groves, principally formed by a species of the narrow-leaved *thesium*‡.

The next day, after a few hours walk to the north-west, they found, under the shade of some very large trees, two huts of the same rude architecture which they had already seen. They were in perfect repair, and seemed to have been recently inhabited. A beautiful plant was gathered, which forms a new genus; it is one of the *trides* with two stamina.

Our adventurers were crossing a small coppice, when a large kangaroo quitted his burrow: at first, our naturalist followed, for the space of thirty yards, one of the little paths which these quadrupeds make through the bushes: he could not avoid using his fore-feet in these narrow passages. When he had reached the extremity of them, he sprang forward by leaps, passing over the shrubs with so much velocity that he was presently out of sight.

A sheet of water, into which a charming rivulet directed its course, was covered with an assemblage of wild ducks, which took wing as they approached them; not being prepared for so charming a prospect, they were unable to kill one of them. A breeze got up before night, which seemed to threaten them with rain. No shelter being near them, they were compelled to sleep in the open air: a hedge, which they had themselves constructed with branches and boughs, was their only protection from the weather; and under this shed they produced a magnificent fire.

A very large kangaroo came out within four yards of the naturalist, from the middle of a thicket: his gun flashed in the pan, and the animal moved off slowly, taking one of the paths made through the groves. The numerous tracks of these quadrupeds pronounce them very numerous. It is observable too, that these little

of a new species of eucalyptus, remarkable for its fruit, which has some resemblance of a coat-button.

‡ The cold had obliged them to kindle a large fire, and they were preparing for repose, when the howl of a wild beast, seemingly only a few yards distant, exceedingly alarmed them. The howling resembled that of a leopard; whence it was concluded, that their fire had contributed, much more than they could have supposed, to prevent this animal from making them a nearer visit.

paths generally terminate at some rivulet. The provisions of our adventurers being exhausted, they thought proper to return on board *.

A constant humidity prevailed in the middle of these thick forests, into which our naturalist penetrated towards the south-west. In this spot grew many mosses and ferns, and here they killed the beautiful species of *merops*, indicated by White under the denomination of *wattled bee-eater*. This bird is remarkable for two large appendages, or wattles, on each side of the head †.

A heavy shower of rain, about the middle of the day, forced our adventurers to stop in the large trunk of a hollow tree, which served them as a shelter: this tree exceeded eight meters in circumference. Endeavouring to light a fire in it, after the manner of the New Hollanders, they were so incommoded with the smoke, that they were driven from their retreat. On the approach of night, they found themselves on the banks of a small lake, which, though it had a communication with the sea, was destitute of fish: the people of the *Esperance* had often hauled the seine in it, but never caught any thing ‡.

During their stay at Cape Diemen, they saw no natives but at a considerable distance: all of whom ran off with precipitation, as soon as they were observed: some had left behind them their domestic utensils, which conveyed no very exalted idea of their industry; these were baskets clumsily manufactured of a species of sea-rush. They had also frequently left their water-vessels. No arms were ever found in the places they had recently quitted; they were either taken away or carefully concealed, that they might not be used to their prejudice.

A few straggling huts indicated a scanty population: the shells of fish, collected in heaps near the beach, was though good circumstantial

* Citizen Riche discovered some human bones, in the ashes of a fire kindled by the savages. By their shape, he pronounced them to be the *ossa innominata* of a young girl; they were partly covered with pieces of broiled flesh. Not supposing that these people were cannibals, he supposed it was their practice to burn the dead. These were, however, the only human bones that were seen during their continuance at this anchorage.

† A quadruped of the size of a large dog, about this time, came out of a bush quite close to one of the shipmates. It was white, spotted with black, and had the appearance of a wild beast. These countries will probably, on a future day, add several species to the catalogue of the zoologist.

evidence, that the sea-shores furnished principally the food of these savages. The multiplicity of paths, in which the tracts of different quadrupeds were discovered, demonstrate that they are here very numerous. Whilst day-light exists, they probably remain in the inaccessible haunts of these thick forests. Hooks and lines, and the seine procured our adventurers fish in abundance: east, and south-east winds brought myriads of them into the bay.

Van Diemen's Land was discovered by Tasman, in November, 1642. When Captain Cook anchored there in 1777, four years after Furneaux, he thought he was the third of the European navigators who had landed on this coast: he was then ignorant of Captain Marion's having continued there some time, and that he left it on the 10th of March, 1772.

This harbour on account of its smooth water, is extremely convenient for refitting ships; and the vast forests near it afford a wood which the carpenters of the ship pronounced excellent for ship building.

A small island to the south-west had been called *l'Isle au Perdrix*, Partridge Island, by some of the seamen who had discovered it. Our naturalist accompanied Citizen Riche to that spot on the 20th, to spend the day: and, instead of partridges they found a great quantity of quails. This island is about two kilometers in length: the new species of parsley named *aptum prostratum*, grew in abundance on its shores. They gathered a quantity of it, which they took on board. This islet produced no fresh water, though several forsaken huts attested that it had been inhabited by savages.

Two of the officers had set off at six in the morning to reconnoitre the coast which lay to the eastward of them. They remarked several coves, which formed so many harbours: a strong

‡ Their sail-maker having ventured alone on a short excursion, the preceding day, had lost himself in the woods where he was obliged to pass the night. Several guns having been fired from the ship to signify to him where she lay, he returned on board in the afternoon, exhausted with hunger and fatigue. Having taken no provisions with him, he had been a day and a half without food. He asserted that, during the night, different quadrupeds approached him, and smelt him at a few centimeters distance. Many people believed this relation; but those who had passed several nights in the thickest part of the woods, without meeting with any such familiar animals, seemed a little sceptical.

breeze

breeze impeded their progress, and prevented them from advancing very far into them. Perceiving several fires at a little distance, they came to a determination to land; and hardly had they entered the woods, when they met with four natives employed in keeping up three small fires. These savages immediately fled, notwithstanding the significant tokens of amity which were manifested by our adventurers. In their hasty departure, they left behind them the lobsters, and other shell-fish, which they were broiling on the coals. As many cabins, as they had seen fires, were observed at a little distance.

One of the savages who was a tall muscular man, had inadvertently left a small basket behind him, and was not afraid to return and look for it. He advanced quite close to Lieutenant Cretin, with an air of consequence which his strength seemed to warrant. These savages are not of a deep black, but they have woolly hair, and suffer their beards to grow. Some of them were perfectly naked, others had a kangaroo's skin thrown over their shoulders. The household utensils which they abandoned, consisted of about thirty rush baskets, some of which were full of crabs, and other shell fish. These baskets are generally about a meter in depth, though many of them are shallower, but nearly of the same shape. The method taken by these savages to procure fire, is to strike two pieces of silex one against the other: in this they differ much from the other inhabitants of the South Sea, and even, from the other savages of the east part of New Holland. A circumstance which seems to assign to them a different origin. These people also left behind them several kangaroo skins, and some vessels for preserving water.

* Two persons had been sent, in a boat from the Espérance to visit a cove, about a myriameter distant to the westward. Those who were on this service met with a native, who, notwithstanding every sign of friendship was displayed and expressed, would not suffer himself to be approached within the distance of two hectometers.

† On the banks of a rivulet which contained very good water, grew various species of *casuarina*, one of which is remarkable for its club-shaped fruit. Several paths, the direction towards the rivulet, had been beaten by the kangaroos, for their accommodation in passing to the river to allay their thirst.

The persons who had been sent to survey the whole extent of the strait, returned after an absence of four days: they reported that it was about four myriameters and a half long, from south-west to north-east; not less than six fathoms and a half water had been found in it, with a bottom

The two officers would not permit the sailors to touch any of the effects of these natives; but they took for the admiral a large and small basket, a kangaroo's skin, and a vessel made of sea-weed, which would hold five quarts of water. The savages had no cause to lament the loss of these articles, for the officers left on the spot some knives, handkerchiefs, biscuits, cheese, and an earthen jug*.

It appears that those natives which had been seen the preceding day, had no dislike to the bread and water that had been deposited for them, but the smell of the cheese, it was supposed, prevented their tasting it; for it was found in the state in which it had been left. In the same place were also found one of the knives, and the handkerchief which had been left with their effects the day before. A few shots having been fired at some birds, accelerated the departure of these savages, as a boat from the ship went to the same spot two days after; and none of them were to be met with†.

After having run a demi-myriameter along this channel, they entered a second bay, about a myriameter in extent. On the 26th they weighed anchor early in the morning, and at noon found themselves in a third bay: the depth of water in the middle of which was not less than eleven fathoms; and, at the distance of two hectometers from the shore, they had not less than six fathoms‡.

Our adventurers landed on the beach, from which they had so hastily fled, where they found a great number of stones of a very beautiful granite, extremely hard, and rounded by attrition. Four catamarans lay on the beach; and a sort of skiffs calculated only for smooth

of mud, or fine sand. Adventure Bay is separated from it by a tongue of land, the breadth of which is about four hectometers. The natives kindled upwards of twenty fires on the south shore: several families had probably been attracted towards the coast by the intelligence they had received respecting their new visitors.

‡ They got under way on the 27th, at seven in the morning; soon after which they beheld a fire near the shore, which announced that some of the natives were not far distant: one of them were seen a few minutes after, walking by the sea side. Two boats were observed, intended for the conveyance of passengers, and some savages were seen paddling along in a catamaran, who landed on the sea-coast. With that timidity which their neighbours had before shown, they precipitately made for the shore, and darted into the woods, leaving behind them a few darts of a very clumsy fabrication.

A a

water,

water, as a rough sea would soon dash them to pieces. As these savages are capable of hollowing out the trunks of trees by means of fire, it appears strange that they should not observe the same method in forming their canoes, but they are as ignorant of navigation as of the other arts.

An officer belonging to the Recherche, in passing through the woods, made choice of the path which had been made by the savages. He met six of them, who were entirely naked, walking slowly towards the south, armed with darts of the length of five or six meters. The surprise occasioned by this meeting was strongly depicted in their features; but their number soon banished their alarms, and they ventured to approach on the invitations of this solitary European, who immediately put on their head a cravat and a handkerchief, which he gave them: but they seemed terrified at the sight of a knife, the use of which he explained to them. Their terror was further heightened, when he shewed them the method of sharpening it; and their fears were not totally dispelled, till he made them a present of it. He pressed them to approach the place where the vessels lay at anchor, but his entreaties were unavailing; they persevered in the paths which led them farther from the ships*.

Like the other savages, this woman wore over her shoulders the skin of a kangaroo; she had another, performing the office of an apron by covering her nakedness. Our Europeans were of opinion that this garment was chosen more on account of the severity of the weather, than from a sentiment of shame; for among the natives, seen by Captain Cook at Adventure Bay, at a few kilometers from this place, the women were all naked.

In the night of the 28th, the north wind blew in such squalls that the Esperancee drove, though she was riding by a very heavy bower anchor. They had spent more time than they intended in exploring D'Entrecasteaux's strait; and, in order to get out of it they had to go about the distance of a demi-myriameter. The wind was against them, but the tide was in their favour, and they weighed anchor between nine and ten o'clock. In working out, they often stood within three hectometers of the coast, where their soundings were from twelve to thirteen fathoms. To the northward they discerned a vast bay, or rather gulf, intersected by islots, and terminated by the main land, which was seen in the distance; various bends in it seemed to promise very excellent anchorage.

SECTION V.

Importance of D'Entrecasteaux Strait—Passage from Cape Diemen to New Caledonia—Dangerous Situation of the Recherche—See the Natives by the Sea-Side—Small Archipelago near New Caledonia—Survey the West Part of Bougainville's Island—The Recherche in Danger on the Shoals—Interview with the Savages of Bouka Island—Fondness of the Savages for Music—Their Dishonesty—Anchor in Carteret's Harbour—Various Excursions into the surrounding Country.

IN D'Entrecasteaux's strait, a vessel may come to an anchor in any part, with a certainty of finding a good bottom, with a depth of water from six and a half to seven fathoms. Not a shoal is there to be met with. An equal dis-

tance from its two extremities, where the coarse sand predominates, the ground is not so good, and there is less water. No danger is to be apprehended in approaching the land within the distance of two hectometers. The windings of

* A boat had landed on the other shore near a fire, where eight of the natives were observed, each of whom had his shoulders covered with a kangaroo's skin. These savages fled as soon as they knew they had been seen. An old woman, laden with provisions, which she was not willing to be deprived of, was speedily overtaken by some of the

sailors: she had just been highly delighted with the receipt of a handkerchief, but when they exhibited a knife to her, which they also intended to make her a present of, she was so exceedingly shocked, that she threw herself from the top of a very steep declivity, fled over the rocks, and immediately disappeared.

the channel present a very diversified prospect, and situations perfectly picturesque. In the strait they enjoyed the calmest weather. They were astonished to find such uncommon safety so very near Storm Bay.

The fishes which delight in unruffled water, abound in this channel; hence the fishermen were almost universally successful. They had hardly proceeded three kilometers beyond the outlet of the strait, when they could no longer distinguish its opening. The soundings increased as they advanced into the sea. They soon doubled Cape Pillar, and then shaped their course north-east, to go and explore the south-west coast of New Caledonia.

Having on the 1st of June reached the latitude of $37^{\circ} 17'$ south, and the longitude of $154^{\circ} 5'$ east, they saw a quantity of white and black spotted petrels, and a number of albatrosses, with the extremity of their wings of a deep fawn colour. On the 2d a number of flying fishes, by throwing themselves headlong on board, announced that they had got into the latitudes frequented by bonitoes*.

Some pintadoes, and other birds, which they saw on the 6th of June, induced them to believe that they were in the neighbourhood of some island, though none was yet descried. About noon on the 11th, they thought they had discovered land to the eastward; but after steering in that direction for an hour, the phantom disappeared, and they immediately resumed their course. A man-of-war bird appeared, hovering over the ship, and was killed by a musquet-shot. This bird had, in its bill, the species of cuttle-fish called *sepiolito*.

On the 16th, about five in the morning, our navigators entered the torrid zone, in the longitude of 165° east. About eight they got sight of the Island of Pines, at no considerable distance from the south point of New Caledonia; it appeared like a peak of tolerable height, and they soon perceived that it was surrounded by low lands. Large trees are distinguishable towards the south-east part of the island. At five

* Since the departure of our Adventurers from New Holland, they were reduced to a very small quantity of water, and the heat, which on the 5th, began to be very oppressive, heightened the inconvenience of this privation. A bottle a-day only, was allowed to each individual; though their thirst was augmented in proportion as they advanced towards the torrid zone; the wine could not be substituted

in the afternoon they discovered the shores of New Caledonia to the north-west at the distance of about four myriameters, and they stood in to approach them; but they were obliged to heave to at sun-set to wait for the *Esperance*, whose sailing was never equal to theirs. The *Esperance*, however, joined them in the evening, about eight, and the night was to have been passed in standing off and on; but it falling calm, the ship would not answer her helm. The south-west winds had brought them to New Caledonia, though they had expected to meet with the general winds some days before they perceived this land.

During the night of the 17th, they saw a fire on the island of Pines, and as soon as day appeared, they perceived a reef of rock, which, from the coast of New Caledonia, took a direction towards the south. A calm detained them the whole morning, between these dangerous rocks and the Isle of Pines; but a fortunate breeze sprang up, in the afternoon, and carried them clear of the breakers. In the course of the night the currents had carried them nearer to the reefs, which they thought they had weathered. Day-light, however, showed them all the danger of their situation: surrounded by shoals, little room was left for them to ply in. The south-east wind freshened, and increased the sea, which set them towards the breakers: they were in the middle of them, when the *Esperance* made the signal for them; lieutenant Rossel having then the charge of the deck. The ship was instantly brought close to the wind on the starboard tack, with the intention of tacking to get out of this dangerous situation.

All hands were called upon deck, in order to work the ship so, as to make her surer in stays. Rossel endeavoured several times to tack, but every attempt brought them nearer to the reef. The ship was now drifting on the rocks, where the sea, ready to swallow them up, rose to a prodigious height. There was not a possibility of letting go the anchor, as they could get no bottom with a line of fifty fathoms, though they

for this beverage; the brandy, which several preferred to wine, made them require an additional quantity of water; the salt meat which they generally fed on, added to that thirst, which they had no means of allaying; and the extreme acrimony introduced into their blood by saline food, greatly added to the distress.

were

were close to the reef. Every one was now casting his eye on the objects that might present themselves in order to avoid an almost inevitable death. Destruction stared them in the face, when, by an unexpected piece of good fortune, another attempt to tack succeeded; and, with inexpressible joy, they saw their ship standing away from this dangerous coast: a few islets appeared between the land and the chain of reefs, which was not more than a myriameter from shore.

When they tacked on the approach of night, the topmast had omitted to rig in the main topmast studding sail boom, and the mizen topmast studding sail boom: they were both carried away at the instant they were preparing to make another board; the main topmast studding-sail boom fell into the water; but the mizen topmast studding-sail boom, by its fall, wounded three persons, among whom was Admiral D'Entrecasteaux himself.

A column of smoke, near the foot of a hill, a little distant from the sea-side, convinced our adventurers that this part of the island was inhabited. They had a view of some mountains, covered with trees to their very summit: six fires were perceived in the vicinity of the coast, which announced a great concourse of savages, who had probably been attracted by the sight of the ships, which contrary winds kept almost stationary.

On the 23d at three in the afternoon, they were about six myriameters from the land, when they perceived near the beach a group of twelve New Caledonians, who gazed with astonishment at the ships so near their island. Three natives formed another group, near two fires which they had just kindled. A good glass informed them that they were entirely naked: they appeared to have no inclination to approach them.

In the direction of the lands of New Caledonia, they perceived several islands, surrounded by reefs, and connected to each other by shoals, and sand-banks. During the night of the 29th, the winds set them so far to leeward, that they

had lost sight of the northern extremity of New Caledonia. This island presents a chain of mountains, which occupy an extent of about forty-eight myriameters, from south-east to north-west. When Captain Cook discovered it in 1772, he saw only its north-east side. This coast is extremely dangerous at all times, but is rendered still more so with the south-east winds. The small number of fires which were seen on this land, with its apparent sterility, seemed to indicate that it was thinly inhabited.

After having observed several islets, they saw a few more, which seemed to terminate this Archipelago. Their height gradually diminished, in proportion to their distance from New Caledonia. The admiral informed the captain of the *Esperance*, that if the two ships should happen to separate, the rendezvous would be at Port Praslin, or Carteret's Harbour. Our adventurers were congratulating each other on having terminated this dangerous and fatiguing navigation, in order to enter into an open sea, when the men looking out at the mast-head, gave notice of shoals and a chain of reefs, stretching to the north-north-west: it being too late to stand towards them, they kept to windward during the whole night*.

About two in the afternoon, on the 1st of July one of the ship's company, named Moulin, discovered to the northward, a small low island covered with bushy trees, which was named *L'Isle de Moulin*, Moulin's Island, from the name of the person who had discovered it. This island is about a demi-myriameter in circumference. At four they got sight of two other small islands; as it was impossible for our adventurers to pass these islands before night, they directed their course to the south-south-east, and soon after brought to, till the next morning. During the night they were surrounded by birds which inhabited these low islands†.

Our navigators were now reduced to a very scanty allowance of water, which was a very distressing circumstance so near the line. At ten in the morning on the 9th, they got sight of

dible of the bill. This mandible is moveable like that of parrots.

† On the 7th, between nine and ten at night, they had, in the west, the sight of a lunar rainbow; it differed from the solar rainbow only by its colours being less brilliant. This phenomenon is less frequent than might naturally be expected.

* At sun-set a booby of the species called *peliculus varius*, permitted itself to be caught on board. This bird ventured, without fear, to settle in the main top, by the side of one of the sailors: those of this class frequently alight on the arm that is held out to them. Their smell cannot be very acute, the whole opening of the nostrils consisting of only two trifling slits in the upper man-

Arsacides, and stood directly in for Cape Ne-
pean. These islands, discovered by Surville,
were afterwards seen by Lieutenant Shortland,
who, supposing he had made a new discovery,
gave them the appellation of New Georgia.
The shores of the *Arsacides*, to the north-west,
are steep, and covered with large trees. Several
fires, lighted on the mountains, announced them
to be inhabited.

Early on the 10th they discovered the Treasury
Islands, four myriameters distant to the north-
west by north. Five or six of these islands are
so close to each other, that, at a distance they
are frequently supposed to be but one. Bou-
gainville was of that opinion, when he discover-
ed them to the westward in passing through the
channel to which he has given his own name.
The *Esperance* saw no more than three of these,
though the *Recherche* could distinctly enume-
rate five. The mountains which form these
islands are of a moderate height, nearly covered
with large trees.

Having sailed round Bougainville's Island,
they stood to the north north-east, to go and re-
connoitre the west part of it. At five, when
they were at a distance from its southern extre-
mity, they saw a cluster formed by ten islets;
they remarked that between them, and quite
close to the southern side, there are some breakers
which render the approach to them extremely
dangerous. Two canoes, in which were per-
ceived a great many natives, were under sail
and seemed to direct their course to our adven-
turers; but they passed behind the islet that
was nearest to the ship, and rapidly disappeared.
On the shore of the island they perceived a group
of ten natives, and near them a canoe on the
sand; but they seemed to have no inclination for
launching her in order to pay them a visit.
Night approaching, they were obliged to tack,
in order to gain an offing.

On the 13th, between ten and eleven in the
morning, when they were about a myriameter

* A canoe, with nine savages, put off from the coast,
and directed her course towards our navigators. They
ought to, in order to wait for them; but they stopped
when they were about a hundred meters distance, regardless
of their pressing invitations to induce them to come on
board. They put a plank in the water, freighted with
live and nails; and fastened a piece of scarlet cloth to
the end of a small stick; to give it the appearance of a flag,
Vol. II. No. LXXII.

and a half from the coast, they thought they
were in the most perfect safety, when they found
themselves towards a shoal, which those on the
look-out had not perceived: the water was so
very shallow, that they could readily distinguish
the fishes at the bottom, and they were every
moment in expectation of hearing the ship strike
upon a rock. Several trunks of trees floated
alongside: on one of these which the boats
brought on board, a notch of ancient date was
noticed, which demonstrated that the inhabitants
of the neighbouring island have some very sharp
instruments. Some of the hatchets, given them
by Bougainville, may perhaps be still in use
among them.

About three in the morning of the 14th, the
Esperance made several signals, which created
much alarm. They were thought to indicate
some danger, but they were merely to apprise
them that they had just got soundings in forty-
one fathoms. The part of Bougainville's Island
which they now perceived, seemed more popu-
lous than that which they had hitherto seen:
fine plantations of cocoa-palms tended to con-
firm our adventurers in this opinion.

During the night of the 14th, the currents
had carried them twenty miles towards the north;
at ten in the morning they were a myriameter
to the northward of Bouka Island, the appearance of
which strongly indicated a numerous population*.

At length, however, they succeeded in at-
tracting the natives close to the ship, by throw-
ing some handkerchiefs, pieces of red cloth, and
empty bottles. These people so perfectly under-
stood traffic, that they took care to signify to
our Europeans their full estimate of the value of
their articles of exchange. A handsome bow
was transmitted to them for some handkerchiefs;
and they also received some arrows. As they
had not seen this kind of weapon among our
navigators they endeavoured to convince them of
its value, by teaching them the manner of
using it†.

Being

hoping to prevail upon the savages to come closer: but they
would not take possession of these favours, till the Eu-
peans cut the line which held them at a small distance from
the ship, they could not with this bait be prevailed on to ap-
proach. The sight of the scarlet cloth gave them infinite
delight, and when they became possessed of it, they petition-
ed for more with great earnestness.

† One of the gunners produced a violin, on which he
performed

• *Arsacides*,

Being passionately fond of music, they are much pleased with noisy and lively tunes. One of the officers, who was a tolerable performer on the violin, struck up a tune in very quick time, stopping double. At first they listened with the greatest attention; astonishment was depicted in all their visages, and at length their joy became excessive, when the motions of the arms, and the agitation of the whole body, were unequivocal marks of the most lively feeling.

Not willing to forget that the Admiral had expressed a wish of having a bow; a native promised one in exchange for a hat: but no sooner had he got that article, than he refused to part with the bow. During this time four canoes were communicating with the *Esperance*, one of which contained forty natives: sixteen of these were employed in conducting her; the others were all warriors. This canoe, it was afterwards understood, had kept for a long time at a distance, and did not approach till after the natives, in the smaller canoes, had shewn their countrymen several articles which they had received.

The regularity by which the savages on board this canoe were actuated, seemed to indicate that they had a sort of naval tactics. Between two paddlers placed on the sides, a warrior stood erect, with a bow and arrows in his hand; some intermediate ranks had two other warriors, and sometimes three, with their faces turned towards the stern of the canoe; to enable them to observe all the movements on that side, and to be ready for hostility when retreating. These warriors seemed to enjoy the flavour of the brandy and wine which had been given them, but were not much gratified in eating salt pork.

The savages who visited the ship had very excellent teeth, as they ate, with the greatest ease, the hardest biscuit that could be offered them. From their partiality in favour of nails, and other articles of hard ware, it seemed clear that they were acquainted with the use of iron.

These savages are of the middle size, and the

performed several tunes; the Europeans perceived, with pleasure, that they were not insensible to music: they offered many articles in exchange, wishing to obtain this instrument. Their solicitations, notwithstanding, were unavailing; this was the only fiddle they had to set the ship's company a capering; and they did not choose to part with an instrument which promoted an exercise so conducive to the health of seamen.

A too liberal distribution of favours to these savages at

colour of their skin is a light black. They have no covering, and their muscles proclaim them extremely strong: their countenance is unpleasant, but has great expression. They have a large head, a broad flat forehead and face; a chin thick and prominent, high cheeks bones, a broad flat nose, thin lips, and a very wide mouth. The betel-root, with which they tinge their extensive mouth, renders a horrid face more horrible.

Their ears were ornamented with heavy rings made of shells, the weight of which seemed to have contributed to their great size. Some of them had white and red stripes traced upon their body: bracelets woven of the fibres of the husk of the cocoa-nut, ornamented the wrists of some of them; and one of them was remarked, whose hair and nose were powdered with a reddish earth.

These savages are very dexterous in the use of the bow: one of them brought a booby, which he had just killed with an arrow, on board the *Esperance*. These islanders exercise great industry and skill in the formation of their weapons. Their canoes, formed of several planks, ingeniously joined together, are of an elegant form, and extremely well calculated to pass expeditiously through the water.

At day-break on the 17th, our adventurers directed their course for Carteret's Harbour, where they intended to cast anchor. They bore up between Cocoa-nut Island and New Ireland, where they anchored about one in the afternoon, in thirty-one fathoms water; about four hundred meters from Cocoa-nut Island. Only one hundred meters nearer to the last-mentioned island, they would have lain as snug as in the best-sheltered harbour. A ship may here anchor within a little distance of the land; for at twenty meters from the shore there are five fathoms; and further off the depth suddenly increases. They landed at Cocoa-nut Island, in order to pass the remainder of the day. It was covered

length corrupted their principles, and they frequently had recourse to artifice and dishonesty to procure them. The admiral, wishing to procure a bow, agreed to give some handkerchiefs striped with red, for that article. The price was positively agreed on, and these articles were delivered to them in advance, relying on their probity. But when they had got the handkerchiefs in their possession, they would not part with the bow, basely offering only some arrows, which were contemptuously refused.

with large ever-green trees: their roots, buried between the calcareous stones, found very little vegetable earth; but they grew with great vigour on account of the great moisture of those spots. It was charming to behold the beautiful tree known by the name of *barringtonia speciosa*, attracted by the humidity, horizontally spreading its branches far out above the waters of the sea. Various species of fruit-trees also grew on this island.

Among the large trees which grew on Cocoa-nut Island, a new species of *ureca* was seen, whose trunk was thirty-six meters in height; and only two-thirds of a decimeter in thickness. It seemed extraordinary that so weak a tree could support itself at such an elevation; but they were no longer astonished, when they caused one to be felled; for they found the wood of it so extremely hard, that it resisted reiterated strokes of the axe. A quantity of a mucilaginous substance, under the form of pith, occupied its centre: this pith being removed, the trunk exhibited a cylinder, the wood of which did not exceed a centimeter in thickness. It is of a beautiful black, and the fruit is of a red colour. Mosses and ferns were very numerous, and grew with extreme vigour in these moist spots.

The continual rains at Carteret's Harbour, have rendered some species of spiders extremely industrious. Several had made themselves excellent retreats in the middle of their web; which is of a very close texture, in the form of a sugar-loaf, having the point raised, and a little inclined towards the south-east, that the prevailing winds may not incommode their little habitation. The

* Night overtook them in the middle of the woods, when they enjoyed the pleasing view of a vast quantity of glow-worms, that in their flight, diffused a tremulous gleam. It was now about the hour at which the species of crab, called *cancer ruficola*, issued from the holes that it had dug. They trod on many of these creatures, in returning to the boat which was waiting for them. Several of the party apprehended they might be venomous animals, till they were convinced to the contrary.

rain runs off this sort of cone, before it can penetrate it. The spider, perfectly sheltered in this mansion, only comes out occasionally, to seize upon the poor insects which happen to get entangled in his ingenious nets. Nature has been bountiful to some other species of spiders, covered with a thin skin; which is not only tough, but so glossy, that they seem to have been decorated with the finest varnish. These last are not in the least affected with the heavy rains, to which they are continually exposed; and they wait patiently in the middle of their web, till some insect is betrayed into it. Among these spiders were discovered some whose body was terminated in a point, the *aranea, aculeata*, and the *aranea spinosa*.

Leigh's island is much smaller than Cocoa-nut island, affording few different productions. The steep mountains of New Ireland, which surround Carteret's Harbour, are three times the height of those of Cocoa-nut Island. Carteret's Harbour forms a sort of basin, where the clouds charged with water, after having cleared the high mountains of New Ireland, experience a calm which prevents the air from supporting them; thence result abundant rains, which are sufficient to deter navigators from anchoring there. The greatest activity had been exerted in procuring a supply of wood and water, and on the morning of the 24th, they made every preparation for sailing. It is impossible to form an idea of the vast quantity of rain that fell. It was, indeed, a torrent, pouring down almost incessantly. The harbour afforded no refreshments.

Two men, who belonged to the ship, saw an alligator quite close to the beach, on the south extremity of Cocoa-nut Island. Animals of this kind were not, however, thought to be common here; for, during their stay at this anchorage, no accident happened, though many persons frequently bathed.

† Some savage had probably perished in the midst of these rocks, as a human skeleton, almost entire, was observed by our Europeans.

SECTION VI.

Quit Carteret's Harbour—The Esperance loses an Anchor—Passage through St. George's Channel—See the Portland Island—Several Interviews with the Inhabitants of the Admiralty Islands—Despotism of the Chiefs—The Rapidity of their Sailing—The Hermit's Islands—Their Inhabitants—A Water-Spout—New Guinea—Pass through Pitt's Strait—Ravages of the Scurvy—Anchor at Ambuina.

ON the 24th of July, about eleven in the morning, they availed themselves of a light breeze from the south-east, to sail between Cocoa-nut Island and New Ireland. The currents carried them to the west north-west, and at noon they were a myriameter to the west south-west of their anchoring place. The *Esperance* did not weigh her anchor soon enough to take advantage of the breeze: it fell calm almost at the instant she had loosed her sails: she was therefore soon obliged to drop an anchor, and wait for a wind to extricate herself from her disagreeable situation. At four o'clock, however, she came up with the *Recherche*, and her Captain informed them that they had like to have been lost at the mouth of the harbour they had just quitted. Compelled by the currents to anchor on a bottom of coral, the cable had been cut by the rocks, when there sprang up from the south east, the light breeze which carried them clear of the reefs.

The *Recherche* lay to during the night, and the currents carried her into St. George's channel, with so much rapidity as to occasion her to drift at the rate of upwards of a demi-myriameter an hour. About two in the morning of the 25th, the Isle of Man bore west south-west at the distance of a demi-myriameter. At four in the afternoon they brought to, to reconnoitre Sandwich Island the next day, but they were so drifted by the currents during the night, that at day-break on the 26th, they were astonished to find themselves within four hundred meters of this island*.

On the 28th they continued their course towards the Admiralty Islands, where Commodore Hunter, according to the information of the two

* Sandwich Island is of a middling height, and is clothed with trees. New Ireland, which is opposite to Sandwich Island, presents to the view no lands of considerable elevation. A few huts, under the shade of the forest of cocoa-palms, induced the Europeans to suppose that they should have an interview with some of the inhabitants of Sandwich

French Captains, supposed he had perceived some vestiges of *La Perouse's* unfortunate expedition; and they stood to the southernmost island of this little Archipelago. Like many of the islands in the South Sea, this is guarded by reefs at no considerable distance from the shore. They saw to the south-east, a few canoes going along between the reefs, but no attempts were made to come to them. They saw also several groups of savages, standing on the prominent points of the coast, to take a survey of the ships.

The Admiral dispatched an officer on board the *Esperance*, to consult with her Captain respecting the measures necessary to be pursued at the Admiralty Islands, in consequence of the information that had been transmitted to them at the Cape of Good Hope. On the 29th, in the morning, Captain Huon waited on the Admiral, when it was decided that they should repair to the island that was in sight, to the north-east of that which they had just coasted. In fact, one of the depositions which had been transmitted to the commander, stated that it was at the easternmost island that the savages, clothed in the uniform of the French navy, had been seen. About noon they were at the distance of a myriameter from this island, when they perceived some natives advancing towards the sea-shore. A few huts were distinguished at a distance among the cocoa-nut trees; and other islanders made their appearance on the south-east point. The number gradually increased as they advanced towards them. Several canoes were hauled up on the sands, and our adventurers were in expectation of seeing them launch into the water to come off to them; but the natives seemed not to shew the least disposition for approaching. As

Island: but it was probably too early in the morning for these savages to visit them, as not one of them appeared. On the morning of the 27th, they saw the Portland Islands, among which they ranged very close. They form a group of seven islets, which occupy a space of a myriameter and a half in extent: they are flat, covered with large trees.

the

the admiral was inclined to have an interview with them, they stood on, and brought to under the lee of the island, where they found but indifferent shelter, as it is of small extent. The savages had assembled in crowds: some of them running along the beach, while others, looking earnestly at the ships, invited them by signs to come on shore; their shouts appeared to be expressive of joy. A few of them launched a canoe, and seemed to hesitate for some time whether they should advance towards their ship; but the *Esperance* being more to the windward, they steered towards her. The small canoe had an outrigger, and carried seven natives, who returned on shore immediately.

At half past one they brought to, and a boat was dispatched from each ship with a number of articles, which were to be distributed among the inhabitants of this small island. They observed that this was cultivated to its very summit. Different plots of ground, enclosed by palisades, convinced the Europeans that the right of landed property is not unknown to the inhabitants. The whole of the island presents a roundish mountain, the foot of which is adorned with plantations of cocoa-palms, whilst the elevated spots seemed appropriated to the culture of edible roots.

The boats having gone within a hundred meters of the coast, found no bottom with thirty-three fathoms of line; the reefs which guarded it, prevented them from approaching any nearer. Crowds of the natives advanced on that side: upwards of one hundred and fifty of them were employing their utmost efforts to induce them to land on their island; but the reefs presented an obstacle which they could not overcome. These savages having thrown a few cocoa-nuts to our adventurers, were exceedingly delighted to behold with what facility they opened them by means of a hatchet*.

* A native, distinguished from the rest by a double row of small shells upon his forehead, seemed invested with great authority. He ordered a savage to jump into the water, and take our adventurers some cocoa-nuts. The fear of swimming unarmed to persons with whom he was unacquainted, made the poor fellow hesitate a little; but the chief, unaccustomed to meet with any resistance to his will, did not allow him time to reflect, he enforced his orders by several blows on the belly of the man, who was obliged instantly to obey. To console the poor creature, a few bits of red cloth, some nails, and a knife, were given him by the Europeans, which he received with the most extra-

These islanders, who were charmed beyond measure with the sight of the European nails and hatchets, were not equally enamoured with the knives. At first they would not receive them till they were shut; but their fears gradually subsided, and they were willing to receive them either shut or open. These people often repeated the word *capelle*, in asking for the articles of traffic. This was supposed to be the name given by them to iron, which they preferred to any thing that could be offered to them.

One of their canoes was driven by the sea, against the barge belonging to the Europeans, and received some damage; but instantly a man belonging to the latter held the canoe, that she might not receive a second stroke. One of the chiefs, mistaking his intentions, cautioned the paddlers to be on their guard, and most of them instantly abandoned her; jumping overboard to swim on shore to the island. The mistake, however, was by this time perfectly explained, and confidence was re-established between the parties. The women kept at a little distance, under the cocoa-nut trees; their whole cloathing consisted of a piece of mat round the waist.

The men were eager to approach the boats of the Europeans, but it soon appeared that curiosity was not their only motive, as they exerted all their ingenuity to get possession of the property of these visitors. Impunity increased their audacity, and when they missed their aim they were not discouraged, though they were disappointed; but took the earliest opportunity of making a fresh attempt on some other article. One of the thieves, who had taken a knife, was detected in the fact, and prevented from carrying it off: his want of success did not induce him to renounce his enterprise; nor was he a loser by having been dilatory. A flag, in which red was the predominant colour, attracted his attention, and he soon became master of it: the last act of

vagant joy, as soon as he had landed, curiosity assembled all the others round him; and every one demanded a share of the presents: some canoes were immediately launched, a great many other natives swam off to their boats, and, in a short time, a vast concourse surrounded them. It seemed astonishing that neither the violence of the surf nor that of the sea dashing against the breakers, had not prevented them from leaving the island. Another chief, emblazoned with the same badges of distinction, was also distinguished by the blows which he dealt liberally out with his stick, to several of those which he honoured with his commands.

thieving was not discovered till he had got to a considerable distance from the boat, and near landing on the island*.

The natives of this island have not a very black skin; their countenance is agreeable, and not very dissimilar to that of the Europeans. Born in a fertile island, and under a clement sky, satisfaction seems exhibited in their features. The boats being ordered to return at four o'clock greatly affected the natives, who earnestly entreated leave to stay on their island. The women assembled on the beach, and were as importunate in their invitations as the men had been: but orders were given, and the boats could not defer their departure. With regret the Europeans quitted the savages, when they were launching into the water several canoes loaded with cocoa-nuts, which they were bringing to them. The delicious juice of these fruits would have been highly useful in arresting the progress of the scurvy, which was beginning to make ravages on board of the two ships.

At first these people seemed to manifest some symptoms of honesty, but they were not long before they displayed a very opposite inclination; for, whenever they thought they could commit theft with impunity, they never let an opportunity escape them. They grew the more expert in these practices as they grew in years, the oldest among them being the most daring and incorrigible thieves. This island, which is nearly of a circular form, is about a demi-myriameter in length, and seems well peopled: near three hundred inhabitants were seen by our Europeans.

On the 30th they stood to the northward of the Admiralty Islands: there they saw a mountainous island occupying the centre of this group, the outlines of which are formed by several flat islots, which seem to have recently emerged from the bosom of the deep. They are, in some degree, linked to each other by reefs and sandbanks. A great many cocoa palms were per-

ceived on most of the islots: a vast assembly of the natives presented themselves on the shore, and some of them advanced as far as the adjacent reefs. The islots where no cocoa-nut trees were observed, seemed to be uninhabited.

Several canoes were launched, and six which had just set their sails, directed their course towards the Europeans. They immediately brought to, in order to wait for them: some of them were conducted by seven, and others by nine men. When they were within six hundred meters of the ship, the savages took in their sail, and employed their paddles to get nearer. Each canoe was under the direction of a chief, who stood on a platform to pronounce his orders. When these canoes had advanced about three hundred meters by paddling, they stopped, and with an exalted voice, addressed a long speech to the Europeans. His eloquence was entirely lost, but the signs he made evidently demonstrated that he was inviting them to come on shore.

Our adventurers endeavoured to prevail on them to come nearer the ships. They could not resist the sight of some pieces of red cloth, and, after a little consultation among them, they ventured to advance a little. Some nails and knives fastened to a plank, and lowered down to them, diffused great joy among them, when the savage, who untied them, held them up to the rest.

These savages now presumed to come nearer to the ship, but without consenting to come on board. By degrees the number of their canoes increased, and traffic was carried on with integrity: several of the natives, who had been pushed from the ship by the canoes, before they had time to pay for the article they had purchased, made every effort to bring back its equivalent. They sedulously sought for the person to whom they were indebted, and when he was found, delivered to him the value of the goods they had received†.

The greater part of these savages had their ears

* A looking-glass having been given to one of these savages, he viewed himself in it with astonishment, and shortly after broke it; imagining perhaps that it had the effect of magic.

† The great number of canoes which surrounded the Europeans prevented several from coming near the ship; but many of the paddlers jumped overboard, and swam to them with the articles of traffic. The disposition of these inhabitants is remarkably mild, if a judgment may be formed.

of it by their conduct towards the Europeans; and an air of good nature was depicted in their features. How very different are these, from the savages of a little island they had visited a few days before! It is surprising to find so much difference in the manners of savages at so short a distance from each other, and who are equally bordering on a state of nature! But it should be remembered that the former had only to deal with boats, while the latter trafficked with ships, which perhaps kept them in awe.

The

ears pierced, and different shells fastened to them;
it is the interior lobe of the ear, which, after
having been bored, they distend so extremely,
that it hangs down lower than the shoulder.
Their hair is black and curly; but they some-
times redden it with an ochre mixed with oil.
Their skin is of a light black; it is sometimes
painted with red in different parts of the body,
and especially the face.

Neither bows nor clubs were seen among them;
but they have darts, from a meter and a half to
two meters long. The volcanic stone, with
which these were armed, was sharp on each edge,
and its whole length was three fourths of a de-
cimeter: this agate was fixed at one of the ends
of the dart, where it was fastened with a cord
covered with a species of mastic. This must be
a dangerous weapon among naked people.

Several of the natives had a hole bored in the
septum of the nose, through which they had
passed a string: at the extremities of which long
eye-teeth were suspended. An order issued by
the admiral had very much impeded the traffic,
but the savages had still many articles which they
were desirous of parting with.

Their canoes are formed of the trunk of a
tree, hollowed out, and its sides raised with
planks: they are about two thirds of a meter in
breadth, and ten meters in length. They have
an outrigger of about four meters long, which
also extends laterally almost the same distance.
On the opposite side is another outrigger, which
does not dip into the water, serving only to steady
the sail. The chief sometimes sits on it. The
sail is made of matting, and is square; the sides
of which are four meters in length: two cylin-
drical spars, of the same dimensions, supply the
place of a yard. Their paddles are broad in the
blade, and have a handle about two meters long:
a savage placed near the stern, steers with his
paddle. Close to a fishing place, our adven-
turers saw seventeen canoes, which immediately
began to paddle towards them. They brought

The chief of each canoe usually made the paddlers resign
the articles they had received from the navigators. Some-
times they employed force to oblige them to deliver the
resents they had received to them. One of the paddlers
had just accepted of a piece of red serge, which he would
not part with to one of the chiefs, till the latter had com-
pelled him to do so, by giving him a very severe drubbing.

* The clouds appeared to be agitated by a whirlwind,

to, in order to wait for them; but, disregarding
their invitations, they kept at the distance of a
kilometer from the ship: they therefore made
sail again, steering west by south.

In the evening two canoes put off from the
coast, and directed their course towards the Eu-
ropeans. It was dark when they got within hail.
One of the chiefs very audibly addressed them:
as it was almost calm, the adventurers endeavoured
to attract them to their ship; but they would
not venture near enough to receive their presents.
Some of the officers imagined, that a sky-rocket
would afford them pleasure, but it was found to
have a contrary effect; for the sight of it only
terrified them, and caused them to make off with
precipitation.

At break of day on the first of August, our
adventurers perceived the Hermits' Islands, dis-
covered in 1781 by Don Francisco Antonio
Maurelli, in the Spanish ship of war, *La
Princessa*. Their high lands seemed, at a
distance, to leave between them sufficient intervals
to afford a passage for ships; but they after-
wards discovered low coasts stretching out into
the sea; and they distinguished the reefs by which
they were connected. This little Archipelago is
composed of thirteen islets, in the midst of which
lies a principal island, whose extent is about
three myriameters. The group of the Hermits'
Islands, including the reefs, is about seven my-
riameters in circumference.

At five in the afternoon of the 8th, they were
under the equator, when they saw at the distance
of one third of a myriameter, a considerable
water-spout forming to the south-west. Though
the air was perfectly still around them, the sea
was frothy, and much agitated at the spot where
the water-spout originated. A small cloud was
stationary at a few decimeters above the place
whence it rose. The water-spout had the form
of two very elongated cones, united at their
summit; the base of one resting on the sea, that
of the other was lost in a sombre cloud*.

During

which, collecting a vast quantity of water, was pouring
down in torrents. If, as some natural philosophers assert,
a water-spout sucked up the waters of the sea in a great
volume, this water ought to be salt at its fall, which by no
means accords with experience: a person of credit, who
saw two fall on board a ship, assured the Admiral, that
they had constantly discharged fresh water. In the con-
trary supposition, this phenomenon may be easily explain-

ed

During a great part of the night of the 18th the wind had roared over the lands of New Guinea, and driven a vast quantity towards this quarter. The sky seemed to announce a tempest; but it may be necessary to remark, that the storms near the equator display a more menacing aspect than is usually realized: it was not long before very fine weather succeeded.

Our adventurers saw, stretching from east to west, a fine chain of mountains, the most elevated of which was about fifteen hundred meters in perpendicular height: the lofty trees which covered them, added much to the grandeur of the landscape. On the 19th, at two kilometers from New Guinea, they sounded with a line of a hundred fathoms, without striking ground. Two fires, announced by the rising of the smoke at the foot of the large trees, were the first indications that this country was inhabited.

They were now at no considerable distance from the Cape of Good Hope of New Guinea, which they doubled at the distance of two kilometers. On the 23d, they ran very close along the shores of New Guinea, intending to enter among the Moluccas, by Watson's Strait. At nine in the evening, they heard, towards the western shore, the voice of some savages, seemingly addressed to them: a fire appeared at the same time. On the 24th, at day-break, they were close to Passage Island, and perceived on the Batanta coast, a small village; the inhabitants of which seemed to view them with indifference. Pitt's Strait is about five myriameters in length, and one myriameter in width. When they tried for soundings, they could not strike

ed. The transparency of the sea-water was changed during the whole day of the 9th by a *fucus*, consisting of very short, and very stringy filaments.

Sharks are numerous in these seas: several were taken of the species most widely diffused (*squalus carcharias*.) One of these, of a middling size, astonished our navigators with its voracity. Though pricked by four successive hooks in less than half an hour, it persevered in following them till it suffered itself to be caught.

The surface of the sea was violently agitated on the 12th, throughout a great space: Captain Huon, imagining this might proceed from breakers, put about; but the illusion presently disappeared. This notion was produced by a considerable shoal of fishes, which were rising to the surface of the water: they were followed by a vast number of birds.

* It is remarkable that though salt meat is one of the principal causes of the scurvy among seamen, two of the persons on board, who were violently attacked with it, had not eaten any. One of these worked in the hold, and the

ground with a line of one hundred and twenty-five fathoms. They put about to avoid some shoals; several persons, however, were of opinion, that there was a sufficient depth of water for the ships to go over them.

On the 27th the ship was surrounded by twenty-seven whales, which were six or seven meters in length. On the 1st of September, being a clear day, our adventurers enjoyed the grand prospect of several chains of mountains, parallel in their direction from east to west. They saw several fires lighted on the island of Ceram, and a fire on one of the mountains, which proves that their summits are frequented by the natives. On the approach of night, they were two kilometers from the coast of Ceram. They also saw pretty close to the shore, several fires, which appeared to be kindled above the water by fishermen, in order to attract the fish.

A sea-breeze which sprung up about ten in the morning of the 4th, favoured their progress to the southward, and they soon perceived the west coast of Amboyna to the south-south-east. The situation of their scorbutic people, was daily becoming more alarming; and the number of them increased with such rapidity, that they wished earnestly for favourable winds: the continual rains at Carteret's Harbour, had greatly augmented their disorder, most of them suffering acute pains in the loins*.

They made some stretches, which brought them sufficiently near to the west extremity of Amboyna†, to enable them to enter the roadstead during the night. Admiral D'Entrecasteaux dispatched his second lieutenant to the Governor

noxious air which he there inhaled, added to the great humidity of that part of the ship, greatly accelerated this disorder.

† The islands of Amboyna and Banda were taken, without resistance, in February and March, 1796, by the English admiral P. Ier. When the English seized these islands in 1796, the annual produce was about 163,000 pounds of nutmegs, and 46,000 pounds of mace.

The nutmeg-tree grows to the size of a pear-tree, the leaves resembling those of a laurel, and bears fruit from the age of ten to one hundred years. The nutmeg, when ripe on the tree, has both a very curious and beautiful appearance: it is about the size of an apricot, and nearly of a similar colour, with the same kind of hollow mark all round it; in shape it is somewhat like a pear: when perfectly ripe, the rind over the mark opens, and discovers the mace, of a deep red, growing over, and covering in part, the thin shell of the nutmeg which is black. *Asiatic Register*, 1800. p. 216.

of Amboyna, to ask permission to put into the
island. The governor, assembled his council,
and permitted them to anchor. They found, in
this little island, the means of supplying their
ships, far beyond their expectations, with every
thing that was necessary for continuing their
voyage.

A captain, in the Dutch East-India Company's
service, was sent by the Governor to point out
the place where our navigators were to anchor.

After having made several boards, they came to
at half past one in the afternoon, in twenty-seven
fathoms water, the bottom muddy sand. There
was then here a Company's ship, taking in her
cargo of cloves. The *Esperance* anchored half
an hour after to the north-east of the *Recherche*.
In the road were eighteen vessels, all under Dutch
colours. One of these only was a three-masted
ship; the others were chiefly brigs and sloops.

Fishing Places of the Inhabitants—Sago Palm—Extraction of its Pith—Observations on the
Island and its Inhabitants.*

AT half an hour after three, they saluted the
fort with nine guns; and the fort saluted
them with the same number. The admiral had
invited all the officers to accompany him, at five
in the afternoon, to pay a visit to the governor;
but our naturalist, knowing nothing of this ar-
rangement, strolled about the town. He found
himself surrounded by gardens, where the principal
culture is that of trees, which highly favour the
indolence of man under a burning sky, by yield-
ing him a profusion of delicious fruits, requiring
little more trouble than to gather them.

Different varieties of plantain trees, and many
species of orange-trees, were growing in these
delightful gardens: the guava, the custard-
apple, and different species of *ammona* here yield
their exquisite fruits. A few trees of the *henné*
were also remarked, which rose to the height of
four meters. The Arabian *jasmin*, rising among
these charming trees, blended their sweet odour
with so many delicious perfumes.

On returning to the town, a minister of the
protestant religion invited them to his house.
He brought them several sorts of spirituous

• Gabriel Abalen, a boy belonging to the ship, who was
pointed to attend on the warrant officers, disappeared in
the evening of the 7th: he had been seen on board the
whole day; but, in the evening, they called him several
times in vain. This youth, though of a mild and temperate

liquors; but water, perfectly limpid, just taken
from the spring, was the most agreeable beverage,
especially to persons who had been long reduced
to a brackish element, and fed only upon salt
provision. This worthy ecclesiastic was astonish-
ed at having entertained them at so cheap a
rate. He informed them that earthquakes were
frequent at Amboyna, and that one of unusual
violence had been felt within a few years: that it
had been accompanied by a hurricane, which
continued three days; and, during all this time,
the sea had exceeded its limits, and inundated
the country where the town is situated*.

It was very necessary for our navigators to
remain on shore, in order to recover their
strength; the Governor therefore consented to
their taking lodgings in the town. When they
were introduced to this exalted character, he re-
ceived them in the most gracious manner; but
they were concerned at his having, on their
account, encumbered himself with his full dress:
he was almost suffocated with heat under a very
heavy black velvet coat: such a dress is extremely
inconvenient near the line; but the Dutch go-

disposition, had drank enough in the course of the day, to
create the greatest inquietude respecting his fate. He might
have fallen overboard, and it was well known that he could
not swim.

vernors wear it because it is a prerogative of their office*.

The Dutch in Amboyna are in the habit of bathing every three or four days, and at those times they carefully avoid exposing themselves to the great heat, which is experienced from eleven in the morning till three in the afternoon. Our navigators made several attempts to penetrate into the middle of the large plantations of sago-palms; but the waters, which wash the foot of these palms, often obliged them to return as they went: this tree, which is so conducive to the nourishment of man, forms a considerable part of the riches of the island.

On the beach, at low water, our adventurers saw a great number of crabs, of the species called *cancer vocans*. This singular species of animal, one of whose claws is sometimes larger than the body, often becomes the prey of the birds. A little excursion to the south of the town, procured them a sight of the tomb of Rumphius. The simplicity of this monument reminded them of the simplicity of the manners of this accurate observer of nature. His tomb was surrounded by the shrub known by the name of *papa fruticosum*. In the morning of the 15th they went to the westward; but the heat was so

oppressive about noon, that they found it necessary to return to their lodging.

Having for some time followed the banks of a small river, which discharges itself in the roadstead not far from the town, they were returning loaded with fine plants, when, on the approach of night, they met with some natives who had been successful in fishing, and were preparing to dress their fish. They saw them kindle a fire by means of two pieces of bamboo, rubbed one against the other†.

On the 25th Citizen Riche, and another, went up the river called Batou Ganton, which discharges its waters into the roadstead of the town. They proposed to ascend this river as high as possible, and to follow its banks as closely as they could; but their steepness induced them to cross the water, which seldom exceeded a demi-meter in depth. They had not proceeded many yards, when they met a Dutch sailor, who had deserted from a large ship laden with cloves, which was destined to sail for Batavia. The fear of falling a victim to the contagious disorder, so fatal to Europeans, operated so powerfully on this poor man, that he resolved to conceal himself in the woods till the ship had sailed. They sincerely pitied his lot, little supposing that the

* Some refreshments were served up: the admiral wished for some good water, and poured out some which appeared to him the clearest: but he found it saline and unpleasant. It was Seltzer water, much valued by the Dutch as an agreeable liquor; and costs them as much as the best Rhenish wine: but it might well have been supposed, that under a burning sky, after a long privation of fresh meat, our adventurers could not have much inclination to drink salt water.

The admiral next proposed to introduce the party to the members of the council: they approved of his proposal, and were all respectfully received. The fears of our navigators, respecting the lad who had disappeared three days before, were but too well founded; at half past two in the afternoon of the 10th, he was discovered beginning to float near the ship. This young man was much regretted by all the ship's company; and several exclaimed against the inattention of those who, having brought him up in his infancy, had not caused him to learn to swim. It is devoutly to be wished that this event may serve as an example to others. "I have seen with astonishment," says the narrator of this voyage, "that many seamen could not swim."

The west end of the town where our navigators resided, is the quarter principally inhabited by the Chinese: very few of the natives of the island live in it, and only one Dutchman. The other Dutchmen are situated about the centre of the town, or towards the east side of it. The company's garden contains nothing remarkable but a very convenient bath, where the Governor went regularly every

three or four days; another bath near it, is appropriated to the use of the women.

† Among the number of lizards, engaged in the pursuit of insects, the activity of that which is called the flying lizard, is admirable. During the greatest heat of the day, this pretty animal was seen darting with rapidity from branch to branch, extending two membranes, like wings, by means of which it occasionally supports itself in the air. As nature has not furnished it with muscles necessary for flapping such wings, it can only counteract them by moderating the rapidity of its fall.

Wishing to cut some branches of different plants, cultivated in a garden belonging to one of the natives of the island, our naturalist was dissuaded from it by one of the party, by representing that he would expose himself to danger; he pointed to a small shed, and several times repeated, with an air of respect mingled with fear, the word *matui*; when their interpreter informed them, that by this term, which signifies a dead body, they meant to convey an idea of the former possessor of this garden, who had been buried under the shed that they beheld. These inhabitants believe that the soul of the deceased wanders round these places, to protect the produce of them for the present proprietor; and that any other person who should possess himself of it, would die within the year. This opinion is so generally diffused and acknowledged, that one native seldom ventures to touch the property of another: the *matui* is therefore a bugbear which generally secures the crop to the legal possessor.

abode which he so much dreaded, was reserved
for the termination of their expedition.

Having expeditiously exhausted all their provisions, they entertained hopes of purchasing from the natives, a sufficient supply for the remainder of the day. It was three o'clock in the afternoon when they took the liberty of calling at a small house near the bank of the river; but the mistress of this habitation assured them that she had not what they wanted. They protested they would pay her liberally for whatever she would furnish. After a little conversation between the parties, it appeared in the sequel, that these peaceable natives are not always satisfied with the proceedings of the Europeans, who are their masters in the island; and had frequently been deceived by relying on their promises. At length, some glasses of arrack, and a few articles of hardware, procured them her confidence.

They were invited to sit down under the shed, formed by a continuation of the roof of the house. Some cray-fishes, caught in the stream already mentioned, were set before them in profusion. Sweet potatoes and yams were roasted for them, and their beverage was a slightly fermented wine of the sago-palm. The young samuel, who had the trouble of preparing this feast, had a captivating face, and an engaging person: an ingenious air added to the interest he had inspired. Having brought them some fruit, she retreated, and sat down behind her mother, occasionally casting some glances at the new guests, to satisfy her curiosity.

They found the purest gratification in this little repast: the construction of their houses is adapted to the fineness of the climate, and their lightness requires no digging below the rocks for a foundation. As they never experience a severe season, the walls are so constructed as to leave free passage for the air: they consist of palisades, usually formed of the stems of bamboo, almost adjoining to each other.

It appeared extraordinary that these inhabitants, who are so fond of ease, lie on a sort of lattice of sticks, placed at the distance of a demi-meter from each other. This bed was very hard, though it was covered with mats; but those who reposed on them enjoyed the freshness

* From the mildness of the climate, the inhabitants require little clothing: a pair of drawers, descending no lower than the middle of the thigh, or a piece of blue cloth stened round the loins, is the only clothing of the men

of the air, which circulated freely through the interstices. It was raised a demi-meter above the ground; and under it were deposited a part of the household utensils; consisting of three earthen pots, intended for dressing their food; a few bottles, which they had purchased from Europeans; and some spoons, formed from the large shells that are common in Amboyna. Under this bed was also deposited a pick-axe, and a large knife, partaking of the shape of a butcher's cleaver*.

The presents which our adventurers liberally bestowed excited the gratitude of these people: the young girl, after a short absence, returned to offer them some fragrant flowers. A thread was necessary to tie them into nosegays, which was procured from the bastard aloe, called *agave vivipara*. The master of the house went immediately and cut a branch of this plant, and, after scraping off its pulp, he obtained from it a fascicle of threads as long as the leaf, and as strong as those of the best hemp.

On their return they met a slave, whose decrepitude excited their curiosity. They could get no satisfactory information from him respecting his age: he was totally ignorant of the matter. How strange it appeared that a man should not remember the number of years he had passed in slavery!

On the 27th one of our adventurers went up the roadstead in a canoe, with a double outrigger. Some of the sportsmen, proceeding quickly to the eastward of the town, joined the party. They followed the right hand shore of the road, at a small distance from the coast: the water was so limpid that they could see at the depth of three or four fathoms, a white bottom composed of *madreporeæ*, on which they distinguished a species of ray, remarkable for large circular spots of a light azure blue, and several other fishes of very brilliant colours. Among other paddlers, they had a New Guinea man, who had the dexterity to strike several.

Having got about three kilometers from the town, they admired the charming situation of a country-house belonging to the governor, at the foot of the mountains, the chain of which terminates at no great distance from the roadstead.

employed in agriculture. The dress of the women is more expensive: they wear a sort of chemise of the same kind of cloth, reaching to the middle of the leg, which is fastened by a girdle round their waist.

A small house, inhabited by natives, and surrounded by clove and plantain trees, added beauty to the landscape. After having passed some fishing places, they landed about a myriameter from the town, near a house, the master of which gave them as many cocoa-nuts as they desired. They had with them some seamen, who, finding this liquor too sweet, mixed a sufficient quantity of brandy with it, and they had the pleasure to observe that the host did not disapprove of this beverage*.

Curiosity induced one of our adventurers to visit a house situated near the sea-shore. He there found an old man, who, contrary to the custom of these islanders, wore a long beard: he was employed in cooking some whelks, which he had just picked up at low water, at the foot of the mangroves near his habitation. This venerable personage, instead of being surprised at his visit, invited him to partake of his repast. The consort of this aged native joined him soon after; whose youth would have astonished him, had he not been aware that these islanders place their happiness in marrying very young girls. Their countenance assumes great animation, when they speak of a young female, and make horrible grimaces, and distortions of face, when they talk of an old woman.

Almost the whole of the 28th was employed in preparing and describing the specimens collected before. Our naturalist found in an excursion the pretty lizard called *lacerta amboynensis*; he observed that it changed its colour like theameleon; its most usual colour was green, and it frequently turned to a dark brown. Though this lizard moves rapidly, it was caught without difficulty; as it suffered itself to be approached so near as to expose the extremity of its long tail to the eagerness of its pursuers.

One of our navigators walked to the sea-side,

* The manner in which the natives of this country procure fire, is well entitled to notice: it is not so commodious as a good flint and steel, but they can find, almost every where, the substance which produces it; for a bit of bamboo is all that is required. They split into two equal parts, a piece of bamboo a demi-meter long: in one of these parts they make a longitudinal slit, and shape the other to a sharp edge, leaving it four centimeters in width. They put some of the scrapings of the same wood in the hollow, and underneath the slit of the largest piece, which they place in a horizontal position, which the convex part uppermost; they then introduce the other piece into the middle of the slit, having made a notch to receive it, and pressing

in the evening, to examine the marine productions there to be met with; and he prosecuted these researches till dark. He observed some fishermen, in their canoes not far from the shore, who were availing themselves of the darkness of the night to attract the fish, by means of fires lighted near the surface of the water. One of the fishermen was employed in keeping the fire in a flourishing condition, while the others were occupied in accumulating the fish in their nets, attracted from a great distance by this dazzling light: these islanders, upon this occasion, proved themselves very dexterous fishermen†.

One of the naturalists found in the gardens cultivated by the natives, a few nutmeg-trees, the largest of which did not exceed seven meters in height, nor two thirds of a decimeter in thickness. Plenty of fruit were then observed on them. The nutmeg delights in the shade of the large trees: these were sheltered by the *canarium commune*. They are sheltered by the same tree in the island of Banda, which is principally appropriated to their culture by the Dutch.

The council of the Dutch East India Company, which resides at Batavia, finding the produce of the nutmeg-trees of Banda sufficient for exportation, ordered, a few years previous to the arrival of our adventurers at Amboyna, all the nutmeg-trees that grew there to be destroyed. This order was so completely executed, that very few escaped. A hurricane, in the very same year, effected at Banda, what the council had just caused to be executed at Amboyna. Orders were then given by the council to endeavour to repair the mischief which they had done at Amboyna. The culture of the nutmeg-tree was re-established; in consequence of which, those which were now met with on the shores of the roadstead, were still very young.

They saw the beautiful laurel called *lauras* it strongly they cause it to make the motion of a saw, when in the space of less than a minute, the scrapings take fire. † At Karuka, a small island to the westward of Amboyna two springs present themselves, the heat of which is so considerable, that several Europeans have affirmed they will boil an egg hard in the space of five minutes. The burning vapour issuing from these waters is not prejudicial to the trees which are continually laved by it; on the contrary, they display a vigorous vegetation. In the island of Banda, also to the eastward of Amboyna, there is an open volcano. The island of Karuka is chiefly devoted to the culture of the clove tree.

curilaban, which yields by distillation, an aromatic oil much esteemed. The largest clove-trees that were seen in this excursion were about seven meters in height. The natives carefully avoid exposing them to the rays of the sun, which would take away part of the essential oil of this excellent aromatic.

On the first of October they employed a few hours in visiting the Governor's cabinet of natural history, in which were found a numerous collection of beautiful butterflies in perfect preservation. Among them were a great many double ones, extremely uncommon: a large box was entirely filled with the beautiful species called *papilio agamemnon*. In this cabinet were also observed an excellent choice of shells, among which were upwards of twenty screw shells. Captain Huon obtained a number of very rare shells from the secretary of the Council; among others, one of the rarest and most valuable, the glassy *nautilus*, which that officer has bequeathed to the Museum of Natural History at Paris*.

Citizen Riche, the naturalist, made the paddlers dive, when they often brought up some valuable marine productions. A beautiful shrub, known under the name of *abronia augusta*, was much admired. The nutmeg-trees here attract pigeons of the species called *columba alba*. Those which our adventurers had shot, had their gaw filled with nutmegs.

The excessive perspiration, encouraged by this burning climate, frequently produces cutaneous disorders. Five of the islanders, at whose habitations our adventurers stopped, had their bodies covered with *morphea*, the scales of which, when they fell off, were immediately replaced with others. This disease sometimes spreads over every part of the body. Children were also seen afflicted with a cutaneous disease, which was not attended with any degree of pain; though considerable part was covered with large warts, within a third of a decimeter from each other.

In the evening of the 9th the Governor gave an entertainment, to celebrate the birth-day of one of his sons, who was then in Europe for the

They remarked, in a bend of the land, on the skirts of a sandy beach, some places for entrapping fish, formed by an inclosure of bamboos, so closely fixed as to prevent them from escaping. This reservoir presented a vast quantity of these aquatic inhabitants for their pursuers. Not only the human race attended them, but herons and kingfishers were frequent visitors. The presence of our ad-

completion of his education. The coolness of the atmosphere at that time permitted dancing; the ball was already begun, and several cotillions had been formed in the grand saloon, in which his Excellency had received them, and the Admiral D'Entrecasteaux, at the first visit they paid him. The orchestra consisted of four black slaves who played the violin, and of another who played the bass. The ball was followed by a splendid entertainment, which was exhibited on the same scene.

From the number of guests assembled about nine o'clock, the supper party was expected to be numerous; but the majority of the company were indifferent about dancing, and did not make their appearance till towards ten. Cheerfulness presided at this repast, and the ball was not concluded till sun-rise.

Our navigators were surprised, at this entertainment, not to find M. Stramfer, a minister of the Protestant religion, from whom they had received the greatest civility and attention: but they soon obtained information that he had lately incurred the displeasure of the governor; because, after having for several years assiduously attended the education of his children, this poor clergyman had thought proper to solicit payment for his services. His Excellency more than intimated that the honour of educating the Governor's children, was an ample compensation; and, if he expected more, he would find himself mistaken.

The island of Amboyna, named *Ambou* by the natives, was then the first of the Dutch governments in India, after the general government of Batavia. The road of Amboyna forms a channel about two myriameters long, and two thirds of a myriameter in breadth. In many places, its shores afford good anchorage: in some, however, there is a bottom of coral. Towards the middle, the depth of water is too deep for anchoring.

The island of Amboyna is divided into several districts, which in many places forms so many villages, called *nygrees*, the command of each

venturers occasioned a few of them to fly away; but several others remained with their long claws deeply buried in the water, patiently waiting for a favourable opportunity of seizing on them. Perched on the bamboo which constitutes the inclosure, many of these birds were seen darting, from time to time, on the unwary finny prey, and selecting them for a repast.

nygree is given to a native, and with it the title of *Orankaye*. This man, to whom the police of this small canton is confided, is responsible to the Dutch government; to which he applies in cases of importance. The Dutch East India Company, on investing a person with this authority, presents him with a silver hilted sword. The chiefs are clothed in the European manner; and all in black. They wear a cocked hat, sharply pointed at the corners, which are very low: shoes are added to this official dress, which are only worn when they are obliged to appear in public, or in the presence of the Dutch chiefs.

Orankaye is formed of two Malay words, *oran kaya*, which, translated literally, signify *rich man*. The inhabitants of Amboyna speak the Malay language: it is very soft, and has some analogy with the language of the inhabitants of the South Sea. The use of betel has been established from time immemorial among these people: they take some young leaves of the pepper tree, and having covered them with a little pure lime, made of shells, and newly slacked, they chew them with the cashew-nut. These islanders, however, do not content themselves with chewing betel; they procure from Molucca an extract of bitter plants, known by the name of *gamber*, which they also employ in mastication.

The marshy places here are devoted to the culture of the sago-tree, which furnishes the inhabitants with a very salutary food.

This government, attentive only to its own interest, stifles among these people all the energy of industry, almost forcing them to abandon every other species of culture for that of clove and nutmeg-trees. The Dutch limit the cultivation of spices, that it may not too much exceed the ordinary consumption. Plenty of farinaceous

roots, and a great number of trees, furnish them almost without culture, an abundant subsistence; nature seeming inclined to compensate man for the indolence to which she seems to have condemned him under so burning a sky*.

The frequency of earthquakes and hurricanes here, occasions a preference to be given to wooden houses. Hardly any but the public buildings are constructed of stone. In tempestuous times, the inhabitants are obliged to quit their dwellings, and retreat to little huts slightly erected, where they are in greater safety than the massy houses, which provoke an overthrow by the obstinacy of their resistance†.

Though these people are accustomed to give up almost every thing they possess to the Europeans, there is one, which they are very little disposed to resign. Jealousy reigns so triumphantly among them, that it would be extremely dangerous to attempt to hold any improper conversation with their women: no fear of punishment would deter them from pursuing the most violent emotions of revenge.

Among the Dutch the men have European clothes for their dress of ceremony. Those who wear a wig, deliver it into the hands of one of their servants, and then put on a large cap of very fine white linen. The European women wear a petticoat, which almost touches the ground, and a gown like a chemise, open in front, which falls no lower than the petticoat, and is drawn in by a sash; their hair is rolled spirally behind the head, and confined by two large pins which cross each other. The women among the natives, who reside in the town, wear dresses of the same form, but generally black. The women in the country, give a preference to blue. The female slave, instead of a gown, wear a sort of shift, which is open in front like

obtained a grant from the Dutch East India Company to remain in the island, enter into competition with them in trade; but they are not successful rivals; the Chinese have many advantages over them, from their number and their connections.

† The Chinese, as may reasonably be supposed, have a pagoda. A few natives of the island, who have preserved the religion introduced by the Arabs and the Moors, have a mosque. The Dutch have been more successful in making proselytes to their religion, in the environs of the principal establishment. The rod of iron, with which they govern these miserable people, so assimilates them to slaves, that it is not astonishing to find among them many of the vices which proceed from this state of degradation of man.

* The Chinese are almost the only foreigners whom the Dutch permit to reside in Amboyna; but they are obliged to get naturalized, which deprives them of the privilege of returning again to China. They are permitted to navigate in the Moluccas; and they can procure, at Macassar and Batavia, where the ships from China are admitted, the merchandise which these vessels bring from that country. They are all engaged in trade; some of them having purchased at an extravagant price, the exclusive privilege of vending particular articles; and they much more than indemnify themselves, by manifesting no scruples of conscience in the price they demand for such articles. They employ every art to get money, without considering how much their reputation suffers by such proceedings: in this respect they have lost every spark of sensibility. Some Jews, who have

that of the free women. The free men wear their hair turned up with a comb. The slaves tie a handkerchief round their head.

The only spirituous liquor they could procure

was arrack, of which they purchased several casks. Some navigators are too liberal in their commendations of this liquor: it is even inferior to brandy of a middling quality.

SECTION. VIII.

Departure from Amboyna—Behold different Islands—Navigation along the Coast of New Holland—Death of the Smith of the Recherche—Anchor in Legrand's Bay—The Esperance loses Two Iron Tillers—Various Excursions in the neighbouring Country—Riche loses himself Two Days in the Woods—Sail from Legrand's Bay to range along the Shore—Want of Water obliges them to quit the Coast—Arrival at Cape Diemen.

WHILST they were waiting for a fair wind to sail from Amboyna, a light breeze sprang up early in the morning of the 14th of October, from the south-east: they weighed anchor immediately, and by eleven o'clock they were at the outlet of the roadstead. The Admiral had granted permission to the ships' companies to take on board for themselves, hogs and poultry; in consequence of which every part of the ships was encumbered with them. Most of them were placed between the decks; and they were the more offensive, as the noxious odour which they diffused was greatly augmented by the heat of the climate.

Our adventurers were again witnesses of a phenomenon which never fails to terrify navigators, as in the night it creates an idea of breakers. Early in the morning of the 19th, when the air was hardly agitated, they perceived the sea foaming at a distance; some waves, impelled with force, succeeded each other, and reached them in a short time: a strong rippling, occasioned by the sea having received an impulse, different to that given it by the wind which had blown during the night, succeeded to this motion of the waters. The cause seemed to depend on the tides which run between the lands, where the currents acquire a rapidity, in proportion to the confinement which the waves of the sea there experience.

They got sight of Kisser Island at nine in the morning, bearing from south to east by south. A cloudy sky did not permit them, till four in the afternoon, to discover the northern coast of Timor, from which they were only at the distance of a myriameter: some lofty mountains reared their heads above the clouds, on which fires were kindled at night, at different heights. To our adventurers, these fires answered the purposes of so many light-houses, serving to direct them along the coast.

At seven in the morning of the 23d, they were a demi-myriameter from a settlement belonging to the Portuguese, on the coast of Timor, which is called Laphao. A canoe, with a double outrigger, immediately came and reconnoitered the ships, to which she approached very near, but returned towards the west without having spoken to them. Calms being frequent along the coast of Timor, they hauled off from it on the 25th, and directed their course to the westward*.

It was not quite half past two o'clock in the morning of the 6th, when they stood on to the east-south-east: and, as soon as day-light appeared, the Esperance made the signal for land in the north-east quarter, at the distance of three myriameters: it was the western extremity of the south-west coast of New Holland, discovered by Leuwin in the year 1662†.

About

On the 5th of December, the sight of several gulls, and other birds, which seldom quit the shore, indicated the proximity of land. The wind blew too strong at west-south-west, to permit them to stand directly in for it.

† In the morning the smith of the Recherche was found dead in his bed. The day before he had been present at an entertainment, which had formerly been celebrated by the French gunners with scrupulous exactness; they had long

been

* A number of whales repeatedly surrounded their ships, spouting out water on their very decks. Between four and five in the morning of the 26th, they perceived by the light of the stars, the island of Savu; and were only two kilometers from the coast. The island of Savu presents an enchanting prospect, being intersected with several very fine bays; the gentle declivities of which must afford the natives a favourable soil.

About noon on the 8th, they observed inland to the northward, a very lofty mountain, insulated in the midst of a vast plain of sand, producing a picturesque effect, about five myriameters distant from the coast. Its rugged points were distinguished throughout the whole extent of the mountain, which seemed to stretch a myriameter and a half from east to west. As they had not any indication of inhabitants, since they had coasted these barren shores, they apprehended that some spring of clear water might attract them towards the foot of this mountain. The smoke of two large fires that instant convinced them of the propriety of this suggestion. At half past four, after they had doubled a cape, terminated by some rocks near the coast, they found themselves opposite to a wide bay: it was skirted by lands in general very low; but, towards its eastern side, they remarked a few hills detached from each other. A good shelter against winds is afforded from the west and south-west, but not from those which blow from the south-east. Some red-shafted tropic birds, and albatrosses of darker hue than usual, amused themselves by flying round our adventurers.

At four in the morning of the 9th, they stood on the north-east by north, in order to draw in with the coast, and they perceived it almost immediately. About nine they discovered an islet to the eastward, which was connected to the main by a chain of reefs. Three fires lighted successively on the point of land which the reefs spit off, informed them that there were savages on this spot. From other similar fires, kindled along the coast, thick columns of smoke ascended, the inhabitants perhaps wishing to announce their presence in that quarter.

At six in the morning of the 12th, they stood on before the wind in the middle of some islets, lying about a myriameter from the coast, though they were uncertain of finding a passage among them. About ten they had made considerable progress, and perceived that they were linked together by reefs. The weather had a threatening appearance, and the wind blew from the west south-west with the greatest impetuosity. They had long sought, between these shoals, some

been collecting for this repast a quantity of provisions. The unfortunate smith, enfeebled by a limited degree of abstinence, to which the whole crew were condemned since their departure from Amboyne, had indulged his appetite too

break that might permit them to gain the open sea, but without success; for as they had no other outlet, than the passage by which they had run in, they tacked, in order to stand towards it: in vain they lay up several times for the opening; they were always obliged to run in again to the middle of the shoals, and thus continue plying to windward, in a space strewn with rocks, concealed under water, on which they were in constant expectation of seeing the ship strike; as it required a very experienced eye to distinguish them in so rough a sea. Citizen Raoul, assistant pilot, and a very intelligent man, had gone up to the main topmast head, and thence he directed the course of the ship. They saw themselves frequently driven close to shoals hidden by the waves, and he carried them clear of them all, though it was extremely difficult to discern them even at a short distance.

The *Esperance*, which did not hold so good a wind as the *Recherche*, was now close to the coast, having no other resource than to run ashore if she could find a shelter where she might anchor. At one in the afternoon they perceived her at a great distance: she had just clued up her sails, and the commander of the *Recherche* was uneasy, thinking she had struck; but the position of her masts soon dispelled his fears, by convincing him that she was come to an anchor: but her distance, and the violence of the wind, prevented our adventurers from understanding the signal she was making to them.

The admiral did not hesitate to seek the same shelter: he immediately gave orders for bearing up north by east under the foresail, and they presently ran to within a little distance of the *Esperance*, and found her, in a slight degree, protected from the sea by an islet. Signals were made from that ship, to warn them to keep close to the land. In coasting the little island, they beheld the frightful prospect of a boisterous sea, which, having cleared the south point, opened in its fall a gulf, exposing to view part of the base of this rock. The fear of approaching too near the land, induced them to cast anchor about five o'clock, to windward of the *Esperance*, but not sufficiently within the anchorage to avoid

freely, and an apoplectic fit terminated his existence. Fortunately, a very intelligent workman of the same profession, had been taken on board at the Cape of Good Hope, who succeeded him, or his loss would have been irreparable.

falling

falling on board of her, if their ship dragged her anchor. The danger was the greater, as their first anchor came home: axes were in readiness for cutting away the masts; to give less hold to the wind, but a second anchor brought them up.

Being violently tossed about by the sea, they were exposed to almost the whole impetuosity of the wind; continually afraid of seeing their cables part; as they would, in that case, have fallen on some rocks, where the sea was breaking in a tremendous manner. Towards night, they let go a third anchor under foot, to be more certain of withstanding such violent efforts.

The mercury in the barometer, which had fallen to twenty-seven inches, eight and a half lines, perceptibly rose at day-light on the 11th, and announced that the storm was at end.

The sea having fallen considerably, Captain Huon sent his boat to inform the commander of the Recherche, that, on the preceding day, the Esperance had been carried so rapidly towards the land, that she was on the point of running ashore, when Citizen Legrand, a meritorious officer, had in the height of the gale gone to the mast-head, and rapturously exclaimed, on coming down, that the ship was clear of danger. He described the situation of the anchorage which he had discovered, and strenuously affirmed that the vessel might ride there in safety. The salvation of the two ships depended upon the discovery; for, had the Recherche been obliged to stay during the night, in the midst of these shoals, after having so long struggled against the violence of the gale, in hopes of gaining the open sea, she would infallibly have been lost*.

* This bay, which obtained the name of Legrand, will recall to memory the signal service rendered to the expedition by this excellent seaman. From the place where they lay, they enumerated twelve islets, with some rocks and breakers, which afforded them shelter. In this vast basin the sea might send them a profusion of very heavy waves; but they were fortunately anchored in good holding ground. Several seals, of the species called *phoca pucilla*, were observed basking in the sun, on the rocks, and along the shore; some of them permitted themselves to be killed with spears. Their boats were surrounded with swans, several of which were easily taken with the hand; whilst others were apprehensive of danger, and immediately took to flight. This new species is a little smaller than the wild swan, and is of a cinereous grey, the tint of which is brighter under the belly; the bill is blackish, with a protuberance of a sulphureous colour at its base; the feet are slightly tinged with red.

Vol. II. No. LXXIII.

The swell had not sufficiently subsided to render it safe even for a good swimmer to attempt to get on shore; which was not the only danger to be apprehended, as such adventurers might probably become the prey of a large shark, that had kept a few yards astern of them. They had seen him ever since the dawn of day, prowling round the ships, and he had sedulously followed their boat, as if he had resolved to have a snap at one of them. The chaplain of the Recherche fell into the water, and would probably have been devoured by this voracious animal, had not the coxswain rescued him from the danger†.

The islet, on which they now were, was composed of a beautiful granite, where quartz, felspar, and mica predominate. From the summit of this little island they distinguished, at a distance, part of the reefs and rocks on which their ships had like to have been dashed to pieces. Their number still terrified them, and they were astonished at having been able to escape from so many dangers. Two gulls, a male and female, came to settle on the heights in the vicinity: the female having been shot, the male, alarmed at the report of the explosion, at first took to flight, but presently he returned to the same spot, life being no longer desirable without his mate; he therefore courted annihilation by her side‡.

Soon after he distinguished some others, advancing towards the beach: before they ventured to come on shore, they raised near half their body above the water, and continued some time in that attitude, swelling and looking about, on all sides, to judge whether it would be dangerous to come and repose upon the rock.

Enormous sharks, of the common species, fre-

† Some seamen belonging to the Esperance, amused themselves by walking on the rocks, and killing, with their stieks, - considerable number of seals; many of which were white, some of a dark grey, and others of a deep brown: but they were all of the same species, classed by Buffon under the name of *petit phoque*.

‡ One of our naturalists had fired with a small shot at a seal, that was lying down at a pretty considerable distance from him; he found himself wounded, and distrusting his strength, did not throw himself into the water. Presently he saw another very large one, which, attracted by the cries of the wounded seal, came and licked the places whence the blood was flowing: this animal submitted to the operation, at it afforded him some relief: but, seeing a boat approaching, they both plunged immediately into the sea.

F f

quently

quently made their appearance in the basin where our adventurers lay at anchor. On board the *Esperance*, one of them was caught, which was four meters long.

At day-break on the 14th, the geographical engineer of the *Recherche*, set off in a barge to reconnoitre the islets of this little archipelago, and to search for a passage to the eastward, between the shoals; he was, at the same time, to look out for a commodious watering place. Labillardiere wished to have been appointed on such an expedition; but as geographical operations are little connected with the researches of naturalists, he was not made acquainted with the hour of their departure.

Not being able to procure a boat to carry him to the main land, he determined to pass a day on the islet to the south-west; the coast of which he followed, first proceeding to the north-west. Here, on one of the most lofty summits, he found a little stream of fresh water, issuing from the clefts of a rock of granite. This discovery afforded joy to him and his little party, as they had long been reduced to a very scanty allowance of that delicious article.

Not far from this he perceived some cavities, filled with very clear water, which he supposed might be as fresh as that which was flowing from the rock, as it was upwards of two hundred meters perpendicular above the level of the sea. He was, however, mistaken; for it was very salt. Some birds were waiting for this little party to retire, that they might quench their thirst at this fountain. Here our naturalist killed a beautiful fawn-colour turtle, remarkable for six or eight golden feathers towards the

* Having determined to pass the night on shore, the party sought for a convenient place, and at length made choice of a hollow in a rock, where they were, for some time, perfectly sheltered from the wind and rain, which came on about the close of the day. The cold was sufficiently piercing to induce them to kindle a fire. Not having much provision remaining, the naturalists selected from the birds which he had shot, such as he chose to reserve for his collections, and gave his companions the others, which they broiled upon the coals. They were in expectation of enjoying a tolerably comfortable supper, and quiet repose during the night: when, all on a sudden, the wind shifted, and they became engulfed in their cave, which they were obliged to desert with precipitation, or be suffocated with the smoke. To add to the disappointment, the wind was so violent as to extinguish the fire before the penguins were sufficiently dressed, but a keen appetite rendered them palatable. Still an ample stock of water, which they had

base of the wings. *While*, in his *Voyage to New South Wales*, published in 1790, has called it *The Golden-winged Pigeon*.

A great many penguins were caught here, of the species called *aptenodyta minor*, which Captain Cook also met with at New Zealand; these were concealed in very deep holes in the rocks, from which it was found difficult to get them out. On an elevated spot, not far distant, our naturalist procured a few plants which he had not before seen. Here he gathered a new and very remarkable species of *eucalyptus* *.

At day-break on the 15th, they proceeded towards the south-west. Among a great many vegetables, a leguminous plant was gathered, which may be classed among those whose corolla is papilionaceous, and the filaments of the stamina separated from each other.

The geographical engineer, sent to make a survey of this little archipelago, reached his ship in the early part of the night: he had determined the position of more than twenty islets scattered in about a degree, both in longitude and latitude. He landed on several points, but discovered no convenient place for watering; the only fresh stream which he had perceived would hardly have supplied sufficient for the daily consumption of their ships. He had found behind the point of the main land to the east-north-east, a good anchorage, with not so great a depth of water as there was in that which they occupied †.

The boat, which returned at two in the afternoon, brought the melancholy tidings that he was not to be found. Captain Huon waited on the admiral to communicate this circumstance to

brought from the top of the mountains, afforded them the agreeable reflection, while they were at supper, that they were at liberty to drink as much as they chose.

† The weather being favourable on the 16th, a boat was sent in search of Citizen Riche. That naturalist, enraptured with the beauty and the rich productions of the country, which had not before been visited by any observer, had probably forgotten himself in the contemplation of the stupendous charms, and very soon lost his way: he had then returned to the place of debarkation. On proceeding in the direction he had been observed to take, their people had a near view of some natives, with whom, however, was not possible to have any intercourse; for they always fled as the people advanced towards them. Riche's situation was the more alarming, as he had been absent almost a day and a half; and they knew that he had bewildered himself, without provision, in a very barren country.

him, and to be taken by the admiral and Labillardiere. The restoration of the mind to the exterior of the world have fallen into the hands of the savages. The consequences almost become those that the nature absolutely frightful a situation *.

After having returned they had to find where very by destitute grew a beautiful *irides*. Though they lay, the colour At day-light they selves into towards the west. The and had proclaimed of progress, the hands, a few some fine pictures the avidity

* Their stores supply could not be enumerated. After enumeration, he observed an unfortunate accident, with the name Deschamps. The favour of the captain, and the loss of the boat. These probabilities Labillardiere's error, in particular, and the most celebrated Captain Cook, in 1777.

him, and to consult with him on proper measures to be taken on this disastrous occasion. The admiral having sent for the naturalists Deschamps and Labillardiere, Captain Huon informed them of all the steps that had been taken for the restoration of their unfortunate colleague. He reminded them of the dangers to which he might have exposed himself in advancing alone into the interior of the country, where perhaps he might have fallen under the merciless blows of the savages. He added, that the most fatal consequences were to be apprehended, for it was almost beyond the limits of possibility to suppose that he could have lost his way so long. The nature of these burning sands, which are absolutely destitute of water, rendered still more frightful all the conjectures on the horrors of his situation*.

After having advanced in different directions, they returned to the landing-place at night-fall. They had travelled over a soil covered with sands, where very extensive premises were seen absolutely destitute of verdure. In these barren spots grew a beautiful plant, which has an affinity to the *irides*.

Though the heat was oppressive here in the day, the cold was felt pretty severely at night.

At day-light on the 17th, they divided themselves into two parties; one of which advanced towards the north, and the other went to the west. They directed their route by the compass, and had proceeded about a myriameter across the plains of calcareous sand. In continuing their progress, they remarked, in the midst of these sands, a few rocks of a calcareous nature, where some fine plants were gathered; which withstood the avidity of the soil.

* Their stock of water was much reduced, and as no supply could be obtained at this anchorage, Captain Huon, after enumerating the disadvantages of remaining any longer here, observed, that all farther researches for finding their unfortunate associate could only be detrimental to the expedition, without affording the smallest hope of finding him. Deschamps gave his opinion, without hesitation, in favour of their departure, declaring that he coincided with the captain, and that they had nothing more to do than to lament the loss of their friend.

These probabilities had not the same effect upon the mind of Labillardiere, he endeavoured to convince the others of his error, in being too rash, and quoted, among other particulars, an example taken from the voyages of one of the most celebrated of navigators. He reminded them that Captain Cook had two sailors who lost their way, in December, 1777, on Christmas Island, the one for a whole

After walking briskly for four hours, they arrived on the banks of a large lake, which communicates with the sea. The banks of the lake, which they followed for some time in approaching the sea, are somewhat marshy; this lake extends very far inland, since the party that went to the north-west also reached its banks: some of them came to inform them, that they had remarked, almost close to the lake, impressions of shoes, which left no doubt that Riche had passed there, but the marks of naked feet, which appeared close to his, created suspicions that he had been carried away by the savages into the interior of the country. A circumstance which increased the probability of this conjecture was, that they had found his pocket handkerchief on the sands, and, a few yards farther on, one of his pistols. At a little distance they perceived the smoke of an expiring fire, and found it were some pieces of paper on which they recognised Riche's hand-writing. The sand too, in this spot, retained the impression of a person who had lain down.

They were all returning towards the boats, lamenting the fate of the unfortunate wanderer, when they saw one of these who had remained to take care of the boats, running to meet them, and to inform them that Riche was still living, and that he had arrived at the water side, exhausted by hunger and fatigue. He had been upwards of fifty-four hours on shore, and had taken with him no other provisions than a few pieces of biscuit. His emaciated state deferred his friends from suffering him to indulge his appetite, and it was only by trying gradually the digestive powers of his stomach, that they gave him some food. His countenance, which at

day, and the other for forty-eight hours; that Cook had caused the latter to be sedulously sought after by several detachments; that Christmas Island is a small low island, hardly covered with shrubs; while New Holland, where Riche had lost himself, was an immense country: he therefore requested that there might be employed, in search of their unfortunate friend, at least as much time as Captain Cook had spent in search of some of his sailors.

This reasoning instantly produced the intended effect: a boat was dispatched from each ship from the main land, and Labillardiere had the satisfaction of being nominated as one of the persons who were to exert every effort and attention to bring back their lost companion. The Admiral directed the guns to be fired every half hour; that, if Riche were still living, he might with greater certainty direct his steps towards the anchorage. The wind favoured them, and they presently reached the shore.

first appeared distorted, brightened up by degrees.

When he was recovered from the state of stupor, into which he had been thrown by so long a privation of food, he related to his associates, that at no considerable distance from the fire which had been found still alight, he found a small stream of water, where he had quenched his thirst: that, in searching among the plants, analogous to those whose fruits may serve for the sustenance of man, he found a shrub of the family of the *loti*, which furnished him with some little fruits, but in too small a quantity to satisfy his wants. On the first day that he bewildered himself he met the spring, near which his property had been found: he passed the night there; and the whole of the next day was occupied in searching for the place where their ships lay at anchor, without being able to discover it. During this laborious walk, he found not a drop of water; but chance conducted him again to this same spring, where he also passed the second night.

Having seen some savages at a distance, he endeavoured to speak to them, to enquire into their manner of living, and to procure some food, but they all thought proper to desert him with great celerity. In this climate men have not much occasion for cloathing: these were all entirely naked.

Some kangaroos, of the large species, and some cassowaries, were all the animals that Riche had perceived. Though in a state of dejection, he had till the last day carried about him many interesting productions; but his strength diminished so rapidly, in the course of his last twenty-four hours, that he found it difficult to crawl along the shore to look for the ships: he was then obliged to abandon the whale, even of the most valuable specimens he had.

When they found him a little recovered from his languor, they conducted him on board. All the signals agreed on to announce that they had the good fortune to find him again were exhibited in vain: the people on board were so perfectly convinced of the inutility of their researches, that they did not understand them till

* During the time that they continued at this anchorage, they could not haul the seine: but on board the ships they caught a few fishes with hook and line, among which were the *labrus cyprinoides*, and several new species of the *perca* genus. In the evening all the boats were hoisted in, and

the boat approached the ship, and Riche was perceived standing in the midst of the people *.

The darkness of the night on the 23d, occasioned them to lose sight of the *Esperance* about eleven at night; and she did not, till three hours after, answer their signals by a gun, which they heard from a great distance. They were apprized of the vicinity of some natives, by fires, the smoke of which they perceived pretty far from the shore, from several points very distant from each other.

The sea was very high, and the wind blew with violence from the south-west to the west-south-west; after having gradually increased, it raged impetuously almost the whole of the night, and raised the waves to an astonishing height: the adventurers had not before been so violently tossed about by any storm. The south-west winds in these seas are generally boisterous, and add considerably to the dangers to which a navigator is exposed in ranging along this low coast. At day-break on the 25th they stood in for the land. The wind had become fixed at west-south-west, and had brought back fine weather.

On the 28th they were only two kilometers from the coast; at noon the nearest land was two thirds of a kilometer to the north-north-west of them. The sea was covered with a species of sea-weed called *fucus natans*. On the 31st, towards the middle of the day, they perceived a fog rising, which represented to them on every side a table land. The illusion was so striking, that the persons who came up from below, supposed they had just entered a vast basin. They were, however, two myriameters from the coast, which the fog did not permit them to distinguish. In the evening, the sky darkened towards the land, and lightning flashed from the thickest clouds; the fog which had encompassed the horizon, then dispersed, and the wind shifted to the westward, blowing very fresh.

In the evening of the 3d of January, 1793, Captain Huon informed Admiral D'Entrecasteaux of the injury which the *Esperance's* rudder had sustained. He also told him that the ship's

our adventurers waited till next day to weigh anchor, if the wind should permit. By six in the morning of the 18th, they were under sail, and after passing a little island to the northward, stood out to the open sea.

company had been reduced to a pint and a half of water per day each man; that he had been obliged to discontinue the distribution of antiscorbutic drinks, &c. and that thirty casks of water formed the whole remaining on board of the *Esperance*.

About noon, on the 4th, they made sail with the wind at south-east, and stood on towards Cape Diemen, thus taking their leave of a very barren coast, upwards of one hundred and sixty myriameters of which they had ranged along. Before they touched on this coast, they had no idea of meeting so frequently with tempestuous winds, especially at this season, which should be considered as the summer in these seas, the sun having now been upwards of two months in the southern hemisphere*.

At four in the morning of the 19th, they saw the land, extending from north-east by north to east by south, the nearest land bearing east north-east, at the distance of three myriameters. They saw no opening or bend to make them presume that they should there meet with a good anchorage. They discovered, above all the other mountains, that which they had seen covered with snow the preceding year, at the period of their anchoring in Port D'Entrecasteaux; but as they were now in the season of the greatest heats, they no longer perceived any snow, but in the large excavations, where it had been sheltered from the rays of the sun, during a considerable part of the day. This mountain is remarkable for a small peak in the shape of a cone, which terminates its summit.

Early in the morning of the 22d, they were at the entrance of Storm Bay. The wind was at south-south-east, and prevented them from

* At four they lost sight of the land from the mast-head, and had thirty fathoms water. About ten in the morning of the 8th, they saw a great number of cetaceous fishes of a new species, which seemed to be of the *delphidas* genus. They may be readily distinguished by a large black spot on

entering D'Entrecasteaux's Strait, where they intended to anchor: and they were obliged to enter a bay, which they had named *La Baie de Roches*, (Rocky Bay) from its having rocks almost even with the water's edge. This is the first cove on the larboard hand on entering Storm Bay, and its direction is from north-east to south-west. The *Esperance* anchored there at a very early hour.

Having run a third of the way up into this bay they got bottom at two fathoms and a half. Our navigators had been misled by the report of Cretin's soundings of this cove the preceding year, and ran aground. This happened between nine and ten o'clock: the wind came down in heavy squalls from the tops of the mountains, and drove them with violence towards the coast, working them deeper and deeper in the sand. The *Esperance* immediately sent her launch and barge to their assistance, which, even with the exertions of their own boats, in vain endeavoured to tow the ship's head round to starboard. They were then convinced of the necessity of carrying out a stream anchor to the west-north-west, in order to steady their ship by a good hawser, to prevent her from being driven nearer the coast. To lighten her, they started in the hold, and caused to be dispersed all the salt water with which most of the empty casks had been filled. Having thus rendered the ship more buoyant than she was, they hove at the capstern on a bower anchor, which had been dropped quite close to the former; but it was not till near one o'clock that they were able to get off this sand-bank. At length their reiterated efforts were fortunately crowned with success, and the ship was brought afloat.

the back, behind the dorsal fin; the upper part of the body is of a blackish brown, and the belly white: the largest exceeded three meters in length. They were preceded by a shoal of dolphins, and were, like them, swimming in a body.

SECTION IX.

Continuance in Rocky Bay—Excursions into the Interior—Difficulty of penetrating into the Forests, Pit-Coal towards the North-West of the South Cape—Interview with the Savages—Their Conduct—Visited by One in the Night to observe them while they were sleeping—Several Savages accompany them across the Woods—Other Interviews with the Inhabitants—Polygamy established among them—Savages arrive on board—Departure from Rocky Bay—Pass through D'Entrecasteaux's Strait—The Ships run aground—Excursions into the neighbouring Country—Interview with the Natives—Deposit their Arms in the Woods—Anchor in Adventure Bay.

AT five in the morning of the 23d of January, our adventurers landed near the entrance of their anchorage. The *Esperance* had already found, in a small cove to the north-west, a watering-place, abounding with good water, which was procured without difficulty. The rivulet that furnished it discharged itself into the sea, from the height of upwards of a meter. Advancing towards the head of the bay, they found a house, methodically built by the savages: the skill with which they had disposed the bark of the trees that covered it, was admirable; it was impervious to the heaviest rain.

They had been informed, that some persons belonging to the *Esperance*, had, the preceding evening, seen three natives seated round a small fire close to this house; but, being terrified by the report of a gun fired at some birds, they instantly fled. The flood tide had just brought up the sea into the interior of the country. A great number of wild ducks were seen, but they would not suffer themselves to be approached but at a very considerable distance.

On the 26th at day-break, a party set off with an intention to take an excursion for two days: they landed on the south-west, and nearly in that direction followed a path made by the natives, where they remarked several recent impressions of naked feet, among which were some of very young children. It was instantly conjectured, that, terrified at the continuance of the Europeans in Rocky Bay, a few families had gone in search of another retreat, where they might suppose themselves in greater safety.

The adventurers observed a shed, erected as a shelter against the strong breezes from the south-west. Near it they saw a fire, which appeared to have been just kindled. The south-west wind

blew in the afternoon in impetuous squalls, and brought on some rain at the moment they arrived at the sea-side, quite close to the south cape. They proceeded, for a little time, towards the north, across some sand-hills, before they went to the shore; but they were at length impeded by a perpendicular mountain, which projected into the sea: they attempted to go round it, but found it impossible to penetrate through the thickets by which it was encompassed.

As it grew late, they measured back their steps, intending to seek, near the point at which they had already crossed, a convenient place for passing the night. A tufted bush was the best shelter they could perceive, which they improved by an additional covering of boughs, thinking to be perfectly secure from the inclemency of the weather; but the south-west wind blew so violently during the night that it commanded admittance for the rain. To heap up the measure of their misfortunes. The cold was extremely sharp, and obliged them to approach the fire, though they were more molested by the rain, than they would have been in their temporary cabin*.

M. Labillardiere had already observed some burrows dug in those sand-hills which afforded sufficient solidity; he now saw a great number of them; but he knew not by what animal they had been formed, when a kangaroo got up on their approach, and earthed itself in one of them. In vain did they discharge their musquets several times into the holes, hoping the smoke would induce it to come out: it still remained in its retreat. Shortly after, several tracks of kangaroos, made across a little wood, roused the ardour of two sportsmen who were of the party: they soon discovered, in the middle of a meadow,

* As soon as day appeared, they quitted their inhospitable quarters, and traversed the surrounding sand-hills. The swell had detached, from the bottom of the sea, the

sponge called *spongia cancellata*, which they saw thrown up in great quantities upon the beach.

watered by a delightful rivulet, several of these quadrupeds; but not one of them, however, would suffer itself to be approached. At length the party arrived on board, exceedingly fatigued, which was the more intolerable as they had not a moment's sleep for the last forty hours.

A plan having been formed, by a party, to set out on the 1st of February, in order to visit the highest of the mountains of this part of New Holland; each individual carried provisions for himself for five days; supposing that portion of time would be sufficient for the completion of their object. They set out early in the morning of that day, with what they considered an ample supply of biscuit, cheese, salt pork, and brandy.

After a very laborious walk, they reached the summit of a mountain, whence they perceived, to the southward, the middle of the roadstead of the south cape; and, to the north-west, the great mountain to which they were directing their steps. Night obliging them to stop, they kindled a large fire, near which they enjoyed pleasant repose after the fatigues of the day. They slept in the open air, having no other shelter than very high trees, the branches of which were chiefly situated near their tops; and this part of the forest was totally destitute of shrubs. They sought for trunks excavated by fire, but those could only be met with in the places frequented by the natives: they had seen many of them by the sea-side, and had remarked several paths made by them; but here nothing indicated to them that they had come into the middle of these thick forests.

The air was extremely calm: our naturalist awoke about midnight; and seeing himself insulated amidst these silent forests, of the majesty of which the light of the stars afforded him a glimpse, he conceived the most exalted ideas of the inexpressible grandeur of the scene.

On the 2d, at day-break, they proceeded on their jaunt: the difficulties were greatly increased; often did the trunks of trees, thrown down one upon the other, form an almost impenetrable barrier, and subject them to the necessity of climbing on the most lofty, and of crawling from tree to tree, at the risk of falling from a consi-

derable height: several of them being covered with a fungous bark, soaked by the constant humidity which prevails in these thick forests. The great chain of mountains appeared to extend to a vast distance. Insurmountable difficulties continually presented themselves, and as these forests did not afford them the smallest means of subsistence, the party resolved unanimously to renounce their project.

After having got out of the forests, they were able to continue their march along the sea-side, where they for some time found an easy road; but they were soon obliged to clamber over some steep rocks, at the foot of which they saw the sea break in a very frightful manner. This road, though difficult, was certainly frequented by the natives; a dart having been found belonging to one of them*.

On the 7th M. Labillardiere, the gardener, and two men belonging to the ship, set out early in the morning, to spend two successive days in visiting the environs of Port D'Entrecasteaux. They debarked on its entrance on the west shore, at the time of low water; and, by a fortunate chance, they found themselves on a bank of oysters, of which they engrossed a considerable stock.

Though snakes are not very common at Cape Diemen, they saw two lying asleep in the sun, under large stumps of trees; but on their approach, they fled into the hollowed trunks, which served them as a retreat. They were of the species of the *coluber*, and by no means dangerous. The river was obstructed at almost every step by large trees; they were a considerable time before they could find one which rendered it commodious for crossing, without too much difficulty, to the other bank. They then proceeded to the north-east, traversed a large plain, and reached the head of the great lake, the banks of which they followed as far as the sea. After travelling over a great extent of ground, they returned to its extremity, in order to pass the night near a rivulet that they had already crossed. The weather being fine, they slept in the open air, sheltered only by some large trunks of trees lying on the ground: they soon, however, found themselves very cold,

* Having a full view of the side of the mountains, they saw a horizontal stratum of pitcoal. Several new species of *lobelia*, grew in the clefts of the rocks. They walked

along, for some time, in the midst of the shrubs, most of which are of the family of the *Erica*, and of that of the *loti*.

and were stimulated to kindle a comfortable fire.

At day-light on the 8th, while the two men who accompanied the party were asleep, the gardener and our naturalist advanced alone, towards the part of the lake opposite to that which they had visited the day before. After having proceeded about three kilometers, they thought they heard the sound of human voices. Advancing a few paces, they were convinced of having their ears assailed by an assemblage of such voices. Soon after they perceived, through the umbrageous trees, a great number of savages, many of whom were employed in fishing on the banks of the lake. As the party was unacquainted with their pursuits, and totally unarmed, they did not hesitate to rejoin their two companions, who were severally provided with a musquet. They instantly crossed the woods to conceal themselves from the sight of such visitors, that they might not be pursued by them.

After having mentioned to their two shipmates the cause of their return, our naturalist expressed a desire of communicating with these inhabitants; but it was first necessary to dispose of their means of defence in such a manner, as to be instantly enabled to resume them, should any hostile measures be attempted. They hastily prepared a few cartridges, and set out towards the place where they had perceived them. They had not proceeded many steps before they met them. The men and boys were ranged in front, nearly in a semi-circle; the women, girls, and children, kept behind, at the distance of a few paces. As these people seemed to assume no menacing position, the party approached the oldest of the men without hesitation. He willingly accepted a piece of biscuit which our naturalist presented to him, and of which he had seen him eat. A friendly shaking of hands suc-

* The Europeans joined in company with the inhabitants, and a degree of intimacy arose among them: a number of kind offices were reciprocally exercised and received. The women were desirous of coming nearer their visitors; which was at first slightly opposed by the men, but they afterwards obtained permission to approach. It seemed astonishing, that, in so high a latitude, where, at this early season of the year, when the cold was pretty severe during the night, these people did not feel the necessity of clothing themselves: even the women were, in general, entirely naked, like the men; though some few of them had their shoulders and part of their back covered with a kangaroo's skin, the hair of which was next their body.

ceeded, accompanied by a placid smile from each*.

Labillardiere had given them several things, without requiring any thing in return. He now wished to obtain from them the skin of a kangaroo; only a young female among the savages then present, was possessed of such an article. He therefore applied to her to favour him with it, and offered in exchange for it a pair of pantaloons. At this proposal the girl ran away, and hid herself in the woods. The other natives were displeased with her conduct, and intreated her to comply with so reasonable a request. At length she yielded to their solicitations, and approached to deliver him the skin, for which she received a pair of pantaloons. According to the fashion of these ladies, this sort of covering was much less useful to her than the kangaroo's skin, which served to cover her shoulders. The utility of the pantaloons was explained to her, but in order to make her perfectly comprehend it, a proposal was made for the Europeans to put them on. To this she readily agreed, and placed both her hands on their shoulders, while she raised her legs one after the other, that she might be properly cased in this new garment. To prevent any misunderstanding in this business, they preserved, on this occasion, as much gravity as they could.

These savages were forty-two in number, composed of seven men, and eight women, and twenty-seven children; among whom they remarked several girls arrived at the age of puberty, and still less clothed than many of the mothers. All the company were invited to come and rest themselves by the fire. The Europeans wished to shew these savages the effect of their musquets, after having given them the most positive assurances that no danger was to be apprehended from them. They appeared,

A pole-axe, which had been used in cutting a few boughs, excited the admiration of these natives. As they saw that their visitors were disposed to give them any thing they possessed, they were not afraid of asking them for it; and when their request had been complied with, they were transported with joy. They were fully sensible of the value of their knives, and received with pleasure a few tin pots. One of the party exhibited a watch, which instantly created a longing for it; an earnest petition was preferred by one of these natives to get possession of it, but when he found it could not be obtained, he readily declined any further application.

however, somewhat terrified at the noise of the explosion*.

It is to be supposed that, at Cape Diemen, there are few serpents to be met with whose bite is dangerous; or, if there are any, the inhabitants know how to distinguish them from the others: they pointed out one, which was gliding among the grass pretty near them, but it did not seem to create the least degree of fear or apprehension. When the boat arrived for our Europeans, they invited some of the natives to embark with them. After some hesitation, three of them agreed to come into the boat; but it appeared afterwards that they had no intention of leaving their party, for they hastily stepped out as soon as the Europeans were prepared to quit the beach.

The next day they returned, with a large party, towards these savages. For some time they kept along the coast, beyond Port D'Entrecasteaux, when, perceiving a fire in the vicinity of the sea, they were induced to land. Presently some natives approached them, expressing by loud shouts, the pleasure they enjoyed at seeing them again. One of the Europeans produced his violin, and thought by noisy tunes to create a degree of enthusiasm among them; but his vanity was completely mortified at their indifference. Savages are never much affected by the sounds of stringed instruments†.

Our party knew not to what cause to attribute their repugnance to their aliments, for they re-

* These savages have woolly hair, and suffer their beard to grow: their skin is not a very deep black; but the nearer it approaches to that tint it is thought the handsomer, or they would not cover the upper parts of the body with charcoal dust, to give them a more sable appearance. On their skin, particularly about the breast and shoulders, are seen tubercles and spots, placed at different distances from each other.

One of the sailors, who accompanied the party, thought he could not regale these people better than by offering them brandy; but, accustomed to drink water only, they were so exceedingly disgusted at the taste of it, that they soon spit it out again. The attentions which these savages lavished on the Europeans, astonished them much. If their path was encumbered with heaps of dry branches, some of them walked before and placed them on the sides: they even broke off those which, being still attached to the fallen trees, obstructed the road they were pursuing.

† On their advancing up the heights that skirt the sea, they saw a number of the natives who had received them so favourably the day before. Joy was depicted in their

VOL. I. No. LXXIV.

fused to taste almost every thing that was offered them: they did not even permit their children to eat the sugar which was given them.

When the party set off to go to Port D'Entrecasteaux, more than half of these peaceable inhabitants rose up, in order to accompany them: four of the young girls were also of the party; they received with indifference the clothes that had been given them; and, unwilling to load themselves with an unnecessary burden, they instantly deposited them in the coppices bordering on the path, intending perhaps to pick them up again on their return. Apparently they set very little value on presents of this sort, for none of them were seen to wear any of those articles which the Europeans had given them.

Three of these girls were already arrived at the age of puberty, and were all of a sprightly disposition. Our adventurers certainly lost a great deal by not understanding the language of these natives; one of the young girls said a prodigious number of things to them, for she spoke a long time, and with great volubility. She doubtless perceived that they did not comprehend her; but no matter—she would still talk. The others endeavoured frequently to delight them with their airs, the modulation of which was pleasing, from their analogy to those of the Arabs of Asia Minor. Two of them sang the same air together; but the one constantly a third above the other, forming this harmony with great propriety‡.

The

countenances when they saw them approach. They were assembled, to the number of nineteen, seated round three small fires, feeding on mussels as fast as they were dressed upon the embers. They also saw, broiling on the same fires, the species of sea-weed called *fucus palmatus*; and when it had acquired a certain degree of softness, they tore it in pieces and ate it.

‡ During this long excursion, some of them took our adventurers by the arm, from time to time, intending to assist them in their journey. In a short time they arrived at the entrance of Port D'Entrecasteaux. Two of the young girls, being considerably behind the other natives, were following, without suspicion, the different windings of the beach with three of the sailors; when the latter, availing themselves of a retired place, began to take unwarrantable freedoms with the damsels. Alarmed at this insult, the young creatures immediately fled to the rocks which extended farthest into the sea; intending to jump into the water; and swim away, if they had been pursued; but they quickly retired to the spot where our adventurers were assembled with the other savages. Their conduct was not influenced

It h by

however,

The following day they landed near Port D'Entrecasteaux, with a number of persons from the two ships, expecting to see the savages again: it was not long before some of them advanced to meet them; manifesting, at the same time, the most unequivocal marks of confidence. They first attentively examined the inside of their boats; and then, taking them by the arm, entreated them to follow them along the beach. Hardly had they proceeded two kilometers, when the Europeans found themselves in the midst of forty-eight natives; including men, women, and children. Seven fires were burning, and round each a little family was assembled.

Our adventurers had already been convinced that savages have little taste for the sounds of the violin, but they flattered themselves that they would not be found insensible to lively tunes: the musician exerted himself, and expected to obtain their plaudits; but the bow fell from his hand when he beheld the numerous assembly put their fingers in their ears, that they might no longer be tortured with his execrable noise.

These people entertain swarms of vermin: our Europeans admired the patience of a woman, who was sedulously employed in picking them off from one of her children; they also saw, with great aversion, that, like most of the blacks, she cracked these disgusting insects with her teeth, and swallowed them with avidity. It is worthy of remark, that monkeys have the same habits. It is supposed that this fashion originated among the savages, and the monkeys are only the imitators.

This numerous assembly was much astonished on observing the effects of gun powder, when they threw it on the burning coals. Unwilling to believe that the Europeans had no women among them, they naturally supposed that the youngest were women. In short they were not convinced, till, having obtained permission, they ascertained the fact with their own eyes.

by coquetry or affectation, for so far from boasting of their honour or chastity, they did not mention a syllable of the transaction. The time for our adventurers to return on board was now arrived, but not one of the natives would accompany them; they quitted them, and retired into the woods.

On the 10th, the geographical engineer of the Recherche set out in a barge, to reconnoitre the extent of the vast bay at the entrance of D'Entrecasteaux's Strait, whither they were speedily to sail. In advancing towards the south-

The women are very active in procuring food for the subsistence of the family. They each took a basket, and were followed by their daughters, who did the same. They went to the rocks projecting into the sea, and thence ventured to the bottom of the water, in search of lobsters and other shell-fish. As they remained long out of sight, our Europeans were uneasy on their account; for they had dived among sea-weeds of great length, and fears were entertained that they were entangled in them. At length they re-appeared, and demonstrated that it was no difficult matter for them to remain under water twice as long as their most expert divers. A moment was sufficient for them to take breath, and then they dived again successively till their basket was nearly filled.

Observing some very large lobsters in their baskets, the Europeans were afraid that those crustaceous fishes would injure the poor women with their enormous claws; but they soon perceived that they had taken the precaution to kill them, as soon as they had caught them. They quitted the water only to bring their husbands the fruits of their industry; and they frequently repeated the operation of diving till they procured a stock sufficiently abundant for the subsistence of their families: on other occasions they warmed themselves for some time, with their face towards the fire where their fish were broiling; and they had other small fires kindled behind them, that they might be warmed on both sides at once.

It gave our Europeans much uneasiness to see these poor creatures condemned to so severe a task: they were also exposed to the ravenous jaws of the sharks, or in continual danger of getting entangled among the sea-weed which grows at the bottom of the water. In vain were the husbands requested to partake of this trouble: they continued about the fire, regaling themselves with the choicest morsels: they condescended,

west, our naturalist crossed some glades, where he killed a charming species of parrot. Very different from the known species of the same genus, it does not perch, but frequently rises from among the grass, and alights there again almost immediately. The form of its feet, armed with long claws a little incurved, sufficiently indicates the habits of this bird; whose plumage is green, spotted with black: black and yellow are the prevailing colours beneath the belly; a few small reddish feathers are distinguishable at the base of the bill, above the upper mandible.

however, to add fresh fuel to the fires as they successively required recruiting*.

Every thing being prepared for the departure of our adventurers, they only waited for a fair wind to put to sea: but a calm having detained them, they had the pleasure to see the savages, who, in their last interview had promised them a visit, had been as good as their word. They were five in number. One of them carried a piece of rotten wood, lighted at one of its extremities, and which burnt slowly. The others, having been invited by the Europeans to dance in a ring with them, endeavoured to imitate their motions. From their necks were suspended a great number of articles, of which the Europeans had made them a present, and which seemed to afford them much delight. Before these people left our adventurers, they gave them to understand, that the next day their families would attend them; but when they made them comprehend that they were to sail that very day, they seemed exceedingly afflicted at the intelligence.

The Europeans landed in this country a she-goat, and a young he-goat, that those quadrupeds might be naturalized in these regions: they will probably thrive well on the mountains of this extremity of New Holland, and be a great resource to navigators. It is, however, to be apprehended that the savages may destroy them before they have had time to multiply.

At day-break on the 14th of February, our navigators got under sail from Rocky Bay, with the wind at south-west, intending to go and anchor in D'Entrecasteaux Strait. Some natives announced their presence in the neighbourhood, by lighting several fires on the east coast. They had crossed the great roadstead at the entrance of the strait, and when they thought themselves in the utmost security, struck on a shoal, of no great extent, formed of a mixture of sand and mud; where they were compelled to wait till half past six for the flood, to bring the ship afloat. The *Esperance* had worked herself still deeper into the sand; for she could not get off till about eight o'clock.

The boat that had been sent five days before,

* Two of the most robust of the men were seated among their children, and each of them had two wives at their side; they informed our adventurers, as well as they could, that these belonged to them; a proof that polygamy is established among these people. The other women, who had each a husband to herself, was equally fond of com-

returned after having observed some very deep bights, which form excellent anchorages, but no river had been met with. The boat was loaded with black swans, which permitting themselves to be closely approached, had been shot for their temerity.

Citizen Beaupré, the geographical engineer, set out in the admiral's barge to visit the great bight to the northward on coming out of D'Entrecasteaux's Strait. The north wind, which blew on the 16th, prevented them from weighing. The next day they weighed anchor, but with a breeze too faint to stem the current, which was against them. About noon a few natives appeared on the east bank, about a kilometer from the ship; being joined by others, they soon amounted to ten, and kindled a fire, round which they seated themselves. Shouts of joy were reciprocally given and received by the savages and the European seamen. The latter landed in great numbers, to have a nearer view of the former. When the Europeans were at a little distance from the shore, the natives advanced towards them without arms, and their smiling countenances announced that the visit afforded them pleasure. Their joy sometimes displayed itself in immoderate bursts of laughter. They expressed much gratitude when presents were made them of pieces of cloth, glass beads, a hatchet, and some trifling articles of hard ware.

These natives seemed to bear the greatest resemblance to those whom our adventurers had seen a few days before; only they remarked some of these who had lost one, and others both of the middle incisors of the upper jaw. They could not learn whence this custom originated; it is so far from being general, that most of the natives have preserved even all their teeth.

They informed our adventurers that they lived on fish, like the other inhabitants of Cape Diemen: and yet it did not appear that they had the smallest trace of any cutaneous disorder; though an opinion has prevailed that people who subsist on that kind of aliment are subject to a species of leprosy. They arrived on board soon after sun-set. The wind having become fa-

municating that intelligence. While the Europeans were with them, no intimations were given that they had any chiefs: on the contrary, every family seemed to enjoy a state of perfect independence; but the strictest subordination was manifested by children to their parents, as well as by the wives to their husbands.

yourable

vourable, they got under way, and went and anchored a myriameter farther on. The next day they weighed anchor at a very early hour, but they were obliged to come to again almost immediately, the wind having become contrary.

They anchored on the 23d of February, at eleven in the forenoon, in Adventure Bay, in eleven fathoms water. The nearest shore lay south-east of them, one kilometer distance. During the time they lay at anchor, they made excursions into the neighbouring country. Penguin Island, which they went to visit, is no more than a hill, scarcely detached from the principal island. A new species of mugwort was gathered on it, remarkable for its large leaves, of a light fawn colour.

The steep hills with which the sandy beach is bordered, exhibit, a little further to the northward, cavities which seemed to be much frequented by the natives, as they judged from the black colour with which they had been tinged

by the smoke, and the remnants of lobsters, and other shell fish which are scattered about*.

The fishermen were tolerably successful at this anchorage. The fires which they had kindled on the beach during the night, attracted many fishes to their nets. This practice had been so successful among the people of the Esperance, in D'Entrecasteaux's bay, that they had a stock sufficient for the consumption of several months, some of which were pickled, and others dried.

Our adventurers put on shore, near the northern bank of this bay, a goat with kid, and a young he-goat, hoping the savages would allow these quadrupeds to propagate in their island; but it is to be feared that they will destroy these animals before they have multiplied; for it appears that such a circumstance has really happened with respect to the sow and boar which Captain Cook had left them; not the least trace could be discovered of these animals, or of their posterity.

SECTION XI.

Departure from Adventure Bay—To the North of New Zealand—Interview with the Inhabitants—Discover several Islands—Anchor at Tongataboo—Inhabitants anxious to come on board—The Islanders much addicted to Theft—A Scutinel knocked down and robbed of his Musquet—The Offender delivered up to Admiral D'Entrecasteaux—Queen Tuck comes on board—Toobou gives an Entertainment to the Admiral—The Smith of the Recherche beaten and stripped in open Day—Take on board young Plants of Bread-Fruit Trees.

AT eight in the morning on the 28th of February, they got under sail from Adventure Bay; and were driven along by heavy squalls from the south-west: it was not long before they doubled Cape Pillar, behind which they saw several fires lighted by the savages. They next steered to the northward, and stood on about eight myriameters in sight of the coast, leaving Oyster Bay to the westward. They then shaped their course for the Friendly Islands.

On the 10th of March, at day-break, they saw the islets called Three Kings: they also observed three principal rocks, not far distant from

each other, and surrounded by other rocks much smaller. Though it was then foggy, they distinguished to the northward, some others, which made a part of the same group. They were extremely barren, and were at first supposed to be uninhabited; but a thick column of smoke ascending from the easternmost islet, proclaimed to them the presence of savages. They had probably chosen this abode for the convenience of fishing in the midst of the shoals.

About eleven o'clock our adventurers descried the coast of New Zealand, which they approached, standing to the eastward, under favour of

* Several inscriptions, engraved on trunks of trees, inform the traveller, that Captain Bligh had anchored in this bay in February 1792; that he was to proceed to the Society Islands, in order to take in the bread-fruit tree, and carry it to the English West-India colonies, situated within the tropics.

Bligh had with him two botanists, who, at a small distance from the shore, sowed cresses, acorns, celeriac, &c. Towards the south-east was seen, at a small distance from the shore, an apple-tree, the trunk of which was about two meters in height, and one demi-decimeter in girth. It did not appear to have been grafted.

light breeze. The natives had kindled a large fire on the highest of the hills which skirt the sea, and extend as far as Cape North. Between five and six they were at no great distance from this cape, when two canoes put off from the shore, and stood towards them. After some hesitation, they ventured to come alongside, and approached them with confidence. They received, with peculiar satisfaction, the cloths of different colours that were presented to them, and faithfully returned, with the most scrupulous exactness, the value that was agreed on.

They gave the Europeans, in exchange for their articles, any thing they had in their canoes; and were not backward even in parting with their arms. The largest darts received from them did not exceed five meters in length, by four centimeters in thickness; the smallest were not half so long. They each consisted of a single piece of hard wood, which they had completely polished. They disposed of a quantity of fish they had just caught; which are indeed so numerous along the coast, that, in the little time that they had been lying to, they saw several prodigious shoals, which, rising to the surface of the sea, ruffled it at different times for a very extensive space. These savages even parted with their clothes, to procure the European articles of traffic. Some of the young lads had ear-rings, made of a very hard serpent stone; they were oval, and most of them about a decimeter in length*.

At that moment a third canoe arrived from the nearest coast: it was conducted by twelve islanders, who instantly requested some hatchets in exchange for their effects. One of them had obtained such an implement, and another petitioner loudly and peremptorily demanded such another, and would not be pacified till another was given him. It had been dark for upwards of half an hour, when these people paddled away, directing their course towards the coast. As our navigators continued lying to, they sounded at different times; and the depth of

* It is well known that these people delight in eating human flesh, and every thing that awakens in them the idea of such food, gives them infinite satisfaction. A sailor belonging to the ship offered one of them a knife; but, in order to explain to him the use of it, he pretended to cut off his finger, which he immediately conveyed to his mouth,

water was constantly from thirty-three to forty-six fathoms, over a fine sandy bottom.

To the land-breezes, which blew faintly during the night, some north-westerly winds succeeded, about day-break on the 13th. They were yet very near the coast, and could easily have gone to anchor in Lauriston Bay; had not the lamentable events that had befallen Captain Marion, and afterwards Captain Furneaux, deterred the admiral from putting in there.

On the 17th they got sight of Curtis's Islands: they are two in number, and very small, and are about two myriameters from each other. At six in the evening they discovered new land, at a great distance to the north-north-west, which determined them to pass the night lying to. The next morning they saw it as soon as day appeared, and gave it the name of La Recherche: its form is nearly triangular. They saw on the coast a few small openings, where the earth had fallen down, and where they might have landed. On the 22d, at nine in the evening, they entered the torrid zone, in the longitude of 184° east. The next day they discovered Eooa, one of the Friendly Islands: the beautiful verdure with which it was every where covered, pronounced the fecundity of its soil. At half past six they hove to, in order to wait for the Esperance: they spent the night in standing off and on.

On the 24th, at seven in the morning, they were but three myriameters from Tongataboo, though they could hardly distinguish it, the land being rather low. They ranged very closely along its eastern shore; standing to the north and north-west, that they might not lose sight of the opening that leads to the harbour. When they were about the middle of the channel, several canoes with outriggers came out to meet them, loaded with fruit, hogs, and poultry: they were each conducted by two or three natives, a few of them contained four. One of them, advancing too precipitately towards them, her outrigger was unshipped, and the three paddlers fell into the water. Without being much embarrassed, however, they swam towards the nearest coast,

and imitated the act of chewing it. Immediately the cannibal, who observed all his motions, seemed in raptures, and laughed aloud for a considerable time, rubbing his hands with a degree of extacy. These people are tall, and extremely muscular. In the afternoon they departed.

dragging after them their skiff, which they soon righted, and launched again*.

Arriving, at length, in the road of Tongataboo†, and having made several tacks in order to reach the anchorage, they let go the anchor two kilometers south-west of Pangaimotoo, in eleven fathoms water. They were immediately surrounded by natives, who came in such numbers on board the ship, that the deck was soon covered with them.

A native, attended by several others, who appeared to hold him in the greatest respect, declared himself one of the chiefs of the island. Requesting to see the commander of the ship, he instantly ordered a hog to be brought, and gave it him as a present. This islander received a hatchet from the hands of the admiral, for which he expressed his most grateful acknowledgments. In less than an hour, a dozen hogs were procured, by means of exchanges, the smallest of which weighed five myriagrams: a middle-sized hatchet was deemed a valuable consideration for a middle-sized hog.

The admiral had commissioned one of the officers to treat with the islanders for what provisions they might be able to furnish them; and, to avoid all competition, he had prohibited every other person from trafficking; but the eagerness of the natives was not to be repressed; every one displayed his commodities to the best advantage. The adventurers were amused to see them hold under their arm their little pigs, which they from time to time squeezed heartily by the ears to inform them, by their squeaking that they wished to sell them.

A chief of the warriors, named *Feenou*, came on board at five in the afternoon: he was of the middle stature, very fat, and about forty-five

* Most of them had provisions on board; but they remarked one that was not thus equipped, and they supposed he had nothing to offer them; but they were mistaken: she was navigated by two men, whose countenance bespoke much gaiety and fun; while they pointed out to them two women that were paddling with them: their signs and tokens sufficiently indicated that they knew not how to be unkind, when favours were requested of them.

† In the Missionary Voyage, 1797, there is an interesting map of Tongataboo, which thence appears to be a plain country, in an universal and surprising state of cultivation, the whole island consisting of inclosures, with reed fences about six feet high, intersected with innumerable roads. The whole is such a picture of industry as to form a reproach to nations who call themselves civilized. The length of Tongataboo is only about sixteen miles, by about

years of age. Like the other inhabitants, his features were of the European cast. He seated himself on the spot appropriated for the officer of the watch, with four of the natives, and commanded the others to squat; with the exception of a few, whom he permitted to sit down on the arm-chest.

Feenou had complimented the admiral with a present of the largest hog that they had ever seen since they had been at the anchorage; he had also given him two very handsome clubs, made of *casuarina* wood, in which were incrustrated pieces of bone, some of a circular form, some in the shape of star-fish, and others representing birds. This chief seemed extremely well pleased, when the admiral presented him with a hatchet, a piece of red cloth, and a parcel of nails: To attest his gratitude for these favours, he immediately applied each of the articles to the left side of his forehead, after having received them with his left hand.

Towards sun-set, the navigators begged him to send away from the ship all the natives, the crowd of which was become extremely troublesome. They wished that none of them might be permitted to remain on board, that they might avoid the trouble and inconvenience of keeping watch over them during the night; but his authority, perhaps, was limited; for, having driven away a considerable part of them, he departed, and directed his course towards the west coast of Tongataboo. His method of relieving us from these islanders was somewhat singular: he pursued them with his club, which he wielded with such force, that they could only escape the blows of this destructive weapon, by precipitating themselves into the sea†.

Feenou, who returned the next morning to pass

eight at its greatest breadth. On the north side there is a lagoon, with several isles, constituting a tolerable harbour. The commodities are, as usual, hogs, bread-fruit, coconuts, and yams.

Though the people of the Friendly Isles are more free from wars than some of the neighbouring group, yet Tongataboo is often stained with human victims; nor do their ideas of property prevent their stealing from strangers. Some missionaries were there left, who imparted some useful arts to the natives, but the rats were destructive to the European plants. These, with hogs, dogs, and guanos, constituted the only quadrupeds, till cats were left in the voyage of 1797. The morais seem to be here called *faatookas*; and are constructed in the form of terraces, with high steps, the material being coral stone.

† The natives had not come on board merely to satisfy their

a few hours on board, was exceedingly entertained in observing the tricks and gestures of a monkey, which belonged to one of the gunners.

The tents for the observatory were pitched on the south-east coast of Pangaimatoo, and clothes of different colours, with variety of articles of hard ware, were sent to procure fresh provisions in exchange. An enclosure was marked out with a rope, fastened to the extremity of stakes fixed in the ground. With such barriers, it was proposed to restrain, night and day, the inhabitants, upwards of two thousand of whom, chiefly from Tongataboo, were already collected round them*.

They found a great number of inhabitants employed in building houses, in order to settle on the island of Pangaimatoo. They had been attracted by the choice that our Europeans had made of this little island, for purchasing the provisions with which they could supply them. The architecture of these mansions was not of the most magnificent kind, nor the portal very superb. On one of the sides an opening was formed, which sometimes extended the whole length of the house; but a person could not enter it without stooping, and supporting himself on his hands. Under such a roof it was impossible to stand upright, except towards the middle; but these people usually remain squatted in the house†.

For a considerable time our adventurers followed the skirts of the shore, where they saw a number of bread-fruit trees in full vigour; though their roots were often washed with brackish water. Presently the sea, swelled by the flood, obliged them to penetrate into the interior of the island, where they traversed thick woods. They then walked over cultivated grounds, in

their curiosity, or to dispose of their goods; for it now appeared that they had stolen a great many things from the ship, and only six islanders were remaining. These individuals, having no other means of returning on shore than by swimming, begged to be permitted to pass the night upon deck: one of them, however, preferred swimming on shore, though they were two kilometers from the nearest coast. The facility with which he executed all his motions was astonishing. Our adventurers declared they had never seen an European swim with so much confidence and celerity.

* *Futtasuihe*, one of the sons of the late king Poulaho, appeared to the same spot early in the morning. He undertook to keep the natives in order, and the trade was conducted with tranquillity; but his method of enforcing obedience was severe. If any one of them offered to pass

some of which grew sweet potatoes: further on they found fields of the paper mulberry-tree, cultivated on account of its bark, of which the natives manufacture cloth to wear.

Some natives attended them very closely, pretending to have no other view than to be useful to them; but they, from time to time, caught some of them diving their hands into their pockets, to pilfer their property. Whenever they were detected, however, they were compelled to restore the goods to the owner. But one of them, having taken a knife belonging to a sailor, ran swiftly off with it into the woods, and effected his escape.

Soon after they observed a group of islanders, who were preparing to drink *kava*. Our adventurers were invited to sit down near them, where they remained while the beverage was preparing. They call by the same name the species of pepper-tree, of which it is chiefly composed; and the elongated, fleshy, tender roots, which are frequently upwards of a decimeter in thickness. They first carefully clean them, then chew them into a sort of paste, which they form into balls about a decimeter in circumference. These balls are deposited in a large wooden vessel, and placed at a certain distance, till the bottom is nearly covered with them, when the vessel is filled with water. The liquor is then stirred about, and distributed among all who are present. Our adventurers were invited to partake of this rich liquid, but having seen the method of preparing it, all but the chaplain of the ship begged leave to be excused: that reverend gentleman had the courage to swallow it. Wishing to know the taste of this root, M. Labillardiere preferred chewing a small piece of it himself, which he found tart and stimulant. All those who had

a few decimeters beyond the line which had been drawn, he instantly threw at him any thing that came in his way, regardless of the consequences that might thence result. A young man had nearly lost his life, for not having strictly attended to the orders of *Futtasuihe*, who forcibly threw at him a large billet of wood, which the youth had the good fortune to avoid.

† In the environs of these peaceful abodes, men of the most obliging disposition, took a pleasure in informing strangers, that they might be favourably received by the softer sex in these fortunate islands. But, in making these obliging overtures, it appeared that they had an eye to their own interest, as well as the accommodation of lovers, for they never forgot to demand a recompence for their information.

drank

drank of the *kava*, ate yams, fresh roasted on the embers, perhaps to counteract the ill effects of this intoxicating liquor.

Our Europeans were not far from the tents of the observatory, when they were invited by some of the inhabitants to eat fruits. Citizen Riche had just placed on the ground a pole-axe, when a native slyly came behind him, snatched it up, and ran away with it. He was immediately pursued, but he fled too rapidly to be overtaken. A chief, who was on the spot, went in pursuit of the plunderer, and the plunderer, but returned without having succeeded*.

On the 26th of March they landed early in the morning, on the nearest coast, where they had the satisfaction of seeing these islanders in possession of the sugar-cane. They sold them several birds; and, among others, a charming species of *lori*. Several of them had lizards of the species known by the denomination of *laecerta umboynensis*, which they recommended as very palatable food.

The natives, in their train, incommoded our adventurers much by their numbers, and officious eagerness to oblige. Many of these people pretended a particular regard for them, whilst, at the same time, they were purloining their effects. They endeavoured, in vain, to get rid of such attendants, but their remonstrances were so very different from those they had been accustomed to from chiefs, that they were not regarded†.

Two sentries watched night and day for the safety of the settlement, which they had formed on the island of Pangaimatoo. These were sufficient for keeping off the inhabitants, who had endeavoured to enter slyly to purloin the articles that had been there deposited: but no precaution had been taken against a vigorous and sudden attack. An islander, however, availed himself of a heavy shower of rain on the approach of day, to follow one of the sentries; and he struck him so violently on the head with his club, that the latter instantly fell, and the assassin took away his musquet. The other sentry spread the

intelligence among those who were sleeping in the tents. The alarm was given: every one flew to arms. The watch-word was heard on board the *Esperance*, she having the day before moored within hail of this shore: she immediately let off some false fires to apprise the *Recherche*.

The commander of the expedition went on shore at six o'clock in the morning, with a detachment well armed. He ordered the tents to be struck immediately, and conveyed on board; and with them all the articles which had been deposited within the enclosure for the purpose of traffic. The retreat of our Europeans afflicted several of the chiefs, who lamented the melancholy accident which occasioned it: they reprobated the base act of treachery that had been committed, admitted that the offender deserved death, and protested that he should not long survive his crime. They endeavoured to obtain permission for the traffic to be continued as before.

The detachment of our navigators having advanced a little into the interior of the island, to observe the disposition of the natives, perceived that about a thousand of them had slept in the neighbourhood of their establishments. The commanding officer requested them to keep at a greater distance, which they did not consent to, except a small group of armed men, who instantly raising their clubs and darts, refused to recede a single step. Perhaps it would have been necessary to repress this audacity, but a chief named Toobou, one of the king's relations, fell on them with impetuosity, and dispersed them with heavy blows of his club.

The admiral, before he entered the boat to return on board, made presents to the several chiefs who were collected round him: he informed them that he expected them not only to give up the assassin, but also the musquet that he had stolen; as well as to restore the sabre which had been purloined the day before from one of the gunners. He then informed them that, on those conditions only, the traffic should be re-

tent, where they deposited the provisions that had been purchased in the course of the day; they were followed thither by two inhabitants whom they supposed were chiefs. Our naturalist put his hat upon the ground, supposing it to be in a safe place; but these two sharpers were attentive to their business; one of them dexterously concealed his hat under their clothes, and went away before it was missed; the other very quickly followed him.

* A prodigious number of canoes surrounded the ship for the disposal of their commodities, though the admiral had given orders for them to be kept off. Another kind of traffic, more particularly prohibited by the orders of the Admiral D'Entrecasteaux, was also connived at by the sentinels; a number of young girls, found little difficulty in escaping their vigilance, and entered every moment by the ports.

newed. All the inhabitants retired when the launch quitted the beach; but as soon as she had reached the ship, several of them repaired to the place which they had just abandoned, in hopes of discovering property that might have been left behind. They observed one of them who had the dexterity to extract a nail, on which one of the time-keepers had been suspended.

Feenou came on board in the afternoon, and presented to the admiral some bread-fruit, yams, plantains, and a hog; receiving, in return, a hatchet, a hand-saw, and several joiners' chisels; among which the natives gave a decided preference to the hatchet. After paying the greatest attention to the particulars of the assault, which had been perpetrated by one of the inhabitants on the sentry, he promised to have the musquet restored to them the next day; and assured them that he would also bring them the culprit, on whom he would execute justice in their presence.

Our naturalist had formed the project of going to pass the 28th of March on the island of Tongataboo, with some of his ship-mates; but the admiral persuaded him to defer this jaunt, till the chiefs had convinced him of their resolution of checking the depredation of their subjects*.

Toobou received, as a present from the admiral, a red coat, in which he dressed himself immediately; he also received a hatchet from him. *Feenou* was likewise complimented with a

* A great number of canoes surrounded the ships; but none of them were permitted to come alongside. Several islanders, perceiving that no traffic was permitted, amused themselves in fishing with nets, which were about eight meters long, by a meter and a half wide, and the meshes of which were a fourth of a decimeter square.

About nine in the morning three chiefs came on board, to inform our Europeans that they were shortly to receive a visit from *Toobou*, supreme chief (*eguilu**) of Tongataboo, Vavao, Annamooka, &c. that he was going to deliver up to them the culprit whom they had demanded, and to restore the musquet which he had stolen. About the hour of eleven, *Toobou* arrived, with several chiefs. The criminal was lying on his belly at the feet of the chief, with his hands tied behind his back. *Toobou* ordered him to be immediately conducted up the side of the ship, and the stolen musquet and bayonet which he had taken from the sentinel delivered up. Two pieces of cloth, fabricated from the paper mulberry-tree, each of which was sufficiently capacious, when extended, to have covered their ship, two hogs, and several large mats, were the presents he made to the commander of the expedition. The warrior, *Feenou*, not dissuading to perform the office of executioner, instant-

ly raised his club, to give the culprit a decisive blow upon the head: it was not without much difficulty that he could be prevailed on to avert the fatal stroke before their faces: at length he gave him up to the admiral's disposal, not doubting but he would receive such punishment as his crime demanded. The malefactor extended his neck, supposing his last moment was arrived. At this critical time, the sentinel arrived, who had been knocked down with his club, and entreated that the life of the criminal might be spared: his punishment was therefore mitigated to a few strokes on the shoulders with a rope's end. But *Feenou*, enraged at the mildness of the judgment proposed, again raised his club to dispatch him. The admiral, however, declared that he should live; but *Feenou*, to the last, insisted that he should not escape the punishment which he had merited.

At length *Feenou* brought the sabre which had been taken from one of the gunners, and delivered it to the admiral; at the same time making him a present of a large fish of the *perca* genus, called the *perca guttata*. Before he quitted them, he informed the conductors of the canoes on the spot, that the next day the traffic would be renewed†.

Not far from the market, whither the natives had resorted with their commodities for sale, a very jolly woman, at least fifty years of age, was observed, surrounded by an extensive circle. Many tokens of respect were shewn her, in the presence of our Europeans; as, by catching hold of her right foot, and placing it on their head, after having made a very low bow; others touched with their right hand the sole of her right foot. Several chiefs, whom they personally knew, also paid her other marks of deference. They were informed that she was queen

At this critical time, the sentinel arrived, who had been knocked down with his club, and entreated that the life of the criminal might be spared: his punishment was therefore mitigated to a few strokes on the shoulders with a rope's end. But *Feenou*, enraged at the mildness of the judgment proposed, again raised his club to dispatch him. The admiral, however, declared that he should live; but *Feenou*, to the last, insisted that he should not escape the punishment which he had merited.

† An islander exposed a dog to sale, which was the only animal of the kind, that our adventurers had seen at the anchorage: he spoke much in commendation of the poor quadruped, declaring it would furnish a most excellent banquet. It is known by the name of *kouli*, in these islands, and is usually of a fawn colour: it is not unlike a wolf-dog.

Tinch. Her hair, cut about two-thirds of a decimeter in length, was covered with a reddish powder; a part of her forehead was also ornamented in the same manner.

After having expressed a desire to go on board the *Recherche*, to see the commander of the expedition, she asked our adventurers to accompany her, and immediately embarked to go thither with part of her court. She gave a hog, some yams, and several very handsome mats to admiral D'Entrecasteaux, who made her a present of different pieces of cloth, which she seemed highly to esteem.

Tinch was very tenacious of the honours which they were under the necessity of displaying whenever they met her. *Feonou*, and the king's brother *Toobou*, were on board, and had promised to dine with them: when she came alongside, they immediately urged the people not to let her come upon the quarter deck; however, she presently made her appearance there, and they saw the two chiefs precipitately retreat into their canoes; for they would otherwise have been obliged to come and take hold of her right foot, and very respectfully incline their heads towards it, as an acknowledgment of their inferiority. This queen informed them, with an air of importance, that even king *Toobou* was compelled to pay her these marks of respect, because it was from her that he held his dignity.

One of the sailors held in his hand a piece of boiled salt pork, which *Feogo*, one of *Tinch's* ladies in waiting, seemed to wish to taste: he presented it to her, and she received it with pleasure; but not daring to take the liberty of eating it in the presence of the queen, the latter condescended to go and sit down about twelve yards further off, that her attendant might be at a proper distance from her; but before she quitted her place, she received from this young girl the same marks of respect as the other natives had paid her in their presence.

They were very near the small island *Nougounougo*, when some inhabitants pointed out to them, under the name of *Mackaha*, an islet near Pangaimatoo. They proceeded towards this island; and, as the tide was coming in, they were obliged to walk into the water up to their middle. Presently they arrived at the place

where the queen regularly held her court, under the shade of a very tufted bread-fruit tree. She was there giving a vocal concert, in which *Putatafaho* sang and beat time; which all the musicians exactly followed. Some performed their part in it by accompanying, with different modulations, the simple melody of the others. During this concert, a number of islanders appeared, each carrying on the shoulder a large stick, at the ends of which were suspended yams and fish: of these they formed the base of a quadrangular pyramid, which they raised to about two meters. This present was intended for Admiral D'Entrecasteaux, to whom *Tinch* was gixing an entertainment*.

One of the prettiest girls of the company had the little finger of her left-hand wrapped up in cloth made of paper mulberry-tree bark, which was stained with blood. As they were desirous of seeing the wound, she produced the two first joints of her little finger, which had recently been cut off on purpose, to cure a very serious disorder. The little girl soon afterwards departed; but not till after she had kissed the daughters of *Toobou*, in the manner of the inhabitants of the Friendly Islands; which consists in touching, with the tip of the nose, the nose of the person embraced.

The inhabitants which formed a circle round them, having stolen several articles of their property, they complained of their conduct to *Toobou's* daughters, who instantly quitted the room without uttering syllable; probably intending to go in search of their father, to request he would put a stop to the repetition of these thefts. Our adventurers remarked, that, as they were passing towards the island of Pangaimatoo, they saw a woman enjoying a meal in a very singular manner. Seated near a pillar, and motionless as a statue, she occasionally opened her mouth, to receive the pieces of bread-fruit which another woman put into it. They were informed, that she was not permitted to touch with her hands any kind of food, because she had, within a few days, washed the body of a dead chief.

When they arrived at Pangaimatoo, Queen *Tinch*, seated in a shed covered with cocoa-nut leaves, and erected under the shade of some fine

* Labillardiere then gave a long elaborate account of the Admiral's visit, in consequence of an invitation from King *Toobou*; but, judging of the probable feelings of our

readers, from what the editor experienced in passing through such an immense quantity of trivial and impertinent matter, he has thought it his duty to omit the particulars.

bread-fruit trees, was giving an entertainment to Admiral D'Entrecasteaux. She first commanded the young girls of her suite to dance, which they did with infinite grace. They sang at the same time, while *Puttafaihe*, who was in an erect position, directed their motions and animated them with his voice and gestures*.

The Europeans were assembled together, to the number of about thirty, and were quenching their thirst with the delicious juice of the cocoanuts which *Tineh* had presented to the admiral, when an islander had the audacity to snatch a knife out of the hands of one of their party. Indignant at so much effrontery, the robber was pursued by several as far as the island of *Tongataboo*; but, seeing themselves surrounded by a great number of inhabitants, they speedily returned towards the anchoring-place. However, the smith of the *Recherche*, a German by birth, thought proper to distinguish himself alone in the midst of these islanders. An affray ensued, and a launch manned and armed, arrived from the *Esperance*, commanded by Lieutenant *Trobrient*. Knowing little of the subject of the alarm, and supposing that the natives were disposed to fall upon them, the lieutenant ordered the detachment to seize a double canoe, at the very moment she was landing upon the coast. Most of the natives who were within her, instantly jumped overboard; but the chief, to whom she belonged, remaining on deck, *Trobrient* sent one of his boats' crew to secure him. This man, having aimed a blow at the native with a club, the latter disarmed him, and got possession of it: they then grappled with each other, and *Trobrient* fired at the islander, whom he killed by a musquet-shot. They were all exceedingly concerned at the unfortunate accident.

Another islander, who beheld this deed, threw himself into the sea, from the top of the canoe's mast. A soldier, who was a German by birth, whom our adventurers had taken on board at *Ambouyna*, perceiving the daughter of the unfortunate chief, who had concealed herself in the bottom of the canoe, and lifted up his sabre with intent to cut her down; but *Citizen Avignon*, a gunner belonging to the *Recherche*,

* One of the armourers of the *Esperance* was much surprised to see, among the dancers, the islander who had stolen his sabre. The fellow, perceiving he had been recognized, retired precipitately. Our adventurers expressed

seized the arm of the rash assailant, and threw himself between the soldier and the young girl, whose mother was not long in reaching the beach; weeping bitterly for the loss of her husband. The girl was much afflicted for the loss of her father, and struck herself with violence on the cheek and the breast, with her fist.

The Europeans retained, as hostages, the son of the king, and *Titifa*, chief of the Island of *Pangaimatoo*: but they observed, with much concern, the dejection into which this detention threw the king's son. The two chiefs passed the time in the great cabin of the *Recherche*. During the night they observed a great number of fires, on the north coast of *Tongataboo* than they had ever seen before. At day-break in the morning, they were waked by the piercing shrieks of two women, who were weeping as they conducted their canoe round the ship. They shrieked alternately, in order that their voices might be particularly distinguished; and *Titifa* instantly recognized them: they were his wife and daughter, who in the greatest agonies of grief were striking their cheeks and breast with their fists. He immediately ran upon deck, and assured them that he had been kindly treated on board, and that he might further appease them, he informed them that he should quickly return on shore. Soon after which he got into the launch with the son of king *Toobou*, and they were both conducted to the island of *Pangaimatoo*.

The wife and daughter of *Titifa* followed them in their canoe, when, as they were passing close to the *Esperance*, a musketoon accidentally went off, and a ball passed through the bottom of their skiff; they were then obliged to quit her, as she was sinking. Our adventurers received them into their boat, and they soon forgot the danger they had escaped. When they landed on the coast, the greater part of the natives left it, to retire into the interior of the island; but *Titifa* persuaded them to return, and ordered them to range themselves in a circle, which they implicitly submitted to. The traffic then recommenced immediately, and was conducted with great regularity: the chief continued with them, but

a desire to behold the feats of the wrestlers among the natives; but they were informed that such amusements were never exhibited in the presence of the queen.

Toobou's son deserted them as soon as he had set his foot on shore.

It now appeared that the chief who had been killed the preceding day, by *Trobrient*, was much esteemed by these islanders; several of them having given manifest proofs of their concern for him, and had seriously lamented his loss. Apprehending the natives might probably think of retaliating, the admiral ordered every person belonging to the expedition to remain within the inclosure where the traffic was carried on. Their ships were now amply supplied with all the provisions that these islanders could furnish. *Tiufa*, and some other chiefs, were not entirely free from inquietude, respecting the hostile intentions of some of the islanders towards them; they communicated their fears to them, and begged they would return on board before the close of the day. They had not sufficient authority to restrain the vindictive spirit.

On the approach of night they discovered that their rudder chains had been stolen*.

Vouacecece, one of the chiefs of *Fidgi*, had arrived at *Tongataboo*, a short time before our navigators had cast anchor. He informed them of what they had frequently heard, that, with south-east winds, it took him three days to go in his double canoe to *Fidgi*, the situation of which he described to be the north-west, about seventy-two myriameters distant from *Tongataboo*. This is an astonishing run for people, who, having no instruments to take observations, steer solely by the stars, as soon as they have lost sight of the land†.

King *Toobou* having been informed that our

* Many of the natives were incessantly asking for rings and glass beads, with which they decorated themselves as soon as they received them. Their requests were always accompanied with a gracious smile; at the same time gently inclining their heads, and placing one of their hands upon their breast.

On the 7th of April Queen *Tineh* came on board, when *Fecnuu* was in the admiral's cabin, to whom he had brought as a present, a beautiful crown, formed of the brilliant feathers of the red-shafted tropic bird, and others of a shining tint. When he came out, previous to his departure, he endeavoured to conceal himself from the sight of the queen; but when she perceived him, she obliged him to approach, and perform the foot-ceremony. He did not dare to refuse her these honours, but he performed the unpleasant task with a very ill grace.

† Our Europeans were informed, by the inhabitants of *Tongataboo*, that all the natives of *Fidgi* were cannibals;

Europeans would speedily quit the island, arrived on the 8th to endeavour to procrastinate their departure, at the same time expressing much concern at their determination to sail so speedily‡.

Our navigators had often seen the chiefs openly take possession of articles belonging to the people; and they always remarked, with astonishment, that this kind of oppression did not lessen the unalterable gaiety of their disposition. When they were again assembled, they heard them continually breaking out into violent bursts of laughter.

From the intelligence given to our navigators, by the most respectable inhabitants, concerning the ships which anchored in this archipelago, they were convinced that *La Perouse* had not put into any of these islands. Besides, they affirmed that no fatal accident had happened to the vessels that had stopped here, except to *Bligh's* launch.

The inhabitants of the Friendly Islands are, in general, tall, and well proportioned; for which they are doubtless principally indebted to the abundance, and the good quality of their food. The elegant form of these islanders is not injured by hard labour. Their muscular appearance induced our Europeans to suppose they were extremely strong, but they perceived that an indolent inactive life had rendered them incapable of making great efforts.

Both men and women have a custom of cutting off one or two of the joints of the little finger; and sometimes of the third finger, with a superstitious idea of curing themselves of some severe and alarming disorders.

but *Vouacecece* endeavoured to exculpate himself from this charge, by asserting that it was only people of the inferior class (the *touas*) who ate human flesh: it appeared, however, from other respectable information, that it was likewise eaten by the chiefs.

The admiral received, as a present from *Futtasaihe*, a small canoe with an outrigger, newly built. It was three meters long, three decimeters broad, and could only carry two persons.

‡ On the 9th they were visited by several chiefs early in the morning, when they informed the inhabitants, that they were on the point of quitting the island: our adventurers were much surprised at seeing numbers of young girls burst into tears upon the occasion, and uttering the most grievous lamentations. Their grief was doubtless very poignant; but it was not very durable: many minutes had not elapsed when they were seen making merry with their female companions.

The

VOL. I

The natives of the Friendly Islands have a swarthy skin, from their frequently exposing themselves to the heat of the sun; but the women, who are pretty constantly resident in

their habitations, or under the shade of the trees, have a very fair complexion. The latter have also, in general, a very agreeable, and a very animated countenance.

SECTION XII.

Departure from Tongataboo—Make the South Part of the Archipelago Del Espiritu Santo, or New Hebrides—Anchor at New Caledonia—Interviews with the Natives—Description of their Huts—These Natives are Cannibals—Their Impudence—Their Attempts to get Possession of the Europeans' Boats—Excursions into the Interior—Death of Captain Huon—New Species of Spider, eaten by the Savages of New Caledonia.

ON the 10th of April our adventurers got under sail about seven in the morning. Some natives followed in their canoes, testifying their extreme concern at seeing them depart from their island. They soon, however, outstripped the canoes, which were conducted only by means of paddles. They ceased to follow them as soon as they had gained the open sea. The next day at five in the afternoon, they saw Turtle Island to the north west by north. On the 16th, at seven in the morning, the *Esperance* made the signal for land at the distance of about four myriameters. It was *Erronan*, the most easterly of the islands of the Archipelago *Del Espiritu Santo*, discovered by Quiros in 1606. A little before noon they got sight of Anatom, bearing south-west by south, distant five myriameters*.

They were standing to the westward with a fresh easterly wind, when, about three in the morning of the 18th, the officer of the watch heard the cries of a flight of sea-birds passing very close to the ship. Fearing they were in the vicinity of the rocks, which frequently serve them as a retreat, our navigator resolved to wait for day-light before he continued his course. When the dawn of day appeared, he discovered, at a little distance to leeward, a great extent of reefs, on which the ship must have gone to pieces, had they not casually made this discovery. The night was extremely dark, the wind blew very fresh, and it would have been impossible to perceive the breakers time enough to avoid

them. Beyond this shoal they discovered, bearing to the south-west, an island about a myriameter distant from it, and to which was given the name of Citizen Beaupre, the geographical engineer of their expedition.

About one in the afternoon they discovered, to the south-west, the high mountains of New Caledonia; and at half past four they were two kilometers from the reefs which skirt that island. Here the foot of its mountains is washed by the sea. They observed a fine cascade, the waters of which, after often disappearing in deep gullies, rose again, and discharged themselves into the sea; and they admired the picturesque effects of the torrents which they perceived towards the south-west; the foaming waters of which produced an agreeable contrast to the dull verdure of these elevated lands.

At day-break on the 19th, they approached within a kilometer and a half of the reefs, ranging along them to discover the channel by which it was necessary for them to enter, in order to arrive at the anchorage. Their depth of water in the cut formed between the reefs; was from ten to twelve fathoms and a half; and as they were between the reefs and the shore, they had no more than from six and a half to eight fathoms. A double canoe immediately got under sail to come off to them: she was manned by eleven natives, who displayed great knowledge of the art of navigation. After addressing their discourse to our adventurers, and waving about

became colder. During the night they enjoyed the brilliant spectacle of these clouds, which were irradiated by the resplendent light of the burning substances, vomited, at intervals, from the bottom of the abysses of the volcano.

* At five in the afternoon, they made the island of Tanna; columns of smoke were issuing from its volcano, and extending themselves in the air, forming clouds which at first rose to a prodigious height; and which, after having traversed an immense space, gradually sunk lower as they

some pieces of white cloth, at the distance of about two hundred meters from the ship, they returned towards the coast.

The *Esperance* being a little to the windward of them, ran aground on a shoal; when the *Recherche* manœuvred so effectually as to avoid the same danger, and they anchored soon after in order to be enabled to give her assistance. Admiral D'Entrecasteaux immediately sent their launch to her, and by eight in the evening, intelligence was received that she was brought afloat again, without having received any damage*.

The adventurers held up some cocoa-nuts and yams, entreating them to furnish them with a quantity of those articles; but instead of going to procure such food for sale, they wished to purchase theirs; offering, in exchange for them their darts and clubs, acknowledging that they were very hungry; at the same time applying their hands to their bellies, which appeared extremely lank. Perceiving that the Europeans had some poultry on board, they instantly imitated the crowing of the cock, in so exact a manner as to convince them that they had such feathered animals in their island. None of the women, who were a part of the freight of these canoes, could be prevailed on to enter the ship; and when the adventurers wished to oblige them with any article, the men undertook to deliver it to the proper person.

Their canoes are not built in so workman-like a manner as those of the Friendly Islands: one of them received so much damage in her side, by striking violently against the ship, that she filled in a very little time. The savages, who were in her, immediately jumped into another, and suffered themselves to be drifted by the current, which carried them towards the land. Very early in the morning of the 21st, they weighed, in order to warp towards Observatory Island, by means of hawsers fastened to each other; but they broke repeatedly; and obliged them to let go the anchor again.

Our navigators were immediately surrounded by canoes, conducted by the natives, which came

on board and bartered for a variety of their articles; but those who were possessed of cocoa-nuts and sugar-canes, would not part with them for any price.

The savages were quite naked: their hair is woolly, and their skin almost of as deep a black as that of the natives of Cape Diemen, whose cast of countenance strongly resembles theirs. Several had their head surrounded by a small net with wide marshes. Some had braids of grass fastened to their hair, together with that of the bat, which extended to the middle of the back.

Most of these islanders were armed with darts and clubs, and carried in their girdle a bag filled with oval stones, which are destined to be thrown in their slings. The inferior lobe of their ears, in which a large hole was bored, hung down to their shoulders; embellished by some with leaves of trees, and by others by a piece of wood, serving only to increase its size. Several had that particular lobe cut into shreds. Behind the ears of one of these savages, our navigators remarked some tubercles in the shape of a sweetbread, and half the size of the first. He was much flattered at having this ornament examined; the magnitude of which was increased by means of a caustic.

The women had no other garment than a fringe, formed of the filaments of bark, which answered the purpose of a girdle, passing several times round the body. The canoes kept close to the ship, by the assistance of ropes which had been thrown to the conductors. By way of anchor, the savages had a heavy stone fastened to a long rope, but none of them rode by it.

On the 22d, our adventurers weighed at six in the morning, and made several tacks to get nearer to Observatory Island, named by the inhabitants *Pudyoua*. When they anchored, at half past ten, they saw the land of New Caledonia, the nearest coast of which was eleven hectometers and a half distant from the ship. The inhabitants had no occasion for their canoes in paying them a visit, most of them leaping into the water, loaded with the articles which they wanted to dispose of.

* The next day, at sun-rise, four canoes advanced towards their ships, but the people in them betrayed some fears as they came nearer; one of the savages, however, who conducted them, yielded to the invitation of the Europeans by coming on board; and his example was followed by many of the others. They were surprised to find

that they preferred cloth to nails or hatchets; though they could readily perceive they were not unacquainted with the value of iron, which they designated by the name of *pitiou*; but the hard stones, frequently employed among them, render the use of this metal much less necessary than to many other islanders of the South Sea.

Going on shore about one in the afternoon, our adventurers were surrounded by a multitude of inhabitants, who issued from the middle of the woods, through which they had penetrated at different times, without going far from the sea-shore. Here they saw a few insulated huts, three or four hundred yards distant from each other, and shaded by a small number of cocoa-nut trees. Some time after they observed four, which formed a little hamlet in a gloomy part of the forest: they were each formed like a bee-hive, and were about three meters in width and breadth*.

On the return of the Europeans to the landing-place, they found upwards of seven hundred natives, who had flocked thither from all quarters. In exchange for their goods, they asked for cloth and iron; and some of them took the earliest opportunities of proving that they were most audacious thieves. The following instance will demonstrate what is here advanced. A fellow proposed to barter with one of our adventurers a bag filled with oval stones, which he carried at his girdle, for a certain equivalent. He untied the bag, and pretended to give it the European with one hand, while with the other he received the value that had been stipulated: but, at that instant, another savage, who was placed behind him, began to scream outrageously to induce him to turn his head, when the knave ran away with his bag, and with the European's property; and endeavoured to conceal himself among the crowd. They did not, however, wish to punish him, though most of the party were armed with muskets†.

* Many of these huts are surrounded by a palisade, a meter and a half high, made with the leaf stalk of cocoa-nut trees: there were also a great many which were not surrounded by palisades. Near some of these dwellings, small heaps of earth were raised three or four decimeters, and covered towards the middle with a very open lattice-work, two or three meters high. The savages call them *abouet*, and intimated that it was a burial-place. The natives inclined their head on one side, supporting it with their hand; they afterwards shut their eyes, to express the repose enjoyed by the remains of those who are here deposited.

† One of the savages, having in his hand a bone newly broiled, and in the act of devouring the remains of the flesh which was still upon it, advanced towards Citizen Piron, and invited him to partake of his meal. The latter, imagining the savage was offering him a piece of some quadruped, accepted the bone, which was then covered only with tendinous parts; and having shewn it to our na-

On their arrival on board, they were astonished to find none of the natives there: the reason was instantly communicated. It appeared that they had exercised the art of thievery in such a daring and shameless manner, that they had been driven away on account of the multiplicity of their offences. Many of them had gone off in their canoes, and the rest had jumped into the sea, to effect their escape on shore.

Few of those belonging to the expedition, who remained on board, would believe the particulars related of the barbarous propensity of these islanders: but Labillardiere brought with him a bone, now picked clean, which their surgeon recognised to be that of a girl. He presented it to the two natives, whom he had on board, and instantly one of these *anthropophagi* seized it with avidity, and tore with his teeth the ligaments and cartilages which yet remained: he then presented it to his countryman, who seemed highly gratified with gnawing it.

Near the watering-place was found an iron candlestick, eaten with rust, which had probably remained there since 1774, the period when Captain Cook anchored in this roadstead‡.

The heat was now excessive, and our Europeans had not yet found any water. They followed a gully, where they beheld the traces of a torrent which there falls in the rainy season: the verdure of the shrubs in the vicinity of its banks, induced them to hope that a spring might probably be near it, at which they might extinguish their thirst. Soon after they beheld a very limpid streamlet issue from the bottom of an enormous rock, whence it flowed, and filled a

turalist, he perceived that it belonged to the *ossa inominata* of a youth of about fifteen years of age. This cannibal thought it not disgraceful to avow that the flesh which had covered these bones, had served as a meal to some islander, and extolled it as delicious food.

This discovery created some uneasiness among the party, respecting the fate of some of their people who were still in the woods; but they all made their appearance in a very short time afterwards; and they had no longer any apprehensions of falling a victim to the barbarity of these savages.

‡ On the 23d they landed, early in the morning, on the nearest part of the coast, where they found some savages who were partaking of a repast. They invited our Europeans to take a relish of some human flesh, which had been recently broiled. They signified, by very expressive signs, that, after having pierced with their darts, the individual whose remains they saw in their hands, they had dispatched him with their clubs. They probably meant to insinuate that they only feasted on their enemies.

great

great cavity, in a neighbouring sand stone. Our adventurers stopped at this place, and the natives came and seated themselves by them. They offered the latter some biscuit, which they readily ate, though it was worm eaten; but they would not taste any cheese.

When our adventurers had proceeded half way up the mountain, the natives desired they would advance no farther: assuring them that the inhabitants on the other side of that chain would eat them. They ascended, however, as far as the summit; for, being well armed, they were under no apprehensions from these cannibals. Those who accompanied them were perhaps at war with the others, as they would not attend them any farther.

On their return, our adventurers stopped at the foot of this mountain, in the midst of some savage families assembled near their huts, and intimated a desire of quenching their thirst with cocoa-nut juice; but as that fruit was far from being plentiful in this part of the island, they did not immediately consent to sell them any. At last one of them ascended a lofty-cocoa-nut tree, and pulled some from the top to present to them. Holding the trunk of the tree with his hand, he rapidly run up all its length, and displayed more agility than they had ever before seen exerted, among the other islanders that they had visited. The waters of the sea frequently washed the foot of the cocoa-palm, the fruit of which they had procured; whence the tartness of the beverage was easily accounted for; but, being thirsty, they did not find it disagreeable.

Several thefts and outrages having been committed by different parties of the savages, many of their movements had been noticed from on board the *Recherche*; the admiral therefore ordered two guns to be fired at them, which dispersed them immediately into the woods; but shortly after, one of their chiefs advanced towards them, alone and unarmed, holding in his hand a piece of white cloth; which the commanding officer received as a pledge of the good understanding that was not afterwards to be interrupted between the savages and them.

On the 29th our adventurers set out early in the morning, to the number of about twenty-

* A heavy shower obliged our adventurers to seek a shelter in the cavities of the rocks, where they continued for some time. They invited the savages, who attended them, to

eight, all well armed, intending to cross over a very lofty mountain to the south east; and afterwards to descend, if the weather was favourable, into a fine valley which they had perceived, very far behind this mountain. Walking first to the eastward, along the shore, they entered a large wood, where, among the different birds which they killed, they saw a beautiful species of magpie, which they denominated the magpie of New Caledonia; it is black, except the upper part of the belly, the back, and the neck, which are white; it is of a pale black for two thirds of its length, beginning at the base.

When one of the party expressed to the savages a wish to have some water, two of them immediately offered their services to fetch some from a gully, at the distance of about two thousand yards. Thinking these voluntary servants were a long time gone, the party began to suspect that they had carried off the bottles, which had been entrusted to them; but they at length returned, and seemed happy at having had it in their power to procure for them some very clear water to quench their thirst*.

On the 7th of May they were informed of the death of Captain Huon, which occasioned deep regret to all the persons belonging to the expedition. About one in the morning, this skilful seaman had sunk under a hectic fever, which had preyed upon him for several months. He had supported the approach of death with becoming firmness. He was buried, according to his dying request, in the centre of the island Pudyona, about the middle of the night. He had requested that no monument might be erected to his memory, fearing the inhabitants of New Caledonia might discover the place of his interment.

Soon after sun-rise they landed on the coast to the number of eight, and penetrated into the woods to the west-south-west. Passing near a hut, they saw a native, holding in his hand a mask, which he offered to sell for two joiners' chisels. It was cut out of a piece of cocoa-nut tree. He repeatedly covered his face with it, and looked through the holes which had been perforated in the upper part. It had no aperture at the eyes, but only at the mouth. It is pro-

partake of their repast: but they were exceedingly surprised to find that these cannibals would not eat the salt pork which they offered them.

hable that these people make use of masks that they may not be recognized by their enemies, when hostilities are meditated*.

A marine, who accompanied them, had lost one of his pistols: the inhabitants of the huts were informed of this circumstance, and that a reward would be given to any person who should bring it to the owner. About half an hour afterwards, a savage was observed running towards them to restore the lost article, which he declared he had found upon the sands. At this intelligence the soldier recollected that he had forgot it in the place where he had dined. A bit of cloth, and a waistcoat, fully recompensed the islander for his honesty and trouble. He took his leave of them, pronouncing the word *alaouai*, after having slightly bowed his head, and went away well satisfied.

When the party had reached the beach, one of them fired off a musquet to call the attention of the people on board the ship, and as a signal for them to send them a boat: the report of this piece drew about eighty of the natives round them: all of whom were prevailed on to sit down as they arrived. One of these savages had a few sweetish oranges, which he readily parted with for a pair of scissors.

On their arrival on board, they heard that several persons belonging to the *Esperance*, being in a boat, had just been furiously pelted with stones by some savages; on whom they had found it necessary to fire several musquets to compel them to retire into the woods. It must, however, be acknowledged that this skirmish was occasioned by the imprudence of one of their own people, who, wishing to make the New Caledonians keep back, had levelled at him his musquet, which he had through awkwardness fired off.

On the 8th of May, Admiral D'Entrecasteaux appointed Dauribeau to the command of the *Esperance*.

* Two children were observed near a fire, regaling themselves with spiders of a new species, which our adventurers had frequently remarked in the woods, where they spin threads of such an astonishing strength, that they were often much incommoded by them in their excursions. The children first killed them, by shutting them up in a large earthen vessel, which they were heating over a considerable fire: then they broiled them on the embers and ate them: a hundred of them, at least, were swallowed in the pre-

Our naturalist went ashore in the afternoon, and presently perceived some of the inhabitants insulting their fishermen, and endeavouring to take from them the net, with the fish they had recently caught. They were obliged to fire at them several times, before they could completely disperse them. All this time they stood firmly on the beach, repelling the attack with their slings; and severely wounded the gunner of the *Esperance* in the arm with a stone: they then fled precipitately, but in a few minutes they returned to their charge. At length, perceiving two of their party brought to the ground by musquet shots; and so wounded as to be incapable of crawling into the woods, without the utmost difficulty, the panic became general: they fled, and not an individual among them had the audacity to attack them again.

The next morning, at day-break, our Europeans landed on the shore the nearest to the ship; six of them, all well armed, penetrated into the woods, and walked to the south-south-west. Our naturalist found, in this excursion, a great many vegetable productions, which he had not before gathered. Being already got to a considerable height in the mountains, some of their people thought proper to fire off their musquets in the air, merely to discharge them before they returned on board. The noise of these small arms induced them immediately to direct their steps towards them, apprehending they might probably be involved in some quarrel with the savages.

Night coming on, they got into the boat, intending to go on board their ship, but the wind blew so strong at east-south-east, and the current was so rapid, that they were carried forcibly to the westward. With much difficulty they reached the *Esperance*, whence they set off half an hour after, when the weather was become more favourable, to proceed to the Recherche†.

Their

sence of the Europeans. The inhabitants of New Caledonia call this species of spider *nouque*.

† The inhabitants of New Caledonia are, in general, of a middling stature, and have woolly hair; but it is customary, with many of them, to pluck out the hair: some of them, however, permitted their beards to grow. The colour of their skin is as black as that of the savages of Cape Diemen; but they do not, like them, cover themselves with charcoal dust. Several of them were adorned with

Their darts are about five mètres long, and not above six centimeters in circumference near the middle. They have an ingenious method of accelerating the velocity of these javelins when they throw them. For this purpose they use a very elastic piece of cord, made of cocoa-nut bass, and the hair of the *vespertilio ternatatus*; they fix one of its extremities to the end of the fore-finger, while the other, which is terminated by a kind of round button, embraces the dart, on which it is disposed, in such a manner that it flies off the weapon as soon as it is thrown.

The well known voracity of these Caledonians, deterred the admiral from giving them the *he* and *she* goat which he had intended for them. It was generally believed that they devoured the hogs and dogs, of which Captain Cook made a present to one of their chiefs, before they suf-

fered them to multiply. They paid very little attention to their fowls. Our adventurers saw only three hens and a cock, while they remained upon the island.

Our Europeans, during their residence here, could obtain no information respecting the fate of the unfortunate navigators, who were the principal objects of their researches. It is not, however, beyond the sphere of probability to imagine, that this dangerous and almost inaccessible shore has been fatal to them. It is certain that La Perouse was to explore its western coast; and it cannot fail of exciting horror in the feeling mind to reflect on the destiny of those hapless voyagers, who may be compelled by shipwreck, to take refuge among the cannibals by whom it is inhabited.

SECTION XIII.

Departure from New Caledonia—Interview with the Inhabitants of Santa Cruz—Their Dishonesty—A Savage fatally wounds a Sailor with an Arrow—See a Part of Solomon's Archipelago—Interview with the Inhabitants—Their Treachery—Explore the North Coast of La Louisiade—Interview with its Inhabitants—Death of Admiral D'Entrecasteaux—The Scurvy makes great Ravages—Death of the Baker of the Recherche—Anchor at Waygiou.

ON the 10th of May, early in the morning, our navigators set sail for New Caledonia; but when they had gained the open sea, they were becalmed near a large chain of reefs, and against which the sea was breaking with violence; but they succeeded in drawing off from them by means of a light breeze from the south-east: they ran along them on the two following days, and on the 13th they discovered, beyond this chain, Moulin's Island; and soon after made Huon's Islands. On the 14th, the ship was on the point of striking on the shoals, with which these islands are surrounded, when day-light presented to them the danger of their situation; in consequence of which they immediately tacked, and stood away from them.

Soon after they directed their course towards

necklaces, made of plaited hair; and their arms are sometimes decorated with bracelets cut out of shells, or of quartz, and other hard stones. These warlike people are particularly attentive to the manufacture of their weapons, which are remarkably well polished. They seemed, however, to be unacquainted with the use of the bow.

the island of Santa Cruz*, which they beheld to the north-west, at about four myriameters distance. On the 21st, about four in the afternoon, they saw coming towards them, two natives in a canoe, with an outrigger. They stopped at a considerable distance, till five other canoes had joined them, and then advanced nearer to the ship. They invited our Europeans by signs, to land upon their island; but none of them would venture to come on board, though repeated invitations were given them; one of them, however, came within the distance of about fifty meters. They had bows and arrows, and their persons were ornamented with necklaces and bracelets, studded with shells.

On the 22d, at dawn of day, our navigators stood in for the land, and they presently per-

* This island was first discovered by Mendana, in his second voyage, in 1596, and received the name of *Egmont Island* from Captain Cartaret, who visited it in August. See Hawkesworth's *Voyages*; and *Navigations aux Terres Australes*, by de Brosses.

ceived twelve canoes steering towards them. They came alongside the ship; and many of them were loaded with different sorts of fruit. It was somewhat surprising, that these islanders appeared to hold iron in no considerable degree of estimation; though one of them had in his possession the end of a joiner's chissel, mounted in a wooden handle; but when they had been shewn some pieces of red cloth, they pronounced, in the accents of admiration, *youlee! youlee!* They were so well pleased, that they even consented to part with some of their weapons; but, afterwards, fearing that they might probably be turned against themselves, they would not sell any of their bows; and even took off the barbs from the arrows, before they would consent to part with any of them*.

At eight in the morning the Admiral sent two boats to sound a bight which they perceived at two kilometers distance to the north-west. On a sudden they were not to be seen, and apprehensions were entertained respecting their safety; when they reappeared about noon, at the opening of the channel that they had just examined: several musquets which had been fired from these boats, had proclaimed to them that they had been attacked by the savages; and, on hearing the reports of these musquets, the surrounding canoes had precipitately fled. This bight, which had been taken for a bay, was found to be one of the extremities of a channel, which separates Egmont Island from that of New Jersey.

A quantity of canoes had followed their boats, whilst considerable groups of savages on the beach, strove to attract them towards the shore, by exhibiting cocoa-nuts, plantains, and other different fruits: at last some of the natives leaped into the water with their articles, to receive the pieces of cloth of various colours, which they were to have in exchange.

* Of their dishonesty, they exhibited many proofs: that they might obtain the European articles of traffic for nothing, they offered a fair and liberal price, but stipulated that they should be delivered before hand. When that part of the condition was complied with, they had the daring effrontery to keep possession of the article, and absolutely refused to pay the value that had been agreed on.

† These islanders delight in chewing betel; they had leaves of it, with cashew-nuts in bags made of matting, or of cocoa-nut bass. These people are generally of a deep olive colour; and their cast of countenance assorts with that of the greater part of the inhabitants of the Moluccas:

The boats, having returned to the entrance of the channel, not far from a small village on the coast of New Jersey, were on the point of quitting these savages; when one of them was observed standing up in the middle of his canoe, and preparing to direct an arrow at a man in the *Esperance's* boat. Though all the Europeans were on their guard, this islander recommended his hostile demonstrations. One of the seamen levelled his piece at him; but the savage, disregarding his threat, deliberately bent his bow, and shot off an arrow which struck one of their boat's crew in the forehead, though he was at the distance of eighty meters. This was instantly returned, by the discharge of a musquet and musketoon. The latter piece covered, with a shower of bullets, the canoe from which the arrow had been directed; and instantly the three islanders who were in her, jumped overboard. Soon after they returned to their canoe, and paddled towards the coast; but at length the aggressor was struck by a ball, when they all three jumped overboard a second time, and swam away; abandoning their canoe, with some bows and arrows, of which the boats' crew took possession†.

The nose and ears of most of them are pierced with holes, to which tortoise-shell rings are affixed. Most of them are tattooed, and particularly on the back‡.

The sailor who had been struck with the arrow, suffered but little pain. He refused to have his wound dressed by the Surgeon of the *Recherche*; choosing rather to wait till he returned on board the *Esperance*. Indeed it was not then supposed that so slight a wound could possibly be fatal to him.

After running along the coast for about a myriameter and a half, our adventurers arrived opposite to a large bay, where there was probably a good bottom, but it is open to the south-east winds which were then blowing.

It was, however, remarked that some of them had a very black skin, thick lips, and a broad flat nose: and who appeared to be of a very different race; but all of them had wide foreheads, and curly hair. They are rather tall, but their thighs and legs are far from being muscular, occasioned, as it is supposed, by a life of indolence, and by passing so much of their time in their canoes.

‡ These savages had a particular fondness for white hair, as it formed a striking contrast to the colour of their skins. The *beaux* of these regions are said to employ lime to produce this effect; a practice which also prevails in the Friendly Islands.

Our

Our navigators had not seen any canoes along this coast till about four in the afternoon of the 27th, when they observed a skiff entitled to that denomination approaching the ship. They were much astonished that the islanders who were in her had dared to venture in so hazardous a conveyance, the greatest breadth of which did not exceed two thirds of a meter. The conductors were under the necessity of seating themselves in the deepest part, to keep the canoe in proper trim. When they were within about two hundred and fifty meters of the ship, they addressed a few words to them in a very audible tone, pointing to their island, to which they invited them to repair: they condescended to come a little nearer, but a very hard swell compelled them to regain the shore. These islanders were as naked as the inhabitants of Egmont island*.

On the 30th, with very little wind, the currents very perceptibly carried our adventurers towards the *Island of Contrarities*. They were three kilometers from it, when a canoe put off from the coast to come alongside of their ship. She contained four natives, who displayed much gratitude for the presents of cloth and hardware bestowed upon them, and gave them several cocoa-nuts in return†.

On the 12th, at ten in the morning, they made the coast of *La Louisiade*‡; and on the 18th, in the morning, they saw two canoes, with outriggers, and under sail, each manned by twelve savages: they ran rapidly round the ship, observing their motions with the strictest attention;

* The *Esperance* came within hail of the *Recherche*, about eight in the evening of the 29th, to communicate the particulars of an act of treachery of some of the islanders. She had been surrounded during the preceding night by a great number of canoes, from which only two natives had come on board. These had bestowed the highest commendations on the produce of their island, and promised to procure a large quantity of them for their people, if they would come on shore. These two men, however, went away about the middle of the night; but, among many of the canoes that had remained near the *Esperance*, one of them was observed to be considerably larger than the others, which, on the approach of day, paddled several times round the ship. At length this canoe stopped for about a moment, and instantly flew from it at least a dozen arrows; by which M. Dessert, one of the ship's company was wounded in the arm: most of the other arrows had struck into the ship's side. After this perfidious act the wretches fled. A musquet discharged a ball after them without doing any execution: but a sky-rocket, aimed with great precision, burst quite close to their canoe, and threw them into great consternation.

but continued at a considerable distance. Every thing proclaimed to them a numerous population on the southern coast. Soon after they beheld, coming towards them, several canoes, each containing ten or eleven savages, who kept at about a hundred meters from them; but the bits of cloth, which were thrown overboard for them, induced them to come nearer. They appeared surprised at seeing in the ship a young negro, which they had taken on board at Amboyua. These islanders had woolly hair, and their skin was of an olive colour. None of them wore any cloathing, but they were decorated with bracelets, to which different shells were affixed. Some had a small bone, in a hole bored through the septum of the nose.

Two canoes were observed close to the *Esperance*, at half after three in the afternoon, at which time the musquet shots were fired from that ship, and the savages rapidly paddled away. It was soon proclaimed that the natives, without the least provocation, had provoked this attack by throwing stones at the crew. Fortunately, however, these treacherous islanders had not hurt any one; and the officers of the *Esperance* only fired at them to frighten them.

The commander of the *Esperance* sent Admiral D'Entrecasteaux a bludgeon, and a shield, which he had procured from these savages. The bludgeon was broad, and flat at one of its extremities. The shield was the only defensive weapon, which had been remarked among the savage nations which they had visited. It was

† On the 4th of June, our navigators doubled Cape Hunter: and on the 9th, the Captain of the *Esperance* informed them of the death of Mahot, the unfortunate fellow belonging to her crew, who seventeen days before had been wounded in the forehead with an arrow, by a savage of Egmont Island. Many persons presumed that the arrow from which he had received the wound, had been poisoned: but those of which the Europeans had taken possession, were found not infected with poison; for they pricked with them several fowls, and no bad consequences ensued. It is by no means uncommon in scorching climates, to see the slightest scratch followed by a general spasm, which is generally a symptom of death.

‡ This land, which was discovered by Bougainville, in 1768, appears to have been unknown before that period.

It seems probable that the land called *Louiside* by Bougainville, is either an extension of Papua, or islands adjacent to the south-east. In either case, when it shall have been sufficiently explored, the description will probably fall into this division. *Pinkerton's Mod. Geog.* ii. 483.

about a meter high, five decimeters and a half broad, and a centimeter and a half in thickness. It was of very hard wood, and the outside was slightly convex.

On the 21st, at about seven in the evening, our Europeans lost Admiral D'Entrecasteaux. He sunk under the violence of a dreadful cholera,

which he had endured two whole days. For a considerable time he had experienced some slight symptoms of scurvy; but they did not suppose themselves threatened with so severe a loss. On the 11th of August they doubled the Cape of Good Hope of New Guinea, and on the 16th they anchored at Waygiou.

SECTION XIV.

Stay at Waygiou—Scurbutic People relieved—Interview with the Natives—Anchor at Bouru—Pass the Strait of Boutin—Ravages of the Dysentery—Anchor at Sourabaya—Stay at Samarang—Detention at Fort Ankai—Stay in the Isle of France—Return to France.

WHILST our navigators remained at Waygiou, they were frequently visited by the natives, who brought them turtles, many of which weighed from ten to twelve myriagrams; the principal part of which they had taken on the Aiou Islands. The soup which had been extracted from them afforded great relief to their scorbutic patients. The inhabitants, knowing how much they were coveted, demanded about ten times their value for them. The natives also sold them some turtles' eggs boiled; and some turtles' flesh dressed after the manner of the Buccaneers. They also offered them sago, under the form of a sourish paste, which they had caused to ferment.

Most of the islanders have the body entirely naked; the heat of the climate rendering any kind of covering unnecessary. The chiefs, indeed, are dressed in a very wide pair of pantaloons, and a banyan of cloth, which they purchase of the Chinese, who occasionally anchor near this spot. Some were embellished with silver bracelets, which they had also procured from the Chinese. The greater part of the chiefs of these savages had been to the Moluccas, and spoke the Malay language. Some of them wore a hat made of the leaves of the *pandanus*, of a conical shape, in imitation of the Chinese; and others had the head wrapped up in a sort of turban. They have, almost generally, thick, long, and curly black hair. They shewed great dexterity in shooting with a bow, at the distance of upwards of forty yards, to which their arrows al-

ways came extremely near. Some of the natives are armed with very long spears, tipped with iron or bone.

These islanders seem to know how to manufacture iron, for they set a great value on the bars of that metal which were given them: they also manifested an inclination for tin; but they gave a very decided preference to their cloths, especially those of a red colour. The island of Waygiou, called by the inhabitants *Owaridu*, is covered with large trees, and seems a very mountainous country. The bamboo huts of the natives are raised on stakes to about three meters above the ground, and covered with leaves of the fanpalm.*

During their continuance in this island, our naturalist was constantly visiting its forests, and gathered a rich collection of new plants. He also killed several very scarce birds; among others the species of *promerops*, which *Buffon* called the *promerops* of New Guinea, a large black cockatoo, and a new species of hornbill, to which he has given the name of *Catalao* of the island of Waygiou. It has an arched bill, of a dirty white, two decimeters in length; and each mandible is unequally indented; the wings and body are black, and the tail is white, and the neck of a brightish rufous. This beautiful creature is eight decimeters in length, from the end of the bill to the extremity of the feet.

A great many wild cocks were seen in the woods. The female produced by one of the natives was not much larger than a partridge, though the

* It is a very singular fact that, at the moment they landed, such of the seamen as were in the least affected with the scurvy, and even those who had no appearance of it,

were considerably swelled in every part of the body; but this symptom, which very much alarmed many of them, entirely disappeared after three or four hours walking.

eggs she laid were twice as large as those of the European hens. The species of wild hen is black, whilst that which Labillardiere killed in the forests of Java was of a grey colour*.

While they continued here, they received a visit from several chiefs. One who enjoyed that rank at Rawak, had supped and slept on board the *Esperance* the eve of their departure; but when he saw that they were preparing to weigh anchor, he jumped overboard, fearing that they intended to carry him away. This intimidation was accounted for, when our adventurers were afterwards informed that, five months before, the Dutch had carried off his brother, in the midst of an entertainment which they had given him on board their ship. The chief's clothing consisted of a pair of pantaloons, and a very wide banyan, with a suttin waistcoat; rings of gold were, however, pendant at his ears.

On the fourth of September they anchored in the road of Buro, at the distance of two kilometers to the north-north-east of the Dutch settlement. The commandant of this post immediately dispatched to them a corporal, to offer them such refreshments as they might stand in need of. In a few minutes afterwards, some musquet-shots were fired into the middle of a herd of buffaloes, which were grazing on the shore; and the corporal informed them that the president had ordered the two fattest to be killed for the two ships. Being no stranger to the wants of navigators, he sent our adventurers a great quantity of fruit, several bottles of a very pleasant *liqueur*, extracted from the sago-palm, and some young leaves of a species of fern of the *asplenium* genus.

This, and a few successive days were employed in visiting the different districts of the island, which every where presents a diversified and picturesque aspect. The sago-palm is very common here, forming the principal food of the inhabitants; and is also an article of exportation.

The island of Buro contains several kinds of wood, appropriated to cabinet-work. Two

Chinese junks were then aground on the mud, to the north-west of the Dutch fort. The village near which this fort is built, is called *Cayelee* in the Malay language. Such of the natives as are Mahometans, have a Mosque there; the roofs of which diminishing by stories in proportion as they rise, afford an agreeable object to the eye.

Birds, especially parrakeets, are so extremely numerous here, it seems very evident that, from them the island derives its name, which in Malay signifies bird. Stags, goats, and wild boars are so plentiful in the woods, that the natives supply the president with as many of them as he chooses to have, for two musquet cartridges for each animal. The natives entertain an invincible dread of snakes, which they say are very numerous in their island; but our naturalist, during the time of his stay in it, met with none of these reptiles, though he traversed the forests pretty constantly. The rainy season was not yet arrived; but the high mountains collected almost every evening, storms which burst forcibly during the night.

On the 16th of September, our navigators set sail from Buro, directing their course towards the strait of Bouton, into which they entered on the afternoon of the 22d. The next day they anchored, about a kilometer from the coast. Dauribeauf being ill, Russel was entrusted with the conduct of the expedition, and formed the plan of sailing out by the channel which separates Pangesani from Celebes.

They consumed much time in getting through this strait, as they had been under the necessity of remaining at anchor every night; and before they could make sail in the day, they were always obliged to wait till the tides had occasioned currents favourable for them.

The natives came on board, bringing with them different species of the fruits common in the Moluccas. They also procured for our adventurers a great number of fowls, some goats, and a considerable quantity of fish, prepared after the manner of the Buccaneers; and they frequently furnished them with fresh fish †.

In

* The great crowned pigeon (*columba coronata*) is very common in these thick forests, where they also met with some wild orange trees, the fruits of which supplied their scorbutic people with a very wholesome lemonade.

Our Europeans were informed by the natives, that the road in which they had cast anchor, was infested by alliga-

tors; but this intelligence did not deter their people from bathing. Having penetrated into some forests of mangroves, they observed their tracks imprinted on the mud. It is during the night that alligators are most to be dreaded.

On the 8th

In the island of Pangetani, our adventurers often traversed thick forests of the palm, known by the name of *corypha umbraculifera*, where they beheld squirrels of the species called *sciurus palmarum*, which instantly fled at their approach*.

The village of Bouton is situated on an eminence, and surrounded by thick walls, which protect the inhabitants against the incursions of their enemies. The houses are built of bamboo, and covered with palm-leaves, like those of the inhabitants of the Moluccas. The Sultan resides in a fort constructed of stone. It appeared to our adventurers, that this chief lived in an evident state of distrust with the agents of the Dutch East India Company, though he was their ally; for the three Dutch soldiers who were the only inhabitants of the Company's factory, were not permitted to live in the village where he takes up his residence. They were sent away to a wretched solitary habitation.

It was dark when our adventurers got down to the sea-shore in order to return on board. Most of them had been attacked by the dysentery for several days; but they were obliged to wade into the water up to the waist, to reach the boat, which must have greatly aggravated their disorder.

In the course of this day the natives had procured them rice, maize, sugar-canes, yams, ducks, goats, eggs, and fowls. Hard-ware had been offered them in exchange for these refreshments, but they gave a preference to the money which is current in the Moluccas, and particularly the small coin washed with silver, called *koupan pera*, which the Dutch bring from Europe.

forest, afforded plenty of food to numerous troops of pigmy monkeys; they killed some of them in order to preserve their skin. They remarked, on the moist ground, numerous tracks of stags, wild boars, and buffaloes. They very frequently met with herds of the last, lying down in many places: but they always took to flight as soon as they found they were perceived; and it was next to impossible to follow them through the mud.

* The natives, convinced of the danger of living near marshes, which render the northern coast of Pangesani extremely unwholesome, have not erected any village there. It was in the midst of these marshes that the adventurers picked up the form of a very contagious dysentery, which made great ravages on board the ships, the people having before been enfeebled by the long use of unwholesome aliments. A great number of the people were carried off by this malady.

On the 8th, at four in the afternoon, our adventurers

On the 11th in the morning, they crossed the strait of Salayer: a great many natives were scattered about the shore, where their canoes were lying; others were making sail towards Celebes.

They brought up several times along the coast of Madura, and in the afternoon of the 19th, they cast anchor in five fathoms water, at the entrance of the channel leading to Sourabaya, one of the principal settlements occupied by the Dutch in the island of Java. They intended to anchor there, and at nine in the morning a boat had been dispatched from the Esperance to the village of Grissay, to procure a pilot to conduct the ships up the channel that leads thither.

Some demur, however, ensued, but instructions were afterwards received from Batavia, that the council of Sourabaya would afford them every assistance in their power, and on the 26th they sent them pilots.

The dysentery had then carried off six of their people, since their departure from Bourou. They soon obtained liberty to reside in the town of Sourabaya; where, on the 31st, our naturalist took up his quarters at the house of Messrs. Bawer and Hogh, who received him with great cordiality. Ten days after, the council of Sourabaya revoked the commission they had given, and they were immediately obliged to return on board, with the exception of the sick.

The sick was increasing on board the ships with alarming rapidity. Almost half the ships' companies were already attacked by the dysentery and malignant fever; and the number of the diseased persons only diminished by the death of some of them: but at length the council restored

repaired to the village of Bouton, to see the Sultan, who resided there: they did not know, that, in order to have access to him, it was necessary to bring him presents. As they had nothing to offer him, he was not to be seen: but his son, and his nephew condescended to receive them, near the fort where he resides. They affected no inconsiderable degree of consequence, frequently observing that the whole island was under the dominion of the Sultan; that he was the ally of the Dutch East India Company; and that its enemies were his. They informed them that the inhabitants of Ceram, having once made an incursion on their coasts, four of them had been seized and delivered up to the king, who instantly caused them to be beheaded. Then, having prevailed on them to advance a few yards, he shewed them the heads of these unfortunate beings, exposed on the walls of the fort, at the end of very long pikes. With an air of peculiar satisfaction, he commented invidiously on this tragic spectacle.

the

the commission they had revoked a few days before; and they had the satisfaction of seeing themselves again assembled in the town*.

Being somewhat recovered from the dysentery, by which our naturalist had been much enfeebled he frequently made excursions to the environs of the town. On the 11th of December the governor of Sourabaya gave him liberty to visit the mountains of Pran, about six myriameters to the west-south-west of the town. They set off the next day to go to the village of Poron, which is built at the foot of these mountains. Some Javanese carried their baggage, suspending it to long bamboos, the ends of which they rested on their shoulders†.

Resuming their journey they experienced a very heavy fall of rain, which incommoded them exceedingly. They were accompanied by a sergeant of the Dutch troops, who soon convinced them of his authority over the Javanese, who were going to the village which they had just left: he ordered the umbrellas, which they were carrying, to be snatched out of their hands, and none of them presumed to make any resistance. He then presented those conveniences to our adventurers, declaring that he thought it extremely strange that such people should think of preserving themselves thus from the rain, while they saw them exposed to the inclemency of the weather. But he was greatly surprised when he observed that not one of them would make use of the umbrellas, which they intreated him to restore to the persons whose property they were. At length they reached the village of Poron, where they were respectfully received by the chief, who has the title of Deman.

They passed the night in a bamboo habitation, where the greatest cleanliness prevailed. The

next day they took up their quarters at the western extremity of this village, under the dependency of Tomogon of Banguil, who arrived in the morning from his residence at a little distance, to order the inhabitants to watch over their personal safety; and to furnish them with such provisions as they might require. This Tomogon was a sensible man: he spoke Dutch fluently, and was no stranger to the news and politics of Europe. Being a Chinese by birth, he was under the necessity of embracing the Mahometan religion, to obtain the title of Tomogon.

On the 14th our adventurers did not travel far, but the following day they crossed a space of a demi-myriameter in a plain much inundated; they afterwards reached the mountains of Prau. The Tomogon of Banguil went thither on horseback, followed by upwards of a hundred horsemen. Our navigators found him in the forest, where he was waiting for them. Having singular notions of politeness, he had caused chairs to be brought for them to sit down at the summit of a mountain, whence they discovered, through the trees, a vast extent of country, which he informed them was in his dependency. Being anxious to afford his visitors a more satisfactory view of it, he ordered the tops of a great many trees to be cut off.

Peacocks are very common in this forest, which they traversed in every direction. The inhabitants were employed in clearing, near the mountains, an excellent spot of ground covered with trees, the smallest of which they cut down with a hatchet: from the largest, they contented themselves with peeling off the bark near the root, convinced that such an operation would terminate the life of the respective tree‡.

Not far to the westward of the village of Poron,

* During the time that M. Labillardiere spent at Sourabaya, the heat was excessive. He there saw, with astonishment Reaumur's thermometer rise to 27°; but this heat was of short duration; for the change of the monsoon, which happened early in November, occasioned abundant rains, especially in the afternoon, which cooled the atmosphere in such a manner that the thermometer stood at no more than from 22° to 23° in the hottest part of the day.

† After proceeding about four myriameters, they arrived at Souda-kari, where they dined at the house of the chief of the village, who had prepared for them a sumptuous dinner. It consisted of different fish, dressed Buceaneer fashion, and of horse and buffalo flesh, which had been preserved for upwards of six months, after having been cut in very thin stripes, and dried in the sun. These dishes were

all very highly seasoned with pepper, pimento, and ginger; and rice supplied the place of bread. A profusion of delicious fruits concluded the entertainment.

‡ In the course of the following days our adventurers visited the mountains of Panangounan, advancing to the territories of the emperor of Solo, into some large forests of teak-wood, under the shade of which the *pancratium amblyneuse* was growing in abundance. The guides were much terrified with the apprehensions of meeting with tigers declaring that they were numerous in the thickets bordering upon the rivulets; where they concealed themselves that they might be in readiness to seize the quadrupeds when they came to allay their thirst. In these different excursions, Labillardiere killed several wild cocks, whose variegated plumage and brilliant colours excited his admiration.

Poron, stood two colossal statues, which the Javanese call *retcto*, and which are held in great estimation. The natives address their invocations to these figures, in their greatest necessities. They are fabricated from a block of stone, and are about twenty-two decimeters high. They are represented in very ample garments, and the two heads have the same cast of countenance as the Moors. It seems probable that these statues have been erected in honour of some of those conquerors of the Moluccas, though the inhabitants are incapable of giving any information on the subject.

Riche and Labillardiere had formed the project of going to spend some time on the mountains of Passervan. They are very lofty, and remarkable for their fertility. Several species of fruit trees, brought from Europe, thrive extremely well on these heights, the temperature of the air there being very mild. As Riche and Labillardiere lived in the same house, they frequently went together to prosecute their researches: but on the 19th of February, 1794, at four in the morning, the commandant of the fort (Chateauvieux) followed by thirty Dutch soldiers armed, came and informed them, on the part of Dauribeau and the principal officers of the expedition, that they were under arrest. Shortly after, several of their shipmates shared the same fate, without being able to divine what could have given occasion to so arbitrary an act of authority. Soon after they were informed that some news, which had arrived from Europe, had induced Dauribeau to hoist the white flag, and put himself under the protection of the Dutch, who were then at war with France. He had probably, at this time, formed the project of selling the ships belonging to the expedition. And, in order to succeed with more certainty, he thought it necessary to get rid of those persons who were likely to disapprove of such conduct. Accordingly, seven of them, *viz.* Legend, Laignel, Willaumez, Riche, Ventenal, Piron, and Labillardiere were delivered up to the Dutch as prisoners of war, and they were

tion. Their crowing, which was frequently heard in the middle of the woods, induced him to imagine that he was in the vicinity of some habitation; but he soon knew how to distinguish it perfectly from that of the domestic cock. The comb of the wild cocks is of a whitish colour, mixed with a slight tint of violet, and assumes a darker hue towards the edge.

VOL. II. No. LXXVI.

conducted to Samarang, being compelled to travel about forty myriameters along terrible roads, in the rainy season*.

At length, after having suffered much fatigue, they arrived at Samarang, on the morning of the 11th of March. The commanding officer of the fort immediately conducted them to the house of the Governor Overstraaten. The latter informed them, that the principal surgeon of the hospital, M. Albegg, had prepared a lodging for them, and he desired they would come and occupy it. On their arrival at the surgeon's, they were astonished at being led into one of the wards of his hospital, where they were shewn seven beds, which had been purposely provided for them; the apartments of which were totally destitute of chairs or tables. In vain they expostulated with him on his strange conduct, protesting that they were not sick, and did not desire to become so in an hospital. His answer was, that the governor's orders were such, that he was not permitted to provide them any other lodgings.

Our sufferers were therefore under the necessity of having recourse to the governor, in order, if possible, to represent the harshness of such proceedings, towards men who had endured a long and fatiguing voyage for the advancement of the arts and sciences; and that they thought themselves entitled to a different reception among a civilized people. After a full investigation of this business, however, these unfortunate people were permitted to quit the hospital, and take up their residence near the center of the town. Some little time after, they were suffered to go a demi-myriameter from Samarang, but were prohibited from directing their steps towards the sea-side.

Our naturalist had remarked that, on the different heights of Java, a great number of coconut trees had been stripped of their leaves, and were dead as they stood; but he was, at length, informed, by several inhabitants of the hills, situated at a little distance to the north-west of Samarang, that they had been struck by lightning: that these people had been witnesses of the

* "Dauribeau had stripped Labillardiere of all his collections: most of the ship's company were thrown into the prisons of the Tomogon of Sourabaya, from which they came out shortly after, some to be transferred to those of Batavia, and the others to remain with Dauribeau.

O o

fact;

fact; and they further declared that the same thing happened on a great many other heights in the island. Indeed these tall trees, thus insulated, are particularly exposed to the effects of lightning; and the abundant sap, with which they are furnished, contributes not a little to attract the elastic matter.

On the 15th of April intelligence was received that a packet was speedily to sail from Batavia for Europe; and the Governor of Samarang permitted two of the Europeans to wait upon the regency of Batavia, to ask for a passage on board that vessel. They were all impatient to revisit their native country, but chance was to decide who were to be the happy persons: the lot fell on the Citizens Riche and Legrand, and they accordingly set off for Batavia on the 6th of May.

The dysentery, which Labillardiere had caught in the marshes of the strait of Bouton, he now expected a return of in the marshes of Batavia; the exhalations from which are still more insubrious. Batavia is so pernicious an abode to most Europeans, especially in the first twelve months that they inhabit it, that, out of a hundred soldiers who arrive from Europe, ninety are expected to die within the year. The other Europeans, who enjoy all the comforts of opulence, do not indeed perish in so frightful a proportion. Piron and Labillardiere did not obtain permission to go to Batavia, till the moment of the departure of the Dutch fleet. Their companions in misfortune, Laignel, Ventenat, and Willaumez, set off to proceed thither; and the moment they arrived, they were sent to fort Tangaran, about two myriameters from the town. Riche and Legrand instead of procuring a passage in the packet which was speedily to sail, had been confined in fort Ankee; but they had the good fortune to sail, about two months after, for the Isle of France, in a vessel that was conducting prisoners thither.

Dauribeau not satisfied with having stripped Labillardiere of his collections, requested the Governor of Samarang to take from him the manuscript, containing his observations during the voyage in search of La Perouse. In vain he remonstrated against this violation of the most sacred property, Governor Overstraaten gave orders for examining his baggage, which he had caused to be sealed up a month before; but fortunately that journal escaped these researches.

Dauribeau, who had lately arrived to treat with the Governor, respecting the sale of the ships belonging to the expedition, died there on the 22d of August. The moment of the departure of the Dutch fleet was drawing near. Citizens Piron and Labillardiere set out for Batavia on the 1st of August. On the 2d of September they cast anchor in the road of Batavia. Having remained on board here about two days, the commanding officer in the road conveyed them on shore, and they were immediately sent to Fort Ankee, which is situated about a demi-myriameter to the westward of the town. It is surrounded by morasses, which render this abode exceedingly unhealthy.

These marshes serve as a haunt to enormous serpents of the species called *boa constrictor*. One of them came pretty regularly, every four or five days, and carried off some poultry, from the house of a publican in the neighbourhood of Fort Ankee, at whose house they had been permitted to make their meals. An old slave had been long suspected of stealing these fowls, and had frequently received fifty strokes of the ratten, when ever these feathered inhabitants were missed, without regarding his protestations of innocence; but the real thief was at length discovered to be a snake. This voracious creature had swallowed a remarkably large hen, and became so swelled that he was unable to return through the opening by which he had introduced himself. The slave then took his revenge for the blows he had received. The hen that was taken out of his stomach, had entered it head foremost, and had undergone no alteration. This snake was only four meters in length; but a Javanese killed one, a few days after, which was above ten meters long. It did not appear that he was in the practice of amusing himself only with poultry; they found, in his stomach, a kid that weighed a myriagram and a half.

The river which flows at the foot of Fort Ankee, is frequented by alligators: Labillardiere saw a large one advance among a group of children who were bathing in this river. The monster instantly seized one of them and disappeared.

During the last two months of our adventurers' residence at Ankee, four officers belonging to the *Modeste*, a French privateer, came to reside in the fortress where they were detained, which rendered their captivity more tolerable. They had

had been made prisoners of war on board a Dutch ship, a few days after they had been in possession of her.

The fort Major informed our navigators of the death of the purser of the *Recherche*, whose name was Girandoen. It was now discovered that this person was a woman, as had been suspected from the commencement of the voyage; though she had a very masculine appearance. Motives of curiosity, it is said, determined her to undertake this voyage. She had left a very young child in France.

The *Nathalie* corvette, with Citizen Riche on board, had been sent from the Isle of France to Batavia, to claim their ships from the regency; but on her arrival in the road she was detained for five months under the guns of two Dutch ships of war: and she could obtain no other satisfaction than that of carrying away the persons belonging to the expedition who were in confinement, and a few French prisoners of war.

At length, on the 29th of March, 1795, they set sail for the Isle of France. It was high time that Labillardiere should quit the morasses, which surround Fort Ankee, where he had, for upwards of a month, been attacked by a dy-

sentery, and which was making a very rapid progress; but as soon as he breathed a pure air his complaint as rapidly diminished. On the 7th of May, he arrived at the Isle of France, and often visited its high mountains, paying particular attention to its diversified productions.

No opportunity presented itself of his returning to his native country, till General Malartic sent to France the *Minerva*, the command of which he conferred on Citizen Laignel, one of his companions in misfortune. He embarked on board this vessel, which set sail from the Isle of France on the 20th of November. On the 12th of March, 1796, they anchored off the Isle de Bas, and shortly after he repaired to Paris.

Labillardiere soon received information that his collections in natural history had been conveyed to England. The French government immediately claimed them. Sir Joseph Banks, President of the Royal Society of London, seconded his claim with great energy; and soon after he had the happiness, in receiving them, to find himself enabled to make known the natural productions which he observed in the countries he visited during the course of this voyage.

END OF ADMIRAL D'ENTRECASTEAUX'S VOYAGE.

TRAVELS IN KAMTSCHATKA,

During the Years 1787 and 1788,

BY

M. DE LESSOPS,

Consul of France, and Interpreter to the Count De La Perouse.

AFTER accompanying the Count de la Perouse for upwards of two years, on his destined Voyage round the World, M. de Lessops was honoured by him with the conveyance of his dispatches, over land, from Kamtschatka to France. On the 6th of September, 1787, the king's frigates entered the port of Avatsha, or Saint Peter and Saint Paul*, at the southern extremity of the peninsula of Kamtschatka. On the 29th of the same month, he was ordered to quit the Astrolabe, and received his dispatches and instructions from the Count de la Perouse.

In the evening he took his leave of the commander, and his worthy colleague the Viscount de Langle. His regret at parting from them cannot be described: he was torn from their arms, and found himself in those of Colonel Kasloff Ongrenin, governor-general of Okotsk and Kamtschatka, to whom Count de la Perouse had presented him rather as a son, than an officer charged with his dispatches. At this instant his obligations commenced to the Russian governor, to whose amiable† disposition he was till then a stranger. In conducting our traveller to his house he spared no pains to divert him from his melancholy reflections, on being left alone in these half-discovered regions four thousand leagues distant from his native land; but the re-

ception he met with from the inhabitants, and the civilities of the Russian officers, rendered him less sensible of the departure of his countrymen.

That event took place on the morning of the 30th of September‡: they sailed with a wind that conveyed them speedily out of sight, and continued favourable for several successive days. The governor had promised to conduct our traveller as far as Okotsk, which was the place of his residence, and he thought himself so happy under his guidance, that he could not hesitate about surrendering himself implicitly to his direction. Mr. Kasloff had affairs to settle, which, with the preparations for their departure, detained them six days longer.

The bay had been minutely and accurately described by Captain Cook, but some alterations had since been made, which are to be followed by several others, particularly with respect to the port of Saint Peter and Saint Paul. Instead of five or six houses, an entire town, it is supposed, will speedily make its appearance there, built of wood, and tolerably well fortified. Such, however, is the projected plan, which is to be ascribed to Kasloff, whose views are equally great and conducive to the service of his sovereign. The execution of this plan will increase

* The Russians call it Petropavloskaia-gaven.

† After repeated civilities to every individual engaged in the expedition, he was anxious to supply the frigates with provisions. Though oxen could not be procured without the utmost difficulty, he furnished seven at his own expence, and could not be prevailed on to accept of any equivalent, but regretted that he was not able to procure a greater number.

‡ Mr. Pinkerton, in his *Modern Geography*, calls "this ingenious traveller," (M. de Lessops) "gives the most precise information concerning the manners of the Kamtschadales, and the Tschuks, the most remote people of Asiatic Russia. He travelled in the winter, when the snowy hurricanes were often so thick as to obstruct the view as much as a heavy fog." *Pinkerton's Modern Geography* vol. ii. 54.

the

the celebrity of the port, already rendered famous by the foreign vessels which have touched here, and by its excellent situation for commerce.

The port of Saint Peter and Saint Paul* is situated at the south of the entrance of the bay, and closed in by a narrow neck of land, upon which the ostrog †, or village of Kamptschatka is built. On an eminence to the east is the house of the governor, with whom Mr. Kasloff resided during his stay: near it stands the house of a corporal of the garrison, and a little higher that of a serjeant; who, next to the governor, are the only distinguished persons in this settlement. Opposite to the entrance of the port are the ruins of the hospital mentioned in Captain Cook's Voyage ‡. Below these, and nearer the shore, stands a building denominated a magazine to the garrison, which is constantly guarded by a centinel. Such was the state in which they found the port of Saint Peter and Saint Paul.

By the intended augmentation it will probably become an interesting place: the entrance was to be flanked by fortifications, and a battery was also to be erected on the neck of land which separates the bay from the lake. There is now on the point of a rock, a battery of six or eight cannon, lately erected to salute their frigates. The augmentation of the garrison forms a part of the plan, which at present only consists of forty soldiers or cossacs. In the time of service they have a sabre, firelock, and cartouch box; in other respects they are not distinguishable from the indigenes, but by their features and idiom. The narrow projection of land, which closes in the entrance of the port, is at present composed of between thirty and forty habitations, including winter and summer ones, called *isbas* and *balagans*. The present number of inhabi-

* The earliest navigators say, this is the most commodious port in this part of Asia: and ought to be the general depot for the commerce of the country. This would be the more advantageous, as the mariners which frequent the other ports usually think themselves fortunate if they escape shipwreck; and for this reason the empress prohibited all navigation after the 26th of September.

† An ostrog signifies a construction surrounded with palisadoes. Its etymology may probably be derived from the entrenchments hastily constructed by the Russians to prevent the incursions of the natives. Ostrog is now the appellation given to almost all the villages in this country.

‡ Near this place was buried, at the foot of a tree, the body of Captain Clerk. The inscription placed on the

tants, including the garrison, does not exceed one hundred.

The banks of the bay of Avatsha are rendered difficult of access by mountains, wood, and volcanoes. Our traveller was astonished at the abundant vegetation of the valleys, the grass being nearly equal to the ordinary height of a man: and a grateful smell was diffused far and wide by the rural flowers, among which were wild roses and many other odoriferous plants.

The rains are heavy here in spring and autumn, and the blasts of wind are frequent in autumn and winter. The snow makes its appearance on the ground in October, and in April or May the thaw begins to take place. The summer is moderately fine: the strongest heats seldom lasting beyond the solstice. Thunder is seldom heard here, and its effects are never found injurious. Two rivers discharge their waters into the bay of Avatsha: they both abound with fish and water fowl; but the latter are so wild that you cannot approach them within fifty yards. These rivers cannot be navigated after the 26th of November, being always frozen about that time: in the depth of winter the bay is covered with sheets of ice, which are stationary there while the wind continues blowing from the sea, but are totally dispelled when the wind is blown from the land. The port of Saint Peter and Saint Paul is generally shut up by the ice in January.

The company departed from this port on the 7th of October; they consisted of Messrs. Kasloff, Schmaleff||, Vorokhoff, Ivaschkin**, and M. de Lessops; besides four serjeants, and an equal number of soldiers, in the suite of the governor. The commanding officer of the port, perhaps as a token of respect to M. Kasloff, his

tomb was in wood, and consequently liable to be effaced. La Perouse, anxious that the name of this navigator should be immortalized, and that no injury might be apprehended from the weather, substituted instead of it an inscription on copper.

§ About fifteen or twenty wersts from the port, there is a volcano, which was visited by the naturalists who attended La Perouse, and which has been particularly mentioned in his voyage.

|| Inspector-general for the Kamptschadales.

** M. Ivaschkin is the unfortunate gentleman whose distresses excite the compassion of every reader of sensibility; they are particularly related in La Perouse's Voyage round the World.

superior, joined their little troop, and they embarked upon *baidars** to cross the bay to Paratounka, wherethey were to be supplied with horses to proceed upon their journey. In less than six hours they arrived at this ostrog, where the rector resides, and where also his church is situated. They were hospitably received by the reverend divine, who entreated them to make his house their abode: but they had hardly entered when the rain fell so abundantly, that they were obliged to make the visit longer than they had intended.

The ostrog of Paratounka is seated on the side of the river of that name, at the distance of about two leagues from its mouth: it is not more populous than that of St. Peter and St. Paul. The small pox has made dreadful ravages in this place. The number of balagans and isbas seemed to be nearly the same as at Petropavlofska. The Kamptschades reside in the first during summer, and repair to the last in winter. In order to bring them gradually to resemble the manners of the Russian peasants, they are prohibited from constructing any more *Yurts* or subterraneous habitations which are now all destroyed, except a very few vestiges which still exist in the northern part.

The balagans are elevated on a number of posts about thirteen feet high, placed at equal distances. This simple colonnade supports a platform of rafters, joined to each other, and plastered over with clay: this platform may be considered as a floor to the whole building, which consists of a roof in the form of a cone, covered with thatch or dried grass, placed upon long poles fastened together and bearing upon the rafters. Thus the whole apartment is formed, and an opening in the roofs supplies the place of a chimney by letting out the smoke, when a fire is lighted to dress their victuals: their cookery is performed in the middle of the room, where they eat, drink, and sleep together, without disgust or scruple. The apartment has no windows, a low narrow door

* Baidars are boats somewhat similar to European ones: made of planks from four to six inches wide, fastened together with withies or corals; they are the only vessels used to sail to the Kuriles islands; they are usually rowed, but they will admit of a sail.

† As dried fish constitutes the principal nourishment of themselves and their dogs, it is necessary that they should have some place sheltered from the heat of the sun, and at the same time fully exposed to the air. Under the rustic porticos which form the lower part of their balagans they hang their fish, taking care to place them beyond the reach of their canine associates. Dogs are essentially serviceable

barely admits the light: the stair case is well assorted with the rest of the building, and consists of a tree jagged in a slovenly manner, so inconveniently contrived as to endanger the life or limbs of any one who ventures to ascend it. When the inhabitant is not inclined to receive visitors, it is usually signified by turning the stair-case, with the steps inward†.

Their winter habitations are less singular, resembling those of the Russian peasants, but on a smaller scale. The isbas are constructed of wood, and are formed by placing long trees placed horizontally upon one another, and filling up the interstices with clay; the roofs resemble our thatched houses, and are occasionally covered with coarse grass, rushes, or wooden planks. The interior part is divided into two rooms, with a stove so conveniently situated as to communicate warmth to both, and to furnish a fire-place for their cookery. On two sides of the large room, wide benches are provided, on the chief of which a wretched couch is placed, made of planks, and covered with bear's skin. This is the bed appropriated to the chief of the family: and the women, who in this country are the slaves of their husbands, think themselves happy to be permitted to sleep on it. Here is also a table, and a number of images of different saints, with which the Kamptschadales delight to furnish their chambers. The windows are small and low: the panes consist of the skins of salmon, or the bladders of some animals: the fish skins are rendered transparent by dressing and scraping, and admit a feeble light into the apartment; but objects cannot be distinctly seen through them‡.

The rain continuing, the party were unable to proceed on their journey, but M. de Lessops embraced a short interval that presented itself in the course of the day, to visit the environs of the ostrog. He went to the church, which was built of wood, and ornamented in the Russian

to the Kamptschadales to draw their sledges, and they have no other kennel than what the portico of the balagans affords them, to the posts of which they are carefully tied.

‡ In every ostrog a chief resides, who is called *toyon*. This species of magistrate is chosen by a majority of the natives of the country. This *toyon* is a peasant, like those he is appointed to govern, and is not honoured with any marks of distinction. His duty is to watch over the police, and enforce the execution of the orders of government: under him an assistant is chosen, to execute a part of his functions, or occasionally to supply his place.

taste: he saw there the arms of Captain Clerke, and the English inscription respecting his death. The village is surrounded with a wood, which he traversed by proceeding along the river, and perceived a vast plain extending to the north and to the east. On the banks of the rivers that wind along this plain, frequent traces of bears are perceived; those animals being attracted by the fish with which these rivers abound: M. de Lessops was assured by the inhabitants, that fifteen or eighteen were frequently seen together upon those banks; and that, whenever they hunted them, they seldom failed to bring home one or two of them at least, in the space of twenty-four hours.

The ostrog of Koriaki is situated in a coppice wood, on the border of the Avatscha: five or six isbas, and about double that number of balagans comprising the whole village; it is smaller than that of Paratounga, and has no parish church. The next day the travellers mounted their horses to proceed to Natchikin, an ostrog on the Bolcheretsk route. It was agreed on among them to stop a few days in the neighbourhood to inspect the baths, which M. Kasloff had constructed at his own expence. The road from Koriaki to Natchikin is tolerably commodious, and they crossed, without much difficulty, the little streams descending from the mountains, at the foot of which they were passing. Having travelled about three fourths of the way, they met the Bolchaia reka†: they proceeded on its bank till they came to a little mountain, which they were obliged to pass before they could reach the village. A heavy rain, which began at Koriaki, ceased a few minutes after; but the

wind having changed to the north-east, a vast quantity of snow poured down upon them, and accompanied them till their arrival at their destined spot; at length they forded the Bolchaia-reka, and arrived at the ostrog of Natchikin; where they saw about six or seven isbas and twenty balagans. They did not stay here, M. Kasloff being desirous of hastening to the baths: equally induced by curiosity and necessity‡.

They are situated about two wersts to the north of the ostrog, and a hundred yards from the bank of Bolchaia-reka; which must be crossed a second time before a person can arrive at the baths. A continued vapour ascends from these waters, which form a rapid cascade down a steep declivity, three hundred yards from the baths. In their fall they form a streamlet of a foot and half deep, and six or seven feet wide. Not far from the Bolchaia-reka, this little stream unites with another, and they both pass together into the river. At their conflux, which does not exceed nine hundred yards from the source, the water is so extremely hot that the hand cannot be endured in it for half a minute.

The party lodged near these baths in a place resembling a barn, covered with thatch; the timber work consisting of the trunks and branches of trees: but their habitation was found so insupportable during the night, on account of their being so extremely cold, they resolved to quit them four days after their arrival. They returned to the village, and were again accommodated by the toyon; but the attraction of the baths drew them back every day, and they hardly ever came away without bathing. M. Kasloff being desirous of ascertaining the properties of

* The party at length quitted Paratounga and resumed their journey: twenty horses sufficed to convey them and their baggage, M. Kasloff having dispatched a part of it by water as far as the ostrog of Koriaki. The river Avatscha, having no tide, it is not navigable farther than this ostrog. With regard to themselves, they crossed the river Paratounga at a shallow, and waded along several of its branches; their horses, notwithstanding their burthens, advanced very briskly, and the weather was so fair that M. de Lessops began to think the account he had heard of the rigour of the climate had been exaggerated; but he was shortly after convinced that it was his lot to experience the most piercing frosts, and to contend with the violence of whirlwinds, and the most alarming tempests. The party was about six or seven hours in travelling from Paratounga to Koriaki, which did not exceed forty wersts*. When they arrived there, they were again obliged to shelter them-

* A werst is one thousand yards.

selves from the rain, and to take refuge in the house of the toyon, who ceded his isba to M. Kasloff, and the night was passed under his roof.

† Large river. Russ.

‡ The snow had penetrated through M. de Lessop's clothes, and, in crossing the river, his feet and legs were made extremely wet; he therefore wished to be able to change his dress; but on reaching the baths, he was informed that the baggage was not arrived. The company proposed drying themselves by walking about in the neighbourhood; and after some conversation on the subject, M. Kasloff had recourse to the bath, which quickly relieved him from all disagreeable apprehensions; but, not venturing to follow his example, M. de Lessops was obliged to wait the arrival of the baggage: he had imbibed so much of the damp, that a shivering fit attended him during the whole of the night. The next day he made a trial of the baths, and received much pleasure and advantage from them.

these

taste:

these waters, they were analysed, and M. de Lessops has inserted the process at large in his travels*.

The party having fixed upon the 17th of October for their setting off, the sixteenth was employed in preparations. Ten small boats, which were really nothing more than trees, scooped out in the shape of canoes, lashed together in pairs, serving as five floats to convey themselves, and part of their effects. What they could not take with them, they were obliged to leave at Natchikin, as they had already collected all the canoes that could be found in the village.

The dinner supplying the adventurers with renewed strength and spirits, they resumed their voyage, and had not advanced above a verst before two boats came to their assistance from Apatchin. They were instructed to repair the damaged boat, and to supply the place of those which were unfit for service.

The Bolchai-reka, in its windings, ran nearly in the direction of the east-north-east, and west-south-west. Its current is very rapid, but the stones and shoals obstructed the passage to such a degree, as to render the labour of their conductors truly intolerable. As they approached nearer the mouth of the river, it became wider and more navigable, dividing into several branches, and then uniting; after having watered

* While the party remained at the baths, and at the ostrog of Natchikin, their horses had brought, at different times, the effects which they had left at Koriaki, and they began to make preparations for their departure. In the mean time M. de Lessops saw a sable taken alive. At some distance from the baths, M. Kasloff observed a large flight of ravens all hovering over the same spot, skimming continually along the ground: the regular direction of their flight induced him and his companions to suspect that they were attracted by prey. They were indeed pursuing a sable which was perceived upon a birch-tree, surrounded by another flight of ravens. The gentlemen travellers had also an inclination to become possessed of this animal; but as they had left their guns at the village, they were at a loss how to effect their purpose: but a Kamptschadale happily drew them from their embarrassment, by undertaking to catch the sable. He adopted the following method. Having procured a cord from the caparison of one of the horses, he began to make a running knot with it, while some dogs, accustomed to the sport, surrounded the tree: the animal, from fear or stupidity, stood watching them, making no other motion than that of stretching out its neck when the cord was presented to him. His head was twice in the noose, but the knot slipped: the sable then threw himself upon the ground

* M. Kasloff, who was president of this chase, presented this sable to M. de Lessops, promising to procure him

a variety of small islands, some of which are covered with wood. Different species of water fowl divert themselves in this river; the surface being almost covered with ducks, plovers, and many others, but they are too cautious to admit the near approaches of man, their natural enemy.

Night coming on, it was not thought prudent to proceed any further, as during its obscurity the smallest accident might have proved fatal to them: this consideration induced our party to desert their boats, and to pass the night on the bank of the river, where Captain King and his party halted†. A good fire warmed and dried our adventurers. One of the floats contained the accoutrements of a tent; and while they were pitching it, they fortunately saw two of their floats advance, which had not been able to keep pace with them. The pleasure which this re-union afforded them, and their propensity to rest after the fatigue of the day, contributed to procure them a very comfortable night.

The next morning they proceeded to Apatchin, where they arrived in about four hours; but the water was so shallow that their floats‡ could not come up to the village: they landed about four hundred yards from the ostrog, and accomplished the rest of the distance on foot. This village is smaller than the preceding ones by three or four habitations; it is situated in a small plain, on a

when the dogs attempted to seize him, but the nose of one of them was so horribly torn with his claws and teeth, that he was far from being pleased with his reception: Wishing to take the animal alive, the dogs were kept back by the travellers, and the sable ran up a tree, where the noose* was again presented to him, and the Kamptschadale succeeded. This easy method of catching sables is a pleasing circumstance to the inhabitants of this country, who are required to pay their tribute in the skins of these animals.

† Cook's Voyage, iii. 208.

‡ They embarked upon these floats early in the morning on the 17th. Four Kamptschadales, with the assistance of long poles, conducted their rafts; and they were frequently obliged to get into the water to haul them along, the stream in general being extremely shallow. After some time, one of their floats received an injury, which unfortunately happened to be that which was freighted with their baggage: at noon a more deplorable accident happened; the float which contained their cookery, sunk to the bottom before their eyes: such a loss they could not sustain with indifference; they were eager to save the wreck of their provisions; and, lest a greater misfortune should arrive; they wisely resolved to dine before they proceeded any farther.

branch of the Bolchaia-reka. Apatchin afforded nothing interesting: M. de Lessops left it to join the floats, which had passed the shallows, and were waiting for them. The farther they advanced, the deeper and more rapid was the river, and nothing impeded their course to Bolcheretsk, where they arrived in the evening accompanied by one of the floats, the rest having found themselves incapable of keeping up with them.

They were no sooner landed than the governor conducted M. de Lessops to his house, and politely requested him to accept of that accommodation while he continued at Bolcheretsk. He not only procured him all the pleasures and amusements in his power, but furnished him with all the information which his office permitted him to give.

Supposing he should continue some time at Bolcheretsk, from the necessity of waiting till sledges could be used, M. de Lessops amused himself by writing a description of the country, and a representation of the manners and customs of the inhabitants. He begins with a description of the town or fort of Bolcheretsk, which, he says, is situated on the border of the Bolchai-reka, in a small island formed by several branches of this river, which divide the town into three parts. The most distant division, which is called *Paranchine* contains ten or twelve isbas; the middle division has also a number of isbas, and a row of wooden huts, serving for shops; opposite to these stands a guard-house, which is also a court of justice; it is larger than the rest, and guarded by a sentinel. The governor's house in Bolcheretsk is higher and larger than the rest, and is built like the wooden houses of Saint Petersburg. The church is simple, constructed like the village churches of Russia; on the side of which, three bells are suspended, covered with a timber roof.

* M. de Lessops then relates the particulars of his generous treatment in an excursion to view the galliot from Okotsk, which had been unfortunately shipwrecked, and was attended with such insurmountable difficulties, that they abandoned their project, and returned to Bolcheretsk.

† The population of Bolcheretsk amounts to between two and three hundred. Among these there are sixty or seventy cossacs or soldiers; the rest of the inhabitants are composed of merchants and sailors. These people, Russians and Cossacs, combining with a mixed breed found among them, carry on a clandestine commerce; their industry and knavery are continually employed in cheating the poor Kamptschadales, whose credulity and propensity to drunken-

North-west of the governor's house, several dwellings present themselves, consisting of twenty-five or thirty isbas, and a few balagans. The whole of the wooden houses, exclusive of the shops, the chancery, and the governor's house, amounts to upwards of fifty. How this town acquired the additional appellation of fort, appears somewhat mysterious, as no traces are to be found of fortifications†.

A vedro of French brandy here, containing from fifteen to twenty quarts, costs eighty roubles‡. The merchants are permitted to traffic in this article. The inhabitants of Bolcheretsk differ little from the Kamptschadales in their mode of living: but they are less satisfied however, with balagans, and their houses are a little cleaner. Their clothing is the same: the outer garment, which resembles a waggoner's frock, is made of the skins of deer, or other animals, tanned on one side: under these they wear long breeches of the same, and next the skin a short tight shirt of nankeen or cotton; the womens' are of silk. Both sexes wear boots, of goats' or dogs' skins in summer, and in the winter of the skins of sea wolves, or the legs of the rein-deer. The men usually wear fur caps: Their gala dress is an outer garment, trimmed with otter skins and velvet, or furs of the most excellent quality. The women are generally clothed like the Russian women.

As their food consists principally of dried fish, the men are employed in procuring them; and the women, besides their domestic occupations, gather fruits and other vegetables, which, next to the dried fish, are the most esteemed provisions among the Kamptschadales and Russians of this country. When the women engage in making these harvests for winter consumption, it is a holiday with them, which is celebrated with intemperate joy, accompanied with the most extravagant and indecent

ness expose them to the mercy of such unprincipled plunderers. When they are found in a state of inebriety, these harpies obtain from them the barter of their most valuable effects, their whole stock of furs, frequently the fruit of the labour of a whole season. The fascinating sight of a few glasses of brandy deprives them of all prudence; for the momentary pleasure of gratifying their strange propensity in this particular, they will incur immediate and inevitable destruction. They cannot guard against their own weakness, and the cunning and perfidy of these traders; who in their turn swallow, in similar potions, all the profits of their knavery.

‡ Eighteen pounds sterling.

scenes, giving themselves up to all the follies and absurdities which their imagination may suggest*.

The most common fish here are trouts, salmon, and sea-wolves: the fat of the latter is very wholesome, and also serves the inhabitants for lamp-oil.

Among the vegetables used by the Kamptschadales, are the sarana root, wild garlic, *Slatkata trava*, or sweet herb, and other plants nearly similar to what are found in Russia. The sarana is known to botanists, and has been described at large by Captain Cook. Its farinaceous root supplies the place of bread: it is usually dried before it is used, but it is salutary and nourishing in every mode of preparation. From the wild garlic a fermented beverage is made, which the Kamptschadales are fond of. The *slatkata-trava*, or sweet herb, which has been minutely described by the English, is highly esteemed by the natives, particularly the spirit distilled from it. Brandy is also distilled from this herb, which intoxicates more expeditiously than French brandy†.

The Kamptschadales are mild, honest, and hospitable; but having little penetration or suspicion, they are easily imposed on. They live together in the most perfect harmony, and their unanimity disposes them to assist each other, which strongly manifests their zeal to oblige, when the slothfulness of their disposition is taken into consideration. An active life would make them the most miserable of mankind, their whole happiness consisting in tranquil indolence: and the height of intoxication‡.

M. Kasloff, and those who accompanied him, frequently gave balls, and other entertainments

* They cannot be accused of too much delicacy in the preparation of their food: they waste no part of the fish; for, as soon as it is caught, they tear out the gills, which they suck with great avidity: by a further refinement of sensuality, they also cut off some slices of the fish, which they swallow with rapture, accompanied with delicious clots of blood. The fish is then gutted, and the entrails preserved for the dogs. The rest is prepared and dried, and generally eaten raw, though it is occasionally boiled, roasted, or broiled.

But the food which extravagantly delights these epicures is a species of salmon, called *tchaouitcha*. When it is caught, they bury it in a hole, where it remains till it becomes perfectly putrified: in which infectious state, it highly regales the delicate palates of these voluptuous people. M. de Lessops wanted to overcome the aversion he had taken to this luxurious repast, but his resolution was unequal to it; he was not only unable to taste it, he could not admit it to approach his mouth: for, whenever he attempted it, the fetid

for the amusement of the ladies of this ostrog, who accepted such invitations with alacrity and joy. The women, whether Kamptschadale or Russians, have a strong propensity to pleasure, which their eagerness will not permit them to conceal or disguise. The precocity or forwardness of the girls is beyond conception, and seems to suffer no diminution from the coldness of the climate. The women of Bolcheretsk who attended these assemblies, and who were principally of a mixed blood, or of Russian parents, were not disagreeable in person, some of whom might indeed with justice be pronounced handsome. The bloom of their youth, however, is of short duration; but their disposition is extremely cheerful, and they sometimes engage in conversation beyond the line of decency; they omit no sally of gaiety that tends to amuse and delight the company: and the majority of husbands, whether Russians or natives, are not very susceptible of jealousy.

In their dances they sometimes imitate the animals they are fond of pursuing, from the delicious partridge to the unweildy bear: they represent the sluggish and stupid gait of the latter: its feelings and situations, his domestic amusements, and his agitations when pursued. They certainly have a perfect knowledge of that uncouth animal, they are so exact and so extremely natural in representing all his motions. M. de Lessops asked the Russians, who had often been present at the taking of these animals, whether their pantomime ballets were well executed, and they assured him that the cries and attitudes of the bear were as accurate as possible: but these dances are as fatiguing

exhalation which it emitted gave him an intolerable nausea.

† The inhabitants consist of three sorts; the natives, or Kamptschadales; the Russians and Cossacs; and the issue from intermarriages: The indigenes are few in number, the small pox having made great havoc among them; and the few which remain are dispersed in the different ostrogs of the peninsula. The genuine Kamptschadales are short, their eyes small and sunk, their cheeks prominent, and their nose flat: they have very little beard, and their complexion is tawny: this description will apply equally to the men or the women; they are not therefore very seducing objects.

‡ But, notwithstanding their defects, it is to be lamented that their number is not more considerable, for it clearly appears, from every information that M. de Lessops could collect, that, "if we would be sure of finding sentiments of honour and humanity in this country, it is necessary to seek for them among the true Kamptschadales; they have not yet bartered their rude virtues for the polished vices of the Europeans sent to civilize them."

to the Europeans it is distressing their limbs, these absurd

There are sometimes the another mode which requires. A Kamptschadale goes out to fight than a gun, his stock of powder. Thus equipped the haunts of among the bears and rivers, at the approach will sometimes the quadrup advances with ground a for enables him with greater of striking the head, or instantly charged disabled by who has not he then arm into a contest

* Sometimes it has received traced by me dying.

† It is said he tears the skin then leaves the Kamptschadale human aspect.

‡ In the wild different mode the den which branches of the frosts continued sledges, attacking him to defend encounters such his fate is equal to death.

§ Mr. Tookouth and numerous, kill the animals sometimes we are also high

to the European spectators, as to the performers; it is distressing to see them distort and dislocate their limbs, to express the pleasure they enjoy in these absurd diversions.

There are various modes of attacking the bear; sometimes they lay snares for him, but there is another mode, very much adopted in this country, which requires strength and courage to ensure success. A Kamptschadale, alone or in company, goes out to find a bear. He has no other weapon than a gun, a lance or spear, and his knife; and his stock of provision consists of about twenty fish. Thus equipped he penetrates the woods to explore the haunts of the animal: he usually posts himself among the briars, or the rushes bordering on lakes and rivers, and waits with patience and intrepidity the approach of his adversary: thus situated he will sometimes remain for a week together, till the quadruped makes its appearance. When it advances within his reach, the hunter fixes in the ground a forked stick belonging to his gun, which enables him to take a surer aim, and to shoot with greater certainty. It is seldom that he fails of striking the bear, with a small ball either on the head, or near the shoulder; but he must instantly charge again, because the animal, if not disabled by the first shot, runs at the hunter*, who has not always time to prepare a second shot: he then arms himself with his lance, and enters into a contest with the bear, and if he does not

* Sometimes it takes to flight, notwithstanding the wound it has received, and conceals itself in thickets, where it is traced by means of its blood, and found either dead or dying.

† It is said that when a bear triumphs over his aggressor, he tears the skin from the skull, draws it over the face, and then leaves him; a mode of revenge which induces the Kamptschadales to believe that this animal cannot bear the human aspect.

‡ In the winter when the country is covered with snow a different mode of hunting prevails: the bear then retreats to the den which he has constructed during summer with the branches of trees; and there he remains, sleeping, while the frost continues. The Kamptschadales pursue him in their sledges, attack him with their dogs, arouse him and oblige him to defend himself. Rushing from his lurking place, he encounters sudden death; and if he declines coming forth, his fate is equally certain, by permitting himself to be crushed to death under the ruins of his den.

§ Mr. Tooke says, the best sables are found near Yakouth and Nerzhink; but those of Kamptschatka are most numerous, and several stratagems are employed to catch or kill the animal, without any injury to the skins, which is sometimes worth ten pounds on the spot. The black foxes are also highly esteemed, one skin being sometimes sufficient

give him a mortal thrust, his life is in imminent danger†. In these combats, the man is not always the conqueror; but the inhabitants are not deterred from this practice by the frequent examples of the death of their countrymen‡.

Other animals are hunted nearly in the same manner, such as rein-deer, argali, foxes, sables, hares, otters, beavers, &c. but they have not equal dangers to encounter. The Kamtschadales sometimes suffer hunger for many successive days rather than quit their station, when there appears a probability of success; but they are amply repaid for fasting by devouring the flesh of the animals, and ruminating on the value of their skins.

The seasons for the chase are when the fur of the animal is in its greatest perfection; sable hunting begins with the winter. These animals usually live in trees, and are called by their respective names; a part of the fur nearest the skin corresponding in colour with those that are the most frequent, as the birch, the fir, &c. Foxes are hunted in autumn, winter, and spring; there are four different species. 1. The whitish red fox. 2. The bright red fox. 3. The fox with a mixture of red, black, and grey. 4. The black fox, having on the fur of the back a slight grey tint. There are also two other species, the blue fox, and the white fox§.

Rein-deer are hunted in winter, and argali in autumn: otters are scarce, but ermines are ex-

to pay the tribute of a village. The rock or ice fox, generally of a white colour, sometimes bluish, is found in great numbers in the eastern Archipelago. This animal rivals the ape in sly tricks and mischief. Other animals pursued for their skins are the marmot, the marten, the squirrel, the ermine, and others of inferior repute. The bear is destroyed by many ingenious methods. The Korais contrive a loop and bait hanging from a tree, by which he is suspended. In the southern mountains his usual path is watched, a rope is laid in it with a heavy block at one end, and a noose at the other. When thus entangled by the neck, he is either exhausted by dragging so great a weight, or attacking the block with fury he throws it down from the precipice, when it seldom fails to drag him to destruction. On the European side of the Uralian chain, where the peasants form the beehives in tall trees, the bear is destroyed in his attempt to seize the honey, by a trap of boards suspended from a strong branch, and slightly attached to the entrance of the hive: the animal finding this platform convenient for his purpose, undoes the slight fastening to get at his luscious repast, but is instantly conveyed to a great distance, and remains in the perpendicular of the branch, till he is discovered and shot by the contrivers. *Tooke's View, iii, 43. Pink. Mod Geog. ii, 74.*

tremely

tre mely plenty. The Kamptschadales fish for salmon and trout in June, for herrings in May, and for sea wolves in spring, summer, and autumn; but principally in the latter. They generally use common nets, or a kind of harpoon: seines are used only for sea wolves. They have also a method of fishing, by closing up the river with stakes, leaving narrow passages for the fish; so constructed that when they once have entered, they find it difficult or impossible to retreat.

There are but few horses in Kamptschatka; but dogs* are numerous: they are used for all the purposes of carriage, and are fed with the offals of fish, or such parts as are rejected by their masters. In summer, when their services are not required, they are permitted to provide for themselves by visiting the sides of lakes and rivers; but they return with great punctuality at the time they are expected. When winter returns, their labour is renewed. These animals are not very large, but resemble such as are commonly used by shepherds. Hardly a single inhabitant, whether a Russian or native, has less than five. They use them for the conveyance of their effects, their provisions, or their persons. They are harnessed to a sledge, in pairs, like horses, with a single one before, serving as a leader, who is appointed to that honourable station from his superior sagacity, and one who perfectly understands the terms used by his conductor. The number of dogs employed in drawing is proportioned to the load; five are thought sufficient for a common team, which is called a saunka. The harness, which is made of leather, passes under the neck, and is joined to the sledge by a strap: bears' skin is sometimes used to decorate these collars.

The form of the sledge resembles that of an oblong basket, each end of which is elevated in a curve: it is about three feet in length, and one in breadth: the body of the sledge is made of very thin wood; the sides are of open work, embellished with straps. The seat of the charioteer is covered with bears' skins elevated about three feet from the ground: the charioteer is furnished with a stick, which serves him as a rudder or a

* They are castrated, like horses; but some of them do not survive the operation, and others become crippled and unfit for service; should they be permitted to remain in their natural state, it would be impracticable to harness them with females. All males, however, are not mutilated; a sufficient number is reserved for the pre-

whip; iron rings are suspended to ornament the stick, as well as to encourage the dogs by their jingle. The Kamptschadales are singularly expert in the management of their dogs.

The common mode of sitting in a sledge is sideways, as a lady rides on horseback. M. de Lessops, astonished at the dexterity displayed by the drivers of sledges, and thinking he should acquit himself tolerably well in that character, procured a carriage, and ventured to become the charioteer: a number of falls, which he successively received, from his inability to conduct that curious machine in a masterly style, did not discourage him from proceeding, and he at length became an amateur of the exercise, and acquired a degree of reputation in it. From that moment he became his own driver, and almost abandoned every other mode of conveyance.

To fill up the additional time M. de Lessops was destined to continue here, he visited some of the environs, and amused himself much with the constructing of his travelling sledges; but his principal delight was in the company of M. Kasloff, and the officers of his suite.

In adverting to the diseases of Kamptschatka, the small pox demands particular notice; as having committed great ravages. It appears not to be natural to the country, nor is it common. It made its appearance here in 1767, and 1768, being brought into the place by a Russian vessel. The Kamptschadales are probably indebted to the same party for their knowledge of the venereal disease, which happily is not prevalent. It appears to be exotic, and is attended with ruinous effects from the injudicious administration of medicines.

Surgery is in a state of barbarism at Kamptschatka, and physic does not appear to have made any considerable progress. They have had their impostors and empirics, which seem now to have lost all credit among them.

Women of this country have generally about four or five children, and seldom produce more than ten. They sometimes suckle their infants four or five years; whence it may be supposed

servation of the species, and these are frequently occupied in hunting.

† A close coach to sleep in, fitted to the sledge, not unlike a common carriage in Russia called *vesok*: this was lined with a bear's skin, and covered with the skin of a sea wolf.

that Kamtschadale mothers have very strong constitutions. It is observed, however, that the natives of either sex, do not live longer than Russians*.

The district of Paratounka, includes seven ostrogs and the Kurilles islands. The number of inhabitants, in the whole, amounts to about six hundred and twenty. The rector of Paratounka is allowed a salary of eighty roubles, and twenty pounds of rye flour. He has no tythes, but receives a certain emolument attached to his church.

The current coins are the golden imperial of ten roubles, the rouble, and half rouble. A very few silver coins are under this value. Copper and paper money have not yet made their appearance in this peninsula. The pay of the soldiers is fifteen roubles a-year†.

Towards the close of November the cold grew suddenly severe, and in the space of a few days all the rivers were frozen; not excepting even Bolchai-reka, which generally escapes the severity of frost, from the rapidity of its stream. On each shore of the peninsula, a manifest difference is found in the atmosphere. A drought prevailed at St. Peter and St. Paul's, while frequent showers were complained of at Bolcheretsk. Very heavy rains produce much injury here, by occasioning

* The Christian religion was introduced here by the Russians, but the inhabitants know little of it except the ceremony of baptism. Slaves to their inclinations, they follow their impulse upon all occasions, and practice religious rites only when they accord with their own interest or convenience. There are eight churches in Kamptschatka, viz. Paratounka, Bolcheretsk, Ichinsk, Tiguil, Vorekney, Lutcheskaia, and two at Nijemel: to which may be added the church of Jingiga, in the country of the Korians.

† The property of the Kamtschadales devolves, upon their decease to the next heir, or to whom the testator bequeaths it. The will is as much respected and adhered to as in any of the European nations. Divorces are not allowed. The penalty of death is never inflicted at Kamptschatka: the punishment of the knot is now no longer practised. For petty, or capital offences, whipping is inflicted. Perhaps the offenders gain no advantage by the change in punishments; whipping being more simple and expeditious, recourse is had to it with less scruple, and it is liable to frequent abuse. The Kamptschadale idiom is uncouth, guttural, and difficult to be pronounced.

‡ The wind varied considerably while M. de Lessops resided at Bolcheretsk; the south and west winds are generally attended with snow. Hardly a day passed without his experiencing two or three violent tempests. "Woe to all travellers" exclaims this intelligent writer, "who are exposed to this terrible weather! Necessity compels them to stop, or they run the risk of losing themselves, or of falling every moment into some abyss; for how is it possible that they should find

great floods which force the finny race from the rivers, when a famine has been more than once the consequence in all the villages along the coast‡.

The frequency of these tempests, and the deplorable accidents which they occasion, convinced the party of the necessity of deferring their departure. M. Kasloff was certainly impatient to arrive at the place of his destination, and M. de Lessops was equally anxious to prosecute his journey, that he might execute the trust reposed in him; but the other gentlemen condemned their eagerness, and clearly demonstrated that it would be the height of rashness to proceed. This reflection had its proper effect, and furnished M. de Lessops and M. Kasloff with an acquittal from all censure, for consenting to so necessary a delay§.

To enjoy this tumult more at his ease, M. de Lessops quitted his sledge for another of smaller dimensions, where he could better observe what passed. He rejoiced that no accident had happened, and was perfectly convinced that all this embarrassment had been occasioned by the inhabitants of Bolcheretsk, who voluntarily attended M. Kasloff to Apatelin, from motives of profound respect. Hardly had they arrived at

their way or advance a step, when they have to resist the impetuosity of the wind, and to disengage themselves from the heaps of snow that suddenly encompass them."

§ These gales of wind having ceased about the middle of January, they eagerly prepared for their departure, which was fixed for the 27th of the same month: they furnished themselves with brandy, beef, flour, and oatmeal. A quantity of loaves were provided for them, some of which were reserved till the commencement of their journey, and the rest were sliced and baked to be eaten as biscuits. Multitudes of dogs were collected, and provisions in abundance for their support. The party started at seven in the evening, their baggage not being ready till that time: it was moonlight, and the snow added lustre to its brightness. They started with *eclat*, having thirty-five sledges in the procession; a serjeant named Kabechoff superintended; and when he gave the signal, the sledges set off in file. Three hundred dogs were employed in drawing these sledges, all active and adroit: speedily the line was broken, and the utmost confusion succeeded; a spirit of emulation among the conductors produced a kind of chariot race, and the contention was who should drive fastest. The dogs resented this insult; and, partaking of the rivalry of their respective masters, fought with each other for the precedence, and many of the carriages were overturned. The clamour of the persons overturned, the yelping of the contending dogs, and the vociferous chattering of the guides, made "confusion more confounded," and nothing that was said could be understood.

this ostrog, when a tempestuous wind arose, which continued the whole night and the following day. Here a last farewell was taken of the inhabitants of Bolcheretsk; and M. de Lessops was particularly struck with their gratitude and attachment to M. Kasloff, and the regret they expressed at leaving our author; having entertained an idea that the famous Beniowsky, a supposititious Frenchman, had successfully represented that nation in an invidious light. M. Schmaleff quitted the party at break of day, to proceed to Figuil in his official character.

Leaving Apatchin almost at the same time, the small party of travellers became still smaller, and were rendered more capable of expedition. Having passed the plain in which this ostrog is situated, they met the Bolchai-reka, and followed it through many of its windings: they found it necessary, however, to quit this river, the current having put the ice in rapid motion; and, before they reached Malkin, they crossed the Bistraia, and arrived at the ostrog about two o'clock. Having no supernumerary dogs, they were obliged to halt here, to give their canine travellers a little rest to recruit their exhausted strength.

The toyon of Malkin respectfully met M. Kasloff, and offered him his isba: great preparations had been made for the reception of this little party, which induced them to pass the night at the ostrog. They were very hospitably treated by the toyon, but their repose was horribly disturbed by the incessant howlings of these clamorous steeds; yet M. de Lessops says, that after a few sleepless nights occasioned by their shrill incessant yelpings, Morpheus at length overpowered him, and he became insensible to all their noise. By degrees he became so inured to the cries of these animals, that he could repose in the midst of them with the most perfect tranquillity. The dogs are fed but once a-day, and dried salmon is their most common repast.

The ostrog of Malkin contains about five or six isbas, and a dozen balagans, and is situated on the borders of the Bistraia, surrounded with

* But a most unpleasant odour is exhaled from a dismal lamp, serving to light the whole house; a rag rolled up in the middle performs the part of a wick, and the grease of the sea wolf or some other animal is the substitute for oil: when lighted a dark thick vapour seizes the nose and throat, and penetrates to the very heart. Another disagreeable smell is experienced in these habitations; it is the nauseous exhalation from the dried and stinking fish. The inhabitants

high mountains. From Malkin the travellers proceeded towards Gamel, but they met with several impediments on the road: the Bistria not being completely frozen, they were obliged to make circuitous marches and to cross the woods, where the snow, though deep, wanted firmness, and the dogs sunk in it. They were therefore induced to abandon this road and make again for the Bistraia; and when they again arrived at it, they found it in a more practicable state. The solidity of the ice seemed to promise good travelling, and they readily embraced the apparent advantage, following its course till they came to an ostrog on its bank, consisting of four isbas, and twelve balagans. After passing an indifferent night in the house of the toyon of Gamal, they set off the next day for Pouchine. The Kamptschatka passes near the lower part of this ostrog: the isbas here had no chimnies, having only, like the balagans, a narrow opening in the roof to aid the smoke in its departure, but which is often closed up to confine the heat: the interior of these isbas is lined with soot*.

The travellers slept at Pouschiné in the house of the toyon, and departed early on the following morning: the farther they advanced, the more were they obstructed by the snow. The conductors were constantly employed in keeping the sledge upright to prevent it from overturning: they were also obliged to exert their lungs to encourage the dogs, who frequently stopped, though blows were cruelly and lavishly bestowed upon them. These poor animals found infinite labour in disengaging themselves from the snow, which covered them as fast as they could shake it off.

The party next arrived at the ostrog of Charom, situated upon the Kamptschatka, where they passed a part of the night, and left it before the morning. In seven hours they reached Vercknei-Kamptschatka, thirty-five wersts from Charom: it is a very considerable place, having more than a hundred houses: the situation is commodious, and commands a pleasing prospect. Besides bordering on the river, it is

of these dwellings exhibit a spectacle equally disgusting: a group of women, besmeared with fat, are seen wallowing on the ground amidst a heap of rags; some of them suckling their half naked children, bedaubed with filth from top to toe; others ravenously devouring different fragments of fish, principally raw and putrid. Several appeared in a *dishabille*, as disgusting as can be conceived, gossiping on the most indelicate domestic occupations.

adjacent to the woods, and has a fertile soil, which the inhabitants begin to cultivate. The church, though built of wood, deserves commendation. Here are a species of buildings, about the height of a balagan, constructed solely for the purpose of drying fish. A serjeant had the command at Vercknei, and inhabits a house belonging to the crown. This village is also the residence of the unfortunate Ivaschin, of whom mention has been already made.

The travellers remained but a short time at Vercknei, setting out from thence after dinner to Milkovaia Derevnia, or Milkoff, at the distance of fifteen wersts. They passed a pretty large field inclosed with palisades, and, farther on, a hamlet inhabited by labourers, who are Cossacs, or Russian soldiers, employed in agriculture on government account: they had also eighty horses, belonging to the crown. M. de Lessops had some conversation with the Cossacs, relative to the productions of their canton; declaring his opinion that he thought every species of corn might be cultivated there with success; and they, in reply, assured him, that their last harvest had surpassed their hopes, and was not inferior to the finest harvests in Russia.

Arrived at Milkoff, the travellers no longer saw Kamptschadales or Cossacs, but a colony of peasants. They were selected in 1743 from among the primitive inhabitants of Russia and Siberia, and chiefly from among the husbandmen. The view of administration in sending them here was to clear the land, promote agriculture, and encourage the native inhabitants, by

* The habitations of these emigrants, situated on the Kamptschatka clearly shew that they live at their ease. Their cattle thrive from their exemplary care and industry, and their countenances display an air of satisfaction and content. Their labour, though advantageous, is not excessive. Every man ploughs and sows his own field, and having only a trifle to pay for it, he is abundantly rewarded for improving a fertile soil. This colony has no concern with the chase, Government having wisely taken care to prohibit it, that their labours might be devoted wholly to agriculture. Their chief is a *sarosta*, selected from the old men of the village, who is required to inspect the progress of agriculture, and to regulate the operation of seed time and harvest; as well as to animate the zeal of the labourers, and stimulate the negligent to a rational performance of their duty.

† His dress usually consisted of an outward pargue or covering of deers' skin, and a fur cap, which would occasionally cover his ears and part of his cheeks. When the cold was more intense, he added two kowklanki, made of

their example and success, to employ themselves in the necessary art: but unfortunately their example and instruction had no effect upon the sluggishness of these unaspiring natives*.

Wishing to go to Machoure, to pass a day with the baron de Steinheil, M. de Lessops left M. Kasloff at Milkoff, and set out twenty-four hours before him, that his journey might not be delayed. The roads, however, were in no better condition than what he had before experienced, and he could not proceed so rapidly as he intended. The first village he came to was Kirgan: the few houses which compose the ostrog, stand on the border of a river called Kirganik, which is formed by a variety of streams descending from the mountains, and uniting above the ostrog. The cold was so severe that, though he covered his face with his handkerchief, his cheeks were frozen in the space of half an hour: he rubbed his face with snow, (a common practice upon these occasions) and was speedily relieved, though an acute pain succeeded it, which continued for several days. But if his face was frozen, the rest of his body experienced a different fate: By conducting his own sledge, the violent exercise threw him into a violent perspiration, and fatigued him extremely†.

He made no stop at Kirgan, but reached Machoure about two in the afternoon: he alighted at the baron Steinheil's, with whom he became acquainted at Bolcheretsk, and was so happy as to be able to converse with him in several languages. He passed the whole day with the baron, (4 Feb.) and in the evening M. Kasloff

thicker skin, one of them having the hair on the inside, and the other on the outside. In the severest weather, another kowklanki still thicker, was put over all this, made of argali, or dogs' skin. To these kowklankis a small bib is fixed before, to defend the face from the wind: they have also hoods behind which fall upon the shoulders. His neck was guarded by a cravat, made of sable or the tail of a fox, and his chin with a similar preservation, fastened upon his head. His forehead, being very susceptible of cold, was covered with an otter or sable fillet, and over this his cap. He derived more warmth from his fur breeches, than from all the rest of his dress: he had double deer-skin spatterdashes, with hair on both sides, and he put his legs into boots of deer-skin. With all these precautions, his feet grew wet, after travelling two or three hours, either from perspiration or the penetration of the snow and if he stood motionless for a moment in his sledge, they instantly became frozen. At night he exchanged his spatterdashes for a pair of fur stockings made of deer-skin.

arrived

arrived as he had promised. The ostrog of Machoure was one of the most considerable in the peninsula, but the cruel ravages of the small-pox has reduced the number of its inhabitants to twenty families*.

At break of day M. de Lessops took leave of the baron de Steinheil, and travelled with his party sixty-six wersts upon the Kamptschatka, the ice of which was perfectly firm and smooth: in the evening at sun-set they arrived at the village of Chapina. Setting off the next morning, they found the snow extremely troublesome; it had fallen so abundantly that they were hardly able to proceed; but they made some little progress through woods of fir and birch. At length they met with two rivers; one of which was small; the other, however, was about sixty yards in breadth: the latter is called the great Nikoulka. Both these streams issue from the mountains, and, uniting here, pass in company to the Kamptschatka; neither of them was frozen, which may rationally be attributed to the extreme rapidity of their current. The quantity of firs that skirted these rivers, resembled so many trees of ice: a thick hoar frost, occasioned by some dampness, having given the whole a lucid chrystalline appearance.

Crossing a heath at some distance from Tolbatchina, our travellers perceived three volcanoes, none of which emitted flames, but columns of black smoke. The first, on a level with Machoure has its reservoir in a mountain of a conical shape, the summit being a little flattened; this volcano was long thought to have been extinguished, but it has lately resumed its ancient office. The crater of a second volcano, north-east of this, continually throws up smoke, but exhibits not a spark of fire: the third, which is north-east of the second, could not be distinctly seen, a high mountain somewhat intercepting the view.

Arriving at the ostrog of Tolbatchina, forty-four wersts from Chapina, the party were informed that a Kamptschadale wedding had been celebrated there in the morning: they regretted they

* All the Kamptschadales of this village are chamans, or believers in the witchcraft of these supposed sorcerers. They pay a secret homage to their God Kouta, and address their prayers exclusively to him when they solicit a boon or blessing. When they engage in the chase, they abstain from washing themselves, and carefully avoid making the sign of the cross: they invoke their Koutka, and sacrifice to him the first animal they catch. It is also a part of their

not having been present at the ceremony, but they saw the parties; the bridegroom appearing to be about fourteen years of age, and the bride not exceeding eleven. Such marriages would be thought premature in any other country than Asia.

Being particularly desirous of seeing the town of Nijenei Kamptschatka, and supposing it would be an unpardonable offence to have left the peninsula without seeing the capital, M. de Lessops resolved to visit it, having first consulted with M. Kasloff to rejoin him at the village of Yelofski, where some government arrangements would detain him several days: he took leave of him, and proceeded to Kosirefsk; and from thence to Ouckloff, a village containing one isba, and eleven bulagans. A lake in the neighbourhood is so abundantly prolific in fish, that all the villages in the environs resort to it for their winter stock.

Leaving Ouckloff, M. de Lessops travelled partly upon the Kamptschatka, and partly across extensive heaths, till he arrived at Krestoff, a small ostrog where he only stopped to change his dogs. The weather which had been fine since his departure from Apatchin, now suddenly changed. The sky became clouded, and a west wind produced a heavy snow, he could not therefore examine minutely the volcano of Kutchesskaia; it threw up flames which seemed as if they ascended from the midst of the snow, with which the mountain is covered to its very summit. On the approach of night he reached the village of Klutchesskaia, inhabited by Siberian peasants from the neighbourhood of the Lena sent to cultivate the land.

The ostrog is pretty large, extending principally from east to west: the church, which is built of wood, and in the Russian taste, is situated to the eastward; the houses are cleaner and better constructed than usual in this part of the country. The Kamptschatka which passes at the bottom of the ostrog, is never entirely frozen in this part: in summer it often overflows the houses, though all of them are built upon an eminence†.

M. de

superstition to consecrate to the Koutka their new-born children, who from their leaving the cradle are destined to become chamans: their veneration for sorcery approaches to insanity, and is really to be pitied. The magicians, however, no longer decorate their garments with mystic rings, nor exercise their magic instruments.

† Leaving Klutchesskaia, our traveller proceeded through Kamina, Kamahoff, and Tchoka, and from thence to Nijenei;

M. de Lessops was fortunate enough to be banished to the Kamptschatka, where he hardly entered the leankoff camp. Many of the ample, and the der of their he hastened separately, whom he found in a marriage*.

* The cont vice, and the major not on the morning t lose any part ceremonial, t not promise m Vol. II. P

M. de Lessops alighted at the house of an unfortunate exile, named Spafidoff, who had been banished to Kamptschatka in 1774. He had hardly entered, when an officer from M. Orleanoff came to congratulate him on his arrival. Many of the principal officers followed his example, and all of them made a very obliging tender of their services. As soon as he was dressed, he hastened to return his thanks to each of them separately, beginning with Major Orleanoff, whom he found busily preparing for an entertainment, in consequence of an approaching marriage*.

The next day he was invited to dine with the uncle of the bride, and partook of an entertainment similar to that on the preceding day, the fire works excepted. This gentleman is the protopope or chief in all the churches in Kamptschatka, who has the decision of all ecclesiastical affairs. He is an elderly man, with a long white beard, and has a truly venerable appearance. There are two tribunals at Nijenei, one respecting the affairs of government, and the other for regulating mercantile disputes, and each of these jurisdictions holds from the tribunal of Okotk, to the governor of which it is answerable for its proceedings.

While M. de Lessops continued at Nijenei, he saw nine Japanese, who had been brought there the preceding summer, from the Aleutienne is-

Nijenei; and had the pleasure of entering, a little before noon, that capital of Kamptschatka, which is neither very striking nor agreeable. It exhibits merely a cluster of houses, with three steeples soaring above them, and is situated on the border of the Kamptschatka, in a basin formed by a circular chain of mountains, which are however at a pretty considerable distance. The houses, which consist of about a hundred and fifty, are built of wood, in a wretched taste, small, and almost buried under the snow, which the hurricanes drive among them. Of the two churches which make their appearance in this town, one is ornamented with two steeples, and the other belongs to the fort; both miserable structures! The fort is near the middle of the town, in an enclosure of a square form. Here are also the Magazines, the arsenal, and the guard-house. The house of the governor, Major Orleanoff, is near the fortress: it is larger, but not more elegant than the other houses.

* The contracting parties were a Pale in the Russian service, and the niece of the protopope, or chief priest. The major not only politely invited our author, but attended in the morning to conduct him to his house, that he might not lose any part of this interesting spectacle. The strictness of ceremonial, the extreme delicacy, formality, and civility did not promise much mirth or pleasantry: the repast, however,

VOL. II. NO. LXXVII.

lands, by a Russian vessel; many particulars of whom he circumstantially related; but to follow him through his narrative would be wantonly digressing from the abridgment that may be reasonably expected from us.

Having spent three days at Nijenei Kamptschatka, he left it in the afternoon of the 12th of February, to meet M. Kasloff, depending upon seeing him at Yelofki. He arrived at Tchoko early in the evening. The next morning he arrived at the ostrog of Kamini, where he took the road of Kartchina. He passed three lakes, the last of which was not less than five leagues in circumference; and slept at the ostrog, which was seated on the river Kartchina. He continued his route as soon as it was light, and notwithstanding the bad weather, travelled seventy wersts, which brought him to Yelofki, on a river of the same name, surrounded by mountains †.

M. Kasloff was surprised at our author's expedition, but he could not immediately accompany him in his departure. His business not being finished, they were obliged to prolong their stay; and they had a further expectation that M. Schaaleff would soon arrive, and meet them at this ostrog. Five days were thus passed in fruitless expectation. At length M. Kasloff complied with the impatience of our author, and they agreed to set off on the morning of the 19th ‡.

The first business of their Kamptschadales was now

was extremely sumptuous, consisting of an infinite variety of soups and other delicacies, on which the company fed heartily. Roasted dishes, and pastry composed the second service. The fruits of the country, which had been boiled up and mixed with French brandy, formed a principal part of the beverage. Making a little free from this, the guests by degrees assumed an air of good humour, the potency of the fumes having occasioned the grossest mirth to be circulated round the table. To the feast a ball succeeded, which was accompanied with decent regularity: the company were gay, and Polish, as well as Russian Dances, were introduced. The festival ended with fire-works, which had been prepared by Major Orleanoff. Our author enjoyed the astonishment of the spectators, who were little accustomed to such exhibitions, and exclaimed in full chorus at the amazing splendour of each squib. He was equally struck with the regret they expressed at the shortness of its duration.

† The villages have generally the same name as the rivers on which they are placed, except those that are on the Kamptschatka.

‡ They travelled gently in the morning, and in the afternoon were suddenly molested by an outrageous tempest from the west and north-west. Being an open country, the whirlwinds became so violent that there was no possibility of

proceeding

now to dig a hole in the snow, which was here about six feet deep; others procured wood, a fire was kindled, and the kettle put on it. A light repast, and a glass of brandy to each, exhilarated the company; and, as the night approached, measures were prudently taken to facilitate repose. Each individual prepared his own bed, and they were not ceremonious on the occasion. Having dug a hole in the snow, they covered it with the small branches of trees; then, wrapping themselves up in a kouklanki, with the hood over their heads they lay down very comfortably. The dogs were unharnessed, and tied to some adjacent trees.

The wind abating, the adventurers proceeded on their journey, before the appearance of daylight: they arrived at Ozernoi at ten in the morning, but their dogs being excessively fatigued, they were obliged to pass the day and night there, hoping the tempest would subside. The ostrog has its name from a neighbouring lake; the little river Ozernaia runs at the bottom of the village. The toyon's residence was the only isba they saw; but there were two yourts, and fifteen balagans. The next day before noon, they reached Ouké, and waited there in expectation of a serjeant of M. Kasloff's suite, had been ordered to visit them there. Ouké contains but one isba, twelve balagans, and two yourts. One of the yourts had been cleaned for M. Kasloff, and the party passed the night in it.

At Khaluli, an ostrog on the river of the same name, there were but two yourts, and twelve or

proceeding. The snow, which they drew up into the air at every blast, created a thick fog, and their guides declared they could not be answerable for misleading them, for they knew not how they were proceeding. They could not prevail upon them to conduct them any further. They proposed to lead them to a neighbouring wood, where some shelter might probably be found; a step which was assented to without hesitation, after they had collected their sledges, lest they should be separated and lost. Having accomplished this business, they happily gained the wood, at about two in the afternoon.

Speaking of the yourts, which he attempts first to describe, he says "We have no sooner descended those savage abodes, than we wish ourselves out again; the view and the smell are equally offensive: the interior part consists of one entire room about ten feet high. A bench, five feet high, and covered with various skins half worn out, extends all round it. This bench is only a foot from the ground, and commonly serves as a bed for a number of families." He then informs his readers that he has seen in one yourt more than twenty persons, mixed together, eating, drinking,

thirteen balagans. Nothing worthy of remark occurred here: The adventurers also passed an old village of the same name, which had been deserted on account of its disagreeable situation: Inaschkin consists of two yourts and six balagans, situated on a small river of the same name: the adventurers slept at that village, and passed the greater part of the following day there, under terrible apprehensions of a hurricane.

They next proceeded to Dranki, a small ostrog, which they quitted at break of day. In the afternoon they crossed a bay fifteen wersts wide, and upwards of twenty-five deep. Karagui was the next ostrog they arrived at, seated on an eminence and affording a view of the sea. It has three yourts, and twelve balagans.

The travellers being obliged to wait here for a stock of dried fish, intended for the nourishment of the dogs in the desert, which they are now to traverse, M. de Lessop takes this opportunity of transcribing many particulars which he had registered among his memorandums from time to time. They are not placed in the order they were written, but they must be supposed to have been written with rapidity.*

The dress of the children resembles that of the Koriacs, consisting only of one garment, formed of a single deer-skin, which sits close to every part of the body; so that the children appear to be entirely sewed up. An opening at the bottom, before and behind, is covered with a piece of skin, which may be fastened and lifted up at pleasure†.

These

sleeping, and obeying all the commands of nature without restraint. The fire-place is either in the middle, or against one of the sides. In the evening they rake the coals in a heap, and shut the entrance that the smoke may not evaporate, and diminish the heat; a wretched image of some saint is perceived in one corner of the apartment, shining with grease, and blackened with smoke: To such images the Kamptschadales prostrate themselves and address their prayers. The furniture consists of seats and vessels, fabricated from wood, or the bark of trees. Their culinary utensils, which are copper or iron, are disgustingly filthy: The remnants of their dried fish are scattered about the room, and the women and children are almost perpetually employed in broiling pieces of salmon skin, which they swallow with apparent glee.

† Having been informed that two herds of Koriacs were at no great distance, M. de Lessop sent a messenger to request them to sell him some of their animals; in consequence of which two rein-deer were brought to him alive the same day, which proved a seasonable supply to his people, who began to apprehend a scarcity of provision: but as these

* The storm stiaued till the they wished to brated female alited fame ex duced them to dance. Pray consideration of two of brandy

These animals are employed by the Koriacs, as the dogs are by the Kamptschadales.

The long expected provisions at length arrived, under the guidance of the serjeant who had been long expected. Our travellers had prepared for their departure; but an impetuous wind, accompanied with snow, detained them. Their supply of food was not considerable, and as their necessities were so urgent that they were obliged to have immediate recourse to it, expedition was required, lest their stock should be consumed before they passed the deserts.

All the men and women of this place smoke and chew tobacco; and, by a strange kind of refinement, mix ashes with their tobacco to add to its strength. Snuff was presented to them, which they applied to the mouth instead of the nose. Their pipes resemble those of the Chinese, and are made of bone. When they make use of them, they swallow the smoke with seeming gratification, instead of emitting it from the mouth.

All the tojons of the different ostrogs we had visited in coming from Ozernei, escorted the travelling party as far as Karagni, which was to manifest their respect for M. Kasloff. The second day after their arrival, they took an affectionate leave of him, expressing their sorrow that they had not been able to afford him a better reception in the course of their journey. They addressed themselves in the same friendly terms to M. de Lessop, and earnestly entreated him to accept some presents from them. Refusal made them the more urgent, and to oblige them he was under the necessity of receiving their favours.

Koriacs spoke neither Russian nor Kamptschadale, they found it impossible to treat about the price, till an inhabitant of Karagni kindly undertook the office of interpreter. There are Koriacs of two denominations: those who are regularly entitled to that appellation have a fixed residence; the others are wanderers, and are called rein-deer Koriacs; their flocks, which are numerous, are maintained by conducting them to those cantons that abound with moss; and when they are exhausted to convey them to others. Thus they wander about incessantly, encamping under tents of skin, and existing on the produce of the deer.

* The storm abated, but another tempest arose, and continued till the evening: To divert their attention therefore, they wished to be entertained with the abilities of a celebrated female dancer, who was a Kamptschadale. Her exalted fame excited the curiosity of our travellers, and induced them to send for her, but she positively refused to dance. Prayers and entreaties were repeated in vain; no consideration could induce her to comply. A bumper or two of brandy, however, seemed to effect a change in her in-

The travellers left Karagni at one in the morning on the 2d of March; the weather was tolerably calm; but they found themselves unable to cross a bay, which the tempest of the preceding evening had cleared of its ice; they were therefore obliged to go round it. On the approach of night, they erected their tents in the open country, and the sledges were ranged around them; the spaces between being covered with linen or skins, accommodated their guides with shelter and beds. When the kettle boiled they took tea, and then prepared for supper, the only certain meal they partook of every day. The corporal acted the part of a cook: the dishes provided were neither numerous nor delicate, but he was expeditious; and keen appetites were very indulgent. He usually prepared a kind of soup, consisting of a biscuit of black bread, mixed with rice and oatmeal. It was manufactured thus: he put a piece of beef, or rein-deer into boiling water, having first cut it into thin slices, and the article was ready for eating in an instant. The evening before their departure from Caraggy they had killed their second deer, and regaled themselves with its marrow; they also had its tongue boiled, and thought it extremely delicious.

They pursued their journey in the morning, but found it impossible to travel far; the wind blew with extreme violence; and the dogs suffered severely; some of them were so much exhausted that they died of fatigue upon the road, and others were unable to exert their strength for want of nourishment: they had only a fourth part of their usual allowance, and not a sufficient quantity re-

clinations: at the same time a Kamptschadale began to dance before her, challenging her by his voice and gestures. Gradually her eyes sparkled, her countenance became convulsive, and she seemed completely agitated. She answered the shrill notes of the dancer in similar accents, beating time with her head, and assuming extraordinary postures: her movements became more rapid, and she appeared unable to contain herself; she darted from her seat, and defied her partner with the most extravagant cries and distortions: her limbs appeared disjointed, she tore her cloaths, and fixed her hands to her bosom, which she attempted to tear also. Her transports were accompanied with more extravagant postures, and she appeared no longer as a woman, but as a fury. In her frenzy she would have rushed into the fire, had not her husband industriously prevented it. When he perceived that her head was disordered, and that she staggered in all quarters, he took her in his arms, and placed her on a bench, where she fell, and remained an inanimate clod. This scene, however, instead of affording amusement, was found disgusting to our travellers.

maind

remained as a scanty supply for the last two days. In this extremity they sent a soldier to the ostrog of Kaminoi to procure succour, and to send the appointed escort to meet them; which was a guard of forty men, sent from Ingiga, on the first intelligence of the revolt of the Koriaes.

Being only fifteen wersts from Gavenki, where they expected a supply of fish for their dogs, they ventured to encourage them with a double portion, the better to enable them to convey our travellers thither. They pursued their journey at three o'clock in the morning, and arrived at Gavenki about ten, where they saw two isbas falling to ruins, and six ill constructed balagans. It was not astonishing to hear, that, not long before, upwards of twenty of the inhabitants voluntarily quitted their country in search of a better abode.*

There is neither spring nor river in the neighbourhood: a lake supplies the inhabitants with water. In winter they break the ice on this lake, and carry home large pieces of it, which they cause to be suspended in a trough of about five or six feet high: the heat is found sufficient to dissolve the ice, and when any of the family are thirsty, they have recourse to the trough †.

Famine had now so probable an appearance, that our travellers apprehended such a fate in this desert. Having no fish left for the dogs, they were obliged to feed them with their own provisions; but small was the share allotted to them, prudence dictating the most rigid economy to be observed. They were in want of water; the only little brook

* Soon after the arrival of the travellers at Gavenki, a dispute arose between their serjeant, and two peasants of the village, to whom he had applied for wood: they refused to give him any, and a violent quarrel ensued. The Kamptschadals drew their knives*, and attacked them, but they were immediately disarmed. When M. Kasloff was informed of this violence, he ordered the guilty to be punished; and he went out himself to hasten that punishment. One of the culprits was about eighteen years of age, and the other bordering on thirty: being stripped, and laid prostrate on the ground, two soldiers held their hands and feet; and four others gave them a copious distribution of lashes. The severity exercised by M. Kasloff on this occasion, was extremely necessary, as our travellers began to perceive in this village, some symptoms of the contagious turbulent disposition of the Koriaes.

† Our travellers remained at Gavenki about thirteen hours, when they set off in the night for Povtarsk. On the first day they had little reason to complain of the river; the next they were much harassed by snow, and the gale was so impetuous, that their conductors were blinded. To

* The length of these knives is about three feet, they are worn in their girdle, and hang upon the thigh.

they could find was a mere mass of ice, and they could only quench their thirst with the snow: Want of wood was another misfortune; not a tree had they seen during the whole journey, and they could hardly procure a shrub. There was no possibility of their warming themselves; and the cold was extremely rigorous. From the slow pace they travelled, they were almost frozen. They were also obliged to stop frequently to unharness the dogs, that were successively expiring †.

On leaving Gavenki, the western coast presented itself to view, about two wersts from Pousteretsk. Our travellers had crossed the whole of this part of Kamptschatka, which is at least two hundred wersts; and they had travelled more on foot than in their sledges. Their conductors could not make their dogs proceed, without harnessing themselves to assist them in drawing. They also frequently encouraged them, by holding up a handkerchief, folded up to resemble a fish. By such contrivances as these, they were able to pass the mountain leading to Pousteretsk. From the obliging manner in which the women received them, they thought themselves perfectly safe, as soon as they set foot in the hamlet. Six of them came to meet them, exhibiting enthusiastic transports of joy, and skipping and singing like so many maniacs. The rest burst out in loud bursts of laughter, to express their satisfaction at the arrival of these travellers, which they said was unexpected ||

To add to their misfortunes, their Gavenki guide was old and short-sighted, and, though he had an incredible knowledge of these roads, he was continually misleading them. At the conclusion of the second day's journey, the dogs' provision was reduced to a single fish, which M. de Lessops divided among them. The want of food enfeebled them, and rendered them unable to proceed: some of them sunk under the blows of their conductors, others declined their duty, and many of them expired on the spot: only twenty-three now remained of the thirty-seven dogs that were harnessed on leaving Bolcheretsk, and these were reduced to extreme poverty. M. Kasloff's stud was also much reduced.

† M. de Lessops's feelings in this dilemma, are thus affectingly mentioned by himself—"I cannot (says he) describe what my feelings were in this situation. My mind still suffered more than my body. The inconveniences that were common to us, I patiently shared with my companions; their example, and my youth gave me courage to support them. But when I thought of my dispatches, my constancy forsook me. They were continually in my hands, and I never touched them without shuddering.

|| The travellers entered Pousteretsk on the 9th of March, at three in the afternoon. They visited all the reservoirs of fish,

VOL. II. N

To this strange sight succeeded the distressing spectacle of those hapless dogs that beset their yourt; their leanness was truly affecting, as they could hardly stand upon their legs. By their incessant cries, they seemed to appeal to the compassion of their masters, and almost to reproach their incapacity to relieve them. Many of them approached the aperture in the roof of the yourt to let out the smoke; and feeling the benefit of the heat, drew nearer still; and at last, from faintness or inability to support themselves, they fell into the fire before their eyes.

Under all these distressing circumstances, M. Kasloff afforded them some consolation, by communicating to them the last expedients he intended to adopt. Hearing that a whale had been driven on shore near Potkagornoi, he had dispatched a messenger to that village, to bring as much of the flesh and fat of it as he could get. This resource, however, being uncertain, M. Kasloff proposed that each of them should sacrifice the provision intended to be reserved for their dogs, to be given to serjeant Kabechoff, who had promised to go to Kaminoi. Situated as they were, a feeble ray of hope was a sufficient inducement for them to risk their all: especially as the poor soldier, whom they had dispatched to Kaminoi, had failed of procuring succour. They embraced the proposal of M. Kasloff, confiding in the integrity and abilities of this serjeant.

Having received instructions for conducting his journey, and taken with him the whole of their provisions, he was directed to take up the poor soldier in his way, and proceed to the execution of his commission; the particulars of which

fish, but had the misfortune to find them empty. All their researches in pursuit of them were fruitless. The dogs had been, in the mean time, unharnessed, preparatory to their being tied up in troops, as is usual. No sooner were they fastened to the posts, than they began to devour their strings and harnesses, and the majority of them instantly escaped into the country, wandering about, and consuming whatever their teeth could penetrate: Some died, and became the prey of the rest; they eagerly rushed upon the dead carcases, and feasted with avidity; every limb, when seized upon by one hungry dog, was contested by a number of competitors, and if he was vanquished in the combat, he became, in turn, the object of a new combat.

* This is a small village seated on the declivity of a mountain, washed by a narrow gulf of the sea: two yourts, containing about fifteen persons, forms the whole of its population. The inhabitants pass the summer in fishing, and preparing stock for the winter. But the country does not ap-

pear to abound much in fish, if a judgment could be formed from what our traveller remarked: their aliment, at that time, consisted of the flesh and fat of the whale, the bark of trees, and the buds steeped in the oil of the whale, or in the fat of any other animal. They seemed, upon the whole, to fare very wretchedly.

must be deferred till after some observations, concerning Poustaretsk have been communicated*.

In catching rein-deer, they pursue the following method: they enclose a certain extent of land with palisades, leaving several openings, where they spread their nets or snares. They afterwards endeavour to drive the deer into them; but, by attempting to save themselves, the deluded animals run through the openings, and are caught by the neck or their horns. Some few escape by tearing the nets or leaping the palisades, but the hunters are generally successful.

The women, exclusive of their domestic occupations, are employed in preparing, staining, and sewing the skins of animals. The sinews of the rein-deer, stripped very slender, serve them instead of thread: their needles, which have nothing singular, are brought from Okotsk, and their thimbles are always worn upon the fore-finger†.

M. Schasmaleff joined them on the 12th, which gave our travellers much pleasure, as they had entertained very unpleasant apprehensions on his account. He had left them about six weeks, and a month had elapsed since the time he had appointed for meeting them. He had not much provision left, but his dogs were in as wretched a state as theirs. They embraced the opportunity which now presented itself of fetching their equipage which they had left upon the road, concerning which they had received no intelligence.

Letters were brought them from Kaminoi, informing them that they had no succour to expect from that quarter: the detachment from Ingiga were unable to come near them: they had been so

pear to abound much in fish, if a judgment could be formed from what our traveller remarked: their aliment, at that time, consisted of the flesh and fat of the whale, the bark of trees, and the buds steeped in the oil of the whale, or in the fat of any other animal. They seemed, upon the whole, to fare very wretchedly.

† The pipes, which they use in smoking, will scarcely contain more than a pinch of tobacco, which they renew till they are completely satisfied. They constantly swallow the smoke, instead of blowing it out, and gradually become so intoxicated that they would fall into the fire, if precautions were not previously taken to prevent it. The fit lasts them about a quarter of an hour, during which their suffering is beyond conception: a cold sweat covers their bodies, the saliva distills from their lips, and their breathing is short and convulsive. When they have experienced all these symptoms, they congratulate themselves on having entered into the true spirit of smoking.

long at Kaminoi, that they had not only consumed their own stock of provisions, but also the supply that had been destined for them.

This intelligence destroyed all their hopes; the despondence of M. Kasloff was so extreme, that he seemed insensible of his promotion, an account of which was conveyed to him by the same messenger. He was advanced from the government of Okotsk to that of Yakoutsck. A more extensive field was now open for exercising his talents in the art of government. But his thoughts were otherwise employed than in calculating the emoluments of his new appointment.

In this critical moment an idea suddenly occurred to M. de Lessops of separating himself from M. Kasloff; and yet, upon reflection, he saw every thing in it that was disobliging to him, and mortifying to himself; he therefore endeavoured to drive this strange idea from his mind, but in vain. He even disclosed the purport of his scheme to the governor, who instantly pronounced it a wild project, and opposed its being adopted. Our author answered his objections, alledging that by continuing together, they deprived each other of the ability of pursuing his respective journey. They could not set off together, as there were only twenty-seven days remaining; with that number one of them would be able to proceed, and his departure would relieve the other from the difficulty of maintaining so many famished steeds.

At this moment their express from Potgagornoi arrived, and brought them a large quantity of the flesh of the whale. Our author rejoiced at this fortunate circumstance, and renewed his argument; and M. Kasloff, instead of opposing him, applauded his zeal, and complied with his solicitations; the 18th of the month being fixed on for the day of his departure. Every thing flattered him with the hope of success, and no obstruction was to be apprehended from the Koriacs. Their friendship was established by presents of tobacco and snuffs, as well as other articles which M. de Lessops had purchased during his sea-voyage, with what had been left him by the Count de la Perouse. But particular care was taken to make them as drunk as possible, that they might report favourably of their reception.

* While they remained at Poustaretsk, the governor dismissed their Kamptschadale guides. Some of them belonged to Bolcheretsk and were four hundred leagues from their home. These poor creatures, most of their dogs having

It was of the utmost importance to consult their taste, and to indulge them with complete intoxication, which would be considered as the very essence of politeness.

Our author requested the Koriacs to take charge of his two portmanteaus: at first they expressed some unwillingness, objecting to the distance, which was as far as Ingiga; but entreaties, enforced by the purse, induced them to take them into their sledges. Having adopted this method of getting his baggage properly conveyed, he had nothing to think of but his dispatches. To the last moment of his stay, M. Kasloff had been employed in preparing his letters; with these he delivered a passport to M. de Lessops, which contained an order to all Russian officers, &c. to assist him with the means of proceeding on his journey with safety and expedition.

The 18th arrived, and M. de Lessops took leave of M. Kasloff. In his travels he passes over the particulars, but admits that it was equally affectionate and distressing. He departed from Poustaretsk at eight in the morning, in an open sledge drawn by seven dogs, which he drove himself: the soldier, who escorted him, had eight harnessed to his sledge. They were preceded by a guide, chosen from the inhabitants*, whose sledge was drawn by a team of twelve, which contained the remainder of the author's effects, and the provisions. He was accompanied by M. Schamaleff, and the officers of his suite; but instead of travelling together to Ingiga, as had been agreed, they separated a few days after.

On leaving Poustaretsk, they descended the gulf, and in a few hours arrived at the mouth; after which they travelled upon the sea, but were greatly interrupted by piles of ice, that had the appearance of so many rocks: they were continually under the necessity of attempting to surmount them, frequently at the risk of being overturned. M. de Lessops many times narrowly escaped from being dangerously wounded: his musquet, which was fastened to a sledge, was bent like a bow, and many of his companions were severely bruised. In the evening they arrived at a hamlet, containing two wretched yourts, and three balagans. A person, who lived in one of the yourts, fled at their approach †.

died of fatigue and hunger, were obliged to return on foot.
* All the wandering Koriacs avoided them in the same manner, fearing they might be obliged to assist them.

A Cossac had been sent forward previous to their departure from Ponstaretsk, by M. Schmaleff, with orders to remain at this hamlet till they should arrive, and endeavour to explore some repositories of fish. This precaution had the desired effect: when they arrived, the Cossac conducted them to a cave, which contained a plentiful stock, and our author purchased a considerable quantity. Early in the morning on the 19th, the party pursued their route; but the road was so terrible, that the sledges would soon have been shattered to pieces, if the company had not determined to proceed on foot. M. de Lessop was compelled to this alternative, to guard against the danger of being overturned; but he only avoided one misfortune to fall into another. Finding himself much fatigued, he resolved to re-ascend his sledge; and a sudden jolt ensued which turned it upon its side. He could only drag himself on as well as he was able: his legs bent under him, a profuse perspiration came on, and a burning thirst added to his weariness. Unfortunately he saw a little river; absolute necessity conducted his steps to it; he broke the ice, and impatiently put a piece of it into his mouth, but he soon repented it. His thirst indeed was relieved, but his excessive heat was exchanged for the opposite extreme; an universal chill seized all his limbs. The sharpness of the night co-operated with the aguish sensation, and he became so extremely weak, that he was unable to proceed a step further. He entreated his companions to halt, to which they complied, from pure civility to him. With much difficulty a few little shrubs were collected, and a fire produced which barely answered the purpose of boiling some water in the kettle, to make a decoction of tea. After taking a few cups of that beverage, he retired to his tent, where he laid down on a small mattress spread upon the snow, and covered himself with plenty of furs to revive perspiration; but in vain: he did not close his eyes during the night: a burning fever, with all its concomitants, attended him, and when he rose in the morning, he could not articulate a sound. Supposing that a longer continuance in this place would be of no benefit to him, he determined to conceal the malignity of his disease from M. Schmaleff.

He was the first to propose going on, but before he proceeded, his sufferings became insupportable. He was obliged to drive himself, and

consequently to be in continual motion: sometimes the badness of the roads compelled him to run by the side of the sledge, and to call aloud to the dogs to encourage them to proceed. By efforts that tortured his lungs, and exhausted his strength, he at last succeeded: but this painful exercise proved salutary to him; and gradually promoted perspiration; in the evening his breath improved, and the fever took its leave of him.

His depression of spirit was succeeded by the most lively joy: a supply of unexpected succour was conveyed by serjeant Kabechoff for him, and he was on the point of receiving a hundred and fifty dogs, well fed and trained. What a sudden and happy change in such a situation! The soldier who conducted these animals offered our author part of his provisions, but he refused them, not being absolutely in want, and the soldier had no profusion.

In pursuing their route, the travellers perceived a small river, bordered with some shrubs, and beyond it a chain of steep mountains; over which they were to pass before they could arrive at another river, called Talofka. They left the road at a distance from Kaminoi, to traverse an extensive heath, and afterwards a considerable lake. Crossing the river Penguina, almost at its mouth, they were astonished at the vast heaps of ice that covered it. They were under the necessity of hoisting their dogs, and even their sledges from heap to heap; a manœuvre which consumed more time than can easily be conceived.

They reached Kaminoi, however, on the 24th, before noon; and were received by the inhabitants with the utmost civility. In the absence of Eitel, another prince called Eila had the command; he conferred on them every mark of respect, and placed a sentinel at their door to refuse admittance to any suspected person.

This was not in consequence of the report that had been spread of the rebellion of the Koriacs, which was evidently false: their behaviour to our travellers, and the reception they had prepared for the governor, plainly announced their present disposition. Nor can it be presumed that the arrival of the soldiers sent from Ingiga could have this effect; their wretched condition was ill calculated to awe men like the Koriacs, who know not what it is to be intimidated. The sight indeed of the cannon, and of the Cossacs in arms, who had entered the village without any hostile declarations,

rations, created some alarm. They called upon their leader to mention, whether he was come to strike a blow at their liberty, and extirpate them; adding, that if such were the intentions of the Russians, they would all die rather than submit. The officer politely assured them, that he was sent to meet M. Kasloff, which was an honour his rank demanded.

This explanation removed all their suspicions; and the Koriacs and Russians lived together on the most amicable terms; but the apprehensions of a famine occasioned such guests as the soldiers to be considered burthensome.

The ostrog of Kaminoi is situated on an eminence, at the mouth of Pengina, containing a number of balagans, and twelve very large yourts. These habitations occupy a considerable space of ground; and the palisades, which surround them, are fortified with bows and arrows, spears, and muskets. Thus wretchedly defended, the Koriacs suppose themselves impregnable. Here they repel the attacks of their enemies, and particularly the Tchoukchis, the most formidable of their foes. The population of Kaminoi is estimated at three hundred, including men, women, and children. Before he left the village, M. de Lessops saw ten or twelve baidars, or boats, of different sizes: many of them were well constructed, and some would commodiously hold about twenty five persons*.

He left Kaminoi at eight in the morning of the 26th, the weather being tolerably calm. At the distance of fifteen wersts, he traversed the mountains he had seen before, and crossed a river called *Chestokova*†. Gusts of wind came with great violence: the islands of snow so obstructed the air, that day-light could hardly be distinguished. In the course of this terrible hurricane he was eager to proceed, but the guides refused even to make an attempt: thus opposed, he sullenly retired to his tent; but was agreeably consoled by the arrival of seven *Tchoukchis*, in sledges drawn by rein-

* M. Schamaleff, perceiving that he could not accompany our author from this village, his presence and assistance being required towards the better accommodation of the detachment of soldiers, he resolved nevertheless to let him depart without him. He made him a present, however, of a confidential soldier, named *Igor-Golikoff*‡; saying, "In this man I make you a valuable present;" and it afterwards

‡ His escort thus consisted of four men; this *Golikoff*, the soldier who accompanied him from *Poustaretsk*, and two others taken from the detachment as his guides; he thought

deer. He received them under his tent, and they thankfully accepted his invitation to continue there till the storm subsided. Among these *Tchoukchis* was the chief called *Tumme*. He addressed himself to our author to express his gratitude for the reception he enjoyed from his indulgence, and declared that he desired nothing so ardently as his friendship and acquaintance.

They next adverted to general subjects, and particularly concerning the advantages of their respective countries. Not being able to conceive in what part of the world, M. de Lessops was born, they asked him if he did not come from the other side of the great river. He readily perceived that he was incapable of instructing them in this subject, and that they did not understand a word of a geographical dissertation which he addressed to them; they had had no accurate idea either of number or extension: to give them some conception of the subject, he took a sheet of paper, in which he drew a sort of geographical chart, wherein he marked the situation and distances of Russia and France, with respect to their country.

He was not perfectly understood; but he was gratified by the eagerness and attention with which they listened to him. He was astonished at the solidity of their understanding, and the anxiety they felt for the acquisition of knowledge. Superior in these particulars to the Koriacs, they seem to reflect more on what they say, hear, and see than they are accustomed to do: these two people have nearly the same idiom; but the *Tchoukchis* have a method of prolonging the final syllables of words; and their pronunciation is slower and sweeter than that of the Koriacs.

The attention with which M. de Lessops examined their dress, created a wish in them of seeing the French habit‡, he therefore ordered his uniform to be taken out of his portmanteau; at the sight of which they were particularly delighted: Every one was desirous of touching it, every one was enraptured with its singularity and beauty.

appeared that he was not deceived. This generosity increased the reluctance he felt on leaving so good and gallant an officer.

† A subaltern officer who had been killed there, at the head of a detachment sent to keep the revolted Koriacs in awe.

His buttons, marked with the arms of France, were particularly inspected, and admired: after which they eagerly reached out their hands, and begged he would divide them among the petitioners. He consented, on their promise to preserve them, in order to shew them to all strangers, hoping that, among the rest, a Frenchman might arrive upon their coast.

After regaling them as well as he could with tobacco, they parted upon terms of the greatest amity. On leaving our author, the Tchoukchis said, he would probably soon meet their equipages and their wives, whom they had left behind that they might not be retarded in their progress. The weather becoming calm soon after the departure of these Tchoukchis, M. de Lessops pursued his journey.

The next day he perceived, by the side of a wood, a troop of rein-deer browsing on the top of a mountain. Examining them more attentively, he saw some men among them who appeared to be guarding them. Curiosity prevailing over fear, he advanced to learn the nature of the business. While he was surveying the men with the rein-deer, he was approached by two women walking about: the eldest accosted him in the Russian language, and informed him that he was within two hundred yards of the camp of the Tchoukchis, the view of which was intercepted by the wood: desiring these two women to conduct him thither, he submitted himself to their guidance. As they went on, he asked them of what country they were; when one of them informed him that she was a Russian, and had been induced to visit this country from a sentiment of maternal affection. She had braved dangers and fatigues to recover her daughter, who had been detained by the Tchoukchis as a hostage. The other woman also related an interesting story respecting herself; but as such details are inconsistent with our plan of brevity, they cannot be recited at large.

The histories of these women had so entirely engrossed his attention, that our author arrived at the camp before he perceived it. The joy of the people at seeing him was extreme, and they

instantly surrounded him. They severally addressed him, to pass the night with them, and when he answered in the affirmative, they saluted him with transports and huzzas. Ordering his tent to be erected at the extremity of the camp, he invited the chiefs to visit him, and they eagerly obeyed his obliging summons. After the first compliments were over, they entered into general conversation, and talked in a summary way, of the respective manners and customs of their countries*.

The camp of these Tchoukchis was fixed upon the margin of a river, and behind the wood, as already mentioned. It consisted of about a dozen tents, ranged along the bank. Bundles of spears and arrows are fixed to guard the entrance of each: the tents are extremely hot, their covering being made of deer-skin, which the air cannot penetrate, and a stove is placed in the centre of each. The bed consists of small branches of trees, spread on the snow, like litter, and covered with deer-skins. Here a whole family will lie down and sleep together, regardless of sex or age: their filthiness surpasses imagination; they are not disgusted at seeing their food close to the most offensive objects, for words cannot describe their excess of indolence.

Among these Tchoukchis, who did not exceed forty in number, there were about sixteen women†, and nearly as many children. Every person of superior rank has valets in his service, to undertake the management of the deer, and guard them in the night against the intrusion of wolves.

The dress of the women is remarkable. It consists of a deer-skin fastened round the neck, where it has an opening both before and behind. When they travel, they have a *kouklanki* over their common dress, and their feet are covered with boots made of the legs of rein-deer. Their hair is black, sometimes turned up in tufts behind, but more frequently separated on the forehead, and hanging in long braids on each side: their ears and their neck are decorated with glass beads of different colours: and, when they find themselves cold, the hood of their pargue forms a suitable covering.

supped with him. The necessity of taking rest, at length, induced them to separate.

† Polygamy is tolerated among these people: and they are so singularly polite as to offer their wives or daughters to their guests. To refuse this offer would be an insult.

* M. de Lessops distributed tobacco among the most distinguished of these Tchoukchis, and afterwards entertained them with tea and rye biscuits. Their chief named *Che-gouliaga*, of equal rank and power with Tumme, two of his relations, and two women who undertook to be interpreters,

Their countenance is far from pleasing; their features are coarse though the nose is not flat, nor their eyes sunk in, like the Kamptschadales. In these particulars they resemble them less than the Koriac women: they are also taller, but not slender, and have a sluggish appearance; but they perform all laborious and domestic offices. The features of the men are more regular, and less Asiatic: Their complexion, like that of the women, is very tawny, and their dress, manners, and customs are similar to those of the wandering Koriacs. These Tchoukchis go annually to Ingiga: they leave their country early in autumn, arrive at this settlement in March, transact their business, and return; but they seldom reach their home till about the end of June. The merchandize taken with them is chiefly of sable and fox-skin parkes, and morseteeth, for which they receive in exchange tobacco, kettles, lances, musquets, knives, and other instruments*.

Not choosing to prolong their stay, our author took leave of these Tchoukchis, and received from them the most affectionate caresses; which he gratefully returned, as he could not too highly extol the reception of this hospitable people. He set off early in the morning, and having travelled about fifteen wersts, he passed two balagans and a yourt, and soon after arrived at Pareine. This ostrog is smaller than Kaminol, though perhaps more populous: The first person he beheld in this place, was a woman of a mixed breed, with melancholy portrayed in her countenance; on enquiring the cause of her distress, she uttered a loud shriek, and tears fell abundantly from her eyes†.

* Like all the northern people, they have a strong propensity to drunkenness: their fondness for brandy is so extreme, that when any one permits them to taste of it, they must repeat their kindness till they are perfectly intoxicated or insults and violence would ensue. They smoke as much as the Koriacs, and use pipes of a similar construction.

† After a momentary pause, she informed M. de Lessops that she had left Ingiga, with her husband, her son, and some friends, to visit some relations at Pareine. Overtaken by a most terrible hurricane, they had unfortunately strayed from the road, and were totally separated from each other. The father and son were in the same sledge, and after wandering a long time, in pursuit of shelter, were at length completely lost. After two days search, their bodies were found buried in the snow, dead and frozen. More successful than her husband, this woman had found a shelter on the margin of a river, fifteen wersts from Pareine, where she and her companions had arrived, almost perishing with grief and fatigue. The tempest, she said, was so terrible that neither the heavens nor the earth could be perceived: the

While M. de Lessops was commiserating the woman's distresses, the inhabitants of Pareine assembled about him: Youlitka, their chief, approached to invite him to pass the night in the village, but being strongly prejudiced against him, as well from his character as his perfidious countenance, he intimated to him that he had no inclination to stop. On his refusal, the chief mentioned the impossibility of procuring dogs and provisions for him till the next morning. Our author construed his behaviour to signify some fatal intention, and resolved within himself that no consideration should induce him to stay. Youlitka alledged some new obstacle, and with a sarcastic smile, seemed to defy him to proceed.

Two hundred men, at least, now tumultuously pressed about M. de Lessops, to inspire him with terror, or to observe his embarrassment. In this perilous conjuncture he addressed them in the Russian language, hoping some among them might understand him, who might have less fidelity than their chief. His harangue was short but vehement; and after mentioning his unremitted endeavours to merit their kindness by his behaviour, and thanking them for the favours he had already received in the course of his journey, he added, that, "Except in the present instance, I have never had occasion to demand the succours of which I stood in need: far from waiting till I had produced my orders, they had shewed the utmost readiness to anticipate my wishes, before I could make them known‡."

With a view of atoning for his improper behaviour, he invited our author to wait in his yourt, till the necessary preparations were made

snow, frozen in the air, grew thicker as it fell, and seemed a shower of icicles. To complete the catastrophe, she grievously lamented her inability of returning to her native country, and again burst into a flood of tears. Our author having said every thing to console her that compassion suggested to him, quitted her with regret, as he had nothing to afford her any relief but useless pity.

‡ At the mention of the word *orders*, he perceived they cast a look of astonishment at each other; and being satisfied that he had been favourably attended to, he assumed more warmth and resolution. Then, taking his passport from his pocket, and viewing Youlitka with an air of displeasure he presented it to him, declaring it was his intention to depart in the space of two hours. The chief was disconcerted by this abrupt conclusion: Convinced that he was now compelled to comply with our author's wishes, or render himself criminal, by disobeying the mandate of the governor, he ordered the quantity of fish, which M. de Lessops wanted, immediately to be collected for him.

for his departure. He also invited them to dine at his table; to this he also consented; but shuddered at his imprudence, when he was conducted forty feet under ground to his yurt; yet as he was well armed, he thought he should be able to defend himself. Youltitka*, suspecting our author was not very well satisfied with his situation, endeavoured to excite his confidence, swearing that he had the highest esteem for him, and that he was in perfect safety; but he knew the chief too well to place any faith in his asseverations.

Though a tragic scene was doubtless intended to have been exhibited, this repast was attended with apparent convivial mirth: The dinner being ended, our author sent one of his soldiers to order the dogs to be harnessed; and, the provisions being also ready, he was prepared, in the course of ten minutes, to take leave of his Koriacs. Though they appeared to be satisfied with him, he knew not that they were really so: and was happy to escape from them. It was two o'clock in the afternoon, but conceiving it was incumbent on him to make up for the delay he had experienced, he did not halt till he was fifteen wersts from Pareiné. That day, and the next, he crossed a variety of rivers, though nothing worth reciting occurred.

His principal food had long consisted of reindeer; delicious as it was, it was always cloying; but the most alarming circumstance was, that our traveller's stock began to be almost exhausted: they fed on it but once a-day, their other meals consisting principally of dried fish. Fortunately our author had this day the good fortune to shoot a brace of partridges, which varied the uniformity of his daily food. The day was beautiful, and the sky prognosticated colder weather, which was devoutly to be wished, as the snow was so soft that the dogs sunk up to their bellies. Before he retired to his tent, our author perceived some ill-boding clouds, and communicated his conjectures to his guides: they considered their own knowledge on such a subject to be infinitely superior to his, and positively asserted that there was not the least reason to apprehend foul weather†.

* A more disagreeable countenance than that of Youltitka can hardly be imagined. Large and squat, his whole face seamed with the small-pox, and mutilated with several scars: a sullen countenance, black hair, and enormous lowering eye-brows, under which there was but one eye, and that sunk in his head; the other he had lost by accident.

Our travellers had proceeded but a few wersts, when they perceived, at a distance, a company of five Koriac sledges, drawn by rein-deer. The dogs, allured by the scent of these animals, advanced towards them with ardour: the Koriacs seemed to avoid them. It was at length discovered that the company they had seen were wandering Koriacs, returning to their families from Ingiga, where they had been to see their friends, and dispose of their deer-skins.

While our author waited the return of the soldier, who had been sent to gather intelligence respecting the company of strangers, he observed some clouds pass rapidly over their heads, which confirmed him in the idea that they were menaced by an approaching tempest. His confidential soldier, Golikoff, had defended the contrary opinion, but he was now convinced that this prediction would be verified; he said he had even mentioned M. de Lessops to the Koriacs, as a prophet, upon this occasion, and he should be sorry that he should be mistaken in the very first instance. This simple avowal diverted him, especially as his conductors were witnesses to it; and he, in return, intended to amuse himself with their simplicity.

To conduct this business with the greater certainty, he intended to have recourse to his compass, which would be an ample guide in the midst of the whirlwinds. He asked one of the most intelligent of his conductors to point out to him in what direction Ingiga lay, with many other questions relative to the task he had undertaken, and received very satisfactory replies. Having taken these precautions, he informed his people that he intended to proceed, and was determined not to stop, on any consideration. If they should at any time, suppose he had lost his way, they need only to mention it to him, and he would set them right. They started at each other with an air of astonishment, not caring to say, in absolute terms, that he was clearly out of his senses. The most intrepid of them, however, ventured to declare that it was impossible he could guide them, without the greatest danger of losing them; and he was certainly in jest. Without making any

† In the morning, by way of jeer, the guides again questioned M. de Lessops, respecting the weather. He persevered, however, in his original opinion, and requested them to wait till the evening before they dogmatically persisted in their obstinacy.

reply, he ordered every one to his sledge, threatening punishment to those who should dare to disobey him, and instantly gave the signal to depart*.

Finding themselves so near Ingiga, they were no longer desirous of stopping; they even importuned our author to gain the river, and proceed instantly to the town. He complied, and they coasted along the bank till they arrived opposite to Ingiga, where they crossed the river before they could approach its walls. Answering the necessary interrogatories, as in all fortified places, they were admitted through the gates; when Major Gaguen, having heard of our author's approach, civilly received him, and offered his house for his accommodation.

The town is very large and populous, situated on a river of the same name, defended by a square inclosure of palisades, and wooden bastions, erected on piles. These bastions are provided with cannon, and contain a quantity of warlike stores. They are constantly guarded by centinels, as are also the three gates of the town, of which only one is kept open. The governor's house is situated in a square, and has a strong guard. The houses are of wood, and low, but very uniform. The church is a wretched edifice, and almost in ruins; a new one is under contemplation. The population is about five or six hundred inhabitants, who are either merchants, or engaged in the service of government. The commerce of

* At half after eight they had advanced about fifteen wersts, when the horizon was almost covered with dark clouds: the tempest unfolded itself, and the wind raised the snow in eddies; terror and confusion reigned among his companions, and they knew not what they were about. The violence of the hurricane deranged many of their sledges, and the conductors entreated our author to halt. He reminded them of his promise, and seemed determined to proceed. Then ordering the sledges to keep as close together as possible, he took his compass from under his fur cloak, that he might have it continually before his eyes, and began his task of directing the caravan. They travelled thus during the remainder of the day, in the midst of solemn darkness, not being able to see the soldier in the sledge, and hardly his foremost dogs.

Amidst the complaints and remonstrances of his people who requested him to stop, he strove to pacify them, and at a quarter before nine, a dark veil was visible before them, which gradually became blacker and more extensive. The next moment they perceived the trees, and exclaimed in raptures, "we are safe!"—It was indeed the forest of Ingiga: to be certain of which he sent them a little forward to take a survey, and they speedily returned, transported with

Ingiga consists of furs, and particularly the skin of rein-deer.

In mentioning the customs of the Koriacs, M. de Lessop informs us that his chief source of information was a Koriac, with whom he became acquainted at Kaminoi: the facility with which he expressed himself in the Russian language; and his rectitude of mind, commanded his esteem; he also understood that he was a Koriac prince, called *Ouminzin*, and brother to a chief of the wandering Koriacs. During our author's stay at Kaminoi, his conversation was a source of instruction and amusement to him.

In many respects there is a strong resemblance between the fixed, and the wandering Koriacs: it is therefore surprising that there should be so little cordiality among them, as to occasion them to be considered as two different people; their country, however, is the same, and comprehends a vast extent. It was formerly extremely populous, till the number of inhabitants was considerably diminished by the ravages of the small-pox: their contests with their neighbours, and with the Russians have also contributed to reduce its population. The number of fixed Koriacs, even at this time, hardly exceeds nine hundred; and though it would be difficult to calculate that of the wandering Koriacs, they are not supposed to exceed that amount†.

A ferocious spirit is the consequence of such a state of war: attacking and defending creates

joy, to inform him that they were close to the river. They admired his miraculous skill in predicting bad weather, when appearances manifested the reverse, and afterwards preserving them among all the horrors of the tempest: they could not recover themselves from their astonishment. It was in vain that he exhibited his compass, and endeavoured to explain to them his manner of deriving from it all his knowledge: They replied, that such a conjuring book was unintelligible except to persons like himself, skilled in the art of magic.

† The manners of the former, which are far from being estimable, announce duplicity, distrust, and avarice. They have the vices of all the northern nations of Asia, without the virtue: they are strangers to generosity, mercy, or benevolence: nothing can excite them to perform a meritorious action but the absolute certainty of a reward. From this perfidious and savage disposition, no durable connections could ever be formed with their neighbours: So unsociable a spirit, naturally created an abhorrence of all foreign dominion. Hence originated their insurrections against the Russians, their atrocious robberies, and their daily incursions on the people who surround them.

inflexible courage, which pants for perpetual combats and glories in contempt of life. Superstition gives a zest to this ardent thirst of blood, by imposing a new law enforcing them to conquer or die. Neither the bravery, nor the number of their adversaries can in the least intimidate them: in these situations they swear to *destroy the sun*. This terrible oath is discharged by murdering their *wives and children*, and burning their possessions. The vanquished never seek their safety in flight; honour forbids it; and not a Koriac will survive the slaughter of his countrymen.

The vicinity of the Russian settlements has produced no civilization among the resident Koriacs. Their only aim, in their intercourse with the Russians, is to acquire wealth or plunder. Insensible of the advantages of polished life, they consider their own manners and customs as absolutely perfect. Their regular employments are hunting and fishing, but they cannot always exercise those employments: at other times they practice the less difficult tasks of sleeping, smoking, and procuring intoxication. Enemies to industry, like the Kamptschadales, they live upon fish; and the fat of the whale or sea-wolf. The whale is usually eaten raw; the other is dressed like their fish, except the sinews, the marrow, the brain, and perhaps a slice of the flesh, which they devour raw with the utmost avidity. Reindeer is thought delicious among them: vegetables compose a part of their food, and they make a refreshing beverage of various sorts of berries*.

The extravagant price of brandy, and the difficulty of procuring it, has led them to adopt a potent drink extracted from a red mushroom, known in Russia as a strong poison, by the name of moukkamorr†. It is not from absolute sensuality, nor for the enjoyment they receive in drinking the liquor: they merely seek a state of oblivion, stupefaction, or a cessation of existence.

The features of the greater part of the Koriacs are not so Asiatic, but they might be taken for Europeans, did not their low stature, aukward

form, and the colour of their skin proclaim the contrary. The other Koriacs exhibit the same outlines as the Kamptschadales: very few of the women, in particular, are without flat noses, sunk eyes, and prominent cheeks. The men are almost beardless, and have short hair. The hair of the women is neglected, and generally flows upon their shoulders.

Among the absurd customs adopted by the Koriacs, is the probation to which a young man subjects himself in order to get married. Having fixed his choice, he waits on the relations of his mistress, and becomes the *drudge* or slave of the family. The young lady is enveloped in a multiplicity of garments, which so completely conceal her, that the face itself is hardly visible: She is not permitted to be alone a single moment; her mother and several old matrons accompanying her wherever she goes. The lover's aim is to touch the naked body of the lady by any means he can devise: during which time he executes with zeal and submission, all the functions that the relations impose on him. After experiencing a variety of tribulations, vexations, and disappointments, and perhaps after the expiration of two or three years, he obtains his end. Elate with his victory, he communicates his success to the relations; the witnesses are summoned, and her hand is bestowed upon the conqueror; after this long preliminary step, he is admitted without restraint to his elected wife, free from all her cumbersome attire. The second stage of courtship is extremely short; the damsel, in the presence of her family, pronounces her consent, and nothing more is requisite to entitle him to all the claims of a husband. A nuptial feast is provided for the relations, and a general intoxication is frequently the consequence. Though a plurality of wives is not allowed among the Koriacs, M. de Lessops has "seen instances of its being practiced without scruple‡."

The Koriacs acknowledge a supreme being, the creator of all things, who inhabits the sun, and

journey, and to prevent his starving in the other world. If the deceased be a wandering Koriac, his deer conduct him to the pile; if a resident Koriac, his dogs convey him thither, or his relations. The body is exhibited in its best attire, lying in a kind of coffin. There it receives the last best wishes of the attendants, who, with torches in their hands, deem it an honour speedily to reduce their friend to ashes. The funeral pomp terminates in a scene of intemperance, where the fumes of their tobacco and strong liquor obliterate

* It is used in Russian houses to destroy insects.

† The rivers near this ostrog are so small as to be frozen up as soon as the cold sets in, and, for upwards of half the year, the inhabitants can only drink melted snow or ice.

‡ On the death of a Koriac, his relations and friends assemble to pay him their last visit of respect: they erect a funeral pile, on which they place a small portion of the wealth of the deceased, and a stock of provisions, brandy, and whatever he may be supposed to require for so long a

and whose burning orb they consider as the throne or palace of the lord of nature*. They neither fear nor worship him; neither do they address any prayer to him. Goodness, they say, is his essence: all the good that exists in the world proceeds from him; and it is impossible that he should do an injury. The principle of evil they consider as a malignaat spirit, who divides with the immaculate being the empire of nature. Their power is equal. One is intent on procuring happiness to mankind, the other endeavours to render them unhappy. Diseases, famine, tempests, calamities of all kinds, are the instruments of his vengeance. To pacify his wrath, they sacrifice their personal interest, and have recourse to devotion: the terror of this menacing deity fills every heart, and draws forth expiatory sacrifices. They offer to him various young animals, as reindeer, dogs, &c. the first fruits of their hunting and fishing, and whatever they possess that is most valuable. There is no temple set apart for his votaries: this fantastic God is equally worshipped in all places, who conceive that they render him propitious by piously getting drunk in their yourt: for drunkenness is a religious practice with these people, and the basis of all their solemnities.

The idiom of the Koriacs is foreign from that of the Kamptschadales; the pronunciation is slower and more shrill, but it is free from those hissing, which are as difficult to be uttered as to be written.

M. de Lessops was anxious to quit Ingiga, but his dogs were fatigued, and there were but few to be procured in the town; and those few, not in the best condition: he therefore proposed to take rein-deer instead of dogs, hoping to travel much quicker by that mode of conveyance; he naturally expected greater risks, more fatigue, and less repose than he had before experienced; but he was particularly desirous of trying this

the remembrance of the solemn scene. Their grief indeed is so transient upon these occasions, even for the loss of persons most dear to them, that it is an evident proof of their indifference about life, the brevity of which neither astonishes nor afflicts them. After a few months widowhood the women are permitted to marry again.

* The also believe in inferior deities: some of whom they consider as household Gods, the guardians of their rustic habitations. These idols, rudely carved and blackened with smoke, are hung up conspicuously in their yourts, dressed like the Koriacs, and adorned with bells,

fashion of conveyance, to enable him to pass a decisive opinion on the speed of these animals.

Every difficulty and impediment being removed, his departure was fixed for the 5th of April. M. Gaguen caused every preparation to be made for that important business: a quantity of small wheaten loaves, were made under his inspection, and a necessary supply of biscuit. A great variety of food, intended for his own consumption, was, contrary to his remonstrances, added to our author's baggage. Many other presents were presented to him in so fascinating and friendly a manner, that he had not the resolution to refuse them: his kindnesses were indeed so numerous to our author, that he was unable to mention half of them; and to his care he was principally indebted for the re-establishment of his repose and health.

Though prepared to depart on the 5th of April, none of his conductors were to be found: the next day a new obstacle arose: it was Sunday, and therefore an improper day for travelling; this objection was the effect of superstition, rather than of devotion: It was not the sanctity of the day that operated upon them, but the idea that some misfortune would be the consequence. After a variety of ineffectual entreaties to prevail on them to set out, to no purpose, our author was obliged to stay and dine with M. Gaguen, who politely congratulated himself on the delay. Perceiving, however, that M. de Lessops was really desirous of starting, he proposed to cure the conscientious people of their imaginary fears: he defied him, and he accepted the challenge. He ordered brandy to be profusely dealt out to all our author's attendants, Russians as well as Koriacs. Their heads became speedily warmed, and in the full flow of their spirits, they no longer regarded the pretended danger: every one was alert in harnessing the deer, and the sledges were ready for travelling in an instant†.

Our author walked out of the town, escorted by

riings, and other iron and copper trinkets. The other inferior deities they consider as inhabiting mountains, woods, rivers, &c. M. de Lessops frequently saw the remains of dogs and rein-deer, suspended on stakes, and testifying the devotion of the sacrificers.

† A pleasant scene occurred during this interval: Oumiavin, merely out of compliment to M. de Lessops, became completely inebriated; to shew the height of his respect for that gentleman, he practiced many absurdities, which he called taking leave. He went out, and instantly returned, officially attempting to assist in every thing. The sledge being

by most of the inhabitants, who delighted in doing honour to the only Frenchman that had ever visited them. M. Gaguén, and the officers of the garrison, conducted him to the gates, where, having repeated his thanks for their politeness, they separated.

Of the four soldiers who attended our author when he left Kamnoi, only Golikoff and Nedarezoff remained with him: the others were left at Ingiga, which was the place of their residence. But, on the recommendation of M. Gaguén, he accepted the services of a young merchant, who desired to accompany him to Okotsk.

Fearing some fatal accident might happen, if M. de Lessops was permitted to drive his own sledge, remonstrances and petitions were addressed to him, not to presume to engage in so dangerous an undertaking; or, at least, they enjoined him not to attempt the experiment the first day. When he came to his vehicle, he saw his guide already seated in front, and took his place without particularly observing him; but, on looking round, he saw it was a Koriac prince, named *Eviava*. He eagerly expressed his joy in having the honour to conduct him, and then assumed his situation.

They travelled very slowly till the evening; but M. de Lessops felt a great inconvenience in not having an interpreter, to enable him to enjoy the conversation of the princely guide. They stopped at seven o'clock. It was thought necessary to gain a mountain, well known to our Koriacs, in our first stage; the convenience of a

being ready, he pretended to lift it, that he might form a judgment of its weight; but, unable to keep himself from staggering, the good Koriac fell, and in falling broke the point of M. de Lessop's sabre. The poignancy of his grief at the sight of this accident was astonishing: he threw himself at the feet of that gentleman, which he embraced and bathed with his tears, conjuring him not to depart 'till he had forgiven him. Our author endeavoured to raise him, and assured him of his most cordial friendship: but he persisted in his posture, and his eyes continued deluged with tears: It was half an hour, at least, before he appeared to be pacified.

* Before our author remounted his car, *Eviava* told him he was under the necessity of rendering their vehicles less ponderous; the continual weight of two persons exceeding the ability of their steeds to draw. He wished him to make the experiment of being his own charioteer, and take one of the empty sledges, with which he was furnished as a resource in case of accident. This proposal was so consonant to his wishes, that he instantly accepted it, seized the reins, and commenced his new apprenticeship. He found the task ex-

traveller is not considered in the choice of a resting place; that of the rein-deer only is consulted, and a spot abounding with moss is constantly preferred. When half way up the mountain, the steeds were unharnessed, and no other attention paid to them than tying them with leathern thongs. The animals instantly scraped away the snow, under which they knew they should be able to find their food. At a short distance the travellers made a fire, a frugal supper ensued; the Koriac prince being permitted to mess with our author, he appeared to be highly flattered by that honour. M. de Lessops was then permitted to repose about two hours in the snow, and when that time was expired, he was ready to proceed on the journey.

The Koriacs are accustomed to travel, four, five, or six days incessantly, almost without repose. The rein-deer travel day and night, being unharnessed every two or three hours, and allowed an hour for feeding, after which they go on with equal ardour; and they persevere in the same method till the conclusion of the journey. De Lessops might therefore consider himself as fortunate, when night arrived, to be indulged with two hours uninterrupted sleep; but this favour could afterwards be only conditionally granted, for he was generally obliged to submit to the practice of his inflexible conductors*.

On the left of the road, he saw Karbanda, a small village on the sea coast, ninety wersts from Ingiga. Three wersts farther on, he saw two yourts and six balagans, which are only in-

treinely arduous: from inattention or inexperience, his legs became entangled, and the violence of his fall induced him to relinquish his hold of the reins, that he might apply his hand to it. The deer, finding no longer the same restraint, advanced more rapidly, and became more irritated in proportion to his efforts to get free. Dragged along in this alarming manner, with his head sweeping the snow, and frequently striking against the skate of the sledge, his sufferings were inconceivable. He was no longer capable of crying out, and gave himself up as lost; when, by a motion purely mechanical, he extended his left hand exactly on the reins that floated by accident. A sudden jolt of the sledge suddenly obliged him to draw back his hand, and this involuntary check instantly stopped his deer.

A swoon succeeded, but his senses returned in a few minutes and he recovered his strength: He sustained no other injury than a contusion on his legs, and a head-ach, which were attended with no material consequences. Rejoicing at his narrow escape from danger, he again ascended his sledge, and placidly pursued his journey.

habited

habited in summer. Proceeding through a small wood, watered by the Noyakhova, he came to a wretched hamlet, consisting of a single yourt, and three or four bulagans, inhabited by ten or twelve Koriacs, who civilly produced him shelter. The following day afforded nothing interesting; but in the evening, Eviava, who knew not perfectly the yourt of Oumiavin's brother, proposed to him to ascend a mountain to the left, hoping to find his countryman to assist them. More than an hour was consumed, when no trace of a habitation could be perceived. Observing that our author was weary, and little disposed to go any farther, Eviava seemed displeased; M. de Lessops desired he would make the search without him, and he would repose himself on the spot they then occupied till his return. In about three hours he came back exulting, and informed our author, that he had found his friend, prince Amoulamoula, and all his herd. They requested him not to quit the place where he was before the morning, as they all intended to come to meet him. He was not sorry for the event, as it procured him almost a night's repose.

At the dawn of day his visitors appeared: the chief approached him first, to accost him in the Koriac mode: his compliments were accompanied with a beautiful fox-skin, or *sevadouschka*, which he presented to him and compelled him to accept. In return for this civility, he entertained them with brandy and tobacco, which he had brought with him from Ingiga. Having thanked them for their kindness, he respectfully took his leave; being furnished with the necessary information to enable him to direct his course.

Though the snow was deep and soft, the deer ran with ease and celerity: having broader feet than the dogs, they sink less below the surface than the dogs; but though this may be considered as an advantage; let it be remembered that the dogs are not so soon tired, and the traveller is not under the disagreeable necessity of stopping

* His name is Oumiavin, but he is distinguished from his brother by the addition of Simeon, a name which he received in baptism when an infant: like all the Koriacs, he is small and sallow: his countenance declares his frankness and benevolence, and the whole of his figure commands strong prejudices in his favour. His short hoary locks, and symmetry of features, give him an air of dignity and distinction. He is lame of his right arm, in consequence of an obstinate contest with a bear: his companions, declining the encounter through fear, he was left alone to oppose the monster; and

every two or three hours. In their way our travellers killed a number of partridges, and saw an amazing quantity. Some rein-deer fled rapidly from their presence; and happily the abundance of their provisions was no incentive to commit slaughter. About noon they perceived the Stoudenais-reka, and about an hour after they arrived at the yourt of Oumiavin's brother.

The new host, as head of the family, advanced to meet M. de Lessops: the satisfaction displayed in every countenance within the mansion, was perfectly understood. The address of the old prince was short, but replete with cordiality and politeness. Every thing was at his disposal, and he was courteously requested to command the services of himself and family.

When M. de Lessops entered the yourt, his first care was to discharge the debt he had incurred to prince Eviava. After making a proper estimation, according to the agreement, he acknowledged to owe him seven roubles, forty hopecks. In receiving this sum, his good conductor accused him of an excess of generosity, and that it was more than he was entitled to; and that to pay him for an obligation conferred upon himself, was, in his opinion, an act of sublime virtue. They sat down to a jovial dinner, and fared sumptuously; a profusion of brandy was not withheld upon the occasion. A farther account of our Koriac host may not be unacceptable*.

The deer is the only source of riches to this wandering people; the chief of a horde has seldom less than two or three hundred, and some of them are possessed of three or four thousand. Oumiavin's flock, when M. de Lessops was with him, amounted to about nine hundred. Multitudes of these animals are seen on the top of a mountain, near the Stoudenais-reka, collected together, or scattered into parties, seeking under the snow for moss: they seldom wander from the flock, and are regained without much difficulty. On the

though he had no other weapon than his knife, he defeated and slew him. The chase is his favourite amusement: equally skilful and intrepid, he is regarded as a very fortunate huntsman. But the strength of his mind renders him most estimable and interesting: he formed a project, which, if it had been permitted to be carried into execution, would have been a lasting monument of his superior sense and profound reflection, though it arraigned the court of Russia for a tyrannical abuse of power.

VOL. II. N

evening of our author's arrival, he saw a pleasing confirmation of this fact: they had been assembled, on his account, that a selection might be made for his use. On a particular cry of their keepers, the tame deer came forward, (the young ones and those exempted from labour going off in a different direction,) those that were wanted were easily caught, by means of a noose, thrown over them with singular dexterity. The choice being made, those which were destined for our author's use, were forcibly detained*.

A young deer was killed, by the order of Simeon Oumiavin, and cut up for the use of our author: half a wild deer was added to it, the flesh of which appeared more succulent. To this present was added four beautiful skins. De Lessops then entered the yourt, where he passed the night on a mattress.

There is no kind of resemblance between the habitations of the wandering, and the underground dwellings of the fixed Koriaes, though the appellation is the same: the Russians indiscriminately give the name of yourt to all the lodgings of these people. The primitive signification of the word *yourt*, is a subterraneous apartment; but the yourts in question are merely tents or huts placed on the surface of the ground. Round it a number of poles are erected at equal distances, which, uniting at the top, strengthen and support each other. This rustic timber-work is covered with tanned deer-skins, extended from the base to within half a yard of the summit, which is left open to admit air, and to serve as a passage for the smoke. The family, and the servants, who superintend the flocks, sleep under *pologs*, which are a kind of inferior huts, ranged in distinct apartments round the wall of the yourt and resembling the square tents of the Tchoutchis.

This species of habitation is adapted to the convenience of these wandering people: the removal of their dwelling being no very laborious

* The female deer is not usually employed in labour, being reserved for the propagation of the species: they are coupled in autumn, and foal in the spring. The young males, which are intended for draught, are castrated. There are always three or four deer in a flock that are trained for the chase. The instinct of these animals is astonishing, for they are hunting even while they are feeding. When a tame deer perceives a wild one, he imitates the gait and manner of the other, who sometimes approaches him without suspicion: they soon begin to play together; their horns become entangled, they part, join each other again; and these sportive

task, they feel no reluctance in occasionally changing their quarters. On any inconvenience being discovered, they remove to a more commodious place; their sledges are always kept loaded by the side of their habitations, and the provision and other articles resorted to when they are wanted.

Twelve sledges were by this time prepared for our author, and Simeon Oumiavin assured him that he would himself be his guide, and accompany him, if necessary, as far Yamsk; but, after gratefully thanking him for his polite attention, he declined the acceptance of that favour: In the morning of the 10th of April, he therefore took his flight, and at noon reached Tavatoma, desirous of seeing a hot spring, which Oumiavin had pointed out to him in the neighbourhood. Accompanied only by M. Kisseliov, he travelled two wersts to reach the spring; which is said to be composed of a number of others, issuing from a mountain at the left of the river, and which unite as they descend. A thick smoke appears in the clouds above these waters, but it has no offensive smell: they are extremely hot, and continually bubbling. Their taste being sharp and disagreeable, they are supposed to contain sulphurous and saline particles: the stones the party picked up along the stream had all a volcanic quality: but the effect of the water was astonishing: M. de Lessops washed his mouth with it, and M. Kisseliov his face; the latter had the skin of his face taken off by this application, and the former had his tongue and palate flayed, and was for a long time unable to eat any thing hot or high seasoned.

Their curiosity being satisfied, they prepared to join the rest of the company. To effect this they imagined they were to pass a mountain opposite to that on which the hot spring issued. Their rackets made them retreat instead of advancing, which induced them to take them off, and ascend by the use of their hands, and

amusements are continued till the tame deer gradually draws his prey within musquet-shot of the hunter. With a well-managed deer, sometimes the companion may be seized alive, but when too many artifices are practiced for that purpose, the wild deer sometimes suspects the trick, and escapes the danger by precipitately galloping away.

When a Koriae leaves his yourt in the morning, the deer gather about him in expectation of their favourite beverage, which is human urine; for this delicious treat they manifest the keenest gratitude, by instantly swallowing up whatever quantity is administered to them.

knees. Apprehensive that they had mistaken the road, and overcome with fatigue, our author intreated his companion to endeavour to gain the summit, from whence he supposed he might probably perceive the rest of the party. He succeeded, and after anxiously waiting about an hour and a half, he saw the good Koriac advancing with a sledge to his assistance. They had in reality taken a wrong direction, and were several times on the point of perishing before they discovered the party they had deserted.*

He was tormented by a burning thirst; and though the mountain was covered with snow, he could not procure fire to dissolve it, as not a single shrub could be perceived: at length he observed some small cedars, and a fire having been kindled, he allayed his thirst. It was now two o'clock, and at seven they all assembled: Oumiavin met with no accident, but he was so extremely fatigued that it was nine before he could proceed.

The next day's labour was troublesome; especially to the deer; the snow was so deep and loose, that the animals were buried in it up to their necks: many of them refused to draw, and were consequently left behind. Great inconvenience attends a reliance upon the efforts of deer, when a long journey is required to be performed with only short intervals of rest: as soon as they are tired, the traveller must abandon them or stop; it is no longer possible to make them move.

Our traveller, and his companions, were proceeding towards Toumané on the morning of the 14th, and were within ten wersts of it, when a violent gale of wind, accompanied with snow, had almost blinded them; but they reached the village about four in the afternoon. It is situated south-west of Ingiga, at the distance of four hundred wersts, in a wood through which the river Toumané flows. It contains three yourts, three wooden magazines, and about a dozen baglans. Though this river abounds with fish,

* They had determined on the 11th to endeavour to ascend the mountains of *Villequinshoitkrebout*, but the task was impracticable: on the following day they appeared to be within a few wersts of them, though they were still at a considerable distance. Having at length passed this place, they crossed a small river at the bottom of these mountains, when they came to that of *Villeguy*, which is the loftiest, and gives its name to the rest. At first sight it seemed inaccessible, but a narrow passage presented itself; and, confiding in his noble conductor, they entered it. In four

the inhabitants feed principally upon the bark of the birch tree steeped in the oil of the whale.

The deer were now incapable of drawing our travellers any further, on which account Oumiavin appeared extremely melancholy, as he found it impossible to conduct our author, as he had intended, as far as Yamsk. By his advice, however, he entreated the inhabitants to supply him with what dogs they had, but he could only procure a small number. There was no other method of making up the quantity required, than that of harnessing young dogs, and females in a state of pregnancy. On the 17th, after two days of bad weather, the wind abated, but the sky was covered with black menacing clouds. Having taken leave of Simeon Oumiavin, and his Tourmané, M. de Lessops departed in the afternoon, with his escort, and all his baggage, in five open sledges; each team consisting of eight or ten dogs: he had also hired a servant extraordinary, to serve him in the capacity of a charioteer, being no longer able to undertake that office himself.

Approaching the sea, it was thought advisable to proceed upon that element, in order to avoid seven mountains: when they had advanced about fifteen wersts, partly upon the ice, and partly upon the coast, they were under the necessity of returning, as the snow fell so abundantly, and the wind blew with such impetuosity, as to make the sledges totter, and the dogs recede. Our author's guides informed him of his danger, and, fearing to mislead the travellers, they proposed to seek refuge in a deserted yourt in the neighbourhood, with the situation of which they were perfectly acquainted.

This deserted shelter was situated on a small river called Yovana, about twenty wersts from Toumané: when they approached it they were covered with snow. Eager to descend into this asylum, that they might escape the remainder of the tempest, they attempted to find an aperture;

hours they arrived at the peak, after climbing an enormous and almost perpendicular mass of the height of two hundred yards, with rocks and stones projecting in a variety of places. When "arrived at the summit," M. de Lessops says, "I became giddy upon looking down the precipice I had climbed, and my heart shuddered at the danger I had escaped." He was far from thinking himself safe, as he was still to undergo the task of descending; but his obliging Koriac explained to him the methods he might safely take, and enabled him to arrive securely upon firm ground.

but they soon discovered that the entrance was stopped up with snow about four feet deep. They arranged their sledges, and making the rackets supply the place of shovels, they began to open a passage. This part of the business employed the assistants about an hour, but they were still in want of a ladder; however the most hardy among them leaped down, and the others were not long in following him. They fell upon the carcasses of several sea-wolves, entirely frozen, some of them in part devoured, most probably by wild beasts that had chosen this subterraneous habitation for their den. A leathern seine in a corner of the yourt was the only indication that this wretched mansion had ever been visited before by human beings*.

The next day the wind was changed, but continued equally violent; it was the more troublesome to our travellers, as it drove the smoke so forcibly into the yourt that they were almost blinded and suffocated, and endured the extreme cold, without a fire; except to prepare their meals, rather than support so horrible a smother. Our author, wishing to remedy this inconvenience, erected a kind of fence sufficiently high to procure a free passage for the smoke. From that moment they enjoyed a fire; both night and day, without intermission: but they soon perceived that a dampness began to prevail, which was as insupportable as the cold: the fire gradually melted the surrounding ice, and a constant dribbling descended upon their heads; a stream of water at the same time accumulating under their feet. To increase their difficulties the sea-wolves began to thaw and diffuse an unpleasant

odour; a proposal was therefore started and assented to, that, to purify the air, the dogs should be fed with them while they continued in that deplorable situation. This proposal was the more readily complied with, as the scantiness of the dried fish, rendered it necessary to consult economy†.

On the 21st there was a possibility of proceeding; though the sky was obscured with clouds, and the snow fell heavily, the wind had ceased, and our author, and his party resolved to set off in spite of their apprehensions of another hurricane. They directed their course towards the sea, upon which they travelled the distance of two wersts from the shore; but in the evening they approached nearer in order to halt. The ice being perfectly smooth, their little camp was easily erected. The next morning they made for the main ocean, in order to avoid the curvatures: they had observed several bays, and they crossed that which was the most extensive, though unfortunately a gust of wind prevented them from examining it; but they were informed by the guides that it was named from the river Iret, which falls into it. On the approach of night they came on shore, and halted till the morning on the banks of the river Iret.

Nothing remarkable occurred on the 23d. The wind indeed assailed them with much violence in the middle of a large plain: the sky cleared up, and they met a serjeant with dispatches from Okotsk. They saw the river Yamsk, and, pursuing its course came to the ostrog of Yamsk. The biscuits being nearly consumed, M. de Lessops was not only obliged to sleep there, but also to continue

* While the travellers were employed in removing the sea-wolves, that they might have room to lie down, the conductors fastened the dogs, and furnished them with their allowance of food. During which time a fire was kindled: the company warmed themselves, and partook of a supper: after which M. de Lessops extended himself on the leathern net he found in the yourt: he placed a sea-wolf under his head for a pillow. Some of his companions imitated his example, and, all circumstances considered, the night was passed with some degree of comfort. An entire corner was appropriated to the Koriacs of our author's suite, who huddled together, and were unable to stretch themselves at their length; but they did not complain, or seem to suffer the least inconvenience. They sat down with their elbows

* The snow came down in such abundance, that these poor animals were almost buried under it: but, being accustomed to such weather, they crowd together, and holding their noses in the air, the heat of their breath, by penetrating

resting upon their knees, and seemed to sleep profoundly, and at their ease.

† The weather becoming calmer and milder on the 20th, preparations were ordered to be made for their departure: the dogs were harnessed, and they were issuing from the yourt, when a gust of wind deranged all their measures; the snow came on with renewed violence, and they were obliged to retreat, thinking themselves happy that they were within the reach of shelter. A sudden illness at this moment seized M. de Lessops: the zeal of the soldiers displayed itself in their endeavours to restore him; one of them deluged him in water, while the other chafed his temples with such immoderate kindness that he rubbed off part of the skin.

ing their cold covering, creates a free passage for respiration. They have also the sagacity to shake themselves when the snow becomes too heavy.

there

there a considerable part of the next day, to procure a supply of provisions. The serjeant who commanded the garrison, received him with politeness, and furnished him with necessary information. Yamsk consists of twenty-five wooden houses, a part of which, where the church is situated, being surrounded with palisades.

Two days previous to our author's arrival at Yamsk, a troop of wandering Tougouses had quitted this settlement; but to console him under his disappointment, he was favoured with a sight of the full dress both of the men and the women, which our author has described in his performance; a repetition of which would probably afford but little entertainment to the readers of this abridgment.

The force of the sun this day announced an approaching thaw, M. de Lessops therefore resolved by the advice of the people in the country, to travel in the night, and to rest in the day when the sun had greater power. He quitted Yamsk at eleven in the evening; the caravan consisting of nine large sledges.

At dawn of day our travellers found themselves at the foot of a mountain, at the distance of fifty wersts from Yamsk. The Koriacs call it *Babouschka*, or Grandmother. The summit is said to be the tomb of an old sorceress, equally famous and formidable. The superstition of the people has induced them to call this the loftiest mountain in the world; but travellers are of a different opinion. Arrived at the top of this mountain, the adventurers placed iron cramps under their feet, in the form of tripods, and adopted many other precautions, as the descent is supposed to be extremely dangerous*.

Our author could hardly avoid laughing in the face of the timid prophet; but, on considering that he might probably require the assistance of these people, he affected to shew respect to their absurdity, and assumed a becoming gravity. The

* Having escaped this danger, and arrived safe at the bottom, the Koriacs who attended M. de Lessops, instantly hung up their respective offerings, consisting of tobacco, pieces of iron, scraps of fish, &c. on the summit, where they suppose the sorceress takes her repose of a night. Others had before left on the same place, iron, arrows, knives, &c. Our author perceived a Tchouktchi javelin, decorated with ivory, and advanced to take possession of it, that he might preserve it as a curiosity, but he was instantly deterred by the exclamation of one of the conductors — "What (said he) do you wish to ruin us all? So sacrilegious an act would draw down upon us the most hor-

red which the Koriacs entertain of this Babouschka, most probably originated in the following manner; as a natural effect of their prejudice, they feel themselves disposed to gratitude the very moment they consider themselves out of danger. These offerings were therefore the result of their gratitude for benefits received.

The travellers proceeded to Strednai, a village on the border of the sea, at the entrance of a deep bay. The Koriacs who inhabit it, received M. de Lessops with great cordiality: he rested himself a few hours in a yourt belonging to that ostrog; another building of the same denomination, and some magazines, constituting the whole of it. The yourts are constructed like those of the fixed Koriacs, with this difference, that they are not subterraneous, and the entrance is by a door on a level with the ground. Muscles, which abound on these coasts, are the principal food of the inhabitants.

In the morning of the 26th they arrived at the ostrog of Siglaun, the last in the Koriac territory, on a river of the same name; it is neither large nor populous, and contains but one yourt. They departed from Siglaun at five in the evening, and crossed a bay known by the name of that village: it was large and well defended. Farther on they found another curvature, called the *Bay of Ola*, though they proceeded with velocity, they were ten hours in passing over the widest part of it. The 27th, in the afternoon they stopped at Ola, a Tougouse ostrog, situated at the mouth of the river Ola, which affords a small harbour, to the extremities of which the Tougouses retire in severe weather. They had just quitted it, and taken possession of ten yourts, in which they reside during the continuance of warm weather†.

When M. de Lessops arrived at Ola, he was visited by a number of women; some dressed in the Russian fashion, and others in that of the Tougoun. Expressing his astonishment at seeing

ribble calamities, and you would become incapable of pursuing your journey.

† These yourts are not formed under ground, like those of the Kamptschadales, and some of the fixed Koriacs: besides they are longer and more ingeniously constructed. The winter yourts are round, and built on the ground like the summer ones. The walls are formed of large beams, placed perpendicularly, and the covering is inclined like the French roofs, with a hole at the top for the evaporation of smoke. They have also a bottom door upon a level with the foundation.

them so fine, he was informed that it was a village feast; and it was also customary with them to appear in their best attire before strangers. Among their ornaments, embroideries of glass beads seemed to take the lead; and some of them were not deficient in point of taste.

A striking resemblance is observable between the Russians and Tougouses; they have the same language, and similar features. The men are strong and well proportioned; and some of the women have an Asiatic appearance, but without the flat nose and broad face of the Kamptschadales, and many of the Koriacs. These people are very mild, hospitable, and anxious to oblige. On leaving his village, the travellers proceeded on the sea; they were much embarrassed in the course of the night by the ice; and the frequent cracks which they heard under them, were not much calculated to dispel their fears.

At the dawn of day they arrived on land, intending to surmount a steep promontory, which they found attended with great difficulty and danger: they ventured, however, to ascend it, and after their descent, it was rumoured among the guides that it was not possible to proceed any further; in consequence of which De Lessops sent his soldier Golikoff and others to examine the nature of their situation, who quickly returned with very unwelcome tidings: Golikoff, earnestly recommended that they should return, and endeavour to find a way by land; but this counsel was rejected by his guides. After some consultation and reflection they proposed that the adventurers should abandon their sledges, and taking the most valuable part of their property, cross the bay by leaping from one sheet of ice to another: but the current had so forced them into motion, that the sea was covered with insular pieces. M. de Lessops felt no inclination to adopt this mode of travelling, though he knew not what other plan to pursue. At length he resolved upon the exploration of some practicable path along the shore.

Insuperable difficulties now seemed to present

* Inspired with confidence by this second success, the travellers thought it possible to transport their dogs and sledges in the same extraordinary manner. However incredible it may appear, the reader may venture to rely on this assertion, that it succeeded beyond the most sanguine expectation of the adventurers. It may be proper, however, to remark, that when they returned a second time to fetch the dogs, the poor animals seemed more sensible of their

themselves: with infinite danger he gained a perilous situation on the shelf of a rock, the sea then beating against it, about ten feet below its surface: emboldened by the solidity of this appendage to a rock, he advanced in a side-long direction, with his face turned towards the rock; and in the space of three quarters of an hour, during which time the most trivial slip or accident must have destroyed him, he arrived in a place of safety on the other side of the rock. Having thus surmounted his danger, he began to think of his dispatches. He had left them under the care of his soldiers, but he now thought himself capable of saving them himself. Emboldened by success, and proud of his discovery, he did not hesitate to return the same way.

He took up his port-folio, and the box that contained his dispatches; his two soldiers Golikoff, and Neradezoff, consented to accompany him; without assistance it would have been impossible to save this precious deposit: they carried it in turn. At every stride over the gaps of the path, our author thought he saw his box ready to fall into the sea: twenty times it was on the point of falling from his own hands, and he shuddered as if death itself had been gaping under his steps; he knew not a moment's ease, till he had deposited this charge in a place of safety; and his joy was then as vehement as his anxiety had been*.

These crossings backwards and forwards occupied seven hours of incessant labour and apprehension. No sooner were the travellers out of danger, than they returned thanks to the almighty for their miraculous preservation: they repaired their sledges, and immediately proceeded on a flinty strand, the breadth and solidity of which relieved them from all anxiety. A few hours after, near the ostrog of Armani, they met a number of empty sledges returning to Ola, and earnestly wished them success.

The village of Armani, which is eighty wersts from Ola, consists of a summer yourt and a winter yourt, situated on a river of the same

danger than their commanders: they barked and drew back at all difficult passages: they were not to be cheered or flattered by the voice to the performance of their duty; it was necessary to strike severely, and pull them forcibly. Four of the dogs from awkwardness or terror, could not leap like the rest; one of these perished instantly; and another, after having remained some time suspended by his fore-feet, was extricated from his peril.

name. M. de Lessops passed on to the house of a yakout, three hundred paces farther, where he expected to find a more commodious lodging: it was a yourt in a wood of large fir trees, which he had occupied for thirty years. In his absence his wife received our author cordially, and tendered him some milk, with an acid beverage made principally of mare's milk, called *koukouiss*. It was far from disagreeable, and his Russians in spite of their superstitions for any thing proceeding from a horse, seemed to relish it highly. The husband, by this time, arrived, who had the appearance of a healthy venerable old man. Having been informed of the nature of this journey, by his wife, the host instantly cleaned the most distinguished place in the room that our author might repose himself. He was awaked by the lowings of the herd which were admitted into the yourt: eight cows, a bull, and some calves divided the apartment with him; but though such were his companions, every thing about him had the appearance of cleanliness, and the air was sweet and wholesome. This yakout does not, like the Kamptschadales and Koriacs, employ himself wholly in catching and preparing fish: hunting, and the management of cattle, demand his chief attention, and gratify all his wants. Exclusive of his herd, he has ten or a dozen horses, which he employs for various useful purposes. Every thing about the premises indicated prosperity, happiness, and tranquillity, and the repast, though simple, was thought sumptuous by the partakers of it.

They separated the same evening, perfectly satisfied with each other, and De Lessops travelled the whole night: he arrived at Taousk the next morning, being a distance of forty-two wersts. This ostrog is situated on the river Taon, and contains a church, twenty isbas, and a building for the reception of tributes, surrounded by palisades. Twenty yakouts, two chiefs, and some other Koriacs compose the whole of the inhabitants. The garrison consists of fifteen soldiers, commanded by a serjeant named Othotin, at whose house our author took up his abode till the evening. At night he passed through Gorbe, peopled chiefly by yakouts, and in the morning lost sight of the sea. During the first and second of May, he and his companions, travelled through fields,

and upon the river Kava, without perceiving a single habitation.

On the 3d a gale of wind arose, accompanied with a heavy snow: his tent suspended over the baggage, afforded shelter to the party; but a fire was also required. His conductors undertook to procure wood, which they could not effect without being buried as high as their waists in snow: in the afternoon the wind changed, and the sky became clear. May the 4th our travellers passed over the mountain of Inèè, which may be compared in height to that of Babouschka: on the summit they were so severely pierced with the cold, that they stopped to kindle a fire. In a few hours they came again to the sea, which they left at a short distance from Inè, where they arrived in the evening.

This ostrog is peopled by Russians and Yakouts, whose habitations are isbas and yourts. Here M. de Lessops proposed to change his team, and set off immediately; but he was detained by the difficulty of procuring dogs: the chief of the place was so completely intoxicated, that he could not assist upon this occasion. Twenty-five wersts from Inè, our author passed two yourts inhabited by Yakouts and Tougouises; the name of this hamlet is Oulbé. Coming again upon the coast, he travelled forty-seven wersts, without quitting it, where he saw several sea-wolves, and a whale driven upon the shore.

Having crossed, with some degree of trepidation*, he entered Okotsk on the 5th of May, accompanied only by Nedarezoff. He alighted at the house of Major Kokh, invested with the command in the absence of M. Kasloff, whose arrival with M. de Lessops had been long expected. The governor's letter had communicated to him, the cause of their separation, and our author had briefly related to him the circumstances attending it. He hastened to pay his respects to Madame Kasloff, and deliver some packets addressed to her; but she was absent in the country, and M. de Lessops was too weary to attend her on that day. An express was immediately sent off with the letters, and a day appointed for his visit. Presuming that he required repose, the Major conducted him to the apartment destined for him in the house of M. Kasloff, and he found every comfort and convenience he could wish. In

M. Kokh † invited and conducted our author to his house to dinner, and communicated several plans of amusement to him, in order to induce him to stay some time with him; but his eagerness was so great for the rapid progress of his journey, that he resisted the urgency of his invitations, and the fascinating pleasure of his society, for the faithful execution of the trust reposed in him. Of these facts he informed M. Kokh, who, yielding to his reasons, became satisfied with his eagerness to quit him.

The rains had been so incessant during his arrival, that the roads were thought impassable, at least for dogs. From the best information there appeared no possibility of advancing farther, without having recourse to rein-deer. M. Kokh therefore sent an express to a horde of wandering Tougouzes, to procure our author a supply of these animals.

Having performed this necessary part of his duty, the Major accompanied him to Boulgin, the country residence of Madame Kasloff, who politely received him as the friend of her husband, and the companion of his dangers. The object of her affections engrossed the whole of their conversation. The lady demanded an account of all their difficulties at the time of their separation. He attempted to soften such circumstances as might probably tend to impress themselves too

* Soon after he rose in the morning he received the visits of Major Kokh, and the principal officers and merchants of the town. M. Allegetti, surgeon to the expedition of M. Billings, was among them. His meeting with that gentleman was a fortunate circumstance, as the pain in his breast had returned: he consulted him without hesitation, and afterwards acknowledged, that to his skill and care he was indebted for the perfect cure of his complaint.

† M. Kokh was a German by birth, but he spoke the Russian language as fluently as his own: he had long retired to this settlement with his wife and three children, where he lives comfortably with his little family, rich in the public esteem, and happy in the opportunity which his situation afforded him of doing good.

‡ The town of Okotsk is nearly in a direct line from east to west; the sea at the south, being within a hundred yards of the houses, and the interval between consists of a stony strand: at the north the walls are washed by the Okhota. The habitations are only isbas, a few of which are larger and more commodious than the rest, being destined for the use of the officers. M. Kokh resided at the other end of the town: the governor's house, and the Sessions-house, are both under the same roof, and form a part of

forcibly: she therefore supposed the most disagreeable particulars were only slightly noticed, from an unwillingness to give her uneasiness; a caution which only alarmed her the more. M. de Lessops knew not how to console her, as he himself experienced the utmost anxiety for the fate of this valuable man: but, assisted by M. Kokh, he assumed an air of serenity, and the Major proposed a number of consoling expedients: at last they restored tranquillity to the mind of this affectionate lady, by encouraging her to expect the speedy arrival of M. Kasloff: This lady was born at Okotsk, and, among other female accomplishments, spoke the French language with elegance. In her present solitary retreat, she is principally amused in educating an amiable daughter about three years old.

The next day an express arrived, informing our author that the Tongouzes were separated, and dispersed through the country, and that no rein-deer could be procured. After mature deliberation, and taking the advice of M. Kokh, who endeavoured to dissuade him from it, he came to a resolution to set off the next day without the rein-deer which he had expected. M. Kokh, finding his opposition useless, no longer advised him to the contrary, but promised to give the necessary orders, that every preparation might be made for his departure. M. de Lessops spent the remainder of the day in taking a survey of the town, which he describes in the following manner, or to that effect ‡.

the square. Here is also the guard-house, and the parish-church; but these buildings have not a very splendid appearance. A street behind, extending almost to the river, is inhabited by tradesmen, whose shops are regularly arranged on each side of the street. The port is very insignificant; seven or eight vessels or galliots were to be seen; part of them belonging to the crown, and others to merchants, who trade with America for furs.

M. Kokh having made preparations for our author's departure, and his sledges being loaded and harnessed, he took leave of that gentleman and the rest of the officers on the evening of the 10th of May. His company was augmented by two men, who were to act as pilots on the river Youdoma: he travelled all night, without regarding the wretched state of the roads, though they were covered with water, and in some places reached the bellies of the dogs: the wind continued south, and strongly indicated a continuance of the thaw. In the mean time having crossed the river Okhota, he arrived at Medveje Golova, or *Beaver's Head*, a village inhabited by Russians and Yakouts: he entered it early in the morning, but the dogs were so weary, that he was under the necessity of passing the day, and even the night in that ostrag.

He

He hoped to reach Moundoukan the following day, which is twenty wersts from Bear's Head; but, when he had proceeded about half way some of the dogs refused to draw, and the company reluctantly ventured upon a river that seemed to be the preferable expedient. They had not advanced many paces, when they heard a sudden crack under their sledges; and the next moment De Lessops felt himself gently sinking, but a piece of ice still kept him up. It broke a second time, and his skates were hardly to be seen. All endeavours to extricate himself would have been useless, as the least motion would have plunged him into the water. Fortunately it was but four feet deep, from which embarrassment his people relieved him, till they were nearly as much in want of assistance themselves.

Deaf to the remonstrances of his conductors, he still wanted to proceed; but their mutual aid became necessary to enable them to gain the bank. In the mean time, the snow continuing to melt rapidly, the dogs only paddled in the water, without making any progress, and fell upon one another exhausted with fatigue.

Among our author's guides was a serjeant, whom M. Kokh had strongly recommended. His reputation for courage and experience taught him to regard him as his monitor and guardian: he therefore observed his motions and studied his countenance, which had hitherto been inflexibly composed. While the rest of the company murmured, he uttered not a word, nor altered a muscle of his face. Encouraged by his silence and seeming unconcern, our author almost abandoned his fears, and yielded to a kind of tranquillity. But how great was his astonishment when this serjeant stopped suddenly, protesting he would not proceed a step farther. He urged him to explain himself. "I can no longer be silent," replied he: "but the more I admire your intrepidity, the more I feel myself authorised to inform you of the obstacles which may surround you: many of the rivers indeed are thawed, and could you so far succeed as to pass them, the floods would speedily overtake you. Where will

you then find a resource? Perhaps you may seek an asylum on a mountain, or in a forest*, should you be fortunate enough to meet with either. Can you erect yourself a cabin on the tops of the trees, and rest securely there three weeks, or perhaps a month till the inundation shall subside? And are you certain that, even thus exalted, the waters will not reach you, and force you down, together with the tree you rely on for protection. Are you sure that your stock of provisions will, during this interval, be sufficient to preserve you from the miseries of famine? If you are not intimidated by any of these considerations, proceed; you are your own master. I have done my duty, and I shall take the liberty of quitting you †.

He accordingly set out, and reached Bear's Head the same evening, where he remained till the afternoon of the following day. From thence to the river Okhota, he experienced no other inconvenience than that of travelling very slowly; but in crossing the river, new perils and new alarms arose. The instability of the ice, which was moved up and down by the current, made him apprehensive that it would not bear the weight of so many passengers, and he was continually in fear that an abyss would open, and swallow up some of the party. Having at length gained the bank, they counted over the company, and had the happiness to find that not a single person was lost in the tremendous danger. They arrived at Okotsk, about noon on the 14th.

So speedy a return produced some pleasantries on the part of M. Kokh, and the other officers: but our author was less concerned at the folly of the attempt, than at its failure. He could not avoid contrasting the tediousness of his passage, with the common mode of accomplishing such a journey: Eight months had already elapsed, and he was no farther on his route than Okotsk; but he had not selected any particular season, and had been necessarily detained three months at Bolcheretsk: he had also to contend with tempests, and a thousand other obstacles; and all these delays had been equally involuntary and

* As similar accidents are not uncommon to those who travel in this season of the year; the unfortunate travellers usually ascend the loftiest trees, where they fabricate with the branches a kind of hut, called *labarkis*; but it sometimes happens that these torrents do not abate, in which case they perish for want of food.

† This resolute remonstrance strongly operated on the mind of De Lessops, and induced him to consider, that if he attended to the monitions of prudence, he could not do better than return immediately to Okotsk, from which they were but fifty-five wersts distant.

unavoidable

Vol. II. No

unavoidable. But though these circumstances might all be pleaded in his justification, he still thought it in the highest degree distressing that he had not been able to execute the trust reposed in him. Such were the reflections which agitated his mind, and poisoned the pleasures which every one was desirous of procuring him. At length, however, the attentions he experienced, and the amusements which courted his participation on all sides, totally dispelled his chagrin.

Lofisoff, inspector-general of the garrison, was particularly obliging to M. de Lessops. He immediately directed that the best of their wretched horses should be collected from the environs, and kept in readiness for departing at a moment's warning.

An express arrived from Ingiga which gave infinite pleasure to our author: it brought intelligence of M. Kasloff's arrival in that settlement; but alas he had brought no letter from the governor. This consideration occasioned much anxiety. Every one questioned the messenger by turns, and they would hardly be convinced of his safety; but the probability, and the invariable uniformity of his account, persuaded them at length that their fears were unfounded.

The river Okhota had usually been free from ice by the 20th of May; but, to the astonishment of the inhabitants, it did not begin to float this year till the 26th in the afternoon. It formed a curious exhibition for the town, and M. de Lessops was invited as to a party of pleasure; but supposing it to have been similar to what he had seen at Petersburg, he was not much inclined to repair to it; but, being further importuned upon the subject, he went to the river. Multitudes were there assembled, who expressed their astonishment, in loud vociferations, at the sight of the enormous sheets of ice, which were lifted up by the rapidity of the current. The next moment loud shrieks assailed his ears, and he endeavoured to discover their cause: he approached with trepidation, supposing some unfortunate child was

in danger of being drowned, but he was mistaken in his conjecture.

A society of about a dozen dogs excited this lamentation. Their master, either from avarice or compassion, thus bewailed the fate of these poor animals whose loss now seemed inevitable. Seated tranquilly on the ice which supported them, they gazed with astonishment at the crowd collected upon the bank, whose utmost clamours could not move them from their station. Two only had the sagacity to attempt to save themselves, and with difficulty arrived on the opposite side; the rest almost instantly disappeared, and were probably conveyed into the ocean, where they infallibly must have perished*.

To these fishing enterprises, which daily become more successful, the hunting of water-fowl succeeded: these winged visitors were so abundant as to cover the surface of the water, and furnished a new means of subsistence for the famishing inhabitants. The season now rapidly advanced, and in spite of the frequent fogs, they had fortunately some fine days. They were the more acceptable, as the snow had fallen two inches deep on the 29th, and the cold was remarkably severe. The waters gradually abated, but no appearance of vegetation was perceived: some rotten grass, indeed, from the last efforts of nature at the close of autumn, was all the earth could afford to the horses, till the return of a resuscitating spring.

Our author was so anxious to be gone, that though he was no stranger to the miserable state of these animals, he intreated M. Kokh to order those intended for him to be collected, as he should certainly leave Okotsk on the 6th. of June. His orders were punctually obeyed, and by the kindness of Mrs. Kasloff, with the additional liberality of his friends, he found himself amply provided with bread and biscuit. But the idea that he was to support himself with the sacrifices of friendship, was hostile to his feelings, and it was not without much pain that he was obliged to keep

* These dogs were the only victims of the departure of the ice: but its effects have been sometimes so tremendous, as to have occasioned the removal of the houses near the river. The thaw at length being ended, and a famine beginning to prevail, as the stock of fish procured in the preceding summer was nearly exhausted, M. de Lessops ordered the selno to be immediately used. He was present with a large party, and saw a most agreeable spectacle: it is impossible to convey an idea of the pleasure, the trans-

port of the spectators upon the first cast of the net. An immense quantity of small fish were the produce of one haul, and the joy was loud and vociferous on the occasion. Those who had begun to feel the pressure of famine were first served, and shared among them the blessing of this fortunate beginning. Our author could not restrain his tears when he saw how ravenous these poor creatures were: whole families were crowding and contending for the fish, which were devoured raw before his astonished eyes.

what no refusals could prevail on them to take back.

The day preceding his departure, he had been informed that M. Loftsoff intended to go with him to Moundoukany, and that Lieutenant Hall was to accompany them; M. Allegetti also informed our author that he had prepared every thing to conduct him, as far as the cross of Yuodoma, and that personal attachment was the sole motive of his journey. Of his two soldiers, only Golikoff attended him; Nedarezoff remained at Okotsk; but our author took his father to serve as a pilot on the river Yuodoma. All his preparations being completed, he tore himself from the arms of M. Kokh. Many of the inhabitants did him the honour of attending him to the gates of the town, where the horses waited for them, and where, after mutual good wishes, they separated. On beholding the horse he was to mount, our author drew back with horror and concern: never had he seen before so poor and wretched an animal; the other horses, engaged for this expedition, were equally lean and despicable. In this pitiful plight, the caravan began to march. To console themselves during this cavalcade, each was merry at the expence of his steed. Twelve wersts from Okotsk, a salt-work was pointed out to our author on the sea-coast, in which only malefactors were employed. Beyond this house they left the sea, and travelled for some time on the banks of the Okhota. If the breaking of this river is alarming to the inhabitants of the town, its overflowings must be more fatal to the environs. In overflowing the banks, it not only inundates the adjacent country, but becomes a torrent that swells as it extends itself, and has been said to rise two feet above the tops of the highest trees.

Not far from Medvejégolova, De Lessops'

* The Yakouts do not seem much concerned at the loss of these animals, and have little idea of affording them any assistance. When they refuse to go on, or fall down from fatigue, they are abandoned to their fate, and their carcases are left to be devoured by bears: who never relinquish their prey while any flesh remains upon the bones. Every ten steps these skeletons were seen: more than two thousand of them had been passed between Okotsk and the cross of Yuodoma.

† Setting out at nine the next morning, the company forlode the river Okhota, the course of which they were no longer to pursue: They perceived some scattered yourts at a distance from each other, but hardly ever saw any con-

horse fell under him, and there appeared no probability of getting him up again: fortunately, however, he had quitted the saddle, and therefore received no injury. The animal was left upon the spot*, but could not survive many hours. Eleven horses still remained, and our author was remounted in an instant, and reached the village without any further accident†.

Arriving at Mandoukany, when the horses were much fatigued, the party passed the night there, and all the following day; which was the 8th of June. At the dawn of day M. de Lessops separated from M. Hall and M. Loftsoff, who were to remain in this place. M. de Lessops ascended a high mountain called Ourak, the summit of which was still covered with snow: a river of the same name appears at the foot of the mountain, which is wide, deep, and rapid, and on its bank a yourt is situated inhabited by watermen. At present, however, they were all absent; and being tired of waiting for them, the party launched the best of the boats that were fastened on the bank, and after diligent search they found some oars. They unloaded and unsaddled their horses, and put the baggage in the boat, which in turn conveyed us to the other side: the steeds remained behind, and our author trembled with fear lest the animals should not be able to swim across: the Yakouts seemed perfect in this part of their business; by whipping them they forced them into the water, and the boat preceded them to guide them. One of the conductors remained upon the bank they started from, exclaiming, hooting, and throwing stones to fright them, in order to prevent their turning back. In about half an hour they were safely conveyed over, where they were instantly saddled and reloaded‡, and they pursued their journey.

They halted about twenty-five wersts from considerable number of them together. They live in this isolated manner from a motive of self-interest: horses being their principal source of wealth (some of whom possess upwards of a thousand) If the proprietors should build their habitations nearer to each other, how would they be able to procure nourishment for their numerous studs? Hence it would be necessary to send multitudes of them to a considerable distance, as the neighbouring pastures must be soon exhausted.

‡ The Yakouts are so much accustomed to this exercise, that they might defy the most expeditious groom: they tie the horses three and three to each other's tails, and a single rope serves to lead them all.

Moundoukany, to which they were invited by the appearance of some pasture, and few traces of bears were discoverable. From a fast of about six months, the voracity of these animals was greatly to be dreaded. Departing their dens they prowled about the country, and ravenously attack any animal they can discover, and particularly horses. When the travellers arrived at their destined spot, the horses were eased of their burdens, and permitted to graze at liberty. Fires were then lighted at equal distances round their little camp, and our author frequently discharged his musquet at the entrance of his tent; knowing the report and the smell of the powder would effectually drive away the bears. At day-break their horses are summoned to assemble; and, should any of them be dispersed, they come at the cry of the Yakouts, who, like the Koriacs with their rein-deer, possess eminent talents for this purpose*.

To make the most of his time, he restricted himself to one regular meal in the evening, taking no refreshment in the course of the day but some rye-biscuit. Sometimes indeed he and his party subsisted on the fruits of his success. But if he happened to kill any small animals, they fell to the lot of his Yakouts, except the skins which were returned to him. Golikoff had prejudiced him against this kind of food, by representing them as extremely nauseous; but being once tempted by the whiteness of the flesh to taste one of these little animals, he found it less disagreeable than he had been induced to believe: though they retain the flavour of the fir, he should think them very acceptable in a time of scarcity.

Their principal food, known by the name of *boudouk*, was more offensive to him: it is a kind of thick frumanti, made of rye-meal, water, and fish-oil; the quantity they devoured of this composition shocked him, though he was informed that in general they are not very great eaters: it was however said, that sometimes, by way of treat, they roast a whole horse, which is speedily demolished at a meal, by a very small number of

guests; and the intestines of the animal, are not considered as the least delicious.

Our author was awaked at an early hour by his guides, who came to inform him that the river had considerably abated during the night. A number of horsemen had also just arrived, who had been detained on the opposite side, and who had crossed without difficulty, which inspired them with the fullest confidence. They were reduced merchants who intended to try their fortune as factors of a man of property, whose speculation had obtained the approbation of the court, and all the succours which they required. Its object was the fur trade, particularly that of sables, caught by the Koriacs and Tchouktchis. They were allowed four or five years for their undertaking; and they were not only to collect furs by way of purchase, but also to hunt the animals that furnished them. Fearing no other obstacles than the hostilities of the natives, they were provided with ammunition and arms to repel their insults.

When our author had passed the river, he asked the guides if it was the last he should have to cross; they replied in the negative, and assured him that he would meet with three others in the course of the day. This intelligence alarmed him, and the dread of his horse's falling with the box made him shudder. Emerging from a thick wood, he found himself on the bank of a rapid torrent, the breadth of which was about two hundred yards; at a little distance this stream was received by the Ourak. Conceiving it to be fordable, he spurred his horse to make him descend: in the middle of the river he felt his legs tremble; he encouraged him: he proceeded, and the water did not reach above his knee. Emboldened by this circumstance he pushed on, and soon approached the opposite bank; to ascend which a ridge of ice was to be surmounted. The declivity was steep, but no better landing-place presented itself: he directed the animal towards the perilous ascent; and, though he had gained a position for his fore-feet, he fell backward into the water; the horse and the rider floating in

* Having often seen tufts of horse-hair suspended to the branches of trees, our author asked the cause of it, and was informed that they were offerings made by the inhabitants to the Gods of the woods and highways; a species of superstition that has at least one good effect, as the offering may serve to identify the road to travellers. In the course of the preceding day our author crossed various

branches of the river Ourak; and about five in the afternoon met that river again: its width was not considerable, but as the rain had swelled the current, and the principal guide represented it as dangerous, the resolution formed of passing it was not persisted in: he pitched his camp in the neighbourhood, where the horses fortunately found some provender to eat.

different

different parts of the stream; they were both carried along by the violence of the current, and our author insensibly grew weaker. Approaching the spot where the two rivers joined, a voice suddenly assailed his ear, exclaiming, "Catch at the bridle of your horse, or it is over with you!"—The sound, the idea of the danger reanimated him; he struck forward with all his might, stretched out his hand, and seized the rein. Providentially, at the same moment, his horse obtained a footing. Our author seized the upper end of the bridle, and threw his arms round the neck of the animal; remaining, as if he had been suspended between life and death, and calling aloud for assistance. His faithful Golikoff had endeavoured to follow him in his misfortune; but the vigour of his horse did not correspond to the zeal of the rider: he was the person that had given him the salutary and terrible advice of grasping at his horse; and when he perceived its happy effects, he hastened to ascend the shore, to land, to run towards him in order to preserve his life*.

The party again mounted their horses, but M. de Lessops declared his blood froze in his veins whenever he approached a river; and he was now become so cautious that he sent one of his guides before, and was not willing to venture till he had received a signal from the opposite side. He arrived in a reasonable time at Oratskoi-plodbische; which was the first habitation he had seen since the yurt belonging to the watermen, and he continued there the remainder of the day. The Ourac flows at the foot of this hamlet; here are only five inhabitants, each of them being a soldier, and has an isba: they are

* After having leaped on the neck of his deliverer, his first care was to tear off the port folio which was fastened to his girdle; and he had the satisfaction to find that the two important packets, which La Perouse had particularly recommended to his care, had not received much injury. He had left his box on the other side; but the uneasiness on that account was soon dispelled, by the arrival of M. Allegetti and his other companions, who safely returned it to its owner, and congratulated him on his miraculous escape.

† The next morning the travellers crossed the river Orak in a boat; its source is at no great distance: it proceeds from an immense lake where they halted in the evening; it is about seven wersts in circumference, and is said to abound with fish. A scene took place this day among the Yakouts, concerning a horse that it was thought necessary to leave upon the road. Accountable for horses committed to their care, it is usual when they lose any of them from the excess

appointed to guard a magazine for the reception of effects belonging to government†.

Wishing to travel quicker, our author entrusted the baggage to the care of old Nedaresoff, and passed on before with M. Allegetti, Golikoff, and a Yakout. A pond, of the depth of about a foot presented itself; into which M. Allegetti rode, and Golikoff followed, holding our author's box on his saddle. After a few paces the horse stumbled, and threw him off sideways; but more intent on his deposit, than his own preservation, he fell upon the box, in consequence of his extreme caution not to relinquish his hold. He immediately alighted to assist him; but having fallen into the mire he had received no injury: though the box was evidently wet, the water had not penetrated to the inside. The horses were so fatigued, that their riders alighted and led them by the bridle, while the Yakout was lashing them behind. They travelled the remainder of the day, except where the new grass‡ began to appear, when a pause was made to console the poor beasts with a little refreshment.

In the afternoon they arrived at the Cross§ of Yuodoma. On an eminence, secure from the overflowings of this river, a number of magazines appear in view, guarded by four soldiers, and which are also considered as an asylum to them, when their common habitations by the side of the Yuodoma are flooded: these soldiers also act in the capacity of watermen. On seeing our author's passport, they submitted entirely to his guidance. Unfortunately all their boats were in a wretched condition, and he had neither materials nor workmen to refit them.

Of the four boats that were on the strand, our of fatigue, &c. to cut off the tail and the ears, which they must produce to the proprietor to exculpate themselves, or pay the value of the animals. A dispute now arose, whether they should terminate the life of this poor unfortunate beast. Our author proposed a more simple and less cruel way of effecting this end, and promised them a certificate that should attest the loss, and supply the usual proofs, by taking the blame of their failure in this respect upon himself. They acquiesced in his proposal, which was considered as an unequivocal proof of their deference and respect.

‡ The progress of vegetation was every day perceptible; the trees, which had so long continued bare, gradually recovered their foliage, and the country soon appeared like an immense meadow, enamelled with rural flowers. What a delightful spectacle for a man whose eyes had, for the space of six months, seen nothing but frozen rivers, and plains and mountains covered with perpetual snow!

§ There is really a cross on the bank of the river.

author chose the best and the narrowest; which was twelve feet in length, and six in breadth: he caused it to be caulked, and tarred, and an additional plank to be placed at the head, to enable it to resist the force of the waves: with some nails from an old boat, and the assistance of one of the soldiers who had been a carpenter, he proceeded; but without mentioning the difficulties he had to encounter, and his adroitness in overcoming them, let it suffice to say, that at three in the afternoon their repairs were completed, the helm fixed, and the oars adjusted, and M. de Lessops ordered his people to be ready by the next morning.

When they were on the point of setting out, a caravan of Yakoutsch merchants appeared: they were proceeding to Okotsk, and our author desired M. Allegretti to accompany them: their separation took place about nine o'clock, after the sincerest professions of reciprocal and everlasting esteem. Our author engaged two of the soldiers to row him, one of whom had before made this voyage: Nedarezoff was at the helm, and Golikoff and our author were to relieve him when he became weary. The rapidity of the current carried them on with such violence, that they required no oars; their velocity hurrying them on at such a rate, that they would probably have reached the famous cataract before night, which was upwards of eighty wersts from the place of their departure.

The conversation of the rowers turned solely upon the dangers they should have to encounter; and being prepossessed with the idea of their inexperience, our author began at last to be alarmed himself, and resolved to act with the utmost care and prudence, that he might not have any reason to reproach himself. Towards the evening, a west-north-west wind produced rain, in consequence of which he halted, and ordered his tent to be pitched over his boat, not choosing to run any risk in bad weather.

* They had still a difficult pass to make, which terrified the adventurers: it is called *Podporojenei*, or the cbb of the Cataract, and is at the distance of about a worst from it. Their object was to make choice of the deepest side, which was pointed out by the blackness of the water, and our author steered towards it. A multiplicity of high swollen waves tossed them about with more violence than if they had been in the open sea. Suddenly their boat was pitched upon a rock, which was on a level with the water, and which had not been perceived. They were thrown down by the force

After four hours navigation the next day, he perceived the cataract: accompanied by his two pilots, he went to reconnoitre the spot. At a short distance from it, he saw a little stony island, which is only visible when the waters begin to fall. The soldiers advised him to pass, if the waters were sufficiently high to admit of it, by the canal at the right; though they admitted that the descent was very rapid, they assured him it was much less so than that of the cataract. Approving of this advice, he returned to the boat, and resolved to put it in practice: then, encouraging his people as well as he could, he took the helm: Nedarezoff sat by him, and Golikoff assisted one of the rowers, as they had only two oars among them. They proceeded thus till they reached the conflux of the two streams, one of which led to the canal, and the other was devoured by the cataract. The impetuosity of the latter would have drawn them into the abyss, had not the strength and skill of the rowers prevented it: and they were at length so fortunate as to get extricated from the treacherous current, and enter into the canal*.

To avoid this accident, care must be taken to pass exactly in the middle of the stream, without attending to the waves which rise and seem to break against the rocks. At the bottom of this *podporojenei*, another river empties itself, the clearness and smoothness of which forms a striking contrast to the turbulence and agitation of the Yudoma, that the two rivers are easily distinguished. At the left of the Yudoma, another formidable arm appears, which is called *Tschortosskoi-protok*, or Devil's Arm. It falls into the Yudoma. It is well known by the number of rocks and dead trees which obstruct its entrance: those who are not careful to steer constantly to the right, are drawn in here by a rapid current, and ruin is inevitable.

M. de Lessops found himself indisposed by the attack of a fever, but did not much attend to it:

of the shock; and, supposing themselves to be irretrievably lost, had not the resolution to raise themselves.

In vain were they importuned to row on—they were deaf to the repeated exclamations of our author—he caught hold of the helm, and, perceiving that the boat had sustained no injury, he animated their drooping spirits, and prevailed on them to resume their stations. The moss on the rock preserved them from imminent destruction; the boat gently touched it on its passage, and glided along with wonderful facility.

he only laid himself down in the boat, and observed no other regimen than that of drinking cold water. Notwithstanding the assertions he had heard, he could not easily be induced to believe that the Ourak was more rapid than the Yudoma.

He entered the Maya on the 22d, the banks of which are not so deep and dreary as those of the preceding, though at intervals there are mountains and rocks. The difference of the current was very perceptible, as they only sailed four wersts an hour. The gnats became so troublesome as to be almost insupportable: they could only be kept off by the smoke of rotten wood, with which it was necessary to support an incessant fire*.

He discharged his guides, who continued their course on the Aldann: they were a werst from him, when he repented the having dismissed them. The Yakouts, who were the proprietors of the horses, apprehending they would be too much fatigued, heard with regret that he intended to make use of them. Not daring openly to refuse him, they endeavoured to escape by stealth; but being pursued they were prevailed on to come back. To secure them, they were all shut up in one isba, from which they were not permitted to come out, till they had consented to convey him to Amgui: a selection of ten of the best horses, had in the mean time been made for his use.

After a night's repose, which relieved our author from his slight indisposition, he cheerfully mounted his horse, accompanied by the Yakouts; who had been reprimanded by Golikoff, and were become more manageable. They were now in perfect good humour, and sang with the greatest glee: but their vocal music is not very agreeable, as it principally consists of a perpetual and monotonous shake in the throat. They are, however, great improvisatori. Their subject is derived from whatever passes before them, or whatever occurs to them, but does not display a ray of genius; it is little more than a tiresome repetition of the same words.

* On the 23d M. de Lessops quitted the river Maya, for one larger and more rapid, called the Aldann; but he only crossed it to visit a habitation on the other side, opposite to the mouth of the Maya. He there found some marines belonging to M. Billings's expedition, who advised him to embrace the opportunity which presented itself of furnishing himself with horses of burthen, which on their return would convey him as far as Amgui. According to the itine-

In the midst of an extensive wood, M. de Lessops saw, on the border of a lake, two fishermen providing for their winter consumption: their habitation was merely a roof constructed from the bark of trees: when the summer is on the point of departing, they seek among their relations, a warmer and less exposed retreat. A great deal of rain fell on the 25th, particularly while our author halted, which was from four till eight in the afternoon. The Yakouts, in order to defend themselves from it, placed a bear's skin on their shoulders in the form of a cape: the tail of a horse, ntached to the handle of a whip, served as an useful instrument to keep off the flies, with which they were so much molested, that our author was frequently induced to have recourse to this fly-trap.

On the evening of the 25th, the travellers arrived at the border of the river Amgai: it was too deep to be fordable, and the boats were all on the opposite side. They called in vain for assistance: no person appearing from these reiterated shouts, one of the Yakouts stripped himself, and swam over to procure a boat. The crossing of the whole caravan consumed almost the whole of an hour; the travellers then mounted their horses to proceed to the habitation of a Yakout prince, named Girkoff. In their road they saw a number of yourts, but all at a considerable distance from each other. Golikoff went on before to that belonging to the prince, to pave the way for a good reception. To do him justice, it must be admitted that he treated our author with the greatest civility; he not only offered him his yourt, and entertained him with excellent milk and butter, but declared the best of his horses should be devoted to his service†. Being informed that he had much occasion for repose, he pointed out the habitation that was intended for him; and while it was preparing, he politely shewed him the conveniences of his yourt, which was one of the most complete that he had seen.

The size of these houses is usually regulated by the wealth of the proprietor, and the number

rary, he was to go by water to Belskaia-pereprava, which is in the usual road from Okotsk to Yakoutsk, but by going the way of Amgui he would considerably shorten it. This certainty, together with the happy chance that provided him with horses, induced him to alter his former plan.

† He had a stud of two thousand horses in very good condition, though he had lost a considerable number by the conveyances occasioned by M. Billings' expedition.

of his family. Beams placed by the side of one another, and plastered with clay, form the walls, which are not perpendicular. Inclining towards the top, they supported a roof. The house, which has but one door, is divided into two apartments. The cleanest is the residence of the family, who sleep in distinct huts, distributed against the walls; every couple having a hut to themselves. The other part of the yourt, destined for the cattle, is no more than a kind of stable*.

In the idolatry of the Yakouts are united all the absurdities of the ancient Kamptschadales, Koriaks, Tchouktchis, and other neighbouring inhabitants: but they have some more solid principles, and amidst all their fictions and superstitious practices, may be traced some exalted ideas of the supreme being, and of future rewards and punishments. They delight in fables drawn from their absurd mythology, and they relate them with all the confidence of credulity itself. M. de Lessop has given two specimens of their allegorical ingenuity in his travels at large.

Remains of ancient tombs of the Yakouts were frequently pointed out to our author in the woods; they were clumsily put together, and suspended on the branches of trees. But, from some motive, they have renounced this custom of exposing their dead in the open air, and remote from their habitations. Their mode of interment is now similar to that of Christians.

The pomp displayed at funerals is more or less

* A leathern trough is fixed in one corner of the yourt, into which they daily put mare's milk, and stir it about with a stick somewhat similar to what is used in churning butter. Every person who enters the apartment, more especially the women, stir the milk a few minutes before they attend to any other business. It is thus they procure that acid pleasant beverage, called *kounouiss*; which, if permitted to ferment, becomes a very potent liquor.

As his host spoke the Russian language with tolerable fluency, he drew from him some information respecting the manners, customs, and religion of his countrymen.—When summer commences, they quit their winter habitations, and with their families, and some horses collect fodder for the consumption of the frost season. In their absence, the other horses are left to the care of the servants, and the neighbouring pastures furnish an ample maintenance for their herds. Our author sincerely lamented that he was not present at their festival in the month of May, in which was celebrated the return of spring. They assemble in the open country, where they roast both oxen and horses; and, having provided a large quantity of fermented *kounouiss*, they eat and drink immoderately, dancing and sing-

magnificent, according to the wealth and quality of the deceased: if a prince, he is decorated with his most splendid habit, and his exalted arms. The body, placed in a coffin, is conveyed by the family to the tomb, amidst their most solemn groans: his favourite horse, and another which is the best of his stud, both richly caparisoned, are led by the side of the corpse. When arrived at the place of interment, they are fastened to two stakes near the grave, and while the body of the master is conveying to the abode of clay, their throats are cut over the corpse. This sanguinary libation is the homage paid to his attachment to these animals, who are supposed to follow him. They are then flayed, and the hides fixed horizontally on the branches of trees near the grave. A fire is kindled, and the favoured animals are roasted and eaten on the spot; after which the company disperses. If the deceased should happen to be a woman, instead of horses they sacrifice her favourite cow: In other respects the ceremonial is the same.

The Yakouts are generally large and robust; strongly resembling the Tartars in their features. Their dress is simple, and almost the same in summer as in winter. Over their chemise they wear a large striped waistcoat with sleeves. Their breeches only extend to the middle of the thigh; but their boots, called *sarri*, reach above the knee.

Polygamy is admitted among these people: as they are accustomed to take frequent journeys, a-

ing at intervals, and terminating with necromances. In these festivals their chamans preside, and deal out their rodomontade predictions.

These sorcerers are more revered than in Kamptschatka. Regarded as interpreters of the Gods, they grant their mediation to the Yakout, who solicits it with fear and trembling, but never appears remiss in paying for it. Our author has seen these dupes make a present of their finest horse to convey a chaman to his village. Nothing can be more terrible than the magic exhibitions of these impostors. Knowing nothing of them but from report, he was desirous of being present, and he thus describes the chaman that exhibited before him—Dressed in a habit which was ornamented with bells and plates of iron, which made a horrible noise, he also beat upon a kind of tabor with so much violence that it was terrifying. He then ran staring about like a maniac, with his mouth open, and his head turned about in frantic motions. His black dishevelled hair concealed his face, and from beneath it alternate groans, tears, sobs, and peals of laughter, rapidly succeeded. These are the usual preludes of these revelations.

Yakout:

Yakout has a wife in every place where he stops: but though they have this licence, they are extremely jealous, and the inveterate enemies of whoever shall dare to violate the rights of hospitality.

M. de Lessops found, when he awoke, nine excellent horses ready saddled, for which his best thanks were due to prince Girkoff. He requested he would ride his favourite horse, which ambled with the most perfect ease to the rider. Grateful for his favours and civilities, he left him early on the 27th, hoping to meet with more habitations than usual, that he might more frequently rest himself, and get a regular supply of steeds. In the evening he alighted at the house of another Yakout prince, who had just repaired to his summer habitation*.

On the 28th our author approached the river Sola, and rode upon its banks. The heat and flies incommoded him much; and he experienced such extreme thirst that he stopped at every yourt he saw, to get a supply of koumouiss. The next morning he reached Yarmangui, two hundred wersts from Amgui, and on the border of the Lena. By crossing this river he would have been at Yakoutsk; but by order of the governor, every traveller was required to wait here till he had permission to enter the town. He had reconciled himself to this regulation, when a subaltern officer requested him to go a little farther, where he would find the inspector-general, and a lieutenant belonging to Mr. Billings. They were informed of his arrival, and received him with a countenance of joy: he represented to them that the threatened delay would counteract his views; in consequence of which they gave immediate orders for his being conducted to the other side of the river. About noon he entered the boat provided for him, and was four hours in crossing the Lena, the width of which appeared to be about two leagues.

On his landing, an officer of the police conducted him to the apartment which he thought proper to fix upon for his residence. Requesting

* It may not be deemed impertinent here to describe their *ourassis*, for such is the name appropriated to these picturesque dwellings. Like the yourts of the wandering Koriaks, they are circular, spacious, and constructed with poles, ranged in the same manner, and kept asunder by a kind of hoops at the top; the whole covered with the bark of the birch tree, formed into pieces, placed in a downward direction. These pieces are edged with a ribband, made of

to be directed to the house of M. Marklofski, the governor, he received the necessary information, and waited on him immediately. He received him with the utmost politeness, conversing entirely in French, and invited him to stay a few days at Yakoutsk, to recover from his fatigue. Among his obliging attentions, he requested our author to sup with him and Mr. Billings the same evening: having a strong desire to be acquainted with the latter, he waited with impatience till the hour arrived. Their profession of travellers gave them a degree of familiarity the moment they met; but they were both silent and reserved on the subject of their respective missions, carefully avoiding, in conversation, every circumstance that might lead to it.

Having been extremely fatigued with riding, our author was advised to sail up the Lena to Irkoutsk: approving of this advice, M. Billings assisted him in procuring a boat, ordered two sails to be made of his tent; and gave him a trusty soldier for a pilot; taking care also to furnish him with every thing that might be thought useful in his passage. The five days which our author remained at Yakoutsk were principally employed in preparations for his departure; but he had leisure to remark, that this town was the most pleasant and populous of any he had seen in the country through which he had passed.

Yakoutsk is built on the western side of the Lena; and the houses, which are large and commodious, are formed of wood. The churches are principally of stone. The port is formed by an arm of the river†, that flows under the walls of the town. Barks are the only vessels that trade here, and are principally used for transporting the provisions sent by government. The merchants hire these boats to convey their commodities from the neighbourhood of the source of the Lena.

This town is principally inhabited by Russians, the Yakouts seldom appearing in it but when this business demands their attendance. Having sup-

bark, and shaped into festoons; and the inside of the yourt is ornamented in the same manner. The nature of these ornaments, depends upon the taste or caprice of the proprietor. The chairs and beds are also thus embellished for the heads of families. The domestics sleep on mats upon the ground, and the fire is lighted in the middle of the house.

† The Lena crosses Siberia, almost in its widest part, and pours itself afterwards into the Frozen Ocean.

plied himself with a fresh de Lessops left Yakoutsk one o'clock in the morning, and light announced the approach of the night. † He was struck with the f canoes, but the bottoms were sent but little surface to the wa are easily upset. The Tounge joined to see him: they surround civilly, that he knew not how to

plied himself with a fresh stock of provisions, M. de Lessops left Yakoutsik on the 5th of July, at one o'clock in the morning. Already the twilight announced the approach of the sun, and the banks which line this river as far as the first stage, could be distinctly seen. As they could not always be avoided, the men who conducted the boat were continually requesting all those who were in it, to place themselves in the water, and assist, like the conductors, in hauling it over the shoals. An account of every day's navigation will not be given, the observations it furnished not being sufficiently interesting.

The stages are estimated by stations, and are frequently thirty, forty, fifty, sixty, or seventy wersts. Hence a judgment may be formed of the labour of those who are condemned to this service. For twelve hundred wersts this severe employment is the punishment inflicted on convicts and malefactors. They share this labour with the horses. These culprits have no other relief than a small quantity of flour allowed by government. Many of these wretched beings are married, and retire with their families in ruined shacks, scattered along the right bank of the river. Seeking shelter from the rain, our author one day entered a miserable residence of this description, but was nearly overcome by the noxious air. Words cannot convey an idea of the shocking picture of misery that struck his eyes.

Fishing and hunting occupy the leisure hours of these outlaws, but they still preserve their vicious propensities. On the approach of a boat, they usually have recourse to flight, to escape the laborious service imposed upon them by government.

The travellers arrived at Olekma, on the 14th of July. This town was the first that our author had seen since his departure from Yakoutsik, though it is seven hundred wersts from it. It is a small ill-constructed place, situated at the mouth of a river of the same name. Leaving it in about two hours, a canoe came up to them, with only

one man in it: He offered for sale some bark of the birch tree, which he had stripped in the neighbouring woods. This trader was a Tougouse, whose family was settled on the left bank.

Wishing to be better acquainted with these people, our author ordered his boat to be fastened on the right bank, and accompanied only by Golikoff, he entered the canoe of the Tougouse, who, as well as himself, was highly pleased with the favour of a visit which he intended to make to his relations†.

The Tougouses, like the wandering Koriacs, live in an unsettled manner. Their yourts are smaller, and are covered with the bark of the birch: in other respects there is no difference. Every family has a separate yourt. A small wooden idol is the chief ornamental piece of furniture; it is of the human shape, but has an enormous head, and is decorated with rings and bells. It is named Saint Nicholas, in allusion to the patron saint of Russia. The Tougouses are not so large as the Yakouts; but their eyes, flat nose, and broad face, resemble those of the Kamptschadales: they are hospitable, ingenious, and good-natured. In religion, they have the stupid credulity of the Koriacs.

After fishing and hunting, which oblige these people to be more settled, their attention is engrossed by their rein-deer. These animals constitute all their wealth, and provide them with food and clothing: Obedient to the hand that guides them, they permit their governors, whether men or women, to mount and ride them wherever they please‡. They train them up to carry in this manner, and yield obedience to the motions of a bridle twisted about their horns.

Our author's navigation became more agreeable when he had reached Pelodoui, a village inhabited by Russians. There he was relieved from the dangerous exiles, and was attended only by honest and assiduous peasants. Vitim was the next village he arrived at, but as it resembles all the Russian hamlets, it requires no particular

sessions of friendship. A young deer was killed and laid at his feet; and in making him this acceptable present, they lamented that their poverty deprived them of the ability of doing more. Our author, like these Tougouses, was not at that time able to be very bountiful in presents, but he testified his gratitude by leaving them some of his cloaths.

† Their journeys extend to the frontiers of Tartary and China.

* In the northern latitudes there is hardly any perceptible interval between day and night for more than a week.

† He was struck with the form and lightness of their shoes, but the bottoms were so nearly circular as to present but little surface to the water, and consequently they were easily overset. The Tougouses were so exceedingly rejoiced to see him: they surrounded and welcomed him so warmly, that he knew not how to answer their profuse pro-

description. Birds are numerous in the environs, and on the borders of the Lena. The clouds of gnats which cover them invite them thither.

As the bank became wider and more sandy, M. de Lessops and his party were frequently drawn by horses: the ropes were weak, but the pleasure of advancing inspired him with confidence. In the night of the 29th, his vessel touched upon a rock, which the darkness had concealed. The rope broke with the shock, the boat was in an instant full of water: with much difficulty it was drawn on shore by him and his assistants. Immediately our author mounted one of the horses, placing his box before him: he soon arrived at a village, where he was accommodated; and, his boat being refitted in the course of the day, he proceeded on his route the next morning.

His boat was afterwards broken a second time, and as hastily repaired: another day his rudder, which often struck against the bottom, was carried away. He took horses at Toutoura, and having passed through the village of Verkhalensk, he arrived the 5th, at two o'clock in the afternoon, at that of Katschouga. In this place travellers are provided with *kibiths**, or Russian, four wheel carriages, which are conducted by exiles, and occasionally by the Bratskis. Between this place and Irkoutsk an uncultivated district presents itself, inhabited solely by these Bratskis, who are only a colony of shepherds, said to be descended from the Tartars, whom they very much resemble. Their appearance is savage and ferocious, and they are extremely addicted to theft and robbery: their numerous flocks consist of oxen, horses, and sheep.

In passing over mountains, and through the most terrible roads, the faithful Golikoff was frequently obliged to cry out from the bruises and anguish he experienced, by the continual jolting of their infernal vehicle. At length Irkoutsk became visible, and the adventurers crossed a small arm of the river without coming

* These conveyances resemble a large cradle, but they are not hung upon any thing; a person, indeed, may lay down in them, but he feels every jolt of his cradle.

† During M. de Lessops' stay at Okotsk M. Kokh, at his request, had conferred on him the rank of corporal. This unexpected favour made so strong an impression upon him, that on his return from the parade, he seemed to be almost frantic with gratitude and joy.

‡ This town, which is the capital of the government of

out of the carriage. There he was detained by a sentinel, who was so perfectly satisfied with the name and office of our author, given in writing, that he permitted him to go before him. It was in the evening of the 6th of August, that he entered this capital, having travelled, since he left Yakoutsch upwards of fifteen hundred wersts.

Alighting at the office of police to enquire for a lodging, the superintendant conducted him to a house, but the master of it, instead of obeying the orders which enjoined him to receive him, did not condescend to rise from his seat to mention his refusal. The officer was much irritated at this behaviour, and seemed determined to avenge his insulted authority; but, almost at that instant, the commandant of the place, Major Dolgopoloff arrived: he had heard of our author's arrival, and of the mortification he had experienced, and after making a thousand apologies for his being so indecently treated, conducted him to a very elegant apartment, furnished and ornamented with peculiar taste and splendour.

The next day the commandant presented our author to the governor, major-general Arsenieff, to whom he delivered the dispatches of M. Kasloff, as the governor-general was then at Petersburg. M. Arsenieff received him with the most polite attentions, and insisted upon his having no other table. Finding the governor so willing to oblige him upon all occasions, he embraced this favourable opportunity of warmly recommending to him the soldier Golikoff. The service which this brave fellow had rendered his master, and his fidelity and zeal on a variety of trying occasions, sufficiently pleaded for him, and M. Arsenieff was anxious to secure himself so good a subject. But poor Golikoff† had not a wish beyond that of being incorporated in the garrison of Yakoutsch, where his father lived, and where he should be able to shew his attachment to M. Kasloff, under whose orders it would be his happiness to obey‡.

Irkoutsch and Koliwan, is situated near the mouth of the Irkout. Within its extensive circumference many stone edifices are contained, and churches built of brick; the wooden houses are large and commodious; its population is numerous, and its society brilliant. The modes and customs of Petersburg are introduced here. Every person in office has an equipage, and rank and quality regulate the number of horses which are destined to their respective carriages. This town is the see of an archbishop.

He

He had no pasture, except and he was not knowing he could supply of sustenance had supplied port, as far as of M. Arsenieff insisted on carrying. When the travellers' carriages, Golikoff, in his eyes, admitted to accompany men, as it was bestow on him the last instance of request, his Golikoff.

† The head-dress of wood, placed on

He had no preparation to make for his departure, except that of purchasing a kibitk: and he was no longer concerned about provisions, knowing he could readily procure a regular supply of sustenance at every stage. The governor had supplied him with a *poradojency*, or Passport, as far as Petersburg. Having taken leave of M. Arsenieff, his son and M. Dolgopolooss insisted on conducting him to the first stage. When the travelling party were seated in their carriages, Golikoff approached him with tears in his eyes, and begged he might be permitted to accompany him as far as these gentlemen, as it was the noblest recompence he could bestow on him. He was so affected with this last instance of attachment in complying with his request, his pleasure was equal to that of Golikoff.

Our author crossed the river Angava in a ferry boat, and soon arrived at the place of their separation. While he repeated his thanks, and took leave of his two friends, M. Kasloff concealed himself behind the carriage, and endeavoured to conceal his tears, earnestly recommending our author to the care of the soldier who succeeded him. He fell at his feet, and seized the door of the carriage; nothing but force could tear him from it, and never did our author's sensibility experience so violent a shock. He departed with a very wounded heart, as he could not flatter himself that he should ever see him again.

Here the ingenious writer apologizes for the brevity which will be but too manifest in the future account of his travels, partly on account of the same country being already fully described by ingenious and impartial writers; and partly from inability, in point of leisure, to furnish a more ample detail of particulars. From this period, his observations are principally directed to what more immediately concerns himself.

He then proceeds to inform his readers, that he passed through a small canton inhabited by Bratskis. Beyond Oudinsk he arrived at Krasnoyarsk, where the axletrees of his carriage were repaired. He afterwards entered the desert called

Barabinskoi-step. The post-service is performed by exiles. These unfortunate wretches exist like those who conducted M. de Lessop's from Yakoutsk to Peledoui, and are equally indolent and ferocious. Accustomed to the fertile country about Irkhout, their eye cannot survey this barren waste without concern: perhaps this melancholy contrast may be ascribed to the sloth of the perverse inhabitants. The earth to which justice has banished them, seems reluctant to support them; its withered bosom refuses to assist their impious culture.

Our author crossed the Oka, the Yenisei, the Tom, and the Obi, which are the principal rivers of this province; on the last he narrowly escaped drowning. Before he arrived at Tobolsk*, he passed the Irtysh twice, the last time near the mouth of the Tobol. This capital, situated between the two rivers, would have been one of the handsomest towns in Siberia, had not a tremendous fire reduced the greater part of it to ashes. In quitting this town he passed the Irtysh a third time to reach Catharinebourg, where he remained till his carriage was again repaired; during which time he visited a neighbouring gold mine, and the place appropriated to the copper coinage. Our author then refers to several travellers for a description of the colonies of Tcheremisses, Tchouvaschis, Votiagnis, and Tartars. He only adds respecting these last, that the neatness of the inside of their houses astonished him. These Tartars, who lead a tranquil life, are husbandmen, having a profusion of corn and cattle. They profess the Mahometan religion†.

The necessity of having his passport examined by the governor of Casan, and the difficulty of procuring horses, kept him in that town till break of day. The Wolga, which washes its walls, adds to the beauty of its situation. The houses are chiefly of wood, and the churches of stone. Beyond the Wolga, which is a river famous for its navigation, and which falls into the Caspian sea, our author passed between Rouzmodemiansk and Makariell. The latter, though but a village, is celebrated for its linen manufactures. At a

this is fastened with a knot, and covered with an embroidered handkerchief, in which the most glaring colours have the preference. The handkerchief is large, and hangs loosely behind, edged with a broad fringe or lace of gold or silver, proportioned to the rank or opulence of the wearer. The rest of their dress resembles a robe de chambre.

small

* Mr. Pinkerton says Tobolsk contains about 15,000 souls, and is esteemed the capital of Siberia. Being mostly built of wood, it was nearly consumed by fire about 1786. *Mod. Geog.* ii. 87.

† The head-dress of the Tcheremisses is a small shell of wood, placed on the forehead near the root of the hair:

small distance from it, he had just crossed an ill-constructed bridge, which trembled under his carriage, when his impatience had almost terminated his life. His postillion, animated by his repeated requests, drove him with great rapidity*. Hearing a sudden and violent stroke against the box of his kibith, he pushed his head forward and instantly received a blow which forced him back in his carriage. A cry, uttered by the courier who rode within, informed him that he was wounded.—A stream of blood ran down his forehead; the carriage stopped, and he alighted. It appeared that the circle of a wheel had broken, the edge of which had struck him with additional force in consequence of the speed. Applying his hand to the wound, he found it large and deep; and, supposing the skull was injured he considered himself as a dead man.

He now began to reflect on the cruelty of his fate: after surmounting so many obstacles, so many perils; and at the very gates of Petersburg, where he ardently longed to behold the best of fathers; on the eve of entering his native country, of acquitting himself of his embassy, by delivering his important dispatches, and to be struck by a mortal blow! The reflection overcame him, and he swooned.—Recovering, he armed himself with courage, tied a bandage about his head, and causing the wheel to undergo a temporary repair, he proceeded.

He left his kibith in this village to the care of his soldier; and while his post-carriage was harnessing, he entered a public house, and had some brandy poured into his wound: a compress was also placed upon it, which enabled him to proceed to Nigenei-novogorod.

The surgeon major being absent from home, he was conducted into a filthy habitation to wait for him. Impatient of suffering, without being professionally informed respecting the nature of his wound, he asked if no other person could be found to administer relief. A *podtcher*, or surgeon's mate, was recommended, who, after many difficulties, came to assist him. His address gave him no favourable opinion of his talents and sobriety; his bluntness and tottering gait pronoun-

cing him a drunken man. In his alarming situation, though feeling some compunction at trusting himself in such hands, he consented to be probed, but the wretch had forgotten his instruments. A pin, however, was the probe borrowed for the purpose; and, after examination, he declared that his skull was laid open, but not fractured in the least; and that, with the application of brandy and water, he might proceed on his journey. This place has nothing particular in it to render it essentially different from any of the Russian towns. When our author passed through it, it boasted of the honour of having a company of comedians.

Arriving at Moscow, M. de Bosse wished to have our author's wound examined by the most eminent surgeons, whose report gave him confidence, though the pains in his head were very acute. His carriage being much shattered, he left it at Moscow, and travelled in the common post carriages; but they were small and uncomfortable. He passed by Iver, Vonischhei-volotschok, Novogorod, and Sophia near Taarskocelo, and entered Petersburg on the 22d of September, having travelled six thousand wersts in forty days.

Conforming to the instructions of the count de Perouse, he delivered his packets into the hands of the count de Segur, minister plenipotentiary from the court of France to the empress. This minister not only received him most graciously, but interested himself in his health by the strongest marks of attention and affection. Charged with his dispatches, M. de Lessops left Petersburg the 26th. At Reimer, as the weather was foul, he was eight hours in procuring watermen, to take him across an arm of the sea, called Courich-haff. He slept at Berlin; and at length arrived at Versailles on the 17th of October, at three o'clock in the afternoon. He alighted at the house of count de la Lucerne, and had the honour of being afterwards presented by him to his Majesty, who graciously condescended to interrogate him respecting various circumstances of his expedition, and rewarded him the next day by appointing him consul at Cronstadt.

tipsy. In the villages, after harvest, it is necessary to take them forcibly from the public houses.

VOYAGE ROUND THE WORLD;

BUT MORE PARTICULARLY TO THE

NORTH-WEST COAST OF AMERICA.

Performed in 1785, 1786, 1787, and 1788.

IN THE

KING GEORGE AND QUEEN CHARLOTTE,

BY CAPTAINS PORTLOCK AND DIXON.

ABRIDGED FROM THE NARRATIVE, DEDICATED TO HIS MAJESTY.

BY CAPTAIN NATHANIEL PORTLOCK.

THE Dedication to his Majesty, prefixed to this performance, after descanting in the usual complimentary strain, on the essential use of Voyages of Discovery, adds, "To a people, whose renown and whose safety are derived from their shipping and navigators, the Voyages of Discovery, which your Majesty successively projected and achieved, may be regarded as highly useful to your subjects, and beneficial to mankind. English seamen have been always celebrated for their bravery: your

Majesty has, by those Voyages made them more skilful. They have ever been adventurous, but your Majesty has made them more safe."

Before the adventurer concludes his dedication, he judiciously adverts to the salutary methods recommended by the sovereign for the preservation of the health of seamen. "Your majesty has taught them," says this illustrious navigator, by your salutary intimation, "how to preserve their health in every climate."

SECTION I.

Observations on the Fur Trade—The King George's Sound Company established—Two Vessels purchased—Their Crews, and Names of the Officers—Passage to Portsmouth—Departure from Portsmouth—in Danger near the Caskets—Various Refreshments procured—Proceed on the Voyage—Arrival at St. Jago—Falkland's Islands—Method of extracting Oil from the Blubber—Arrive at Owhyhee.

THOUGH Captain Cook, with all his skill and perseverance, did not obtain the great object of his voyage to the western coast of America, the discovery of a practical passage from the North Pacific to the North Atlantic Ocean, he added many additional facts to philosophy, and opened to commerce several very extensive prospects. The voyages of this reign were prosecuted with disinterested views, and were liberally exposed to the world without reserve.

VOL. II. No. LXXX.

If Great Britain has formerly received information from the discoveries of France, the French are much indebted to them for having lately opened the whole globe to human eyes, and to human industry. But no sooner were the voyages of Cook, of Clerk, of Gore, and of King accomplished, and their respective narratives published, than a new expedition was, in 1785, dispatched from France, under the conduct of Perouse and De Langle, to glean on this ample

field what the misfortune of Cook had left unattained.

As early as 1781, Mr. Bolts attempted an adventure to the North Pacific Ocean, from the bottom of the Adriatic, under the emperor's flag; but this feeble effort of an imprudent man, failed prematurely, from causes which have not yet been sufficiently explained. The project of Bolts was afterwards adopted by the British subjects who are settled in Asia: they were naturally struck with the suggestion of Captain Cook, that an advantageous trade might be carried on from America to China for furs. A brig of sixty tons, with twenty men, under the command of James Hanna, was dispatched in pursuit of this flattering object, from the river of Canton in April 1785, and arrived in the subsequent August in Nootka Sound, the American mart for peltry. Whatever Hanna's success might have been in 1785, he performed a similar voyage in a larger vessel in 1786. In this year, the merchants of Bombay sent two vessels, under the direction of James Strange; and the traders of Bengal dispatched two vessels, which were commanded by the Lieutenants Mears and Tipping, to the American coast for furs, in the hope of Indian profits. These several adventures incited to similar pursuits the torpid spirit of the Portuguese at Macao, whose progenitors had been the discoverers, the conquerors, and the monopolists of the east*.

To carry this design into execution, the King George's Sound Company purchased a ship of three hundred and twenty tons, and a snow of two hundred tons; having thus a size and a burden which Captain Cook recommended as the fittest for distant employments. These vessels were im-

* These enterprises have proved important to the world by enlarging the limits of discovery, and rendering navigation more safe in the North Pacific Ocean: and by familiarising the South-Sea Islanders to European persons, manners, and traffic. In the present times the British, the French, and the Spaniards have at the same moment, busied themselves in searching every coast and creek, with the glorious purpose of benefiting the human race, by adding to their happiness. In May 1785, Richard Cadman Etches, and other traders, engaged in a commercial partnership, under the title of the King George's Sound Company, for conducting a fur trade from the western coast of America to China. This enterprise alone evinces what English copartnerships and English capitals could undertake and execute, were they less opposed by prejudice, and restrained by monopolists.

mediately put into dock, that they might be fitted for so long a voyage. It was not, however, till the 8th of July that they were moored at Deptford: the best provisions were purchased, as being in effect the cheapest; and great attention was paid in providing such articles as would tend to preserve the health and comfort of the crews.

In the mean time the owners appointed their humble servants Nathaniel Portlock commander of the larger vessel, and George Dixon of the smaller; both of them having accompanied Captain Cook in his last voyage into the Pacific Ocean; and were therefore thought equal to such engagements. Other officers of competent talents were also selected, that they might be the better qualified to decide upon their respective merits. The novelty of this enterprise attracted the attention of many persons, eminent for talents or station, who countenanced this voyage, and strengthened the company by their approbation. When Sir Joseph Banks and Lord Mulgrave, Mr. Rose, and Sir John Dick came on board, the Secretary of the Treasury named the largest vessel the *King George*; and the president of the Royal Society gave the smallest the appellation of the *Queen Charlotte*. Besides the profits of traffick, or the advantages of discovery, this voyage was destined to other national objects. Several gentlemen's sons, who had manifested an inclination to a naval life, were put under the care of Captain Portlock, for the purpose of being early initiated in the knowledge of a profession, which requires long experience, as well as a supereminence of genius to arrive at perfection†.

Having most of their stores on board, they proceeded down the Thames to Gravesend on the 29th of August. The next morning the crews

were paid their river wages, with a month's advance, and the ships came to anchor the same evening in the Margate Roads.

Adverse winds detained them for several days, but they arrived at Guernsey on the 20th of September, where they took in a considerable quantity of spirits, wine, and cider. At five in the morning of the 25th, they unmoored, and after encountering a heavy gale, they proceeded without any memorable occurrence, and arrived safe at St. Jago on the 24th of October, where they were amply supplied with water and refreshments.

After waiting on the commander of the fort, who is styled the "Captain Moor," and paying a port charge of four dollars for each vessel, Captain Portlock visited the two wells in the neighbourhood, both of which afforded excellent water. Having set the people busily to work in filling water-casks, and rafting them off to the boat, he again waited on the Captain Moor, accompanied by Captain Dixon. He knew not that he had given any cause of offence, but from the haughty and disrespectful manner in which he now conducted himself, he was convinced that he had by some means been disgusted. He seemed inclined to thwart him in every reasonable request, and though the day was extremely sultry, he appeared unwilling to grant him a little water to drink; but, when the captain intimated a resolution of waiting on the governor, who resided at some distance from Praya, to inform him of this improper treatment of the subjects of a friendly power, he thought proper to relax a little, and civilly permitted him to trade with the inhabitants. The remainder of the day was employed in purchasing hogs, sheep, goats, and oranges, with which the market was tolerably supplied.

The watering of both the ships being completed, the captain resolved to continue here two days longer, to give the crews an opportunity of recreating themselves on shore; being convinced that such a measure would have a salutary effect on them, especially at a place where no great quantity of spirituous liquors was to be procured.

The business at this place being at length completed, and the crew in excellent health, the cap-

tain proposed sailing the first opportunity. At day-light on the 29th they unmoored, and pursued their voyage.

Saint Jago, though generally mountainous, appears to be a very fine island; but the professional duties of our navigators would not permit them to make excursions into the interior parts: the vallies seem fertile, and well calculated for producing sugar cane. Cotton is raised here; and some of the natives appear to be industrious, but they are exceedingly oppressed by the Portuguese soldiers, who impose an exorbitant toll on the unhappy countrymen who bring their commodities to market. Refreshments of all kinds are tolerably plentiful, and might be purchased at very reasonable prices, were it not for those oppressions, which seem to be without remedy from an inattentive government*.

On the 15th of December, they passed a great number of spermaceti whales; a large piece of bark, which seemed to have been recently separated from the tree, was observed floating in the water; and albatrosses, with a number of birds entirely white, were seen flying about in every direction. During the forenoon of the 20th the water was very much discoloured, but as there is no known land near the situation they were in, they did not choose to interrupt their progress by sounding. They saw a shark, many silver-coloured birds, and several whales.

From this time to the 2d of January 1786, they had very tempestuous weather, attended with violent squalls: they were often induced to sound, but never got any bottom with 120 fathoms line. Early in the morning of the 2d, they got soundings in 72 fathoms water, and immediately afterwards saw Falkland's Islands, about seven leagues distant.

On the 4th of January they came to anchor at Falkland's Islands, where they found a tolerably good harbour, and other conveniences for watering, with a sandy bottom in twelve fathoms water. Here all hands were permitted to go on shore, and had a double allowance of brandy; some fresh pork being also killed on the occasion. Some of them made excursions into several parts

for his preservation; but a boat at length picked him up, when he was about two hundred yards from the vessel, and had been eight or ten minutes in the ocean; fright and fatigue had almost deprived him of existence.

of

of the country, and discovered the ruins of a town, surrounded with garden-ground; where many sorts of vegetables were observed; such as horse-radish, shallots, celery, and small potatoes; but many of these articles appeared to be somewhat in a degenerate state: our navigators also saw a hog, but they found him too wild and active to suffer himself to be captured.

From this time till the 14th, the ship's companies were engaged in several necessary employments. A number of seals and sea-lions were killed, for the sake of their skins and blubber; and liberty was given to the people to go on shore at every opportunity.

At nine in the evening of the 15th, a sloop arrived in the harbour, and anchored off the town. The next morning Captain Coffin came on board the King George, and informed Captain Portlock that his sloop is named the Speedwell, and is tender to a ship called the United States, commanded by Captain Hussey, now lying at Swan Island, in company with the Canton, Captain Whippy: the United States having 300 tons of oil on board, and the Canton about half that quantity.

The principal part of their oil is procured from animals which they call sea elephants; these are certainly amphibious, as they usually frequent sandy bays. A large animal of this kind yields about half a ton of oil, which is produced without boiling, the blubber is so exceedingly free. From the description given by the late Captain Cook of an animal he saw at New Georgia, it was clearly a sea-elephant; and there is every reason to suppose they may be found in that island in great plenty*.

Every essential business being now completed, the captain was determined to get to sea immediately; but having occasion to send one of his mates on board the Speedwell, he returned with a message from Captain Coffin, informing him

* The feathered tribes which inhabit these islands, are numerous, and contain a great variety, but most of them are already well known. Captain Portlock procured specimens of the *Yellow-winged bunting*, the *Rusty-crowned plover*, and the cinereous lark. The yellow-winged bunting is nearly the size of a yellow hammer: the length five inches and a half: the bill brown; the plumage on the upper part of the body, a reddish brown: the legs yellow.

The rusty-crowned plover, is nearly of the size of the *ringed plover*; its length about seven inches and a half; bill three quarters of an inch long, and black; the forehead, chest, fore-part of the neck, and the upper part of the

that Captain Hussey had, on board the United States, six or seven thousand fur seal-skins, which would be disposed of at a moderate rate. Not willing to neglect an opportunity of making an advantageous purchase, Captain Portlock sent immediately for Captain Dixon to consult him on the business.

After some deliberation Captain Portlock accompanied Captain Dixon to the Speedwell, to have some conversation with Captain Coffin respecting the skins; but the information he then gave them respecting them, amounted to little more than what he had before said of them in the message. The day being far spent, and their distance from the ships considerable, they remained on board the Speedwell all night. Captain Portlock embraced the earliest opportunity which presented itself, of having some conversation with Captain Hussey respecting the purchase of his fur seals; but they perceived that he was not disposed to part with them, dropping an intimation that he meant them for an Eastern market†.

Having furnished themselves with what necessities they could procure at Falkland Islands, with a fine southerly breeze, they weighed anchor, and came to sail on the 23d of January. They run clear of Ball Island, which is situated on the west side of the entrance into Swan Island Bay, and then shaped their course for New Island. Captain Hussey communicated the following intelligence to Captain Portlock, "—that most of the springs at New Island are rendered brackish by a very heavy sea, which constantly sets in with a westerly wind, the spray of which flies over the beach, and mixes with the freshwater springs."

In the afternoon of the 26th, they saw Staten's Land very high, bearing south, distant about six leagues. At midnight they tacked, and at two in the morning of the 27th, they again saw Sta-

breast and belly, white. Behind the black bar on the top of the head, is a circle of rusty iron colour, surrounding the back part of the head as a wreath. The legs are black.

† In accompanying Captain Hussey to the north side of States Bay, Captain Portlock found a sea-elephant, which at once convinced him that those animals they saw at Kerguelen's Land were really sea-elephants, and that they were much mistaken in calling them sea-lions. The elephant was killed with the greatest ease imaginable; but at the north point of the bay, many of the sea-lions were drawn up in a kind of rank on the beach, and disputed their passage with the greatest ferocity.

ten's Land. point of Staten's Land, west by compass, choosing to keep the strong current of La Maire.

On the 22d, remarkably fine weather, hammocks to be used, bedding to be changed, inattention to the fatality among the navigators, sail in this case, navigators exposed to be erroneous, past, having proceeded westward; and ended with squalls.

In the afternoon, Captain Portlock and Charlotte for the King George, directly for Staten's Land, the Spaniards. their track, in it, thinking that with a good enable them to crews; without Islands, that was. At the same time, place of rendezvous, before they arrived, days for each of period, to sail.

From this time, no difficulty occurred:

* Seals were observed on the coast of Staten's Land, in the month of February. Captain Portlock saw a seal, the hind part of the nose was similar to that of a seal; it was killed in a few minutes; the harpoon, after

† A number of seals were killed; the symptoms of scurvy; the symptoms of scurvy, and in a few days began to swell and the same time.

As there are few advanced stages of

ten's Land. Soon after they doubled the east point of Stæen's Land, and steered south by west by compass, to get a good sailing; not choosing to keep near the shore, on account of the strong current which sets through the straits of La Maire*.

On the 22d of February, the weather being remarkably fine, the captain ordered the sailors' hammocks to be brought upon deck, and their bedding to be completely aired; convinced that inattention to things of this nature often occasions fatality among seamen. It is the general opinion of navigators, that south-west winds usually prevail in this part of the Pacific Ocean; but our navigators experimentally found this opinion to be erroneous, the wind, for a considerable time past, having blown from the northward and westward; and generally in strong gales, attended with squalls.

In the afternoon of the 21st of March, Captain Portlock sent a boat on board the Queen Charlotte for Captain Dixon: he came on board the King George, and they agreed to stand on directly for Los Majos, an island discovered by the Spaniards. This island being but little out of their track, induced Captain Portlock to steer for it, thinking there was a probability of meeting with a good harbour and water, which would enable them to refit their vessels, and refresh the crews; without running down to the Sandwich Islands, that were considerably out of their course. At the same time they appointed Owhyhee as their place of rendezvous, if they should separate before they arrived at Los Majos; there to wait ten days for each other, and if not joined during that period, to sail for King George's Sound.

From this time till the 10th of April, little variety occurred; on that afternoon they passed a

* Seals were observed in considerable numbers, and many pieces of rock-weed were seen about the ship. On the 1st of February Captain Portlock struck a very remarkable fish; the hind part and tail resembled those of a shark; its nose was similar to that of a porpoise: he could not describe it more minutely; for in struggling it extricated itself from the harpoon, after being struck near half a minute.

† A number of the ship's crew were now attacked by the scurvy; the symptoms of which were a stiffness about the knees and hams, afterwards the shin-bones became sore; and in a few days, the parts which had before been stiff, began to swell and turn black; the mouth becoming sore at the same time.

As there are few instances of a person recovering from an advanced stage of the scurvy, whilst at sea, Captain Port-

lock thus mentions the regimen his boatswain was under during his illness.—“Besides the assistance he received from Mr Hogan my surgeon, who was very skilful in his profession, he had for his breakfast a pint of sweetwort, with some soft bread, which I ordered to be made for him. About ten o'clock he gathered some small salad from the little garden: this he ate with vinegar: for dinner he had portable soup with barley, celery seed, mustard seed, mustard, cress, and rape seed boiled in it; besides which, he ate plentifully of kroust. These things had so good an effect, that in a fortnight he was able to do his duty as usual: Captain Dixon likewise grew better, though slowly; and he attributed this favourable turn of his disorder chiefly to the mineral water prepared by Dr. Melville, a few bottles of which I sent him.”

Notwithstanding every precaution, the scurvy made its appearance among the people; the boatswain was indeed so much afflicted with it, that his recovery was thought extremely doubtful: fortunately, however, it happened, that some small salad, such as mustard and cresses, which Captain Portlock had sown in several casks of mould procured at Falkland's Islands, was now in the height of perfection. He had also some horse-radish, and potatoes, in the same state: these things were given to the boatswain, which effectually checked his disorder, and his health and strength gradually returned. This unwholesome weather, had also affected the health of several seamen on board the Queen Charlotte: and Captain Dixon, in particular, was much disordered; and when Captain Portlock paid him a visit on board the Queen Charlotte, he found his disorder to be the scurvy. On his return, he sent him a cask of mould, with salad growing in it; together with some kroust, garden seeds, and a few bottles of artificial mineral water, prepared by Dr. Melville, in imitation of Seltzer water, supposed to be a most excellent antiscorbutic †.

With a fine breeze they steered west by south to make Owhyhee, the principal of the Sandwich

lock thus mentions the regimen his boatswain was under during his illness.—“Besides the assistance he received from Mr Hogan my surgeon, who was very skilful in his profession, he had for his breakfast a pint of sweetwort, with some soft bread, which I ordered to be made for him. About ten o'clock he gathered some small salad from the little garden: this he ate with vinegar: for dinner he had portable soup with barley, celery seed, mustard seed, mustard, cress, and rape seed boiled in it; besides which, he ate plentifully of kroust. These things had so good an effect, that in a fortnight he was able to do his duty as usual: Captain Dixon likewise grew better, though slowly; and he attributed this favourable turn of his disorder chiefly to the mineral water prepared by Dr. Melville, a few bottles of which I sent him.”

Islands. They expected to have fallen in with the islands of Los Majos, from the situation they are laid down in; but no such islands were to be found in that track. They made their way, therefore, as fast as possible to Owhyhee, where they arrived on the 24th of May; when a number of the natives came off in their canoes, and brought with them some small hogs, and a few

plantains, which were purchased for beads and small pieces of iron. A great quantity of their fishing lines were also purchased, some of which were about four hundred fathoms long. The Indians traded cheerfully and honestly; and, after taking a general survey round the ship, returned to the shore extremely well satisfied.

SECTION II.

Proceed along the Coast of Owhyhee—Arrive at Karakakooa Bay—Behaviour of the Natives—Arrive at Woahoo—Supplied with Water by the Natives—Arrive at Onehow—Transactions there—Method of salting Pork—Meet with Russian Settlers—Abundance of Salmon.

KARAKAKOOA Bay being the only harbour our navigators knew of at Owhyhee, they were anxious to make it as soon as possible, which they expected to have accomplished the next day, but were disappointed by variable winds and frequent squalls. Soon after the close of day, a number of fires were observed all along the shore, which were supposed to have been lighted in order to alarm the country: it is customary for the natives, however, to light fires when they make offerings to their Gods for success in war; and this might possibly be the case at present; but they had observed a shyness in the people, as they approached Karakakooa, frequently enquiring after Captain King; and seemed, by their behaviour, to suppose they were arrived to revenge the death of Captain Cook.

On the 26th of May an inferior chief came on board, who informed them that Tereoboo, was king of Owhyhee, when Captain Cook was killed in that island, and that the present king's name was Maiha Maiha: he strongly urged Captain Portlock to go on shore; but, on his declining it, he assured him that the king would pay him a visit the next day: the captain paid little attention to this piece of intelligence, as it was not probable that Maiha Maiha would venture on board, after the active part he took in that unfortunate affray, which terminated in the death of Captain Cook.

Many canoes came along-side, and the people were extremely importunate to come on board: they behaved in a daring and insolent manner, and could hardly be prevailed on to quit the ship: all this, however, was endured with patience, not

choosing to have recourse to violence, if it could possibly be avoided; but the captain was afraid he should not be able to do the necessary business at Karakakooa with ease and safety, and particularly that of filling their water, and getting the sick people on shore.

As they approached the harbour great numbers of canoes joined them; and as many of them were hanging by their ship, their progress was so much retarded, that it was four in the afternoon before they came to anchor. When they had anchored, they were immediately surrounded by an amazing number of the natives, both in canoes, and in the water; they grew extremely troublesome, constantly crawling up the cable, and the ship's sides. During this time no principal chief made his appearance, which was much to be regretted; for had any person of consequence been on board, the rest would have been kept in order, and the business properly conducted.

In the afternoon they procured a number of fine hogs, a quantity of salt, plantains, potatoes, and taro; which last was the finest they had ever seen. Bread-fruit was scarce, and what they obtained of it was very indifferent. At night fires were kindled all round the bay, and the people on shore appeared to be in perpetual motion: several canoes were continually about the ship, and, about midnight, one of the natives brought off a lighted torch, seemingly in order to set fire to it; but being driven away, he paddled to the Queen Charlotte; where they being equally on their guard, he again resorted to the shore.

Early the next morning they were visited by a

vast multitude accompanied them keep them in daring and insolence to place centinel boarding them. vinced them that without the protection their taking a station probably be attended consulting with it was resolved imaginable expense

Exclusive of were assembled bers were collected and others on the demands the water needed to be many ch Captain Portlock crowd was so great boats could hardly become absolutely and Captain Portlock out injuring them they fired six for the same time the ship tabooed by the top-gallant mast effectual; for immediately, the Indians confusion and precipitation, many of the owners did not rapidly on shore

Several canoes some of them brought which our navigators During the night off and on, with violence. The natives of Owhyhee with hogs and in the morning on board in for the appeared, Captain Cook that he had been a

* They had now a molestation, and about of the bay to the west about three leagues from instantly surrounded by

vast multitude of the natives, but no chiefs accompanied them who had influence sufficient to keep them in order; they grew so extremely daring and insolent, that the captain was obliged to place centinels with cutlasses to prevent their boarding them. This unexpected reception convinced them that nothing could be done on shore, without the protection of a strong guard; and their taking a step of such a nature might probably be attended with fatal consequences. After consulting with Captain Dixon on this business, it was resolved on to quit Karakakooa with all imaginable expedition.

Exclusive of the vast concourse of Indians that were assembled about the ships, immense numbers were collected on shore; some on the beach, and others on the top of a lofty hill which commands the watering-place; and there also appeared to be many chiefs among them. At nine o'clock Captain Portlock gave orders to unmoor, but the crowd was so great round the ship, that their boats could hardly pass to the buoys. It now became absolutely necessary to drive them away: and Captain Portlock wished to deter them without injuring them; after drawing out the shot, they fired six four pounders, and six swivels; at the same time their colours were hoisted, and the ship tabooed by hoisting a white flag at the main-top-gallant mast head. This measure was found effectual; for immediately on their beginning to fire, the Indians made for the shore with confusion and precipitation: in the extreme hurry and bustle, many of the canoes were upset; but the owners did not stay to right them, swimming rapidly on shore without them*.

Several canoes continued to attend the ships; some of them bringing off water, in calabashes, which our navigators purchased with nails. During the night of the 29th of May, they stood off and on, with variable winds and hazy weather. The natives of Owhyhee still following the vessels with hogs and vegetables. At three o'clock in the morning on the 31st of May they wore and stood in for the land; but when day-light appeared, Captain Portlock was surprised to find that he had been driven, during the night, eight

or nine leagues to the south-west; and instead of fetching in with the west point of Morotoi, as the Captain expected, he was hardly able to weather the east point of Woahoo. At length, however, they anchored in the bay, which the captain distinguished by the name of King George's Bay, in twelve fathoms water; the east point of which was denominated Point Dick, in honour of Sir John Dick; the west point being named Point Rose, after George Rose, esquire, secretary of the treasury.

Soon after their arrival, several canoes came off with cocoa nuts, plantains, sugar cane, and sweet root; in return for which they received small pieces of iron, and a few trinkets. The next morning a greater number of canoes appeared about the ship, having small hogs and some vegetables. Great numbers of the natives, of both sexes, impelled by curiosity, anxiously visited them, notwithstanding they were so far distant from the shore.

As watering the ships was become an object of the first consideration, a convenient spot was sought for that purpose. They landed on some rocks, just round Point Dick, and met with no opposition from the inhabitants: on the contrary, they were kindly received, and conducted to a sort of bason formed by the rocks, about fifty yards from the place where they landed; but the quantity they found was insufficient even for a present supply. Finding, at length, that they could not water near this spot, without an infinite deal of trouble, besides the danger of losing their casks, and getting the boats dashed to pieces against the rocks, they gave up the idea of watering here.

In the morning of the 3d of June, Captain Portlock dispatched Mr. Hayward and Mr. White, in a boat from each ship, to examine the west part of the bay for a landing place, and fresh water. In their excursion, some of the natives supplied them pretty briskly with water, and some of their calabashes contained about ten gallons; for one of which a ten-penny nail was given, which could not be thought unreasonable. In the afternoon the boats returned, and Mr. Hay-

ward, plenty of hogs and vegetables. Many of their people were now employed in killing and salting down hogs for sea-stock; their present situation being much more convenient for carrying on that business than the harbour: Here they had a fine free air; in the bay it was close and sultry.

ward.

* They had now an opportunity of unmooring without molestation, and about eleven o'clock, began to warp out of the bay to the westward, till they were at the distance of about three leagues from Karakakooa, where they were instantly surrounded by a great number of canoes, with

ward reported, that he found only a pond of standing water, which could not be got at without much difficulty. Towards evening the surgeons returned on board with the convalescents, and informed the captain that the inhabitants had behaved quietly and inoffensively, and that there was no danger of their being molested; they admitted, however, that they were rather incommoded by the immense number which curiosity had collected together.

The inhabitants now brought them water in such abundance, that, about noon on the 4th, they had filled all their empty casks, having procured twenty-nine butts, eight hogsheads, and three brandy pieces, which contained one hundred and thirty gallons each. As good water may be procured at this island, with great facility, for small nails and buttons, it is a method which seems worthy of adoption. Potatoes and taro are to be met with here in great plenty; bread fruit and yams appeared to be scarce.

Having completed their water, and obtained such refreshment as Woahoo afforded, they determined to lose no time in proceeding to Onehow, to get a supply of yams which that island produces in abundance. On the morning of the 5th, they weighed and stood to the westward, under an easy sail. As they approached Point Rose, a vast number of canoes joined them: when they were a-breast of Point Rose, their old friend the priest came on board, in a large double canoe, to take his leave; bringing with him an excellent feathered cap as a present for Captain Portlock from Tahceterre, in return for which he sent him two large towées, and some other trivial articles. He also gave the old priest a light-horseman's cap, and another to a young chief who had been a constant visitor on board since their arrival; being desirous of shewing any future navigators who might happen to touch here, that the place had been recently visited by British ships. The guests were exceedingly delighted with their presents, and after many professions, took their leave, and went to shore*.

As their daggers are very dangerous and de-

* Captain Portlock is of opinion that Woahoo is the finest island in the whole group, and the most likely to prove advantageous, should it be settled by Europeans; there being hardly a spot in it which does not appear fertile. Warriors, and war-like instruments, were seen here in

destructive weapons, the captain would not suffer any to be made in either of the ships, though frequently importuned by the natives for that purpose. He always thought it a very imprudent action to furnish the Indians with weapons which might be turned against themselves; and his suspicions were but too well founded; for by one of the daggers, which was given by them to the natives of Owhyhee, their much lamented commander Captain Cook was killed; after a series of years spent in the service of his country, and for the benefit of mankind in general.

He, unfortunately set the example, by causing some to be made after the model of the Indian pahos; and this practice was afterwards followed by every person who could procure iron enough to make one; so that the armourer, during their continuance at these islands, was almost wholly employed in making these destructive weapons.

Since the year 1778, when the Sandwich Islands were discovered, almost a total change in the government took place. It appeared that Tahceterre, the present king of Woahoo, was the only surviving monarch then left among the islands. He was then only king of Morotoi, and Peerceoranna, who then governed Woahoo, was at war with him, and had dispatched a number of fighting canoes to attack his dominions. Peerceoranna's forces appear to have been defeated on this occasion, for presently afterwards Tahceterre took possession of Woahoo; and, flushed with his success, attacked and conquered the island of Mowee, which is now annexed to his dominions. Terecobo, who was then king of Owhyhee and Mowee, fell in battle, in defence of his dominions. There appears to be no reason to doubt of what is here advanced; for Maiha Maiha, the present king of Owhyhee, when our navigators were last there, was only an inferior chief, and is now, as Captain Portlock understands, in some measure subject to Tahceterre. Besides which, the Woahoo chiefs having left in their possession most of the daggers that had been left at Owhyhee, amounts almost to a proof of their

abundance; and many of the former were tattooed in a manner totally different from any the captain had ever seen among the Sandwich Islanders: by excess of tattooing, many of the faces of the natives were rendered totally black.

having been victorious; and the natives of these islands seem determined never to part with their weapons but at the expence of their lives*.

In the morning of the 7th of June, they bore away and made sail from the westward. The land on the east and south-east part of Atooi, rises gradually from the sea-side, till it terminates in the high land. On the eastern shore there are a few small sandy bays, but they afford no shelter for ships to ride in. After passing the south-east point the land appeared to be generally well cultivated. Several canoes were about the ship, from which they procured a few vegetables; but the surf ran so high on the beach, that the natives could not bring off any considerable quantity†.

In the morning of the 9th they were surrounded by canoes, abundantly supplied with yams and sugar cane. A chief, named Abbenooe, whom Captain Portlock knew when he was at this island before, also paid him a visit, and recognised his old acquaintance, the moment he appeared on board. Having appointed half a dozen persons to trade with the natives for yams, the captain went on shore in search of the wells mentioned by Mr. Bligh, accompanied by Abbenooe as a guide. On their landing, a number of the natives appeared upon the beach, but they were permitted to walk to the wells without the least molestation. After proper examination, they found that the water of one of these wells was brackish and stinking; the other afforded good water, but in no great quantity. On this occasion, Captain Portlock says, "I would recommend it to all ships watering among Indians, to have a sufficient number of casks hooped with wood instead of iron, for the pur-

pose of filling on shore. By this means much mischief might be avoided; for the Indians, having no temptation to steal them, probably would behave in a peaceable manner, and might safely be trusted to assist in rolling the casks ‡."

Though Oneehow belongs to Tāaa: king of Atooi, Abbenooe governs it in his absence. Captain Portlock made the old man a present of some red baize, and two large towes, which he sent away immediately to Tāaa: at Attooi. The messenger informed him that Tāaa: himself intended to have paid him a visit, but that he could not leave Attooi for several days, being obliged to perform some religious ceremonies for one of his wives, who was lately dead. But they had very little reason to regret the absence of his majesty, for Abbenooe kept the natives in excellent order, and encouraged them to bring whatever the island afforded; and after the people of Attooi had disposed of their cargo, he sent them back for a further supply.

Anxious to make Tāaa: some further acknowledgment for his salutary supplies, he sent him, as a present, a light-horseman's cap; this, however, was not thought a sufficient recompence by Abbenooe, who strongly importuned Captain Portlock to send with it an armed chair, which was a part of the furniture of the cabin, as it would be extremely convenient for one of the king's wives, who had lately laid in. He readily complied with his friend's request, and dispatched the chair and cap to Atooi, in the charge of special messengers. Their business now proceeded regularly, and the trading party were fully employed in bartering for yams and other refreshments: others were wholly occupied in killing and salting hogs for sea stock. Since

* From the best information that could be procured, it appeared, the principal of the Sandwich Isles, were at this time governed by the following persons: Woaahoo, Morotoi, and Mowee, were subject to Taheteere; Maiha Maiha governed Owhyhee and Rannai; and a chief, whose name was said to be Ta'nao, was king of Atooi and Oneehow.

† As Atooi was known to afford plenty of hogs and other refreshments, they stood in for Wymoa Bay, where Captain Cook anchored the last voyage; being desirous of procuring some good hogs for salting; but being disappointed, they proceeded to Oneehow under all the sail they could carry. No sooner were they moored, than several canoes visited them, bringing yams, sweet potatoes, and a few small pigs, for which nails and beads were given in exchange. Among the people in these canoes, several faces were recognised which had been seen before; parti-

cularly that of an old priest, in whose house a party of our Europeans had taken up their abode, when detained all night on shore by a heavy surf.

‡ After examining these wells, Captain Portlock made an excursion into the country, accompanied by Abbenooe, and a few of the natives. The island seems to be well cultivated, but its principal produce are yams: a few trees are irregularly scattered without order or variety. Some are about fifteen feet high, and have a smooth bark, with round leaves, and bear a kind of fruit resembling a walnut. Another kind were about nine feet high, with blossoms of a beautiful pink colour. Another variety had nuts growing on them, like our horse-chestnuts. The last sort are in use as a substitute for candles, and afford a most excellent light.

age, but it may not improperly be mentioned in this place: The root was peeled very clean, cut into small pieces, and put into a kettle, six of the large roots being found a sufficient quantity for twelve gallons of water. This was put on the fire at three in the afternoon, and, having boiled an hour and a half, was put away to cool. By the time the liquor was luke-warm, a gill of prepared yeast was added, and the beverage then put in a cask. It generally began to work about midnight, and by nine in the morning it was pleasant and palatable. This beer was constantly drank by such of the seamen as were affected with the scurvy, and they found great benefit from it. It is useful as a common drink, and is a most excellent antiscorbutic.

They stood to the north-north-west, along the west side of Ouchow, which form several sandy bays, seeming to afford shelter and good anchorage. About ten o'clock their good old friend Abbenooc took his leave, and all the canoes departed; on which occasion they fired ten guns, and hoisted their colours.

On the 22d of June, they saw a great number of flocks of a sooty colour, and about the size of a pigeon. On the 28th Captain Portlock went on board the Queen Charlotte, to appoint a rendezvous for the ships in case of a separation, the weather being thick and hazy. They fixed on a situation in Cook's River, near Cape Bede. This situation was a very eligible one, there being a probability of finding a good harbour there; and which ever vessel happened to arrive there first, would be able to make signals to the other on her entering the river.

On the 28th the water altered its colour, and had the appearance of soundings; but when they sounded with a line of 120 fathoms, they got no bottom. The next morning a number of seals were seen playing round the ship, but their distance from America was so great that they could not think these animals came from thence, or from any known islands near the coast: there was great reason to suppose they were near some land which has not yet been discovered. They had daily seen seals, whales, and porpoises, with a great number of petrels, and various other birds: they often sounded with a line of 150 fathoms, but found no bottom; nor was there any appearance of land. Captain Portlock struck one of the seals that were playing about the ship, and got it on board: its

fur was so very close and fine, that the captain, at first sight, imagined it to be a sea-otter.

On the 19th they were greatly surprised to hear the report of a great gun from the shore: it was now so very thick over the land, that they could not see the smoke of the gun; but they fired a gun, and hoisted their colours, and presently afterwards fired another, supposing it would be answered. On their firing the second gun, another was fired from the shore, in the direction of east, three quarters south. It now seemed very clear that some person had got to this place before our navigators, at which Captain Portlock was not a little chagrined. Soon after which they perceived a boat rowing towards the ships; on which they tacked, and stood in shore to meet her. By seven o'clock, the strangers came on board, and were found to be Russians.

Having no person on board who understood the Russian language, they could gather but little information. It seemed, however, that they last came from Kodiak, and proceeded to Cook's River in boats. The harbour which they intended to make, the Russians informed them, was a very good one; and they offered to take a person from the ship in their boat, to examine it. Their offer being accepted, Mr. Mc. Leod was sent with them to examine the harbour, and sound the entrance. The Russians left them between eight and nine o'clock, and immediately afterwards they came to anchor, in thirty-five fathoms water. At four in the morning of the 20th, the Russian boat returned with Mr. Mc. Leod, who informed Captain Portlock that the harbour was a very good one, and that there was a safe passage into it on either side of the small island at the entrance.

After examining the spot, he landed on a beach where the Russians had taken up their abode: as they had nothing more than tents, covered with canvas, or skins to live in, it should seem they only continue here during the summer season. He observed but few sea-otter skins among them, and they appeared green, as if they had been recently stripped from the animal. The Russian party consisted of twenty-five men; though they associated with a number of Indians, who were on the most friendly terms with them.

The Russian chief brought Captain Portlock a present of a quantity of very fine salmon, sufficient for the consumption of both ships, for a whole

whole day; for which he presented him some excellent yams, and instructed him how to dress them: these were accompanied with some beef, pork, and a few bottles of brandy. He expressed his gratitude as well as he was able, and returned on shore, perfectly satisfied with his reception*.

On the 21st of July Captain Portlock went on shore, in search of a convenient place for wooding and watering the ships. He found abundance of wood, and several excellent runs of water. None of the natives had yet made their appearance; but, as the Russians were continually on their guard from their apprehensions of being surprised by the Americans, Captain Portlock thought it prudent to adopt a similar kind of conduct; and sent a chest with arms to attend the parties on shore.

In the afternoon the seine was hauled at the head of the bay, but a few cole-fish only were caught. While they were performing this operation, the Russian chief paid the Europeans a visit, and informed them that very few fish were to be caught in that place, but in a spot near his residence, very considerable quantities might be procured. Captain Portlock therefore took the seine thither; and, in several hauls, took thirty salmon, and a few flat fish: but the Russian informed him, that his indifferent success was owing to the time of tide, it being then low water; and, to give himself a proper chance, the experiment should be made when it was nearly high water. But he assured him, if he would leave the seine all night, and a man with it, he should have plenty of fish the next morning. The captain

* Contrary to the Russian custom, these people were always fearful of getting intoxicated: but this caution was supposed not to originate from their dislike of their potent liquor, but from a fear of being surprised by the neighbouring Americans in a state of intoxication. They were continually on their guard, with their arms always ready; not a man among them sleeping without a rifled barrelled piece under his arm; having a long knife and a cutlass by his side.

† The Russian settlement, if such a temporary residence deserves that title, is situated on a pleasant piece of flat land, about three miles in length, and 200 yards over, bounded by a sandy beach on one side; and a lake of fresh water, which falls into the sea on the other. The Russians were only twenty-five in number, exclusive of the Indians brought from Kodiak and Oopaslaska: they had two skin boats, each calculated to row twelve oars, and the thwarts were double banked. The chief, and the Indians, took

gladly embraced this offer, and left one of his seamen to assist in the operation†.

At seven o'clock, the next morning, he sent the whale boat to the Russian settlement, to learn what success they had had with the seine. The boat returned about nine, deeply laden with excellent salmon, part of which was conveyed on board the Queen Charlotte. The people now having a plentiful supply of good fish, they were no longer kept upon salt provisions, in lieu of which, they were regularly served with fish and yams.

Towards noon the Russian chief returned the captain's visit: his information pointing out the mode of procuring abundance of fish, demanded some addition to his former present; he therefore gave him several articles which he thought would be found serviceable; as Port wine, brandy, vinegar, and salt. Having been informed at the chief's residence, that he had boiled some of the yams which had been given him, and found them very excellent, he added to his present about four hundred more. Though the captain and his new acquaintance understood each other but very imperfectly, they were both delighted with the mutual exchange of friendly offices. After staying on board a short time, he took his leave.

Soon afterwards Captain Portlock went in the whale-boat, accompanied by Captain Dixon, to make a survey of the harbour: it runs up about nine miles, nearly in an east-south-east direction, and afterwards terminates in a fresh water river, which branches out in several directions. There are several projecting points on each side of the harbour that form very snug bays, with excellent

up their abode in a small tent covered with canvas, and the remainder slept under the two boats. They have no bread; their food consisting principally of fish, and a mess made of the root of a plant, by Steller called the *Serena*, which would have been palatable, had it not been mixed with animal oil. They procured no furs by bartering with the Americans; nor had they furs of any kind, but such as the Kodiak Indians, their attendants, caught in hunting.

It seemed evident that this little party were under great apprehensions from the Americans: they even assured them that they had attempted to surprise them several times; which rendered it absolutely necessary for them to be eternally on their guard. The Russian chief represented them as a set of cruel savage people, though they spoke very favourably of the Oonolaska and Kodiak Indians. Having procured what intelligence he could from this chief, Captain Portlock returned to his own vessel in the evening.

beaches, where a ship might, if necessary, be safely landed on shore; the depth of the water, close to the beach, seven and eight fathoms. After determining the extent of the harbour, they landed, and walked up to the fresh-water river: it was narrow, but abounded with salmon; and on the banks were observed the tracks of bears and mouse deer. On getting into the mouth of the largest branch, their attention was excited by a large brown bear coming down the river. Captain Portlock entertained hopes of his coming within musquet-shot of him; but getting sight of them, he made off into the woods, with a more rapid motion than could have been expected from a bear.

In the course of an hour, they saw about twenty more of these animals, but they were all so extremely shy that they could not shoot one of them. Night coming on, they repaired on board about ten.

By the 25th of July, they had completed their wood and water, and their ships were ready for sea: as there was a probability of meeting inhabitants, they consequently stood a chance of procuring furs. Landing on the west side of the bay, and walking round it, they discovered two veins of kennel coal, situated near some hills above the beach, about the middle of the bay. In the evening they returned on board, and tried some of the coal they had discovered, and found it to burn clear and well.

At noon point Bede bore south by east, and Anchor Point north 21° west, distant from the nearest land about five leagues. They stretched up the river with light breezes from the southward and eastward, till half past five o'clock, when the flood-tide being spent, they came to with stream anchor in twenty fathoms water, over a rocky bottom.

SECTION III.

Indians visit the Ships with Furs—Exhibit a thieving Disposition—Bring Salmon to barter—Description of the Country, Climate, Produce—Ships proceed down the River—Presents given at parting—Quit Cook's River—Proceed towards Prince William's Sound—Proceed along the Coast—Departure from the Coast—Arrive at Owhyhee—Anchor at Woaheo.

SOON after they had anchored, two small canoes came off from the shore nearly abreast of the ship; and went along-side the Queen Charlotte. The persons in the canoes had nothing to barter but a few dried salmon, which Captain Dixon purchased for beads: he also made them a few presents, to convince them that his intentions were friendly, and that he wished to deal with them on amicable terms. They seemed to comprehend Captain Dixon's meaning, and promised to bring furs on the subsequent day. About seven the next morning, two large canoes, and several small ones, were seen pushing off from the shore. The large canoes contained

about twenty people each; the small ones only one or two at the most. When at some distance from the shore, they began a song, which was continued for a considerable length of time; after which they came along-side, extending their arms as a token of their pacific intentions, and many of them exhibited green plants with a similar intent. Most of these Indians had their faces smeared with red ochre and black lead, which gave them a very disgusting appearance; many of their noses and ears were ornamented with blue beads or teeth: and they had a slit in the upper lip, in a line parallel with the mouth, decorated in a similar manner*.

* From this party our European navigators procured about twenty sea-otter skins, with a few cloaks made of the curless marmot skins, sewed together very neatly. They traded with great integrity, and importuned the Europeans to go on shore. The captain entreated one of them, who appeared to be a chief, to come on board, which he declined at first, unless a sailor was placed in the canoe as a hostage; but in the course of this conversation,

another of his companions ventured on board; and soon afterwards the chief, and many others followed his example: To convince them, however, that they were perfectly safe, the captain sent one of his people into their boat, as had been at first proposed. After remaining a considerable time on board, and gratifying their curiosity with taking a survey of the vessel, they left them, and paddled on shore with seeming satisfaction.

From this favourable beginning, the captain supposed he could not change his situation for a better, he therefore determined to keep it a few days; accordingly they righted the best bower, and moored it to the southward, and the stream to the northward*.

An aged chief went on board the Queen Charlotte, from whom Captain Dixon received some information respecting the Russians. He perfectly comprehended from the old man's pointing to the guns, and describing the explosion they made, and other particular circumstances, that a battle had happened between the Russians and the natives, to the disadvantage of the former. The chief, however, intimated that he was not displeased with our navigators on that account, as he was certain they belonged to a different nation, and their dress was totally different. How this quarrel originated, they could not learn with any degree of precision, but theft is supposed to have been the probable cause,

The Indians, on leaving the ship, informed our navigators that the neighbourhood was drained of furs, but they would visit the adjacent country in pursuit of more. Our navigators were inclined to believe the information obtained from their visitors, respecting the scarcity of furs in this part; as they had observed for several days past, that the canoes came from different quarters, and the very few skins they brought were of an inferior quality. They were therefore determined to quit Cook's River the first opportunity, and proceed to Prince William's Sound, where they expected to procure an abundant supply of fine furs.

After some very unsettled weather, they had fresh gales to the southward, with thick hazy weather; but this did not prevent two canoes from venturing along-side with a few salmon. On the 8th, two of the natives came on board, and Captain Dixon gave each of them a knife, a gimblet, and some beads. They knew not the use of the gimblet, till it was pointed out to them; after which they were taught to bore a hole through a piece of wood, which at once

* On the 30th a number of visitors came in their canoes, of whom they purchased some excellent sea-otter skins; with several marmot cloaks, racoons, and foxes: plenty of fine salmon was also obtained, for an equivalent in beads and buttons. For several days traffic was carried on with peace and quietness; but not being able to get the better of their propensity to thieving, some of the natives could not

discovered their value; and the gimblets were thought superior to any of the other presents.

The visitors being prepared to go on shore, it began to blow very hard; when they were politely asked to stay on board till the gale was over, and their canoes should be hauled upon deck. This proposal was readily agreed to; but a surly old man in one of the canoes, thought proper to object to it, and insisted on their leaving the ship; which they accordingly did, and with difficulty arrived on shore.

The land to the westward is beautifully diversified with vallies and gently-rising grounds, and generally clothed with pines and shrubs. Many of the vales have small rills of water, which discharge themselves into the sea; in one of them several houses were observed, and some stages on which the natives dry their salmon. These, contrasted with the mountains situated behind them, which are enveloped in snow, compose a picturesque landscape.

Besides the various sorts of furs which have been enumerated, Cook's River produces native sulphur, ginsang, snake-root, black lead, and coal, with the greatest abundance of very fine salmon; and the natives conduct themselves with so much candour and liberality in their bartering, that a very profitable business might be carried on here by any persons who have sufficient enterprise to undertake it.

On their leaving Cook's River, several canoes came off from a town near the south point of Trading Bay. In one of them they found a man who was so extremely useful in procuring furs, that they gave him the appellation of "the Factor." From him they understood, that the Russians frequented the west side of the island to the southward, and that there is a passage from that to the main. The factor brought nothing with him to dispose of, except a few salmon: his principal motive in paying the navigators this visit, was to entreat their assistance against the Russians: he was extremely importunate with them to comply with his request, intimating, at the same time, that he could instantly assemble

resist the temptation of stealing the hooks from a black strap, and a grindstone handle, which, being made of iron, was doubtless thought a valuable prize. The captain, however, did not adopt violent measures for this offence, but contented himself by ordering strict attention to be paid to the actions of such plunderers, who should presume to pilfer any thing in future.

a large fleet of canoes, with which, and the assistance of their ships, they could certainly get the better of their enemies. On the captain's refusing to comply with this request, he seemed much disappointed and chagrined; but to afford him some consolation under his disappointment, he gave him a light-horseman's cap, with which he was highly pleased; and his countrymen viewed him with such a confused mixture of admiration and envy, that it seemed questionable whether he would long keep it in his possession. A few trifles, however, were distributed among the other Indians, and they returned on shore perfectly satisfied, though the British navigators had refused to espouse their cause.

About nine o'clock in the morning of the 11th of August they saw a number of canoes, which they supposed were traders coming off to the ship; but, viewing them through a glass, he observed two Russian boats among them: they were probably the same party they had met in Coal Harbour; whence they concluded that the factor's intelligence might probably be true, of their having a settlement on the west side of the island.*

On the 27th of August Captain Portlock sent his whale-boat on board the Queen Charlotte for Captain Dixon, to consult him on their future proceedings; he presently appeared on board the King George; and having fixed on George's Sound for their winter quarters, they formed a resolution of quitting this part of the coast in a day or two, should the wind continue unfavourable, and endeavour to make some harbour farther to the southward. These points being settled, Captain Dixon returned on board his own vessel.

On the 4th of September, finding his state of health but very indifferent, Captain Portlock again sent for Captain Dixon to come on board; intending, should his illness render him incapable of keeping the deck, for the Queen Charlotte to take the lead, and make for Cross Sound, from thence to Cape Edgecombe, and then to

* Having light variable winds, with calms by turns, they took the advantage of the tide in standing down the river, and at noon on the 13th were clear of it. The Barren Islands then bore south-west and south, and Cape Elizabeth north; their distance from the nearest shore about three leagues. The land on which Cape Elizabeth is situated is an island, and in the straits formed by that and the back lands, there is good anchorage and shelter. Here

King George's Sound; where they had agreed to winter, and build a shalop of about sixty or seventy tons burthen, if they should be fortunate enough to arrive there before the severity of the winter season had hindered them from making the necessary preparations.

In the afternoon of the 9th, finding himself so ill as to be unable to keep the deck, Captain Portlock desired his first mate to speak the Queen Charlotte, and request Captain Dixon to take the lead, which he accordingly did. Not falling in with Cross Sound, and not having leisure to look for it in any other situation, they tacked at four o'clock on the 9th, and stood to the southward, with a moderate breeze from the east-south-east. The almost constant succession of disagreeable weather they had for some time experienced, induced them to suppose that the bad weather was set in, and that their making a port on the coast was a precarious point; in which case they would be under the necessity of spending the winter at the Sandwich Islands. Under this consideration, the captain thought it prudent to put the ship's company to an allowance of water, at the rate of two quarts per man each day.

They plied with variable winds till the 16th, when not supposing there was a probability of meeting with a harbour near Cape Edgecombe, they declined all further thoughts of it, and determined to stand for King George's Sound. The Queen Charlotte being some distance ahead, wore and stood under their lee, and Captain Dixon hailed, informing Captain Portlock, that he saw no appearance of a harbour or any inhabitants.

Early on the 22d, they saw land extending from north to north-east distant about ten leagues. At two o'clock on the 23d, seeing a canoe putting off from the shore, they shortened sail and brought to, for her to come up: she had two Indians, but neither of them could be prevailed on to come on board: they had four fish, which were purchased of them, and they were further

would be a most desirable situation for carrying on a whale-fishery, those animals being very numerous on the coast, and close in shore; and there are excellent harbours handy for the business. The Barren Islands which are situated nearly in the midway between Point Banks and Cape Elizabeth, are high and totally barren: they lie in a cluster, and have good passages between them.

gratified

gratified with a few trifling presents; after which they quitted them, and paddled for that part of the shore between Woody Point and King George's Sound. In the course of the evening they frequently sounded, and had from fifty-four to sixty-two fathoms water over a muddy bottom.

After many ineffectual attempts to get into the Sound, and reflecting on the improbability of getting into it this season, the bad weather seeming to be set in for a continuance: added to these considerations, the crews stood greatly in need of refreshments. It was therefore irrevocably determined to quit the coast, and stand directly for the Sandwich Islands: after hailing the Queen Charlotte, Captain Dixon was made acquainted with this resolution. They proceeded towards the Sandwich Islands, without any memorable occurrence; the wind hanging from south to south-east, and being generally light and variable, their progress was rendered somewhat tedious.

On the 14th of October, steering west by south, at five o'clock in the afternoon they saw land, which they soon discovered to be the high mountain on the island of Owwhyhee, with several patches of snow on its summit, bearing west near thirty leagues distant. In the morning of the 16th, with a fresh breeze at south-east, they stood to the south-west for Owwhyhee, the north point bearing west by south, eleven or twelve leagues, and their distance from the nearest shore five leagues. At noon they stood to the north-west by north, about three miles distant from shore: about five the east end of Mowee bore north-north-west, about ten leagues distant. Night coming on, fires were lighted in different parts of the country, perhaps to inform the inhabitants of more distant parts of their arrival.

As they run along with a gentle breeze, almost

* On the 19th of November, Captain Portlock went in his whale-boat on board the Queen Charlotte, to confer with Captain Dixon respecting their future proceedings. The result of this conference was, that their rigging fore and aft stood much in need of repairing and overhauling, and that it would be prudent to quit their present situation, and proceed for King George's Bay, Woahoo, where they could be sheltered from the prevailing winds, and adjust the hulk and rigging of both ships; accordingly, with a light breeze, and very unsettled weather, they bore away to the northward, intending to pass to the eastward of Mowee, and then to run down for Woahoo. A little before dark, they saw a canoe to the south-west, making

within pistol-shot of the shore, the natives of both sexes assembled numerously on the beach, waving slips of white cloth as a token of peace and amity. Expecting to find good shelter in a bay on the west side of the island, and near a district called Toeyayaa, the captain sent the whale-boat to sound, and look out for a harbour. In the mean time they stood off and on under an easy sail, giving the natives an opportunity of exhibiting the produce of their island, which was done in great abundance. Hogs, fowls, geese of wild species, plantains, bread-fruit, taro, and cocoa-nuts, and salt, were bartered for nails, towes, and trinkets of different kinds. In the course of four hours, the navigators purchased as many hogs as, when salted, filled seven Tierces; besides great numbers of a smaller sort for daily consumption. Near two tons of vegetables were also procured.

The Indian traders acted very fairly and conscientiously, but some of the spectators, of whom there were great numbers of both sexes, manifested their usual propensity to thieving. One man had the dexterity to steal a boat-hook out of a boat along-side, though a boat-keeper was then in her; and another crept up the rudder chains, and stole the azimuth compass from a cabin window. Many trifling things were peculated in the course of the day, which cannot be any matter of astonishment, as there were about two hundred and fifty canoes about the ship at once, which contained at least a thousand people.

With a light variable breeze they steered south-east towards Owwhyhee, and by noon were within three miles of the shore; many of the visitors of the preceding day came along-side, with fine hogs, and plenty of vegetables, which they were willing to dispose of*.

In the afternoon of the 23d, it being calm and pleasant,

after them, having a small mat up for a sail, and paddling very laboriously. They brought to, and picked her up. Four men were in their canoe, besides a quantity of provisions, as potatoes, plantains, &c. It appeared that they belonged to the island of Mowee; and on our navigators standing in for the east part had put off with their little cargo, expecting to take it to a good market; but, upon their bearing away from the island, they found the weather so very bad, and the wind so strong against them, that they could not reach the shore: They bore away after them, set their sail and practised every effort to get up with the ship: The captain thought himself happy in being fortunate enough to get sight of them; for they must otherwise have

pleasant, the Indians they had picked up off the east end of Mowee, embraced the opportunity of going on shore. The captain urged them to stay on board till the morning; that they might have an opportunity of standing close in shore, and have less danger to encounter; but they fixed upon the present moment, and seemed regardless of the distance, though it was not then less than about five leagues. These poor fellows did not depart empty-handed, for, in addition to the presents they received from the captain, almost every person on board gave them some significant token of their friendship: their misfortunes thus became singularly advantageous to them.

It was the intention of our navigators, after leaving Owhyhee, to proceed immediately for King George's Bay, Woahoo, and there attend to the necessary reparations of the ships. They plied, however, with variable winds till the morning of the 30th, without any material occurrence; at that time the wind seeming fixed to the northward and eastward, and in a more settled state than it had been, they bore away for Woahoo. At four o'clock they hauled round Dick's Point, and at five came to anchor in King George's Bay, in twelve fathoms water.

HAVING anchored in King George's Bay on the 30th of November, a few canoes came along-side immediately after, but they had hardly any thing for sale: the bay indeed seemed very thinly inhabited, and by persons of little importance. The captain expressed a wish to some of them to procure him a supply of water, and directed them to bring it as they had formerly done. They would readily have complied with his request, in consideration of the nails and beads which were to have been given to them in exchange; but they instantly informed him, that not only water, but every thing else upon the island, was tabooed by the king's order.

Finding matters thus situated, he gave a man, who exhibited some degree of importance in his deportment among the present visitors, a present for the king, and another for his old acquaintance the priest; requesting him to inform the king that they wanted water and re-

freshments, and humbly requested that the taboo might be taken off. At sun-set the natives, at the captain's request, quitted the ship, and went on shore. Early the following morning, several canoes were observed along-side, which, notwithstanding the taboo, had brought them water, and vegetables. Several large and small canoes came round Point Dick into the Bay, and landed at the head of it. His old friend, the priest, paid the captain a visit soon afterwards, according to custom, in a large double canoe, ornamented with branches of the cocoa-nut tree. After solemnly paddling round the ship, and amusing himself by running down every small canoe that came in his way, he came along-side; but before he entered the ship he enquired for Captain Portlock. The captain, attending to this enquiry, appeared at the ship's side to receive him, when the priest handed up a small pig, which was afterwards formally presented to the

never was gratitude more feelingly expressed than by these poor Indians, for the little favours they had fortunately been able to confer upon them. On the 22d toward sun-set, their visitors, after disposing of their cargoes, took a very friendly leave of them, and pushed immediately for the shore.

captain, as a token of peace and amity, agreeably to the usual practice at all the islands.

The old man then informed the captain, that the king, (who was just arrived in the bay with a large fleet of canoes) would come on board to visit him, and on his return on shore the taboo would be taken off, and the natives be at liberty to supply him with whatever the island afforded. The captain made him a present, and sent another for the king, to be delivered on shore by him into his own hand. The priest departed about ten, and returned about eleven in his own private canoe, accompanied by many others. In a very large canoe, paddled by sixteen stout fellows, the king then made his appearance, attended by many of the principal chiefs. When his canoe approached the ship, all the rest paddled off to some distance to make room for his majesty; who, after having paddled three times, approached the vessel with great state and solemnity, entered confidently on board, but would not permit any of his retinue to follow him, till he had obtained permission for their attendance, which was granted to eight or ten of the principal chiefs. The king brought the captain a few hogs and vegetables, by way of present; for which a suitable compensation was made. Many of the chiefs also brought trivial articles, which were properly noticed and acknowledged.

The king, whose name is Tahceerre, is a stout personable man, about fifty years of age, and seems highly esteemed by his subjects. He continued on board the greatest part of the day, and directed the natives to bring an abundant supply of water, and plenty of every other article of refreshment that was required. Towards evening he returned on shore, highly gratified

* On the 3d of December they received another visit from Tahceerre, which was rendered as agreeable as the former by the customary presents of hogs, vegetables, and cocoa-nuts. The ships were surrounded by canoes, and multitudes of both sexes were playing in the water, though they were at a considerable distance from the shore. Their old friend, the priest, was almost constantly on board, and, as usual, drank such an immoderate quantity of yava as greatly to incommode him: he seemed almost debilitated, and his body was covered with a kind of leprous scurf. He had generally two attendants on board with him, to chew the yava-root for him; and he furnished them with such constant employment that their jaws were perpetually in the act of chewing. Sometimes, indeed, he was

with the reception he had met with, and the presents he had received. They instantly began to feel the good effects of Tahceerre's visit: no longer under the influence of the taboo, the natives now procured a plentiful supply of water, hogs, and vegetables; a party was therefore instantly directed to salt a quantity of pork for stock: the boatswain, and another set, were ordered to examine and adjust the rigging*.

They were again visited by his majesty on the 4th, who, in addition to his customary present, brought a large quantity of very excellent mullet, which had been taken in a small salt lake at the head of the bay. Though he frequently ate with our Europeans, he never could be prevailed on to taste any wine or spirits; nor did he ever use the yava, water being his only beverage. He seemed much delighted with the attention that was usually paid him, and his visits were found very agreeable; for he not only encouraged the natives to furnish them with proper supplies, but even kept them in due order and decorum, that they might not incommode the Europeans by assembling too frequently in multitudes. This afternoon their stock of water was completed; the natives, having in the space of three days, filled forty butts, besides a considerable number of puncheons and brandy-pieces; so eager were the natives in the prosecution of this business.

They were now rather deficient in the article of fuel, having consumed a great deal in heating water to scald hogs, and various other purposes. This circumstance having been mentioned, a quantity of excellent fire-wood was readily procured, in exchange for nails and buttons†.

The natives daily repeated their visits, bringing with them wood, hogs, and vegetables; and many

under the necessity of hiring chewers to assist him, which he could not get performed on more moderate terms than a head for every monthful.

† Numbers of sharks were seen lurking about the ship, four or five of which were caught: and, having taken out their livers, they were given to the Indians, who consider them as very acceptable presents. The priest got two of the largest, which he seemed to behold with delight, and having ordered them to be carefully lashed in his canoe, was preparing to send them on shore. On this occasion, a remarkable circumstance occurred; at the moment that the priest's canoe got a-stern of the ship, one of the sharks not being perfectly secured, fell out of the canoe, and sunk to the bottom in eleven fathoms water; there being at the

came from the sole motive of gratifying their curiosity; those who were not furnished with canoes, could swim from the shore, though at the distance of about two miles; and, after remaining the whole day in the water, found it no difficult task to repair to the destined spot.

The old priest was still a constant attendant, though he sometimes went on shore, under the pretence of paying a morning visit to his majesty; but it clearly appeared that his principal motive was to replenish his stock of yava, of which his consumption was immense. He now began to be extremely restless and uneasy; and, on the captain's expressing a desire to know the cause, he intimated that Taheeterre, and his principal warriors were planning some mischievous plot against our navigators. Taking him upon deck, he pointed to a large house on the top of a hill, over the eastern point of the bay: this house, he informed him, was built for an Eatooa, or God's House, wherein great offerings were to be made to their different Eatooas, and to consult them upon the event of an attack upon the ship, which they were determined to persevere in, if they were encouraged by their oracles. He seemed displeased with the king's conduct upon this occasion, and desired they would be constantly on their guard against him.

Improbable as this information appeared to be, it would have been the height of imprudence totally to disregard it; a constant watch was therefore ordered to be kept upon the cables, that they might not be cut or injured by the natives.

At the same time several large hungry ones swimming about; an Indian, however, ventured down with a rope, slung the dead shark, and afterwards hauled him into his canoe, without any apparent apprehensions of fear from those that surrounded him. Sharks are by some thought valuable, as they answer a variety of purposes. Of salted shark, some people are very fond; the skin makes an excellent cover for drum heads, and their teeth are fixed in wooden instruments to answer some of the properties of knives.

On the 14th a number of canoes attended the ships, principally laden with fire-wood. About noon the king came off in a large double canoe, attended by his principal chiefs, all of whom were permitted to come on board, and treated with the usual freedom and attention. They were, however, prepared for an attack, if any thing hostile had been attempted: centinels were placed in different parts of the ships, and the great guns and swivels were pointed into the canoes along-side, with lighted matches ready at hand. Taheeterre had certainly perceived these preparations, and even spoke of them to his attendants, notwithstanding which he conducted himself in his usual manner. After having been on board some time, he wished to know the ef-

fects of their fire-arms; of which Captain Portlock gave him aocular demonstration, by discharging a loaded pistol with a ball at a hog that stood at a little distance, and killed it on the spot. The king and his attendants were startled at the report of the pistol, but when they saw the hog lie dead, and the blood flowing from the wound, they were terrified, as much as they were surprised. This instance of the fatal effects of their fire-arms made so deep an impression upon their feelings, that they no longer entertained any idea of attacking our Europeans.

People were constantly observed going up loaded, towards the house mentioned as the scene of solemn offerings; it appeared nearly finished, and the natives were covering it with red cloth.

The captain having, at all times, treated the king and his attendants with the most marked attention, could not give credit to this report of the old priest; not even supposing that all the iron they might have on board could induce them to engage in such an attack. He resolved, however, to admit Taheeterre on board, as usual, whenever he came, and to regulate his conduct as circumstances occurred. In the evening the priest quitted the ship to go on shore, having promised to return the following day*.

The king remained on board about two hours, and, after receiving a small present, took his leave; informing the captain, at the same time, that he intended to quit the bay, and return to his residence at Whyteetée in the evening. It was remarkable that, when Taheeterre left the ship, all the canoes left them, and paddled to the shore in different parts of the bay†.

For the two following days, not a single native came near either of the ships, their canoes being hauled out of sight; but vast numbers were observed about the house upon the hill. Early on the 17th of December, the old priest came on board, attended by his yava-chewer Towanooaha. The veteran seemed exceedingly enraged at the king's recent conduct; and informed the captain that the king, and all his principal chiefs had been presenting offerings to their gods,

effects of their fire-arms; of which Captain Portlock gave him aocular demonstration, by discharging a loaded pistol with a ball at a hog that stood at a little distance, and killed it on the spot. The king and his attendants were startled at the report of the pistol, but when they saw the hog lie dead, and the blood flowing from the wound, they were terrified, as much as they were surprised. This instance of the fatal effects of their fire-arms made so deep an impression upon their feelings, that they no longer entertained any idea of attacking our Europeans.

It was not long before the old priest came on board, not in a large double canoe as usual, but in a small old battered one hardly capable of conveying him, and seemed to have performed this visit as if it was undertaken by stealth. As soon as the old man made his appearance upon deck, he began to accuse the king of being a villain, minutely repeated his former story, and begged the captain would watch him narrowly. After haranguing for some time, he went on board the Queen Charlotte, where he passed the remainder of the day. Their wooding business was now perfectly completed, a sufficient quantity having been procured for at least six months consumption.

and

and consulting them, but that the gods were good for nothing, and that the king and his adherents were the basest of men for aiming to injure them most essentially, though they had received innumerable unmerited favours from those liberal navigators. The captain thanked his enraged friend for his intelligence, and said he would endeavour to counteract what was meant to be injurious to him.

For a considerable time Captain Portlock had been strongly importuned by Towanooha, and a distinguished youth in the island, who was on the most intimate terms with his majesty, to take them with him to Atooi; but he never supposed they were in earnest till the 17th, when the young chief, whose name is Paapaaa, came on board, and mingled his intreaties with Towanooha so pressingly, that he promised to attend them on board; and they returned on shore to get ready for the passage. The yava-chewer being now a kind of gentleman passenger, no longer considered himself in the humble capacity of a servant, but drank plentifully of yava himself, and laid in a plentiful stock of that root*.

In the forenoon several large and small canoes came off, bringing a considerable supply of vegetables, and a few hogs. The king also, with his retinue, paid the captain a visit: on his coming on board, he seemed rather shy, but conducted himself nearly in his accustomed manner. When Captain Portlock mentioned the red house upon the hill, he seemed very much confused, and, changing the conversation, began to talk about his two countrymen who were to accompany him to Atooi. He seemed particularly interested in Paapaaa's welfare, and earnestly requested he would take care of him and use him well; and if they stopped at Atooi, he begged the captain would leave him under the care of Taaa, who is brother to Tahetterre, and a relation of Paapaaa's. The captain also made the king a present, on which he bade them adieu for the last time; and after taking a very affecting one of his countrymen, he went on shore: the other canoes remained along-side, expecting to dispose of their cargoes. In the afternoon, the rigging was set up, and every thing prepared for sea.

* Towards evening the natives began to pull to pieces their new-built house upon the hill; and at eight o'clock several houses were on fire along the shore near the bay; but, as no Indians were on board, they could not learn whether they were set on fire by accident or design: but

About four on the 19th of December, they began to unmoor, but, in the necessary preparations, they found the stream cable gone about three fathoms from the house: as they lay in ten fathoms water, this part could never have been at the ground, as they never had rode the least strain by it; it therefore appeared very certain that it must have been cut by the Indians. The Queen Charlotte having weighed, and standing out of the bay, they made the signal to anchor, when she stretched in the bay, and came to close by them.

The best situation for anchoring in King George's bay, is near the middle of it, and about a mile from the reef; where there are six and seven fathoms water.

They did not anchor again till the 25th, which was in Wymoa bay; soon after which several canoes came off. They enquired for the king and their old friend Abbenooe, who they understood were with the principal chiefs at Apoonoo, a town in the island where the king usually resides; but they were informed that the king and his retinue would speedily be at Wymoa. The natives, in the mean time, supplied them with every necessary. The next day Captain Portlock, accompanied by his two passengers, repaired on shore, with a view of examining the western point of the island, to search for a well-sheltered bay for the ships to ride in. On reaching the shore, he was respectfully treated by a great number of the inhabitants, a was afterwards indulged by some of the most respectable people, by their services in keeping the multitude at a distance, whose curiosity might otherwise have incommoded them.

Being disappointed in his search for a harbour, he began to think of returning on board; but after walking four or five miles, he found it impracticable to reach Wymoa before night overtook them; and being then at no great distance from a mansion belonging to Abbenooe, he resolved to take up his abode in it for the night. They arrived at this comfortable spot about sunset, and one of Abbenooe's men, who had joined in the party during the afternoon, ordered a hog and dog to be killed and dressed for their sup-

the next morning, when the old priest enquired the cause of the fires that had been seen the preceding evening, he was informed they were houses belonging to the Gods, with whom the chiefs were displeased; who, to be revenged, had consumed Gods and houses together.

pers; a large quantity of taro was directed to be procured; and the house was most brilliantly lighted with torches prepared from dry rushes. The repast being ready about eight o'clock, it was served up with great order, and was exceedingly enjoyed by the hungry partakers. At the conclusion of the feast, the remains were ordered to be preserved, to afford a relish in the morning, previous to setting out on their return. On their quitting the house at that time, not less than a hundred women were seen about it, most of whom had children in their arms: they were extremely desirous of knowing the captain's name, which they generally pronounced *Po Potè*; and such of the infants as could speak, were instructed by their mothers to call on *Po Pote*. On this occasion he distributed a few trinkets among them, with which they appeared perfectly satisfied.

During the captain's absence, the commerce on board had been very considerable; and on his return, he had the supreme satisfaction of seeing the decks full of fine fat hogs for salting.

In the morning of the 25th of December, Tyanaa, a chief whom the captain had seen before, came off in a large double canoe, bringing with him a present of hogs and vegetables, for which a liberal return was made. He informed them that the king, and a number of his chiefs would be down in a day or two, and in the mean time they should be plentifully supplied with whatever the island afforded. After many professions of regard Tyanaa took his leave, and returned on shore*.

Early the next morning Abbenooe went on shore, and returned about nine o'clock, in the company of Taaao, and many of the principal chiefs belonging to the island. His majesty brought the captain a very handsome present, consisting of hogs, and a great variety of different vegetables, together with cloth, mats, and

* The natives continued to supply our navigators with fine hogs, froot, and roots; and a large party were engaged on shore in killing and salting pork for stock. On the 28th, they saw a number of canoes come round the eastern point of the bay, and soon afterwards Abbenooe came on board, but so exceedingly emaciated, and covered with a white scurf, from the immoderate use of the yava, that he had not the appearance of the same person. He brought two canoes loaded with provisions, as a present for the two ships: After staying some time with Captain Portlock, he went on board the Queen Charlotte, with the present destined for Captain Dixon, and, returning

several elegantly feathered cloaks: all which he insisted upon his receiving: they were consequently conveyed into the ship, and the captain displayed his gratitude by the return he made for these favours.

Paapaaa and Towanoha being now on board, Captain Portlock took an opportunity of introducing them to the king, agreeably to Taheeterre's request. Previously to this, he gave them a few trifling articles which they presented to him, and were favourably received. He now found, as he had before supposed, that Abbenooe was highly esteemed by his majesty, being consulted by him on all important occasions. Taaao appears to be about forty-five years of age, stout, and well-proportioned: and his disposition is said to be more amiable than that which is possessed by any of his subjects. He made offers of friendship to Captain Portlock, and kindly assured him that he should be amply provided with the produce of the adjacent islands. He entreated Abbenooe to continue on board, to prevent disputes between the natives and the Europeans, in the course of their extensive trading.

Canoes in abundance came off on the 31st of December, freighted as usual, with hogs and vegetables. The king also paid Captain Portlock another visit, accompanied by an old chief named Neeheowhooa, who was said to be the king's uncle, and a person of the first consequence. This old chief, it seems, had formerly been one of the greatest warriors that Atooi, or any of the islands had ever produced, and had been greatly instrumental in establishing them under their present kings Taheeterre and Taaao. The hardy veteran shone forth in his appearance, and the scars with which his body was almost covered, bore unquestionable testimony of his valour. He was quite a cripple, and had lost one eye: the sight of the other was also much impaired by the wounds he had at sundry times

in the evening, took up his lodging with Captain Portlock.

† The king, and his retinue, remained about two hours on board, gratifying their curiosity in observing the ship, its embellishments, and conveniences. Taking leave of Captain Portlock, they went on board the Queen Charlotte, where they continued a short time, and then returned on shore. Abbenooe attended his majesty to see him safely landed, and returned to the ship for the night. He was indeed so constant an attendant, that a cot was hung up for him in the cabin, with which he was so highly pleased that he never slept out of it.

received in battle, which baffled all the arts of surgery to heal. Taaao appeared much afflicted on account of his uncle's situation, and, supposing our Europeans could perform wonders, entreated them to cure him. Captain Portlock recommended him to the care of his surgeon, who examined his wounds, and furnished him with proper dressings, accompanied with instructions for the application of them. The veteran seemed perfectly to understand the surgeon's directions, and promised punctually to attend to them.

On the 1st of January, 1787, the weather was extremely fine, but hardly a canoe was to be seen: on enquiring the cause of Abbenooe, he said a tabooara had been imposed by the king. A tabooara is a kind of tax demanded by the sovereign on the property of the adjacent plantations, being a certain portion of their produce. At Abbenooe's request, Captain Portlock attended him on shore, to observe the ceremony; and greatly admired the order and regularity by which the natives were governed: men, women, and even children, submitted to the impost with the greatest cheerfulness. Some brought forward their hogs, others bread-fruit, taro, or whatever the island produced; all which were separately placed in heaps*.

On the 2d and 3d of January, the wind blew very fresh, with frequent squalls, during which time they had but little intercourse with the natives, and their stock of vegetables was nearly expended; Abbenooe, however, procured a seasonable supply.

The weather being fine the following day, they sent the long boat on shore to procure provisions; and Captain Portlock, accompanied by Abbenooe, followed in the whale boat. They landed on a beach a-breast of the village of Wymoa; and whilst the people were getting

the hogs and other provisions into the long boat, walked two or three miles up a valley, leading from Wymoa towards the mountains†.

Taaao paid the captain another visit on the 10th, accompanied by his eldest son Taaevee, a fine youth about twelve years of age. The king informed him that he intended this as a farewell visit, as he intended shortly to return to Apoonoo: but that Abbenooe should be left on board to accompany them to Oncehow, which island, together with its produce, he urged the captain to accept as a present; and desired Abbenooe to take care that the natives supplied them sufficiently with yams, without expecting any thing in return for them. But Captain Portlock begged (if they would not permit them to sell the produce of the island,) that they might be rewarded for their trouble in digging and bringing off the yams to them; which he very reluctantly assented to, and after receiving a present with which he was much delighted, he took a very friendly leave of him, as did his son and the attending chiefs; to each of whom, on parting, he gave a satisfactory present.

Among the persons of consequence in the train of Taaao, on his farewell visit, was his uncle Neeheowhoaa: His wounds being considerably better, he knew not how to express his thanks in such language as ought to accompany his gratitude. He begged permission to come daily on board to have them dressed, and seemed convinced that they would speedily be healed. After attending his nephew on shore, he returned with a large double canoe, laden with hogs, as a present to the captain and the surgeon, as a token of his gratitude. The hogs were taken on board, though they protested against receiving them as a present; the old warrior, however, could hardly be prevailed on to receive any thing in return. The captain desired him to attend daily

* Taaao, and many of the principal chiefs, attended to see the rules of the tabooara properly enforced; and, at the completion of it, the whole was divided into two parcels, which the king told Captain Portlock were intended as a present for the two ships, and desired he would send boats on shore to carry them off. The king's generous method of proceeding obtained the Captain's approbation, and he was determined that he should not be a loser by his liberality, though he had it not then in his power to make him a suitable return.

† In the afternoon of the 4th they caught a female shark;

so very large that it was necessary to hoist it out of the water with a tackle. It was thirteen feet and a half in length, and eight feet and a half in circumference: its mouth was so capacious as to admit the head of a puncheon with ease. On opening the shark, forty-eight young ones were found in her, each about the length of eight inches, two turtles weighing about sixty pounds each, several small pigs, and a large quantity of bones. The liver, which was very large, was kept for oil, and the fish given to the natives who considered it as an inestimable treasure.

on board, that his wounds might be regularly dressed, which gave the veteran the highest satisfaction.

On the 27th, the king in a large double canoe, attended by several others, quitted the bay to proceed to Aponoo, Abbenooe still remaining on board the King George, where his presence was of considerable importance; for if any disturbance arose in their traffic with the natives, he always settled it to their mutual approbation.

On the 11th they were employed in preparing for sailing; the weather was cloudy, with some rain. At six o'clock they weighed, with a fresh breeze from the north-east, and came to sail; the Queen Charlotte and the long boat in company: after clearing the bay, they made way for the south point of Oneehow. From the 12th to the 16th nothing important occurred, when they came to anchor in Yam Bay, in fifteen fathoms water, over a bottom of coarse sand. They found a very heavy sea rolling into the bay, which rendered it dangerous for the natives to come off with any thing: they went on shore to request of the natives a supply of yams, but the surf still continued so heavy, they refused to have any intercourse with our navigators.

In the morning of the 17th Captain Portlock went on shore with the whale-boat, accompanied by Abbenooe; and, as the surf ran too great for canoes, they were obliged to row in under the reef, where they found a place that the boat could lie at her anchor with safety. They entered a canoe, intending to go on shore, but were overset by the surf before they reached it, and were obliged to swim for it. After landing they walked about seven miles to the northward, at some little distance from the beach; but the country seemed very poorly cultivated; and

Abbenooe informed him, that after the people had taken their stock of yams in, they had greatly neglected the island, barely planting a sufficiency for their own use; that some of them had even quitted the island, and taken up their residence at Atooi.

On the 20th several of the people were permitted to go on shore; all of whom returned except three, who were in an indolent state of health, and whom the captain was willing to indulge with a longer absence till they should find themselves a little better. Abbenooe had provided a comfortable house for their reception, and ordered them proper necessaries and refreshments. A heavy gale coming on presently after, obliged the captain to cut the cables, and run out of the bay, and the three invalids were consequently left on shore. Abbenooe, and several of the Indians, were on board at that time, and went to sea with them.

From the 21st to the 26th they were kept beating off and on about Oneehow and Atooi; at length they came to anchor in the south point of Yam Bay. The three invalids, who had been indulgently treated by the natives, and who had been on board the long-boat ever since their anchorage in the bay, were now got on board. On the 5th of February, the captain permitted the second watch to go on shore: a number of Abbenooe's people attended them by his order, that no quarrels or altercations might arise, and that they might be regularly supplied with provisions. In the evening when the people returned, not a single theft had been committed, and every one had been generously treated with every luxury the island could afford. On the 31st they came to anchor in Whymoa bay, in twenty-nine fathoms water, over a bottom of fine muddy black sand*.

The

* The following anecdote, though extraordinary, related by Mr. Goulding, a volunteer in the service, shows in what estimation a favourite dog is held among the natives. In walking along the shore, he met with an Indian and his wife; the latter of whom had two puppies, one at each breast: struck with the oddity of the circumstance, he was induced to try if he could not purchase one of them. Persuasions and temptations were earnestly employed to prevail on the woman to consent to such a transfer of property; but they were long found ineffectual; at length, however, the sight of some nails had such powerful attractions on the husband, that he commanded her to part with one of them: at length, with every demonstration of affectionate

concern, she reluctantly consented, giving it a last endearing embrace. Though she was then at a considerable distance from the ship, the woman would not part with her nursing, till she arrived where the boat was lying to receive him on board. On its quitting the beach, she earnestly requested to be once more permitted to caress it before she parted with it. That favour being granted, she immediately placed it at the breast, and after a profusion of endearments, returned it to him again.

The following passage, from Mrs. Piozzi's Travels through Italy may serve to accompany this anecdote. "If the Neapolitans do bury Christians like dogs, they make some singular compensations we will confess, by nursing dogs

This day, at Captain Portlock's request, two chiefs on board, who were residents at Whymoa, thought proper to exercise themselves with their spears: their wonderful dexterity in that science astonished every person on board. One of them, named Na-Maa-teerue, is a well made personable man about five feet six inches high, but his skin is much blemished by the immoderate drinking of yava, and he is blind of one eye. Though he is not supposed to possess much property, he is greatly respected, and his company is sought by all the principal men of the island. He is now revered, on account of having been, and still remaining a man of valour. The loss of his eye was occasioned in battle by a stone slung from a sling, but this accident did not hinder him from distinguishing himself in military exercises and engagements, of which he gave the most satisfactory proofs. He took his stand, unarmed about, three or four yards from the cabin door: the other person stood at the distance of eight or ten yards from him, provided with five spears. On the signal being given for commencing the action, a spear was forcibly aimed at Na-maa-tee-rae, which he avoided by a motion of the body, and caught it by the middle as it passed him: with this spear he parried all the rest without the least apparent concern, and with no great exertion. He then returned the spears to his adversary, and armed himself with a Pa-ho-a; they were again thrown at him, and again as easily parried. One of the spears, struck into the bulk-head of the cabin, and the barbed point was broken off in attempting to get it out. The indifference manifested by his countenance, while the spears were casting at him, sufficiently proved his courage and expertness. Though all the spectators shuddered at the danger he seemed exposed to, they were equally astonished to see with what facility he baffled his opponent.

Being on shore, on the 5th of February, with his old friend Abbenooe, the captain observed, in the village of Wytnoa, four or five pretty

dogs like Christians. A very voracious man informed me yesterday morning, that his poor wife was half-broken hearted at hearing such a countess's dog was run over; for, said he, *having suckled the pretty creature herself, she loved it like one of her children.* I bid him repeat the circumstance, that no mistake might be made: he did so; but seeing me look shocked or ashamed, or something he did not like—Why, madam, said the fellow, *It is a com-*

large houses without inhabitants, though seemingly in good condition, on asking Abbenooe why they were tabooed, he was informed they were structures erected for the king, whenever he chose to honour Whymoa with a visit, and that no persons were permitted to use them in his absence. He also informed the captain, that the king had directed him to build him a house on a clear spot to the westward of these houses, and that he had brought him here to make choice of a situation to his own liking. For a time he declined the favour intended him, but his friend's earnest entreaty at length prevailed on him to consent to gratify them; and accordingly fixed immediately on a spot.

No sooner had he signified his consent than workmen were engaged; some were dispatched to fetch wood from the country; others to procure long grass for thatching; all orders were received with the greatest satisfaction, and every one exerted himself to the utmost; so delighted were they with the idea of having their friend Po-poo-te among them. Near to the spot, Captain Portlock had fixed, he procured a large stone, on which he etched the initials of his name, his country, and the year of our Lord. All this he explained particularly to his friend, who seemed delighted with the explanation. The stone was ordered to be placed in the centre of the house.

One very great inconvenience attends their houses, which is their want of windows: the extreme heat of the weather makes them very uncomfortable and close; but the principal precautions are against the rains and cold. When they find it too warm, they repair to the water to cool themselves, being totally indifferent whether it is by night or day. The captain requested of his friends to have windows in his house; one at each end, one on each side of the door, and one at the back, for the double advantage of light and air. He assured him it should be done as he desired; and every thing being adjusted respecting the building, they proceeded up the

mon thing enough for ordinary men's wives to suckle the lup-dogs of ladies of quality; adding, that they were paid for their milk, and he saw no harm in gratifying one's superiors. As I was disposed to see nothing but harm in disputing with such a competitor, our conference finished soon; but the fact is certain. *Piozzi's Travels through Italy, &c. &c. li. 57."*

valley, attended by a great number of the natives of both sexes, who behaved with the greatest friendship and hospitality; pressing him earnestly to enter every house he came to, and partake of such fare as they were able to bestow. Many of the women brought their children to him, that is to salute, by touching noses; his compliance with which seemed to afford them singular satisfaction. He was much delighted to see so much happiness in the countenances of many hundred of the Indians, whom he had formerly the greatest reason to think were a treacherous people. This excursion gave the captain an additional opportunity of admiring the ingenuity and industry of the natives, in laying out their taro and sugar-cane grounds; a considerable part of which are made on the banks of the river, with causeways of stones and earth, leading up the valleys, and to each plantation. The taro beds are usually a quarter of a mile long, dammed in, having a place in a part of the bank which serves as a gateway. When the rains commence, in the winter season, the river swells with the torrents from the mountains, and the taro beds are overflowed. When the rains are over, and the rivers decrease, the danks are popped up, and the water preserved to nourish the taro and sugar-cane during the dry season; the water in the beds is usually a foot and a half, or two feet, over a muddy bottom: the sugar-cane generally in less water, grows very large and fine, and is a material article of food with the natives, especially the lower class: the taro also grows as large as a man's head, and is the best article of the bread kind they have; sometimes they make a pudding of it, which they keep till it becomes a little sour, when they esteem it a great delicacy: it is then called po-c. The Indians eat an immoderate quantity of this article. Captain Portlock says he has seen his friend Abbenooe eat about two quarts at a meal, besides a quantity of fish or pork.

On his arrival on board, he found every thing in good order: the intention and industry of the people in supplying him with every thing in their power, exceeded all example; their hospitality and generosity were unbounded. Abbenooe's attachments to both ships' companies was singular. In general he slept on board the King George, where he was indulged with a cot, as has already been observed; an old man, however, had some falls before he perfectly understood its construction, by getting in on one side, and lying out of the other.

After gratifying his curiosity among the plantations, his friends accompanied him to a large house, near the bottom of the hills, on the west side of the valley, not exceeding three miles from the beach. It was large, commodious, and neat, with a handsome new mat on the floor: a wooden image of a tolerably large size, was seated on a chair; a grass-plat, with this figure in the centre, is inclosed with a small railing made of wood: several to-es, and other small articles, were also observed. Abbenooe informed the captain that this house had been built with the to-e he had given him on his first coming to Oncehow; and the other articles were also presents bestowed on him at different periods; and that the image was to commemorate his having been among them. Few people could obtain admittance into this house. Among other articles, it contained several drums; one of which was of considerable magnitude; the head of it was made of the skin of the large shark, already described; and these drums were said to be dedicated to their gods. Having taken refreshments, such as pork, salted fish, taro, and cocoa-nuts, they returned to the beach.

The long-boat being in shore, to convey provisions collected by a tabooara, or tax imposed by the king, Captain Portlock says, he had great reason to be well satisfied with the natives who attended on this occasion: he went off in the long-boat, accompanied by Abbenooe, and some other chiefs, who were much delighted with the sail to the ship, a brisk breeze happening at the time*.

From the 9th to the 12th of February nothing remarkable occurred. Three canoes came off with provisions, and, after having sold their cargoes, took their leave of us, as did their faithful friend, who left his son on board, wishing to go with us.

On the 16th their old friend Abbenooe came off from the east point of Atooi, in a large

On the 8th the king arrived in the bay, with his usual attendants: he came on board, and seemed delighted with the friendly intercourse that subsisted between his subjects and the people. The Europeans always went on shore unarmed, that the natives might not be apprehensive of danger; and this conduct encouraged a mutual confidence in each other. The king continued on board a few hours, and then Captain Portlock accompanied him on board the Queen Charlotte, to the Captain Dixon.

double canoe, bringing a fine hog and some taro. Captain Portlock made him a present, with which he was perfectly satisfied, and immediately went on board the *Queen Charlotte*.

From this time till the first of March nothing extraordinary happened. A chief of some consequence, named Nohomitehitce, who had frequently been on board, and found very serviceable in procuring provisions, requested to be taken into the ship. He was so earnest in his solicitations, that the captain at last consented. He said he had collected a number of little articles, which he made a present of to his father, a very aged and infirm man, but Poorecare, one of the king's messengers, who rules with an unlimited sway when the king and chiefs are absent from the island, knowing the old man was possessed of these things, went to him, and insisted upon all his treasure, consisting of to-es, beads, rings, and other articles which his son had given him. The aged man denied that he had any such property in his possession; having previously taken care to remove them out of the house, and conceal them in a hole on the ground, at a convenient distance from the habi-

tation. The messenger still insisted upon knowing where they were, and the old man continuing obstinate, the king's officer seized him by the throat, and threatened to murder him, if he did not immediately deliver up the goods. He had proceeded so far in the execution of his threat, that he was nearly strangled before he would discover where his treasure was deposited: as soon as this information was obtained, the messenger made himself master of the whole.

Nohomitehitce landed with his canoe at this instant, and saw his father thus perfidiously plundered of his property, but did not interfere; not perhaps from a deficiency of courage, but dreading the unlimited power of a king's messenger. Nohomitehitce being taken on board according to his request, and relating his sorrowful tale, wanted to punish the messenger, for his ill behaviour; but Captain Portlock advised him to the contrary; and being afterwards tired of living upon salt provisions, he quitted the ship and left them. Since that time, the captain had no opportunity of seeing the king or Abbenoo before he left the islands, to enquire what had been done in his father's affair.

SECTION V.

Passage from the Sandwich Islands to the American Coast—Beer made of Sweet-Root—Arrival at Montague Island—Anchor in Hanning's Bay—Boats sent on a trading Expedition—Meet with a Vessel from Bruga!—Visited by a powerful Tribe of Indians—Their Propensity to Theft—Departure from Montague Island—The Ships separate—Indians visit the Ships with Sea-otter Skins—Boat sent out—Plundered by the Indians—Visited by several Tribes.

PROCEEDING for the coast of America, a second time, nothing of material consequence occurred till the 19th of March. This day Captain Portlock, supposing himself about twenty-five or thirty leagues to the eastward of the *Resolution* and *Discovery's* track towards the coast, and having a strong gale with very thick weather, did not think it prudent to run during the night. *Queen Charlotte* brought to close under their lee quarter. During the night it continued to blow very hard, with heavy squalls from the south-south-east. From this time to the 12th of April, they kept their course for the coast. Both ships' companies were very well.

Having mentioned the method of brewing the sweet root, Captain Portlock here observes, that three quarts of molasses were put into six gallons of beer, in addition to a pint of essence of malt, and after remaining a short time in bottles, it was not inferior to the finest cyder. Richard Greenhalt, one of the quarter-masters, had a bottle given him daily, and it was found of infinite service to him; its good effects were almost instantaneous; it is an excellent and most valuable medicine. The poor man was so reduced with an almost continual spitting and vomiting of blood, that Captain Portlock's surgeon was of opinion he could not live many days.

Towards evening on the 17th, supposing the

Before he lef five canoes, som others two; but

* On the 25th t but the scine was ha company were sent the only refreshment could walk only a being entirely cover appeared in great

were not more than ten leagues from the south-west point of Montague Island, Captain Portlock hauled the wind to the westward, under an easy sail, to wait for day-light to run in for the land; but in this he was disappointed; for soon after midnight, the weather grew very thick, and it began to rain. On the 18th, at three in the morning, the weather cleared a little: this, however, was of short continuance, for, in less than an hour, it again became thick, and the wind began to blow very fresh at south. They sounded with a hundred and fifty fathoms line, but got no bottom. They had then a succession of fresh gales, and thick dirty weather.

During the night of the 23d, they stood to the eastward under an easy sail, and early the next morning they stood in for the south-west point of Montague Islands, under all the sail they could make. At noon on the 24th, the extremes of Montague Island in sight bore east-by-south five miles, and north by east four leagues, their distance from the nearest shore about three miles.

About one o'clock an appearance of a good bay presented itself on the Montague Island shore, to which Captain Portlock directed his course: at two o'clock the whale-boat was sent to sound and examine it. She returned in an hour, when the officer in her reported, that the ships could ride in it with safety; they accordingly hauled in for it, and anchored at four o'clock in twenty fathoms water, over a muddy bottom. On looking round the bay, Captain Portlock thought he could perceive it take a short turn round a point nearly at the bottom, on which he went, accompanied by Captain Dixon, to examine it. They carried good soundings to the said point, and found that a ship could lie in four and a half and five fathoms water, with the south point of the bay just shut in with this point at about a cable's length from the shore.

Before he left the ship they were visited by five canoes, some containing only one man, and others two; but the captain was surprised to find

that they had not the skin of any animal among them. They had beads of various sorts, particularly yellow and green, of which they seemed much to approve. These visitors frequently repeated the word *Nootka*, at the same time pointing up the sound. Towards evening these people went away, and paddled out of the bay, after stealing several fishing-lines which were hanging overboard*.

No Indians coming near, he resolved to quit the place; and accordingly, on the 29th they weighed, and sailed out of the bay; but the same evening was obliged to run in again on account of contrary winds. During the night of the 2d of May, they had light variable winds, with calms by turns; but at nine the next morning a fine little breeze springing up from the westward, they weighed, and stood out of Hanning's Bay; when coming to an anchor, the long-boat and whale-boat of each ship, were made ready for a trading expedition farther up the sound, under the direction of Captain Dixon. In the mean time Captain Portlock proposed staying with the ships, and to have them hauled on shore. Here they could also fill their water, and do many other necessary works; this harbour being perfectly convenient.

Early the next morning the boats set out on their expedition, and by five were out of sight, clear of the harbour. Their various operations now began: the starboard side of the ship was cleaned, and paid with a coat of tar, chalk, and train-oil well boiled together.

When Captain Portlock was last at the Sandwich Islands, he bought a double canoe, which was fitted up; he now sent her, with two of the people, into an adjacent creek to get crabs and mussels; they being the only refreshment, the decoction of spruce excepted, which they could now obtain. About noon he had the satisfaction of seeing an Indian enter the harbour in a single canoe; he soon appeared along-side, but had nothing to barter, except a little porpoise-blubber, which he seemed to consider as a valuable article. The captain made him a present, which

* On the 25th they got some water for immediate use, but the seine was hauled without success: some of the ship's company were sent on shore the 26th to collect shell-fish, the only refreshment the place was known to afford; they could walk only along the beach, the adjacent country being entirely covered with snow. Wild geese and ducks appeared in great plenty, but they were so extremely shy

that they could not be approached within gun-shot. In walking along the beach, Captain Portlock saw the remains of two Indian huts, and a quantity of wood that had evidently been cut down with edge tools; he therefore concluded that the Russians had visited this place the last autumn, not supposing the people of any other nation had been in these seas.

was more than equal to his expectations, and endeavoured to make him understand the nature of the traffic he wanted. He seemed to comprehend him, and respectfully took his leave, which flattered him with hopes that he would bring others to trade with him. Wild geese and ducks were now flying about in great abundance, but they were extremely shy; the captain was indeed afraid to fire at them, lest the report of the musquet might prevent the Indians from coming into the harbour.

By noon on the 7th the larboard side of the ship was finished; and at high water, they attempted to heave her off; but she did not float. Next morning at three o'clock, being high-water, and a high tide, they heave her off, and laid her in her former station. On the 8th they were visited by three of the natives in two canoes; but they had nothing to barter, except two river-otter skins, and two seal skins, which Captain Portlock bought of them, and sent them away well pleased.

On the 10th of May Captain Dixon returned, with the boats, from Snug-Corner Cove. During this excursion he had purchased thirty-six sea-otter skins, and a few other furs; they were principally procured near Cape Hinchinbrooke, to which place they first repaired, and afterwards proceeded towards Snug Corner Cove; the

* Being on shore, giving directions about the armourer's tent, Captain Portlock was informed from the ship, that a boat was seen about the entrance of the bay, plying into the harbour: conceiving this to be the Nootka's, he went immediately on board, and sent his whale-boat out to her assistance; at ten o'clock the boat returned, with the Nootka long-boat in tow. Their assistance proved very acceptable, for the long-boat's crew were almost perished with wet and cold, and in a very weak condition. Captain Meares came in the boat himself, and more particularly related a narrative of his distressed situation during the winter, which was indeed a dreadful one; for before it broke up, the captain, and a Mr. Ross his chief mate, "were the only two persons capable of dragging the dead bodies from the ship over the ice, and burying them in the snow on the shore. Nay there was not a single person on board, who was not deeply affected with the scurvy."

Towards evening the wind blew strong, and in squalls, but the next morning the weather grew moderate: all hands were employed in wooding, watering, brewing, and working in the hold. The Queen Charlotte, having finished cleaning, brewing, and paying, hauled off the beach into her former station. In the afternoon they completed their water. At five Captain Meares took leave of our navigators, and proceeded towards his ship with as many refresh-

Indians having informed them that there was a vessel in that neighbourhood. The natives spoke several English words distinctly, and pointed out to Captain Dixon the place where the vessel lay. From this information he was induced to set off, attended by some of the Indians in their canoes, to the place he had been directed to, and on the 8th arrived on board. He found her to be the snow Nootka, Captain John Meares, from Bengal. Captain Meares had left that place in March 1786, and arrived in Prince William's Sound in October, where he wintered, and had buried a considerable part of his ship's company, and the survivors were in a very sickly state. Captain Dixon brought Captain Portlock a letter from Captain Meares, pointing out his distresses, and craving his assistance. He read the letter with infinite concern, and resolved to embrace any opportunity that might present itself of rendering him service*.

Most of this necessary business being now completed, the forges and brewing utensils were brought on board, and every thing got ready for sailing. At six in the afternoon the long boat set off for Cook's River, her crew in excellent spirits, and well found for a six weeks cruise. In the evening four canoes came along-side, but soon paddled away, having no articles to trade with†.

On ments as the boat could carry. They spared him some flour, sugar, molasses, Sandwich Island Pork, gin, brandy, and cheese; with two good seamen to assist in navigating his ship to China; at which place he was to return them. It was on their own requests, that both of them went on board the Nootka, and not from any influence of intreaty: the names of these two worthy fellows, were George Willis, and Thomas Dixon. Besides the articles above enumerated, Captain Portlock furnished Captain Meares with 150 cocoa-nuts, hoping they would assist in the recovery of his people.

† In the afternoon of the 13th, two large Indian boats approached our navigators, containing about forty persons, including men, women, and children: a number of small canoes attended them. They brought only two very indifferent skins, and a few fish, which Captain Portlock bought, and made their chief, named Shoo-na-waa, a handsome present: he was, the captain understood, chief of the most powerful tribe in the Sound. These people were audacious thieves; for even the little boys were possessed of small hooked sticks for the purpose of picking pockets: about six o'clock these shameless pilferers quitted them, and went out of the harbour. The Queen Charlotte's boat was then about two miles without the harbour, with a fishing party, and the Indians hastened to join her. Fearing those

On enquiry, it appeared that the people had no fire-arms, and an unfortunate circumstance, a musquet will determine the issue of any violence.

Every thing being ready, the ship anchored at day-break, and a light breeze from the north-east, the harbour; and the ship hauled up towards the shore. All the morning the ship lay at anchor, but at three in the afternoon, with which the ship departed. At six o'clock the ship hauled up towards the shore, and a good opportunity of getting out of the harbour, and for separating, and for the ship to depart, already mentioned.

Captain Dixon boarded, and the two ships, the Queen Charlotte, and the Hinchinbrooke, a fine breeze from the north-west, with which the ship pointed in an arm of the bay, a good shelter round the shore, and a whale-boat to examine the bay, following with the ship, was a fine harbour, and a good in, and anchored, over a muddy bottom. Though their situation was not very comfortable, Captain Portlock did not think that they were higher up the bay than several canoes, whom the captain perceived, and after skins. In the afternoon the ship hauled up the small bay, within shore of the bay, and again in five fathoms, the ship head and stern.

On the day several canoes, whom the captain perceived, and after skins. In the afternoon the ship hauled up the small bay, within shore of the bay, and again in five fathoms, the ship head and stern.

Vol. II. No. LXXX

On enquiry, it appeared that Captain Dixon's people had no fire-arms in the boat; which was an unfortunate circumstance, as the bare sight of a musquet will deter the Indians from attempting any violence.

Every thing being ready for sea, they weighed anchor at day-light on the 14th, and with a light breeze from the north-east, went out of the harbour; and after getting out of the bay, hauled up towards Prince William's Sound. All the morning they had light variable winds; but at three in the afternoon, a fine breeze came on, with which they stood over for Hinchinbroke Cove. At six o'clock Captain Portlock sent his whale-boat on board for Captain Dixon; and as a good opportunity now seemed to present itself of getting out of the Sound, they determined on separating, and for each ship to adopt the plan already mentioned.

Captain Dixon soon afterwards returned on board, and the two captains took leave of each other: the Queen Charlotte shaped her course out of the Sound, and Captain Portlock bent his for Hinchinbroke Cove. At six the next morning, a fine breeze sprung up from the south-west, with which they ran up; and seeing a point in an arm of the cove, that promised good shelter round it, Captain Portlock sent the whale-boat to examine and sound the place; and following with the ship, he soon perceived there was a fine harbour round the point; he therefore stood in, and anchored in seven fathoms water, over a muddy bottom.

Though their situation was an eligible one, Captain Portlock discovered, by sounding around the shore, that they could have a better birth by lying higher up the harbour. In the course of the day several canoes came along-side, from whom the captain purchased about a dozen sea-otter skins. In the morning of the 16th, they moved up the small bower, and after hauling the ship within shore of the best bower, let it go again in five fathoms water, and moored the ship head and stern. The land around them had

some daring wretches should pillage the boat, Captain Portlock kept a good look out with his glass, and soon observed a struggle between the two parties: he immediately set off in his whale-boat, she being always ready armed; and leaving directions with his mate to follow in the yaul, rushed out rapidly towards them: No sooner had the Indians seen the boat round the point, than they took to

a very dreary appearance, being deeply covered with snow quite down to high water mark: no space presented itself to walk in but the beach, after the tide had fallen. Two fresh-water rivulets were observed at the head of the harbour, which had the appearance of affording plenty of salmon at a proper season.

The articles they had to barter with, not being held in great estimation, the captain resolved to dispatch the whale-boat and yaul, under the direction of Mr. Cressleman and Mr. Bryant, on board the Nootka, to procure of Captain Meares some trading articles which he wanted, and which he knew that gentleman could spare. In the morning they had fresh gales from the eastward, but the weather being more moderate about noon, the captain sent the boats off to proceed up the Sound.

Next morning several canoes brought a trading party along-side, having with them thirteen good sea-otter skins, and a few very indifferent ones. The harbour affording very fine crabs and muscles, a considerable quantity of each were collected. On the 25th the whale boat returned from the Sound: they had parted with the yaul off the north point of the bay. Mr. Cressleman brought the articles captain Portlock had sent for to the Nootka, except a compass; the other things which had been requested, Captain Meares promised to deliver on his joining Captain Portlock at Cape Hinchinbroke, which he engaged to accomplish as soon as possible.

On the 26th they had a very heavy gale from the eastward: at six in the evening, the gale increasing to a violent degree, with constant rain and sleet, the top-gallant masts were got down upon deck, and the top-masts stuck close to the rigging. From this time to the 30th, the weather was so strong, that their operations on shore were considerably retarded. During this interval, only three canoes came along-side, with cod and halibut, sufficient for a day's support of the ship's company*.

Being at Garden Island on the 9th, Captain Portlock

their paddles, and went off as expeditiously as they were able. The captain rowed out and joined the Charlotte's boat, and soon perceived that the Indians had taken all their fishing lines, and were forcing their anchor out of the boat at the very moment that he was in sight.

* On the 16th of June the weather being fine, the captain, the boatswain, with four of the people, went to dig a spot

Portlock saw the Nootka turning in towards the port, and dispatched the whale-boat and yaul to her assistance. At seven o'clock she anchored just without the King George. Some Indians coming into the bay the next day, seemed rather shy on seeing the Nootka, which might probably have been occasioned from their having fired at some of the natives before they quitted Sutherland's Cove, and wounded one of them. Captain Meares went on board the King George, to request his assistance, which was readily complied with.

On the 11th the long boat returned from Cook's River, having met with tolerable success; Messrs. Hayward and Hill assuring Captain Portlock that more business might be transacted in another trip. As soon as the boat was cleared, she was ordered to be fitted out with provisions, and an assortment of trading articles, for a second expedition.

The seamen and artificers were occupied in various employments for the Nootka, till the 15th, when a strong gale came on, with violent gusts of wind, and heavy rain. The weather becoming moderate on the 16th, the people resumed their various employments, and by the 17th the Nootka was in a condition fit for sea. For some time the weather had been extremely wet, and had much injured the health of many of the seamen; several of whom were ill of fevers, and violent colds. The Nootka being ready for sailing, Captain Portlock sent his whale-boat on the 19th, to assist them in getting under way, and at one she stood out of the cove: their spruce beer, being now in excellent order, was daily served out to the ship's company; and the sick people received considerable benefit from it.

The surrounding country now wore a plea-

of ground for a garden, on a small island near the entrance of the cove, and which he named Garden Island. When the ground was ready, a variety of different sorts of seed were sown in it; as cabbage, onion, radish, saroy, celery, and many other culinary articles. On the 7th a canoe, with five Indians, came along-side, from whom the captain bought two sea-otter skins, and a considerable quantity of fine cod.

At ten in the evening the whale-boat and yaul returned from their expedition, with some very good skins, which they had purchased of a chief named Sheenaawa. The captain intended them for a longer trip, but they unluckily got into a large flat bay, where the boats grounded, and, before they could extricate themselves, the tide ebbed, and left them dry for about two miles round. Sheenaawa, and

sing aspect; the rains had melted most of the snow, and every thing seemed to indicate the approach of summer. The surgeon, and many who had lately been his patients, walked on shore, on the 20th, and gathered a quantity of water-cresses, which grew on the margin of the fresh-water rivulets. Plenty of flounders were caught in these streams with hook and line: these, with excellent crabs, which were abundant, proved an admirable substitute for salt provisions. In fishing for flounders, several cod and halibut were taken; which induced the captain to send the canoe some distance into the bay, to try for them; the canoe returned, laden with halibut and cod of very excellent quality.

In the afternoon they were visited by an Indian party, bringing with them some good sea-otter skins. They pointed towards the south-west, signifying that plenty of good furs might be procured from that quarter. This information occasioned the captain to send the boats on another expedition; and on the 24th he dispatched the whale-boat and yaul on a trip to the south-west part of the Sound, with provisions for a month, and a regular assortment to ensure success in trade. Such of the ship's company as could be spared, were now indulged with leave to recreate themselves on shore: Some of them ascended the highest hills in the neighbourhood, on the sides of which grew snake-root in great abundance, and a variety of flowers in full bloom. About eight in the evening Captain Portlock observed two Indian boats, and several canoes, enter the bay, landing on a sandy beach about three miles and a half from the ship.

Early the next morning, these new visitors came along-side, in one of their large boats; they consisted of twenty-five persons. Their

his tribe, which consisted of about two hundred men, observing their situation, paid them a visit, most of them armed with spears and knives. The boats crews, perceiving that plunder was what the Indians wanted, endeavoured to prevent it, but at the same time prudently kept their plunderers in good temper; which was acting very judiciously; for had they acted otherwise, and forcibly prevented them from stealing, not a man in either boat could have escaped the vengeance of their numerous opponents. The plundering party, all circumstances considered, were satisfied with moderate plunder. They stole two muskets the same number of pistols, and some of the people's clothes; and what old Sheenaawa regarded as a thing of incalculable value, was Mr. Crossleman's quadrant, which he anxiously seized, together with his ephemeris.

+ They daily caught weather not permitted

chief seemed to be a well-disposed man, of low stature, having a long beard. His body had been injured on one side, probably by a paralytic stroke; and his age was supposed to be about sixty. The old man made Captain Portlock a present of a valuable skin, but had hardly anything else to dispose of except a few salmon, which the captain bought of him. He also made the chief a present, and distributed some trinkets among the women and children.

The name of this chief was Taatucktellingnuk: he informed the Captain that Cheneecock, situated in the south-west part of the Sound, was the country to which he belonged. Our new friends remained alongside the remainder of the day, and went on shore in the evening extremely well satisfied. The whole of his party were courteous, well informed, and well disposed. The natives belonging to Tacklaccimute, whom the captain supposed to inhabit Comptrollers' Bay, are particularly docile and friendly*.

Sheenawaa, whilst the Nootka wintered in Sutherland's Cove, sent repeated messages, intimating that he intended to come and cut them off. These messages, or rather menaces, were always delivered to an Indian girl, that an officer had purchased on their first arrival in the Sound. This girl made her escape from the Nootka in the winter, and probably gave an account of her weak and defenceless situation; as there can hardly be a doubt, from the number of men that Sheenanaa had with him at the time of the affair with the boats, that he meditated an attack on the Nootka; but bad weather coming on afterwards probably frustrated the design.

Taatucktellingnuk visited Captain Portlock on the 26th, requesting him to permit one or two of his people to attend him on shore to spend the night, offering to leave some of his people on board as hostages till their return. This singular request was complied with, and he ordered two of the people to accompany him on shore: he

left three of his tribe on board, fully to convince the captain that he intended no harm. Early the next morning the old chief came again on board, and brought the two Europeans with him. Hostages being then formally exchanged, the captain made the old man and his companions some inconsiderable presents, and they all went to shore, perfectly satisfied with the attention that had been shewn them.

These Indians lodged in temporary huts, composed only of a few sticks, and a little bark: their principal food was fish, but by way of variety they fed on the inner rind of the pine-bark dried. Their greatest luxury was, however, a kind of rock-weed covered with the spawn of some fish, of which they gather and devour great quantities: they also eat the inner rind of the angelica and hemlock roots, which, though absolute poison to our Europeans, by constant and habitual use became salutary to them.

In hauling the seine on the 30th, they caught a large quantity of herrings, and some salmon; the herrings were small, but very good, two hogsheads of which were salted for sea-store. On the first of July old Taatucktellingnuk took his leave of the captain, and with his tribe paddled from the harbour towards Montague Island†.

On the 21st Captain Portlock went in the whale-boat into a small bay, about three miles from the ship, where some days before he had discovered a quantity of fine water cresses. The weather being tolerably fine, the captain took several of the people with him who had lately recovered from sickness, that they might have a walk, and receive some refreshment from the water-cresses: this little excursion had a beneficial effect on every one; they sat down on the grass, and dined heartily upon fried pork and salmon, and, by way of salad, ate abundantly of the water-cresses; they also gathered a sufficient quantity to serve every per-

* The country, inhabited by Sheenawaa and his tribe, is called Taatucktellingnuk; and they are said to be the most powerful tribe about the Sound, being hated by all their neighbours, with whom they are perpetually at variance. Old Sheenawaa (whose rapacious disposition has already been noticed) had never appeared in the harbour after his depredations in the boats; but some of his people brought our navigators a few sea-otter skins, which they had procured by plunder or barter.

† They daily caught large quantities of salmon, but the weather not permitting them to be cured on board, captain

Portlock sent the boatswain with a party on shore, to build a kind of house to smoke them in: in this erection there was sufficient room to hang six hundred fish up conveniently; and, seven fires being constantly burning, they were extremely well cured. The seine was several times hauled on the 11th, and not less than two thousand salmon were taken at each haul; but as the weather would not suffer them to cure them as well as they could have wished, they only kept a sufficient quantity, and let the rest escape. The salmon were now so numerous along the shores, that any quantity of them might be taken with the greatest ease.

son on board. Behind the beach where they landed, a fresh-water lake empties itself into the bay by a small river at the northern part of the beach, in which there was abundance of salmon. On the edge of the lake, the track of an animal was observed, which much resembled that of the mouse-deer. They returned on board in the evening, without seeing any of the Indians.

The long-boat appearing in sight the next day at noon, it appeared that all her crew were in good health. In this trip they had experienced much very bad weather, and had not been so successful as they expected. They fell in with numbers of the Kodiak Indians, who always be-

haved with great propriety, as did all the inhabitants of the river.

On the 24th their wooding and watering was completed, and every thing they had on shore taken on board: they lopped off the branches of the tallest tree on Garden Island, and fixed a long staff with a wooden wane on it; near the bottom was inscribed the name of the ship, with the year, and day of the month. Every thing being ready for sea, they weighed anchor at two o'clock in the morning of the 25th, and stood out of the cove; and by four, being clear of the cove, the boats were hoisted in.

SECTION VI.

Range along the Coast of Montague Island—Prince William's Sound—The Inhabitants, Manners, and Customs—Food—Cookery—Produce—Weapons—Hunting Implements—Anchor in Portlock's Harbour—Intercourse with the Natives—Long-boat sent on a trading Expedition—Visited by a distant Tribe of Indians—A Party of Traders from the East—Visit the Natives—Visit from North-west Friends—Account of the Natives—Leave Portlock's Harbour.

ON quitting the harbour (which was named Port Etches) Captain Portlock intended to stand out of the Sound by way of Cape Hinchinbrooke, but not approving of the appearance of the weather to the south-east, he resolved to push for the passage on the west side of Montague Island. He therefore shaped a course for the north point of Montague Island, with a fresh breeze at east-north-east.

After various occurrences of no importance, they were obliged to anchor in twenty-one fathoms water, over a black sandy bottom; the south point of the bay bearing south three quarters west, two miles, and the south point of some low land, lying off the entrance: into the Prince of Wales's Passage west by south, three leagues distant. Soon after they arrived in the Bay, three of their old friends from Cheenecock came along-side, in two canoes: they were on a hunting expedition, and had three very good sea-otter-skins in their possession, which they readily parted with on receiving what was equivalent.

As they were now taking leave of Prince William's Sound, some description of the natives, their manners, customs, &c. with the pro-

duce of the country, may probably afford the reader satisfaction; the following particulars, which are the result of very close attention, and minute remarks on their behaviour and general conduct, will not be perhaps unacceptable.

These people are, taken in a general point of view, short in stature, and square made: their faces are flat and round, and they have prominent cheek bones, with flattish noses: their teeth are white, and good; their eyes dark and quick of sight: their smell, which is naturally acute, is much improved by their habitual method of scenting the snake-root. Their complexions are generally lighter than the Southern Indians, and rosy cheeks are seen among some of their women: their hair is black and straight, and they delight in having it long; but on the death of a friend, they cut it short, to signify their sorrow; no other method seeming to have been adopted as expressive of their lamentations. The legs of the men are generally ill-shaped, which may be rationally attributed to their constantly sitting in one position in their canoes. They are not destitute of pride or vanity, for they often paint the face and hands, cause their ears and noses to be bored, and the under-lip slit.

An

VOL. II. No.

An ornament made of bone or ivory, is hung in the hole of the nose to decorate it, and from the ears beads are usually pending, which extend almost to their shoulders. The slit in the lip is also ornamented with bone or ivory, fitted with holes, which are sometimes embellished with beads reaching to the chin. These holes in the lip are sometimes as large as the mouth, and have a very disgusting appearance. But with all this imaginary finery, they are extremely filthy in their persons, and are frequently covered with vermin, which in times of scarcity, are frequently taken as food. Captain Portlock says, "I have seen them pick and eat to the number of a dozen or more; and they are not very small*."

During the intercourse of our Europeans with these people, they became less addicted to thieving, from Captain Portlock's sometimes appearing a little angry with them, and taking pains to shew them the impropriety of their conduct. Upon the whole they seem to be a good kind of people, and could a settlement of sufficient strength be established, they would probably be an industrious set of people, in hunting and procuring sea-otter, and other skins for sale. The weaker tribes are frequently plundered by the stronger, and often prevented from hunting, which would not be the case were a proper settlement established; for that would give protection to the whole inhabitants of this Sound†.

The country round it, after the snow leaves it about the middle of June, is pleasant enough: before that period, the weather is at times, very fine and pleasant, and at other times exceedingly

* Their cloathing consists wholly of the skins of animals and birds. They are very friendly; and remarkably tender and affectionate to their women and children; but if the least improper treatment is practised to their women, their indignation is great. Thieving is a prevailing propensity among them; a vice by no means peculiar to themselves, but equally observable in all other Indians; not only from strangers, but from one another. When they happen to be detected, they will sometimes give up the articles they have stolen, with a loud laugh, and instantly appear as unconcerned as if nothing had happened amiss. Thieving, among these people, is rather considered as meritorious, instead of disgraceful, if the pilferer has shewn any dexterity, but the bungling robber is not much admired. The professed thief is generally known by a profusion of paint upon his face; and whilst others are admiring the whimsicality of his appearance, his hands will constantly be employed, if any thing near him is entitled to his attention.

† The whole of these people stand so much in awe of

boisterous with constant rain, which washes away the great quantities of snow, leaving the lower parts clear, and the vegetables are instantly perceived coming forth.

This country abounds in trees of the pine kind, a quantity of alder, and a kind of hazel. Fruit-bushes are extremely plenty; such as raspberry-bushes, bilberry-bushes, alderberry-bushes, currant-bushes, and strawberries. Here are water-cresses, wild celery, sour dock, shepherd's purse, angelica, hemlock, and wild peas. The buds of the young black-currant bushes were made use of as tea, with the pine tops mixed, which drank very pleasant‡.

During the summer season, these people lead a strange wandering life, and in bad weather, are either sheltered in their canoes, or small sheds, made of a few sticks, covered with bark: their winter habitations are from four to six feet high, about ten feet long, and seven or eight broad. They are built with thick plank, and the crevices filled up with dry moss.

Their weapons used in war are spears of sixteen or eighteen feet long, headed with iron, and long knives, in the use of all which they are astonishingly dexterous. Their fishing implements are wooden hooks, with lines made of small rock-weed, which grows to a good length, and will bear a good strain, if kept clear of hinks, and properly moistened: with these hooks and lines they catch halibut and cod; they catch salmon in wiers, or spear them; and herrings are taken in small nets. The instruments with which they kill the sea-otter, and other amphibii-

fire-arms, that a few men well provided would be perfectly secure. Captain Portlock says, "Were I to advise a place for wintering at and forming a settlement, it should be the west harbour of Port Etches. It hath several advantages over any place I have seen on the coast; one of them is, that it lies so near the sea, that in all probability it would be one of the last places that would freeze, and one of the first in which the ice would break up."

‡ The natives never practise the method of smoking their provisions; and, for salt, can only dry their fish in the sun, having no other method of curing their winter stock: they generally roast their fresh fish, by running some sticks through to spread it, and clapping it up before the fire. They usually dress their animal food in baskets or wooden vessels, by putting to it red hot stones, till they think the victuals are dressed enough. It is indeed astonishing that they can dress their provisions so expeditiously as they do in this way.

ous animals, are harpoons made of bone, with two or more barbs; having a staff of seven or eight feet long, on which a skin, or well-blown bladder, is fastened as a buoy; and darts of three or four feet long, which they throw with a wooden instrument of the length of about a foot.

Being well clear of Montague Island, they stood to the southward and eastward, intending to make a harbour near Cape Edgecombe. All the land next the sea, beginning about eight leagues to the south-east of Cross Cape, and trending to within ten leagues of Cape Edgecombe, appears to be composed of low woody islands, having apparently several places of good shelter. On drawing near the opening, about two miles from the shore to the north-west of it, they had twenty and twenty-five fathoms water. A large Indian boat came out, perhaps to view the ship: of twelve people who were in her, only three of them were men; the rest were women and children.

The navigators run up to the north-west of the harbour, and anchored about noon. Soon after they were moored, the Indian boat, which had followed them, came along-side, and the people entertained them with a song. Their language appeared to be totally different from that spoken by the natives of Prince William's Sound; but they extended their arms, like those people, as indications of peace. Their boat was the body of a large pine-tree, neatly excavated, and the whole of it neatly and elegantly finished. Captain Portlock made his new visitors a few trifling presents, and spoke to them about sea-otters' skins, by the name they bear at Prince William's Sound; but as they did not understand him, he shewed them a sea-otter skin, intimating by signs that he requested they would bring him some; to which they seemed perfectly inclined. They were ornamented with beads of various sorts, and had some articles which induced him to suppose that the Queen Charlotte had touched near this neighbourhood; particularly in a tin kettle and some towels, exactly corresponding with

* Towards evening the visitors were preparing to go on shore, but by securing the captain's friendship, they wished to leave one of their party on board for the night, and take one of his people with them on shore. As they seemed to betray no mischievous or plundering disposition by their manner of behaviour, the captain had no particular objection to the proposal; especially as the person he might send would have an opportunity of observing what number

theirs. The Indians, after receiving a few presents, left the ship and went on shore, where they continued a short time, and then returned with a few dry sea-otter skins. The chief informed Captain Portlock that they had frequent intercourse with the inhabitants of Prince William's Sound, in the course of which quarrels sometimes arose, and battles frequently ensued; one of the men pointed to a deep wound near his hip, which he had received in an engagement with them*.

Early the next morning the Indians returned with the European, to be exchanged; but they brought very little trade. The person who went on shore with the Indians, informed the captain that their residence was at the foot of a hill, near a run of fresh water, issuing out of an adjacent valley. Their house seemed to be of the temporary kind, and very few articles of trade were to be seen in it.

The long-boat, at five in the morning of the 7th of August, was sent on a trading expedition towards Cape Edgecombe, and the islands to the south-east of that cape: the adventurers were particularly enjoined to return in seventeen days; and, if they happened to fall in with the Queen Charlotte, to desire Captain Dixon to sail with them towards their present harbour, and remain in the offing till Captain Portlock should join him.

The adjacent country abounding with white cedar, Captain Portlock sent the carpenter on shore with a party, to cut some for sawing into sheathing boards: the remainder of the ship's company were employed on various necessary occasions. A small canoe came along-side on the 8th, with one man and a woman; but they had nothing to dispose of: they soon returned towards the eastern point of the Sound. About eight in the evening, the same canoe came again, in company with two large boats, containing twenty-five persons. They entertained the Europeans about an hour with singing, and then took their leave, and went on shore. On leaving

of sea-otter skins they had in their possession, and might be enabled to form an idea of their manner of living. He therefore permitted one of his people to go on shore; and that he might be under no apprehension about his safety, two of the Indians (instead of one as had been at first proposed) remained on board, and behaved very properly. They were good-looking young men, and had much the appearance of being brothers.

the ship, they intimated that they had some excellent skins to dispose of, and that they would produce them in the morning: soon after daylight they again made their appearance alongside, bringing five excellent sea-otter skins, with a number of beautiful black skins; such as the captain had never seen before, but he supposed they were a species of seal.

This tribe traded very conscientiously and fairly, and as they had not exhibited *traits* of a thieving disposition, the captain admitted several of them on board. When dinner was served in the cabin these people required very little invitation to partake, but began to eat very heartily; and so well did they relish the repast that was set before them, that the table was soon cleared, and there was occasion for another course: that was accordingly brought in; and they ate with as keen an appetite as before; but being at length fairly satiated, they gave over, but with some reluctance. After surveying the different parts of the ship, and receiving some inconsiderable presents, they returned to the shore, well satisfied with their luscious feast*.

These Indians had a quantity of beads about them, extremely different from any that the captain had before seen: they had also a carpenter's adze, with the letter B and three *flour-de-lis* on it. The chief declared that he received these articles from two vessels, which had been with them to the north-west: he further observed, that they had a drum on board, and several great guns. When this small party had done trading, the chief requested to stay all night on board with the elder boy; a boon which the captain willingly complied with, and sent Joseph Woodcock on shore with the other man and child. The chief from the north-west, with his little

party, took leave of the captain the next morning, and proceeded towards home; promising him to return in the course of eight or ten days with more sea-otter skins.

On the 11th of August two large boats came into the Sound from the eastward, containing individuals belonging to a tribe who were entire strangers to the Europeans: of men, women, and children; taken collectively, they amounted to twenty-five. Of these Captain Portlock bought some valuable sea-otter skins, a cloak of small black skins, and several separate hides of the same denomination. This new party of dealers did not associate with the other Indians: but when the business was over, and their curiosity gratified, by examining the ship, and its contents, they went on shore in a bay near the ship, where the cooper was employed in brewing spruce-beer†.

The next morning the captain went in the whale-boat, accompanied by Mr. Wilbye and one of the young Indians, to the residence of the latter; he undertaking to be their guide and conductor. Rowing to the north-west for about two miles, they came to a point of land, which was found to be an island, situated at the entrance of an arm of the Sound, which trends away between north and north-east. The Indian informed the captain that his habitation was situated up that arm. Arriving at his place of abode about noon, they found it a small temporary house; near which were the ruins of two others which had been considerably larger, and seemed to have been used as winter habitations. On the beach was observed a large boat, and three others on a smaller scale; the large one could accommodate thirty persons, and the others not exceeding ten each. From this circumstance

* About one o'clock on the 9th of August, an Indian boat came into the Sound with two men, a boy about twelve years of age, and a young child in her. One of the men was not only a fine looking fellow, but had much the appearance of a person of great consequence. Captain Portlock bought of these visitors some fine sea-otter skins, and a number of wild geese. The method of catching these birds is, to chase and knock them down as soon as possible after they have shed their large wing-feathers, when they are unable to escape by flight.

† Some of their old friends came on board in the evening to sleep with them, and a man was sent on shore by way of hostage as usual: it appeared necessary to conform to the custom of the natives in this particular; for more than once, when hostages were refused in consequence of the appearance of bad weather, they were much alarmed,

and would not come near the ship on any consideration.

On Sunday the 12th Captain Portlock permitted the ship's company to recreate themselves on shore, supposing a walk would be highly serviceable to them: the surrounding country was pleasant and agreeable, affording great quantities of ripe blackberries and raspberries. In the course of their ramble, this party fell in with a large spot of low swampy ground, situated behind the brewery beach, on which the Indian tea grew in great abundance. This discovery was fortunately made at a critical period; the greatest part of our other tea being expended, and that which we had so recently explored was found a most excellent substitute. It grows on a low shrub, about twelve inches from the ground; the leaf is about half an inch long, tapering gradually to the point, and the under part is covered with a light downy substance.

he expected to have seen a numerous tribe, and was surprised to discover that it consisted only of three men, three women, the same number of girls, two boys aged about twelve years, and two infants. One of the women appeared to be at the advanced age of eighty; the eldest of the men was very much marked with the small pox; and the disease seemed to have been equally severe with a young girl of the age of about fourteen. The old man said that distemper had carried off a great number of the inhabitants, and that he himself had lost ten children by it; ten strokes were tattooed on one of his arms, to signify that he had sustained such a loss. The captain did not observe any of the children under twelve years were so marked, and therefore supposed this disorder about twelve years before that period: as the Spaniards were on this part of the coast in 1775, it seemed probable that from them these poor wretches caught the fatal infection. They seem to be a nation designed by providence, to be a scourge to every tribe of Indians they come near*.

On the 15th the long-boat returned from her expedition to the eastward; she had been to the eastward of Cape Edgecombe, where they met

* The Spaniards were among them in the height of summer, and probably they caught the infection about August. To observe their manner of living at that season of the year, it seems miraculous that any of them should escape with their lives. Men, women, and children are all huddled together in a close house near a large fire, surrounded with stinking fish. All round the house, and along the banks of a little creek running down by this miserable dwelling, were strewed stinking fish; among which were observed several beds of maggots a foot deep, and ten or twelve feet in circumference. The sufferings of the poor Indians, when this disorder was at its height, must have been inconceivable, and the country was doubtless nearly depopulated; for to this day it remains very thinly inhabited.

† A short time before they intended sailing to return to the ship, two Indians went in two boats, and took an opportunity of cutting their cable. The anchor lay in twenty-eight fathoms water without a buoy, so that there was not the least chance of recovering it. Having accomplished this piece of mischief, they hastened to the shore, and landed at a small distance from the long-boat. Exasperated at their daring behaviour, the Europeans landed with the boat, and entirely destroyed both the Indian boats; when the natives fled into the woods. This crime of the Indians was of so mischievous a nature, that it became necessary to punish them for it; and the destruction of their boats would probably make a greater impression than taking away some of their lives. After filling their water,

with some inhabitants, and purchased about a score of good sea-otter skins. Between the harbour and the cape, they fell in with a strait about a league wide at the entrance, with bold shores and good anchorage†.

On the 20th their late visitor from the south-west made his appearance in a large boat; his party consisting of twenty men and women, and ten or twelve children. As this chief, on his taking leave of Captain Portlock, had promised to return with a large cargo of sea-otter skins, a brisk trade was now expected to begin; but at this time his old acquaintance was not for transacting business in a hurry; he supposed that, on his last visit, they were not impressed with an adequate idea of his importance; for now he came along-side, with his party, in great pomp and solemnity, all of them singing; they had instrumental, as well as vocal music, which consisted of a large old chest, beaten with the hands, by way of drum, and two rattles. The chief held one of the rattles in his hand, often shaking it with an air of consequence, and the rest of his tribe were particularly exact in copying his motions‡.

After this long ceremony was over, the chief made

and getting a little wood on board, the long-boat returned to the ship, and during the whole passage did not see a single canoe.

On the 18th Captain Portlock went in the whale-boat to survey the south point of the entrance into the Sound; and, landing in a small bay, found a sort of monument near the beach, probably erected to the memory of some distinguished chief. This edifice consisted of four posts, each about twenty feet long, stuck in the ground about six feet distant from each other, and in a quadrangular form. About twelve feet from the ground there was a rough boarded floor, in the middle of which an Indian chest was deposited; and on the side of the edifice to the westward, and which pointed up the Sound, the resemblance of a human face was painted. This wooden edifice, from its tottering condition, had probably been erected a long time, as it began to decay: in attempting to examine the chest, to learn what it contained, the whole fabric had like to have given way, on which Captain Portlock ordered the boat's crew to desist, that a building might not be destroyed that was possibly looked upon by the Indians as sacred, and which they were anxious to preserve.

† He was decorated with an old coat, made of cloth which formerly had been scarlet, with some old gold or silver fringe about the shoulders; he had also a cloak, embellished on each side with a profusion of buttons, and small lead pipes, each about an inch long. His hair, after having been well oiled, was entirely filled with down taken from gulls: and in this grotesque figure, he displayed a

made the captain a present of half a sea-otter skin; but produced nothing for sale, intimating that he must go on shore before any traffic could begin. Returning again, with his party, Captain Portlock thought the traffic would instantly commence; but he was again disappointed, for singing was again begun; and, in order to vary the amusement, the chief represented a variety of characters, whilst his people were engaged in singing. At one time he appeared as a warrior, and assumed an appropriate dress, and seemed to have all the ferocity of an Indian conqueror about him. He next appeared in the character of a woman, wearing a mask which represented a woman's face, with their usual ornaments; this character was so well imagined and supported, that it seemed beyond the reach of Indian art.

After the conclusion of this entertainment, of which the approbation of the spectators was expected and required, the chief and his attendants came on board, and trade was proceeded on. In the course of the day Captain Portlock bought twenty-five pieces of good sea-otter, equal to about ten whole skins; but it appeared that the chief charged for the entertainment as well as the furs, for he was obliged to pay extravagantly dear for the articles he purchased.

The chief remaining on board with one of his people, and as he required a hostage, the captain sent Joseph Woodcock on shore with his party. Woodcock having been frequently left as an hostage, was become intimate with many of the natives, and they seemed excessively fond of his company. Upon one of these occasions, he remained three days among the Indians; which gave him an excellent opportunity of observing their customs and mode of living; and his account exactly tallied with the captain's own observations on shore: their filth and nastiness ex-

ceeded all conception; and their food, which consisted principally of fish, was mixed with stinking oil and other disagreeable ingredients. The remains of every meal were thrown into a corner of their hut on a heap of the same kind of materials in a complete state of putrefaction, which diffused a very loathsome and offensive odour: to render the situation still more horrible, the same apartment served them both to eat and sleep in.

This comfortless situation frequently induced Woodcock to take a ramble into the woods; but his motions were strictly watched by some of his new companions, who were always apprehensive that he sought an opportunity of making his escape from them. Once in particular, when he had rambled a considerable distance from the residence of the Indians, he began to amuse himself with whistling; not supposing, even if the natives heard him, that they could possibly be offended; but in this respect he was exceedingly mistaken; for several of them ran up immediately, and insisted on his silence. Not perfectly comprehending the meaning of this peremptory injunction at first, he ventured to go on with his tune. One of the natives, however, put a stop to it, by laying his hand on Woodcock's mouth; considering the whistling as a signal for his companions to come for him. But though he was thus narrowly watched by these people, they treated him in other respects with great kindness; and, at their meals, selected the nicest morsels for him to regale on, mixing his fish with plenty of putrid oil, which in their opinion, added greatly to its perfection: they were so fully convinced of the delicious relish communicated by this oil, that he found it no easy matter to persuade them to let him eat his fish without sauce*.

On the 21st the Indian chief, with his party,

Poor Woodcock soon became as much caressed by these crawlers as his companions, but as such guests were a novelty to him, he began to feel his situation extremely disagreeable. The Indians endeavoured to persuade him to retaliate in the manner they were accustomed to act; but this was so totally repugnant to his feelings, that he could not follow their plan of operations. At length, however, he prevailed on some of the women to drive them from their quarters, and the hunters were probably well paid for hunting by the game they captured.

returned on board, but he was as tedious in the disposal of his furs as he had been on the preceding day. About seven in the evening their trading was finished; and, knowing the neighbourhood was cleared of all the furs, Captain Portlock resolved to take the earliest opportunity of quitting the Sound: the ship was consequently immediately put into a state fit for sea.

This party from the north-west understood the art of thieving with as much dexterity as any of their former visitors in the Sound. When any one had fixed his eye on an article he intended to steal, it is astonishing to see with what patience, secrecy, and dexterity he will convey the booty away. One fellow, in particular, conceived a fancy, for Captain Portlock's drinking mug, which was a black-jack: he had got it under his frock, which was made in the fashion of those at Prince William's Sound; but, unfortunately for the poor fellow, it happened to be about half full of beer, a part of which having splashed over, discovered the thief and his intentions. Though the captain kept two people continually in his cabin, to observe the motions of the bystanders, whilst he traded with any of them, one fellow found an opportunity of getting a cutlass under his frock, and was not detected till he was descending the side of the ship. Captain Portlock took it from him, gave him several strokes with the flat side of it, and afterwards drove him from the ship. Yet, notwithstanding all their vigilance, another fellow stole out of a box in the cabin four pair of worsted stockings, and several other articles, with which he got out of the ship undiscovered. Their visitors from the east appear to have much more honour and honesty than the western people, and are less savage and ferocious.

The women at this Sound, which has obtained the appellation of Portlock's Harbour, disfigure themselves in a very extraordinary manner, by making an incision in the upper lip, in which they wear an oval piece of wood, the size being regulated by the age of the wearer; some of them had these ornaments of the magnitude of a tea-saucer. The weight of this preposterous embellishment drags the lip down so as to cover the whole of the chin, leaving the lower teeth and gum naked and exposed, which gives them a disagreeable appearance. The children have their lips bored when about two years of age,

and put a piece of copper wire to prevent it from closing; this they wear till they are about fourteen, when it is taken out, and the wooden ornament introduced. They also have their ears bored, where they wear their ornaments of beads and other things. Their apparel is the same kind as worn by the men; and both sexes delight in long hair, considering it as a very prepossessing ornament. The women wear the hair either clubbed behind, or tied up in a bunch on the crown of the head: the men wear it loose, or tied at the crown. The method of dressing the hair with bird's down, is only practised by the men. The women are generally hair-dressers for their husbands, in which character they conduct themselves with dexterity and good nature.

Polygamy is not countenanced here: Captain Portlock never observed any of the natives to have more than one woman, whom he seemed to consider as his wife; to whom they pay strict attention, and treat with tenderness and affection: any familiar advances towards another's wife is deemed an unpardonable affront. Both men and women are also fond and affectionate parents. The women are the treasurers, who generally keep their riches in a box or basket; and the women also take the lead in fashions. It is not the custom of these people, as with the South-sea Islanders, for the men and women to eat separately, nor are the females confined to food of a particular description. Men, women, and children sit down indiscriminately at their meals, which principally consist of different kinds of fish: such as salmon, seals, sea-otters, porpoises, and a variety of shell-fish.

Their persons, with regard to size, are like the Europeans: the men have a fierce and savage aspect, which, with their dress, gives them much the appearance of warriors; their weapons of war are daggers, and long-pointed spears: they are soon irritated, and their revenge is unlimited: being well acquainted with their tempers, Captain Portlock always guarded as much against them as possible: and upon all occasions took care to be well provided for them in case of an attempt, by keeping his pistols ready charged before him.

Their women, were it not for the filth which they abound in, would be by no means disagreeable; their features in general are pleasing, and expressive of a modest diffidence. They frequently

quently gave witness the when the wood those times, the line, and began innocent scenes while they were pened to pleaur laugh, they alburst of joy and however, is har

quently gave our navigators an opportunity of witnessing their desire to please, particularly when the wooding party went on shore. At those times, they usually ranged themselves in a line, and began to sing, not omitting to exhibit innocent scenes of drollery, to please the people while they were at work. If their exertions happened to please the people, and make them laugh, they all immediately joined in a loud burst of joy and approbation. Their language, however, is harsh and unpleasant to the ear.

The habitations of these people are made of a few boards, which they take away with them when they repair to their winter quarters. It is

surprising to see how well they shape the boards with the wretched tools they employ. Their country is mountainous, and covered with the pine-tree; many of which grow to an amazing size.

They have great ingenuity, which they demonstrate upon various occasions: they form a curious basket of twigs, in which they frequently boil their victuals, by putting red-hot stones in them. Their ideas of carving are far from being contemptible; every utensil they make use of, having some rude carving, representing one animal or another.

SECTION VII.

Passage from the Coast to the Sandwich Islands—Transactions there—Letters received from Captain Dixon and Mr. Ross—Their final Departure—Passage to China—Arrival there—And proceeded to England—Anchoring in Margate Roads on the 24th of August, 1778.

ON the 17th of September, at two in the morning, standing to the south by east, Captain Portlock saw a large flight of flying-fish, the first during the passage: also a few tropic birds, and some bottled-nose porpoises. From this time to the 27th, nothing interesting happened; and then, at half past eight, they saw the high land of Owhyhee, bearing west-south-west, distant fifteen or twenty leagues. On the 28th at five in the morning, they found themselves two leagues and a half from the land: at which time they bore up, and made sail towards the shore. At five they were six miles from the shore, when a parcel of canoes came off with the different productions of the island; as hogs, fowls, bread-fruit, plantains, taro, and a few cocoa-nuts. Of other articles they also bought an abundant supply; and though there was a heavy swell, and the day unsettled, some of them made several trips to shore, before the evening came on, for other cargoes, as they disposed of their first. Remaining within about four or five miles of the shore, from seven in the morning till seven in the evening, they purchased about two hundred hogs and pigs, six dozen fowls, three tons of bread kind, with plenty of fishing gear: they found these articles very commodious

for trading with, as they could get provision for them upon very moderate terms.

On the 29th of September they caught several very large sharks: it was astonishing to see how little these fish are dreaded. Captain Portlock frequently saw five or six large sharks swimming about the ship, when there have been upwards of a hundred Indians in the water, including men, women, and children. They seemed perfectly indifferent about them, and the sharks never attempted to make an attack upon them, though at the same time they would seize the bait of the Europeans very greedily.

On the 3d of October, in running along shore, a number of canoes, large and small, came off to our navigators, but had hardly a single article of provision. From these visitors they understood that the king, and most of the principal men of the island were at Oneehow, and that previous to their setting off for that island, they had tabooed the hogs, and prevented their getting any. They were also informed that the Nootka and Queen Charlotte had been at the island: and Captain Portlock received intelligence that Captain Dixon had left a letter for him with Abbenooc, which then lay at his house at Wymoa. The next morning a young man, named Tahiree,

who

who was the son of Abbenooe, came on board, with intelligence that the letter was tabooed in the house, and could not be delivered to any person but Abbenooe, or in obedience to his direction. About ten o'clock the following morning, Captain Portlock, made sail for Oneehow, with a fair breeze at east south-east.

On the 4th of October, at six in the evening, they came to anchor on the south-west side of Oneehow, in sixty-two fathoms water. At nine in the morning two canoes came alongside, from which they procured a temporary supply of yams. From the people of these canoes they understood, that Abbenooe would be on board in a short time, accompanied by the king and his principal men. About two in the afternoon the king came on board, attended by Abbenooe and the principal men of Oneehow and Atooi, bringing with them a large quantity of yams and potatoes. Abbenooe, observing one of the people, who was just returned from shore, having only one shoe on, enquired what was become of the other. Being informed that he had lost it in the surf, as he got into the boat, Abbenooe took a canoe and paddled away for the beach, and in less than an hour he returned on board, bringing the shoe and buckle, greatly delighted that he had been successful in his undertaking.

In the morning of the 7th, a messenger from Atooi brought Captain Dixon's letter, dated the 18th of September, and that he had left the coast, on the 9th of August, all well, and with fifteen hundred skins. November 4, at five in the evening, saw, at day-light the islands of Saypan and Tinian. At half past eight, the passage between Saypan and Tinian open, steered for it, and about nine passed close to the south end of Saypan, immediately to the westward, off which point is a good bay*.

On the 18th, at day-light our navigators were

* A number of white animals were observed grazing on the plains of Tinian, which were supposed to be the white rattle with which Lord Anson says the island of Tinian so much abounds. They could not, though within half a mile of Saypan, perceive an animal of any kind: but both the islands appear transcendently beautiful, abounding in immense quantities of cocoa-nut and other trees.

+ Whilst they lay there, a dangerous mutiny happened on board the *Belvidere*, Captain Greer, then lying at the same place. On which occasion a court of enquiry was held for the trial of the mutineers. The court having gone through the evidence, and asked what the prisoners had to

surrounded by a number of Chinese fishing vessels, or junks. At half past nine, seeing a Chinese vessel steering towards them, they shortened sail, and brought to, hoping to get a pilot out of her. Sent the whale-boat on board her, which speedily returned, accompanied by a boat from the Chinese vessel, in which came a pilot, with whom Captain Portlock agreed for his carrying the ship to Macao for fifty dollars. At half past ten stood to the west-north-west.

On the 21st they weighed, and stood towards Macao, and at half past four anchored in Macao-road, in four fathoms and a half. On the 25th, at two in the afternoon came to six fathoms, two miles below Wymoa†.

On the 30th of May Captain Portlock sailed for England, and on the 13th of June arrived at the island of St. Helena, from whence they resumed their passage on the 19th, and anchored in Margate Roads on the 24th of August: the people all in high spirits, and rejoiced to see their native shore.

The grand object of the voyage, of which an account is given in the preceding sheets, being to trade for furs, in expectation of finding it an advantageous traffic; the public will therefore naturally enquire whether such expectations has been answered, especially as reports have been indusively propagated to the contrary. That the *King George's Sound Company* have not accumulated immense fortunes, may perhaps be true, but it is also true that they are gainers to the amount of some thousands of pounds; and that they have not been more completely successful, allowance will naturally be made for their inexperience in a first essay. From this plain statement of facts, it is perhaps the most profitable and lucrative employ that the enterprising merchant can possibly engage in.

say for themselves, it appeared that there had not been the least cause for murmur against the ship's company, or for ill usage from any one petty officer in the ship. The court were therefore of opinion, that severe and immediate corporal punishment should be inflicted upon the ringleaders; and that *Berry* and *Lilly*, at different ships of the fleet receive, *Berry* one hundred, and *Lilly* seventy lashes; that the rest be punished on board the *Belvidere*, and that *Lord Anson* and *Keiff* receive sixty lashes; *Garland*, *Skinner*, and *Connor* forty-eight lashes; *Hastings* and *Langford* twenty-four lashes; and *Kelly*, as least culpable, receive twenty lashes.

A
VOYAGE TO MADAGASCAR,

AND

THE EAST INDIES.

BY THE ABBE ROCHON,

Member of the Academies of Sciences of Paris and Petersburg, Astronomer of the Marine,
Keeper of the King's Philosophical Cabinet, Inspector of Machines, Money, &c.

TRANSLATED FROM THE FRENCH.

THE island of Madagascar was discovered in 1506, by Lawrence Almeyda; but it has been known from time immemorial by the Peruvians and Arabs, under the name of *Sarandib*. When the Portuguese first discovered it, they wished to give it the name of the Island of Saint Lawrence. In the reign of Henry IV. the French named it *Isle Dauphine*; and though its real name is *Madecasse*, it is generally known under that of Madagascar.

This large island appears, by the united testimony of several learned geographers, to be the *Cerne* of Pliny, and the *Minuthiasde* of Ptolemy. It extends almost N. N. E. and S. S. W. and lies between the twelfth and twenty-sixth degrees of southern latitude. It is greatly celebrated for the fertility of its soil, and the variety of its productions; and is plentifully watered by streams and large rivers, as well as by a number of small rivulets, which have their sources at the bottom of that long chain of mountains, which separates the eastern from the western coast.

The traveller, who, in the pursuit of knowledge, traverses for the first time, wild and mountainous countries, intersected by ridges and valleys, must be often struck with terror and surprise, at beholding the awful precipices; the summits of which are covered with trees, as ancient, perhaps, as the world: his astonishment is further increased on hearing the sound of immense cascades, which are too inaccessible for him to approach. But these truly

picturesque scenes, are ever succeeded by rural views, delightful hills, and flourishing plains, where vegetation is never interrupted by the severity and vicissitude of seasons. Exuberant pastures afford nourishment to numerous herds of cattle and flocks of sheep. Agriculture is here seen making wonderful advances, while nature alone defrays almost all the expences. The fortunate inhabitants of Madagascar never moisten the earth with the sweat of their brows: they turn it up slightly with a pick-axe, and the business is achieved.

The forests contain an infinite variety of the most beautiful trees; such as palms of every kind, ebony, wood for dying, enormous bamboos, and orange and lemon-trees. All the forests of Madagascar abound with plants unknown to the botanists; some of which are aromatic and medicinal, and others fit for dying. The most indefatigable botanist, in the course of a long life, would be but slightly acquainted with the natural history of all the vegetable productions of this island, the extent of which, in latitude, comprehends several climates. There are, indeed, few countries in the world where navigators can find, in greater abundance, and at less expence, refreshments of every kind.

The natives of Madagascar are called *Malagaches*, or *Madecasses*: they are portly in their persons, and somewhat exceed the middle stature. The colour of their skin is different: and among one tribe it is of a deep black; among another it is tawny; some are approaching to a copper

colour; but the greater part of them have a tint of the olive. Those who are black have woolly hair, like negroes on the coast of Africa: those who exhibit a complexion similar to that of the Indians and Mulattoes, have as lank hair as the Europeans. Their nose is not flat; they have a broad open forehead, thin lips, and features regular and agreeable; and they display a countenance of peculiar frankness and good-nature. These people are extremely indifferent about acquiring knowledge, which cannot be obtained without reflection. A natural want of care, and a general apathy renders every thing insupportable to them that requires attention: they pass the greater part of their lives in sleeping, and in amusing themselves*.

The Malegache, like the savage, is absolute master of himself; his freedom knows no limit or restraint: he goes where he pleases, and acts as he pleases; so that he injures not a fellow creature. The Malegache never attempts to oppose the will of any one: each individual has his own peculiar manner of living, and his neighbour never attempts to disturb or interrupt him. In this respect these islanders are much wiser than the Europeans, who ridiculously suppose that all the people of the earth ought to conform to their customs, prejudices, and opinions.

Are savages then so much to be pitied? Are they to be censured for confining their wants and desires to the procuring what is absolutely necessary for their subsistence; They enjoy in peace the gifts of nature, and calmly endure those evils which are inseparable from humanity. The conduct of a man in a state of civilization

* The Malegache, like the savage, has no idea of virtue or vice: he thinks only for the present, and supposes there are no men on the earth who are uneasy respecting futurity. These islanders are free beings, enjoying peace of mind, and health of body; man is naturally a humane compassionate being, and possesses that salutary organization, which, in a great degree, supplies the want of laws and virtues. It is that which prevents the robust savage from robbing childhood, or feeble old age, of its subsistence. To this noble organization the savage is indebted for that aversion which he feels to hurt his own species.

† Vander Stel, governor of the Cape of Good Hope, having procured a Hottentot child, caused him to be educated in the best European manner: splendid apparel was given him, and he was instructed in several languages, in which he made a considerable progress. Vander Stel, pleased with his talents, sent him to India under the pro-

is more reprehensible: idleness and opulence plunge him into vain and false enjoyments, which entail on him a train of infirmities: while unrestrained passions, and a taste for frivolity make him deviate from the path that leads to happiness. Were the savages as unhappy as we suppose, because they reject the superfluities on which we set so great a value; why do they not adopt our manners, our customs, and our laws? †.

The inhabitants of Madagascar, which are divided into a great number of tribes, have been estimated at about four millions; but this calculation is supposed to be infinitely too great; though it is impossible to ascertain the truth on this point, as the island is divided into a great number of societies, who are totally distinct from each other, and are governed by their own usages. A tribe is composed of several villages, who have a particular chief, sometimes elected, but generally succeeds by hereditary right. The lands are not divided, but are considered to be the property of those who take the trouble to cultivate them. These islanders are unacquainted with locks or bolts: hunger regulates their hours of repast, though they usually dine about ten in the morning, and sup at four in the afternoon. Their food consists of white rice, exceedingly light, and well boiled: which they besprinkle with a succulent kind of soup, made of fish or flesh, and seasoned with pimento, ginger, saffron, and a few aromatic herbs. This simple dish is served up in the leaves of the raven, which perform the offices of plates, dishes, and spoons. These vessels are always clean, as they are renewed at every meal. The Malega-

tection of a commissary-general, who employed him in the company's affairs. On the death of the commissary, this Hottentot returned to the Cape; and, after visiting some Hottentots who were his relations, he came to a resolution of pulling off his gaudy European dress, and to clothe himself with a sheep's skin. In this new attire he repaired to Vander Stel, taking with him a bundle, containing his old clothes; and, presenting them to the governor, thus addressed him: "Be so kind, sir, as to observe, that I for ever renounce these clothes; I am determined, from this moment, to observe the religion, manners, and customs of my ancestors. The only favour I have to request of you is, that you will permit me to keep the necklace and cutlass which I now wear."—He then instantly withdrew, without waiting for the governor's answer, and was afterwards beheld at the Cape. And such examples are far from being uncommon among the Madecasses.

That part of Madagascar is situated in the Indian Ocean, and is chiefly surrounded by two seas, of them are also of breadth, and sides in a place of three buildings, kind of inclosure for children.

The chiefs are dressed in a stick headed with a small bunch of hair of red woolled on their heads. The chiefs is now very fine of Carcanos, priors of all the among their subjects they require only a

* They are expert at Europe, which are many of their plumage, on account of their ex- quill, the different kinds, afford ment to the Europe dove, the spoon bird, and a kind of

ches have only two methods of preparing their food; they either boil it in handsome earthen vessels, or they broil it upon the coals*.

The Malegaches catch immense quantities of sea and fresh-water fish. Those who live on the borders of the sea are supplied with the dorado, soles, pilchards, herrings, mackarel, oysters, crabs, and turtle. The rivers also afford abundance of fine eels, and fresh-water mullets, much superior in taste and excellence to sea-mullets. There are, however, on this coast, several kinds of fish which should not be eaten till proof was obtained of their not being poisonous. To try whether they are really in that state, a piece of silver is placed under their tongue; and if it loses colour, and becomes black, those who would have eaten them would experience very fatal symptoms, and be exposed to great danger. Several of the people belonging to Admiral Boscawen's squadron lost their lives at Rodriguez, by omitting this necessary precaution.

Of the Southern Part of MADAGASCAR.

That part of Madagascar in which Fort Dauphine is situated, is very populous. The villages are chiefly built upon eminences, and surrounded by two rows of strong palisades; some of them are also fortified by a ditch ten feet in breadth, and six in depth. The chief resides in a place called Douac, consisting of two or three buildings, surrounded by a peculiar kind of inclosure, for him, his women, and his children.

The chiefs are always armed with a fusée, and a stick headed with iron; at one end of the latter a small bunch of cow's hair is affixed; and a cap of red woollen cloth serves as a covering for their heads. Though the authority of these chiefs is now very much limited, yet in the province of Carcanossi they are the supposed proprietors of all the lands, which they distribute among their subjects to be tilled; for which they require only a small quit-rent. The people

* They are expert at catching a number of birds unknown in Europe, which are prized by the naturalist for the beauty of their plumage, as much as they are by travellers on account of their exquisite taste. The pheasant, the partridge, the quail, the pintado, wild-ducks, and teal of different kinds, afford the most excellent and delicate nourishment to the Europeans. The black paraquet, the turkie dove, the spoon bill, the black-bird, the green woodpecker, and a kind of bat of most extraordinary magnitude

of the province of Carcanossi are not entirely ignorant of the art of writing; they have some historical books in the Madecasse language: but their learned men, whom they call *Ombiasses*, use only the Arabic characters. These *Ombiasses* are both sorcerers and physicians; the most celebrated of which come from the province of Matatane, where magic is supposed to flourish in its full glory. The *Ombiasses* profess, in the public schools, Geomancy and Astrology; and it appears certain that the art of writing has been brought into this island by the Arabs, who conquered it about three hundred years ago. Their paper is manufactured from the *Papyrus nilotica*, which the Madecasses name *Sanga-Sanga*. The pens used by these islanders are made of the bamboo; and their ink is produced from a decoction in boiling water of the bark of a tree which they call the *arandrato*.

The Arabic language has made some progress in the north-west part of this island; and it is well known that the Arab princes formed large establishments along the African coast. They also took possession of the island of Comora; and when they emigrated to Africa and the adjacent isles, they did not forget their own country. They still carry on an inconsiderable trade with Aden, Mascate, and the coasts of Abyssinia. Thus have they introduced their language, and left some traces of Mahometanism among the Malegaches. Formerly there subsisted between the Arabs and the Portuguese of India very great animosity, arising from the zeal of these two nations for the propagation of their respective religions; and much mischief ensued. The Arabs made frequent attacks upon the Portuguese establishments on the coasts of Africa, and even destroyed some of their settlements; but this hatred gradually subsided, when the decline of the Portuguese power rendered them less objects of jealousy. An attempt was made at Goa, about twenty years ago, to take advantage of this suspension of hostilities, and to form a Portuguese

improve the delicious catalogue. The Abbe Rochon says, "It was not without a considerable degree of reluctance, that I first ate the bats of Madagascar, dressed after the manner of a fricaseed chicken. The animals are so hideous, that the very sight of them frightens our sailors; yet when one can overcome that disgust which is inspired only by the idea of their figure, their flesh is found to be more palatable than that of our best fowls."

settlement

settlement at Cape St. Sebastian in Madagascar. The intention of this establishment was merely religious. The Portuguese thought of forming a mission, rather than a factory; but this project was not attended with success.

As this island has been so much frequented by the Arabs, it seems surprising that Mahometanism has not made greater progress in it; but, if we except circumcision, abstinence from pork, and some few unimportant practices, the descendants of the Arabs themselves have lost sight of the fundamental parts of their religious opinions. They believe not in a future existence: and, like the Maniæes, they admit of two principles, one superlatively good, and the other extremely wicked. They never address their supplications to the former, but they dread the severity of the latter, to whom they are continually doing homage, and offering up sacrifices*.

The Anacandrians are descended from the Rhoandrians; on which account they share with the Rhoandrians the honour of killing, for the other islanders, the animals necessary for their subsistence. The Ontzalsi enjoy no particular marks of distinction: they are generally valiant soldiers, and can throw a stone with great dexterity; their time is usually spent in dancing, sleeping, and amusing themselves. From their earliest infancy they are taught songs, replete with lessons of morality, or containing fables respecting their origin.

The native blacks are divided into four classes: viz. the Voadziri, the Lohavohits, the Ontzoa, and the Endeves. The Voadziri, it is affirmed, are descended from the sovereigns of the island: they are rich in slaves and flocks, and are permitted to possess several villages. These people are held in much estimation among the islanders of Madagascar, for they have preserved the right of killing, when they are not in the presence of a

Rhoandrian or a Macandrian, such animals as belong to their subjects: The Lohavohits are less powerful, and never can possess more than one village. The Ontzoa are related to the Lohavohits, but they have no kind of authority or privilege. The Ondeves are slaves by extraction†.

How can it be supposed that these people, involved in the darkness of ignorance, can defend themselves against the deception of the Ombiasses, when the most enlightened nations are dupes to quacks and impostors. Reason is seldom so powerful as to prevent a man entirely from that fondness for the marvellous which often hurries him into the most ridiculous allusions; and if he sometimes conceals this fatal propensity, it is merely because he is ashamed of his weakness‡.

A plurality of wives is common among the chiefs and those who are rich; but they cannot legally be married to more than one; the rest are only considered as concubines. A divorce is easily procured whenever the conjugal union displeases the husband or wife; but, when they separate thus, by mutual consent, they restore to each other the property they respectively possessed before marriage. In Madagascar, the adulterer is deemed a robber, and punished accordingly. The people therefore pay the greatest respect to marriage, and exhort strangers to behave with decency to their wives; but they voluntarily offer them their daughters. Married women have their hair separated into tresses, and bound up in the form of a nosegay on the top of the head: young women permit it to fall carelessly over their shoulders. Husbands are always sprightly and merry in the company of their wives; as soon as they perceive them, they begin to dance and sing. The Malegache women generally seem cheerful and happy, and their manners are found peculiarly pleasing to the Europeans.

intelligent, and grateful: they are passionately fond of women, and never appear sorrowful or dejected in their company: their principal aim is to procure the approbation of the fair. The man here never commands as a despot, nor does the woman ever obey as a slave; but the balance of power inclines in favour of the women. Their empire is that of beauty, mildness, and the graces; for, when you except the colour, the Malegache women are handsome. Their persons are slender and genteel, their features delicate, their skin soft and smooth, and their teeth are remarkably white: they have also fine blue eyes, the pupils of which are brown and sparkling.

* The island of Madagascar is so little distant from the coast of Africa, that it may probably have been peopled from the vast continent; but the different races are now so intermixed, that they could with difficulty be discriminated. The descendants of real negroes may, however, be distinguished, but it would be a vain attempt to point out those who descended from the whites.

† Such of the islanders as have any erudition relate, that the creator of heaven and earth formed, from the body of the first man whilst he was asleep, seven women, who were the mothers of the different castles; of which the author gives a very uninteresting section.

Vol. II. No.

When

When the Malegaches are at war, their women sing and dance almost incessantly, in order to animate the vigour and courage of their husbands. Their songs are either panegyrics or satires, and are well calculated to interest the auditors. In these compositions, glorious deeds are celebrated, and contemptible actions reprobated. When a woman suspects her health has been injured by a familiar intercourse with Europeans, she absents herself from their assemblies to escape the raillery of her companions, and commits herself to the care of the physicians, or Ombiasses. These savage people know how to deliver themselves happily from the venereal disease, and prevent it from spreading in this island so much as it has in Europe.

Whatever travellers may say, depraved morals are only found in a state of civilization. Pericious examples, frivolity of tastes, a variety of interests, and fictitious wants, degrade human nature so far as to make some metaphysicians believe, that they are all born with a secret propensity to vice. Man, naturally, says Hobbes, is a wicked being. Let us banish such a disagreeable idea, "I have studied, says the Abbe Roehen, with some care the character and customs of the islanders of Madagascar; I have several times assisted at their assemblies when they were deliberating upon important affairs; I have followed them in their dances, their sports, and amusements; and I have always found among them that prudent reserve which secures them from those fatal excesses, and those vices, so common among polished nations."

If the Malegaches have sometimes employed treachery, it has been occasioned by the tyranny of the Europeans. Can these people defend themselves by any other means from our bayonets and artillery? If they are destitute of knowledge and resources, have we not taken advantage of their weakness to make them yield to our caprices? They are rigorously treated by us, in return for their generous hospitality; and we brand them with the names of traitors and cowards, for compelling them to break the yoke which we thought proper to load them with. These melancholic truths are sufficiently proved by the ruin of the different establishments which the Europeans have endeavoured to form in Madagascar.

The Abbe then observes that in 1642, Captain

Picaulet obtained for himself and his associates the exclusive privilege of trading to Madagascar, and at the same epoch a grant of the island was given to a powerful company by letters patent from the crown. After which one Pronis was commissioned to take possession of it. The conduct of Pronis giving great offence, Flacore was chosen to succeed him, but he did not arrive at Fort Dauphine till December, 1648, and a tedious account of the ancient history of the place is then given by the Abbe, which would almost occupy the usual number of pages given in a volume; all of which would be foreign to our plan, and consequently be offensive to our readers.

Towards the conclusion of the last century, the French were anxious to people their colonies at any rate; and they were not very scrupulous respecting the means. Young men, accused of misconduct, were often hurried away by stratagem or violence. The greater part of their colonies, however, received benefit from these forced emigrations; and the exiles seemed to have forsaken their vices when they forsook their climate. It may be readily perceived that ease and liberty must have produced this change. In civilized countries, restraint inflames the passions; but in free and fertile countries the disturbers of social order almost instantly lose their vicious inclinations.

"Can there be a happier nation in the universe than the United States of America? The rights of every individual are there held sacred; and dangerous would it be to attempt to violate any of them. In that happy country, virtue, knowledge, and talents meet with a most distinguished reception. Little inequality is found there; and the people acknowledge that only which arises from superiority of talents and knowledge. Law is equally powerful there over him who commands as over him who obeys. Justice is distributed with an equal and impartial hand, and convenience is never substituted for equity. Here the most numerous class of citizens are never degraded by absurd prejudices, which, in Europe, renders individuals so discontented with their situation that they are induced to quit it."

It is then highly necessary to reform every thing that leads man aside from his duty; to inspire him with love for his fellow creatures, and convince him that it will promote both his

interest and his happiness not to do an injury to another. But this salutary end cannot be attained by multiplying capital executions. Every society indeed has a right of excluding from its bosom, all those who disturb its good order: but can it assume to itself the power of life and death over those individuals who compose it? This question has frequently been warmly debated, but has it ever been resolved? The marquis of Beccaria, in his treatise on *crimes and punishments*, says, "It appears to me absurd that laws, which are only an expression of the public will, that detests and punishes homicide, should commit the same crime themselves; and that, to deter mankind from murder, they should themselves command a *public murder*." "What then are real and useful laws?" adds Beccaria, "Those which all would propose, and which all would wish to observe." According to this illustrious author, the death of a criminal is a less effectual check than the durable example of a man deprived of his liberty, and obliged to repair by labour the injury he has done to society*.

The islanders of Madagascar are not a stupid and worthless people, merely because their manners are contrary to ours. Customs and usages differ according to climates. Men are every where delighted in disfiguring themselves a thousand various ways: the Indian lengthens his ears, the Chinese crushes his nose, and carefully flattens his forehead; and if we narrowly search into particulars, we shall perhaps discover that man in a state of civilization is guilty of as many great absurdities as the savage.

If these people imbibe the most ridiculous prejudices and superstitions; let it be observed that there is no country upon the face of the earth which has not its chimeras and its fables. In all regions you may see men invoking spirits, confiding in amulets, and amused with astrological reveries. And are not the most civilized nations the dupes of this spirit of infatuation. When superstition is added to the multiplied vices of large societies, its poison acquires ad-

ditional strength and activity. But we ought not to be astonished at the superstitious practices of the Madecasses: Can it be surprising that a weak and tender being, exposed from his cradle to a variety of infirmities, should ever respecting the cause of those calamities which oppress him? Is it wonderful that the savage, under the influence of a deranged imagination, should have recourse to amulets or spells, to avert the dangers with which he supposes himself threatened? If hurricanes ravage the fields which he has cultivated; lightning destroys the shelter he has framed; and the earth opens under his feet, as if preparing to swallow large tracts of country. Menaced by so many disasters, can the Madecasse remain an unconcerned spectator? No! the less enlightened he is, the greater will be his terror. He will ascribe these evils to the anger of an invisible being, whom he resolves to appease by prayers and sacrifices; and mistaking the nature of the worship which is due to the Deity, his folly will dictate to him the most absurd, childish, and even sanguinary practices. It is only the effect of infatuation, from which few people are free; that the Madecasses seem to us more criminal than cannibals, when, urged by superstition, they expose to the teeth of ferocious animals, their new-born infants, according to the decision of the Om-biasses.

These wretched impostors pretend to observe the aspect of the planets, and condemn to death the new-born children, when the moment of their birth has been pronounced unpropitious. The months of March and April, the last week of every other month, and every Wednesday and Friday throughout the year, are days of proscription. This inhuman decree of the Om-biasses, however, is not always carried into execution; fathers more affectionate, and less superstitious, sometimes cause these innocent victims, after they are sentenced to the forest, to be privately taken away by faithful servants, and avert the malignity of the cruel star.

* Should the colony of malefactors which the English have established in Botany Bay, have, for the happiness of humanity, that success which might reasonably be expected, can the other nations of Europe hesitate at following the example? Will they be afraid of the expences which such emigrations may occasion? But these expences are just, as well as beneficial to society, and would be found inconsiderable

when compared with the present disbursements for imprisoning and executing criminals. Can we prefer the punishment of the galleys to such a banishment? What advantage can society derive from galley-slaves? Do they not become more burthensome than useful? Besides, the mind of vicious men spreads corruption to every individual. In such a society the least guilty soon arrive at the height of profligacy

Of the North-East Part of MADAGASCAR.

The north-east part of this island is a rich magazine for the colonies of the isles of France and Bourbon; and the most frequented ports are the Foulepoint, St. Mary, and the bay of Anton-gil. In these three places the French have attempted to form all their establishments. A soldier, named Bigorne, who was in the service of the East India Company, gave me some interesting information respecting the settlements of the pirates in these districts. This man had gained the confidence of the islanders, and by a long residence among them, acquired a kind of influence over them. From this man I procured considerable knowledge respecting the productions, as well as the manners and customs of the inhabitants of the north-east part of Madagascar. The inhabitants of this coast are more docile and humane than those in the province of Carcanossi. These inoffensive people are unacquainted with locks and bolts, and shut the doors of their houses with nothing more permanent than the branches or boughs of trees. Were they the repositories of treasure, they would leave them equally exposed, without dreading the visits of any plunderers. Their dwellings are constructed merely with leaves and mats, and are therefore far from being impregnable.

The pirates who practised their depredations in the Indian seas, alarmed at the preparations which were making to extirpate them, or at least to check them in their nefarious career, took refuge on the north-east coast of Madagascar. Several nations, who experienced enormous losses from these banditti, united together to deliver the Indian seas from the oppression of these formidable tyrants, who had seized a large Portuguese ship, in which was the archbishop of Goa, and the Count de Receire; and the same day another vessel richly freighted. Both these valuable prizes were captured before the isle of Bourbon.

The pirates, accustomed to war, and elated with their success, resolutely continued to exercise the plundering trade for a long time; and before they were extirpated it was found necessary to bring a considerable force against them; to terrify them by exemplary punishment, and to pursue them through the most imminent dangers, even to the place of their retreats, where they

were under the necessity of setting fire to their vessels. Such were the measures adopted to clear the Indian seas of these aquatic robbers; who had infested them from the time that Vasco de Gama opened a passage to India, by the Cape of Good Hope. The total destruction of their maritime forces now prevented them from interrupting commerce any more, and compelled them to quit the establishment they had formed at St. Mary, an island bordering on Madagascar.

They soon began to signalize themselves, however, by new acts of atrocity. But of all the evils, and all the disorders occasioned by their perfidy, is that of having introduced the slave-trade into Madagascar. Liberty is so connected with the essence and dignity of man, that it seems to have been the height of injustice to have converted it into a saleable commodity.

These banditti, being thus obliged to renounce their former wandering kind of life, they found it necessary to excite quarrels and wars among the Malagaches, and also render war advantageous to the islanders; convinced that the sale of prisoners, that is to say, a trade in slaves, answered two ends to them, that of perpetuating divisions among the Malagaches, and that of procuring a new mode of enriching themselves. By this new crime the pirates terminated their course of robbery, a crime which continues to depopulate the island of Madagascar.

If these observations do not make that impression which they ought on enlightened nations, and force them to proscribe slavery, how can they suppose that it will be perceived by savages involved in the darkness of ignorance? We cannot therefore be surprised that the Malagaches, considering the advantages which they continually derive from the sale of slaves, still entertain a grateful remembrance of these infamous men, to whom they conceive themselves indebted for a considerable part of their riches.

Reflections on the Northern Part of MADAGASCAR.

This is more fertile in productions of every kind than the Southern part, and is much more frequented by European vessels; but the interior part of the country has never yet been visited. The high mountains of Vigagora present, at every step, obstacles sufficient to stop the most resolute and persevering adventurer. The
who

who may be so adventurous as to undertake a journey by this rugged way, ought previously to furnish himself with ropes and poles to climb the steepest places.

In the forests the compass is an essential guide; and, every where else, mechanics furnish the traveller with the means of escaping from the most difficult situations. These means, however, vary according to circumstances:—a kind of hammock, like those used in the colonies for carrying women and children, would be found extremely useful to those who travel in these wild countries; but it should be light and water-proof. This hammock should therefore be made of strong canvas, covered with gum elastic dissolved in linseed oil, a kind of varnish used for confining the inflammable air in balloons. Such a hammock might serve as a bed, by suspending it between two trees; or, by means of a bamboo, it might be formed into a vehicle for transporting the adventurer from one place to another when he finds himself fatigued.

Foulepoint, called by the natives *Foulou-Foulou*, is the place most frequented by the Europeans in the northern part of Madagascar. The harbour is surrounded by a reef of rocks, which check the force of the waves, and shelter ships from heavy seas. The shores are very bold, the least depth of the water being twenty-three feet at low tides. The entrance of the harbour, which is on the north side, is about fifty fathoms in breadth; and the depth of the basin is fifty fathoms: it is capable of receiving ten large vessels, which may anchor along-side of each other in upwards of thirty feet of water; but in the winter season, the entrance is shut by a shifting sand bank; which is dissipated when the south-east succeeds the north winds. During the neap tides the reef of rocks appear above the water; and many natural productions may then be found on them; such as marine plants, mosses, black coral, sea-stars, insects, and shells, which by the variety of their form, and the brilliancy of their colours, are chosen to ornament the cabinets of the curious. The mouths of the rivers here abound with oysters of an excellent flavour. Ships can procure at Foulepoint all kinds of provisions in abundance, and on very reasonable terms. Some years ago, however, the inhabitants of Foulepoint refused to deal in hogs or pigs, because an old man, who was reputed a sorcerer, had for-

bidden them. This Ombiasse pretended that dreadful misfortunes would attend them, if they did not endeavour to destroy the race of those filthy animals: but this prohibition does not deter the Europeans from procuring them in the mountains, where they may be found in large quantities.

The villages in the neighbourhood of Foulepoint, which are not numerous, are dispersed on the declivities of little hills, and defended by palisades. They are agreeably shaded by a multitude of trees; but the most remarkable is the *raven*, a kind of palm-tree, known only in Madagascar. This tree, the top part of which is prepared and eaten like the cabbage-palm, rises to a great height. It is covered with a hard bark, and its fibrous wood is used in constructing houses, the walls and partitions of which are formed of the ribs of its leaves, which are both solid and pliable. Of the leaves of the *raven* the Madecasses also make their plates, dishes, and cups; and under the membranous covering, which incloses the flowers of this palm, a gummy substance of an exquisite taste is found, which is not inferior to honey.

It cannot be surprising that the Madecasses should delight in being surrounded by so useful a tree. They make large planks of it, by splitting it from one end to the other: but these planks must be straightened the very moment they are split.

The lands in the neighbourhood of Foulepoint abound with rich pasture and cattle. In passing along the fertile banks of the delightful river Ongleby, the traveller is surprized at its suddenly disappearing in the sands, at the distance of about four miles from its mouth. This river which is deep in some places, and shallow in others, abounds with fish and water-fowl. But this stream, like the rest in Madagascar, is infested with monstrous crocodiles, the sight of which strikes a terror in the most intrepid islanders. Great precaution is necessary to avoid the danger of these destructive animals. The Abbe Rocoux says, "I one day saw an ox dragged away and devoured by one of these monsters." That which renders the rivers of Madagascar delightful, contributes to makes them dangerous: the trees and shrubs which cover their banks, serve as an asylum for these formidable animals.

A Description of
TRADE. by M.

high mountains of *Ambotismene*, the land gradually rises, and the plains and valleys are sheltered from the winds by little hills. The heat, however, does not incommode, the country being high and covered with wood: the low lands being less cultivated, are more wild and rural. The islanders here do not secure their cattle, but suffer them to wander without a guide or shackles.

The meadows are watered by a multitude of streams and rivulets, and they are the more delightful as they are formed by the hand of nature. The flowers which decorate them have more splendour, and display a greater variety of tints than those which adorn the European meads. Tufts of trees, irregularly scattered, render these rural spots more interesting and picturesque.

When you quit the plains and meadows to enter the immense forests which form a retreat for a variety of wild animals, another scene of astonishment assails your imagination. Profound solitude, refreshing coolness in so warm a climate, shades inaccessible to the rays of the sun, and echoes from all quarters repeating the bellowing of cattle, afford you new enjoyments. But these enjoyments are not equally delightful to all; yet,

however insensible many may be to the beauties of nature, they cannot behold without a kind of enthusiasm, that multitude of enormous trees, among which the fofersbe is particularly distinguished.

Those who prefer the study of botany to that of mineralogy, will find plants in *Ambotismene* to gratify their curiosity. Excellent iron mines are dispersed in great profusion all over the island, and approaching almost to the surface of the earth. The Malegaches break and pound the ore, place it between four stones lined with potter's clay, and then employ a double wooden pump, instead of a pair of bellows, to give the fire more strength: thus, in the space of an hour, the mineral is in a state of fusion; the iron produced by this operation is soft and malleable, and cannot be exceeded.

There are doubtless many other mines in the mountains of *Abotismene*; but their summits abound with steep rocks and precipices, and prevent their being approached. The highest of these is about eighteen hundred fathoms above the level of the sea.

These are all the particulars that we think it our duty to lay before our readers from the *Abbe Rochon's Voyage to Madagascar*, though the original work contains 475 pages, and an Introduction. A Description of *COCHIN-CHINA* is also given: and there is added, *A MEMOIR OF THE CHINESE TRADE*, by M. BRUNEL.

END OF ROCHON'S VOYAGE TO MADAGASCAR.

TRAVELS

..THROUGH

SYRIA AND EGYPT.

In the Years 1783, 1784, and 1785.

INCLUDING

An Account of the present State of those Countries, their Productions, Arts, Manufactures and Commerce; with Observations on the Manners and Customs of the TURKS and ARABS.

BY M. C. F. VOLNEY,

IN TWO VOLUMES.

M. VOLNEY has prefixed a preface to the First Volume of his Travels, in which he informs his readers that he had acquired a taste, and even a passion for knowledge when a considerable access of fortune furnished him with the means of gratifying his inclination. He had read, and frequently heard repeated, that Travelling is one of the most efficacious methods of adorning the mind, and forming the judgment. Syria, especially, and Egypt, appeared to him a field equally adapted to those political and moral observations, with which he wished to occupy his mind; considering what they once have been, and what they now are.

"Those are the countries," said our author, "in which the greater part of the opinions that govern us at this day have had their origin. It will be interesting, therefore, to be acquainted with the countries where they originated, the customs and manners which gave them birth, and the spirit and character of the nations from whom they have been received as sacred: to examine to what degree this spirit, these manners, and these customs, are altered or retained; to ascertain the influence of climate, the effects of the government, and the causes of the various habits and prejudices of these countries: in a word, to judge from their present state, what was their situation in former times."

With these views he informs us that he set out for Egypt in 1782, and after continuing seven months at Cairo, and procuring but little assistance in learning Arabic, he determined to proceed into Syria. Eight months' residence

among the Druses in an Arabian convent, however, rendered the Arabic familiar to him, and enabled him to travel through all Syria during a whole year. Travellers, in general, have been deficient in the two principal means of acquiring knowledge, time, and the language of the country. Without possessing the latter, it is impossible to appreciate either the genius or the character of a nation. Interpreters can never supply the defect of a direct communication. And without continuing a sufficient time, no traveller can form an accurate judgment; for the novelty of every thing around us naturally confounds and astonishes.

M. Volney adds, "I have endeavoured to maintain the spirit with which I conducted my researches into facts: that is, an impartial love of truth. I have restrained myself from indulging any sallies of the imagination, though I am no stranger to the power of such illusion over the generality of readers; but I am of opinion that travels belong to the department of history, and not that of romance. I have not therefore described countries as more beautiful than they appeared to me: I have not represented their inhabitants more virtuous nor more wicked than I found them, and I have perhaps been able to see them such as they really are, since I have never received from them either benefits or injuries."

As to the form of this work, the author has not followed the method used in books of travels, though perhaps the most simple; he rejected those details as too prolix; and has only exhibited general views, as better calculated to combine

facts and ideas

facts and ideas; and from a desire of saving the time of the reader he has avoided the order of an itinerary, as well as personal adventures. Our author recommends his readers to consider the situation of a stranger, who arrives by sea in Turkey. In vain he has read histories and travels;

in vain has he, by their descriptions, endeavoured to represent to himself the aspect of the countries, the appearance of the cities, the dresses, and manners of the inhabitants: he is new to all these objects, and dazzled with their variety.

SECTION I.

Of Egypt in general, and the City of Alexandria—Of the Climate and Air—Of the Winds, and of the various Inhabitants of Egypt—Their Phenomena—Of the hot Wind, or Kamsia.

ALEXANDRIA, in Egypt, will properly elucidate the point we have agitated. The name of this city recalls to memory the genius of one of the most wonderful of men, and reminds us of many great events; the picturesque appearance of the place itself; the spreading palm-trees: the terraced houses, which seem to be without a roof; the lofty slender minarets, all proclaim to the traveller that he is in another world. Innumerable objects present themselves to every sense: he hears a language whose barbarous sounds offend his ear; he sees dresses of the most unusual kind; and figures of the most whimsical appearance. Instead of our smooth-shaved faces, our side-curls, our triangular hats, and our short compact dresses, he views, with astonishment, tanned visages, with beards and mustachios, with large rolls of stuff wreathed round their bald heads; long garments, extending from the neck to the feet, serve as a veil to the whole body; and every one is provided with an enormous pipe of the longitude of six feet: a filthy drove of emaciated half-starved dogs prowl through the streets in eager pursuit of prey; and a kind of wandering phantoms, under a long drapery of a single piece, discovering nothing human but two eyes, barely inform us that they are women. Amid this crowd of grotesque objects, his mind is incapable of reflection, and till he becomes more calm, he views unnoticed the low houses and ill-paved streets, as well as the meagre, swarthy, and bare-footed inhabitants; who have no other clothing than a blue shirt, fastened with a leathern girdle; or a red handkerchief; while the

universal marks of misery, so apparent in all he meets, and the reigning mystery around their houses, make evident the rapacity of oppression, and the distrust attendant upon slavery.

In our country, ruins are an object of curiosity; but in Alexandria, we no sooner leave the new town, that we are astonished at the sight of an immense extent of ground overspread with ruins; the earth is covered with the remains of lofty buildings destroyed; whole fronts crumbled down, roofs fallen in, battlements decayed, and the stones corroded. The traveller passes over an extensive plain, furrowed with trenches, pierced with wells, divided by walls in ruins, covered with ancient columns, and modern tombs, amidst palm-trees and nopals*, where no living creature appears, but owls, bats, and jackalls.

Alexandria is, at present, the emporium of a considerable commerce. It is the harbour for all the commodities exported from Egypt, by the Mediterranean, except the rice of Damietta. The Europeans have establishments there, and factors dispose of their merchandize by barter. It is constantly visited by vessels from Marseilles, Leghorn, Venice, Raguse, and the dominions of the Grand Seigneur; but it is dangerous to winter there. The new port, which is the only harbour for the Europeans, is clogged up with sand, inasmuch, that, in foggy weather, ships are liable to bilge; and the bottom being also rocky the cables soon chafe and part. The old port, the entrance to which is covered by a neck of land called the Cape of Figs, is not subject to this inconvenience; but the Turks admit no

28 32 36 40

10 11 12 13 14 15 16 17

ships into it but those of Musselmén. If Europeans express their surprise that the new port is not repaired, the answer is obvious, that, in Turkey they destroy every thing, and repair nothing. The spirit of the Turkish government is to ruin the labours of past ages, and destroy the hopes of future times, the barbarity of ignorant despotism never thinking about tomorrow*.

The Kalidj alone connects Alexandria with Egypt; for, from its situation without the Delta, and the nature of the soil, it certainly belongs to the deserts of Africa. We do not indeed really enter Egypt till we arrive at Rosetta; there the sands peculiar to Africa end, and a black, fat, loamy soil begins: there also for the first time, we behold the waters of the celebrated Nile; the woods of palm-trees on each side, the orchards, refreshed by its streams, the lemon, the orange, the banana, the peach, and other trees, by their perpetual verdure, render Rosetta astonishingly delightful, its beauties being still more charming by its contrast with Alexandria.

As we ascend the river we acquire some general idea of the soil, the climate, and the productions of this celebrated country. All this part of Egypt is so level and so low that it affords very little prospect of the country, and offers very little variety. Nothing is to be seen but palm-trees, single, or in clumps, which gradually become fewer as you advance: wretched villages of mud walled huts; till at length, towards the junction of the two branches of the river, the mountains of Grand Cairo are discovered in the east, and to the south-west three detached masses appear, which, from their triangular form, are known to be the pyramids†.

It is not the same in Turkey as in Europe: with us, travels are agreeable excursions; but

* In time of war, Alexandria is of no importance; no fortification is to be seen: even the lofty Pharos, with its aspiring towers, cannot be defended. It has not four cannon fit for service, nor any gunner capable of pointing them. The nominal five hundred Janisaries, which should form a garrison, are now reduced to about half that number, and know nothing but how to smoke a pipe. A single Russian or Maltese frigate would be able to lay it in ashes; but the conquest would be of no value, as the country is without water. This must be brought from the Nile by the Kalidj, a canal of twelve leagues, which conveys it thither annually at the time of the inundation, and fills the reservoirs dug under the ancient city, which must supply

there they are, difficult and dangerous undertakings, especially for Europeans, whom the superstitious natives suppose to be sorcerers, come to discover by magic, treasures which the *Genii* have concealed under the ruins. This ridiculous opinion deprives the traveller of security, and prevents every discovery. No one presumes even to walk alone in the fields; nor can he prevail on any person to accompany him. We are therefore limited to the banks of the river, a route frequented by every one, and which consequently can afford no new information. It is only by comparing what we have seen ourselves, with the observations made by others that some general ideas can be acquired.

After having made this comparison, we shall find reason to conclude that the basis of all Egypt, from Asouan to the Mediterranean, is a continued bed of calcareous stone, of a whitish hue, containing shells analagous to those found in the two neighbouring seas‡. This quality is discoverable in the pyramids, and on the Lybian rock on which they stand. The same kind of stone is also found in the catacombs of Alexandria, and in the projecting shelves upon the coast. Copper is the only metal of this country mentioned by the ancients.

The two lakes of Natron, described by Father Sicard, are more interesting objects: they are situated in the desert of Shayaf, or St. Macarius, to the west of the Delta. Their bed is a sort of a natural trench, three or four leagues long, by a quarter wide, with a hard and stony bottom. It continues dry nine months in the year, but in winter water of a reddish violet colour oozes from it, which fills the lake to the height of five or six feet: the return of the great heats causing this to evaporate, a bed of salt remains about two feet thick, and very hard, which is broken with bars of iron. Thirty thousand

them till the next year. Hence it is evident, that were a foreign power to take possession, the canal would be shut, and the supplies of water cut off.

† To give a description of Egypt in a few words, let the reader imagine, on one side, a narrow sea and rocks; on the other, immense plains of sand, and, in the middle, a river flowing through a valley of one hundred and fifty leagues in length, and from three to seven wide; which, at thirty leagues from the sea, separates into two arms, the branches of which wander over a country where they meet with no obstacles, and which is almost without declivity.

‡ These shells consist principally of echin, volutes, bivalves, and a species in the form of lentils.

minerals are procured from them every year. This phenomenon, which indicates a soil abounding with salt, is common throughout all Egypt. Not only this soil, but that of the whole continent of Africa and Arabia, seems either to be composed of salt, or to produce it.

In the midst of these minerals, and of that fine reddish coloured sand peculiar to Africa, the earth of the valley through which the Nile flows, discovers properties which prove it of a distinct class. Its blackish colour, and its clayey cementing quality, proclaim its foreign origin. It is brought by the river from the heart of Abyssinia, as if nature had resolved to form a habitable island in a country to which she had denied every thing. Without this unctuous mud, Egypt never could have produced any thing; that alone seems to contain the seeds of vegetation and fecundity; and these are also indebted to the river, by which it is deposited.

The whole physical and political existence of Egypt depends upon the Nile; that alone provides for the greatest necessity of animal life, the want of water so frequently, and so distressfully experienced in warm climates. The Nile alone, unassisted by rain, supplies vegetation with moisture, the earth, during the three months' inundation, imbibing a sufficient quantity of that valuable fluid for the rest of the year. Were it not for this providential overflowing, only a very small part of the country could be cultivated, and even that would be attended with prodigious labour. With ap-

* We cannot wonder that the Egyptians have always professed, and still retain a veneration for the Nile. They called it *holy, blessed, sacred*; and on the appearance of the new waters, that is, on the opening of the canals, mothers are seen plunging their children in the stream, from a firm belief that these waters have a purifying and divine virtue, such as the ancients attributed to every river.

Earthen vessels, unglazed, are usually kept in every apartment, from whence the water continually transpires: this transpiration produces the more coolness, in proportion as it is more considerable; therefore these vessels are often suspended in passages, where there are currents of air, and under the shade of trees. In many parts of Syria, they drink the water which has transpired; in Egypt they drink that which remains; besides, in no country is so much water used. The first thing an Egyptian does, on entering a house, is to lay hold of the *kolla* (the pitcher of water) and take a hearty draught of it; and that is to the perpetual perspiration, they feel no inconvenience from the practice. But, in the midst of our panegyric, truth requires us to declare, that, for six months of the year, the water of this river

is so thick, that it must be allowed time to settle, before it can be drunk. During the three months which precede the inundation, the stream becomes reduced to an inconsiderable depth, and appears green, foetid, and full of worms. People of delicacy, at all times, take care to perfume it, and cool it by evaporation. Bitter almonds are sometimes used to purify this water, with which the vessel should be well rubbed, and then the beverage really becomes light and good.

But never will these muddy waters have for an European the charm of transparent fountains and limpid streams; never, except from some extraordinary incitement, will a swarthy Egyptian woman, dripping from these yellow and muddy waters, remind him of the bathing Naiads†.

The northerly winds, which blow annually at certain periods, carry into Abyssinia a vast quantity of clouds: from April to July we see them incessantly ascending towards the south, and might be induced to expect rain from them; but this parched country can receive no benefit from them but under a different form. In summer it never rains in the Delta, and but rarely, and in small quantities, during the whole course of the year. It is also certain that it rains still less as you ascend towards the Said: rain is therefore more frequent at Alexandria and Rosetta than at Cairo, and at Cairo than at Miniah; and is almost a prodigy at Djirah. The inhabitants of humid countries, indeed, cannot conceive it possible to subsist without rain; but in Egypt, exclusive of the water which the earth imbibes at the inundation, the dews which descend in summer might be sufficient for vegetation. This is sufficiently proved by their water melons, for when they have only a dry dust under them, their leaves are always fresh. It is also apparent that these dews, as

is so thick, that it must be allowed time to settle, before it can be drunk. During the three months which precede the inundation, the stream becomes reduced to an inconsiderable depth, and appears green, foetid, and full of worms. People of delicacy, at all times, take care to perfume it, and cool it by evaporation. Bitter almonds are sometimes used to purify this water, with which the vessel should be well rubbed, and then the beverage really becomes light and good.

† A long altercation then arises between M. Savary and M. Volney, respecting the rise of the Delta, and various authors on the subject are respectively cited: as *Herodotus, Bibliotheca, Orientale de D. Herbelot, Dr. Shaw's Travels, Kalkasemias, Dr. Pocock's Travels, M. Niebuhr, Demarestus, &c.* but the editor of this abridgment could not feel himself justified in giving a positive conclusion on this contested matter.

‡ When rain falls in Egypt and in Palestine, it diffuses general joy among the people: they assemble together in the streets, slugging and shouting *ye allah! ye morabec!* That is to say, O God! O Blessed! &c.

well as the rains, are more copious in proportion to their proximity to the sea. The dews, as well as the rains, are also more or less plentiful, according to the prevailing wind: The southerly and the south-easterly produce none; the north wind occasions a great deal, and the westerly still more: the two former proceed from the deserts of Africa and Arabia, which afford not a drop of water, while the northerly and westerly winds convey over Egypt the vapours from the Mediterranean, which the first crosses, and the latter traverses lengthways.

The southerly winds, which I have mentioned, are known in Egypt by the general name of *Winds of Fifty Days*; not because they continue fifty days, without intermission, but from their prevailing more frequently in the fifty days preceding and following the equinox. They are by some denominated *poisonous winds*, or more correctly *hot winds of the desert*. Their heat is sometimes so excessive, that it is difficult to form an idea of its violence, without having experienced it; but it may be compared to the heat of a large oven at the moment of drawing out the bread. When these winds begin to blow, the atmosphere assumes an alarming aspect. The sky, which at other times is clear in this climate, becomes dark and heavy; and the sun, having lost his splendour, appears of a violet colour; and the air, though not cloudy, seems impregnated with subtle dust. It is not, at first, remarkably hot, but gradually becomes so; and respiration is rendered short and difficult; the skin is parched and dry: a too rarefied air prevents the expansion of the lungs, and they are found painful. Large draughts of water are found ineffectual to restore perspiration; and every substance deceives the hand which touches it. Even in the absence of the sun, marble, iron, and water feel hot: the streets are deserted, and universal silence reigns. The inhabitants of towns and villages shut themselves up in their habitations, and those of the

* But these hot winds are not peculiar to Egypt; they also blow in Syria. M. Niebuhr met with them in Arabia, at Bombay, and in the Diarbeki. They are also known in Persia, in the rest of Africa, and even in Spain.

The climate of Egypt is certainly extremely hot, for in July and August Reaumur's thermometer stands in the most temperate apartments, at 24 and 25 degrees above the freezing point. In the Said, it rises still higher. Two seasons only should be distinguished in Egypt, the Spring and Summer, that is to say, the *Cool Season* and the *Hot*.

desert in their tents, or in pits formed in the earth, where they remain till the termination of this destructive heat. The duration of it is usually about three days; but, if it exceeds that time, it becomes insupportable. Woe to the traveller whom this wind surprises remote from shelter, as the worst of consequences frequently ensue. This wind is particularly fatal to persons of a plethoric habit, and such as have destroyed the tone of the vessels by fatigue. Much of the danger, upon these occasions, may be avoided by stopping the nose and mouth with handkerchiefs: the camels practice a very efficacious method to guard against this pestiferous effluvia, by burying their noses in the sand, and continuing there till the squall is over.

Its extreme avidity is another extraordinary quality: if water is sprinkled on the floor, it evaporates in a few minutes. Its astonishing dryness withers and strips all the plants, closes the pores of animal bodies, and occasions that feverish heat which is the effect of suppressed perspiration*.

It might naturally be imagined that Egypt, on account of the excessive heats, and its moist marshy condition for three months, must be an unhealthy country. This indeed was my first idea on my arrival there; but when I observed at Cairo the houses of European merchants ranged along the Kalidj, where the water stagnates till the month of April, I conceived that the exhalations thence arising, must create many maladies; but experience taught me the fallacy of this theory. Though the vapours of the stagnant waters are so fatal in Cyprus, and Alexandretta, they are not so pernicious in Egypt. This seems to be owing to the natural dryness of the air, to the proximity of Africa and Arabia, which incessantly draws off the humidity, and the perpetual currents of the wind which is never opposed. So great is their avidity, that flesh meat exposed, even in summer, to the north wind,

The latter continues from March till November; and even from the end of February, the sun is not supportable, for an European, at nine o'clock in the morning. During the whole of this season, the heat is oppressive to all unaccustomed to it. Even the lightest dress, in a state of profound repose, occasions the body to sweat profusely; and this perspiration is found so essentially necessary, that the slightest suppression of it is a serious malady. The departure of the sun, however, in some degree, tempers these heats.

does not putrify, but dries up, and becomes as hard as wood. In the deserts dead bodies of animals are found dried in this manner, which have by drying so far lost their ponderosity, that a man may easily lift with one hand the body of a camel.*

In addition to this drying quality, the air of this country seems to be strongly impregnated with salts, the proofs of which are every where apparent. The stones are corroded by natruin, and in moist places, crystallizations of it are often found, which might be taken for salt-petre. It is doubtless this property of the air and earth, which, added to the heat, gives vegetation an activity which appears almost incredible to inhabitants of colder climates. Wherever plants have water, the rapidity of their growth is astonishing. In Cairo, or Rosetta, the gourd called *kara*, will, in twenty-four hours, emit or send out shoots near four inches long. It is however, evident that this soil is unfavourable to all exotics; foreign plants degenerate there very rapidly; the truth of which is proved by daily experience.

Amid these revolutions which all nations have experienced, there are few countries which have preserved their original inhabitants more pure and unmixed than that of Egypt. Though deprived, twenty-three centuries ago, of her natural proprietors, she has seen her fertile fields successively a prey to the Persians, the Macedonians, the Romans, the Greeks, the Arabs, and the Georgians, and at length the Tartars, distinguished by the name of Ottoman Turks. Several of these nations have left vestiges of their transient possessions; but they have been so blended and confounded in succession, that it is rendered difficult to discriminate their respective characters. We may, however, still distinguish the inhabitants of Egypt into four principal races, of different origin:

The first, and most general dispersed, is that of the Arabs, which may be divided into three classes. First the posterity of those who, on the conquest of Egypt by Amrou, hastened to settle in his country, so justly celebrated for its fertility. This first race is preserved in the present class of fellahs or husbandmen, and artizans, who

* It should be observed, however, that the air near the sea is much drier than that which is higher up the country: thus, at Alexandria and Rosetta, iron cannot be exposed twenty-four hours in the air without becoming rusty.

still retain the features of their ancestors, but are taller and stronger, having a supply of more plentiful nourishment than that of the deserts. The Egyptian peasants in general reach the height of five feet four inches, and many among them attain to five feet, six or seven inches. They are muscular, but not corpulent. Their skin, by the influence of the sun is almost black, but their countenances are not disagreeable. Most of them have heads of a fine oval, with large projecting foreheads: under a dark eye-brow: they have a black, sunken, but brilliant eye; the nose large, well-shaped mouths, and excellent teeth. Those of the villages, forming no alliances, but in their own families, have more general characteristics, and something ferocious in their air, originating in the passions of a mind, soured by the perpetual war and tyranny which surround them†.

A second class of Arabs is that of the Africans, who have arrived at different periods, and under different chiefs, and united themselves to the former; like them, they are descended from the Mussulmen conquerors, who expelled the Greeks from Mauritania; like them they practice agriculture and trades, and are numerous in the Said, where they have villages.

The third class is that of the *Bedouins*‡, known to the ancients by the name of *Scenites*, dwellers in tents. Some of these inhabit the rocks, caverns, and sequestered places, where water is to be procured; others, united in tribes, pass their days in perpetual journeyings, sometimes in the desert, and sometimes on the banks of the river; consulting principally their own safety, and the subsistence of their flocks. Many tribes arrive every year after the inundation, from the heart of Africa, to enjoy the fertility of the country, and in the spring retire into the depths of the deserts: others are stationary in Egypt, where they farm lands, which they sow, and annually change. They confine themselves to certain limits, on pain of war, and their manners and customs are generally similar. Ignorant and poor, they preserve a kind of original character distinct from surrounding nations. Pacific in their camp, they are hostile every where else. The husbandmen,

† Near five feet eight, and five feet ten or eleven i. e. nos, English measure; the French foot (meant through this translation) being to the English as 144 to 135.

‡ Formed of *bid*, desert, a country without habitations. whom

whom they pillage, detest them; the travellers, whom they plunder, resent their treatment: and the Turks, knowing too many of their artifices, endeavour to divide and corrupt them. The different tribes of Bedouins in Egypt, are supposed to amount to a body of thirty thousand horsemen; but they are dispersed and disunited that they are only considered as vagabonds and robbers.

A second race of inhabitants are the Copts, of whom several families are to be found in the Delta; though the greater part of them inhabit the Said, where they occupy whole villages. They descended from the people who were conquered by the Arabs; that is, from a mixture of Egyptians, Persians, and Greeks, who, under the Ptolemies and Constantines were so long in possession of Egypt. They differ from the Arabs by their religions, which is Christianity; and they are distinct from other Christians, by being Eutychians: their heresy has drawn persecutions on them on the part of the other Greeks, which has rendered them irreconcilable enemies. When the Arabs subdued the country, they took advantage of these animosities, to enfeeble them both. The Copts, have, at length, expelled their rivals, and become the depositories of the registers of the lands and tribes. Under the appellation of Writers, at Cairo, they are the secretaries and collectors of government. These writers form a kind of separate class, the head of which is the writer to the principal Bey, who disposes of all employments in that department, which, with the true spirit of the Turkish government, he bestows on the best bidder. The Copts are properly the remains of the ancient Egyptians*. This is rendered more probable, by considering the distinguishing features of this race of people: they are characterized by a sort of yellowish dusky complexion; with a puffed visage, swollen eyes, flat noses, and thick lips: they have indeed the exact countenance of a Mulatto†. It may, indeed, be laid down as a general principle, that features are a kind of

* This is the more probable, as they were in the Said before the time of Dioclesian; and it is certain the Greeks were less numerous in the Said than in the Delta.

† The countenance of the Negroes represents precisely that state of contraction which our faces assume when strongly affected by heat. The eye-brows are knit, the cheeks rise, the eye-lids are contracted, and the mouth distorted. This state of contraction, to which the features

monument, capable, in many cases, of ascertaining the testimony of history, concerning the origin of nations. Travellers who pass from Normandy to Denmark, see, with astonishment, the great resemblance of the inhabitants of these two countries, which still subsists, notwithstanding the distance of times and places. Do not the Jews, wherever they reside, carry with them distinguishing marks never to be effaced?

Language may be considered as another monument equally capable of elucidating and confirming the testimony of history; that formerly spoken by the Copts is a confirmation of this remark. The form of their letters, and the greater part of their words, shew, that the Greek nation, during the period of two thousand years that it continued in Egypt has left irrefragable marks of its influence and power. The Arabs, at length, disdaining the language of the nations they subdued, imposed on them the necessity of learning that of their conquerors. From that time the Arabic became universal; and the other languages, confined to books, subsisted only for the learned, who deserted them. Such has been the fate of the Coptic, that the priests no longer understand it; and in Egypt, as in Syria, every one, whether Mahometan or Christian, speaks Arabic, hardly any other language being understood.

But, to return to my subject, a third race of inhabitants in Egypt are the Turks, who, if they are not masters of the country, at least possess that title. The name of Turk, originally, was not peculiar to the nation to which it is now generally applied: it signified, in general, all the hordes scattered in the east, and even to the north of the Caspian Sea. These are the people who were known to the Ancient Greeks by the names of Parthians, or Scythians, for which that of Tartars has been substituted; a nation of wandering shepherds, like the Bedouin Arabs. They have, in every age, been brave and formidable, inasmuch that neither Cyrus nor Alexander were able to subdue them. But the Arabs

are perpetually exposed in the hot climates of the negroes, is become the peculiar characteristic of their countenance. Excessive cold, wind, and snow, produce the same effect, and thus we discover the faces among the Tartars; while in the temperate zones, where these extremes are unknown, the features are lengthened, the eyes less prominent, and the whole countenance is more expanded.

were more successful. About eighty years after Mahomet, they invaded, under the direction of the Caliph Waleed I, the country of the Turks, forcibly imposed on them their religion, and obliged them to pay tribute. But confusion taking place in the empire, the rebel governors had recourse to their aid to resist the power of the Caliphs, and they engaged in every contest. Thus initiated, and furnished with arms, they soon became a warlike people; and, like the Bedouins, were divided into camps. These tribes, either as allies or enemies, according to their respective interests, were perpetually engaged in wars. Hence, in their history, several nations were equally called Turks, alternately attacking, destroying, and expelling each other. We shall therefore, to prevent misapprehensions, confine the name of Turks to those of Constantinople, giving that of *Turkmans* to their predecessors.

Some hordes of Turkmans, then having been introduced into the Arabian empire, soon attempted to give law to those who had sought their assistance, either as mercenaries or allies. Of this the Caliphs themselves were convinced in a very remarkable instance. Motazzam, brother and successor of Almamoun, having selected a body of Turkmans for his guards, was obliged to quit Bagdad for their improper conduct; and, after this time, their insolence arrived to such a pitch, that they became the disposers of the throne and life of their princes, and murdered three of them in the course of thirty years.

Amidst the disorders of anarchy, a multitude of Turkman hordes penetrated into the empire, and founded different independent states in the Kerman and Korasan; at Iconium, Aleppo, Damascus, and in Egypt.

Till that time, the present Turks, distinguished by the name of *Ogouzians*, remained in the east of the Caspian, bordering on Djihoun; but early in the thirteenth century, Djenkiz-kan, having united all the tribes of Upper Tartary against the princes of Balk and Samarcand, the *Ogouzians* began their march under their chief Soliman, and, driving their herds before them, encamped in 1214 in the Aderbedjan, to the number of fifty thousand horsemen. The Moguls, following them, pushed them into Armenia. Soliman being drowned in 1220, in attempting to pass the Euphrates on horseback, Ertogrul, his son, took the command of the hordes, and proceeded

to the plains of Asia-Minor, allured by abundance of pasturage for his cattle. The good conduct of this chief caused his alliance to be sought by all the neighbouring princes. Among these was the Turkman, Ala-el-din, Sultan of Iconium, who, finding himself old, granted lands to the Turks under Ertogrul, and appointed their chief general of all his troops. Ertogrul proved that the confidence of the Sultan was not misplaced, by vanquishing the Moguls, and in other respects acquired great honour and reputation. On his death, his honours were transmitted to his son Osman; who was also complimented with the Kofetan, drum, and horse-tails, symbols of command among all the Tartars. This Osman, to distinguish the Turks, his followers, gave them the name of *Osmanles*, from which we have made *Ottomans*. In 1300 he assumed the dignity of Sultan, which signifies absolute sovereign.

His successors continued to aggrandize themselves at the expence of the Greeks; till, continually depriving them of whole provinces in Europe and Asia, they at length shut them up within the walls of Constantinople; and Mahomet II. having taken that city in 1453, annihilated this branch of the Roman empire. The Turks, being now disengaged from the affairs of Europe, turned their arms against the southern provinces. Bagdad, subjugated by the Tartars, had been long without Caliphs; but a new power in Persia had succeeded to a part of their domains; and another, subsisting at that time under the name of Mamelukes, had seized on Syria.

The Turks wished to check the ambition of these two rivals: Bayazid, the son of Mahomet, executed a part of this plan, by taking Armenia from the Sofi of Persia, and Selim his son completed it, by subduing the Mamelukes. This Sultan, having prevailed on them to approach Aleppo, in 1517, under pretext of soliciting their assistance in the war against Persia, suddenly turned his arms against them, and took from them successively Syria and Egypt. From that period the Turks established themselves in that country; but they are not very numerous among the villages. Individuals of that nation are seldom met with, but at Cairo, where they exercise the arts, and occupy the religious and military employments. Formerly they were admitted to offices under government, but, within the last

thirty years, a tacit revolution has taken place, which has deprived them of the reality of power, without taking from them the title.

This revolution was effected by a fourth and last race; the individuals of which were born at the foot of Mount Caucasus: they are distinguished from the other inhabitants by the colour of their hair, which is flaxen, and entirely different

from that of the natives of Egypt. These were distinguished by the Crusaders in the thirteenth century, and called by them Mamelukes: after remaining almost in a state of annihilation for two hundred and thirty years, under the government of the Ottomans, they may be said to have regained their consequence.

SECTION II.

A Summary of the History of the Mamelukes—The Present State of Egypt—Military Constitution of the Mamelukes—Their Accoutrements—Education—Manners.

THE Greeks of Constantinople, under a despot and bigoted government, let the finest provinces of their empire, during the course of the seventh century, fall a prey to a new people. The Arabs, though inflamed by fanaticism, and corrupted by luxuries to which they had been unaccustomed, conquered, within eighty years, the north of Africa, and the south of Asia, as far as the river Indus: but though the Arabs knew how to conquer, they were strangers to the art of governing, and their edifice of power soon mouldered into ruins. The vast empire of the Caliphs, passing from despotism to anarchy, became dismembered on every side; and the temporal governors every where erected themselves into sovereigns, and formed independent states*.

Ad-had-el-din, the last of that race, after having been invaded by the crusaders, who had imposed on him a tribute, one of his generals, whom he had dismissed his service, threatened to deprive him of a power of which he seemed absolutely unworthy. Knowing he could not confide in a nation, which his conduct had alienated from him, he had recourse to foreigners.

* But though Egypt was not the last to follow this example, it was not till 969, that a regular power was established in that country, in the person of princes, who, assuming the name of Fatmite Caliphs, disputed the title of their dignity with those of Bagdad. The latter, then stripped of their authority by the Turkmen soldiers, could no longer oppose their pretensions; and thus the Egyptian Caliphs peaceably obtained possession of that rich country, of which they might have formed a powerful state. But the sovereigns of Egypt, no less despot than those of Bagdad,

He called in the tribe of Turkmans who had enslaved the Bagdad Caliphs, and implored the sovereign of Aleppo, to send an army into that country. These troops speedily delivered Ad-had from the tribute, and the menaces of the general. But the Caliph soon discovered that he had only changed his enemies: they left him only the shadow of power; and Selah-el-din, who took the command of the army in 1171, conceived by strangling him. The Egyptian Arabs thus became subjected to strangers, whose princes began a new dynasty in the person of Selah-el-din.

During these transactions in Egypt, and while the Crusaders were, by ill conduct, laying the foundation for their expulsion from Syria, other revolutions were preparing in Upper Asia. Dienkiz-Kan became the chief of most of the Tartar hordes, waited for an opportunity to invade the neighbouring states: an insult committed on some merchants, under his protection, induced him to turn his arms against the Sultan of Balk, and the eastern part of Persia; countries which, about the year 1218, became the theatre of the most bloody devastations. The Moguls

took part in the quarrels of religious sects; they even set new ones, and endeavoured to create proselytes by persecution. One of them, named *Hakem b'amar ellah**, was absurdly and extravagantly impious to pronounce himself a God; and had the folly and wickedness to set fire to Cairo, for his amusement. Others dissipated the public treasure in a capricious luxury, and their courtiers were eager in partaking of the spoils: the people, whom the oppressed, were thus induced to hold them in abhorrence.

sword in hand, pillaging, burning, and murdering, without distinction, reduced the whole country of Sihnuu to a heap of ashes; and extended their ravages even into Russia and the Cuban. This expedition, in 1227, eventually introduced the Mamelukes into Egypt. The Tartars, weary of massacring, had brought back with them a vast quantity of young slaves of both sexes; the camps and markets of Asia were full of them. The successors of Selah-el-din, who corresponded with the coasts of the Caspian Sea, saw they had now an opportunity of forming, at a cheap rate, a fine body of soldiers of tried courage, one of them purchased twelve thousand of these young men, who were Circassians, Mingrelians, and Abazans. He caused them to be trained up to military exercises, and he thus obtained a body of the handsomest and best soldiers in Asia, though they were mutinous and unexperienced. This soldiery, like the Pretorian bands, in a short time gave laws to their master: they grew more insolent under his successor, whom they deposed in 1250, and slew the last Turkman prince; substituting one of their own chiefs, with the title of Sultan; retaining to themselves that of Mamelukes; which signifies military slaves*.

In the year 1617, Selim, Sultan of the Ottomans, having seized and hanged Toumas Bey, the last chief of the Mamelukes, put a period to that dynasty.

To conceive the nature of this revolution, let us consider the manner in which the Mamelukes are continued and multiplied in Egypt. On finding them resident in this country for several

centuries, it seems reasonable to imagine their race is preserved by the ordinary means; but if their first establishment was a singular event, their continuation is at least equally so. Though there have been Mamelukes in Egypt upwards of five hundred and fifty years, not one of them has left subsisting issue: not a single family of them exists in the second generation: all their children perish in the first or second descent. The same is also asserted with regard to the Turks†; and it is observed, that their only method of securing the continuance of their families, is to marry women who are natives, which the Mamelukes have always disdained. Let the naturalist explain why men, married to healthy women, are unable to naturalize on the banks of the Nile, a race born at the foot of Mount Caucasus!—And let it be remembered, that the plants of Europe, in that country, are equally unable to continue their species! Some persons may not believe this extraordinary fact, but it is not, on that account, the less certain, nor does it appear to be new. The ancients have made observations of the same nature.

The Sultan's orders are received, as they express it, *on the head and on the eyes*; that is with the greatest respect; but this appearance of reverence is not obediently attended to. Abiding by her usual policy, the Porte is blind to many abuses, well knowing, that to correct them, will require expensive efforts, and probably an open war, in which the dignity of the empire might suffer. Urgent affairs, for some years past, have also made it necessary to collect all their forces

* Without any other public right to authority, than that of conquest, the Mamelukes had no other rule of conduct and government, than that of a licentious and insolent soldiery. The first leader whom they elected, whose turbulent spirit was employed in the conquest of Syria, reigned seventeen years; but not one of them has since governed so long; the bow-string, poison, the sword, or private assassination, having been the fate of a series of tyrants; forty-seven of whom are enumerated in the space of two hundred and fifty-seven years.

† The Turks, however, are not difficult to please: if a woman is fair, they pronounce her handsome; and if she be fat, she is enchanting: "Her countenance is like the full moon: her bayonets are like cushions," say they, to express the superlative of beauty. They may be said to measure them by the quintal. They have besides a proverb worthy the notice of naturalists: "Take a fair female for

thy eyes, but for pleasure an Egyptian." Experience has proved to them that the northern women are colder than those of the south.

Since the revolution of Ibrahim Kisya, the Ottoman power has become more precarious in Egypt than in any other province. The Porte, indeed, still retains a Pacha there: but this Pacha watched in the castle of Cairo, is rather the prisoner of the Mamelukes, than the representative of the Sultan. He is deposed, exiled, or expelled at pleasure; and, merely by the summons of a herald, clothed in black, must instantly descend* from his high station. Some Pachas, chosen for that purpose by the Porte, have endeavoured, by intrigues, to recover the power formerly annexed to their title; but the heys have now rendered such attempts so dangerous, that they quietly submit to their three years' captivity, and confine themselves to the peaceable enjoyment of their salary and emoluments.

* The formula of deposition consists in the word *ouci*, that is, descend from the castle.

towards the north. Desirous of bestowing the utmost attention to Constantinople, they leave the restoration of their authority in the distant provinces to time and the course of events. They find it necessary, however, to create divisions among the rival parties, that none of them may acquire an established power; a practice that is found beneficial to the state, as well as advantageous to the great officers, who derive large emoluments from the rebels, by purchasing their influence and protection.

The Mamelukes, on obtaining the government of Egypt, adopted measures calculated to secure them the possession of the country. They immediately degraded the military corps of the Azabs and Janissaries: these two bodies, formerly the terror of the Pacha, are now as insignificant as himself. Of this the corrupt government of the Turks has been the principal cause; for, previous to the insurrection of Ibrahim Kiaya, the number of Turkish troops, which should consist of forty thousand men, had been reduced to half that number, by the avarice of their officers, who appropriated the pay to their own use. After Ibrahim, Ali Bey completely terminated their consequence. He first displaced all the officers whose conduct he did not perfectly approve, and left unfilled the places that became vacant, deprived the commanders of all influence, and so effectually loaded all the Turkish troops, that at this day, the Janissaries, the Azabs, and the five other corps, are a mere rabble of artizans and vagabonds, who guard the gates of those who pay them, and tremble in the presence of the Mamelukes, as much as the populace of Cairo. The whole military force of Egypt really consist in the Mamelukes; some hundreds of them are dispersed throughout the country, and in the villages, to support the au-

thority of their corps, collect the tributes, and practise every opportunity of extortion: but the main body reside continually at Cairo. From the most accurate computation it appears, that their number amounts to eight thousand five hundred men, including Beys and Cachefs, common-freed men, and Mamelukes who are still slaves. In this number there are a multitude of youth under twenty-two years of age.

The most powerful house is that of Ibrahim Bey, who has six hundred Mamelukes: Murad has about four hundred; the rest of the Beys, amounting to eighteen or twenty, have each of them about fifty to two hundred. There are also many Mamelukes, who may be called *individual*: these, being sprung from distinct houses, sometimes attach themselves to one, and sometimes to another, as their interest or inclination dictates, though they generally enter into the service of the best bidder. There are also some Serradies, a sort of domestic on horseback, who carry the orders of the Beys; but the whole together does not exceed ten thousand horse. Infantry are not mentioned here, as not being known or esteemed in Turkey, especially in the Asiatic provinces. The ancient prejudices of the Persians and the Tartars, continue to prevail in those countries, where war consists only in flight and pursuit, and the horsemen, who is best qualified for both these, is reputed the only soldier; and the warrior is alone the man of distinction. Walking on foot being held to be degrading, that exercise is reserved for the common people: The Mamelukes, indeed, permit the inhabitants of Egypt to ride on mules or asses, appropriating to themselves the exclusive privilege of being carried by a horse*. Of this peculiar distinction they make a very sufficient use, whether they are in town or country; for, if they only make a

visit to the next horseback.

VOL. II. No.

* But by proper management, and liberal presents, strangers of consequence, who came only to visit the country, may be excused from this humiliating restriction. Lord Algernon Percy, now Lord Lowaine, and the Earl of Claremont, obtained permission to ride on horseback in 1776.

The dress of the Mamelukes consists of a wide shirt of thin cotton, of a yellowish colour, over which they wear an Indian linen gown, or a sort of gown made of the light stuffs of Damascus and Aleppo. This robe, which is called *antari*, reaches from the neck to the ankles, folding over the fore-part of the body, towards the hips, where it is fastened by two strings. A second covering of the same form and width, is worn over it, having ample sleeves de-

scending to the finger ends, this is called a *coftan*, and is usually made of silk stuff, richer than the former. Both these robes are fastened at the waist by a long belt, dividing the dress into two bundles. About this is a third, called *ajunba*, made of cloth without lining, in nearly the form of the other; only the sleeves are cut at the elbow. In winter, and sometimes in summer, this habit is lined with fur, and formed into a pelisse. Over all these three wrappers, they put on an outer garment called the *bentche*, which is the robe of ceremony, and completely covers the whole body, even to the ends of the fingers, which it would be highly indecorous to exhibit before the great: The whole habit, with the *bevishe* on, appears like a sack,

from

visit to the next door; they never are seen but on horseback.

So far with respect to the dress of the Mamelukes, let us now advert to their horse accoutrements. Since the Europeans have had the good sense to examine into the principles of every art, they have found that the horse, to enable him to move freely under his rider, should be as little harnessed as the necessary solidity would permit. This improvement, which has taken place among us in the eighteenth century, has been totally neglected by the Mamelukes, who have hardly arrived at the knowledge of the ninth. Continually the slaves of custom, the horse's saddle among them is a clumsy frame, loaded with wood, leather, and iron, on which a trusequin rises behind: and a pommel before projects so much as to endanger his breast, if he should stoop. Under the saddle they spread three thick woollen coverings, and the whole is fastened by a surcingle, tied with leather thongs. Each stirrup is a plate of copper, longer and wider than the foot, with circular edges, which are sharp and used instead of spurs, to make long wounds in the horse's sides. The horse's furniture altogether weighs above thirty-six pounds, which is rendered the more ridiculous, by the Egyptian horses being so very small. The bridle is a kind of snaffle, but without a joint, and with a curb, which being an iron ring, binds the jaw so as to lacerate the skin. Instead of managing the mouth of a horse like us, the Mamelukes destroy it by violent and sudden checks. This consists in putting a horse on a full gallop, and

from which is thrust a bare neck, and a bald head, covered with a turban. The turban of the Mamelukes is yellow, and of a cylindrical form, turned up on the outside with a roll of muslin. They wear, on their feet, a sock of yellow leather, reaching up to the heels, and slippers without quarters: they have a sort of pantaloons, or trowsers, so long as to reach up to the chin, and so wide that what is provided for one of the legs, is large enough to contain the whole body.

* The art of using these arms to perfection, constitutes the education of the Mamelukes, and is the whole occupation of their lives. Early every morning the greater part of them resort to a plain, near Cairo, and there, riding full speed, exercise themselves in judiciously drawing out their carbine from the bandaleer, discharging it with excellent aim, and then throwing it under their thigh, to seize a pistol, which they fire and throw over their shoulder; immediately firing a second. They are encouraged by the Beys who are present, and whoever breaks the earthen

suddenly stopping him, when at the highest speed. Checked thus by the bit, the horse bends in his legs, stiffens the fore-legs, and slides along like a wooden horse. This manœuvre must greatly injure the legs and mouth of the horse; but the Mamelukes think it graceful, and it is adapted to their mode of fighting. It must be admitted, however, that they are firm and vigorous horsemen, and that they have a warlike appearance, which pleases the eye even of a stranger.

Their principal weapon is an English carbine, about thirty inches long, of so capacious a bore as to discharge ten or twelve balls at a time, which, without much skill, cannot fail of great execution. They also carry two large pistols in a belt, fastened to some part of their garments by a silken string. A heavy mace sometimes hangs at the bow of the saddle, ready to knock down an enemy; and on the left thigh is suspended, by a shoulder-belt, a crooked sabre. The Mamelukes usually procure their blades from Constantinople, and from Europe; but the Beys rival each other in Persian blades, and the sabres of the ancient steel of Damascus, for they sometimes pay the extraordinary price of forty or fifty pounds sterling*.

In Europe, when we hear of troops, and of war, we figure to ourselves a number of men distributed into companies and squadrons, with uniforms, ranks, and lines; and a system of operations founded on established principles. The Mamelukes know nothing of our military arts; and they are strangers to uniforms, to order, to discipline, or even to subordination. Their troops

vessel which is used as a Butt, receives great commendations and a reward. They also practise the management of the sabre; and shoot with bows and arrows, though they no longer employ them in battle. But their favourite exercise is throwing the *djerid*. Though the proper signification of this word is a reed, it is used to signify any staff thrown by the hand, after the manner of the Roman pilum. The Mamelukes use branches of the palm-tree, fresh stripped: these branches are four feet long, and weigh five or six pounds. Armed with these, the Cavaliers enter the list, and, riding full speed, dart them at each other from a considerable distance. When the assailant has thrown, he turns his horse, and his antagonist throws his in his turn. The horses, accustomed to this exercise, are so delighted with it, that they sometimes enjoy it as much as their masters. But this practice is attended with danger; for some of them can dart the weapon with such force as to wound, and sometimes mortally.

are a mob, their march a riot, their battles duels, and their war a scene of robbery and plunder, which generally happen even in the city of Cairo, where there is the least reason to apprehend any thing of the kind: a cabal gathers together, the Boys appear on horseback, the alarm spreads, and their adversaries present themselves: they charge each other in the street, sabre in hand; a few murders terminate the quarrel, and the weakest is probably exiled. The people give themselves little concern in these affrays. It is of no material importance to them that these tyrants cut each others throats. They do not, however, remain spectators of the contest, as there would be danger in the midst of bullets and scymetars: every one, therefore, quits the scene of action till tranquillity is restored; and sometimes the populace plunder the houses of the exiled, which the conquerors seldom endeavour to prevent. In the differences and quarrels of the Bays, the people are merely passive instruments*.

The young peasant, sold in Mingrelia or Georgia, no sooner arrives in Egypt than a new and extraordinary scene opens before him, and every thing conduces to awaken his audacity and ambition: though now a slave, he seems destined to become a master, and assumes the spirit of

* Sometimes the war is transferred to the country, when the strongest and most daring party pursues the other. If they suppose themselves nearly equal in courage or force, they wait for each other, or appoint a rendezvous where the respective troops assemble in platoons, the boldest marching at their head. After mutual defiance, the attack begins, and every one chooses his man: they fire, if they can, after which they begin to fall on with the sabre: it is then that the dexterity of the horse and the cavalier are displayed: if the former falls, the destruction of the latter is inevitable. In defeats the valets, who always attend, remount their masters; but should they happen to be unobserved, they knock them on the head, to get the sequies they may happen to have about them. The battle is frequently terminated by the death of two or three of the combatants. If they are overcome, they capitulate with the conqueror, and return to find a master at Cairo who pays: there they live, at his expense, till some new revolution may happen to take place.

† Luxury is now so excessive among the Mamelukes, that there is not one of them whose maintenance costs less than one hundred and four pounds annually, and many of them consume double that sum. At every Ramadan they must have a new suit of French and Venetian cloths, and Damascus and India stuffs. They must also have new horses and harness, with pistols and sabres from Damascus,

his future condition. He considers how far he is necessary to his patron, and rates himself accordingly. No sooner is a slave enfranchised than he aspires to greatness. In those who command, he observes no superiority of talents which can impress him with respect; he only beholds soldiers like himself, arrived at power by the decree of fate; and if fate should be equally favourable to him, he thinks he shall not be less able in the art of governing, which consists only in taking money, and giving blows with the sabre†.

Such are the men who now govern and decide the fate of Egypt: some fortunate strokes, with abundance of cunning and audacity, have given them this pre-eminence: but the change of fortune has not wrought a change of character in these vile upstarts; they have still the meanness of slaves though elevated to the rank of monarchs. Sovereignty with them is only the means of more luxury, more toys, more horses and slaves, and of gratifying all their caprices. The whole administration is conducted on this principle. It consists in managing the court of Constantinople so as to elude the tribute, or the menaces of the Sultan; and in purchasing a number of slaves, countermining plots, and taking off their secret enemies by poison, or

gilt stirrups, and saddles and bridles plated with silver. The chiefs must have trinkets, precious stones, fine Arabian horses, rich shawls of Cashmere, and variety of pelisses. The women disdain any longer to wear sequins on the head and breast, as not sufficiently gay and splendid, and figure away with diamonds, rubies, and the finest pearls; to which they have added a passion for Lyons stuffs and laces.

The manners of the Mamelukes are horrible, though most of them pretend to the rites of the Greek church, and are circumcised the moment they are bought, even the Turks themselves consider them as renegades, void of faith and of religion. Strangers to each other, they are destitute of those natural ties which unite the rest of mankind. Without parents, without children, the past has done nothing for them, and they provide nothing for the future. Ignorant and superstitious, they become ferocious by the commission of frequent murders, perfidious from their numerous cabals, seditious from tumults, and base, deceitful, and corrupted by every species of debauchery. They are even addicted to that abominable vice, which has been so shamelessly practised by the Greeks and the Tartars. It is certain that there is not a single Mameluke that is not polluted by this depravity; and the contagion has extended among the inhabitants of Cairo, and even among the Christians of Syria who reside in that city.

SECTION III.

Condition of the People of Egypt—Of the Diseases of Egypt—The Small Pox.

IN such a country, every thing is analogous to so wretched a government. Where the cultivator cannot enjoy the fruit of his labour, he works only by constraint; and agriculture languishes. Where there is no security in property, there can be no industry to procure it. The greater part of the lands are in the hands of the Beys, the Mamelukes, and the professors of the law; they have few other proprietors, and the little property of theirs is liable to a thousand impositions. Contributions are continually required of them; and there is no right of succession for real property; every thing returns to government, from which every thing must be re-purchased. The peasants are hired labourers, who are permitted to retain what is barely sufficient to sustain life: they can reserve for themselves nothing but dourra, or Indian millet, of which they make a wretched tasteless sort of bread, without leaven. This bread is baked by a fire made with the dry dung of buffaloes and cows†, which, with water and raw onions, is their only food throughout the year. They think themselves extremely happy if they can sometimes procure a little honey, cheese, sour milk, and dates. Flesh meat and fat can only be procured by those who are in the best circumstances, and on the greatest festivals.

Their whole clothing consists in a shirt of coarse blue linen, and a kind of black cloak: their head-dress is a cloth bonnet, with a red woollen handkerchief rolled over it. Their legs, arms, and breasts are naked; many of them not being provided even with drawers. Their habitations are mud-walled huts, in which they are almost suffocated with heat and smoke;

to these distresses are added continual alarms, the dread of the robberies of the Arabs, the extortions of the Mamelukes, family feuds, and the calamities of a civil war.

Such is the picture of all the villages, and the towns have not a more agreeable aspect. Even at Cairo, the stranger on his arrival, is struck with the universal appearance of wretchedness and misery. The crowds, with which the streets are thronged, present to the spectator nothing but filthy rags and disgusting nudities. Sometimes, indeed, he meets with a horseman richly clad, which renders indigence the more shocking by being contrasted with the display of luxury. The blood of man is here lavished with that of the vilest animals: justice herself inflicts death without formality. The officer of the night, and even of the day, frequently judge, condemn, and execute, in the twinkling of an eye, without appeal. Unfortunate is that man who is suspected of being in easy circumstances; a multitude of spies are ready every moment to accuse him; and it is only by assuming the appearance of poverty, that he can have any chance of escaping the rapacity of power.

Not many years ago, the capital of Egypt, as well as the whole country presented a spectacle of the most deplorable misery. To the constant evils of uncontrouled tyranny, were added natural calamities still more destructive. The plague, brought from Constantinople in November 1783, made its accustomed ravages during the whole winter. Fifteen hundred dead bodies were supposed to be carried out of the gates of Cairo. The summer, indeed, assuaged its fury, but another scourge, equally terrible, soon fol-

* When M. Volney was at Cairo, some Mamelukes carried off the wife of a Jew, who was passing the Nile with her husband. The Jew complained to Morad, who in his rough tone of voice replied—"Well, let the young folks amuse themselves!"—In the evening, one of the Mamelukes informed the Jew that they would restore him his

wife, if he would pay him one hundred piasters for his trouble, and to these terms he was obliged to submit. This instance is the more remarkable, since in this country women are held more sacred than even life itself.

† The reader need not be informed that Egypt is a naked country, which affords no fire wood.

lowed. The inundation of 1783 was not sufficient, therefore a considerable part of the land could not be sown for want of being watered, and another part for want of seed. In 1784, the Nile did not rise so high as was wished, and the dearth became excessive. Soon after November, the famine carried off at Cairo, almost as many as the plague; the streets, which before swarmed with beggars, was now free from them; all of them having perished, or deserted the city. It was generally supposed that the country had lost about a sixth part of its inhabitants. The streets and public places swarmed with meagre and dying skeletons, who implored, in vain, the pity of passengers. These wretches expired before the doors of the Beys, who had large hoards of rice and corn; and frequently the Mamelukes, importuned by their cries, drove them with blows. M. Volney relates that, when he was returning from Syria to France, in March 1785, he saw, under the walls of ancient Alexandria, two wretches sitting on the dead carcase of a camel, "and disputing its putrid fragments with the dogs*."

In this state of barbarism, it seems extraordinary that commerce should still continue so flourishing as we find at Cairo; but, from an examination of the sources, it appears that two powerful causes have contributed to render Cairo the seat of a very extensive trade: the first is, that all the commodities consumed in Egypt are collected within the walls of that city; and all the persons of property, such as the Mame-

* In the present situation of the Egyptians, they may not display probably much courage; though the seeds of it may not be wanting in them; or that it is denied them by the climate. Instead of the degree of heat, it is the ardour of the passions, and the confidence we have in our own powers which enables us to brave danger. We deceive ourselves if we represent the Egyptians as enervated by heat, or effeminate by debauchery. The men of opulence may indeed be a prey to that effemiacy, which is common to them in every climate; but the wretched despised peasants, denominated *fellahs*, endure astonishing fatigues. Volney says, "I have seen them pass whole days in drawing water from the Nile, exposed naked to a sun which would kill us." Those who are valets to the Mamelukes follow their masters every where, and always on foot; they will run, for whole days, before or after their horses, and, when fatigued, will tie themselves to their tails, rather than be left behind.

* It is not uncommon for them to be put to death, merely on suspicion, and this is equally the practice in Syria. At Ramala, a peasant came into the market for several days,

lukes and lawyers, are assembled there, and draw thither their whole revenues, without making any return to the country from which they receive them.

The situation making this city a centre of circulation, is the second cause, while, by the Red Sea, it corresponds with Arabia and India; by the Nile, with Abyssinia, and the interior parts of Africa; and by the Mediterranean, with Europe and the empire of Turkey. Every year a caravan arrives at Cairo, with black slaves, elephants' teeth, gold-dust, ostrich feathers, parrots, and monkeys†; while another, destined for Mecca, coasts along the Mediterranean, and arrives by the desert of Alexandria, consisting of three or four thousand camels. From thence it proceeds to Cairo, and joins the caravan of Egypt, and they afterwards set out jointly for Mecca. The lading of these caravans consists in India stuffs, pearls, shawls, gums, perfumes, and the coffee of Yemen.

The same commodities arrive by another route at Suez: small caravans also come from Damascus, with silk and cotton stuffs, oils, and dried fruits. During the favourable season vessels frequently come in the road of Damietta, unloading hogsheads of tobacco from Latakia, the consumption of which in Egypt is wonderfully great. Vessels come likewise from Marseilles, Leghorn, and Venice, with cloths, and a variety of other articles, which are conveyed by sea to Rosetta, in barks called *djern*‡. We need not therefore hesitate to admit the report of the commissioner-

The character of their minds is perfectly correspondent with the hardness of their bodies: their implacability in their hatreds; their obstinacy in battles between contending villages; their sense of honour in suffering the bastinado, rather than divulge a secret; and the severity with which they punish deviations from chastity in either wives or daughters*, will shew that they are capable of great energy, which only wants a proper direction to become a formidable courage.

† This caravan comes by land along the Nile; it was that in which Mr. Bruce returned in 1772, from Abyssinia, after having performed the most adventurous journey attempted in the present age. In traversing the desert, the provisions of the caravan were nearly consumed, and the travellers were supported, by gum only, for several days.

‡ Boats which carry a very large lateen sail, striped with blue and brown, like ticking.

having his cloak stained with the blood of his daughter whom he had thus killed; and the action was generally approved. Turkish justice never interferes in these affairs.

general of the customs, who asserted, that in 1783, Cairo had traded to almost the amount of one hundred and fifty millions of livres. But, if we consider the channels into which this wealth is poured, we shall be convinced that all this commerce is carried on without adding greatly to the riches of Egypt, or the benefit of the inhabitants.

Having mentioned the commerce carried on at Cairo, with Arabia and India, a question naturally arises, whether it would be practicable to cut through the isthmus which separates the Red Sea from the Mediterranean, that vessels might arrive at India, by a shorter route than the Cape of Good Hope*.

The only method, therefore, of effecting this junction, is that which has been already practised at different times; which is to make the river itself the medium of communication, the ground being extremely well calculated for that purpose; for Mount Mokottom suddenly terminating in the latitude of Cairo, forms only a low and semi-circular mound, round which there is a continual plain from the banks of the Nile, as far as the point of the Red Sea. The ancients adopted the idea of joining the two seas by a canal connected with the river†. At present the commerce of Cairo with Suez is only carried on by means of caravans, which wait the arrival of the vessels, and set out on their departure. That which I accompanied in 1783, consisted of three thousand camels, and five or six thousand men‡. There were also a number of pilgrims who preferred a sea voyage to a land journey: It also

* The space which separates the two seas does not exceed eighteen or nineteen leagues; neither is this interval intersected by mountains. It seems also acknowledged that the difference of levels affords no material objection to such a junction: but the great difficulty arises from the nature of the corresponding coasts of the Mediterranean and the Red Sea, which are low and sandy, forming lakes, shoals, morasses, which will not render the near approach of vessels practicable. It is indeed thought impossible to dig a permanent canal amid these shifting sands. It must also be considered that the country has not a drop of fresh water; nor can a supply of that article be procured for the inhabitants, without bringing it as far as from the Nile.

† Strabo, lib. 17.

‡ It continued forty days assembled, deferring its departure for various reasons; among others, on account of the unlucky days, in which respect the Turks are as superstitious as the Romans formerly were. It set out, however, on the 27th of July, and arrived the 29th at Suez, having journeyed twenty-nine hours by the route of the Haouat

carried the necessary provisions, for no place upon earth is more destitute of every necessary than Suez. From the tops of the terraces, the eye, surveying the sandy plain to the north-west, cannot discern even a single tree, or the smallest spot of verdure. Suez affords no prospect but extensive yellow sands, or a lake of green water; the ruinous condition of the houses heightening the melancholy scenery. The only water that can be drank is brought from the spring, at the distance of three hours' journey on the Arabian shore; but it is so extremely brackish that it cannot be drank by Europeans, without a mixture of rum in it. The sea might probably furnish plenty of shell and other fish, but the Arabs are not expert fishermen; and the governor, who is a Mameluke, is only left with twelve or fourteen persons at Suez; these form his household, and the garrison§.

Next to the christians of Syria, the most considerable body of merchants is that of the Europeans, known in the Levant by the name of *Franks*¶. The principal article of French trade in Egypt, consists in light cloths of Lauguedoc, of which they sell annually between nine hundred and a thousand bales. The other articles of importation are iron, lead, groceries, cochineal, laces, Lyons stuffs, dollars, and sequins. In exchange they take coffee of Arabia, coarse cottons, African gums, untanned hides, sal ammoniac and rice. Cairo is the most precarious and most disagreeable factory of the Levant. Fifteen years ago there were nine French mercantile houses at Cairo; in 1785 they were re-

Arabs, a league farther to the south than the Lake of the Pilgrims.

§ The fortress is a defenceless mass of ruins, which the Arabs consider as a citadel, as it contains six four pounders, and two Greek gunners, who cautiously turn their heads aside when they fire. There the merchandize is embarked, to be conveyed over the banks of sand to the vessels which anchor in the road, and which might be attacked without opposition; the ships themselves are incapable of resistance, none of them having any other artillery than four rusty swivels. Their number diminishes annually, for, by continually coasting along a shore full of shoals, one out of nine or ten is generally shipwrecked. In 1783, one of them was surprised by the Arabs, while the crew were sleeping on the shore. Having plundered it of fifteen hundred bags of coffee, they abandoned the vessel to the wind, which blew it upon the coast.

¶ The orientals usually hold the manners of Europe in detestation, which prevents every idea of emigration.

duced to three, and shortly, it is presumed, there will not remain one. The Christians of Syria, settled some time ago at Leghorn, have given a fatal blow to the French factories at this place, by the immediate correspondence they carry on with their countrymen: and the Grand Duke of Tuscany, who treats them like his other subjects, contributes materially to the encouragement of their trade.

As Grand Cairo is a celebrated city, it deserves to be more particularly described. The founder of this capital gave it the name of *El Kahera*; the Arabs know it only by that of *Masr*, which seems to have been the ancient eastern name of the Lower Egypt. This city stands on the eastern bank of the Nile, about a quarter of a league from the river. When we hear of *Grand Cairo*, we naturally suppose it to be a capital, at least, like those of Europe; but when it is considered, that towns have only begun to be made convenient and elegant within these hundred years, we shall easily conceive that a country which has not been improved since the tenth century, must partake of the common barbarism: Cairo, indeed, contains none of those elegant public or private edifices, in which the architect displays his genius. The environs are embellished with heaps of dirt, formed by the rubbish, which keeps daily multiplying and augmenting, while the immensity of tombs, with the stench of the common sewers, are equally offensive to the smell and to the sight. Within the walls, the streets are crooked, narrow, and unpaved, in consequence of which the crowds of men, camels, asses, and dogs, with which they are thronged, occasion continual clouds of dust. Individuals frequently water their doors, and to this dust succeeds mud and pestiferous exhalations. The houses here have two or three stories, which is contrary to the general custom of the east: they have, however,

* The population of Cairo has often been a subject of dispute: Anthony Faraoun, who was the head officer of the customs, says it approaches seven hundred thousand souls*, including Boulak, a port and suburb: but no calculations of the number of inhabitants of Turkey can be relied on, as no registers are kept of births, marriages, or deaths. The Mahometans have superstitious prejudices against numbering their people; though the Christians may be estimated by their tickets of capitation. According to the plan of M. Niebuhr, taken in 1761, Cairo is three leagues in circumference, which is about the same with Paris, by the line of the Boulevards. Now, if Paris does not contain above seven hun-

the appearance of prisons, as they have not any light from the street; it being very dangerous to have many windows in such a country, and the entering door is made very low. Their rooms within are ill contrived. The superior people, however, are not without ornaments and conveniences: they have spacious halls, in which are water-spouts; discharging into marble basins, and are well adapted to the climate. The paved floor, inlaid with marble and earthen ware, is covered with mats and mattresses, over which is spread a rich carpet, on which they sit cross-legged. A sofa, with cushions, also embellishes the apartment; and above, at the height of seven or eight feet, a range of shelves, decorated with China and Japanese porcelain. The walls, which in other respects are naked, abound with sentences extracted from the Koran, and painted flowers. Their windows are without glass, or moving sashes; but they have an open lattice work, which may probably be more expensive than our glazing. The light enters from the inner courts, from whence the sycamores reflect a pleasing verdure. An opening to the north, or at the top of the ceiling, invites a refreshing breeze, though the different individuals, at the same moment, carefully wrap themselves up in furs, and warm woollen cloths. The rich are thus careful of themselves to avoid diseases, but the common people, with their coarse covering, are perhaps less liable to take cold, and are more rational candidates for superior health*.

A great number of ugly dogs roam about the streets of Cairo, and kites in abundance skim over the houses with frequent and dolorous cries. Though both these creatures are held unclean by the Mussulmen, they never kill them; but, on the contrary, throw them the fragments of the tables; and devotees endow charitable foundations of bread and water for the dogs†. These

dred thousand inhabitants, though the houses are five stories high, it cannot be supposed that Cairo, where they are but two stories, can contain more than two hundred and fifty thousand. It is equally impracticable to give a genuine estimate of the population of all Egypt. But as it is known that the number of all the towns and villages does not exceed two thousand three hundred, and the number of inhabitants in each, on the average, does not exceed a thousand, the total cannot be more than two millions, three hundred thousand.

† Turtle-doves, which are very numerous, build their nests in the houses, and even the children do not venture to touch them.

animals have also the resource of the common sewers, which does not, however, prevent their suffering greatly from hunger and thirst; but it seems very extraordinary that these extremities never produce madness*. Canine madness is wholly unknown in Syria; though the name of the malady is to be found in the Arabic language, and is not borrowed from any foreign tongue.

Blindness is not the only remarkable disease in this country, there being several others which equally deserve attention. It is indeed extraordinary, that such a prodigious number of persons are seen in Egypt whose sight is either lost or impaired. "Out of a hundred persons," says M. Volney, "that I have met while walking the streets of Cairo, twenty have been quite blind, ten wanting an eye, and twenty others have had their eyes red, purulent, or blemished: almost every one wears a fillet, a token of approaching or convalescent ophthalmia." But nothing astonished him more than the indifference with which they support so dreadful a misfortune. *It was decreed, says the Mussulman, praised be God!—God has willed it, says the Christian, blessed be his name!*—Though resignation is the best resource when the evil has happened, it prevents an enquiry into the cause of the disorder, and precludes the discovery of its cure. The following observations may probably assist others in future enquiries:

1st. Defluxions on the eyes are not peculiar to Egypt; they are also frequent in Syria, but not so general; and the inhabitants of the sea-coast are alone subject to them.

2d. In Cairo, which is always full of filth, these disorders prevail more than in the rest of Egypt. They happen more frequently among the common people, than on those in easy circumstances, and among the natives more than foreigners. The Mamelukes are seldom attacked by them: The peasants of the Delta are afflicted with them more than the Bedouin Arabs.

3d. They happen at no certain periods, as Prosper Alpinus has declared, but are common to every month of the year, and to every age.

We cannot ascribe these maladies to any subtle dust in the air, because the peasants are more exposed to this than the inhabitants of towns:

the custom of sleeping on the terraces appears a more probable cause. The usual diet of the Egyptians seems to be a powerful cause. Cheese, sour milk, honey, confection of grapes, green fruits, and raw vegetables, which constitute the common food of the people, create a disorder in the stomach, which physicians say effects the sight: raw onions, in particular, of which they devour great quantities, have a peculiar heating quality, which the Monks of Syria induced me to remark on myself. Bodies thus nourished, accumulate corrupted humours which are constantly endeavouring to discharge themselves. Diverted from the proper channel, by habitual perspiration, they fly to the exterior parts, and take possession where they find the least resistance. They naturally attack the head, because the Egyptians, by shaving it once a week, and covering it with a very hot head-dress, principally attract the perspiration to that part, and if the head receives any impression of cold, on being uncovered, this perspiration is suppressed; and falls upon the teeth, and more particularly on the eyes, as being the tenderest part: every additional cold weakens that organ, and at length it becomes totally destroyed. To strengthen the probability that the excessive perspiration of the head is a principal cause, it is certain that the ancient Egyptians, who were bare-headed, are not mentioned by physicians as being so much afflicted with ophthalmies†; and that the Arabs of the desert, who cover it very slightly, are equally exempt from them.

Blindness in Egypt is frequently in consequence of the small-pox, a very fatal disorder in that country, and very improperly treated. During the three first days, *debs*, or confection of grapes, honey, and sugar, are administered to the patients; and, after the seventh, they are permitted to take milk, meat, and salt-fish: at the time of suppuration, they are never purged, and carefully avoid washing their eyes, even though they are full of pus, and their eye-lids closed by the glutinous matter: they never perform this operation till after forty days, and, in that time, the pus, by irritating the ball, produces an inflammation which affects the whole eye. Inoculation is not entirely unknown among them, but they seldom practise it, nor is it much

* This remark has been made by Prosper Alpinus, in his *Travels on the Physic of the Egyptians*.

† History, however, relates that several of the Pharaohs died blind.

countenanced by the Syrians, and the inhabitants of Anadolia, who have long been acquainted with it*.

This improper regimen is more pernicious than the climate, which is far from unhealthy†. To unwholesome food may be attributed both the deformity of the beggars, and the wretched appearance of the children of Cairo. Their hollow eyes, pale and puffed faces, swollen bellies, meagre extremities, and yellow skins, give them all the appearance of being hastening to the grave. Their simple mothers pretend that this is the effect of the *evil eye* of some envious person, who has bewitched them. This ancient prejudice is still general in Turkey: but the real cause is their pernicious food‡.

Another troublesome complaint, peculiar to the climate of Egypt, is a cutaneous eruption that returns every year: towards the end of June, or the beginning of July, red spots and pimples appear all over the body, occasioning much pain. As this eruption regularly happened at the time of the new waters, several physicians have supposed, that it was occasioned by the salts with which these waters are impregnated: but M. Volney assigns another reason; he says the waters of the Nile become corrupted, towards the end of April, in the bed of the river, and, when drank, produces malignant humours. When the new water arrives, it occasions a fermentation in the blood, which separates the vicious humours, and expel them towards the skin, whither they are invited by the perspiration. It is in effect, a

* The operation is performed by inserting a thread into the flesh, or by making the patient inhale, or swallow, the powder of dried pustules.

† The Mamelukes, from a wholesome diet, and a proper regimen, enjoy the most robust state of health.

‡ Another very general distemper at Cairo is vulgarly called the *Blessed Evil*, called also the *Neapolitan* and *French disease*, with which half Cairo is infected. Many of the inhabitants suppose it to proceed from *fright*, *witchcraft*, or *uncleanmess*. Some of them suspect the real cause, but are too reserved to mention their suspicions. This *blessed evil* is found very difficult to cure; mercury generally fails: sudorific vegetables succeed better, but are not infallible: fortunately, the virus is not very active, on account of the great and natural perspiration. Both in this country, and in Spain, we see old men carrying the disorder about them to the age of eighty; but its effects are fatal to children born with the infection; it is also very improper to carry into a cold country, where it never fails to make a rapid progress, becoming more inveterate from transplantation.

§ The Egyptians, and the Turks in general, have a fond-

real purgative depuration, and is always salutary. Another disease, common at Cairo, is the swelling of the testicles, which sometimes turns to an enormous hydrocele. It is said, principally, to attack the Greeks and Copts; whence a suspicion arises that it is occasioned by the great quantity of oil which they use two-thirds of the year. It is also conjectured that the immoderate use of the hot baths § contribute to it, and produces other effects equally injurious to health.

The spring, which in Egypt is the summer of our climates, introduces malignant fevers, which soon arrive at a crisis. A French Physician, who has attended many persons afflicted with them, says, that the bark, given in the intermissions, in doses of two or three ounces, has frequently saved the patient at the last extremity. As soon as the disease appears, the patient must be restricted to a vegetable acid regimen: meat and fish are prohibited, and especially eggs: the latter are a sort of poison in Egypt. In this country, and in Syria, bleeding is more injurious than beneficial, even in cases where it appears to be most necessary. The Egyptians are, in general, of a bilious habit, as appears from their eyes, and their black eye-brows, their brown complexion, and meagre form. The cholera is an habitual malady among them; and most of them frequently complain of a sourness in the throat, and an acid nausea; emetics, and cream of tartar are therefore generally successful.

Some persons have expressed an opinion that the plague originates in Egypt**; but this sud-

ness for the stove-baths. The law of the Koran, which enjoins a complete ablation after the conjugal act, is alone a very powerful motive; and the gratification of their vanity in its observance is another. With respect to the women they have other motives; First, the bath is the only place where they can make a parade of their luxury, and regale themselves with melons, fruits, pastry, and other delicacies. Secondly, they believe that the bath gives them that *embellishment* which passes for beauty. Strangers differ in their opinions: many merchants of Cairo are pleased with the baths; to others they are disagreeable. M. Volney found the bath produce in him a vertigo, and a trembling in the knees, which continued two days: He candidly acknowledges, that he does not envy the Turks either their opium, or their stoves.

¶ The next day he always administers a clyster to expel the bark.

** Prosper Alpinus, who wrote in 1591, also says that the plague never originates in Egypt; that it is brought from Greece, Syria, and Barbary; that the heats destroy it, &c. See *Medecina Aegyptiorum*, p. 28.

Vol. II. No.

position proceeds from vague prejudices. The European merchants, who have resided many years at Alexandria concur with the Egyptians in declaring that the plague never proceeds from the interior parts of the country, but first appears on the coast at Alexandria, from thence passes to Rosetta, then to Cairo, then to Damietta, and through the rest of the Delta. They also observe, that it is always preceded by the arrival of some vessel from Smyrna, or Constantinople; and when the plague has been violent in one of these cities during the summer, the danger is greater for themselves the following winter. It is well known that it really originates from Constantinople, where it is continued by the folly and negligence of the Turks, who publicly sell the effects of persons known to have died of that distemper. The ships which go to Alexandria, carry the furs and woollen cloths purchased on these occasions, which they expose to sale in the Bazar of that city, and most effectually spreads the contagion. The Greeks, who deal in these articles, usually become the first victims; and by degrees the infection reaches Rosetta and Cairo. When it is confirmed, the European merchants shut themselves and their domestics up in their Kans, and have no further communication with the city. Their provisions, which are deposited at the gate of the Kan, are received there by the porter, who cautiously takes them up with iron tongs, and plunges them into a barrel of water provided for the purpose. If they have occasion to speak to any one, they carefully avoid coming near enough to touch his clothes, or even to breathe near them. This imprisonment sometimes continues for three or four months, during which time they have no other amusement than that of walking, in the evening, on the terraces, or playing at cards.

At Constantinople the plague prevails during the summer, and is weakened, or ceases in the winter: in Egypt it is most violent in winter, and ends in the months of June. In Egypt the winter nourishes the plague, on account of its being mild and humid; but the summer being hot and

dry, it destroys it. Egypt is afflicted with the plague every fourth or fifth year, and its ravages would probably depopulate the country, did not great numbers of strangers resort thither from every part of the empire, and in a great measure repair its losses.

In Syria the plague is not so common: twenty-five years have elapsed since it has been known there*.

Every man has his peculiar taste, according to which he judges. To an Egyptian, Egypt will perhaps be the most beautiful country upon earth: but if I am permitted to give my judgment, from what I have myself seen, I cannot entertain so high an opinion of it. I am not unwilling to do justice to its extreme fertility, to the variety of its productions, and its excellent situation for commerce. I admit that it is but little subject to the variations of weather which discourage the harvest with us; and the hurricanes of America are unknown there, and that earthquakes† are extremely rare. I will even admit that the heat which is so insupportable to Europeans, is not any inconvenience to the natives; but I cannot be reconciled to the pestilential southern blast, the north-east winds which constantly occasion the most violent head-achs, or those swarms of scorpions, gnats and flies, that it is impossible for any person to eat without the danger of swallowing them. Besides no country presents such an uninteresting sameness of aspect: a boundless naked plain, with an horizon every where flat and uniform; date-trees, with bare slender trunks, or mud-walled huts on the causeways, are all that present themselves to the eye. No richness of landscape, no variety of objects, or diversity of scenery, which is so gratifying to true taste! No country is less picturesque, or less adapted to the pencil of the painter, or the descriptions of the poet. We cannot be surprised that neither the Arabs nor the ancients make any mention of Egyptian poets. They know nothing of limpid streams, nor verdant lawns, nor solitary caves; and they are equally strangers to vallies, mountains sides, and pendent rocks. The face of nature, there eternally the same, presents,

Alexandria: but the Turkish police is every where so wretched, that little success can be expected from these establishments, though of such infinite importance to commerce, and the safety of the Mediterranean states.

† A very violent earthquake happened there in 1112.

* The doctrine of predestination, and the barbarism of the government, have presented the Turks from guarding against this destructive disease. It is said, however, that an edict was issued last year for establishing a Lazaretto at Constantinople, and three others at Smyrna, Candia, and

it will be admitted, well-fed herds, fertile fields, a muddy river, a sea of fresh water, with villages rising out of it, resembling islands. Should the eye reach the horizon, it beholds nothing but savage deserts, where the wandering traveller exhausted with fatigue and thirst, shudders at the immense space by which he is separated from the world: in vain he invokes heaven and earth; his cries, lost in the boundless plain, do not receive an echo in return: destitute of every thing, and separated from mankind, he perishes in despair amid a gloomy desert, without the consolation of exciting a sympathising tear. The contrast of this melancholy scene, so near, has probably given to the cultivated fields of Egypt all their charms.

The Turks are strangers to the art of gardening, so much cultivated by polished nations, and despise every kind of cultivation: their gardens are but wild orchards, in which trees are indiscriminately planted; but they have not even the merit of a pleasing irregularity. In vain they

inform us of the orange-trees and cedars, which grow naturally in the fields: in Egypt, where they are frequent, they are vulgar, as being associated with the misery of the huts they cover, and recal only the idea of poverty and desolation. In vain do they describe the Turk, reposing under their shade, and happily smoking his pipe, without care or reflection. Ignorance have their enjoyments, as well as wit and learning; but I never could enjoy the repose of slaves, or dignify the name of insensibility with happiness.

It has been frequently remarked that travellers delight in boasting of the countries through which they themselves have travelled. Vanity, which pervades everything, becomes one of the principal causes of the propensity we all have; either to believe, or to recount prodigies. We have also less desire to be instructed than amused: for these reasons, tale-makers of every kind, have always held a distinguished rank in the esteem of mankind, and in the class of writers.

SECTION IV.

Geography and Natural History of Syria—Rocks—Mountains, Caverns, Earthquakes, Locusts, Animals—Of the Inhabitants of Syria—Of the Pastoral or wandering Tribes—The Turkmans—The Kurds—The Bedouin Arabs.

LEAVING Egypt by the Isthmus which separates Africa from Asia, and following the coast of the Mediterranean, we enter SYRIA, another province of Turkey. The name which has been transmitted to us by the Greeks, is an abridgement of *Assyria*, and was first adopted by the Ionians who frequented those coasts, after the Assyrians of Nineveh had made that country a province of their empire. The name of Syria had not therefore so extensive a signification as it has since obtained: it neither included Phœnicia nor Palestine. If we examine a map of Syria, we shall find that this country is little more than a chain of mountains, which are distributed in various directions from one leading branch: and such is the appearance it presents, when we approach it from the side of the sea, or by the immense plains of the desert. It first runs close to the sea, between Alexandretta and

the Orontes, and continues its course to the southward, and stretches as far as the source of the Jordan, where it separates into two branches, to inclose, in a kind of bason, this river, and its three lakes. As these mountains change their levels and situations, they are also greatly changed in their form and appearance. Between Alexandretta and Orontes, the firs, oaks, box-trees, laurels, yews, and myrtles, which are numerous, give them an air of liveliness which delights the traveller, disgusted with the melancholy nakedness of the Isle of Cyprus*.

On some declivities he observes cottages, environed with fig-trees, and vineyards. Extending to the northward of Aleppo, the country exhibits nothing but bare rocks, without earth or verdure. To the south of Antioch, and on the sea-coast, the hill-sides are cultivated for tobacco olives, and vines. Towards Lebanon, though

the mountains are lofty, they are covered with as much earth as qualifies them for cultivation. After leaving the country of the Druzes, the mountains are neither so high, nor so rugged, and are therefore better calculated for tillage. To the south-east of Mount Carmel they rise again, and are covered with woods, affording very agreeable prospects: but on our nearer approach to Judea, they lose their verdure, their valleys become narrower, and they are dry and stoney; terminating, at the Dead Sea in a pile of desolate rocks, full of precipices and caverns*. To the west of Jordan, and the Lake, a higher and more rugged chain of rocks present themselves, making a more gloomy prospect, and announcing the entrance of the desert, and the end of the habitable lands.

The most elevated point of all Syria is Lebanon, on the south-east of Tripoli. As soon as we depart from Larneca, in Cyprus, though at the distance of thirty leagues, we discover its summit, capped with clouds: This is also discernible on the map, from the course of the rivers. The Orontes flows from the mountains of Damascus, and loses itself below Antioch: The Kasmie, from the north of the Balbec, takes its course towards Tyre; and the Jordan, forced by the declivities, towards the south, prove that this is the highest point. Next to Lebanon, the most elevated part of the country is Mount Akkar: it has the ap-

pearance of an enormous flattened stone, and is in view for two days journey: in winter their tops are covered with snow, from Alexandretta to Jerusalem. Since it is well known that snow, in this latitude, requires the elevation of fifteen or sixteen hundred fathoms, we may conclude that to be the height of Lebanon, and consequently much lower than the Alps, or even the Pyrenees†.

If we examine the substance of these mountains, we shall discover that they consist of a hard calcareous stone, of a whitish colour, and disposed in strata variously inclined. In travelling from Aleppo to Hama, veins of the same rock are continually seen in the plain, while the mountains on the right present high piles, appearing like the ruins of towns and castles. The same stone, under a more regular form, also composes the greater part of Lebanon, Anti-Lebanon, the Mountains of the Druzes, Galilee, and Mount Carmel, and stretches to the Lake Asphaltites. The bed of the torrent of Azkalan, in Palestine, is also lined with a heavy stone, porous and salt, which contains a great number of small volutes and bivalves of the Mediterranean. Pococke saw a large quantity of them in the rocks which border on the Red Sea. Iron is very abundant here. Every summer the inhabitants of Judea cannot be without it, for Moses observed, above three thousand years ago, that its stones were of iron‡.

Syria,

* The place is called *The Grottoes of Engaddi*, which has been a refuge for vagabonds for several ages, some of which are sufficiently capacious to contain fifteen hundred people.

† Mount Blanc, the highest of the Alps, is estimated at two thousand four hundred fathom above the level of the sea, and the peak of Ossian, in the Pyrenees, at nineteen hundred.

Lebanon, which gives its name to the whole chain of the Kestrouan, and the country of the Druzes, presents variety of majestic mountains. Every step displays either beauty, majesty, or grandeur. When we land on the coast, the loftiness and steep ascent of this mountainous ridge, which seems to enclose the country, inspire astonishment and awe. Here the curious traveller seems to command the whole world, now surveying the successive chains of mountains, while the wandering eye, in an instant, transports the imagination from Antioch to Jerusalem; and now approaching the surrounding objects, more minutely examines the rocks, woods, torrents, villages, and towns. He contemplates the valley, obscured by stormy clouds, with some

degree of pleasure, and smiles at hearing the thunder, which had so often burst over his head, now growling under his feet.

‡ The south of Syria, which is the hollow through which the Jordan flows, is a country of volcanoes: the sulphurous sources of the Lake Asphaltites, the lava, and the hot bath of Taberia, plainly demonstrate that this valley has been the seat of a subterraneous fire not yet extinguished. Clouds of smoke are often seen issuing from the lake, and new crevices appear formed upon its banks. It seems probable that the whole valley has been occasioned by a violent sinking of a country, which formerly poured the Jordan into the Mediterranean. It is, however, certain that, at least, the catastrophe of five cities, destroyed by fire, must have been from the eruption of a volcano, then burning*. The quantities of ruins, still found on the western border, seems to be a confirmation of this. Though these eruptions have long ceased, earthquakes continue to be felt, at intervals, in this country. History gives us many examples of earthquakes, which have changed the face of Antioch, Laodicea, Tripoli, Berytus, Tyre, and Sidon. Even so

rich cities, and that they were swallowed up by a volcano." Lib. 16. p. 764.

lately

* Strabo says, "that the tradition of the inhabitants of the country (that is of the Jews themselves) was, that formerly the valley of the lake was peopled by thirteen thou-

Syria, Egypt, Persia, and most of the southern parts of Asia, are subject to clouds of locusts, so often mentioned by travellers. The quantity of these insects is almost incredible, the whole earth being covered with them for the space of several leagues. The noise they make in browsing on the trees and herbage, may be heard at a considerable distance. A person would suppose that fire had followed their progress: wherever their myriads spread, the verdure of the earth disappears; trees and plants, deprived of their foliage, and reduced to their naked boughs and stems, compel the winter instantly to succeed to the rich scenery of the spring. When these clouds of locusts take their flight, to traverse more rapidly a desert soil, the heavens appear to be obscured by them. Happily, indeed, this calamity is not frequently repeated, for it is the certain fore-runner of famine, and the maladies it occasions. The Syrians have remarked, that they are usually bred by two mild winters, and that they invariably come from the desert of Arabia. Hence it may be apprehended, that the cold has not been sufficiently rigid to destroy their eggs, innumerable legions issue forth. When they make their first appearance in the cultivated country, the inhabitants endeavour to drive them off with clouds of smoke, but they cannot always procure a sufficiency of herbage and wet straw: they then dig trenches, in which many of them are buried; but the two most effectual destroyers of them, are the south, or south-easterly winds, and the bird called the *sarnarmar*. These birds, which resemble the wood-pecker, follow them in great multitudes, devouring as many as they can, and destroying large quantities of them. They are therefore much respected by the peasants, who never disturb or injure them. As the winds, just mentioned, drive these myriads of locusts

lately as 1579, an earthquake happened which made wonderful ravages. It destroyed, in the valley of Balbec, upwards of twenty thousand persons: the inhabitants of Lebanon were so terrified at the shocks of it, that for three months they abandoned their houses and dwelt under tents.—"When I was at Aleppo, in December, 1793," says Mr. Volney, "so violent a shock was felt, as to ring the bell in the house of the French consul."—It is remarked, in Syria, that earthquakes seldom happen but in winter, when the autumnal rains have ceased.

* The Jordan, however, has considerable depth; but if the Orontes, were not impeded by successive obstacles, it would be perfectly dry during the summer.

† Lake Asphaltites contains neither animal nor vegetable life: its waters are without fish, and its banks with-

over the Mediterranean, such immense quantities of them are drowned, that when their carcases are wasted to the shore, they infect the air for several days, even to a considerable distance.

In so extensive a country as Syria, we cannot suppose the quality of their soil is every where the same. The mountains are generally harsh and stoney; and the plains flat and loamy, exhibiting every sign of the greatest fecundity. In the territory of Aleppo, near Antioch, it resembles brick-dust, or Spanish snuff. The waters of the Orontes, which pass through this district, are whitish, acquiring that colour from the nature of the land towards its source. The earth, in general, is brown, and as fine as garden mould. Hardly a pebble is to be found in the plains of Hauran, Gaza, and Balbec.

The grand ideas which travellers usually give of distant objects, have accustomed us to mention the waters of Syria with respect. We are frequently induced to say the river *Jordan**, the river *Orontes*, and the river *Adonis*. If we would, however, wish to speak properly, we should hardly find any respectable streams but *Rivulets* in this country: the channels of the Orontes and the Jordan, though the two most considerable, are hardly sixty paces wide at their mouths; the others are hardly considerable enough to be mentioned. They may be said to be nothing but Torrents and Cascades, that from the proximity of the mountains, among which they rise to the sea, the waters have not time to collect in long valleys, and to form rivers. The obstacles by some of these mountains, form lakes, some of which are considerable, as those of Antioch, Aleppo, Damascus, Tabaria, and that which has been honoured with the name of the Dead Sea, or Lake Asphaltites. All these lakes, except the last, contain fresh water †.

out verdure; the extreme saltiness of the water far exceeds that of the sea, and is therefore hostile to animals and vegetables. The soil around it is so impregnated with this saline quality, that it produces no plenty: hence the melancholy aspect which reigns about this lake. The origin of this mineral was particularly noticed by M. Volney, who says, that on the south-west shore, there "are mines of fossil salt, of which I have brought away several specimens." On this shore are also found fragments of sulphur and bitumen, which the Arabs convert into trifling articles of commerce. Unshapen blocks are observed here, which pass with superstitious pilgrims for monuments of the Adventures of *Loft Wife*, though it is no where pretended that she was metamorphosed into stone, but into salt.

The lake of Antioch abounds with eels, and a sort of red

* It was long sup a peculiar to Mex exclusive possession of the living cochini

VOL. II. No.

It is generally said that Syria is a very hot country; but several distinctions are necessary to be made: first, on account of the difference of latitude, which, from the two extremes, is not less than six degrees; secondly, from the division of the country into low and flat, and high and mountainous. We may venture then to establish two general climates; the one very hot, which is that of the coast, and the interior plains, as those of Antioch, Balbec, Tripoli, Gaza, Acle, &c. The other temperate.

In this climate, the order of the seasons nearly tallies with the middle provinces of France: the winter, which continues from November to March, is sharp and severe. Not a year passes without snow, and the earth is frequently covered with it, several feet deep: the spring and autumn are mild, and the summer heat is absolutely insupportable. In the plains, on the contrary, when the sun returns to the equator, the transition is rapid to oppressive heats, which continue till the conclusion of October. But the winter is so moderate, that the orange, banana, and other delicate trees, thrive in the open air. It appears equally extraordinary to an European at Tripoli, to see, under his window, in the month of January, orange-trees, well stocked with flowers and fruit, while the towering head of Lebanon is covered with ice and snow. In the northern parts, and to the east of the mountains the winter is indeed more rigorous, without the summer being less hot. At Antioch, Damascus, and Aleppo, there are several weeks of frost and snow every winter; which arises more from the situation of the country, than from the difference of the latitude; the plains to the eastern mountains being high above the level of the sea, and exposed to all the parching blasts of the north and south-east, and screened from the humid winds of the south and south-west.

In spite of the barbarism of Syria, which is an enemy to all industry and improvement, we are astonished at the variety it affords. Besides

red fish not very excellent; but the Greeks, who keep a perpetual lent, consume great quantities of them. Lake Labaria is still richer; crabs, especially, are very numerous; but the environs, being inhabited only by Mahometans, they are very seldom disturbed.

* It was long supposed that the insect of the cochineal peculiar to Mexico; and the Spaniards, to secure the exclusive possession of it, have prohibited the exportation of the living cochineal, under pain of death; but M.

wheat, rye, barley, beans, and the cotton plant, we find a multitude of useful and agreeable productions. Palestine abounds in sesamum, from which oil is procured, and doura as good as that of Egypt. Maize thrives in Balbec, and rice is successfully cultivated on the borders of the marshy country of Havula. Indigo grows without cultivating, on the banks of the Jordan, in the country of Disan, and with care may be made of a very excellent quality. The hill-sides of Latakia produce tobacco, a principal article of the commerce of that town with Damietta and Cairo. The olive tree of Provence grows at Antioch, and at Ramle to the height of the beech. The white mulberry-tree enriches the whole country of the Druzes, by the beautiful silks which are produced on it, while the vine supported on poles, supplies grapes which produce red and white wines that might rival those of Bourdeaux. Raffia, besides its lemons, produces enormous citrons; and water melons, superior even to those of Brudos. Gaza produces dates like Mecca, and Pomegranates like Algiers. The oranges of Tripoli are equal to those of Malta, and Bairut figs like those of Marseilles. Aleppo has the exclusive advantage of producing pistachios, and Damascus possesses all the fruits that are known in the provinces. Its stony soil is equally suitable to the apples of Normandy, the plums of Torraine, and the peaches of Paris. No less than twenty sorts of apricots are reckoned there; one of which contains a kernel much esteemed through all Turkey. The cochineal plant also grows on that coast, in as high perfection as in Mexico and St. Domingo*. When we consider that the mountains of the Yemen, which produce most excellent coffee, and that they are only a continuation of those of Syria, and that their soil and climate are nearly the same †, we may reasonably suppose that Judea might easily cultivate this valuable production of Arabia ‡.

The face of the heavens, in Syria, especially on

Thierit, who succeeded in bringing it away in 1771, and carried it to St. Domingo, found the nopal of that island contained it before his arrival. It seems as if Nature hardly ever separated insects from the plants appropriated to them.

† The situation of the country of Yemen and Tuhama is very similar to that of Syria. See M. Niebuhr, *Voyage en Arabie*.

‡ With all the advantages of soil and climate it is not surprising that Syria should have always been esteemed a

on the coast, and in the desert, is more constant and regular than in our climates; the sun is seldom obscured for two successive days. In the course of a whole summer, we see few clouds, and still less rain. It begins about the end of October, and is then neither long nor plentiful. The husbandmen wish for it to sow what they call their winter crop, meaning their wheat and barley. In December and January, they have heavier and more frequent rain, and sometimes snow in the higher country. Sometimes also it rains in March and April, when the husbandman embraces the opportunity of sowing his summer crop of sesamum, doure, cotton, tobacco, beans, and water-melons. The remainder of the year is uniform, but the inhabitants more frequently complain of drought, than of too much wet.

The winds in Syria are, in some degree, periodical, and governed by the seasons. About the autumnal equinox, the north-west wind begins to blow stronger, and more frequently. It occasions the air to be dry, clear, and sharp; and on the sea-coast, it causes the head-ach, like the north-east wind in Egypt; and more in the northern than in the southern parts. It also usually blows three days successively, like the south and south-east at the other equinox, and it usually prevails till November. These winds are followed by the north-west, the west,

most delicious country, and that the Greeks and Romans ranked it among the best of their provinces; they did not even think it inferior to Egypt. In more modern times, a Pacha, who well knew both these provinces, being asked to which he gave the preference, thus delivered his answer—"Egypt is certainly a most beautiful farm, but Syria is a charming country house."

To the natural history of Syria we may add, that it produces all our domestic animals, as well as the buffalo and camel, whose ability is so well known. We also find gazelles (antelopes,) in the plains, and a number of wild boars in the mountains. Jackalls are very numerous, they march in draves, and frequent the environs of towns, where they feed on what carrion they can find. They never attack any person, but are ever ready to save themselves by flight. Every evening they give each other the watch word, to begin howling, and sometimes amuse themselves thus, in very doleful strains for a quarter of an hour. In unfrequented places there are also hyenas, and ounces; (properly called) but the country is free from lions and bears: water-fowl are plentiful; but game is not so abundant: The hare and the red partridge are the most common. The colibri, (or humming bird) still exists in the territory of Saïde. Them, and the pelican, are the only remarkable birds in Syria.

The qualities of the air and waters in Syria ought not to

and the south-west, which continue from November to February. In March the pernicious winds arise from the southern quarter, with the same circumstances as in Egypt; but they are less violent as we advance towards the north, and more supportable in the mountains, than in the flat country. Their duration, at each return, is usually twenty-four hours, or three days. The easterly winds, which follow, continue till June, when a north wind succeeds. At the same season, also, the wind varies through all the points, every day; passing with the sun from the east to the south, and from the south to the west, to return by the north, and then re-commence the same circuit. A local wind, called the land breeze, at this time prevails along the coast during the night; it springs up after sun-set, continues till sun-rising, and extends only two or three leagues out at sea.

No country is better adapted to observations than Syria: the confined horizon which bounds our view, circumscribes also our ideas. In Syria, on the contrary, an immense scene opens before us, and the great agents of nature are collected in a place where her various operations may be watched. To the west is displayed the vast liquid plain of the Mediterranean; to the east, the vast desert, but absolutely dry: Amidst these two level surfaces, rise the mountains, of

remain unnoticed. These elements in Syria present very remarkable phenomena. On the mountains, and all the plains, which stretch to the eastward, the air is light, pure, and dry; but on the coast, and particularly from Alexandria to Yafa, it is moist and heavy. The air of the desert, and the mountains, though not unwholesome for such as are in no danger of pulmonary complaints, is injurious to those who are; and it is necessary to send such from Aleppo to Lahakie or Saïde. The salutary air on the coast, is, however, over-balanced by those that are pernicious: and it may, in general, be pronounced unhealthy, as it occasions intermittent and putrid fevers, with destructions of the eyes. The evening dews, and sleeping on the terraces, are found much less prejudicial in the mountains and interior parts of the country, the distance from the sea being greater.

There is also a remarkable difference in the waters of this country: In the mountains, that of the springs is light and good; but in the plain, both to the east and west, we find nothing but brackish water, which becomes more so the nearer we approach the desert, where there is not a drop of any other. From this inconvenience rain is so desirable to the inhabitants of the frontiers, that they have at all times taken care to collect it in wells and caverns, properly closed: hence, among all ruins, cisterns are usually some of the first things that we discover.

which the summits are so many observatories, from whence objects at thirty leagues distance may be perceived. Four observers might discern the whole extent of Syria. They might observe how the region of the sea, at first unclouded, veils itself with vapours; how these vapours form into groupes, and separate, and by a perpetual mechanism, ascend above the mountains: while the desert, invariably clear, never produces clouds, and has only those it has received from the sea. They would be sensible of the truth of an axiom, which should no longer be disputed, "That the heat is greater in proportion as we approach the surface of the earth, and diminishes as we remove from it." Hence it seems to proceed only from the action of the rays of the sun upon the earth. In short, they might attempt the solution of the greatest part of meteorological problems.

Syria, as well as Egypt, has had many revolutions, which have confounded the different races of its inhabitants. Within two thousand five hundred years, it has been ten times invaded, and the invaders have introduced into that country a succession of foreign nations. First, the Assyrians of Nineveh, who, about the year 750 before the Christian era, obtained possession of almost the whole country lying to the north of Judea. Next the Chaldeans, or Babylonians, who completed the conquest of Syria, except the Isle of Tyre. The Chaldeans were followed by the Persians, under Cyrus; and the Persians by the Macedonians, under Alexander.

It then appeared probable that Syria would cease to be subject to foreign powers, and that it would obtain a distinct independent government; but the people, who found in the Seleucida only despots and oppressors, perceiving they were reduced to the necessity of bearing some yoke, preferred the lightest; and Syria, yielding to the arms of Pompey, became a province of the Roman empire.

* Syria has not, like Egypt, refused to adopt the foreign races: they are all become equally naturalized to the country. The inhabitants of the southern plains are more swarthy than those of the northern; and these more so than the inhabitants of the mountains. The women of Damascus and Tripoli are celebrated for the fairness of their complexion and the regularity of their features, but as they perpetually wear a veil, these perfections are perhaps overrated; no person having it in his power to make nice observations. In several districts, however, the women are less scrupulous. In Palestine, for example, married women are seen unveiled, but want and fatigue have deprived them

Five centuries after, when the sons of Theodosius divided their immense patrimony, this country changed the capital to which it was to appertain, without changing its masters, and was annexed to the empire of Constantinople. Such was its situation in 622, when the Arabian tribes, collected under the banners of Mahomet, seized it and nearly laid it waste. Since that period, torn to pieces by the civil wars of the Talmites, and the Ominiades, wrested from the Caliphs by their rebellious brothers, taken from them by the Turkman soldiery, invaded by the European crusaders, retaken by the Mamelukes of Egypt, and ravaged by Tamerlane and his Tartars, it at length fell into the hands of the Ottoman Turks, who have been its masters for two hundred and eighty-six years.

These vicissitudes have introduced into the country so many distinct tribes of inhabitants, that the people of Syria must not be considered as one single nation, but rather as a mixture of different nations.

They may be divided into three principal classes: First, the posterity of the people conquered by the Arabs; that is the Greeks of the Lower Empire.—Secondly, the posterity of the Arabian Conquerors.—Thirdly, the present ruling people, the Ottoman Turks*.

The disorders prevalent in Syria are dysenteries, inflammatory and intermittent fevers, produced by pernicious fruits, which the people greedily devour. The small-pox is often fatal; but the most frequent illness is the cholera; the causes of which are very evident when we consider the vast consumption of raw vegetables, unripe fruit, cheese, olives, sour milk, and ill-fermented bread. Hence, the first prescriptions in almost all disorders, is an emetic.

The Arabic tongue is the general language of Syria: though it is said by Niebuhr, that the Syriac is still used in some villages of the mountains. The Turkish language is only used in

of many of their charms. Their eyes are generally very beautiful, and the long drapery, which forms their general dress, display the shape of the body; which is not always elegant, though hardly ever deformed. *M. Volney* says—"I do not recollect having seen in Syria, nor even in Egypt, two persons crooked or deformed."

The Syrians are, in general, of a middling stature, and less corpulent than the inhabitants of the north. We find, however, in the cities, some individuals, whose corpulence sufficiently proves the influence of diet even in a warm climate.

Syria, by the military, persons in office, and the Turkman hordes*. The Arabic of Syria is much harsher than that of Egypt; but *M. Niebuhr* says, that of the inhabitants of Yemen, and the southern coast, is much softer, and gives a fluency to the Arabic beyond what could have been supposed.

Among the variety of inhabitants of Syria some are dispersed over different parts of the country, and others confine themselves to particular spots†.

All their property consists in cattle; that is, in camels, buffaloes, goats, and sheep. They live on milk, and sell or barter the surplus in the neighbouring country, for arms, clothes, money, and corn. Their women spin wool, and make carpets. The men are wholly occupied in smoking, and looking after their flocks. Continually on horseback, with their lances on their shoulders, their sabres by their sides, and their pistols in their belts, they are expert horsemen, and indefatigable soldiers. The Pachalits of Aleppo and Damascus, which are the only parts of Syria they frequent; are supposed to contain thirty thousand wandering Turkman. Many of these tribes pass, in summer, into Armenia and Caramania, where plenty of grass may be found; and in winter they return to their former quarters. The Turkman are reputed Mussulmen, and have generally submitted to the operation of circumcision; but they seem to give themselves very little concern about religion. They have not the reputation of being robbers, like the Arabs, and they are said not to be deficient in hospitality or generosity. When we consider that they live in plenty, without being rich, and are injured by war, fatigue, and danger, we may reasonably suppose they are equally removed from the ignorance and servility of the peasants, and the cor-

ruption of the mercenary inhabitants of towns.

The Curda are another national body, the tribes of which are dispersed over the Lower Asia, and have much extended themselves during the last century. Their original country is the chain of mountains, from whence issue the different branches of the Tigris. In modern geography it is known by the name of *Curd-estan*. This country is mentioned in the most ancient histories of the east. Among the curds, each village has its chief, and the whole nation is divided into different and independent factions. The disputes, inseparable from this state of anarchy, have detached from the nation a great number of tribes and families, which have adopted the wandering life of the Turkman and Arabs.

These are dispersed in the Diarbekir, and over the plains of Arzroum, Erivan, Sivas, Aleppo, and Damascus. All their tribes united amount to about one hundred and forty thousand tents, or one hundred and forty thousand armed men. Like the Turkman, these Curds are pastors and wanderers, but differ from them in some particular cases. The Turkman give their daughters a marriage dowry; the Curds receive a premium for them. The Turkman disregard antiquity of extraction; the Curds esteem it highly honourable. The Turkman have an aversion to stealing; the Curds are accused of being plunderers, and are therefore much dreaded in the neighbourhood of Aleppo, Antioch, &c. In their Pachaie, and in that of Damascus, their number exceeds twenty thousand tents and huts. They are reputed Mahometans, but think little of religious rites or opinions. The language of the Curds is divided into three dialects. It has neither the aspirations, nor the gutturals of the Arabic‡.

The soil, however, varies considerably in different parts. In the Diarbekir, and in the neighbourhood of Egypt, are the Beduin-Arabs. With respect to the Arabs, they seem especially condemned to a wandering life, by the nature of the deserts. To have an idea of these deserts, the reader must imagine to himself a sky almost perpetually inflamed, and without clouds, immense plains, without houses, trees, rivulets, or hills: where the eye generally meets nothing but an extensive and uniform horizon, like the sea, though in some places the land is uneven and stony. Almost naked on every side, the soil presents nothing but a few wild plants, thinly scattered, and thickets, whose solitude is hardly ever disturbed but by antelopes, hares, rats, and locusts. Such is the description of the whole country, which extends six hundred leagues in length, and three hundred in breadth: it stretches from Aleppo to the Arabian sea, and from Egypt to the Persian gulph.

ferent

* At Alexandretta, and Beilan, they speak Turkish, but these places must be regarded as frontiers of Caramania, where Turkish is the vulgar tongue.

† The Turkman are among the Tartar hordes, who, on the great revolutions of the empire of the Caliph, emigrated from the eastward of the Caspian Sea, and spread themselves over the plains of Armenia and Asia Minor. Their language is the same with that of the Turks, and their mode of life resembling that of the Beduin Arabs. Like them they are obliged to travel over immense tracts of land, to procure subsistence for their numerous herds. But the countries frequented by the Turkman being rich in pasturage, they can feed more cattle on them, and are consequently less dispersed than the Arabs of the desert.

ferent places: On the frontiers of Syria, for example, the earth is cultivable, and even fruitful. As much may be said of the banks of the Euphrates; but in the interior parts of the country, and towards the south, it becomes white and chalky, as in the parallel of Damascus: rocky, as in the Tih, and the Hedjaz; and a pure sand, as to the eastward of the Yemen. This variety in the qualities of the soil occasions some minute differences in the condition of the Bedouins: for instance, in the most sterile countries, the tribes are feeble, and very distant, as in the desert of Suez, that of the Red Sea, and the interior of the Great Desert, called the Najd. Where the soil is more fruitful, as between Damascus and the Euphrates, the tribes are more numerous, and not so far distant from each other: and in the cultivable districts, the camps are frequent and contiguous. In the former case, the Bedouins subsist only on the produce of their herds, a few dates, and flesh meat, which they eat fresh, or dried in the sun, and reduced to a powder. In the latter, they cultivate some land, and add cheese, barley, and rice to their flesh and milk*.

No creature seems more peculiarly fitted for the soil and climate it inhabits than the camel. It cannot be doubted but the nature of the one, has been adapted to that of the other by some disposing intelligence. Designing the camel to dwell in a country where little nourishment is to be found, Nature has been sparing of her materials in his formation; she seems to have furnished him with nothing but what is absolutely necessary: she has not bestowed on him the plump fleshiness of the ox, horse, or elephant; she has given him a small head without ears, at the head of a meagre long neck without flesh. She has withheld from his legs and thighs every muscle not absolutely requisite for motion, and has barely given to his withered

body only the vessels and tendons necessary to connect its frame together. She has allowed him a strong jaw, to enable him to grind the hardest aliments; but, that he might not consume too much, she has contracted his stomach, and obliged him to chew the cud. She has incumbered his foot with a lump of flesh, which, sliding in the mud, and being incapable of climbing, renders him unfit for any soil that is not dry, level, and sandy, like that of Arabia. She has evidently calculated him for a life of slavery, by refusing him any sort of defence against his enemies. Without the horns of a bull, the hoof of the horse, the tooth of the elephant, and the speed of the stag, how can he avoid the attacks of the lion, the tiger, or the wolf?—Nature has therefore, to preserve the species, concealed him in the depth of the immense deserts, where the absence of vegetables can attract no game, and whence the want of game repels every voracious animal. Tyranny must have expelled man from the habitable parts of the earth, before the camel could have lost his liberty. Become domestic, he has rendered habitable the most barren soil: he alone supplies the whole that his master wants. The milk of the camel nourishes the family of the Arab, under the various forms of curds, cheese, and butter; and they frequently feed upon his flesh. Slippers and harness are fabricated from his skin, and tents and cloathing of his hair. Heavy burthens are transported, by his means, from place to place; and, when the earth denies forage to a horse, so essential to the Bedouin, the female camel supplies that deficiency by her milk, for the trifling consideration of a few stalks of brambles or wormwood, and pounded date kernels. Of such importance to the desert is the camel, that without that useful animal, it must infallibly lose every inhabitant†.

It has already been observed, that the Bedouin Arabs

Arabs

* The causes of the sterility and uncultivated state of the desert, is principally to be attributed to the absence of fountains and rivers; and, in general, to the want of water. This want of water is occasioned by the nature of the country, which being flat and destitute of mountains, the clouds glide over its heated surface. They never rest there but in winter, when the coldness of the atmosphere binds them from rising, and condenses them into rain. The nakedness of the country is another cause of drought, as the air is consequently more easily heated, and compels the clouds to rise.

† The Bedouins are, in general, small, meagre, and

tawny, and their complexion is darker than that of the neighbouring peasants. The rich, and their attendants, are, however, taller, and more corpulent than the common class, some of them are five feet six inches high, though, in general, they do not exceed five feet two inches. The lower class of Bedouins live in a state of habitual wretchedness and famine: their difference, therefore, can only be attributed to their food, with which the former are supplied more abundantly than the latter. Abstinence is most remarkable among the tribes of the Naid and the Hedjaz. Six or seven dates, soaked in melted butter, with a little fresh milk, or curds, serve a man a whole day: he is ren-

Arabs are divided into tribes, which constitute so many distinct nations. Each of these tribes possess a certain tract of land, and are collected in one or more camps. If a tribe, or any of its subjects, enter upon a foreign territory, they are considered as enemies and robbers, and a war is the consequence. The manner of proceeding, on such occasions, is very simple. The offence being made known, they mount their horses, and seek the enemy: having met, they enter into a parley; when the matter is either adjusted, or they proceed to the attack either in small bodies, or man to man. They encounter each other at full speed, with fixed lances; which, notwithstanding their length, they sometimes dart at the flying enemy: the victory is seldom contested; the vanquished generally take their flight full-gallop over the naked plain of the desert. Night generally favours their escape from the conqueror. The tribe which has lost the battle, strikes its tents, removes to a considerable distance, by forced marches, and seeks protection among its allies. The enemy, pleased with their success, drive their herds farther on, and the fugitives soon after return to their former situation.

The camps of the Bedouins are formed in a kind of irregular circle, composed of a single row of tents. Each tent, inhabited by a family, is divided by a curtain into two apartments, one of which is appropriated to the women. The empty space, within the large circle, folds their cattle every evening. They have no intrenchments, and their only advanced guards and patrols are dogs: their horses always remain saddled, that they may be ready to mount on the first alarm; but they are strangers to all order and discipline.

dered extremely happy, if he can add a small quantity of coarse flour, or a small ball of rice. Meat is only to be eaten at the greatest festivals; and they never kill a kid but for a marriage or funeral. In times of dearth, the common people do not disdain the most wretched kinds of food, and eat rats, lizards, locusts, and serpents.

But we are by no means justified in concluding, that the frugality of the Arabs is a virtue of choice, or even of climate. The extreme heat facilitates their abstinence, by destroying that activity which cold gives to the stomach. Their being habituated to a sparing diet also prevents the extension of that part, and enables them the better to support abstemiousness.

* The principal shaik in every tribe defrays the expences of all who arrive at, or quit the camp: he receives the

The tribes which live in the vicinity of the Turks are still in more danger of attacks and alarms; for these strangers arrogating to themselves, in right of conquest, the property of the whole country, treat the Arabs as rebel vassals, or as dangerous enemies. And on this principle, they continually wage secret or open war against them.

Each tribe is composed of one or more principal families, the numbers of which bear the title of shaiks, *i. e.* chiefs or lords. These families resemble the patricians of Rome, and the nobles of modern Europe. One of the shaiks has the supreme command over the others. He is general of their little army, and enjoys the title of *Emir*, signifying commander and Prince. To these he adds particular adherents whom he studiously attaches to him by kindness and generosity. A number of small families, who are not wholly independent, stand also in need of his protection and support, and therefore range themselves under his banners. Such an union is called *kabila*, or tribe; and these tribes are distinguished from each other, by the name of their respective chiefs, or by that of the ruling family.

The government of this society is at once republican, aristocratical, and even despotic, without exactly attending to any one of these forms. It is republican, as the people have a great influence in all affairs, and every thing is transacted by the consent of a majority. It is aristocratical, because the families of the shaiks possess some of the prerogatives which every where accompany power; and it is despotic, because the principal shaik has an indefinite and almost absolute authority.

The simplicity and poverty of the lower class of the Bedouins is proportioned to that of their chiefs.

visits of the allies, and every person who has business to transact with him. Contiguous to his tent is a large pavilion, for the reception of all strangers and passengers. There frequent assemblies of the shaiks and principal men are held to determine on peace and war, on encampments and removals, and on the differences with the Turkish governors, and the villages; as well as the litigations and quarrels of individuals. To this crowd, which enters successively he must keep open table: it is indeed of importance to him to be generous; as on the exercise of generosity depend his credit and his power. The Arab places the liberality which feeds him before any other virtue. They bear in mind the proverb, *A Close Fist has a Narrow Heart*. To defray these expences, the shaik has only his herds, a few spots of cultivated ground, the profits of

chiefs. All the wealth of the family is like the following inventory. A few male and female camels; a mare, her bridle, and saddle, some goats, and poultry; a tent, lance, a crooked sabre, a rusty musquet, a pipe, a portable mill, a pot for cooking, a leather bucket, a small coffee-roaster, a mat, some clothes, a mantle of black woollen, and a few glass or silver rings, which the women wear upon their legs and arms. But what the poor man takes the greatest pleasure in, is his mare: with her the Bedouin makes his excursions against hostile tribes, or seeks plunder on the highways. The wants of the Arabs, indeed are few, and their industry is very inconsiderable: all their arts consist in weaving their clumsy tents, and in making mats and butter. They are absolute strangers to all science: all their literature consists in reciting tales and histories, like the Arabian Nights Entertainments. They delight exceedingly in such stories. The Bedouins have also their Love Songs, which abound with sentimental and natural characters. When we consider how much the condition of the Bedouins, especially in the Desert, resembles that of the savages in America, it seems wonderful that they should not have the same ferocity.

It seems, at first view, that America, being rich in pasturage, lakes, and forests, is more adapted to the pastoral mode of life than to any other. But when we consider that these forests, by affording an easy refuge to animals, protect them securely from the power of man: we may reasonably conclude that the savage has become a hunter instead of a shepherd, by the nature of the country. In this state all its habits have contributed to give him a ferocity of character: the fatigues of the chase have hardened his body, and frequent and extreme hunger has rendered him voracious. The habit of taking away life, and tearing his prey has reconciled him to the sight of death and sufferings. Tormented by extreme hunger, he has desired flesh; and, finding that a fellow easily obtained, he did not long hesitate to kill him to gratify the cravings of his appetite. After the first experiment, this cruelty

plunder, and the tribute he levies on the high roads. The shaik, with whom I resided at Gaza, in 1781, did not seem to live at a greater expence than an opulent farmer. We must not, therefore, when we speak of the Bedouins, affix to the words *Prince* and *Lord*, the idea they usually convey.

degenerates into a habit; he becomes a cannibal, sanguinary and atrocious; and his mind acquires the insensibility of his body.

The situation of the Arab is wholly different. Amid his extensive naked plains, without water, and without forests, he could not become a hunter or a fisherman. Finding, however, a light but constant and sufficient nourishment, he has acquired the habit of frugality. Content with milk and dates, he had not any desire for flesh, and he shed no blood: his hands were unaccustomed to slaughter, and his ears were never tortured with the cries of suffering creatures; he has therefore preserved a humane and feeling heart. When the savage shepherd became acquainted with the use of the horse, a considerable change was effected in his mode of life. The facility of passing rapidly over extensive plains rendered him a wanderer. Rather a plunderer than a warrior, the Arab possesses no sanguinary courage: he attacks only with a view of advantage, and, if he meets with resistance, never risks his life for an inconsiderable booty. To irritate him, you must shed his blood, when you will find him as obstinate in his vengeance, as he was cautious in avoiding danger.

Among themselves the Arabs are remarkable for good faith, and a disinterested generosity which would do honour to the most civilised nation. If a stranger only touches the tent of the Bedouins, from that instant his person becomes inviolable. It is thought disgraceful in the extreme to satisfy even a just vengeance at the expence of hospitality. When a Bedouin has consented to eat bread and salt with his guest, nothing can induce him to betray him. Rapacious as he is without his camp, he has no sooner set his foot within it, than he becomes liberal and generous. What little he possesses, he is ever ready to divide.

The Bedouins, from policy, preserve the appearance of Mahometanism; but so relaxed is their observance of its ceremonies, and so little fervor has their devotion, that they are generally supposed to be infidels, who have neither law nor prophet. They jocularly observe, that the re-

ligion.

ligion of Mahomet was not made for them, for, say they, "How shall we make ablutions who have no water? How can we bestow alms who are not rich? Why should we fast in the Ramadan, since the whole year with us is one continued fast? and why should we make the pilgrimage to Mecca, if God be present every where?"—In short, every man acts and thinks as he pleases, and the most perfect toleration is established among them. It must be acknowledged

that there are few polished nations whose morality is, in general, so much esteemed as that of the Bedouin Arabs; and it is remarkable that the same virtues are equally to be found in the Turkman hordes, and the Curds. Among these also, religion is perfectly free from exterior forms; no man has ever seen, among the Bedouins, the Turkmans, or Curds, either priests, temples, or regular worship.

SECTION VII.

People of Syria—Of the Ausarians—The Maronites—The Druzes—The Motonalis.

THE AUSARIANS.

THE first people to be distinguished from the rest of the inhabitants of Syria, among those who employ themselves in cultivation, are those called, in the country, by the plural name Ausaria, in Delisle's map styled Emsyrians. The territory occupied by these Ausaria, is that chain of mountains, extending from Antakia to the Great River. These Ausarians are principally inhabitants of the mountains before mentioned. When the crusaders waged war in these countries, they marched from Marrah towards Lebanon, and engaged with some of these Ausarians, many of whom they slew. William of Tyre*, who mentions this fact, confounds them with the assassins†.

The Ausarians are divided into several tribes, among which are mentioned the Shamsia, or adorers of the Sun: the Kelbia, or worshippers of the Dog, and the Kadmousia, who pay particular homage to the sexual characteristic in women.

M. Niebuhr, who had the same circumstances related to him, could not suppose it possible, because says he, it seems astonishing that mankind should so far degrade themselves: but this mode of reasoning is contradicted by the history of all

nations: which shews that the human mind is capable of the most extravagant excesses, as well as the most palpable absurdities.

Historians remark, that, notwithstanding the vicinity of Antioch, Christianity penetrated very feebly into these countries: very few proselytes were made there, even after the reign of Julian: and from that period to the invasion of the Arabs, there was but little time for its establishment. The progress made by Christianity among these mountaineers, could only tend to pave the way for Mahometanism, a doctrine more suitable to their habits and inclinations.

About one hundred and fifty years after, Mahomed-el-Dourzi having formed a sect, the Ausarians did not approve of its principal article, the divinity of the Caliph Hakem: on this account they remain distinct from the Druzes, though they agree with them in several particulars. Some of the Ausarians believe in the Metempsychosis; others reject the immortality of the soul. In general, civil and religious anarchy is so prevalent among them, that they adopt what opinions they think proper, following the sect that best pleases them: and frequently attaching themselves to none.

Their country is divided into three principal districts, and their tribute is paid to the pacha of

* Lib. xx. chap. 30.

† In the year of the Greeks, 1202, (A. D. 891) an old man lived at *Nasar*, in the environs of Koufa, who, from his fastings, his prayers and his poverty, passed for a saint. But a magistrate, alarmed at his proceedings, seized him, and committed him to prison. In this reverse of fortune, a poor girl, who was slave to the gaoler, took pity on him,

and gave him his liberty. She took the keys of the prison from under the pillow of her master, liberated the old man, and afterwards returned them to the place from whence she had taken them. From this transaction, it was reported, and generally believed, that he had been delivered by an angel. He therefore found little difficulty in establishing a new sect called, from him, *Ausarians*.

Tripoli. Their mountains are not so elevated as those of Lebanon, and are therefore more capable of cultivation. They are, however, more exposed to the Turks, and are more thinly inhabited than those of her neighbours the Maronites and the Druzes.

THE MARONITES.

Between the Ausarians to the north, and the Druzes to the south, we find an inconsiderable people known under the name of *Mawarna* or *Maronites*. Their origin and progress have been much discussed by ecclesiastical writers; but all that is known with certainty respecting them, may be thus related.

Towards the conclusion of the sixth age of the church, while the spirit of retirement from the world was novel and fervid, a hermit, named *Maroun* lived on the banks of the Orontes, who by his fasting, austerities, and solitary mode of life, attracted the respect of the neighbouring people. In the disputes which then arose between Rome and Constantinople, he exerted his interest in favour of the western Christians. His death, instead of abating the ardour of his followers, gave fresh energy to their zeal: Reports had been propagated that miracles had been wrought by his remains, in consequence of which many persons from Kinesrin, Awasem, and other places, built at Hama a chapel and a tomb, whence soon arose a convent, much celebrated in that part of Syria.

The dissensions of the two Metropolitan churches increased, and the whole empire entered warmly into the quarrel of the priests and princes. About the end of the seventh century, a monk, named John the Maronite, from his eminent talents as a preacher, obtained the reputation of being one of the most powerful supporters of the cause of the Pope. Their opponents, who supported the cause of the emperor, and were therefore called *Melkites*, or Royalists, made great progress at that time in Lebanon. To oppose them the more effectually, the Latins resolved to send thither John the Maronite: he was accordingly presented to the agent of the Pope at Antioch, who, after consecrating him bishop of Diebal, sent him to preach in that part of the world. John lost no time in rallying his partisans, and in augmenting their number; but, op-

posed by the intrigues, and even the attacks of the Melkites, he collected all the Latins, and settled himself with them at Lebanon. This is related by the historian of the Lower Empire in the following words: "In the eighth year of the reign of Constantine Pogonatus (A. D. 676), the Mardaites, collecting themselves together, took possession of Lebanon, which became the asylum of vagabonds, and all sorts of rabble. They grew so powerful there, as to stop the progress of the Arabs, and to compel the Caliph Moawia to request of the Greeks a truce for thirty years, obliging himself to pay a tribute of fifty horses, one hundred slaves, and ten thousand pieces of gold *."

The name of Mardaites, used by this author, is derived from a Syriac word, signifying rebel, and is opposed to *Melkites*, or Royalists. Before Constantine Pogonatus, the mountains became the refuge of malcontents, or rebels, who fled from the bigotry of the emperors and their governors. It was probably, from a similarity in their opinions, that John and his disciples took refuge there; and, from the ascendancy they acquired, or already possessed, the whole nation took the name of Maronites. John, however, established order and military discipline among the mountaineers, and provided them with arms and leaders. They employed themselves in combating the common enemies of the empire, and their little state soon became masters of almost all the mountains as far as Jerusalem. The schism which, at this juncture, took place among the Mahometans, facilitated their conquest. Moawia rebelling against Ali at Damascus, Caliph Koufa, to avoid engaging in two wars at once, made a disadvantageous peace with the Greeks in 678. Seven years after, Abd-el Malek renewed it with Justinian II, on condition that the emperor should free him from the Maronites. To this proposal Justinian consented, but was base enough to get their chief assassinated by an ambassador. Soon after another persecution menaced the Maronites with destruction; for the same Justinian sent troops against them, who destroyed the monastery of Hama, and massacred five hundred monks: after which they extended the war into Kesraouan; but, happily, Justinian was deposed, when on the point of causing a general massacre in Constantinople: and the Maronites,

* Cedrenus.

authorized by his successor, attacked Maurice, and slew the greater part of his army, in an engagement in which he himself perished.

From this period we lose sight of them till the invasion of the Crusaders, with whom they were sometimes in alliance, and sometimes at variance. During this interval of more than three centuries, they were deprived of part of their possessions, and reduced to their present state, paying tribute whenever the Arabian or Turkman governors were able to compel them. This was the case with the Caliph of Egypt, Hakem-Bam-Ellah, who in 1014, ceded their territory to a Turkman, Prince of Aleppo. About the year 1215, the Maronites effected a re-union with Rome. William of Tyre, who relates this circumstance, says, they had forty thousand men able to bear arms. In concert with the Druzes, and their emir, the celebrated Fakr-el-din, they made continual encroachments on the Ottomans; but Amarah the Third, sending against them Ibrahim, Pacha of Cairo, that general reduced them to obedience, in 1588, and subjected them to the annual tribute*.

In religious matters, the Maronites are dependent on Rome. They acknowledge the supremacy of the Pope, but their clergy elect a head, with the title of patriarch of Antioch. Their priests marry, but their wives must be maidens; and they are not permitted to marry a second time. They celebrate mass in Syriac.

* Since that period, the Pachas have frequently attempted to introduce their garrisons into the mountains of the Maronites; but, being constantly repulsed, they have been obliged to abide by their treaties. The subjection of the Maronites therefore only consists in the payment of a tribute to the Pacha of Tripoli, of whom they hold their country. This impost is principally levied on the mulberry trees and vineyards, which are almost the sole objects of culture.

The form of government is founded merely on usages and customs. Thus the government preserves itself in a natural equilibrium; for, customs supplying the place of laws, the Maronites are, to this day, equally strangers to the oppression of despotism, and the disorders of anarchy. The nation may be said to be divided into two classes; the common people, and the shaiks; the latter must be understood to be the most eminent of the inhabitants, who, from the antiquity of their families, and the opulence of their fortunes, are superior to the common class. They are all dispersed in the mountains, in villages, hamlets, and detached houses. The whole nation consists of cultivators: every man manages his little domain. Even the shaiks live in the same manner, but they are distinguished from the rest by a pelisse, a horse, and some additional advantages in board and

The Gospel is read aloud in Arabic. Their priests have no stated revenues, but subsist on the produce of their masses, the generosity of their hearers, and the labour of their hands. Some of them exercise trades, others cultivate the soil, and all are industriously employed for the support of their families, and the edification of their flock. Their poverty is rewarded by the respect they receive, and their vanity is incessantly flattered: whoever approaches them is anxious to kiss their hands, which they readily present. Each village has its chapel, and its priest; and each chapel has its bell: a thing unheard of in any other part of Turkey. The Maronites are vain of this privilege, and to preserve it pure, they will not permit a Mahometan to live among them. They also assume to themselves the privilege of wearing the green turban, which, except in this territory, would cost a Christian his life†.

In the country of the Maronites there are about two hundred convents for men and women. These religious are of the order of Saint Anthony. The dress of the monks consists of brown coarse woollen stuff, resembling that of the capuchin friars in Europe: They never eat flesh, but in other respects their food is the same as that of the peasants: they fast frequently, and make long prayers at stated hours in the night, as well as the day. The court of Rome, in affiliating the Maronites, has granted them an Hospitium at

lodging. They all live frugally, and have but few enjoyments. Their wants are also few, for they are unacquainted with the ideas of luxury. The nation, indeed is poor, but no one wants necessities. Property is held as sacred among them as in Europe, nor are robberies and extortions so frequent among them as among the Turks. Travellers may pass with safety, either by night or day; and the stranger is received with hospitality. They have, however, retained the Arab custom of retaliation, and the nearest relation of a murdered person engages to avenge him. Every man, whether shaik or peasant, walks armed with a musquet and poniards; hence they are not novices in the use of arms, when required to be employed against the Turks. The number of men capable of bearing arms, amounts to thirty-five thousand.

† Italy has not a greater plenty of bishops than this little corner of Syria; and they still retain the simplicity of the primitive ages; they are often seen on the roads, mounted on a mule, and followed by a single Sacristan. Their usual annual revenue does not exceed sixty-three pounds, which, in this plentiful country, enables them to live very comfortably. They are chosen from the class of monks, but the priests, in general, know very little more than the catechism and the bible.

THE DRUZES.

The Druzes, of whom frequent mention has been made about the end of the sixteenth century, are an inconsiderable people, whose mode of life, language, and customs bear a striking resemblance to the Maronites. They practise neither circumcision, nor prayers, nor fasting; they observe neither festivals nor prohibitions. They drink wine, eat pork, and permit marriage between brothers and sisters, though not between fathers and children. From hence it may be concluded that the Druzes have no religion; one class of them must, however, be excepted, whose religious customs are very singular. Those who compose it, assume the name of *Okkals*, which means spiritualists: they have various degrees of initiation, the highest orders of which require celibacy: these wear a white turban, as a symbol of their purity; and so vain are they of this emblem, that they even suppose themselves sullied by barely touching a profane person. To eat out of their plate, or drink out of their cup, occasions the immediate demolition of both the offending articles.

They have one or two books, which they carefully conceal; but chance has betrayed their secrecy: these volumes contain only a mystic jargon, which seems to be principally valuable from its obscurity. Hakem Bamr-ellah is there spoken of, by whom they mean God, incarnated in the person of the Caliph: it also treats of another life, and of future rewards and punishments, where the *Okkals* shall be most distinguished. Many degrees of perfection are mentioned, to which they arrive by successive trials. In other respects these sectaries have abundance of insolence and superstition*.

* The rest of the Druzes, who are not thus spiritualized, are perfectly indifferent about religious matters. The Christians, who live in their country, pretend that many of them believe in the Metempsychosis; that others pay their adorations to the sun, moon, and stars. When they are among the Turks, they affect the exterior of Mahometans, attend the mosques, and perform their ablutions and prayers: among the Maronites, they accompany them to church, and, imitating them, make use of holy water. Many of them, at the request of Missionaries, suffer themselves to be baptized; and, when importuned by the Turks,

The Druzes, as well as the Maronites, consist of two classes; the common people, and those of eminence and property, distinguished by the title of Shaiks, and Emirs, or descendants of Princes. The most considerable part are cultivators, either as farmers or proprietors: every man manages his inheritance, improving his mulberry trees and vineyards, and, in some districts, superintending his tobacco, cotton, and grain.

The chief, called *Hakem*, or governor, is a sort of king, or general, uniting, in his own person, the civil and military powers. His authority sometimes devolves from father to son, sometimes from one brother to another; and sometimes the succession is determined rather by force, than by the operation of certain laws. Females are totally incapable of this dignity. Among the Druzes, when the male line of any family becomes extinct, the government devolves to him who possesses the greatest number of suffrages and resources. But the approbation of the Turks must be first obtained, of whom he becomes the vassal and tributary. The office of governor is to watch over the affairs of state, and to prevent the Emirs, Shaiks, and villages from engaging in war against each other: and, in case of disobedience, he may employ force. Being at the head of the civil power, he names the Cadiz, always reserving to himself the power of life and death. He collects the tribute, of which he pays to the Pacha a stated sum. This tribute varies, according to the exigences of the state. Every thing, however, depends upon circumstances: if the governor be a man of ability, he is absolute; if weak, a mere cypher. This is occasioned from there being no fixed laws; a defect common to all Asia, and the radical cause of all the disorders in the government of the Asiatic nations†.

By the last estimates it appears, that the number

receive circumcision, and conclude by dying, partly as Christians and partly as Mahometans.

† Neither the chief, nor the respective Emirs maintain troops; they only retain persons attached to the domestic service of their houses, and a few black slaves. When a nation declares war, every man able to bear arms is called upon to march; he takes with him a small bag of flour, a musquet, some bullets, and some gun-powder, and repairs to the rendezvous appointed by the governor. If it be a civil war, the servants, the farmers, and their friends, arms for their patron, and repair to his standard.

Troops.

ber of men able to bear arms was forty thousand. It may therefore be reasonably asked, Whence arises such a portion of inhabitants, within so small a space?—No other cause is apparent, but that ray of liberty which glimmers in this country. Unlike the Turks, every man enjoys, in perfect security, his life and property. The peasant is not richer than in other countries, but he is free: "He fears not that the Aga, the Kaimmakam, or the Pacha should send their soldiers to pillage his house, carry off his family, or give him the bastinado." Such oppressions are never exercised among these mountains*.

The Druzes have all the prejudices of the Bedouins respecting birth; and, like them, pay proportionable respect to the antiquity of families. But their rank does not exempt them from paying tribute, in proportion to their revenues. Every man, after paying his miri, and his rent, is master of his property. By a particular privilege,

* Troops of this kind, it may reasonably be supposed, have little resemblance to our European soldiers; they have neither uniforms, nor discipline, nor order. They are a mob of peasants, with short coats, naked legs, and muskets in their hands; but differing from the Turks and Mamelukes, as they are all on foot; the Shaiks and Emirs only having horses, which are but ill calculated for the rugged nature of the country: war can therefore only be a war of posts. The Druzes never venture to engage in the plain; well knowing that they should be unable to stand the shock of cavalry, having no bayonets to their muskets. Their dexterity consists in climbing rocks, and creeping among the bushes, and blocks of stone, from whence they fire successfully; for, by the practice of hunting, and military sports, they have acquired the habit of hitting a mark with precision. They are accustomed to surprises by night, ambuscades, and those *coups de main*, which require to attack suddenly, and come to close engagement with the enemy. In the campaign of 1781, they passed three months in the open air, without tents, or any other covering than a sheep-skin. Their provisions consisted, as before, of small loaves baked on the ashes, cheese, raw onions, olives, fruits, and a little wine. The table of the chiefs was nearly as frugal. They are totally ignorant of the science of fortification, the management of artillery, or encampments, nor any thing which constitutes the art of war.

* The Druzes delight in the practice of hospitality: whoever presents himself at their door, as a suppliant or passenger, may depend upon being entertained with food and lodging, in the most generous and unaffected manner. I have often seen a poor peasant bestow the last morsel of bread he had in the house to a hungry traveller; and when I have accused them of want of prudence, their answer is usually to this effect:—"God is liberal and great, and we are brethren. As there are no inns in this country, any more than in the rest of Turkey; when they have once contracted with their guest, the engagement of bread and salt, nothing can induce them to violate it. Various instances of this are related which do honour to their character.

the Druzes and Maronites pay no fine for their succession; nor does the Emir, like the Sultan, arrogate to himself original and universal property. Fathers have, however, as in the Roman law, the privilege of preferring such of their children as they think proper.

The Druzes seldom make alliances out of their own families; they prefer even an indigent relation to a rich stranger. They also observe, to a certain degree, the custom of the Hebrews, which directed that a brother should marry his brother's widow. In short, the Druzes have a sort of republican spirit, which gives them more energy than any other subjects of the Turkish government, and an indifference about religion, forming a striking contrast with the zeal of the Mahometans and Christians. In other respects, their manners and customs are similar to those of the other Orientals.

They may marry wives, and repudiate them at

The following anecdote is extracted from an Arabian manuscript. "In the time of the Caliphs, when Abdallah, the *shedder of blood*, had murdered every descendant of Ommiah, within his reach, one of that family, named Ibrahim, the son of Soliman, had the good fortune to escape, and reached Koufa in disguise. Not knowing any person in whom he could confide, he sat down under the portico of a large house. Soon after, the master arriving, followed by several servants, alighted from his horse, entered, and, seeing the stranger, asked him who he was?—*I am an unfortunate man*, replies Ibrahim, and *request from thee an asylum*.—*God protect thee*, said the rich man; *enter, and remain in peace*. Ibrahim lived several months in this house, without being interrogated by his host. But, astonished to see him daily go out on horse-back, and return at a particular hour, he one day ventured to enquire the reason.—*I have been informed*, replied the rich man, *that a person named Ibrahim, the son of Soliman, is concealed in this town; he has slain my father, and I am searching for him to retaliate*.—*Then I kneel*, said Ibrahim, *that God had purposely conducted me to that place: I adore his decree, and, resigning myself to death, I answered—God has determined to avenge thee, offended man: thy victim is at thy feet*. The rich man, in astonishment, replied—*O! stranger, I perceive that thy misfortunes have made thee weary of life; thou seemest to lose it, but my hand cannot commit such a crime—I do not desire thee*, said Ibrahim; *thy father was such a one* (naming him) *we met in such a place, and the affair happened in such a manner*. A violent trembling instantly seized the rich man; his teeth chattered, his eyes alternately sparkled with fury, and overflowed with tears. In this agitation he continued a long time: at length, turning to Ibrahim—*To-morrow*, said he, *destiny shall join thee to my father, and God will have retaliated*. But *as for me, how can I violate the sacred laws of hospitality? Wretched stranger, fly from my presence—There, take these hundred sequins: Begone, quickly, and let me never behold thee more!*"

VOL. II

pleasure; but such a custom is seldom practised, except by Emirs, and men of eminence. Occupied with their rural labours, they experience no artificial wants, nor those inordinate passions which result from the idleness and the luxury of towns and cities. The veil, worn by their women, is a preservative against the birth of criminal desires, which occasion many evils in society. No man is acquainted with the face of any other woman than his wife, his mother, his sister, and sister-in-law. Every one confines himself to the bosom of his own family, and rambles abroad but little. The women, not even excepting those of the shaiks, make the bread, roast the coffee, wash the linen, cook the provisions, and perform all the other domestic offices. The men cultivate the lands, and form convenient canals for watering them. In the evening they sometimes assemble in the area or house of the chief of the village. There, seated in a circle, with legs crossed, and blowing each a consequential pipe; while, with their poniards at their belts, they recapitulate their various labours, the product of their harvests, peace or war, the conduct of the Emir, or the amount of taxes: they recount past transactions, discuss the present topics, and form conjectures on the future. Their children, wearied with play, attend to the curious debates, and a stranger is surprised to hear them. Here it is generally mentioned how many musquets there were in such a particular camp, and who had the best mare.

Such is their education: they are not taught to read the Psalms, as among the Maronites, nor the Koran, like the Mahometans; but if their minds are not enriched with useful information, they are not debased by injurious ideas. This advantage, however, results from it, that, their understandings being nearly on a level, the inequality of conditions is hardly perceptible: we do not discover, among the Druzes, that immense distance, which in many other societies degrades the inferior, without augmenting the advantage of the great. All the Druzes, whether

they are shaiks or peasants, treat each other with respectful familiarity, equally remote from rudeness or servility. The grand Emir, himself, associates with the rest; appearing as a respectable country gentleman, who does not hesitate to admit the meanest farmer to his table. In a word, their manners are those of ancient times; and their rustic life only points out the origin of every nation, and that they are, at present, only in the infancy of the social state.

THE MOTOUALIS.

In the deep valley of the country of the Druzes, which separates their mountains from those of Damascus, we find another small nation, known in Syria by the name of Motoualis. Like the Persians, they are of the sect of Ali; while all the Turks follow that of Omar or Moavia. The sectaries of Omar, who consider themselves purely orthodox, assume the title of *Somnites*. The word *Motouali* has the same meaning in the dialect of Syria. The followers of Ali, displeased with this name, substitute that of *Adlia*, which signifies asserters of *Justice*, a denomination which they have assumed in consequence of a doctrinal point advanced by them in opposition to the Somnite faith. A small Arabic Treatise, entitled THEOLOGICAL FRAGMENTS, &c. has the following passage*.

To this doctrine, which opposes the system of the Somnites, the Motoualis add certain ceremonies, which heighten their aversion: They curse Omar and Moavia as rebels, and consider Ali and Hosain as canonized saints. They commence the ablutions at the elbow, instead of the end of the finger, as practised by the Turks; and conceive themselves defiled by the touch of a stranger. Contrary to the general practice of the east, they will neither eat nor drink out of a vessel which has been used for either of those purposes, by a person who was not of their sect, nor will they condescend to sit with him at the same table.

These singular doctrines, by separating the

what is difficult: he makes no man responsible for the actions of another; nor punishes him for that in which he has no part; he imputes not as a crime what himself has created in man; nor does he require him to avoid what destiny has decreed. This would be injustice and tyranny, of which God is incapable, from the perfection of the divine nature."

* "Those sectaries who teach that God acts only on principles of justice, conformable to human reason, are called *Adlia*, or *Justiciarians*. God cannot, say they, commend an impracticable worship, nor order impossible actions, nor enjoin men to perform what is beyond their ability; but whenever he requires obedience, will bestow the power to obey. He removes the cause of evil, he allows us to reason, and imposes only what is easy, not

Motoualis from their neighbours have caused them to become a distinct society. They are said indeed, to have long existed as a nation in this country, but they have never been mentioned by any European writer till the present century. La Roque, who visited their country about a hundred years ago, gave them the name of Amedians: but in later times, their wars, robberies, and various changes of fortune, have brought them into consequence in Syria. Till about the middle of this century, they only inhabited Balbec, their capital, a few places in the valley, and Anti-Lebanon, which appears to have been their original country. After 1750, they established themselves among the heights of Beck, and some of them got footing in Lebanon, where they procured lands from the Maronites almost as far as Besharrai. They even became so offensive by their ravages, as to induce the Emir Yousef to attack and expel them. But, on the other side, they advanced along the river, to the neighbourhood of Sour. In this situation, Shaik Dasher took an opportunity, in 1760, to attach them to his party. The Pachas of Saide and Damascus claimed tributes, which they had neglected paying, and complained of several outrages and robberies committed on their subjects by the Motoualis. They were desirous of chastising them; but Daher interposed, became security

for the tribute, and, promising to prevent any depredations, procured allies who were able to arm ten thousand horsemen. Soon after they took possession of Sour, and made that village their principal sea-port. In 1771, they assisted Ali Bey and Daher against the Turks.

But Emir Yousef having, in their absence, armed the Druzes ravaged their country. He was besieging the castle of Djezik, when the Motoualis became informed of the invasion. From the accounts of the barbarities committed by the Druzes, an advanced corps, of only five hundred men, were so extremely enraged, that they instantly rushed forward against the enemy, resolving to perish, or be revenged. But the surprize and confusion they occasioned, and the misunderstanding that had ensued between the two factions of Mansour and Yousef, were so favourable to this desperate attack, that the whole army of twenty thousand men was completely overthrown*.

Such are the distinct tribes in Syria: the other inhabitants, who are considerably the most numerous, are composed of Turks, Greeks, and Arabs. It now remains to give some account of the divisions of the country under the Turkish administration, accompanied with general reflections on its forces, revenues, and form of government.

SECTION VI.

Of the Distribution of Syria into PACHALICS, under the TURKISH GOVERNMENT.

WHEN Sultan Selim had taken Syria from the Mamelukes, he subjected that province, like the rest of the empire, to the government of Viceroy, or Pachas, invested with un-

limited power. To secure his authority more effectually, he divided the country into five governments or Pachalics, as it now remains. These Pachalics are denominated as follows:

* In the following year, the affairs of Daher, taking a favourable turn, the Motoualis began to look cool upon him, and finally abandoned him in the catastrophe which deprived him of life: but they have suffered severely for their imprudence, under the administration of the Pacha who succeeded him. Since the year 1771 Djezzar, master of Acre and Saide has indefatigably laboured to destroy them. His persecution, in 1784, obliged them to be reconciled with the Druzes, and to form an alliance with the Emir Yousef. Though reduced to seven hundred armed men, they achieved greater things in that campaign than fifteen or twenty thousand Druzes and Maronites assembled at

Dair-el-Kaman. They alone took the strong fortress of Mar-Djebaa, and slew fifty or sixty Arnauts*, who defended it. But the animosities which prevailed among the chiefs of the Druzes, having rendered all their operations abortive, the Pacha has taken possession of the whole valley, and even of the city of Balbec itself. At this period, no more than five hundred families of the Motoualis remained, who took refuge in Anti-Lebanon, and the Lebanon of the Maronites; and, as they are now driven from their native soil, it is supposed they will shortly be annihilated, and even their name become extinct.

* The name given by the Turks to the Macedonian and Epirot soldiers.

1. *Aleppo*, 2. *Tripoly*, 3. *Suide*, lately removed to Acre—4. *Damascus*, and 5. *Palestine*, the seat of which is sometimes at Gaza, and sometimes at Jerusalem. Since the time of Selim, the limits of the Pachalics have frequently varied, but their general extent has continued nearly the same. I shall now proceed to give a more minute detail of the most interesting particulars of their present state, especially with regard to the revenues, productions, forces, and the most remarkable places.

THE PACHALIC OF ALEPPO.

This Pachalic comprehends the whole country, extending from the Euphrates to the Mediterranean. This space consists principally of two plains; that of Antioch to the west, and that of Aleppo to the east: the north and the sea-coast are occupied by lofty mountains, known to the ancients by the names of Amanus and of Rhodus. The soil of the principal part of this government is fat and loamy: the lofty plants, which shoot up after the winter rains, seem to indicate great fertility, but its actual fruitfulness is not very considerable. The principal part of the land lies waste; hardly any appearance of cultivation appearing in the environs of the towns and villages. Its chief produce is wheat, barley, and cotton, of which no inconsiderable quantity may be observed, especially in the flat country: on the mountains they rather choose to cultivate the vine, mulberry, olive, and fig-trees. Tobacco is produced on the sides of the hills towards the sea-coast, and pistachios are cultivated in the territory of Aleppo. The pasturage hardly requires any mention to be made of it, as it is abandoned to the wandering hordes of the Turkmen and Curds*.

In most of the Pachalics, the Pacha is the Viceroy and Commander-general of the country; but in that of Aleppo, he does not enjoy the latter office; the Porte having bestowed it on a *Mehassel*, or collector, who is accountable for what he receives. The Pacha, deprived of this lucrative branch of the administration, receives a stated allowance of eighty thousand piasters (eight thousand three hundred and thirty pounds.) A sum which has always been found inadequate to the expenses; for besides being obliged to maintain the troops, and repair the highways and fortresses; he is also under the necessity of making large presents to the minister to enable him to keep possession of his place. But the Porte adds to the account, the contributions he may levy on the Curds and Turkmen, and his extortions from the villages, and

Custom has stipulated that the commission of the Pacha shall not exceed the period of three months; but it is frequently extended to six, and even to twelve months. His office is to enforce obedience in his province, and provide for the security of the country against enemies; to accomplish this, he maintains five or six hundred horse, and about the same number of infantry. He has also the command of the Janisaries, a sort of enrolled militia.

The Janisaries, in each Pachalic, consist of a certain number of enrolled men, who must hold themselves in readiness to march whenever they are required. There being certain privileges and exemptions granted to this corps, there is a competition to obtain admission into it. They were subject formerly to regular exercise and discipline, but that practice having been neglected for the last sixty or eighty years, not the slightest trace of their ancient good order remains. These sham soldiers are merely a crowd of artisans and peasants; as ignorant as the rest of that class, but infinitely more ungovernable. When a Pacha abuses his authority, they are the first ready to erect the standard of sedition. They deposed Abdi Pacha from Aleppo, and obliged the Porte to send another in his stead. The Turkish government, indeed, revenges itself, by ordering the most active mutineers to be strangled, but the Janisaries take the earliest opportunity to create other chiefs, and affairs return immediately to their usual course. The Pachas, finding their measures thus counteracted, have had recourse to the expedient made use of in similar cases; they have taken foreign soldiers into their service, who have neither friends nor families in the country†.

By such iniquitous proceedings, the greater part

certain individuals; nor do the Pachas come short of this calculation. Alidi Pacha, who governed about thirteen years ago, carried away with him, at the end of fifteen months, upwards of four millions of livres (one hundred and sixty thousand pounds) by laying under contribution every kind of trade. He did not even excuse the poor cleaners of tobacco pipes. Very lately another person has been obliged to fly for similar oppressions. The former was rewarded with the command of the army against the Russians; but if the latter has not sufficiently enriched himself, he will be strangled as an extortioner. Such things are not very uncommon in the progress of affairs in Turkey.

† Their cavalry are armed with short sabres, pistols, musquets, and lances: they wear a kind of cap, nine or ten

part of the Pachalics in the empire are impoverished, and laid waste. Thus it happened with that of Aleppo: in the ancient registers of imposts, upwards of three thousand two hundred villages were reckoned; but the traveller now hardly sees any thing but houses in ruins, cisterns rendered useless, and fields abandoned. Those who cultivated them are fled into the towns, where the population is absorbed, and where every individual is happy to conceal himself among the crowd from the rapacious hand of despotism.

The most considerable places in this Pachalic are, first, the city of Aleppo; it is the capital of the province, and the residence of the Pacha. It is situated on the vast plain, extending from the Orontes to the Euphrates, and which towards the south, terminates in the desert. The situation of Aleppo, besides the advantage of a fertile soil, is enriched with a stream of fresh water, which never becomes dry. This rivulet rises in the mountains of Aentab, and terminates six leagues below Aleppo, in a morass abounding with wild boars and pelicans. The city is one of the most agreeable in Syria, and is supposed to be the cleanest and best built of any in Turkey. Its numerous minarets and domes present an agreeable relief to the eye, after its having been fatigued by the unvaried sameness and sterility of the plains. An artificial mountain, surrounded by a dry ditch, contains a ruinous fortress; from whence the whole city may be surveyed; and, towards the north, the snowy tops of the mountains of Bailan are descried; on the west, those

ten inches high, without any projecting rim. Their saddles are made in the English manner, of a single skin stretched upon a wooden tree. Their tattered clothes, rusty arms, and horses of different sizes, give them the appearance of banditti rather than soldiers. Most of the cavalry in Syria are Turkmen, Kurds, or Caramanians; throughout the country they are formed of plunderers, who roam from place to place: they are the scourge of the country, which they lay waste; and of the peasants, whom they often pillage by open force.

The infantry are, in all respects, inferior to the cavalry. Formerly they were procured from the inhabitants of the country by forced enlistments; but, within the last fifty years, the peasants of Tunis, Algiers, and Morocco, seek in Syria that respect which is denied them in their own country. It is impossible for any troops to be less encumbered than these; for their whole accoutrements and baggage are confined to a rusty firelock, a large knife, a leathern bag, a cotton shirt, a pair of drawers, a red cap,

which separate the Orontes from the sea; while to the south and east, the eye can discern as far as the Euphrates. In the time of Omar, this castle impeded the progress of the Arabs for several months, and was, at last, taken by treachery, but it cannot now resist the most considerable assault. Its wall is in ruins, and its old towers are in a similar condition: it has not four cannon fit for service. Three hundred and fifty Janisaries, who should form the garrison, are now busy in their shops, and the aga can hardly find room in it to lodge his retinue. Many rising grounds encircle it, which, in case of a siege, would greatly facilitate the approaches of the assailants: Aleppo, therefore, cannot be considered as a place of importance in time of war; but, as a commercial city, it has a different appearance. It is the emporium of Armenia and the Diarbekar: it sends caravans to Bagdad, and into Persia; and communicates with the Persian Gulph and India, by Basra; with Egypt and Mecca, by Damascus; and with Europe by Alexandretta and Latakia. The French have a consul at Aleppo; the English and the Venetians two; and the merchants of Leghorn and Holland one.

Aleppo is equal in extent to any city in Turkey, except Constantinople and Cairo, and perhaps Smyrna. The number of inhabitants is estimated at two hundred thousand; and the people in general are esteemed the most civilized of any in Turkey. The European merchants no where enjoy so much liberty, or are treated with so much civility and respect*.

and sometimes a pair of slippers. Their pay is about ten shillings and ten pence per month, from which they are obliged to furnish themselves with arms and clothing. They are maintained at the expence of the Pacha. These troops are divided in the ancient Tartar manner, by colour: each colour is reckoned ten men, but they seldom consist of more than six effectives; for the *Agas* being entrusted with the pay of the soldiers, maintain as few as possible, to secure to themselves the advantage of the deficiency. The superior *Agas* connive at these abuses, and partake of the spoils.

* The air of Aleppo, though dry and piercing, is found salutary to those who are troubled with asthmatic complaints. The inhabitants, however, are subject to an epidemic disorder, called the ringworm or pimple of Aleppo; it is, at first, an inflammatory pimple, and at length becomes an ulcer; its usual duration is about a year: it generally fixes on the face, and leaves a scar with which a great number of the inhabitants are disfigured. It is said that

VOL. II. N

Next to Aleppo, Antioch claims our attention; it is called Antakia by the Arabs. This city, anciently renowned for the luxury of its inhabitants, is now a ruinous town, the houses of which are composed of mud and straw, and its narrow dirty streets, exhibit every appearance of wretchedness and misery. It is situated on the southern bank of the Orontes, and is covered to the south by a mountain, on the slope of which is a wall, built by the Crusaders.

Antioch was better calculated than Aleppo for the emporium of the Europeans: by clearing the mouth of the Orontes, which is six leagues lower down, boats might have been towed, though they could not have sailed up that river, the current being too rapid. Its breadth at Antioch is about forty paces. We no longer hear of the Grove of Daphne, or of the voluptuous scenes of which it was the theatre. Though the soil of Antioch is excellent, the plain is uncultivated, and abandoned to the Turkmen; but the hills on the side of the Orontes abound in plantations of figs, olives, vines, and mulberry-trees. The Macedonian king, Seleucus Nicator, who founded Antioch, also built a large city, at the mouth of the Orontes, which bore his name; but not a single habitation of it at present remains. Nothing is to be seen but heaps of rubbish. In the sea, however, may be perceived the traces of two piers, which are indications of an ancient port, now choked up.

The Gulph, towards the north-east, is remarkable for nothing but the town of Alexandretta, or Skandaroon, of which it bears the name. This town, which is situated on the sea-shore, is no more than a village without walls, in which

the tombs are more numerous than the houses, and which owes its existence chiefly to the road which it commands. This is the only road in Syria, where vessels anchor on a solid bottom; but, in other respects, it has many inconveniences. First, it is exposed, during winter, to a wind, peculiar to this place, which, rushing from the snowy summits of the mountains, frequently forces the ships to drag their anchors several leagues. Secondly, when the snow begins to cover the mountains which environ the gulph, tempestuous winds arise, which sometimes prevent vessels from entering for two or three months together. Thirdly, the road from Alexandretta to Aleppo, by the plain, is infested by Curd robbers, who conceal themselves among the rocks*.

A few years ago, the merchants of Aleppo, disgusted with the innumerable inconveniences of Alexandretta, wished to abandon that port, and carry the trade to Latakia. They proposed to the Pacha of Tripoli to repair the harbour at their own expence, on his granting them an exemption from all duties for ten years. To induce him to comply with this request they again talked much of the advantage, which would, *in time*, result to the whole country. "But, what signifies to me what may happen *in time*?" replied the Pacha; why should I deprive myself of present advantages, which are *certain*, for future benefits I cannot hope to partake? The European factors were therefore obliged to remain at Skandaroon. The only curiosity, with which they can amuse strangers, consists in six or seven marble monuments, sent from England; on which you read—*Here lies such a one, taken*

immense distance. This pigeon has nothing peculiar in its form, except its nostrils, which are rough and swelled instead of being smooth and even.

* Another reason, still more forcible, presents itself; the air of Alexandretta is unwholesome in the extreme. It is said to carry off one third of the crews of the vessels which remain there during the summer: it is not, indeed, thought extraordinary, for ships to lose all their men in the course of two months. The season for this epidemic disorder is usually from May to the end of September: it is a malignant intermitting fever, accompanied with obstructions of the liver, which terminates in a dropsy. The cities of Tripoli, Acre, and Larneca in Cyprus, are subject to the same, though in a less violent degree: the cause of this contagion is to be ascribed to the adjoining morasses, stagnant waters, and consequent vapours and mephitic exhalations.

every stranger, who resides there three months, is afflicted with it: experience has taught mankind that the best mode of treating it is to apply no remedy.

Much has been said of the pigeons of Aleppo, which serve as couriers at Alexandretta and Bagdad. They have been little noticed for the last thirty or forty years, because the Curd robbers were assiduously employed in destroying them. The manner of sending advice by these pigeons was; to take pairs, which had young ones, and convey them on horseback to the place from whence they wished them to return, giving them an opportunity to take a full view. When any important intelligence was received, the correspondent tied a billet to the pigeon's foot, and let it loose. The bird, impatient to see its young, flew rapidly away, and arrived at Aleppo in ten hours from Alexandretta, and in two days from Bagdad. They had no difficulty in finding their way back, as Aleppo may be perceived at an

off in the flower of his age, by the fatal effects of a contagious air*.

The village of Martawan, on the road from Alexandretta to Aleppo, is celebrated among the Turks and Europeans, for the extraordinary practice of the inhabitants, who let out their wives and daughters for a trifling sum. This prostitution, much abhorred by the Arabs, is supposed to have originated in some religious custom, which may be sought for in the ancient worship of the goddess Venus. The Franks pretend that the women are pretty; but it is probable that long abstinence at sea has rendered them additionally fascinating to those lately landed: their exterior certainly announces, to an impartial spectator, nothing but disgusting misery and wretchedness.

To the north-east of Aleppo is the town of Marnedj; anciently so celebrated under the names of Bambyce, and Heliapolis. No traces remain of the temple of that goddess, with whose worship we are made acquainted by Lucian. The only remarkable monument is a subterranean canal. All this country was formerly full of aqueducts: the Assyrians, Medes, and Persians thought it a religious duty to convey the water to the desert, in order to multiply, according to the doctrine of Zoroaster, the principles of life and of abundance: at every step we meet with astonishing proofs of ancient population. Along the road from Aleppo to Hama, we behold the ruins of ancient villages, cisterns fallen in, and the remains of fortresses and temples. A quantity of oval and round hillocks were scattered at regular intervals of nearly a league from each other, covered with the ruins of citadels, and were probably sacred places, dedicated to the adoration of some deity; from the well-known practice of the ancients worshipping "on high places."

At present, instead of the high cultivation which might naturally have been expected, we meet with only waste and desolated lands: the soil, however, is of a good quality, and the small quantity it produces of grain, cotton, and sesamum is very excellent; but the frontiers of the desert are wholly destitute of springs and

* The sight of these is additionally distressing, from the languid air, sallow eyes, yellow complexion, and dropsical bellies of those who shew them; as it seems extremely probable that they cannot long escape a similar fate. But

running water. That of the wells is brackish; and the winter rains, on which the inhabitants principally depend, sometimes fail. For this reason, nothing can be conceived more melancholy than these parched and dusty plains, without trees or verdure; or more miserable than the appearance of the straw and earthen huts which compose their villages; nor can more extreme distress be imagined than that of the peasants, exposed to the cruel oppression of the Turks, and the daring robberies of the Bedouin Arabs.

THE PACHALIC OF TRIPOLI.

This Pachalic comprehends the country, stretching along the Mediterranean, from Latakia to the Nahr-el-Kelb, and is bounded on the west by that torrent, and the chain of mountains overlooking the Orontes. The greater part of this country is hilly; though the sea-coast, between Tripoli and Latakia is level. The rivulets, with which it is watered, greatly promote its fertility; but the plain is notwithstanding less cultivated than the mountains, without even excepting Lebanon, with its numerous rocks and pine-trees. Its principal productions are wheat, barley, and cotton. In Latakia, tobacco and olives are chiefly attended to; and in Lebanon, and the Kesraouan, white mulberry trees and vineyards.

This Pachalic contains several tribes and religions. From Lebanon to Latakia, the mountains are inhabited by the Ansarians; Lebanon, and Kesraouan by the Maronites; and the sea-coast and cities, by Greeks, Latins, and the descendants of the Arabs.

The Pacha of Tripoli has all the privileges of his place: the military department, and the finances are under his controul. He also farms the government from the Porte, on an annual lease, at the rent of thirty-nine thousand pounds. He is also obliged to supply the caravan of Mecca with corn, the expences of which are also estimated at seven hundred and fifty purses more. He must likewise conduct this convoy into the Desert, to meet the pilgrims: to indemnify him for these expences he receives the Miri, the customs, and several other emoluments; besides

they have some resource in the village of Bailen, three leagues from Alexandretta, the pure air and excellent waters of which are found very salubrious.

many annual extortions, which amounts to five hundred camels than those of Aleppo, and many more.

The Pacha of Tripoli is personally governing the Ansarians, and the Maronites, having always forcibly driven the Turks into their mountains. The tribute was intrusted to the hands of the Bedouins, proved of by the inhabitants, limited to the year, like the tribute of the Maronites, is disposed of by auction, and petition among wealthy persons.

The farm of the Ansarians among three chiefs; the tribute is exacted for by the Emir, who has a hundred and sixty pounds of tribute in this Pachalic. Tripoli, the residence of the Pacha, is situated on the river Kadish, and exactly at the foot of the mountains, and is separated from the plain, half a league in distance, called *La Marinc*, by a narrow harbour, but a simple road leads from the shore to the shoals called *Pigeon Islands**. In this road was defended by a small fort, which remain, serving merely as a place of refuge for the birds of prey.

The commerce of Tripoli is chiefly in the hands of the French: they have several commercial houses.

The town of Latakia

* Tripoli is a Greek name, having been built by three colonies, each of which formed so many families, that they were soon united into one.

† The environs of Tripoli are fertile, where the nopal grows spontaneously. The silkworm is cultivated for the silk, the orange, and the lemon. But though these places are healthy, epidemic fevers re-appear in September, like those of Sicily.

The commerce of Tripoli is chiefly in the hands of the French: they have several commercial houses. The town of Latakia is situated on the river Kadish, and exactly at the foot of the mountains, and is separated from the plain, half a league in distance, called *La Marinc*, by a narrow harbour, but a simple road leads from the shore to the shoals called *Pigeon Islands**. In this road was defended by a small fort, which remain, serving merely as a place of refuge for the birds of prey.

many annual extortions and exactions. He maintains five hundred cavalry, not in a better style than those of Aleppo, and a few Mogravian infantry.

The Pacha of Tripoli has ever been desirous of personally governing the country of the Ausarians, and the Maronites; but these people having always forcibly opposed the entrance of the Turks into their mountains, the collection of the tribute was intrusted to under farmers, approved of by the inhabitants. Their office is not limited to the year, like that of the Pacha, but is disposed of by auction, which creates a competition among wealthy persons.

The farm of the Ausarians is now divided among three chiefs; that of the Maronites is contracted for by the Emir Yusef, who pays fifteen hundred and sixty pounds for it. Among the places in this Pachalic, we shall first mention Tripoli, the residence of the Pacha. It is situated on the river Kadisha, not far from its mouth, and exactly at the foot of Mount Lebanon. It is separated from the sea by a small triangular plain, half a league in breadth, near a village, called *Lu Marine*, by the Franks. There is no harbour, but a simple road, extending from the shore to the shoals called, *The Rabbit and Pigeon Islands**. In the time of the Crusades, this road was defended by towers, seven of which remain, serving merely as a place of resort for birds of prey†.

The commerce of Tripoli is in the hands of the French: they have a consul here, and three commercial houses.

The town of Latakia, founded by Seleucus

* Tripoli is a Greek name signifying three cities, it having been built by three colonies, from Sidon, Tyre, and Aradus who each formed settlements so near each other, that they were soon united into one.

† The environs of Tripoli are laid out in orchards, where the nopal grows spontaneously, and the white mulberry is cultivated for the silk worm; and the pomegranate, the orange, and the lemon-tree, for their beautiful fruit. But though these places delight the eye, they are unhealthy. Epidemic fevers reign here annually from July to September, like those of Skandaroon and Cyprus.

The commerce of Tripoli consists principally in different coarse silks which are used for laces. It is observed that they are daily losing their quality: this, by well-informed people, is supposed to be in consequence of the decay of the mulberry-trees, of which hardly any thing now remains but some hollow trunks. A question then naturally occurs, Why not plant new ones? An European might with

Nicator, is situated on the southern side of a small peninsula. Its port is a sort of bason, environed by a mole, the entrance of which is very narrow: it might have contained about twenty-five vessels, but the Turks have suffered it to be so far choaked up as to be hardly capable of admitting four. Ships of four hundred tons cannot ride here; and many are stranded in the entrance. Still, however, Latakia has considerable commerce, particularly in tobacco, of which not less than twenty cargoes are annually sent to Diametta. In the time of Strabo, instead of tobacco, the exports consisted of its celebrated wines, the produce of the hill sides. At that time, Egypt was the market, by way of Alexandria. Neither Latakia nor Tripoli are places of strength; they have neither cannon nor soldiers. A single privateer would capture them both. Each of these places are supposed to contain four or five thousand inhabitants.

On the coast, between these towns, we observe several inhabited villages, which were formerly considerable cities: such are Djebila-Merkah, and Tartousa; but we find many places which are only half destroyed, with remains of ancient habitations. Among the latter, one of the principal is the rock of Rouad, formerly a respectable city and republic, known by the name of *Aradus*. Not a wall is remaining of that multitude of houses, which, according to Strabo, had more stories than even those of Rome. The liberty enjoyed by the inhabitants was the cause of its becoming populous, and it subsisted by naval commerce, manufactures, and arts.

propriety start such a proposition:—but here they never plant; for, should they venture to build or plant, the Pacha would say—"This man has got money;" he would send for him, and demand it of him. Should he deny that he is possessed of any, he must suffer the bastinado;—Should he then confess, the drubbing is still continued to extort a further discovery. The Tripolitans are not, however, remarkable for their patience; they are, on the contrary, considered as extremely mutinous. Their title of Janisaries, and the green tarban they wear, give turbulence to their domineering spirit. About a dozen years ago, the extortions of a Pacha drove them to extremities; they expelled him, and remained eight months in a state of independence; but the Porte sent a man of deep intrigue, who, by promises, oaths, and pavlons, gained, and dispersed them; and concluded by terminating the lives of eight hundred in one day, whose heads may still be seen in a cave near Kadishka.—Such is the government of the Turks!

To

To the south of Tripoli is the country of the Kesraouan, extending from Nahr-el-kelb to Tripoli. Djebail, the ancient Byblos, is the principal town in this territory, though it does not contain above six thousand inhabitants. The river Ibrahim, the ancient *Adonis*, two leagues to the southward, has the only bridge to be seen from thence to Antioch, except that of Tripoli. It consists of a single arch, fifty feet wide, and about thirty feet high: it is of a light architecture, and seems to have been a work of the Arabs.

The places most frequented by the Europeans, among the mountains, are the villages of Eden and Basharraï, where the missionaries have a house. In the winter, many of the inhabitants leave their houses under the snow, and remove to the sea-coast. On the frontiers of the Kesraouan, a mile north of Nahr-el-kelb, is the village of Antoura, where the Jesuits have established a respectable house. It is situated on the side of the hill; the limpid waters of which refresh its vineyards and mulberry trees: its distant view of the sea, and its command over the valley, also contribute to render it a most agreeable hermitage. The Jesuits endeavoured to annex it to a convent of nuns, situated at the distance of a quarter of a league; but the Greek Christians having dispossessed them, they erected one close to them, to which they gave the name of the *Visitation*.

THE PACHALIC OF SAIDE OR ACRE.

To the south of Tripoli, and on the same coast, a third Pachalic has, till now, borne the name of Saide, but may hereafter assume that of Acre, to which place the Pacha had lately trans-

* The Pacha enjoys all the privileges and emoluments of his office; he is despotic governor, and farmer-general. He annually remits to the Porte the fixed sum of seven hundred and fifty purses; and he is also obliged to furnish provisions for the pilgrims of Mecca. The time of his government is limited to a year, but this is generally prolonged. His revenues are the *Miri*; the farms of the tributaries; the fees from successions and extortions; and the produce of the customs on exports and imports, which article alone amounted to upwards of fifty thousand pounds, when Djézzar farmed the harbours and creeks in 1784. This Pacha also, as is usually the case with the Turkish governors in Asia, cultivates land on his own account, associates in partnership with merchants and manufacturers, and lends money at interest to husbandmen and traders.

* Every Pacha of three tails is styled *Visir*.

ferred his residence. The extent of this government has considerably varied at different times. Before Shaik Daher it included the country of the Druzes, and the coast as far as Mount Carmel; but, after the ruin of Daher, the government resumed its ancient limits. Djézzar, who succeeded that chief in quality of Pacha for the Turks, has annexed to the Pachalic the countries of Safad, Tabaria, and Balbec. This Pacha, perceiving the advantage of the works erected by Daher at Acre, transferred his residence to that city, which is now become the capital of the province.

By these augmentations the Pachalic of Acre now includes all the country from the Nahr-el-kelb, to the south of Kaisaria. It derives the more importance from this extent, from its uniting the valuable advantages of situation and soil. The plains of Acre, &c. are justly boasted for their fertility: Kasairia possesses a forest of oaks, the only one in Syria. Safad furnishes cottons, which, from their whiteness, are as highly esteemed as those of Cyprus: the mountains of Sour produce as excellent tobacco as Latakia; and in a part of them a perfume of cloves is made, which is exclusively reserved for the use of the Sultan and his women. The country of the Druzes also abounds in wines and silks; and from the situation of the coast, and the number of its creeks, this Pachalic is become the emporium of Damascus, and all the interior parts of Syria*.

The Porte is now on good terms with Djézzar, in consequence of his former services; particularly for his having greatly contributed to the ruin of Daher†.

By sea, he has one frigate, two galliots, and a xebeck,

The total, arising from these different emoluments is estimated at between nine and ten millions of French money (about four hundred thousand pounds.) The tribute, when once settled, never varies; but if the Pacha become rich, methods are employed to squeeze him. He is sometimes permitted to accumulate long without molestation; but when he is known to have amassed great wealth, some expedient will not fail to be contrived to bring to Constantinople his coffers or his head.

He extirpated the family of that prince, curbed the Bedouin of Saker, humbled the Druzes, and almost annihilated the Motoualis. These successes secured him in his government for ten years. He was lately honoured with the three tails, and the title of *Visir** which accompanies them; but the Porte begins to be jealous of his good for-

zebeck, which he has lately taken from the Maltese: thus he apparently means to put himself on his guard against the stratagems of the Divan. Several invidious attempts have been made for his destruction, but they have all proved abortive; the cholera, of which two or three of his enemies have suddenly died, has cooled the zeal of those who might otherwise engage more willingly in so hazardous a business. Besides, he has retained several spies in his service, in the Seraglio, or palace of the Sultan. He has just obtained the Pachalic of Damascus, which is acknowledged to be the most important in all Syria: that of Acre he has resigned to a Mameluke, named Selim, his bosom friend, who is so firmly attached to him that Djeddar may be considered as in possession of both the governments. He is said to be soliciting that of Aleppo; and should his endeavours be crowned with success, he will almost possess the whole of Syria, when the Porte will probably find in him a rebel more dangerous than Daher.

Among the most remarkable places in this Pachalic, the first that presents itself is the town of *Berytus*, pronounced Bairout by the Arabs. It is situated on a plain, which, from the foot of Lebanon, runs out into the sea, and forms a long road, receiving the river Nahr-el Salib. Proceeding westward towards the point, we reach the town of Bairout, which, till lately, belonged to the Druzes; but was taken from them by Djeddar, who made it a Turkish garrison. It still continues the emporium of the Maronites and the Druzes, where they export their cottons and silks, the principal part of which are sent to Cairo. The dialect of the inhabitants is censured as the most corrupt of any in the country, as it unites the twelve faults enumerated by the Arabian grammarians.

une; and is alarmed at his enterprising spirit: and the Pacha begins to be apprehensive of the duplicity of the Divan; a mutual distrust consequently prevails, from whence important matters may be expected. The Pacha maintains a greater number of soldiers, and in a more respectable condition than any other of his rank; and is particularly careful to enroll none but those of his own country: these consist of nine hundred horsemen, and to these are added nine thousand Mograbian infantry.

* In summer, the air of Bairout is thought too sultry; * Dr. Franklin has given very satisfactory reasons for his salutary effect of trees, particularly pines: the subject has also been well treated by several English and French
Vol. II. No. LXXXVIII.

The port of Bairout, like all the others, is choaked up with sands and ruins. The town is surrounded by a wall of soft and sandy stone, which may be pierced by a cannon ball. Two inconveniences attend it which will ever prevent Bairout from becoming a place of strength; it is commanded by a chain of hills to the south-east, and is entirely destitute of water: the women are obliged to fetch what they want from a well at a considerable distance, and when they have got it, they find it very indifferent. By digging, in order to form reservoirs, subterraneous ruins have been discovered, from which it appears that the modern town possesses the same spot on which the former erections were made. The same observations occur with respect to Latakia, Antioch, Tripoli, Saide, and many places on the coast, which have been destroyed by earthquakes, at various periods. Without the town we find, to the west, heaps of rubbish, and some shafts of columns, which indicate that Bairout has formerly been much larger than it is at present. The surrounding plain is planted with white mulberry trees, which, unlike those of Tripoli, are young and prosperous; because, among the Druzes, there is no danger in renewing them; the silk produced here is, therefore, of the finest quality*.

The principal place in the country of the Druzes is *Dair-el-Kamar*, or the house of the Moon, which is the capital, and the residence of the Emirs. It is a large, dirty, ill-built town, situated on the back of a mountain, at the foot of which flows one of the branches of the ancient river Tamras, now the rivulet of Damour. It is inhabited by Greek Catholics and Schismatics, Maronites, and Druzes, to the number of about sixteen hundred. The palace of the prince is a large wretched house in a very ruinous state†.

In

the town, however, is supposed not to be unhealthy, though it was formerly thought so. It has ceased to be unhealthy since the Emir Fakr-el-din, planted a wood of fir-trees which are still standing, a league to the southward of the town. The monks of Mahr-Henna have made this observation respecting several convents; they assert, that since the heights have been planted with pines, the waters of the springs have been more abundant, and more salubrious*.

† The Greek Catholics, availing themselves of the per- philosophers; among others, by the Marquis de Chastellux, in his Travels to North America, under the article Virginia.

In the administration of this house, and the manners of the religious who occupy it, we find some singularities which may deserve attention. Their order is that of Saint Basil, who is to the Orientals what Saint Benedict is to the western Christians. They may pronounce the vows at the age of sixteen; and these vows are, as every where else, vows of poverty, obedience, devotion to the order, and chastity. The condition of the oriental monks is infinitely more severe than that of the Europeans, as appears from the following account of their domestic life. They rise at four in the morning, and retire to rest at nine in the evening, during which time they have only two meals, viz. at nine and five. They live wholly on meagre diet, and hardly allow themselves flesh meat on the most necessary occasions. Like the other Greeks, they have three Lents a year, and a multitude of fasts, during which they are not to eat eggs, milk, butter, nor cheese. Almost the whole year they live on lentils and beans with oil, rice and butter, curds, olives, and a very little salt fish. They have a coarse little loaf of bread, badly leavened, which is to last them two days, and is fresh made only twice a week. With this food they suppose they are less subject to maladies than the peasants, though it is well known that they have all issues in their arms, and many of them are attacked by kernias; occasioned, it is supposed, by their immoderate use of oil. Each of them lodges in a narrow cell, his whole furniture consisting of a mat, a mattress, and a blanket. They have no occasion for sheets, as they sleep with their cloaths on, which consists of a coarse cotton shirt, striped with blue, a waistcoat, a pair of drawers, and a surplice of coarse brown cloth. Contrary to the custom of the country, they wear their hair eight inches long,

mission granted them for that purpose, have founded twelve convents within the last seventy years. The principal of these is Mar-Hanna: it is situated opposite the village of Shonair, on a steep declivity, at the bottom of which a torrent runs in winter into the Nahr-el kelh. This convent consists of a dormitory, with two rows of cells, and maintains forty monks. It has an Arabic Printing-press, the only one which has succeeded in the Turkish empire.

* The same regulations are observed in all the twelve houses of the order. The whole number of these religious amount to about one hundred and fifty, with five convents of women which depend on them. The first superiors who established them, supposed they had performed a meritorious act; but they now repent that it has been done; because nuns are dangerous things in a Turkish country, who, as they are connected with the wealthiest merchants, get rid of

and, by way of hood, a cylinder of felt ten inches high, like those of the Turkish cavalry. Every one of them exercises some trade, or undertakes some useful employment in the house. Two of them manage the kitchen, four work at the printing-press, four are book-binders, and all assist at the bake-house on the days appointed for making bread. The expence of supporting forty or forty-five persons, of which the convent consists, does not exceed six hundred and twenty-five pounds; and from this must be deducted the amount of their hospitality to all passengers, which is a very considerable article: It must be admitted indeed that most of the passengers leave presents of alms, which forms a part of the revenue of the house; the other part arises from the culture of the lands. They form a considerable extent of ground: these lands were cleared out by the first monks themselves; but now they commit the culture of them to the peasants, who allow them half the produce. Formerly the religious would not indulge themselves with wine; but they have gradually relaxed from their primitive austerity: they have even begun to allow the use of tobacco and coffee, notwithstanding the remonstrances of the more aged Monks, who are cautious of granting too many indulgencies to youth*.

Next to Mar-Hanna, the convent of *Dair Mokalles*, or Saint Saviour, is the most remarkable. It is three hours journey north-east of Saïde. The religious there had collected a considerable number of printed Arabic books and manuscripts; but Djeddar having practised hostilities in these districts about eight years ago, his soldiers pillaged the house, and carried away all the books.

Returning to the sea-coast, we first remark their daughters for a stipulated sum, by placing them in these convents; the merchants also bestow on them considerable alms, without requiring any thing in return but their prayers to God, that he would preserve them from the rapacity of the Pachas. But neither their presents, nor the prayers of the religious, can protect them from extortion. Not long ago, one of these merchants ventured to build a house at Damascus, which cost him upwards of five thousand pounds. The Pacha observing it, intimated to the owner, that he should be happy to see his new house, and would pay a visit for that purpose, as well as to take a dish of coffee with him. As it was, therefore, probable, that the Pacha might have been so charmed with it, as not to have quitted it again, he thought it necessary, to avoid his politeness, by making him a present of seven thousand five hundred pounds.

Saïde, the unworthy offspring of ancient Sidon*. This place, once the residence of the Pacha, is a mean ill-built town, and full of modern ruins. On the south side, a fort is built on an eminence, from whence a view may be taken of the sea, the city, and the country; a very few cannon would destroy the whole work, which is only a tower of a single story, already half in ruins. At the other extremity of the town, is the castle, built in the sea, eighty paces from the main land, to which it is joined by arches. To the west is a shoal, fifteen feet high above the sea, and about two hundred paces long: the shoal has a bason, enclosed by a decayed pier; this was the ancient port, but it is now almost choked up by sand. The whole artillery does not exceed six cannon, without either carriages or gunners: the garrison hardly amounts to one hundred men.

Saïde is a capital trading town, the chief emporium of Damascus, and the interior country: the French have a consul here, and five or six commercial houses. Their exports are silks, and raw and spun cottons. The number of inhabitants may be estimated at about five thousand.

Six leagues to the south of Saïde, keeping along the coast, we arrive at the village of Sour; in which name we recognize that of *Tyre*, which we receive from the Latins. The name of *Tyre* recalls to the memory so many great events, and suggests so many reflections, that some minuteness will doubtless be excused in the description of a place, which was anciently the theatre of an immense commerce.

Sour is situated on a peninsula, projecting from the shore into the sea, in the form of a mallet, with an oval head. This head is a solid rock, covered with brown earth, forming a plain of about eight hundred paces long, by four hundred broad. The isthmus, joining this plain to the continent, is of pure sea sand. The village of Sour is situated at the junction of this isthmus

with the ancient island. The point to the north is occupied by a bason, which is at present choked up. The opening at the point, is defended by two towers, opposite to each other.

Further on in the sea, to the north-west of the point, is a ridge of rocks rising to the surface of the water. The space which separates them from the main land in front, forms a kind of road, where vessels may more safely anchor than at Saïde, but they are not perfectly free from danger, as they are exposed to the north-west winds, and the bottom injures the cables. The village contains about fifty or sixty poor families, which are barely supported by the produce of their small quantity of land, and a trifling fishery. Unlike the edifices in the time of Strabo, which were three or four stories high, they now consist of wretched huts, ready to crumble to pieces. Formerly they were defenceless towards the land, but the Motoualis, who obtained this place in 1766, enclosed it with a high wall, which still subsists. The most remarkable building is a ruin at the south-end corner: it was a Christian church, built by the crusaders, but only a part of the choir is now remaining. Two beautiful columns, with shafts of granite, are observed here, of a kind unknown in Syria. Djezzar wished to ornament his mosque at Acre with them, but his engineers were unable even to move them.

The vicissitudes of time, or rather the barbarism of the Greeks and the Lower Empire, and the Mahometans, have accomplished the prediction†. Instead of that ancient commerce, so active and extensive, Sour is now a miserable village, without any other trade than the exportation of a few sacks of corn, and raw cotton; nor any merchant but a single Greek factor, who finds it difficult to procure support for his family‡.

That part of the bay of Acre where the ships anchor

its public fountain surpasses in elegance those of Damascus. The Pacha derives infinite honour from these works, as he was himself, both the engineer and the architect. The port of Acre is finely situated on the coast, being sheltered from the north and north-west winds by the town itself; but as it has been greatly choked up since the time of Fakr-el-din, Djezzar has only made it a landing-place for boats. The fortifications are unimportant: only a few rusty iron pieces of cannon so bad, that some of them burst every time of firing. Its defence on the land side is nothing more than a garden wall, without any ditch.

The

* The name still subsists in a small village half a league from Saïde.

† Ezekiel, ch. 27.

‡ Nine miles to the south of Sour stands the city of Acre, anciently known under the name of Aco, and afterwards by that of Ptolemais. After the expulsion of the Crusaders, it was almost deserted; but it was again revived by the industry of Daher: and the works lately erected by Djezzar, have rendered it a very considerable town. The mosque of this Pacha is considered a master-piece of eastern taste: the covered market is equal to those of Aleppo; and

anchor with the greatest security lies to the north of mount Carmel, below Haifa: the bottom is good holding ground, but this harbour is open to the north-west wind. Mount Carmel is a flattened cone, and very rocky; it is about two thousand feet high. As we go towards the east, at about six leagues distance, we see *Nasra*, or Nazareth, so celebrated in the history of Christianity: it is a small village, a third of whose inhabitants are Mahometans; the other two thirds are Greek Catholics. The fathers of the Holy Land have an Hospitium and a church here. In Daher's time, every one was obliged to bestow a present to every wife he married; he seldom failed to marry about one a week.

Two leagues to the south-east of Nasra is Mount Tabor, from whence is beheld the finest prospect in all Syria: the summit is two leagues of a league in circumference. It had anciently a citadel, a few stones of which now only remain. From hence we discover, to the south, a series of vallies and mountains, which extend to Jerusalem; and to the east the valley of Jordan, and Lake Tabaria appears as if under our feet; beyond this, the eye loses itself towards the plains of Hauran: when, turning to the north, we take a cursory view of the fertile plains of Galilee.

The bank of Lake Tabaria presents nothing remarkable: the town takes its name from the lake. It has a fountain of warm mineral waters in the neighbourhood: for want of cleaning, it is filled with a black mud, which is a genuine Ethiops Mineral. Persons afflicted with rheumatic complaints, find great relief from baths of this mud. The town is little more than a heap of ruins, and hardly contains a hundred families. Seven leagues to the north of Tabaria stands the village of Safad, the seat of Daher's power. Under the government of this Shaik an Arabian college was established there, in which the Motoualis doctors instructed youth in grammar, and an allegorical interpretation of the Koran. The Jews, who supposed the Messiah will establish the seat of his empire at Safad, grew fond of this place, and assembled about sixty families in it; but the earthquake of 1759, demolished

The Pacha, by an abuse too common throughout the Turkish empire, has monopolized all the trade; no cotton can be sold but to him; and from him every purchase must be made. The European merchants claimed the privileges granted them by the Sultan, but in vain—Djezzar said, he

every thing, and Safad is now almost a deserted village.

Proceeding towards the north, we follow a chain of lofty mountains named *Dejebal-el-Shaik*, among which are the sources of the Jordan, as well as those of several rivulets which water the plain of Damascus. Before the earthquake of 1759, the country was covered with the villages and plantations of the Motoualis; but that calamity, and the war with the Turks, have occasioned general devastation. The only place of importance is the city of Balbec.

That city, so celebrated by the Greeks and Latins, under the name of *Heliopolis*, or the city of the Sun, is situated at the foot of Anti-Lebanon, on the last rising ground where the mountain terminates in the plain. As we arrive from the south, we discover the city at the distance of about a league and a half, behind a hedge of trees, over the tops of which appears a white edging of domes and Minarets. After an hour's journey we reach these trees, which produce excellent walnuts, and crossing some gardens, we arrive, by winding paths, at the entrance of the city. We there perceive a ruined wall, flanked with square towers. This wall enables us to take a view of those void spaces and heaps of ruins which appear in every Turkish city; but what greatly attracts our attention, is a large edifice on the left, which by its lofty walls, and rich columns, seems to be one of those temples, which antiquity has left for our admiration. These ruins, which are some of the most beautiful in Asia, as well as the best preserved, demand a particular description.

After having crossed the rubbish and huts, with which it is filled, we arrive at a part which appears to have been a square: there, in a front towards the west, we observe a grand ruin, consisted of two pavilions ornamented with pilastres, joined at their bottom angle by a wall one hundred and sixty feet in length. The front commands the open country, from a sort of terrace, on the edge of which we distinguish the bases of twelve columns: the principal gate is obstructed by heaps of stones. That obstacle surmounted,

was the sultan in his country, and continued his monopoly. These merchants are chiefly French; they have six houses at Acre, with a consul. An imperial agent is also lately settled there, and a resident from Russia.

Around it we observe a row of edifices, displaying all the ornaments of the richest architecture. At the end of this court, is an outlet, through which we behold a more extensive range of magnificent ruins. To have a full prospect of these, we must ascend a slope, and we then arrive at the entrance of a large square court. The eye is first attracted by the end of this court, where six majestic columns render the scene astonishingly grand and picturesque. A second range of columns to the left, appear to have been part of the peristyle of a temple. But we cannot refuse particular attention to a sort of gallery which contains various chambers; seven of which may be reckoned in each of the principal wings. At length we arrive at the foot of the six columns, and then first conceive all the boldness of their elevation, and the richness of their workmanship. Their shafts are twenty-five feet eight inches in circumference, and fifty-eight feet high: the total height, including the entablature, is from seventy-one to seventy-two feet. The sight of this superb ruin, thus unaccompanied, at first strikes us with astonishment; but, on ex-

* The walls of the Corinthian order, now present nothing but pediments of niches, and tabernacles, of which almost all the supporters are fallen to the ground. Between these niches is a range of fluted pilasters, whose capitals support a broken entablature; but what remains of it displays a rich frieze of foliage, resting on the heads of satyrs, horses, bulls, &c. Over this entablature was the ancient roof, which was fifty-seven feet wide, and one hundred and ten in length. No idea can be formed of the ornaments of this roof, but from the fragments lying on the ground. It would perhaps be thought tedious to enter more minutely into the description of this astonishing edifice. The lovers of the arts will find it accurately described in a work published in London in 1767, under the title of *Rules of Balbec*. This work, written by Mr. Wood, the world owes to the attention and liberality of Mr. Dawkins, who, in 1751, visited Balbec and Palmyra.

Several changes, however, have taken place since their journey: for example, they found nine large columns standing; and, in 1784, I found but six. They reckoned twenty-nine at the lesser temple, but there now remain but twenty. The others have been overthrown by the earthquake in 1759.

Nothing can surpass the workmanship of these astonishing columns: though they are joined without any cement, there is not room for the blade of a knife between their interstices; and, after so many ages, they in general still maintain their original whiteness. But the enormous stones which compose the sloping wall are truly astonishing. To

tensive examination, we discover a series of foundations of two hundred and sixty-eight feet in length, and one hundred and forty-six wide. It presented to the great court a front of ten columns, with nineteen on each side. The ground on which it stood was an oblong square. The esplanade this produces, fronts the open country, towards the west by a sloping wall of about thirty feet. The descent, as you approach the city, becomes less steep. Such was the former state of this edifice; but the southern side of the grand temple was afterwards blocked up to build a smaller one, the peristyle and walls of which are still remaining. This temple, situated some feet lower than the other, presents a side of thirteen columns, by eight in front, which are also of the Corinthian order: their shafts are fifteen feet eight inches in circumference, and forty-four in height*.

When we reflect on the extraordinary magnificence of the temple of Balbec, we are astonished at the silence of the Greek and Roman authors. Mr. Wood, who has minutely examined all the ancient writers, has seen no mention of it, but in a fragment of John of Antioch, who attributes the building of these superb works to Antoninus Pius. The inscriptions which remain seem to cor-

the west, the second layer is formed of stones from twenty-eight to thirty-five feet long, by about nine in height. There is still lying there a stone, hewn on three sides, which is sixty-nine feet two inches long, twelve feet ten inches broad, and thirteen feet three in thickness. By what means could the ancients move these enormous masses?—This is doubtless a problem in mechanics curious to resolve. The inhabitants of Balbec, indeed, have a very commodious manner of explaining it, by supposing these edifices to have been constructed by Genii, who obeyed the orders of king Solomon; adding, that the intention of such immense works was to conceal, in subterraneous caverns, immense treasures, which still remain there.

The belief in hidden treasures has been confirmed by discoveries which have been really made from time to time. Not more than ten years ago a small coffer was found at *Hebron*, containing a quantity of gold and silver medals; with an ancient arabic book on medicine. In the country of the Druzes, an individual also found, some time since, a jar full of gold coin, in the form of a crescent: but as the chiefs and governors claim all such discoveries, and persecute those who make them, those who really find any thing valuable endeavour carefully to conceal it. Perhaps they secretly melt the antique coins, and even bury them again in the same place where they found them, the same fears operating upon them which caused their first concealment; and which also prove that the same tyranny formerly existed in these countries.

roborate this opinion, and account for the constant use of the Corinthian order, as that order was not in general use till the third age of Rome. But we are justified in mentioning as an additional proof, the bird sculptured over the gate; for, if his crooked back, large claws, and the caduceus he bears, give him the general appearance of an eagle, the tufted feathers on his head demonstrate that he is not a Roman Eagle. Let it also be observed, that the same bird is found in the temple of Palmyra, and is there evidently an oriental eagle, consecrated to the Sun, the Divinity adored in both these temples. His worship existed at Balbec, in the most remote antiquity. Mr. Wood very rationally supposes, that the name of Balbec, which in the Syriac signifies City of Bal, or of the Sun, originated in this worship. We are ignorant of this city in remote antiquity: but it may reasonably be presumed that its situation, on the road from Tyre to Palmyra, afforded it some part of the commerce of those opulent cities. Under the Romans, in the time of Augustus, it is mentioned as a garrison town. One hundred and forty years after, Antoninus built there the present temple, instead of the ancient one, which then was probably falling into ruins; but Christianity having gained the ascendancy under Constantine, the modern temple was neglected, and afterwards became a church, a wall of which at present remains. It continued thus till the invasion of the Arabs; when, being less frequented, it fell into decay: wars succeeded, and it was converted into a place of defence; and from that time, the temple was rapidly reduced to ruin.

The state of the city is equally deplorable: the iniquitous government of the emirs of the house of Harfouche, had considerably impaired it, and the earthquake of 1759, completed its destruction. The wars of Emir Youssef, and Djezzar has occasioned it to be still more deserted and ruinous; for out of five thousand inhabitants, at which number they were estimated in 1751, little more than one thousand are now remaining; and all these are wretchedly poor, without industry

* In this vast extent of country, the soil and its productions are extremely various; but the plains of Haucan, and those on the banks of the Orontes, are the most fertile. The soil of the country of Damascus, and the Upper Bekaa, is gravelly and poor. On the mountains are cultivated olive, mulberry, and fruit trees, and in some places vines.

or commerce, and cultivating nothing but maize, cotton, and water-melons. The soil of this part of the country is poor, and does not improve as we proceed to the north, or to the south-east towards Damascus.

THE PACHALIC OF DAMASCUS.

This Pachalic comprehends nearly the whole eastern part of Syria. It extends to the north, from Marra to Habroun in the south-east of Palestine. It is bounded to the west by the mountains of the Ausarians, those of Anti-Lebanon, and the upper part of the Jordan; then crossing that river in the country of Bisan, it includes Nablons, Jerusalem, and Habroun, and enters the desert to the east*.

The Pacha enjoys all the privileges of his post, which are superior to those of any other Pachalic; he has not only the farm of all the customs and imposts, but he has an absolute authority, and is also conductor of the sacred caravan of Mecca, under the very respectable title of *Emir Hadj*. The Mahometans deem this office so important, and entitled to such reverence, that the person of the Pacha who acquits himself in it with propriety, becomes inviolable even by the Sultan: it is no longer permitted to shed his blood. But the Divan can pursue its vengeance, without departing from the literal expression of the law, by being empowered to have the offenders pounded in a mortar, or smothered in a sack, of which there have been several instances.

The tribute of the Pacha to the Sultan is but forty-five purses (two thousand three hundred and forty-three pounds; but he is charged with all the expences of the Hadj, which are estimated at three hundred and twelve thousand five hundred pounds: they consist of provisions of corn, &c. and in the hire of camels for the escort, and a great number of pilgrims. Besides this, eighteen hundred purses must be paid to the Arab tribes, near the road, to secure a free passage†.

His military establishment consists of about eight hundred Janisaries, better provided for,

† Besides his other emoluments, the Pacha is heir of all the Pilgrims who die on the journey, which is not the least of his perquisites; for those are always found to be the richest of the pilgrims. Besides all this, he may lend money, at what interest he pleases, to merchants and farmers.

and more: in such a country. The way of escorting the Arabs, but all from his own

The Pachalic is more exposed to the ravages of the Arabs, than any other. The least rava assigned is, that the Pachas, the Pachalic for life: for fifty years, who regularly last of them, time be performed established such soldiers, as to injured by the passion, like a key, was to arise by a moderation here required none.

The city of Damascus is one of the most acknowledged for its lubricity. The city is now with too much hardness of the heart, that the native constructions. The fruit, particularly many intermitted, and autumn, the city is too preoccupied with inhabitants, who exhibits the general

M. Niebuhr, Damascus, says it is somewhat less comfortable: he has seen about eight

* In Syria and to fifteen; but some of us now attend to the Pachalic. The first, the capital is situated in a very east, and shut in to which very much of the rivulets fortunately for Damascus the

and more insolent than in any other parts of the country. These troops are not only required by way of escort for the caravan, and to restrain the Arabs, but also to enable him to collect the miri from his own subjects.

The Pachalic of Damascus, from its situation, is more exposed to the incursions of the Bedouin Arabs, than any other; yet it is remarked to be the least ravaged of any in Syria. The reason assigned is, that instead of frequently changing the Pachas, the Porte usually bestows this Pachalic for life: in the present century it was held for fifty years by a father and three brothers, who regularly succeeded each other. Asad, the last of them, held it fifteen years, during which time he performed many meritorious acts; and established such a degree of discipline among the soldiers, as to prevent the peasants from being injured by their robberies and extortions. His passion, like all those in office throughout Turkey, was to amass money, but he was regulated by a moderation unheard of in this country; for he required no more interest than six per cent *.

The city of Damascus is considered as one of the most agreeable in Turkey; but it is acknowledged to be deficient in point of salubrity. The inhabitants complain, and apparently with too much reason, of the coldness and hardness of the waters of the Barrada; and assert that the natives are frequently afflicted with obstructions. They add, that the too great use of fruit, particularly of Apricots, occasions there many intermittent fevers and dysenteries in summer and autumn. It is also observed that a paleness is too prevalent in the countenances of the inhabitants, which rather indicates sickness, than exhibits the genuine colour of sanity of body.

M. Niebuhr, who has given us a plan of Damascus, says it is two hundred and fifty toises, or somewhat less than a league and a half in circumference: he adds, that he supposes it to contain about eighty thousand inhabitants. The

people of Damascus have an aversion to Christians, and this hatred is maintained and increased by their communication with Mecca. Damascus is the rendezvous for all the pilgrims from the north of Asia, as Cairo is for those from America. Their number annually amounts to from thirty to fifty thousand. Nothing is to be seen but strangers from all parts of Turkey, and even Persia, and every place is crowded with camels, horses, mules, and merchandize. At length this confused multitude set out upon their march, and arrive in forty days at Mecca, for the festival of the Bairam. As the caravan traverses the country of many independent Arab tribes, treaties must necessarily be made with the Bedouins, to establish a free passage, and to take them for their guides. Frequent disputes arise on this subject between the Shaiks; but the preference is usually given to the tribe of Saradia, which he encamps to the south of Damascus along the Hauran. The Pacha transmits to the Shaik a mace, a tent, and a pelisse, to convince him that he takes him as his chief conductor. From this moment the Shaik engages to furnish him with camels at a stated price, which he hires from his tribe and his allies: the Pacha is responsible for no damages, and all losses are on his own account. About two thousand camels perish yearly, which forms an advantageous article of commerce for the Arabs.

It must not, however, be imagined that devotion is the sole motive of these expences and fatigues: pecuniary interest is more particularly consulted in these expeditions. The caravan affords opportunities of engrossing every lucrative branch of commerce: almost every pilgrim converts it into a matter of speculation. On quitting their own country, they collect a quantity of merchandize, which they dispose of upon the road; and, with the ready money it produces, added to what they have brought with them, is conveyed to Mecca, where they exchange it for the

of all Syria. The Arabs speak of it with enthusiasm, and extol the verdure of its orchards, the abundance and excellence of its fruits, and the clearness of its rivers, rills, and fountains. No city contains so many canals and fountains; every house has one; and all these waters are furnished by three branches of the same river, which, after fertilizing a number of gardens for three leagues, flow into a hollow of the Desert to the south-east, where they form a pleasing spectacle called the Lake of the Meadow.

goods

* In Syria and Egypt, the usual interest is from twelve to fifteen; but sometimes it is twenty or thirty per cent.

Let us now attend to the most remarkable places in this Pachalic. The first that presents itself is the city of Damascus, the capital and residence of the Pachas. This city is situated in a very extensive plain, open to the south and east, and shut in towards the west and north by mountains, which very much circumscribe the view; but a number of rivulets fortunately flow from these mountains, which render Damascus the best watered and most delicious province

goods of Bengal, Cashmere, Tonquin, the diamonds of Golcondo, the pearls of Bahain, pepper, and a great quantity of coffee from the Yaman. Sometimes, indeed, the Arabs of the Desert pillage the stragglers, and carry off detached parties of the caravan. But in general the pilgrims arrive safe, in which case their profits are very considerable. At least, however, they are rewarded in the veneration attached to the title of Pilgrim; and by the pleasure of boasting of the wonders of Caaba, and Mount Ararat: and of magnifying the immense crowds of pilgrims, and the number of victims on the day of the Bairam; and repeating the dangers and fatigues they have undergone; the Desert without water, and the tomb of the prophet at Medina; which, however, is neither suspended by a load-stone, nor the principal object of their pilgrimage. The wonderful excite the admiration and enthusiasm of the audience, though, as the sincere pilgrims honestly confess, nothing can be more wretched than this journey. Experience has fully proved, that the greater part of the devotees of Mecca are peculiarly insolent and treacherous, seeming determined to recompense themselves for having been dupes by becoming knaves*.

The Pachalic of which I am speaking affords a remarkable instance of its former greatness; I mean the remains of Palmyra, a city celebrated in the third age of Rome, for the part it took in the differences between the Parthians and the Romans. From that time history preserved the name of this great city; but it was merely the name, for till nearly the end of the last century, when some English merchants of Aleppo, tired of hearing the Bedouin Arabs talk of the immense ruins to be found in the Desert, resolved to ascertain the truth of these wonderful relations. This was first attempted in 1678, but without success, the adventurers were robbed of every thing by the Arabs, and compelled to return without accomplishing their design; but, in 1691, they ventured a second time, and obtained sight of the antiquities in question. Their narrative, published in the Philosophical Transactions, was supposed

* In consequence of this caravan, Damascus is become the centre of a very extensive commerce. By Aleppo the merchants of this city correspond with Armenia, Anadolia, the Diarbekar, and even with Persia. This commerce has existed in these countries from the earliest antiquity. It has

by persons to have been wholly an imposition: they could not persuade themselves to believe that, in a spot so remote from any habitable place, such a magnificent city, as their drawings represented, could have subsisted. But since Mr. Dawkins published, in 1753, the plans and views he had taken on the spot in 1751, doubts are no longer entertained. It is now universally acknowledged that antiquity has left nothing, either in Greece or Italy, to be compared with the magnificence of the ruins of Palmyra.

Mr. Wood, in his description of the Ruins of Palmyra†, says, He set out from Hassis, the 11th of March, 1751, with an escort of the Aga's best Arab horsemen, armed with guns and long pikes, and travelled to Sudad, through a barren plain, hardly affording a little browsing to antelopes, of which they saw a great number. Sudad is a poor little village, inhabited by Maronite Christians; the houses of which are built of mud dried in the sun: After dinner they continued their journey, and in the evening arrived at Owareen, a Turkish village, where they lay. Owareen exhibits as much poverty in its appearance as Sudad, but, from the ruins they beheld there, they were convinced that it had formerly been a more considerable place. The travellers observed a village near this, which had been entirely abandoned by its inhabitants, a circumstance not unfrequently happening in these countries, where lands have acquired value from cultivation, and are frequently deserted to avoid oppression. They set out from Owareen the 12th, and proceeded to Carietein, a village somewhat larger than the former. Here they judged it prudent to remain one day, as well to afford rest to the escort, as to prepare their people and cattle for the fatigue of the remaining part of the journey.

They left Carietein the 13th, making in all about two hundred persons, with the same number of beasts of carriage, consisting of an odd mixture of asses, mules, and camels. On the 14th, about noon, they arrived at the end of the plain, where the hills appeared to meet. Between these hills, a vale, through which an aqueduct formerly conveyed water to Palmyra, for-

flowed through different channels, according to the change of circumstances, and has every where left apparent traces of the opulence it produced.

† Published in folio, in London, in 1753.

merly existed and left of them appeared, which covered to be renes. merly existed: but it is now ruined. To the right and left of this vale, several high square towers appeared, which on a nearer approach, were discovered to be sepulchres of the ancient Palmyrenes. They had no sooner passed these venerable monuments, than the hills opening, exhibited to them, all at once, the greatest quantity of ruins they had ever seen*; and, behind them, towards the Euphrates, a flat waste as far as the eye could reach, without any object which shewed either life or motion. It is hardly possible to imagine any thing more striking than this view. Such a multitude of Corinthian pillars, with so little wall or solid building, afforded a most romantic variety of prospect†.

But the reader is referred to the plates of Mr. Wood, for a particular explanation of these various edifices, and to be convinced of the degree of perfection, to which the arts had arrived in those remote ages. Architecture more especially, lavished her ornaments, and displayed her magnificence in the temple of the sun, the tutelary deity of Palmyra. The square court, which enclosed it, was six hundred and seventy nine feet each way, and a double range of columns was continued all round the inside. In the middle of the vacant space, the temple pre-

sents another front of forty-seven feet, by one hundred and twenty-four in depth; around it runs a peristyle of one hundred and forty columns; and, what is very remarkable, the gate faces the setting, and not the rising sun‡.

Palmyra was at all times a natural emporium for the merchandize coming from India by the Persian Gulph, which, from thence by way of the Euphrates, was conveyed into Phœnicia, and Asia Minor, to diffuse its varied luxuries among numerous nations. Such commerce must necessarily, in the most early ages, have caused this spot to be inhabited, and rendered a place of importance, though at first of no great celebrity. Two springs of fresh water it possesses, were a powerful inducement in a parched and barren desert§. These were doubtless the principal motives which drew the attention of Solomon, and induced that prince to carry his arms to a place so remote from the actual limits of Judea—"He built strong walls there," says Josephus ||, "to secure himself in the possession, and named it Tadmour, which signifies the place of Palm-trees**.

Leaving these venerable ruins, and returning to the inhabited world, we first meet with Homs, the Emesus of the Greeks, situated on the bank of the Orontes: this place, though formerly a

* Though these travellers had visited Greece and Italy.

† The reader must represent to himself that range of erect columns, as occupying an extent of more than twenty-six hundred yards, and concealing a multitude of other edifices behind them. In this space, sometimes a palace is found, of which nothing remains but the courts and walls, sometimes a temple, whose peristyle is half thrown down; and now, a portico, a gallery, or triumphal arch. Here stand groupes of columns, whose symmetry is destroyed by the fall of many of them. If from this striking scene, we cast our eyes upon the ground, another, almost as varied, presents itself. On all sides we see nothing but subverted shafts, some whole, others shattered to pieces, or dislocated in their joints. And, on which side soever we look, the earth is strewn with large stones, half buried, with broken entablatures, damaged capitals, mutilated frizes, disfigured reliefs, effaced sculptures, violated tombs, and altars defiled by dust.

‡ Amid these hallowed ruins of the magnificence of a polished people, are about thirty mud-walled huts, affording a miserable shelter to that number of peasants families, who exhibit every external sign of the most abject poverty. So extremely wretched are the present inhabitants of a place, once so renowned and populous. These Arabs only cultivate a few olive-trees, and barely as much corn as is required for their subsistence. All their riches consist in a few goats and sheep which they feed in the Desert. Incapable of defending themselves from violence, they become

tributary to the Bedouins, who alternately harass and protect them.

The complexion of these Arabs is very swarthy, from the excessive heat, but the women have beautiful features. They are veiled, but they are not so unwilling to show their faces as the eastern women generally are; they dye the end of their fingers red, their lips blue, and their eye-brows and eye-lashes black. They also wear very large gold or brass rings in their ears and noses.

§ These waters are warm and sulphureous, but the inhabitants, who have none but what is brackish, except these springs, find them very good, and they are at least wholesome.

|| *Antiq. Jud. lib. 8, c. 6.*

** Hence it has been inferred, that Solomon was its first founder; but it seems probable that it was then a place of known importance. The palm-trees he found there, are not the trees of uninhabited countries. Prior to the days of Moses, the Journeys of Abraham and Jacob, from Mesopotamia into Syria, prove a communication between those countries, which must soon have made Palmyra. The cinnamon and pearls mentioned as found there in the time of the Hebrew legislator demonstrate a trade with India and the Persian gulph, which must have been carried on by the Euphrates and Palmyra. The king of Jerusalem would not have carried his attention to so distant and detached a spot, without some powerful motive of interest; and this interest could be no other than that of an extensive commerce, of which this place was the emporium.

strong and populous city, is now but a large ruinous town, containing about two thousand inhabitants, partly Greeks, and partly Mahometans. An Aga resides here, as a sub-renter of the Pacha of Damasceas, of the whole country as far as Palmyra. The Pacha himself holds this farm as an appendage derived immediately from the Sultan. Hama and Marra, are held in the same manner: these three farms pay above twenty thousand pounds, and they are supposed to produce about four times that sum.

Two days journey below Homs, is Hama, a place celebrated in Syria for its water-works. The town is situated in a narrow valley, on the banks of the Orontes, and contains about four thousand inhabitants. An Arab Shaik, named Mohammad-el-Korfan, is lately become so powerful as to impose arbitrary contributions on the country. He is reported to be able to bring into the field thirty thousand horsemen*.

As we approach the Jordan, the country becomes more hilly and better watered: the valley through which this river flows, abounds in pasturage, especially in the upper part of it. The river itself is not of that importance which we are apt to assign to it. The Arabs call it *el Sharia*. Its breadth in few places exceeds sixty or eighty feet; but its depth is about ten or twelve. Crossing the Jordan, we enter a hilly country, anciently named the kingdom of Samaria, and a town called Nablous, its capital. This town, situated on the ruins of the Neapoli's of the Greeks, is the residence of a Shaik, who farms the tribute, and is accountable to the Pacha of Damascus.

* Still continuing to descend the Orontes, we arrive at a marshy country, where we meet with a place called Farnia, once a celebrated city of Syria, under the name of Apamea. "It was there," says Strabo, "That the Seleucida had established the school and nursery of their cavalry." The soil of the neighbourhood fed thirty thousand mares, three hundred stallions, and five hundred elephants; instead of which the marshes of Farnia now hardly afford a few buffaloes and sheep. The veteran soldiers of Alexander, who have reposed after their victories, have succeeded miserable peasants, who perpetually dread the oppressions of the Turks and the inroads of the Arabs. Every town, every village is built of materials furnished by ruins, and founded on the rubbish of ancient edifices. The Pilgrims of Mecca assure us they find, at every step, the vestiges of ancient habitations.

+ From the reverence generally expressed and shewn to that celebrated city, it might long be imagined that there could not be a more devout people than its inhabitants; but they have since acquired and well deserved the reputation

Two days journey to the south of Nablous, we arrive at a town, which, like many others already mentioned, presents a striking example of the vicissitude of human affairs. When we behold its walls levelled, its ditches filled up, and all its buildings in ruins, we can scarcely believe that we view the celebrated metropolis, which once withstood the efforts of the most powerful empires: and, for a time, resisted the arms of Rome herself. In one word, we with difficulty recognize *Jerusalem*. The renown of its miracles perpetuated in the east, invites many inhabitants within its walls. Mahometans, Christians, Jews, without distinction of sects, all make it a point to see what they denominate the noble and holy city†.

Yafa is the port where the pilgrims disembark. They arrive in November, and repair to Jerusalem, where they remain till after the festival of Easter. They are lodged promiscuously in the cells of the convents of their respective communions; for which indulgence no gratuity is demanded: but it would neither be civil nor safe to depart without making an offering far beyond the usual price of apartments. Besides, there are also masses, services, exorcisms, &c. to be paid for: the pilgrim must also purchase beads, Agnus Dei's, &c. On Palm-Sunday they purify themselves in the Jordan; an expedition which claims a contribution. One year with another, it produces to the governor four thousand six hundred and eighty-seven pounds.

Particular relations must be consulted to form an idea of the tumultuous march of this fanatic multitude into the plain of Jericho; the indecent

of the vilest people in Syria, without excepting even those of Damascus. Their number is estimated at fourteen thousand. Jerusalem has had governors of its own, with the title of Pachas; but it is now a dependency of Damascus, from which it receives a deputy Governor.

The *Motsallam*, or governor, collects duties on the exportation of singular commodities from Jerusalem, such as beads, relics, sanctuaries, crosses, passions, scapularies, &c. of which about three hundred chests are sent off annually. This sort of commerce is the more advantageous to the manufacturers, as their goods cost them little besides their labour, and the more lucrative for the sellers, as the price is enhanced by superstition. These commodities exported to Turkey, Italy, Portugal, and especially to Spain, produce a return of considerable sums, in the form of alms, or in payments. To this the convents join another important article of traffic, the *Visits of the Pilgrims*.—At all times the devout curiosity of visiting the holy places, has occasioned Christians of every country to resort to Jerusalem.

zeal with which men, women, and children throw themselves naked into the river Jordan; their return and visitation of the holy places: and the ceremony of the new fire, which descends from heaven on the holy Saturday, brought by an angel. The Orientals still believe in this miracle, though the Franks acknowledge that the priests retire into the Sacristy, to perform what is done by very natural means*.

Leaving Jerusalem, we only find three places in this part of the Pachalic which merit particular attention. The first is *Raha*, the ancient Jericho, six leagues to the north-east of Jerusalem. Here was formerly cultivated the balm of Mecca. From the description of the Hadjes, this is a shrub similar to the pomegranate-tree, with leaves resembling those of rue: it has a pulpy nut, the kernel of which yields the resinous juice, called *balm*, or *balsam*. There is not a plant of it now remaining at *Raha*; but another species is to be found there, called *Zakkoun*, which also produces a sweet oil, celebrated for healing wounds. This *Zakkoun* resembles a plum-tree, and has thorns four inches long, with leaves like those of the olive-tree; its fruit is a kind of acorn; under the rind of which is a pulp, and then a nut, the kernel of which affords an oil which the Arabs sell very dear: this is the sole commerce of *Raha*, now a small village in a ruinous state†.

The last place demanding attention is *Habroun*,

or Hebron, seven leagues to the south of Bethlehem. It is situated at the foot of an eminence, on which appear some wretched ruins, the misshapen remains of an ancient castle. The adjacent country is not disagreeably varied by rocky hillocks, groves of fir-trees, a few stunted oaks, and plantations of vines and olive-trees. These vineyards are not cultivated for the purpose of making wine, the inhabitants being such zealous Mahometans as not to suffer any Christians to live among them: the produce is intended to be used merely as dried raisins.

The peasants cultivate cotton, which is spun by their women, and sold at Jerusalem and Gaza. They also have some soap manufactories, and a very ancient glass-house, the only one in Syria. They also make a quantity of coloured rings, bracelets for the wrists, legs, arms, and elbows, and many other trinkets, which are sent to Constantinople. From these manufactures, Habroun is become a place of some eminence, and is capable of arming eight or nine hundred men. Proceeding from Hebron towards the west, we arrive at some eminences, which, on this side, form the last branch of the mountains of Judea. There the traveller, wearied with the irregular country he has quitted, beholds the vast plains which extend beneath his feet, to the sea that lies before him. This is the plain which, under the name of Palestine, terminates, on this side, the country of Syria, and forms the last division.

SECTION VI.

Of Palestine—Of the Government of the Turks in Syria, with Remarks on the Influence of Religion.

THIS district, in its present state, comprehends the whole country between the Mediterranean to the west, the chain of mountains to

the east, a line drawn to the south, by Ka-Younes, and another to the north, between Kan saria, and the rivulet of Yafe. This whole tract

* Easter being over, every one returns to his own country, vain of being able to rival the Mahometan in the title of pilgrim. Many of them, in order to distinguish themselves as such, imprint on their hands, wrists, or arms, figures of the cross, or spear, with the cypher of Jesus and Mary. This painful, and sometimes dangerous operation is performed with needles, and the perforations filled with gun-powder, or powder of antimony, and is not to be effected. But all this appearance of devotion does not exempt these pilgrims from the proverbial censure thrown upon the Hadjes; since the Christians say, "Beware of the pilgrims of Jerusalem."

† The next place entitled to notice is *Bail-el-Iohm*, or Bethlehem, so celebrated in the history of Christianity. This village is seated on an eminence, two leagues south-east of Jerusalem, in a very fertile soil. Fruits, vines, olives, and sesamum succeed here extremely well; but cultivation is very much wanting. They reckon about six hundred men in this village, capable of bearing arms when required. A sort of white wine is made here, which justifies the former celebrity of the wines of Judea, but it has a very great tendency to promote intoxication.

is nearly a level plain, without either river or rivulet in summer, though watered by several torrents in winter. Notwithstanding the dryness of the soil, it may be pronounced fertile; for when the winter rains occur, every thing springs up in abundance; and the earth retains moisture sufficient for the growth of grain and vegetables during the summer.

Palestine is a district independent of every Pacha. Sometimes it has Governors of its own, who reside at Gaza, under the title of Pachas: but it is at present divided into three appanages, or *Melkenas*, viz. Yafa, Loudd, and Gaza. Yafa is the port at which the rice sent from Damietta to Jerusalem, and the commodities from the various ports to the coast of Syria are landed. Here also the pilgrims from the Morea and Constantinople arrive.

As a sea-port, or place of strength, Yafa is hardly to be mentioned; but it is capable of becoming one of the most important on the coast, on account of two springs of fresh water within its walls. The port, which is formed by a pier, and now choked up, might be cleared out, and rendered capable of containing twenty vessels of three hundred tons burthen each. Ships are now obliged to cast anchor out at sea, where they are by no means safe, the bottom being a bank of rock and coral. Before the two late sieges, this was one of the most agreeable towns on the coast: its environs were a continued forest of orange and lemon trees, citrons, and palms. The country beyond contained a number of large olive-trees: but the Mamelukes having cut them all down, Yafa has lost its greatest ornament and convenience; but fortunately they have not deprived them of the rivulets that water its gardens, and nourish the young suckers, which now begin to shoot*.

Not half a league to the southward of Loudd, stands Ramla, the ancient Arimathea: a town also in a ruinous state, where hardly any thing but rubbish meets the eye. The Aga of Gaza resides here in a Serai, the floors and walls of

* To the east of Yafa is the village of Loudd, the ancient Lydda. It has the appearance of a place lately ravaged by fire and sword. From the huts of the inhabitants, to the palace of the Aga, it is one vast heap of rubbish and ruins. A weekly market is, however, held there, to which the neighbouring peasants bring their spun cotton for sale. The poor Christians, who reside here, shew, with great veneration, the remains of the church of St. Peter, and request strangers to sit down in a column, which they say,

which are tumbling down. On his being asked Why he did not repair his own apartment?—He replied, with another question—"Should a more fortunate person obtain this place next year—Who will repay me the expence?"

The only remarkable antiquity at Ramla is the minaret of a ruined mosque on the road to Yafa. By the Arabic inscription it appears to have been built by Saif-el-din, Sultan of Egypt. In this plain, between Ramla and Gaza, we behold a number of villages, miserably composed of dried mud, and which, like their inhabitants, exhibit every mark of extreme wretchedness and poverty. The women have separate apartments. In winter they and their cattle may be said to live together, the part of the dwelling appropriated to themselves, being only raised two feet higher than that which accommodated their beasts. The peasants are thus kept warm without burning wood, which is very commendable economy in a country destitute of fuel. The fire required for culinary purposes, is made of dung kneaded into cakes. In summer their lodging is more airy, but their furniture consists wholly of a single mat, and a pitcher for drinking. The environs of the villages are sown, at the proper season, with grain, and water-melons; all the rest professed Desert, abandoned to the Bedouin Arabs, who feed their flocks on it. Ruined towers and castles are frequently observed; and sometimes a garrison, consisting of the lieutenant of an Aga, and two or three Barbary soldiers, with only a shirt and a musquet; but more frequently they are inhabited by jackalls, owls, and scorpions.

Four leagues from Ramlat, on the road to Gaza, we arrive at the village of Mesmia, where a considerable quantity of cotton is spun. At the distance of a league to the east is El-Tell, the capital of the tribe of Wahidia, where one of the Shaiks, named Bakir, was assassinated a few years ago by the Aga of Gaza, at an entertainment to which he had invited him.

As we approach the sea, on the road to Gaza,

that saint once rested on. They even shew the place where he preached, where he prayed, &c. There is no stirring a step without being shewn the traces of some apostle, some martyr, or some holy virgin.

+ He maintains one hundred horsemen, and an equal number of Barbary soldiers, who are lodged in an old Christian church, the nave of which is converted into a stable; and in an ancient kan, which is disputed with them by the scorpions.

+ Beyond Gaz not therefore be

VOL. II. N

is Yabna, the ancient Jamnia. This village has nothing particular, but an eminence and a rivulet. The whole course of this stream does not exceed a league and a half, before its water is poured into the sea. Leaving Yabna, we behold variety of ruins, the most considerable of which are at Ezdoud, the ancient Azotus, now remarkable for its scorpions. This town, so powerful under the Philistines, displays nothing of its ancient importance. Three leagues from Ezdoud is Majdal, celebrated for spinning the finest cottons in Palestine; which, however, are extremely coarse. On the right is Azkalan, whose deserted ruins daily recede farther from the sea, by which it was formerly washed.

Gaza is composed of three villages, one of which called the *Castle*, is situated between the two others, on a moderate eminence. This castle, which might have been thought strong at the time it was erected, is now a heap of rubbish. The Serai of the Aga, which constitutes a part of it, is in a ruinous state; but it commands a most extensive prospect. The heats, the drought, the winds, and the dews, are the same as on the banks of the Nile; and the inhabitants have the complexion, figure, and manners of the Egyptians, rather than those of the Syrians*.

An advantageous branch of commerce is furnished to the people of Gaza, by the caravans passing and repassing between Egypt and Syria. The provisions they are required to take for their four days journey in the Desert produce a great demand for their flour, oils, dates, and other necessaries. They also fit out, annually, a great caravan, which goes to meet the pilgrims of Mecca, and conveys to them the convoy of Palestine,

* The situation of Gaza has, at all times, rendered it a town of importance. The ruins of white marble, found in its environs, prove it to have formerly been the abode of luxury and opulence; nor was it unworthy of this preference. The soil of the surrounding country is remarkably fertile, and the gardens, watered by limpid streams, still produce pomegranates, oranges, dates, &c. in great perfection. It has, however, partook of the general destruction, and though it enjoys the proud title of the capital of Palestine, it is now merely a defenceless village, hardly containing two thousand inhabitants. The manufacture of cottons is their principal support; and, as they have the exclusive supply of the peasants and Bedouins of the neighbourhood, they employ about five hundred looms; they have also two or three soap manufactories.

+ Beyond Gaza there are but two deserts, but it must not therefore be taken for granted that the country thence

and supplies of various kinds, with different refreshments. They also purchase the plunder of the Bedouins. Immense profits were obtained by the plunder of the great caravan in 1757†.

The desert of Tih, is that into which Moses conducted the Jews, and kept them a long time to initiate them in the art of war, and transform shepherds into conquerors. This desert, which is the boundary of Syria to the south, extends itself in the form of a peninsula between the two gulphs of the Red Sea. Its breadth is generally about thirty leagues, and its length seventy. This great space, principally consists of barren mountains, which join those of Syria, on the north, and, like them also, consist wholly of calcareous stone; but, as we proceed to the southward, they become granitons, and Sinai and Horeb are enormous masses of that stone. On this account the ancients gave this country the name of *Arabia Petraea*. The soil, in general, is a dry gravel, producing thorny accacias, tamarisks, firs, and some scattered shrubs. In some of the vallies, however, it is better, as the earth becomes cultivable after the winter rains, and may almost be deemed fertile. Such is the vale of Djiraddel, in which there are even some groves of trees. Formerly every advantage was made of this country that could be obtained from it, but it is now abandoned, and produces nothing but wild herbs. But, with such scanty provision, this desert maintains three tribes of Bedouins, consisting of about six thousand Arabs, dispersed in various parts. They are called the Arabs of Tor, the most frequented place in the country. It has a pretty good road for shipping,

becomes suddenly uninhabitable; we still continue, for a day's journey, along the sea-coast, to behold cultivated spots and villages: Such as Kan-younes, a kind of castle, in which the Mamelukes keep a garrison of twelve men. Such also is El-Arish, the last place where water can be had fit to be drunk, till you arrive at Salachia, in Egypt. Returning to the desert by the east, we meet with strips of cultivable land, as far as the road to Mecca. They cultivate palm-trees and doura, under the protection, or rather exposed to the rapine, of the Arabs. These peasants, who may be considered as half savages, are more ignorant and wretched than the Bedouins themselves. Incapable of leaving the soil they cultivate, they are perpetually in dread of losing the fruit of their labours. When they have gathered in their harvest, they hasten to conceal it in private places, and retire among the rocks bordering on the Dead Sea.

and water which may be drank: the Arabs also bring some hither from Sinai, which is really good. Nothing further can be noticed here, except that we here and there find a few palm-trees, the ruins of a wretched fort without a garrison, a small Greek convent, and some huts of poor Arabs. Respecting the subsistence of the three tribes, it is derived from their goats, camels, acacia gums sold in Egypt, and their robberies on the roads of Suez, Gaza, and Mecca.

These Arabs have not many mares, like the other tribes; they rear but very few; but they supply the want of them by a sort of camel, called *Hedjina*, which nearly resembles the common camel, but is slenderer, and moves more expeditiously. This animal can continue his pace thirty or forty hours successively, almost without rest, and without eating or drinking; he is preferred by *couriers*, and for long journeys when expedition is required: but the rider must be accustomed to his pace, or his jolting motion will soon gall and disable him, in spite of the cushions with which they stuff the saddle*.

But the most considerable profits of the Bedouins of Tor arise from the pilgrimage of the Greeks to the convent of Mount Sinai. The schismatics have so much faith in the relics of Saint Catherine, which are deposited there, that they doubt of their salvation if they have not visited them at least once in their lives. The rendezvous is at Cairo, where the Monks of Mount Sinai have correspondents who treat with the Arabs for a convoy. On their arrival at the convent, the Greeks perform their devotions, visit the church, kiss the relics and images, mount on their knees upwards of a hundred steps of the hill of Moses, and conclude by making an offering.

The Pacha, as being the image of the Sultan, is the head of the police of his government; under which title must be comprehended criminal justice. He has the absolute power of life and

* Except at the time that these visitations are made, which is only once a year, this convent is a very desert and savage abode, and the surrounding country is only a pile of rugged and naked rock. Mount Sinai, at the foot of which it is seated, is a peak of granite, which seems to overwhelm it. The house has the resemblance of a prison, whose lofty walls have only one window, which, though very high up, answers the purpose of a door; to enter which you must get into a basket, which the Monks have suspended at the window, and occasionally hoist up with

death: a power which he exercises without formality or appeal. When he meets with an offence, he orders the criminal to be seized, and the executioner, who accompanies him, strangles him, or takes off his head upon the spot; and sometimes, indeed, he condescends to perform this office himself. The Pacha often walks about in disguise, and woe to that man whom he detects in the commission of a crime, or an error!—But, as he cannot be every where, he has a deputy, called the Wali, who patrols night and day, keeps a watchful eye on the seditious, apprehends robbers; and, like the Pacha, tries and condemns without appeal. The criminal presents his neck; the executioner strikes; the head falls, and the body is taken away in a leathern sack. This officer has a multitude of spies, who are generally the associates of thieves, and, from their information, is made acquainted with every thing that passes. We cannot therefore be surprised that cities like Cairo, Aleppo, and Damascus, should be safer than Genoa, Rome, and Naples: but how dearly is this safety purchased! and how many innocent persons are sacrificed to the partiality and injustice of the Wali!

In the markets the Wali inspects the weights and measures, in which he exercises the utmost severity. For the smallest deficiency in the weight of bread, meat, or confectionary, he inflicts five hundred strokes of the bastinado, and sometimes even death. But though examples of this kind are common in great cities, there is no country where false weights are so frequently used. The dealer, however, is generally upon his guard: he usually keeps a sharp look-out for the passing of the Wali, or inspector of the market; and, as soon as they appear on horseback, the deficient weights are laid aside, and others produced. The dealers also make an agreement with the servants who precede these two officers; and for a certain sum they can insure impunity†.

ropes. This plan is adopted from the apprehensions of danger from the Arabs.

† The office of Wali does not extend to those various objects of utility, which are under the regulation of our police. No attention is paid to the cleanliness or the salubrity of the cities. They are not watered, swept, or paved, either in Syria, or in Egypt. The streets are narrow, winding, and incommodious; and travellers are disgusted at the sight of a multitude of hideous dogs, which have not any owner. They form a sort of independent body, subsisting

All the magistrates, or judges, reside at Cairo. The Cadi is seated in his clerks and door of the appeal, and each pleads his ground, the particular demerits of the debates between the cries of the soon restore his pipe, harkens, in pronouncing a sentence are seldom with great length of the lawing at the judgment by the infallible. Such is the Turks; and where individuals respective rights

existing on public shed the blood of dogs, though they even declare that night; but for the gates with which the dogs are besieged by a multitude of the gardens, and

It must be not consume the or subsequent consequences of

All the magistrates of the empire called *Cadis*, or judges, depend on the principal chief, who resides at Constantinople. The title of his dignity is *Cadi-el ask*, or Judge of the Army. This Grand *Cadis* names the judges of the capital cities, such as Aleppo, Damascus, Jerusalem, &c. These name other judges, in the places within their jurisdiction. Money is, however, the principal qualification. All these employments, like those of the government, are sold to the best bidder, and farmed from year to year. The tribunal whence these *Cadis* issue their decisions, is called *Makkama*, or place of judgement. Sometimes it is at their own houses, but never at a place suitable to the dignity of a court of justice. In a paltry mean apartment, the *Cadi* is seated on a mat, or a sort of carpet, with his clerks and domestics on each side of him: the door of the apartment is left open; the parties appear, and, without advocates or attornies, each pleads his own cause. Squatted on the ground, they state the facts, dispute, and contest the particulars, and debate upon the merits or demerits of the cause before them. Should the debates between the parties become too violent, the cries of the clerks, and the staff of the *Cadi*, soon restore order and propriety. Gravely smoking his pipe, and fingering his beard, the judge hearkens, interrogates, and concludes by pronouncing a sentence, without appeal. The parties are seldom very well satisfied; but they retire with great respect, paying a fee estimated at one tenth of the litigated property, without murmuring at the judgment, as it is infallibly dictated by the *infallible koran* *.

Such is the state of jurisprudence among the Turks; and they have no public code existing, where individuals may instruct themselves in their respective rights. The judgments given are

resting on public aims. The Turks, who are so ready to shed the blood of man, are not so forward in killing these dogs, though they avoid touching them as unclean: they even declare that they ensure the safety of the citizens by night; but for this they are more indebted to the Wall, and the gates with which every street is secured. It is also said, that the dogs devour the carrion; but in this they are assisted by a multitude of Jackalls, which are numerous in the gardens, and concealed among the ruins and tombs.

* It must be confessed that this simplicity of justice does not consume the property of the parties in preliminary or subsequent expences, but too many abuses are the consequences of this summary decision. Some writers who

chiefly founded on unwritten customs, or on the unfrequently contradictory decisions of the doctors. The Roman law, in many particulars, has served as a basis for the determinations of the Mahometan Doctors, but the great and inexhaustible source to which they recur, is the most pure book, the depositary of all knowledge, the code of all legislation, the *Koran of the Prophet*.

Whoever reads the *koran*, cannot but confess, that it conveys no notion of the relative duties of mankind in society, the formation of the body politic, or the principles of the art of governing. The only laws we find there, consist of four or five ordinances relative to polygamy, divorces, slavery, and the succession of near relations. The rest is merely a chaos of unmeaning phrases, and emphatical declamation on the attributes of God, from which no valuable information can be obtained; a collection of puerile tales, and ridiculous fables; and on the whole so flat and uninteresting a composition, that no man can read it to the end, notwithstanding the elegance of M. Savary's translation. But should any semblance of meaning be visible, through the absurdities of this delicious effusion, it is the inculcation of the most obstinate fanaticism.

We are wearied with the repetition of the words *impious, incredulous enemies of God and the Prophet; devotion towards God and the Prophet*. Heaven is open to whomsoever combats in their cause; *Houris* stretch out their arms to martyrs; the imagination takes fire, and the proselyte exclaims, "Oh! Mahomet; thou art the messenger of God; thy word is his; he is infallible; thou canst neither err nor deceive me; go on, I follow thee." There is no uncertainty in this book; it guides without error, those who believe without doubting, who believe in what they do not see."

censure the proceedings of our legal decisions, have commended the administration of justice among the Turks; but daily experience sufficiently proves, that there is no country wherein justice is more corrupted than in Egypt, Syria, and the rest of the Turkish empire. Venality is no where more flagrant and bare-faced. The parties may bargain for their cause with the *Cadi*, as they would for any common article of food or raiment. Corruption is habitual and general; and how can it be expected to be otherwise, where integrity may be destructive, and injustice lucrative; where each *Cadi*, deciding without appeal, fears no revision of his sentence, nor punishment for his partiality.

What

What is the tendency of this, but to establish the most absolute despotism in him who commands, and the blindest devotion to him who obeys? And such was the intention of Mahomet. He did not mean to enlighten men, but to rule over them. It was to lead them more easily that he ascribed all to God. By submitting to acknowledge himself his minister, he removed every suspicion of personal interest. "There is only one God," says the Koran, "and Mahomet is his prophet. Pray five times a-day, turning towards Mecca. Eat not in the day time during the whole month of the Ramasan. Make the pilgrimage of the Caaba, and give alms to the widow and orphan." Here is the source from whence must spring all the sciences, and every branch of political and moral knowledge*.

The people of Syria are, in general Mahometans or Christians; and this difference of opinion is productive of the most disagreeable effects. Treating each other as infidels and impious, they are actuated by a reciprocal aversion, which keeps alive a sort of perpetual war. And the government, instead of interposing as mediator in these dissensions, ferments them by its partiality. Faithful to the spirit of the Koran, it treats the Christians with the most persecuting severity†.

These distinctions create much hatred and divisions, and manifest themselves in every intercourse of life. The Mahometans talk perpetually of their religion, and consider themselves as the only faithful to God. The Christians, in their turn, affect great devotion; and hence that ostentation of piety which forms one of the principal characteristics of the orientals.

Commerce, in Syria, is still in that state of in-

* The legislators of antiquity have in vain exhausted their genius to explain the relations of mankind in society, and to point out the several duties of every class. Mahomet, more able and profound, resolves the whole into five phrases; and yet it may safely be asserted, that of all the men who have presumed to give laws to nations, none was more ignorant than Mahomet: of all the absurd compositions that have ever been exhibited, not one can be more truly wretched than this book. Of this, the transactions of the last twelve hundred years in Asia are a proof; for the ignorance of the people, in that quarter of the globe, originate in the Koran and its morality.

† All public worship is prohibited to Christians, except in the Kesraonian, where government has not been able to prevent it. They are not permitted to build any new churches; and when the old ones are in a ruinous state,

fancy which characterizes barbarous ages, and uncivilised countries. Along the whole coast there is not a harbour capable of admitting a vessel of four hundred tons. In the interior parts of the country, there are neither roads nor canals; nor even bridges over the greater part of the rivers and torrents. Between town and town, there are neither posts nor public conveyance. The *Tartar Courier*, who comes from Constantinople to Damascus, by way of Aleppo, is the only convenience of this kind. He leads with him a second horse in hand, and has frequently a companion for fear of accidents.

The communication between one town and another is kept up by carriers, but they have no fixed time of departure. No persons travel alone, from the insecurity of the roads. It is usual to wait for several passengers who wish to go to the same place. It appears remarkable that not a waggon or a cart is to be seen in all Syria: Perhaps their absence may be attributed to the apprehensions of their being seized by the minions of government; and thereby sustaining a very considerable loss at one stroke. Every thing is conveyed on the backs of asses, mules, or camels, all which animals are found here in great perfection: the two former are very capable of employment on the mountains, and of climbing and sliding over the slopes of the craggy rocks. The camel is more used in the plains, because he consumes less, and carries more: his usual load is about seven hundred and fifty pounds: his food is whatever you choose to give him: as straw, beans, barley, brambles, pounded dates, &c. With a pound of food a-day, and as much water, he will travel for weeks together. In going from Cairo to Suez, which is a journey

they are not suffered to repair them without paying a very heavy fine. A Christian cannot strike a Mahometan without the risk of losing his life; but if a Mahometan should kill a Christian, he can escape punishment for a stipulated price. A Christian must not appear on horseback in the town, and they are forbid the use of the yellow slippers, white shawls, and every kind of green colour. Red for the feet, and blue for the dress are the colours assigned them. The Porte has just renewed its ordinances to re-establish the ancient form of their turbans: they must consist of a coarse blue muslin, with a single white border. When they travel, they are frequently stopped to pay a toll, from which the Mahometans are exempt: in law proceedings, the oath of two Christians is reckoned but as one; and it is next to an impossibility for a Christian to gain a suit.

of about forty-six hours, including the time allowed for resting, they neither eat nor drink; but these fastings, often repeated, exhaust the strength of the animals. It is useless to endeavour to force them beyond their usual pace; but by allowing them their proper rest, they will travel from fifteen to eighteen hours a day*.

Coin is of so fixed a value, that you may travel over the whole empire without experiencing any change in its denomination or its value. The most simple of these coins is the *Para*, called also *Medin*, a *Fadda*, a *Kata*, or a *Mefria*. It resembles in size an English silver three-pence, and is worth about five liards, (a little more than a halfpenny). After the *para*, there are a succession of pieces of five, ten, and twenty *paras*. All these coins are silver, but with such a mixture of copper alloy, that the *abou-kelb*, is as large as a crown of six livres, though its value be only four livres five sols, (three and six-pence halfpenny.) They have no image, because of the prohibition of the prophet: but only the cypher of the Sultan on one side, and on the other these words: Sultan of the two Continents. The gold coins are the sequin; called *Dahp*, or piece of gold; and also *Zahr-Mahaboub*, or well-beloved flower. It is worth three piastres, or forty *paras*. There is likewise a sequin, called *Fondoucli*, worth one hundred and seventy *paras*. Besides these Turkish coins, some of the European specie has as much currency; such are the silver dollars of Germany, and the gold sequins of Venice. The Venetian sequins are esteemed for the fineness of their standard, and from their being used in making womens' trinkets: the piece of gold is simply pierced, for the convenience of suspending it by a chain, also of gold, which flows upon the breast. The more sequins there are attached to the chain, and the greater number of these chains, the more does the woman conceive herself ornamented. This mode of embellishment creates much emulation among the ladies. Even the female peasants, in imitation of their superiors, wear piastres or smaller pieces; but the women

of a certain rank disdain silver, and will accept of nothing but sequins of Venice, or large Spanish pieces and crusadoes. The practice of weighing money is general in Syria, Egypt, and all Turkey. No piece, however defaced, is refused there; the merchant draws out his scales and weighs it.

The religion of Mahomet having proscribed every sort of image and figure, there exists neither painting, nor sculpture, nor engraving: nor any of those numerous professions which depend on them. The christians, indeed, purchase, for the use of their churches, some pictures of the Greeks at Constantinople, who, in point of taste, are real Turks. In the second place, many of our trades are rendered unnecessary, from the small quantity of furniture required by the Orientals. The whole inventory of a wealthy family consists in a carpet for the feet, in mats, cushions, mattresses, small cotton cloths, copper and wooden platters for the table, some stewing-pans, a mortar, a portable mill, some porcelain, and some plates of copper tinned: all our cabinet and upholstery work are luxuries totally unknown to them; nothing can therefore be so simple as a Turkish removal. Pocock is of opinion that these customs originated in the wandering life formerly led by the ancestors of these nations. Their clothing is as little complicated, though much more expensive. They are unaccustomed to the hats, perukes, hair-dressing, buttons, buckles, stocks, and all that superfluity with which we are surrounded. Cotton, or silk shirts, which have neither ruffles nor wristbands, nor plaited collars; an enormous pair of breeches, serving also by way of stockings; a handkerchief for the head; another round the waist, with three large folds of cloth and calico, compose the whole wardrobe of the orientals. The only articles of luxury are goldsmith's work, which is limited to womens' trinkets, saucers for coffee, the ornaments of their harness, their pipes, and the silk stuffs of Aleppo and Damascus†.

Cairo is perhaps the only place in Egypt or in Syria

The keeper of the *Kan* furnishes the traveller with a key and a mat; and he provides himself the rest. It is therefore necessary that he should take with him a bed, his kitchen utensils, and even his provisions, for it frequently happens that no bread is to be found in the villages.

† In passing through the streets of the towns, you see nothing but a number of beaters of cotton on tenters, re-

4 H

tailers

* There are no public inns, but the cities, towns, and even the villages, have a large building called a *Kan*, or *caravanserai*, for the use of travellers. These places of reception are built a little way out of the towns, and consist of four wings round a square court, in which the beasts of burden are inclosed. The lodgings are cells, where nothing is found but bare walls, dust, and perhaps scorpions.

Vol. II. No. LXXXIX.

Syria, where there are a few Shaiks, who understand the principles of music: they have collections of airs, written in characters, of which the names are all Persian. They have no music but vocal; for they neither know nor esteem instrumental; and they certainly deserve commendation for it; for such instruments as they have, are detestable. They are strangers to any other accompaniment than the unison, and the continued base of the Monochord. Their performance is accompanied with sighs and gestures, which represent the passions in a more lively strain than we should venture to allow. They have the greatest merit in the melancholy strain.

Dancing, which among us is held in equal rank with music, is not equally esteemed by the Arabs; a man cannot practice it without dishonour; and the exercise of it is only permitted to women. This judgment may appear severe, but before we condemn it, let it be considered, that in the eastern world, dancing is not an imitation of war, as among the Greeks, nor a combination of graceful attitudes and movements, as with us; but a licentious imitation of the wantonness of love. This is the species of dance, brought from Carthage to Rome, and which, since revived in Spain by the Arabs, still subsists there under the title of the *Fandango*. It would be difficult, without wounding the ear, accurately to describe it: it will be sufficient to say, that a female, with her arms extended, and an impassioned air, singing and accompanying her songs with castanets, executes, without changing her place, all those motions of the body which passion itself carefully conceals under the veil of night. So

fallers of stuffs and mercery, barbers, tinners, blacksmiths, sadlers, sellers of little loaves, hard-ware, grain, dates, and sweat-meats; but very few butchers, and those very ill supplied. In the villages, the inhabitants have no arts, but those without which they cannot subsist. Every person endeavours to supply his own wants. Each family manufactures the coarse cottons with which they are clothed: every house has a portable mill for grinding their barley, or their Douira: the flour from these mills is coarse, and the little loaves made of it, ill-leavened, and badly baked; but they preserve life, which seems to be all that is required.

* The Sciences are still more neglected than the Arts: in vain have some persons denied this assertion: in vain do they talk of colleges, places of education, and books. These words in Turkey convey not the same ideas as with us. The age of the Caliphs is past among the Arabs, and yet to begin among the Turks. These two nations have neither geometricians, astronomers, musicians, nor physicians at

extrayagant is their licentiousness, that nothing but prostitutes presume to dance in public. Those who excel assume the name of *Amra*, or proficient in the art: the most celebrated are those of Cairo*.

The scarcity of books, and the want of the means of information, are certainly the causes of the ignorance of the orientals; but the radical source is still in the government, which, so far from encouraging the propagation of knowledge, exerts every effort to stifle it in the birth. Under the administration of the Turks, neither rank nor fortune can be obtained through the channel of the Arts and Sciences, or polite literature. If science therefore, which is acquired with much difficulty and labour, can only make us regret its inutility and even expose us to danger, it is better to be without it†.

The situation of the women among the orientals, occasions a great contrast between their manners and ours. Such is the delicacy of the men, that they never speak of them; and it would be extremely indecent to make any enquiries of the men respecting the women of their family. They are astonished that our women go with their faces uncovered, when, in their country, an uplifted veil, is the demonstration of a prostitute, or is a signal for a love-adventure. They have no idea that it is possible to talk with them, and touch them without emotion, or to be alone with them without proceeding to the last extremities. This conduct will sufficiently shew what opinion they entertain of their females; hence we may instantly conclude that they are absolutely ignorant of love, in our sense of the

present. Scarcely can we find one of the latter who knows how to bleed with a fleam. How, indeed should physicians be so formed, as there are no establishments of the kind, and anatomy is repugnant to the prejudices of their religion? Astronomy might gain more admirers, but by Astronomy they mean only the art of discovering the decrees of fate by the motion of the stars.

† When an European arrives in Syria, or any part of the eastern world, he is astonished at the exterior of the inhabitants: it seems as if some premeditated design had determined to produce an infinity of striking contrasts between the people of Asia and those of Europe. With us, to uncover the head is a mark of respect; with them, a naked head is the emblem of folly. We salute in an inclined posture; they erect. They sit, and eat upon the ground; we upon raised seats. Their manner of writing is also contrary to ours; and most of our masculine nouns are feminine with them.

the causes of depop
least considerable,
themselves with a

word. Lovers there are prisoners, ever watching to deceive their keepers, and always anxious to seize the first opportunity, because they know not when another may happen. Should they happen to succeed in an amour, they are as secret as the grave, knowing the fatal consequences of a discovery: in these cases it is hardly possible to avoid the poignard, pistol, or poison. Its destructive consequences to the women render them implacable in punishing; and, to revenge themselves, they are often more cruel than their husbands or their brothers.

This severity tends to preserve chastity and decorum in the country; but in the great towns, as much debauchery prevails as among us; but it is more concealed. Aleppo, Damascus, and Cairo, are not, in this respect, behind our provincial capitals. Young girls are reserved there, because the discovery of a love adventure would cost them their lives; but married women freely devote themselves to pleasure, to indemnify them for the long restraint they have endured, and because they have frequently just reasons for regarding themselves on their masters.

The Turks are much censured for hastening their marriages so much as they do: it is not uncommon to see girls of nine or ten years of age, married to boys of twelve or thirteen: but it must be confessed that the apprehensions of libertinism, and the severity with which that is punished by the Turkish police, greatly promote these premature unions, which is certainly one of the causes of their early impotence. The ignorance of the Turks is so extreme, that they uniformly endeavour to force nature, at the very time that their health is impaired by excess. This also is to be ascribed to the Koran, in which the amorous prophet has inserted a precept inculcating this species of duty*.

From what we can learn of the domestic life of those husbands who have several wives, their lot is not to be envied, nor does it convey a very exalted idea of this part of Mahomet's legislation. Their house is a perpetual scene of riot, tumult, and contention. Nothing occurs but bickerings

* Montesquieu has justly assigned polygamy as one of the causes of depopulation in Turkey; but it is one of the least considerable, as there are few but the rich who indulge themselves with a plurality of women; the common people,

and quarrels between the different wives, and complaints and appeals to the husbands. The wives, having been legally married, complain that their slaves are preferred to them, and that they are persecuted from the jealousy of their mistresses. If one wife is complimented with a trinket, a token of favour, or permission to visit the bath, all the others require the same tokens of attention, or suppose themselves extremely slighted. To restore peace, the polygamist finds it necessary to assume the tone of a despot, and from that moment he meets with nothing but the sentiments of slaves, the appearance of fondness and real hatred. In vain does each of these women protest she loves him more than the rest; in vain does she fly on his entering his apartments, to present him his pipe and his slippers, to prepare his dinner, and to serve his coffee: in vain, while he is indulgently stretched out upon his carpet, does she assiduously chase away the flies which incommode him; all these attentions and caresses serve only to procure an addition to their trinkets and movables, that, if he should divorce them, they may have it in their power to tempt another husband, or find a resource in what becomes their own property. Like mere courtizans, they think only of stripping their lover before he quits them; and this lover, experiencing indifference or disgust, teased by pretended fondness, and debilitated by satiety, must be far from enjoying an enviable situation.

The contempt entertained by the Turks for their women, arises from this concurrence of circumstances, and is evidently produced by their own customs: for how should the women retain that exclusive love, which renders them most estimable, when so many share in the affections of their husband? How should they have the manners requisite to make them amiable, when no care whatever has been taken of their education? The Greeks, who are permitted to have but one wife at a time, enjoy domestic peace, though perhaps they approach no nearer to real happiness.

and especially those of the country, are satisfied with one. Even among the higher ranks, persons are sometimes to be met with, who are wise enough to imitate their example, and acknowledge that one wife is quite sufficient.

TRAVELS THROUGH SPAIN.

KNIGHT AND BARON OF THE SACRED ROMAN EMPIRE:

ILLUSTRATED WITH

NOTES AND OBSERVATIONS.

FROM

A TOUR THROUGH SPAIN AND PORTUGAL, in 1803.

BY

CHRISTIAN AUGUSTUS FISCHER.

CHAPTER I.

*General Division of Spain—Itinerary from Bayonne to Rampeluna, and from thence to Madrid.—
A Mine of Sal Gem at Valtierra described.*

THE dominions of Spain are generally classed by their writers in the following order: the kingdom of Spain, consisting of Old and New Castile; the kingdoms of Leon, Arragon, Navarre, Granada, Valencia, Galicia, Seville, Cordova, Murcia, Jaen, and Majorca; the principalities of Asturias and Catalonia, the provinces of Estremadura, Guipuscoa, and Alava, and the lordships of Biscay and Molina: they are bounded by the Bay of Biscay on the north, by the Pyrenees and the Mediterranean on the east, by the streights of Gibraltar and the Mediterranean on the south, and by the Atlantic Ocean on the west: lying between 36 and 43 degrees of north latitude; and between 8 and 22 degrees of east longitude from Ferrol.

The Pyrenean mountains are the highest in Spain, extending from the ocean to the Mediterranean, several others branching out, as from their root, such as Mount Idubeda, (now called Montes de Oca) the Orbion, Moncayo, the Puerto de Pajares, or pass from Castile to Asturias, the Puerto de Guadarrama, which separates the two Castiles, that of Molina, of Cuenca, of Confuegra, Alacarez, Segura, Cazorla, and the Montes Marianos, (now called Sierra Morena;) the Puerto del Rey, which commands the

communication between Castile and Andalusia, and the Puerto del Muradal, where lies that famous pass called the Navas de Tolosa, celebrated for the victory obtained there in 1212, over the king of Morocco, and other passes of less note.

Amongst the rivers, the Ebro has its source near Fontibre, six leagues from Aguillar del Campo, passes by Logeens, Viana, Calahorra, Tudela, Saragossa, Mequinezza, and Tortosa, and a little lower falls into the Mediterranean at the Alfaque Islands.

The Guadalquivir has its source in the Sierra de Segura, passes by Beas, Baeza, Andujar, Cordova, Loxa, and Seville, and enters the ocean at San Lucar de Barrameda, receiving in its course the waters of the Guadalbullon and Genil.

The Tagus rises in the Sierras near Albarracin, passes by Zurita, Aranjuez, Toledo, Almaraz, Alcantara, Abrantes, Santarem, and Lisbon, where it is three miles broad, and enters the ocean, having the tide as high as Santarem, and receiving in its course the waters of the Jarama, Manzanares, Guadarrama, Alberche, and others.

The Guadiana rises about four leagues from Montiel, in the Laguna Ruydera, and after running under ground appears again near Damiel at the lakes or lacques called *Ojos de Guadiana*, "the

the eyes of Guadiana," then passes by Calatayud, Cuidad Real, Medellin, Merida, Badajoz, and Ayamonte, where it falls into the ocean, after running for some time in Alentejo, in Portugal, and separating that kingdom from Spain, leaving Castro Marin of Portugal on the west, and Ayamonte on the east.

The Duero rises in the Sierra of Orbion, and passes by Soria, Almazan, Osma, San Estevan de Gormaz, Aranda de Duero, Roa, Simancas, Cardenas, Toro, Zamora, Miranda de Duero, and enters the ocean at Oporto, receiving the rivers Eresma, Adaja, Pisuerga, Ezla, Tago, and others.

The Minho has its source in Galicia, near Castro del Rey. It runs south west, and passes by Lugo, Orense, and Tuy, after which it divides Galicia from Portugal, and falls into the Atlantic at Caminha.

Other smaller rivers are also worthy of notice, such as the Segura, Guadalquivir, Lobregat, Guadiana, Vidaso, Tinto, Guadalquivir, &c.

Spain may be said to enjoy a temperate and healthy air, neither so cold as the northern regions, nor so burning as the scorching heats of Africa, and abounds in cattle, game, fowl, corn, wool, silk, wax, honey, excellent wine, brandy, oil, and sugar, all kind of fruit and pulse, aromatic herbs and plants, the finest of oaks, quarries of marble, alabaster, jasper, and other precious stones; mines of silver, lead, copper, iron, mercury, antimony, and cobalt: in short, every natural advantage tending to the pleasure and happiness of mankind.

The territories of Spain are said to contain 25,000 square leagues*. According to returns made to the Count de Aranda, in 1768, the general population of the whole, including the Canaries and Mediterranean islands, amounted to about nine millions: in 1778, it was further calculated to be between ten and eleven millions, and supposed to be increasing.

Quitting Bayonne, I proceeded on my journey towards Spain, and travelling through an uneven country, began to perceive a species of slaty stone which announced the vicinity of the Pyre-

nees, about half a league distant. The environs of Anoa are mountainous. The farmers manure the ground with lime to sow maize or Indian corn, laying on a greater quantity for wheat, without which it yields nothing, which proves the necessity of this method to cherish and expand the tough and cold soil in mountainous countries.

Half a league from Anoa, a rivulet forms a boundary between France and Spain. The country is covered with fern, which they cut and heap in piles, till it rots and serves for manure. You next pass a Carthusian convent at the foot of a high mountain, chiefly of quartz†, whose summit is a rock of purplish sand, and from thence descend to the first village in Spain called Maya, seated in a valley where they have good crops of maize and turnips, and whose soil, though not calcareous, produces equally the same kind of plants; such as the alder, henbane, nightshade, swallow wort, figwort, thorn-apple, hawthorn, and bullace tree. After passing the village of Elizondo, and traversing the vale, I ascended a mountain of blueish lime rock, with fine beech towards the top, its sides lined with many other trees, such as alder, hawthorn, and hemlock. This mountain is one of the highest in this country, upon which is an inn, called Venta de Belate, not far from the top of the mountain.

From the mountain de Belate, it is an easy descent into another vale well cultivated with vines and corn, which extends as far as the city of Pampeluna, capital of the kingdom of Navarre. In this vale there is a wood of stately oaks, with plenty of box, thorn-tree, wild roses, and other common plants of cultivated countries. You keep constantly on the borders of a rivulet, running amongst round sand stones of a purple colour, similar to those on the other side towards France.

In this plain it is clearly seen how the limy rock decays, for in an almost perpendicular fissure above an hundred feet high, the earth which at first sight, and even to the touch, appears to be clay, is nothing more than limy earth, mixed

* The Spanish league is 7680 varas. 17 Spanish leagues make one degree, equal to 20 French leagues.

Three Castilian feet make one vara of Castile, whose length is about 33 inches English.

† Quartz is a hard vitrifiable stone something interme-

diate between rock crystals and flints, or opaque vitrifiable stones, well known to metallurgists, mineralogists, and miners. According to Cronstedt, it is easier to be known than described.

with a small portion of clay, the result of rotten plants as I experienced with the acid I always carry with me whenever I travel *.

Leaving Pampeluna, I traversed a champaign country for two leagues and a half to the mountain opposite, which having passed, a variety of cultivation takes place. Some limy rocks are so barren, that nothing is to be seen but butchers broom, a few oaks, juniper, and lavender, for two leagues and a half further, when I arrived at the city of Tafalla; then passing an extensive plain full of aromatic plants, had five leagues to Caparrosa †.

From Caparrosa I crossed a high hill where any miner might mistake the strata of gypseous stone, which is only one or two inches thick, for spar, but you may dig as deep as you please, and never find anything but gypsum, which is very seldom seen where there is mineral. The country is every where barren and miserable, a perfect desert without water, and nothing but rosemary, lavender, and a few starved oaks. After quitting this wretched district, a fertile plain opens to the eye, supplied by wheels with water from the Ebro.

From Caparrosa it is four leagues to the Ebro, in a plain bordered by a chain of hills from east to west, composed of limy earth mixed with gypseous stone, sometimes in strata, granulated, or in masses, white as snow. This chain extends about two leagues, and towards the middle, where it is the highest, stands the village of Valtierra: about half way up, there is a mine of fossil common salt, which being transparent and resembling chrystal, goes by the name of sal gem, and is seen above ground where the shaft is made at the entrance of the mine. About twenty paces

* The same sort of earth, of a bluish colour, is found near Pampeluna, but harder, and so very hard in a hill opposite to the city, as to deserve the name of stone, disposed in strata with the same obliquity as the fissure above-mentioned, all which proves the decomposition of the rocks.

† This plain may be thrown into four divisions, the first from Tafalla being olive trees, the second vineyards, the third corn fields, and the fourth barren, except a few olive trees, and some corn fields near Caparrosa, where a hill divides the plain, and now and then, the rounded purple stone shows itself again the same as in France.

‡ If this were the case, the beds would not be undulated in this manner, resembling those of coal at Chamond, near Lyons, in France, or those of Asphaltos, in Alsace, that follow the elevation and declivity of the hills or vallies, the

within, one observes that the salt, which is white and abundant, has penetrated into the very beds of gypseous stone. This mine may be about four hundred paces in length, with several lateral shafts, upwards of eighty paces, supported by pillars of salt and gypsum, which the miners have very judiciously left at proper distances, so that it has all the appearance of a gothic cathedral. The salt follows the direction of the hill, inclining a little to the north, like the strata of gypsum, being comprised in a space about five feet in height without variation, and seems to have corroded several beds of gypsum and marl, and insinuated itself into their place, though much of those substances still remain.

At the end of the principal shaft, the miners have carried out a branch to the right, where the saline bed appears to have followed exactly the inclination of the hill, which in that part is very perpendicular: this stratum of salt descends to the valley, and goes on to the opposite hill; which regularity destroys the system of those who pretend that sal gem is formed by the evaporation occasioned by subterraneous fire †.

The strata of saline earth are of a dark blue, but those of salt are white. This mine is of a great elevation with respect to the sea, for you always go up hill to it from Bayonne, excepting those casual descents which are inseparable from mountainous countries.

It is a continual ascent from Valtierra to Agreda, the first town in Castile, on the top of one of the highest mountains in Spain, called Moreays, whose rocks so decompose into earth, as to be covered with plants, deserving the attention of a botanist, from the great variety thence afforded to the vegetable kingdom. From Agre-

bitumen often floating on the water when it meets with it. I am of opinion that salt grows in the mine like minerals, that coal is the product of fossil wood, as appears from such remnants as are found in the mines, and that the asphaltos is produced by the water of some spring. I examined attentively these strata of salt; comparing them with the matter in which they are embedded. I observed the roof to be of gypsum, with aromatic plants, then two inches of white salt, separated from the gypsum by a few threads of saline earth, then, three fingers breadth of pure salt, with two of stone salt, and a coat of earth next another bluish bed, followed by two inches of salt; and lastly, other beds alternately of earth, and crystalline salt to the bed of the mine, which is gypseous stone undulated like the rest, descending to the valley, and rising on the opposite hills.

the country is well cultivated to Hinojosa, without any trees or plants, as far as Abmeriz, and forwards to Abmazan, on the banks of the Dicro: examining this district, which produces wheat and barley, I discovered lime rock at a few feet from the surface, which for a great extent has an outward coat of sandy soil with quartz and sand stone totally different from the bottom, which gives it the appearance of a foreign matter brought from a distance. The phenomenon is singular, and those who are fond of hypotheses have here an ample field to employ their imagination.

Leaving Almazan you rise upon an eminence which affords an extensive prospect, the country at a distance having the appearance of a plain, the eye not being able to catch the many irregularities of ground. After some leagues of uncultivated land, the country improves; three leagues and a half further, I came to Paredes, and crossing a barren plain arrived at Baraona, then passing over the steep hill of Atienza; the confines of the two Castiles, I came in five hours to Xadraque, and four leagues further, to Flores; about half way, there is a place where there are hills with great clefts; one evidently sees they were caused by the rains which carry away the limy earth, and that all that country had been a plain, for the parts that remain without gullies, have a bottom of hard rock, and in proportion as the water makes its way through, they form gullies*.

In passing this road, you go through a wood of scarlet oak, whose leaves are covered with the

gall insect, and on coming out of the wood, find a well cultivated country with vineyards, corn-fields, and plenty of lavender, thyme, lavender cotton, and sage; then passing by the village of Hita at the foot of a pyramidal hill, rearing its lofty crest above the others, like a great rock in the sea, with an old Moorish castle on its summit.

Having crossed the river Henares you enter a fertile plain with a great deal of small grained sandy pebbles. It is remarkable that on entering New Castile, stone of this kind is always found, even in hills of limy earth: after passing a range of cultivated hills I arrived at the famous city of Alcala de Henares, with an university founded in 1449, by that great statesman, Cardinal Ximenez de Cisneros, who also endowed it with a good library, and printed here, at his own expence, the first polyglot bible, known by the name of Complutensian. The university is a handsome structure, Ximenez is buried in the church with an elegant monument, by Dominico of Florence. The medallion of the Cardinal has been removed from the tomb into the library.

Alcala is only six leagues from Madrid, and belongs to the Archbishop of Toledo; it gave birth to Miguel Cervantes de Saveedra, the celebrated author of the much admired romance of Don Quixote. The country around is bleak, owing to the singular aversion which the Castilians have in general to the planting of trees. Nothing further occurred between this place and Madrid, the environs of which will be described on another occasion.

CHAPTER II.

Of the Merino Sheep—Miscellaneous Observations made at Madrid, with some Account of the Royal Cabinet of Natural History.

THE wool of Spain forms a considerable branch of our commerce with that country. It has even been said that its fine quality was originally owing to a few English sheep sent into Spain, as a present by our Henry the Second, or according to others, by Edward the Fourth, in

1465; but without entering into fruitless investigations of an event so remote, and of so little consequence, I shall confine myself to speak of those remarkable sheep known in Spain by the name of *Ganado Merino*, "The Merino flocks," and describe the constant method of conducting

* I saw some just beginning, with a likelihood of rising into hills in the course of twenty years; from whence I conjecture, that if some hills give way, and crumble into

plains; others, in the course of time by the motion of waters, gradually form themselves into mountains.

those

those numerous tribes from the northern to the southern provinces, to which they attribute that peculiar fine quality of the wool, which has rendered it so famous all over Europe.

There are two sorts of sheep in Spain, some that have coarse wool, and are never removed out of the province to which they belong, and others, that after spending the summer in the northern mountains, descend in the winter to the milder provinces of Estramadura, and Andalusia, and are distributed into districts, which go by the name of *Merindales*. These are the Merino sheep, of which it is computed there are between four or five millions in the kingdom*. The word Merino, signifies a governor of a province. The Merino mayor is always a person of rank appointed by the king. They have a separate jurisdiction over the flocks in Estramadura, which is called the *Mexla*, and there the king in person is Merino mayor †.

Each flock consists generally of ten thousand sheep, with a *Mayoral*, or head shepherd, who must be an active man well versed in the nature of pasture, as well as the diseases incident to his flock. This person has under him fifty inferior shepherds, and as many dogs, five of each to a tribe. The principal shepherd has a hundred pistoles (about £75) and a horse every year. The other servants have 150 rials for the first class (1£ 13s. 9d.) 100 rials for the second class, (£1 2s. 6d.) 60 rials for the third class (13s. 6d.) and 40 rials, or nine shillings for the other attendants. Each of these has an allowance of two pounds of bread a day, with the same quantity of an inferior sort for the dogs. They are likewise permitted to keep goats, and a few sheep, of which they have the meat, and the lambs, pro-

	Sheep.
* The Duke of Infantado's flock about	40,000
Countess Campo de Alense Negretti	30,000
Paular, and Escorial convents, 30,000 each	60,000
Convent of Guadalupe	30,000
Marquis Perales	30,000
Duke of Bejar	30,000
Several flocks of about 20,000 each	200,000
All the other flocks in the kingdom together, on an average about	3,800,000
	4,220,000

In 1778, the wool of Infantado was 9285 arrobes in the grease, and Negretti nearly the same. Washed wool, coarse and fine together, worth at an average, eight and a

vided the wool remains, for their master. They may do what they please with the milk, of which they seldom make any advantage. In the months of April and October, each shepherd has twelv rials given him (about 2s. 9d.) as a perquisite previous to his journey.

Though these flocks divide and separate themselves over several provinces of Spain, it will be unnecessary to relate what passes in each, their government being similar and uniform. The places where they are to be seen in the greatest numbers are in the Montana and Molina de Aragon in the summer, and in the province of Estramadura, the Montana is to the north, and the most elevated part of Spain; Estramadura abounds with aromatic plants, but the Montana is entirely without them.

The first care of the shepherd in coming to the spot where they are to spend the summer, is to give to the ewes as much salt as they will eat; for this purpose they are provided with twenty-five quintals of salt for every thousand heads, which is consumed in less than five months; but they eat none on their journey, or in winter. The method of giving it to them is as follows: The shepherd places fifty or sixty flat stones about five steps distant from each other; he strews salt upon each stone, then leads his flock slowly through the stones, and every sheep eats at pleasure. This is frequently repeated, observing not to let them feed on those days in any spot where there is lime-stone. When they have eaten the salt, they are led to some argillaceous spots, where from the craving they have acquired they devour every thing they meet with, and return again to the salt with redoubled ardour †.

At the end of July each shepherd distributes half rials vellon per lb. (about 2s.) exclusive of duties, which are 20 per cent. on exportation.

There is a curious discourse on the wools of Spain in the second volume of the Spanish correspondence of Lord Sandwich, Lord Sunderland, and Sir William Godolphin, in a book entitled, *Hispania Illustrata*. London, 1772.

† There is a supreme council at Madrid called *Consejo de Mexla*, which takes cognizance of all matters relating to sheep, wool, shepherds, pastures, woods, and all concerns that belong to royal seats and parks.

‡ Mr. Bowles observes, that if the district is limy or marshy, the sheep eat less salt in proportion to the lime they find, and asking the reason of one of the shepherds, was told it proceeded from their grazing in corn fields, on which occasion the illiterate shepherd seemed to relate the fact

fact is limy or due to the lime the shepherds, corn fields, on to relate the fact

The rams amongst the ewes, five or six rams being sufficient for an hundred ewes. These are taken out of flocks where they are kept apart, and after a proper time are again separated from the ewes.

The rams give a greater quantity of wool, though not so fine as the ewes, for the fleeces of the ram will weigh twenty-five pounds, and requires five fleeces of the ewes to give the like weight. The disproportion in their age is known by their teeth; those of the ram not falling before the eighth year, while the ewes, from their delicacy of frame, or other causes, lose their's after five years.

About the middle of September they are marked, which is done by rubbing their loins with ocre diluted in water; some say this earth incorporates with the grease of the wool, and forms a kind of varnish, which protects them from the inclemencies of the weather; others pretend that the pressure of the ocre keeps the wool short, and prevents it from becoming of an ordinary quality; others again imagine, that the ocre acts in the nature of an absorbent, and sucks up the excess of transpiration, which would render the wool ordinary and coarse.

Towards the end of September these Merino flocks begin their march to a warmer climate; the whole of their route has been regulated by the laws and customs, time immemorial. They have a free passage through pastures and commons belonging to villages, but as they must go over such cultivated lands as lie in their way, the inhabitants are obliged to leave them an opening ninety paces wide, through which these flocks are obliged to pass rapidly, going sometimes six or seven leagues a day in order to reach open spots, less inconvenient, where they may find good pasture, and enjoy some repose. In such open places they seldom exceed two leagues a day, following the shepherd and grazing as they move on. Their whole journey from the Montana, to the interior parts of Estremadura, may be about one hundred and fifty leagues, which they perform in about forty days.

The first care of the shepherd is to lead them to the same pasture where they have been the

fact though ignorant of the cause, which was, according to Mr. Bowles, "from the salt and limy matter abounds with, and partaken of by cattle, either in licking the stones, or communicated by vegetation to grass; for which reason their appetite is not so keen for any salt that is offered

winter before, and where the greatest part of them were reared. The next business is to order the folds, which are made by fixing stakes, fastened with ropes one to the other, to prevent their escape, and being devoured by the wolves, for which purpose the dogs are stationed without. The shepherds build themselves huts with stakes and boughs, for the raising of which, as well as for fuel, they are allowed to lop off a branch from every tree. This law is the cause of so many trees being rotten and hollow, in places frequented by these flocks.

In April the time comes for their return to the Montana, which the flock expresses with great eagerness, by various movements and restlessness, for which reason the shepherds must be very watchful, lest they make their escape, which often happens when proper care is not taken, and whole flocks have sometimes strayed two or three leagues, while the shepherd was asleep, as on these occasions they generally take the straightest road to the place which they came from.

The first of May they begin to shear, unless the weather is unfavourable; for the fleeces being piled one above the other, would ferment in case of dampness, and rot; to avoid which, the sheep are kept in covered places to shear them more conveniently; for this purpose they have buildings that will hold twenty thousand at a time, which is the more necessary, as the ewes are so delicate, that if immediately after shearing they were exposed to the chilling air of the night, they would certainly perish.

Between fifty and sixty thousand bags of washed wool are annually exported out of Spain. A bag generally weighs eight arrobes, or 194 pounds English. About twenty thousand bags of this wool are sent annually to London and Bristol, worth from £30 to 35 each, so that we have one-third of the produce, and of the best sort. The wool of Paular, which is the largest, though not the best, is reserved for the king of Spain's manufactories. The common and shooting dresses of the royal family of Spain and their attendants, are made of the cloth of Segovia, from whence our English nobility, in Henry the VIIIth's time were supplied with fine cloth*.

them;" however, we cannot admit this to be the true cause, as chemists are now well assured that lime does not contain any salt whatever.

* Breadth of Spanish cloth made at Segovia 1½ the ours, or 57½ inches English.

The crown of Spain receives annually, by all duties together on exported wool, nearly sixty millions of reals vellon per annum (£675,000.)

The town of Madrid is now become the capital of the monarchs of Spain, situated in the center of their dominions, and from one of the filthiest places imaginable, is at present on a par for cleanliness with several principal cities of Europe, being likewise well paved and lighted, but in respect to population, it is far inferior to London, Paris, or Naples. Madrid is in a high situation; all the rivers and brooks in its neighbourhood fall into the Tagus, whose waters roll down to the ocean. The Guadarama mountains, to the north west of the town, are covered with snow several months in the year, which added to the piercing north winds, that reign in the winter, renders it excessively cold, while in summer the southern and westerly blasts are generally attended with dampness and rain. Travellers have told us, that the air is so subtle, that if a dead dog was thrown into the streets over night, he would not have a bit of flesh on his bones in the morning, but this is a fable, as it is a known fact, that dead dogs and cats lie in the streets continually, as well as dead mules, close to the road side, for days together, without any such effect.

The principal streets of Madrid are paved with cut flint, the others with pebbles, found in the neighbourhood, the cut flint on account of its sharpness is very inconvenient to foot passengers, and the flat pavement near the houses is too narrow. The town is well supplied with water, and there are conduits in the principal

* Mr. Bowles has observed, that if that celebrated professor, Mr. Henckel, had come to Madrid, he would soon have been convinced of his error, in saying that flint was not to be found in strata, and only in detached lumps, or in masses; for here he would find all the environs replete with strata of flint; and moreover not a house or a building, but what has been constructed with lime made of flint, which serves for fire arms, as well as for the pavement. In some places pieces are found of it full of a species of agate, streaked with red, blue, white, green, and black, that take a very good polish, but these colours are accidental, and disappear by calcination. No acid will dissolve it, or cause any effervescence; when calcined, it burns in the water with more violence than true limestone, and mixed with the pebble or coarse sand near Madrid, makes an excellent material for building, though it does not answer so well with the fine sand of the river.

† Nothing can be more bleak and dismal than the general aspects of the country round the seat of its monarch, with

streets; that called Del Barro, in the neighbourhood of the town, is constantly drunk by the royal family wherever they are. The bread is white and good, and the Plaza Mayor, or principal square, where the market is kept, is extremely well supplied with all manner of provisions.*

In the environs of Madrid there are about two hundred villages, but few can be seen on account of the inequality of the ground, the country being broken up by continual gullies, and various changes of aspect, occasioned by torrents, and other casual accidents, in a country little cultivated, and abandoned to every vicissitude of season. Near the town they chiefly sow barley, and here and there have some trifling vineyards. Their tillage is much the same as in Old Castile, that is, just to scratch up the earth, and scatter the seed at random, then to cover it over with a similar indifference, and wait for the coming of the poor labourers from Galicia, to get in their harvest. The farmers pretend that if they were to make use of a stronger plough, they should have less corn †.

The royal cabinet of Natural History, at Madrid, was opened to the public by his Majesty's orders in 1775; a handsome house having been purchased, of which the first floor was appropriated for the Royal Academy of San Fernando, and the second for the purpose of receiving an ample collection of natural curiosities, which had been collected in Paris by Don Pedro Davila, a native of Peru, which his Majesty has accepted of, and appointed him director thereof; and was also at the charge of

a great want of trees, to which the Castilians have such a dislike, from a false notion that they increase the number of birds to eat up their corn; as if this reason would not hold good in other countries, where shade is not so necessary, as it is in Castile, to support the moisture of the soil; or that it was ever an objection in Valencia, a kingdom so fertile and wooded: the Castilians not reflecting, that the seeds of plants, and leaves of trees, afford nurture for insects, and birds, and prevent them from destroying the grain as they do in Castile, for want of other food; besides the advantage of screening the earth in hot weather, and preserving a due moisture after dews and rain; for without their aid, the scorching beams of the sun parch up the earth, and renders it unfruitful; so that what little comes up is devoured by birds, in a climate where nature seems to have designed it should be otherwise; for the climate of Madrid is not in itself averse to the propagation of trees, as may be seen by the public walks, and modern improvements and plantations.

bringing

bringing them from Paris. Every thing is ranged with neatness and elegance, and the apartments are opened twice a week for the public, besides being shewn privately to strangers of rank.

The collection of beasts and birds is not large. They have, among other curiosities, the great Ant Bear from Buenos Ayres, the Myrmecophaga Jubacta of Linnæus, called by the Spaniards *Osa Palmira*, which was alive at Madrid in 1776, and is now stuffed and preserved in this cabinet. The people who brought it from Buenos Ayres, say, it differs from the ant-eater, which only feeds on emmets and other insects; whereas this would eat flesh, when cut in small pieces, to the amount of four or five pounds. From the snout to the extremity of the tail this animal is two yards in length, and his height is about two feet. The head very narrow, the nose long and slender. The tongue is so singular, that it looks more like a worm, and extends above sixteen inches. His body is covered with long hair, of a dark brown, with white stripes on the shoulders; and when he sleeps he covers his body with his tail.

The mineral part of the cabinet, containing precious stones, marbles, ores, &c. is very perfect. Amongst other curiosities they have a mass of gold 22 carats, which weighed sixteen marks, four ounces, four ochavos, Spanish weight, found in California, and sent by the viceroy of Mexico as a present worthy of his Majesty's acceptance; also several curious specimens of silver ore, from the Guadalcanal mine in Extremadura, of that sort called *Rostler*.

Specimens of Mexican and Peruvian utensils, vases, &c. in earthenware of that kind, which the Spaniards call *Barra*, wretched both in taste and execution. Some productions likewise of Otahite, which the Spaniards call *amath*.

A curious collection of vases, basons, ewers, cups, plates, and ornamental pieces of the finest

* Were painting and sculpture my objects, this would be the place to describe the many fine pictures in the royal palace, and in the noblemen's houses at Madrid; but I pass them over the more readily, as modern travellers have described the most beautiful of these pictures. I shall just observe that a late writer who spent some time at Madrid, speaking of the church of the Visitation, called *Las Salesas*, where the late king Ferdinand and his queen are interred, tells us, that at the principal altar, there is a fine copy of Raphael's Transfiguration; whereas it happens to be a good picture of the Visitation, in allusion to the name of the church, and done by Francisco de Murota Naples. It is true a most excellent copy of Raphael's transfiguration may

agates, amethysts, rock crystals, &c. mounted in gold, and enamel, set with cameos, intaglios, &c. in an elegant taste, and the most delicate workmanship, said to have been brought from France by Philip *.

That beautiful equestrian statue of Philip the IVth, by Tacca of Florence, which stands in a little flower garden of the Retiro, is worthy of the highest admiration. The attitude of the horse is surprisingly bold, with both his fore feet in the air; and was imitated from a picture of Velasquez, sent to Italy for that purpose. When seen by the Florentine artists, they all agreed it was impossible to execute it; however Tacca with the assistance of Galileo happily applied the principles of equilibrium, and succeeded beyond expectation. This unfortunate artist died soon after of grief from the treatment he received from the grand duke's minister, concerning this statue, but his eldest son Ferdinand came to Madrid, and fixed the parts together, which were three in number, and placed the statue properly. Six hundred and fifty-six quintals of 128lb. of metal each, were employed in the casting. Its height, including the pedestal, is 84 palmos (19 feet 9 inches English †) In an inventory of the effects of the Retiro, it was valued at forty thousand pistoles (£23,000) an enormous sum, and much more than it could ever have cost. It was proposed a few years ago to remove this statue to some more conspicuous place, but it was said to have been objected to by the then prime minister, Marquis de Grimaldi, alledging that they must not pay any attention to the house of Austria, but he would have no objection if the head of Philip could be changed for that of Charles the IIIrd.

Tacca also finished the equestrian statue of Philip the IIIrd, in the Casa del Campo, left imperfect by John de Bologna at his death, and

was seen at another church belonging to the convent of St. Teresa, placed there by the founder, the Prince de Astillana, who considered it as an original of Raphael, and valued it at ten thousand pistoles (about £700) It is supposed to have been done by Julio Romano, the ablest and favourite scholar of Raphael. The same writer speaking of the pictures in the palace of Buen Retiro in the saloon, named *De los Reynos*, calls one picture "Santa Cruz succouring Geneva;" whereas it is the surrender of Genoa to that officer, being placed amongst other historical pieces of the times, which are termed by him, "Scripture subjects of the Old Testament."

† A Spanish palmo is eight inches and a quarter.

was

was brought to Madrid in 1616, by Antonio Guidi, brother-in-law to Tacca, attended by Andrew Tacca, another brother of the sculptor, who brought with him the gilt crucifix fixed on the altar of the Pantheon at the Escorial. The mention of the Retiro has naturally led me into the agreeable gardens of that palace, and to the menagerie, where, among other curiosities, they

have a crested falcon from the Carraccas. The curious bird, which is about the size of a turkey, raises the feathers on his head in the form of a crest, and has a hooked bill; the lower mandible rather straight; his back, wings, and throat black, the belly white, the tail distinguished by four cisereous, and parallel stripes, and is an undescribed bird not taken notice of by Linnaeus.

CHAPTER III.

Description of the Palace and Gardens of Aranjuez—The Royal Seat and Gardens of St. Ildefonso with some Account of the City of Segovia.

THE royal seat of Aranjuez, seven leagues distant from Madrid, and to which a most noble road has been made, is delightfully situated at the conflux of the rivers Tagus and Jarama; which run through the gardens, and add new beauty to this charming spot, where art and nature seem to go hand in hand with the most pleasing and rural simplicity. On one side, five avenues of stately oaks and lofty elms convey the truest ideas of magnificence, while they afford the most reviving shade; on the other, the sudden transitions to lawns and wilderness, the cascades of water breaking through the thickets, the tuneful songs of numberless birds, sheltered in these cool recesses, the occasional appearance and passage of the monarch, attended by the grandees of his kingdom; all these objects united, and concentrated in one point, fill the imagination with pleasing ideas, and impress the mind of a traveller with a thousand agreeable sensations, particularly in the spring, when every thing is in high bloom and perfection, and engage him to look at Aranjuez as one of the most beautiful places in Europe.

The whole of these gardens may be thrown into three grand divisions, distinguished by the names of *La Huerta Valenciana*, *Los Delfines*, and *El Cortijo*. In the *Huerta Valenciana* agriculture and gardening are carried on in the same manner as in that fruitful province, and they plough with horses. In the *Cortijo* they use oxen, as in Andalusia; and in other places they scratch up the ground with mules, as is still practised in some parts of Spain. Whichever way one looks round, a constant variety pleases the

eye and enraptures the mind. At one moment the sturdy buffalo moves before you, drawing a heavy burthen; soon after the slow camel with his ponderous load; while the swift zebra with his striped garment frisks over the plains. As you approach the farm, every object of convenience is consulted, and in the dairy every degree of neatness. The Dutch cow enjoys a luxurious pasture, the brood mares greatly enliven the landscape, and the stables are filled with the most excellent horses. An immense nursery furnishes a manner of trees and plants, a cedar of Lebanon which about twenty years ago was only a sapling is now thirty feet high: the garden called *la Isla* is particularly beautiful and rural. The *Jalisco* tree, which the Spaniards call *Arbol de Amor*, being happily dispersed there, has a very good effect early in the spring, when covered with flowers without a single leaf; the banks of the *Isla* are further enlivened by elegant yachts, for the amusement of the royal family. The fine avenue which also serves for a public walk, called *Calle de la Reyna*, has nothing equal to it at Versailles. The extensive flower garden on one side, renders the walk extremely pleasant in an evening; were I to mention the quantities of flowers and fruit, it would require many details.

At the noon-tide hour, when the freshness of the morning is past, the shady walks near the palace then become an object of singular luxury, as well as the elegant fountains, whose sparkling waters give such a coolness to the air. Whoever has enjoyed the agreeable moments that pass in pleasing converse under these shady bowers, will surely be charmed with their admirable effect.

The nightingale at the latter end of the winter, called *merops apias*, tell us comes from a known not on all the year round, which forward. The well as the ice by the Spaniards, *merops* of C great variety about the six beautiful pur

The palace additions is made by Philip the mansion, nor in the apartment of so many fine to the palace and in the other the former was

Whoever has not think it e Spain should fertile dominion has crossed Guadarrama, prize to behold embellished with mines of Mexico

The nightingale and cuckoo are heard here the latter end of April. That elegant bird, the bee-eater, called by the Spaniards *abejaruxo*, the *merops apiaster* of Linnæus, which our travellers tell us comes no further south than Andalusia, is known not only to breed at Aranjuez and live there all the year round, but is also found at St. Ildefonso, which is twenty leagues more to the northward. The golden thrush is also seen here, as well as the icterus of Edwards, called *oropendulo* by the Spaniards, and *l'aurot* by the French, the *coriols* of Catesby and Linnæus. Amidst the great variety of birds in these woods, there is one about the size of a cuckoo, called *Pito*, of a beautiful purple.

The palace being an old building with several additions is more in the style of a hunting seat, as Philip the 4th. designed it, than of a royal mansion, nor is there any thing very particular in the apartments, to take off from the enjoyment of so many fine objects abroad. The new wings to the palace are finished; in one is a playhouse, and in the other a chapel. Part of the ceiling of the former was painted by Mengs.

There are seven fine pictures of Lucca Jordano in the apartment called *El Gabinete Antiquo*, and six others in that *de los Mayordomos*; particularly one, universally admired, in which a number of beasts are represented listening to Orpheus, and seeming to be struck with the melody of his lyre. In the chapel, over the great altar, there is a fine picture of the annunciation by Titian, presented to him by Charles the 5th, and brought from the convent of St. Juste after the death of that emperor. The Porcelain Cabinet, where there are several large pieces of the king's own manufactory, is also an object of curiosity to a traveller. In a word, this charming place is highly indebted to Charles the 3rd, for bringing the whole to its present state of beauty, and making the new road from Madrid, and the noble stone bridge over the Jarama.

Whoever has seen the gardens of Aranjuez will not think it extraordinary that the sovereign of Spain should have another agreeable seat in the fertile dominions of his crown, but when a traveller has crossed the craggy and bleak mountains of Guadarrama, it will be a matter of singular surprise to behold one of the most dreary rocks embellished with an agreeable villa, where the mines of Mexico have been lavished to effect the

alteration; such is the royal seat of St. Ildefonso; for in few parts of the world, the powers of art have been more strenuously exerted to correct the rugged state of nature, and convert a horrid rock into a sumptuous garden, decorated with beautiful fountains, throwing up water to a great height, like those of Versailles; while a variety of trees, brought from different parts of the world, furnish shady walks, in a spot unfavourable by nature to all kinds of vegetation; shewing to what the art of man can attain, and fully evincing the efforts of Philip the 5th, who at the expence of millions of dollars changed a barren and solitary mountain, into one of the most desirable spots in his kingdom; yet not without those inconveniences which all the power of art cannot conquer; for, on account of its lofty situation, the night air, even after the hottest summer's day, is so piercing, that it makes precaution necessary, to guard against its sudden and pernicious effects. In other respects nothing can be more reviving during the summer heats, than the shade of these gardens, invigorating the languid courtier, whose spirits are further revived by the coolness of the groves, added to the most limpid water that eyes can behold, in some places flying up into the air, to an immense height, in others rolling down in torrents, which, when caught by the rays of the sun, seem like so many sheets of liquid silver, of a most amazing brightness. As the cold air of this place keeps every thing back, the king finds a new spring after he has left Aranjuez, while his subjects are dying with heat at Madrid. The earliest fruits are but just ripe in August at St. Ildefonso, carnations and roses then adorn the parterres; September is the season for strawberries, raspberries, currants, and barberries; and snow lies on the mountains till the beginning of June. Many springs run down from the summit, and sides of the mountains, and are collected into a considerable bason at the upper end of the garden, to which they have given the name of *El Mar*, "the sea;" whence they are distributed to all the different fountains and water-works, the whole garden being on a slope, about two miles in circumference. Other springs with two brooks, form the little river Eresma, abounding in salmon trout, where the king often diverts himself with fishing, under the shade of thickets, beautifully variegated by the pencil of nature.

The dreary mountain at the top of these gardens*, is a kind of rock composed of clay and fine sand; which by degrees crumbling and mixing with rotten leaves and roots, forms that light coat of earth, which just covers the rock, and gives nurture to the firs and other trees and shrubs. The foot of the mountain is of granite, and serves for building, sometimes for mill-stones, though rather too soft for this purpose, standing in need of frequent repairs. They get vegetative earth on the north side, about a hundred paces from the green rails of the flower garden, which being further cherished by manure, is laid a foot high on the rock, and by dint of cultivation and care, they are enabled to raise flowers and fruits, whose roots hardly touch the barren soil of the place†.

The palace of St. Ildefonso has a noble collection of excellent pictures. In the gallery there are many fine statues bought at Rome, out of the collection of queen Christina of Sweden; amongst which the groupe of Castor and Pollux sacrificing, and a fawn, are undoubtedly the most beautiful. The statues in the garden are chiefly of marble of Granada, some few of marble of Carrara: there is nothing else remarkable except the fine looking glasses made in the king's glass house at St. Ildefonso, which supplies all the palaces: they have here the largest tables perhaps in the world for running plate glass. The greatest being 145 inches by 85, and its weight 405 arrobes. The smaller is 120 inches by 75, and weighs 380. This curious art was first invented by the Sieur Abraham Thevart, who proposed it to the court of Versailles in 1668, and is performed much like the casting of sheet lead by the

* Speaking of the gardens of St. Ildefonso, Mr. Fischer observes, that they have a number of fountains, and a staircase for a cascade; but the only pleasing part of it is where you get out of the sight of these, and see "while the dog star rages, through the overhanging trees, the side of the mountain patched with snow. The fountains are situated in centres, whither the straight walks tend: they are all inferior in size to the largest at Versailles; but one of them, a figure of Fame, is said to raise water higher than any in Europe. Fischer.

† Mr. Bowles informs us, That when the late queen mother lived at St. Ildefonso, the Infant, Don Lewis, her son, had an aviary in the gardens, filled with a great variety of beautiful birds; one place was allotted for woodcocks, where they lived for several years. In the middle of their cage a channel of spring water was introduced, which kept up a constant freshness of verdure; a fir tree stood in the

plumbers, by which means they are enabled to make glasses of double the dimensions of those made by the Venetian method of blowing, besides other improvements‡.

At a small distance from the palace, at a place called the *Mata*, near the powder magazine, there is a vein of quartz, which appears above ground, running from south to north for about half a league, till it enters and loses itself in the opposite mountain. A piece of this quartz, of about six pounds, being cut, seemed very curious, being half transparent, and almost as fine as rock crystal of a milk colour, forming those veins called by miners, "noble veins."

The environs of St. Ildefonso, and particularly the foot of the mountain, are covered with a remarkably fine sort of grass, to which they give the name of *cosquilla*, from its effect of tickling the hand when touched. The root is about eight inches long, cylindrical, and about the size of a pin, diminishing towards the point; in the middle of this root, which is smooth, the stem springs up, bearing small capsules at their points, inclosing the seed; in many places, and particularly at Segovia, they make use of it at Christmas for ornaments in the churches, to imitate verdure; it likewise grows in abundance in the plain of Olmedo, and is seldom to be seen elsewhere.

It is only a few hours ride from St. Ildefonso, to the city of Segovia. The naturalist will meet with many objects of curiosity in the environs of this city, observing its different species of marble, granite, limestone, clays, and three sorts of sand. Its famous Roman aqueduct remaining so perfect to this day, will prove the solidity of its mate-

centre, surrounded with shrubs, and they were daily supplied with fresh clods of turf, full of worms, which, though they hid themselves ever so much therein, the bird would instantly discover by the smell, and driving in his long bill bring them immediately out, then raising his head towards the sky, and extending the worm gently the length of his bill, would let it slide down softly without any appearance of deglutition; all which was performed with the utmost facility, as if totally unemployed, without ever missing its aim, and should the woodcock be killed at that moment, these nauseous worms would immediately contribute towards the forming a delicious repast at the most elegant tables.

‡ Although the glass manufactory of St. Ildefonso has produced much larger glasses than any other in Europe, they are nevertheless complained of as being of a dead and black colour. Fischer.

are enabled to see, more effectually than long dissertations. Seguer's method of discovering the inscriptions on the *Maison Quarrée* at Nîmes, the invention of which is originally due to that celebrated antiquary, Mons. Peyresc, might likewise serve to discover that, which was formerly on the aqueduct of Segovia, for the place of the inscriptions, marks, and holes of the letters, are yet very visible. This place is much dwindled at present from what it was formerly. The cathedral is

handsome and has been lately repaired*; the mint in this city only serves for copper: gold and silver are coined at Madrid and Seville. The alcazar or castle is curious, and in a fine bold situation†. The unfortunate Duke de Ripperdo was confined here; they shew you the dark room, from whence he made his escape, and the broken lock on the door is still in the same situation.

CHAPTER IV.

Departure from Madrid for the City of Burgos—Remarkable Objects on the Road from Burgos to the Provinces of Alaba and Guipuscoa, as far as Irum, the last Town on the Frontiers of Spain towards France—Environs of Reinosa—Source of the River Ebro.

ON leaving Madrid, to go into Old Castile, the first grand objects which strike the eye of a naturalist, are the mountains of Guadarrama, that divide the Two Castiles: you leave the famous Escorial on the left, and following the new road, ascend these lofty mountains, whose tops, and particularly where the marble lion-lands, are chiefly covered with fern, which is common here, though scarce in other parts of this country. From the highest part of the road, there is an extensive prospect of Old Castile, which is more elevated than New Castile, and forms a spacious plain not unlike a great sea. An easy descent leads to the *Hermita del Christo del Calco*, where grey and blue marble is dug out of the adjacent mountain, and is found almost close to the road. The mountain terminates at Villacastin, but the grand plain only commences at Labajos, where they sow the peas called *Garbanzos* in a fine blackish soil, but they are not equally tender and large every year, no more than at Salamanca or Zamora; for though the land is good for this sort of pulse, its success depends much upon the weather.

A new bridge has been lately built over the

river Almarza, whose banks are lined with poplar and elm; half a league further there is another plain, without a single tree, but water is found at two or three feet depth; so that a very slight plough answers the purpose, it being sufficient to tear away the weeds, to secure a good crop of wheat; this is generally the case in Castile, where they have fine harvests without being obliged to wait for rain to sow their corn, the vicinity of water and strong dews being sufficient to fertilize the soil, the reverse of what happens in the southern parts, where the water is deep under ground, the soil dry and tough, and strong ploughs must be used; besides waiting for rain or an appearance of its falling, otherwise the grain hardens, and is in danger of being devoured by birds, insects, or rats. In these plains, the villages are numerous, as well as the vineyards; the soil is sandy, and yet, by means of the nearness of water, produces plenty of shumach: every house has its garden, and the sides of the road are chequered with the lychinis, and oak of Jerusalem. Though the plain I have just mentioned is of about eight leagues extent, without the appearance of a spring, or a brook,

* The cathedral is a building which would puzzle any connoisseur in Gothic architecture extremely, being a piece of the sixteenth century; it is large and lofty, with a high tower and little domes, retaining in its outline much of the Gothic character, but very plain, and unlike any particular style of that species of building, and perfectly dissimilar to the florid manner which obtained in England during the fifteenth century. *Fischer.*

† This is the most picturesque object in the world. The great tower has been lately cleaned, which rather modernizes its appearance; but the effect of the whole mass of turrets, chambers, and spires, as viewed from behind, beyond the foss, is as romantic as possible. The front of the castle is covered by rings worked in the plaster with which it is covered, an ornament of Moorish origin. *Fischer.*

the inhabitants drink the waters of wells and cisterns, without any bad consequences, or being troubled with agues, as the water does not stagnate, but has a current near the surface, and regains from a higher region, what it loses by evaporation. This accounts for their having such fine grass and pasture in Castile, and so many herds of cattle, with such a variety of game, birds, and wild and domestic animals.

Near Valladolid there are groves of fir trees terminated by an extensive plain, covered with green wormwood, oak of Jerusalem, and thyme, of that beautiful sort called *thymus legitimus Hispanicus*. The city of Sinancas* appears on the left, about two leagues distance, as you enter the once famous city of Valladolid, situated on the banks of Pisuerga. This large city exclusive of colleges and some churches that have good remains of Gothic architecture, now only exhibits the dismal remains of its former grandeur; and the palace where Philip the Second was born, has nothing but bare walls, where bats and spiders quietly inhabit the mansions of the great Emperor Charles, and the Philips, his progeny.

Every thing is barren, with dreary aspects of flat topped, barren sand hills, as far as Caveron, where they have vineyards, and make a tolerable light red wine. Leadwort is common on the side of the road, whose leaves pounded, are said to be good against the gangrene. The vineyards are numerous, near the town of Duenas, which belongs to the Duke of Medina Celi. The plain extends to Rodrigo, whose environs produce a little lavender, two sorts of shrubby Jerusalem

* The records of the kingdom having been found to be in great confusion, and a large collection of valuable papers discovered at Valladolid, Philip II. ordered his chief architect, Juan de Herrera to construct proper apartments at Simancas for their preservation, and they were disposed of in nine grand divisions, or apartmentss accordingly. In the strongest, called the *Cubo*, were those relating to Granada, Indies, right to Naples, Navarre, Portugal, Vicariate of Siena, monarchy of Sicily, establishment of the inquisition, wills of kings, capitulations of peace with France, with Moorish kings, with the House of Austria, marriages of catholic kings, grants of military orders, and state papers from the time of Ferdinand V. all which are preserved in wooden cases fixed in the wall. In the year 1592 the king visited them. All the proceedings relating to the imprisonment and death of Don Carlos his son, were deposited here in a trunk, carefully locked. Another apartment was built for accounts, and other office papers; in another were papers relating to royal palaces; law suits, grants, knights of military orders, and Indies;

sage, with a sage leaf, and meadow ragwort which are the only plants the country affords. All the territory of Campos is so bare and destitute of trees, that the inhabitants are obliged for fuel, to burn vinestocks, straw, dung, and the few aromatic shrubs they can find; their kitchens are like stoves, and they sit round them on benches, giving to these wretched hovels the emphatic name of *Glorias*. A solitary elm or a walnut tree pointing to these wretched hovels the emphatic name of *Glorias*. A solitary elm or a walnut tree and then appears near a church, a sure sign that water is not far from the surface, and that its roots have partaken of it †.

On approaching the hills, the pebbles which had almost disappeared, shew themselves again, increased both in number and bulk, and although from Labajos they were scarcely larger than oranges, they are now double that size, and rounded, which the others are not, covering the tops of the hills: it is somewhat singular, that these stones, which are of a fine sandy grain, and are found every where in this province, should be of the very identical sort and colour, as those of La Mancha, Molina de Arragon, and other parts of Spain.

The country from hence to Burgos, produces plenty of wheat, and some flax; the road is a continual though gentle ascent, with much conglomerated sandstone, of which there is a sort near Burgos, so firmly conglomerated with small pebble, that it forms a marble like the *Breccia* ‡, and takes a good polish, specimens of which may be seen in the choir of the cathedral of Burgos. The environs of this ancient city are remarkably pleasant and shady, with many

another for records of corporations; and in another the memorials and letters of kings, princes, and states, respecting Flanders since the rebellion. Vida de Philippe II. Por Luis Cabrera de Cordova, Madrid, 1619. The American papers alone fill the largest apartment of this Archive, and are said to compose 873 large bundles. The prospect of such a treasure had excited the most ardent curiosity of the most elegant historian of America, but the prospect of it was all that he enjoyed. Preface to Dr. Robertson's *History of America*.

† When this happens, independent of every vicissitude of weather and climate, other trees would thrive in like manner, and the country might be rendered shady and pleasant, instead of being the most desolate in Europe.

‡ The *breccia silicia* is the plumb pudding stone. This stone is of a very elegant appearance, when cut and polished; it is found in England. See Essay towards a System of Mineralogy, by Axel Fred. Cronstedt; second edition. London, 1772. Sec. CCLXXIII.

beautiful avenues: the hills are no longer flat-topped, but have a cheerful appearance; the waters are pure and salubrious; the rivers abound with trout, eel, and cray-fish. Though the air is sharp and rather piercing, it is esteemed very healthy, and Castile may justly be reckoned the country of partridges, hares, rabbits, and lambs. The city of Burgos is situated on the side of a hill, at the bottom of which the river Arlanzon washes its walls, and has three stone bridges over it. The cathedral is a magnificent Gothic structure, and one of the finest in Spain. The city is well inhabited by ancient nobility, and was formerly the residence of their kings. It gave birth to that illustrious hero Fernan Gon- zales, and near the place where the house stood, a triumphal arch has been erected to his memory at the expence of the city, with the following description:

FERNANDO GONSALVI CASTELLE ASSERTORI SVÆ
STATIS PRÆTANTISSIMO DVCI MAGNORVM
REGVM GENITORI SVO CIVI INTVS DOMVS ARAE
SVMPV PVBLICO AD ILLIVS. NOMINIS ET VERBIS
GLORIE MEMORIAM SEMPITERNAM."

The parish church of Santa Gadea, (St. Aga- tha), more ancient than the cathedral, is remark- able for being the place, where that renowned champion Ruy Diaz de Bibar, also a native of Burgos, commonly called the *Cid Campeador*, obliged king Alfonso the Sixth, before he was proclaimed; to swear three times publicly, that he had no concern in the murder of the late king Sancho his brother, at the siege of Zamora, where he was treacherously slain by a Spanish knight, whose name was Heliel Alfonso, though he is usually called Valido Dalfos. The words of this extraordinary oath were as follow: "You come to swear, that you had no hand in the death of my lord the king, that you neither killed him, nor gave counsel therein."

The king and his nobles answered, "Amen." If otherwise, may you suffer the same death as that of my lord; may a villain kill you, let

* At the second time of tendering the oath the king changed colour, and at the third he was greatly displeased, saying, "Rodrigo Diaz, why do you press me so hard, and make me swear to-day, when you will come to kiss my hand to-morrow?" to which that warrior replied, "Yes, Sir, if my services are properly considered, for in other kingdoms, knights are also rewarded, and you must do the same, if you mean to retain me in your service;" which

him not be a gentleman, nor born at Castile, but come from foreign parts, nor be of the kingdom of Leon." The king and his nobles answered, "Amen *."

After this ceremony, Alfonso was solemnly proclaimed king of Castile, Leon, Galicia, and Portugal, in the presence of the infanta his sister, and the prelates, and nobles of his kingdom:

Quitting Burgos, new objects appear worthy of attention; in crossing an extensive plain, the gum-bearing cistus is seen in great plenty; it is an ever-green, with long, narrow, leaves, gum- my and glossy; the flower is inodorous, and com- posed of fine white petals, of the size of a com- mon rose; each petal having a little purple spot on the tip of it. The old branches distil a liquid matter, which the heat of the sun con- denses into a white sugary substance, like a piece of gum, of the size of one's finger, and yields a true manna; it is gathered and eat greedily by shepherds and boys. The Spaniards were little apprised of the advantages to be drawn from this plant, till of late years, when, on the representation of the royal college of phy- sicians at Madrid, in 1752, orders were given to two of its members, to make a further investiga- tion of this production; it was found that Spain alone could procure manna sufficient to supply all Europe, equal in goodness to that of Cala- bria, in Naples; for not only an incredible quan- tity of it was gathered in the parts abovemention- ed, where it is formed about the dog days, but likewise in the mountains of Asturias, Galicia, Cuenca, Arragon, and Catalonia, though no use had hitherto been made of it,

The descent to Monasterio leads to a valley fertile in corn, soon after the district of Bureba begins, which is a champaign country, and pop- ulous, with numerous gardens, well stocked with fruit trees. Near Bribiesca they manure their land with a sort of blueish white marl; marl, being in its nature, a compound of dif- ferent properties of argillaceous, and calcareous earths, is of great use in agriculture: it is some-

speech the king never forgave, and soon after ordered him to retire out of the kingdom, allowing him only nine days for that purpose. The Spanish chronicles are full of the achievements and feats of the *Cid*. He died in 1099, and is buried in the church of St. Pedro de Cardena, near Burgos, where his memory is held in the highest veneration.

times soft, at other times hard, like stone, or slate, but generally crumbles by exposure to the air.

The road to Pancorvo traverses calcareous mountains, forming part of those called "Los Montes de Oca," by which the Pyrenees are joined to the northern mountains of Spain. The town of Pancorvo lies in the narrowest part of a valley closed in by these hills.

The boundaries of Old Castile are at Miranda de Ebro, three leagues beyond Pancorvo, where there is a bridge over the Ebro*; on the other side of which, the province of Alaba begins, whose inhabitants have likewise made a fine road, at their own expence, to the confines of Guipuscoa. The road continues almost to Vitoria, bordering on the river Zadorra, in which the water lily grows plentifully. The hills are of small, and various coloured calcareous stone, conglutinated together. The first village in the province of Guipuscoa, is Salinas, so called from its briny springs, which they evaporate with a boiling heat, and make salt. It is remarkable, that such springs in France, and Lorraine, are always in valleys, but in Spain are constantly found on the tops of mountains, or in elevated places. This just mentioned, is on a very high hill, with numerous petrifications of shells, in a kind of blueish marble, veined with spar, which has been used in making the road. The hill of Salinas is the highest part of Guipuscoa.

From hence, it is four leagues to Mondragon, so famous for its iron mine in this neighbourhood. From Mondragon it is a journey of six leagues to Legaspia, passing by a forge on the banks of the river Onate, where they mix the ore of two mines, viz. that of Somorrostro in Biscay, noted for the flexibility of its metal, with the ore of this neighbourhood, which being more abundant and hard, takes forty hours in roasting, and is then fused once without any castina†, getting at each fusion a quintal of

* This bridge, which had been so much damaged, and part of it carried away by inundations, when Mr. Swinburne passed this way, and was obliged to go over in a ferry, was entirely repaired when I went over it in July, 1778.

† Castina is a hard calcareous stone, of a whitish grey, used in forges, where iron is fused, in order to absorb the sulphureous acid, that mineralizes the iron, and renders it brittle.

‡ Mica, the glimmer, daze, or gift. See Cronstedt's

iron, following the same method observed with the iron of Somorrostro.

Onate is a populous and affluent town; the church, the colonade, and statues of the college are of sand-stone, full of mica.

It is five hours and a half from Legaspia to Villafranca, passing by Villareal, where the houses are of sand-stone. They prune the oak every where in this country, in the same manner as the mulberry trees in Valencia, that they may throw out more branches, to make charcoal for the forges, and they cut them every eight or ten years, as in Biscay. There are few springs in all these hills, though it so frequently rains, owing to the tenacity of the soil, which impedes the filtration of the water, so that they are obliged to drink melted snow from the mountains, yet without being troubled with the full-throat, so often attributed to this cause, though more probably arising from obstructions in the glands for want of perspiration. Two-thirds of the inhabitants of this province, pass the days and nights in their smoaky cabins, without chimnies, affirming, that the closeness and smoak are conducive to health, as they dissipate dampness, and promote perspiration. The inhabitants are certainly not only robust, but are even seldom troubled with rheums: they are moreover cheerful and sociable, having none of that shyness observed in the meridional provinces.

From Villafranca, it is three leagues to Tolosa, one of the three principal cities of Guipuscoa, and from hence the road continues in sight of St. Sebastian's, and Pasage, to Irum, the last town in Spain. Near this place the river Bidason enters the ocean, dividing Spain from France, and at a small distance from its mouth, the island of Pheasants is remarkable for having been the place where the Pyrenean treaty was concluded in 1660.

That part of Spain called Montana de Burgos, may be thrown into two grand divisions. The first takes in all that space from the highest

Mineralogy, sect. xciii. London, 1772. Mica, or talk, is an earthy or strong substance, consisting of thin, flexible shining plates; micas have a soft touch, resembling that of unctuous substances. They are not soluble by acids. They are incapable of eliciting sparks when struck by steel, as flints do, for which reason they are called *Apyri*, that is, without fire; nor do they form a tenacious paste with water, as gypsum does. Mica is therefore neither a calcareous, siliceous, argillaceous, nor gypseous earth.

part of the mountains, the other, the Castilian mountains, is Santander, and the descent of four leagues, descending as Burgos. half a mile of falls into the sea, and empties it. It may be in the waters between one of the mountains, as well as the coast, their heads as being constant. Two leagues there is another village at the of bilberry which to the great numbers

THE lords of the country, from east to west, consisting of various dimensions, as well as the land, and pasturage, and being, with the effects the mine

* The soil of the kingdom, equal to them are occasional. The soil is in with quartz, as the same manner, league to the main called Aragon, decomposed, as very good grass

part of the mountains, to the Bay of Biscay, and the other, the space extending the same height towards Castile. The highest part of these mountains, is that intermediate situation between Santander, and Burgos, it being a continual ascent of fourteen leagues from Santander to Reinosa, descending afterwards from thence, as far as Burgos. The source of the Ebro is within half a mile of Reinosa, and runs easterly, till it falls into the Mediterranean, while the Pisuerga runs into the Duero, whose course is westerly, and empties itself into the ocean; from whence it may be inferred, that Reinosa divides the waters between the two seas, and is therefore one of the most elevated districts in Spain, as well as the coldest, its lofty mountains raising their heads as high as the line of congelation, being constantly covered with snow.

Two leagues to the southward of Reinosa, there is another high mountain, with an hermitage at the top, where there is a great plenty of bilberry whortle, the vaccinium of Linnæus; and to the westward, there is a height where great numbers of Roman coins have been dug

out, which indicates its having been formerly a Roman colony: near this place several large lumps of emery are seen above ground, fixed in the sand-stone.

The famous river Ebro, which once served as a boundary between the Carthaginians and Romans, has its source in a little valley at a small distance to the eastward of Reinosa, and proceeds from a copious spring at the foot of an ancient tower, called Fontibre; in passing by Reinosa, it is increased by the waters of several other brooks, and springs; two leagues lower, it runs by the narrow pass of Montesclaros, receives different supplies in the course of its passage through the vallies, is considerable when it comes to the confines of Alava, and after traversing many open and fertile districts, passes by the city of Tortosa, where there is a bridge of boats over it, and then falls into the Mediterranean at the Alfaque Islands, but on account of its many rocks, and shoals, is not navigable higher than Tortosa, and even so far only for small craft.

CHAPTER V.

Description of the Lordship of Biscay, and its Products—Reflections on the Genius and Character of the Biscayners—Description of the Town of Bilbao, and the Manners of its Inhabitants—Account of the Iron Mine and Forges at Somorrostro.

THE lordship of Biscay is a mountainous country, about twelve leagues in length, from east to west, and eight from north to south, consisting entirely of hills, and mountains, of various dimensions, most of which are cultivated to the very summit, the vallies being chequered as well as the hills, with villages, farms, arable land, and pasture; the whole with such infinite variety and beauty, as to form a delightful landscape, with the most pleasing and romantic aspects the mind can conceive.

Many of these mountains consist of hills piled up upon each other, like that of Gorveya, which takes five hours to ascend; its summit affords a beautiful plain, with abundance of pasture, where the herds of Biscay, and Alaba remain for some months. Amongst other plants, it produces the *Ribes*, or black currant, whose leaves have a flavour of pepper, and are reckoned useful in gouty complaints. Near Durango the hills are bare, and from their steepness, very difficult to ascend. *Serantes*, near Portugalete, is another

* The soil of Reinosa produces the best of oaks in the kingdom, equal to any in Europe, and some thousands of them are occasionally felled for the service of the navy. The soil is in general, composed of sandy rock, mixed with quartz, as large as chestnuts, cemented in the rock in the same manner as in the warm climate of Granada. About a league to the north of Reinosa there is a very high mountain called Arandillo, whose summit is at present so much decomposed, as to form an extensive plain where there is very good grass. The people of the country say there was

formerly a town here, and the quantities of loose stones still remaining, seem to confirm the report. The nature of this mountain is singular, its basis being of gypseous stone, its summit of sand-stone, and its centre of lime-stone, with large impressions of *corallum ammonis*, and several stellops-shells fixed in the rock. On the road to Reinosa, black marble veined with white is seen in great quantities, the same may be observed at the *Puerto* between Aspetia, and Vidana, where there is a mountain of similar marble, from top to bottom.

high

high hill, in the form of a pyramid, and being seen at a great distance, is a good land-mark for mariners, sailing into the river of Bilbao: from its shape it seems as if it had been a volcano; many have erroneously taken it for the mine of Somorrostro; but this is at a league distance. There are other mountains at half a league or a league in length, with craggy peaks, whose sides nevertheless admit of cultivation, and dwellings, such as that of *Millaroy*; others are low and flat-topped, covered with earth, having farms and habitations, besides wood for charcoal, and even meadows for pasture extending to their summit, but none yield products in proportion to their surface: for the vegetative system rising in a perpendicular line, an oblique superficies cannot support more trees or plants than a plain of equal basis; as on a triangle one cannot raise more perpendiculars than such as fall on its immediate basis.

Small rivers and brooks issue from the crevices and clefts of these mountains; from Gorveya there runs four, which uniting with that from the great mountain of Orduna, added to other

* If we except the ploughed fields, and the bare tops of some jagged mountains, all the rest are covered with woods, either for timber, or charcoal; some are natural, such as the holm, and arbutus, others are sowed, or planted, particularly oaks, which grow very fast. Where there are no woods, and a good depth of soil, it produces impenetrable thickets of the shrub called *Argoma*, as well as Cantabrian heath, and fino gorze. Higher up, where there is less earth, the sides of the hills, and the vallies, have plenty of grafted chestnuts, which the Hamburg ships carry away in great quantities from Bilbao. The apple tree seems here to be in its natural soil, and thrives admirably without cultivation; the whole country produces varieties of this fruit, but those of Durango are the best. *Renets* are common of two or three sorts; cherry trees grow as high as elms, at *Gordejuela*. They have excellent peaches, which they call *pavias*, with this remarkable circumstance, that they are never grafted, or improved by any particular culture. Those of Aranjuez are of this kind, but have not their flavour nor mellowness. Of pears they have great variety, and also those choice sorts, as the *benerre*, *fondante*, *doyenne*, and *bergamotte*; besides abundance of figs, nuts, and currants; and though the country does not produce raspberries naturally, it abounds with excellent strawberries, as well as all manner of garden plants, and pulse in perfection. Their onions are remarkably sweet; Galicia furnishes them with turpots for cattle, as well as for the kitchen; their cows and oxen are small, but stout and robust; goats they had better be without, as great care must be taken to prevent them from destroying the trees: sheep they have none, and indeed it would be a difficult matter to hinder them from continually entangling themselves amongst

torrents bursting through gullies where there is no water in summer, serve to form the river of Bilbao: these are so tremendous in winter, when swelled by heavy rains, as even to threaten the town with destruction, if they unfortunately meet the tide at high-water; the inhabitants are often alarmed in this manner, and it is common with them to go about the streets in boats at this season of the year*.

Most of the mountains of Biscay, and Guipuscoa, are of an argillaceous substance; the stone decomposes very little, or resolves into earth, though calcareous stone is abundant, and in many parts they have manured for ages past with lime, yet it has caused very little alteration.

The Biscayners give the name of republics to their different jurisdictions in their provinces, all which, except Orduna, their only city, and a few towns, are composed of hamlets, and lonely houses, dispersed up and down, according to the convenience of situation, in so close and intersected a country. However their houses have every advantage of distribution, consisting of

the thickets. They have six or seven sorts of grapes, of which they make the *Chacoli* wine; all spots are not equally favourable; however the vineyards are numerous about Orduna and Bilbao, and form the principal revenues of the country gentlemen; but as the prices are fixed, and no foreign wine can be introduced nor sold by the publicans, while their own vintage is selling, they are more eager to increase the quantity than meliorate its quality, so that it is in general bad; besides they make their vintage too early, which gives a sharpness to the wine, and deprives it of body; and being unskilful as well as careless, mixing the rotten and sour grape with the rest, *Chacoli* is in general a very poor wine. Their whole vintage will not suffice for four months consumption, and the deficiency must be made up from the province of Rioja, which occasions saying, "That all the iron of Biscay is swallowed down for foreign wine by the natives." Even Englishmen and Germans, are people of great sobriety, compared with most Biscayners, yet drunken men are seldom seen in the streets, because they are accustomed to eat heartily in these drink entertainments; both men and women breakfast, dine, and in the evening, and sup very plentifully; and yet enjoy excellent health.

† Game would be plentiful if there were not so many sportsmen, though they do not want for partridges, and their quails are the best in all Spain. In marshy places they are well stocked with wild ducks, woodcocks, snipes. In the plains they have hares, but no rabbits, nor any deer, nor roebucks, which last the Spaniards call *corca* as coming originally from Corsica; so they give the name *galgo* to a greyhound, having first had them from Gaul.

principal stores, offices, with out-houses, cellars, orchards, meadows, and other improvements.

traveller, than the whole country from Orduna, which seems the upper part of the new house is to be

Not only Biscay, but also the mountains of Biscay, Casca Solariega, their antiquity, and the Solariega property;" the Spain.

The head of the Mayor, and is a general branches of equity, as to before the establishment of the church, were known as have, even the receipt of the tythe, are deemed reduced a states, with the others, that, though s, which by fortune sprung from or have undoubtedly from a more an the establishment and records; t

* It is pleasing to see them themselves, being obliged to spirit, and pride, and notions of freedom, or to comp from the poor to

principal story, besides the ground floor, for offices, with an appendage of stables, granaries, outhouses, courts, cellars, and gardens; besides orchards, meadows, and often cornfields, contiguous to the building, with chestnut groves, and other improvements to the very foot of the mountains. Nothing can be more pleasant to the traveller, than to see houses and gardens during the whole course of his progress, particularly from Orduna to Bilbao, an extent of six leagues, which seems like one continued village. The upper part of the houses were formerly of wood, but the new ones are of stone. Scarcely an empty house is to be seen or any fallen into ruins.

Not only Biscay, Guipuscoa, and Alaba, but also the mountain of Burgos, are full of gentlemen's seats, known by the name of *Solares*, or *Casas Solariegas* worthy of much veneration from their antiquity; the owners of these are distinguished by the title of *Hildagos de Casa Solar*, or *de Solar Conocido*—"Gentlemen of known property;" the most honourable appellation in Spain.

The head of the family is called *Pariente Mayor*, and is greatly respected by all the collateral branches; some of these are of such antiquity, as to be thought to have dwelled there before the establishment of Christianity, in that country, since their ancestors were the founders of the churches, had the patronage of them, and were known so far back as four centuries ago, to have, even then, been time immemorial, in receipt of the tythes; others, without any patronage, are deemed equally ancient; many are so far reduced as to be obliged to cultivate their estates, with their own hands, yet will not yield to the others, in nobility and descent, alledging that, though some branches have been more enriched by fortunate events, yet they are all equally sprung from one common ancestor. Their names have undoubtedly passed in a lineal succession, from a more ancient date than the ages of chivalry, the establishment of coat armour, or of archives, and records; to which they pay little attention,

as of no importance to illustrate their quality; the possession of one of these houses, or the constant tradition of being descended from a former possessor, being more than sufficient to ennoble their blood; many such having shined in the annals of Spain, by the noblest deeds, which have immortalized their names more than their ancient descent. They have settled in different parts of the kingdom, while the head of the family has continued at home, in a state of simplicity, ploughing his fields, and inspiring his children with sentiments suitable to the heroic ages: the daughters are brought up in a different manner from most other parts of the world; here the most opulent do not disdain the management of household affairs, and every branch of domestic economy, with a noble simplicity, that seems to recal those glorious ages of which Homer has sung. Whoever looks for innocence, health, and content, will find it amongst the inhabitants of Biscay; and if they are not the richest, they may be well deemed the happiest of mankind*.

The country people wear brogues, not unlike those of the highlands of Scotland, tied up with great neatness, being the most useful for a slippery and mountainous country. When they are not busy in the fields, they walk with a staff taller than themselves, which serves them to vault over gullies, and is an excellent weapon in case of assault, with which they will baffle the most dexterous swordsmen; they wear cloaks in the winter, the pipe is constantly in the mouth, as well from pleasure as from a notion that tobacco preserves them against the dampness of the air; all this, joined to their natural activity, sprightliness, and vigour, gives them an appearance seeming to border on ferocity, were it not the reverse of their manners, which are gentle and easy, when no motive is given to choler, which the least spark kindles into violence.

It has been observed, that the inhabitants of mountains are strongly attached to their country; which probably arises from the division of lands, in which, generally speaking, all have an interest.

* It is pleasing to behold with what affability the rich demean themselves towards those who are less so than themselves, being obliged to this condescension from the natural spirit, and pride of the people, added to their education and notions of freedom. Unaccustomed to brook the least scorn, or to comply with that submissive behaviour so usual from the poor to the rich, in more refined and opulent

kingdoms; yet the common proverb of Castile, *Pobresa no es viltad*, "Poverty is not a blemish," has no sway here, for such are their notions of labour and industry, that their spirit makes them consider it an indignity to beg; and though the women are generally charitable, which cannot fail to attract mendicants, yet such are most commonly strangers.

In this, the Biscayners exceed all other states, looking with fondness on their hills, as the most delightful scenes in the world, and their people as the most respectable, descended from the *aborigines* of Spain. This prepossession excites them to the most extraordinary labour, and to execute things far beyond what could be expected, in so small and rugged a country, where they have few branches of commerce: a greater proof of their industry cannot be given than those fine roads made from Bilboa to Castile, as well as in Guipuscoa and Alaba. The passage over the tremendous mountain of Orduna, cannot be viewed without the utmost surprize and admiration.

The manners of the Biscayners, and the ancient Irish, are so similar on many occasions, as to encourage the notion of the Irish being descended from them. Both men and women are extremely fond of pilgrimages, repairing from great distances to the churches of their patrons, or tutelary saints, singing and dancing, till they almost drop down with fatigue. The Irish do the same at their *patrons*. The *Guizonas* of Biscay, and the *Boulamkeighs* of Ireland are nearly alike: at all these assemblies, they knock out one another's brains, on the most trivial provocation, without malice or rancour, and without using a knife or a dagger. In both countries the common people are passionate, easily provoked if their family is slighted, or their descent called in question. The *Chacoli* of Biscay, or the *Shebeen* of Ireland, makes them equally frantic. In Ireland the poor eat out of one dish with their fingers, and sit in their smoaky cabbins without chimnies, as well as the Biscayners. The brogue is also the shoe of Biscay; the women tie a kercher round their heads, wear red petticoats, go barefoot, in all which they resemble the Biscayners, and with them have an equal good opinion of their ancient descent: the poor Biscayner, though haughty, is laborious and active, an example worthy to be imitated by the Irish.

So many concurring circumstances support the idea of their having been originally one people.

* Another instance in which the Irish seem to have closely imitated the Spanish customs, is in the taking of snuff, of which Mr. Howel, who was in Spain in 1620, and went soon after to Ireland, gives us the following account, at an early period, after the first introduction of snuff into Europe: "The Spaniards and Irish take it most in powder, or smutchin, and it mightily refreshes the brain, and I believe there is as much taken this way in Ireland, as there is

It cannot be denied, but that the old Irish, whether from similitude of customs, religion, and traditional notions, or whatever else may be the cause, have always been attached to the Spaniards, who on their side, perhaps from political views, have treated them with reciprocal affection, granting them many privileges and stiling them even *Oriundos* in their laws, as a colony descended from Spain; yet, with all these advantages, if we except those gallant soldiers who have distinguished themselves in the field wherever they have served, few Irish have made a conspicuous figure in Spain, or have left great wealth to their families*.

The king of Spain has no other title over these free people, than that of Lord of Biscay, as the kings of England formerly held over Ireland; they admit of no bishops, nor of custom-houses in their provinces, they content themselves with that renown which they have acquired for themselves and their issue, insomuch that upon only proving to be originally belonging to that lordship, or descended from such in the male line, lawfully begotten, they are entitled to claim public certificates, or executory letters, termed *Cartas executorias*, expressive of their being *Hidalgos de Sangre*, or "Gentlemen of blood;" their nobility having been confirmed to them, by the kings of Castile and Leon, lords of Biscay, in the plenitude of their power. The most lofty Castilians have constant rivals for antiquity and descent in the inhabitants of Biscay, Asturias, and the mountains of Leon. Impressed with these flattering ideas, the high-minded Biscayner leaves his native soil, and repairs to Madrid. Conscious that his blood is pure, uncontaminated with mixtures of Jewish or Mohammedan race, he raises his hopes on honest industry, and sobriety, fulfilling his duties with zeal, and submission; he often meets with relations in affluence, and sometimes rises to the highest employments.

The town of Bilboa, on the banks of the river Ybaizabal, is about two leagues from the sea, and contains about eight hundred houses, with a

in pipes in England. One shall commonly see the serving maid upon the washing block, and the swain upon the ploughshare, when they are tired with labour, take out their boxes of smutchin, and draw it into their nostrils with a quill, and it will beget new spirits in them, with a fresh vigour to fall to their work again."—*Epistole Hoeliana*, London, 1720.

large square by the water-side, well shaded with pleasant walks, which extend to the outlets, on the banks of the river, with numbers of houses and gardens, which form a most pleasing prospect, particularly sailing up the river; for, besides the beautiful verdure, numerous objects open gradually to the eye, and the town appearing as an amphitheatre, enlivens the landscape, and completes the scenery.

The houses are solid and lofty, the streets well paved and level; water is conveyed into the streets, and they may be washed at pleasure, which renders Bilboa one of the neatest towns in Europe. Coaches are not in use, by which means, inequality of wealth is not so perceptible, exterior ostentation is avoided, and the poor man walks by the side of the rich, with equal ease and content.

The air is generally damp, covers iron with rust, destroys furniture in the upper apartments, extracts the salt out of dried fish, and multiplies diseases beyond measure, yet the town is remarkably healthy, and its inhabitants enjoy, to a great degree, the three blessings of life, perfect health, strength of body, and a cheerful disposition, attended with longevity; in the proof of which, though the town is very populous, the hospital is frequently empty, and in the nine months, that Mr. Bowles resided there, only nine persons were buried, four of which were above eighty. Every day men above that age may be seen walking upright, in cheerful converse with youth. Burning fevers, which the Spaniards dread so much and call *tabardillos*, are not known here, and they are seldom troubled with agues. That Bilboa stands on the side of a river, in so damp a situation, and chiefly built on piles, like the cities in Holland, should be so remarkably healthy, with every indication against it, arises from the following circumstances:

The adjacent mountains stop the clouds that arise from the saline vapours of the ocean, rains are frequent, but they are seldom without a sea breeze, or a land wind; the current of the air being thus continually ventilated, never leaves the moist vapours at rest, and prevents their forming those putrid combinations, which heat

generally occasions, on stagnated waters; thus the vicinity of the sea, the rains, and more than all, the strong currents of air, are the physical causes of its salubrity at Bilboa, as on the contrary, the continued heat which rarifies the exhalations of such rivers as have a slow motion, as well as the stagnated waters in ponds or lakes, where there is great heat in the air, and little wind, will be the causes of putrifying the vapours, and bring on fevers and other distempers. For this reason, the inhabitants of La Mancha are so subject to agues, and use as much bark as in Holland, because the air has little motion in summer, notwithstanding the country is open, and the surface is dry. In the same manner, a new house is dangerous to dwell in, where the damp vapours are confined, though one may sleep very safely in the deepest gallery of a mine, if the air has a free circulation.

To these favourable circumstances, the Biscayners, owe their good spirits, and freshness of complexion, and cheerful disposition. In other countries, women are oppressed with the slightest fatigue; here they work as much as the strongest men, unload the ships, carry burdens, and do all the business of porters. The very felons, confined to hard labour in the mines of Almaden, do nothing in comparison with these females; they go barefooted, and are remarkably active, carrying burthens on their heads which require two men to lift up. The wife yields not in strength to the husband, nor the sister to the brother, and after a cheerful glass, though heavily loaded, they move on with alacrity, returning home in the evening without the appearance of lassitude often arm in arm, dancing and singing to the tabor and pipe.

Their music is defrayed at the expence of the town, after the manner of the ancient Greeks. On holydays they play under the trees in the great square; the moment they begin the concourse is great; men, women, and children, of all ages, are engaged at the same time, down to the very infants. The dances, are active, suitable to their strength, but divested of indecent attitudes or gestures*.

* These surprising women, though constantly exposed to the air, have good complexions, with lively eyes, and fine black hair, in which they pride themselves greatly, and are proud to uncommon advantage. Married women wrap a white handkerchief round their heads, so knotted, as to fall down in three plaits behind, and over this the Montera cap.

They have a haughty look, and work in the fields like the men; their language is the *Bascense*, which, without doubt, is original, and as ancient as the peopling of the country, being totally distinct, and without any connexion with any Spanish dialect; those who understand it, assure us it is very soft and harmonious, as well as energetic.

A general

A general neatness prevails in Bilboa. The shambles is a Tuscan building, in the centre of the town, with an open court and a fountain in the middle; nothing can be more cleanly or better contrived, free from all bad scents, or any thing disgusting, as it is copiously supplied with water to carry away every thing offensive. The meat is delivered so fresh and clean, as not to require being washed, as practised in other parts of Spain, which deprives it of its substance and flavours; the veal is white and delicate, and the poultry excellent: the woods afford plenty of wild fowl, besides five sorts of birds of passage, called *Chimbos*, which fatten soon after their arrival, and are greatly esteemed.

Amongst the different sorts of fish common at Bilboa, there are two peculiar to that river, which the inhabitants are remarkably fond of; these are a sort of eels in winter, and the cuttle fish in summer; the former are small like the quill of a pigeon, of a pale colour, about three inches long, and without a back bone, and are caught at low tides in prodigious quantities. In a word, every thing is in plenty at Bilboa, for besides a well supplied market, their gardens abound in pulse, and fruit of all kinds; and a stranger cannot but admire the hospitable disposition of the inhabitants, which soon falls off, if you slight their cordiality, or attribute it to motives of adulation or interest. Such is the happy life of the people of Bilboa, free from the luxurious as well as the ambitious passions, which agitate the minds of their neighbours, they pass their lives in tranquillity, governed by wholesome laws; amongst which they are said, even to have one against ingratitude, with a punishment affixed to it.

* From the above, it results, that a solution, evaporation, alluvion, and deposition, all exist in this mine; its situation is an undulated hill; which viewed from the neighbouring mountains, seems almost a plain; its form is regular, and may be passed round in about four or five hours. The ore forms an uninterrupted stratum, whose thickness varies from three feet to ten, and is covered with a coat of whitish calcareous rock, from two to six feet thick. Every one is at liberty to dig the mine at pleasure, and transport it by land or water, without being subject to duties or any formalities. The people being generally ignorant, and carrying away whatever comes uppermost, often take ore, which has its matrix of quartz, and is of a brittle kind, full of cracks; but the iron masters, who are the purchasers, are more versed, and know what to buy, and what to reject.

† No general rule can be given, concerning the duration,

The famous iron mine at Somorrostro, in Biscay, has all the appearance of being alluvial, and originally composed by the congelation of some fluid matter, increasing by insensible degrees, and reduced into a lamellated state, successively, forming plates, or scales one over the other, thinner than paper; as is evident from the many concavities and crevices, covered by these plates; which supposing to be the case, we need not be surprized at what has been advanced by some of the workmen, who assert that they have often found broken pieces of pickaxes, mattocks, and other instruments, in places that had been worked centuries ago, and are now replete with new ore; if this is a fact, we may further believe them, when they assert, that the mine increases, though the slow progress of nature, in this operation, does not permit us to calculate its gradation, or determine the number of ages sufficient to fill up a cavity of any given size*.

It is generally allowed, that no iron in Europe is so easy to fuse, or so soft as that of Somorrostro. When the ore is first taken out of this mine, it has the colour of bull's blood, and when wetted becomes purple; great quantities are carried away by water, to the neighbouring provinces, where they fuse it by itself, or mix it with ore of their own, which generally yields a harder iron. The following is their process with the ore which is fused without any mixture.

The first operation is to roast it† in the open air, by piling strata alternately of ore, and wood, in order to divide the ore, repel the moisture, and diminish its weight, that it may be more easily fused, and the ferruginous parts separated from the slag: when it is sufficiently roasted, they put it in the forge, with the due proportion

or degree of fire, for this purpose, these being various, according to the difference of the ores; a few days, or even hours, is sufficient for some ores, while others, such as the ore of Rammsburg, require that it should be continued for several months. Shutter enumerates five methods of roasting ores; viz.

First, By constructing a pile of ore and fuel, placed alternately in strata, in the open air.

Secondly, By confining such a pile within walls, but without a roof.

Thirdly, By placing the pile under a roof, without lateral walls.

Fourthly, By placing the pile in a furnace, consisting of walls and roof.

Fifthly, By roasting the ore in a reverberatory furnace, in which it must be continually stirred, with an iron rod.

of charcoal, and when it appears to have fused, by leaving on the hearth, a mass of four or five arrobes, they lay hold of it with tongs, and place it on an anvil under an immense hammer, of about seven hundred to a thousand pounds weight, and there by force of blows, and moving it about, they square it, and reduce it into bars. The numerous sparks which fly off from the blows of the hammer, are no more than the scoriae of the metal. The bar thus shaped, may be doubled or lengthened in a less forge, if they please, and even beat cold as if it was silver. In this manner the ore is fused in a few hours, and the bars formed, and sold to the blacksmiths. Formerly the iron was beat by mere strength of arm, a proof of which may be gathered from the names of many places in Biscay, situated where there is neither river nor brook, and begin, or end, with the termination *ola* or *olea*, either of which in the Biscay language, signifies iron works, such as *Mendiola*, that is, "iron works of the mountain."

According to appearance, a quintal of ore will produce about thirty-five pounds of good iron, and the residue about thirty pounds of slag, and dead earth. As this mine neither contains sulphur, nor acids, it is not necessary to mix any calcareous substance to fuse it, in order to absorb those matters, so troublesome in mines, that have the misfortune to be loaded with them, as is often the case in France. However, it would not be amiss to use a little of it, were it only to assist the fusion of the ferruginous earth, accelerate the process, and lessen the slag, as well as the quantity of fuel. These workmen, by constant experience, have acquired the proper method of managing the ore, as well as to know the quantity of coal for the forge, which is seldom larger than that of a considerable blacksmith; so that little improvement can be made on their labours; though by several experiments, made in 1773, by the *Sociedad Bascongada*, or Biscay society, it appears that it would answer better to roast the iron, in a close chamber than in the open air. A good forge well conducted, will yield to the owner above five hundred ducats a year*; some indeed, hardly produce three hundred, after paying all charges. It is necessary for them to be good economists, with respect to

VOL. II. NO. XCI.

fuel, and to use small forges; for if they were to have such large ones, as are common in most parts of Europe, with all the apparatus of hammers and other implements, they would soon strip their mountains of wood, and the forges would be at a stand for want of materials.

Besides the mine of Somorrostro, there are several others, some of which are worked, and others not. In one near Bilbao, the ore is seen above ground. About a mile from the town, there is a mine in a hill, of a quite different nature from that of Somorrostro, being loaded with vitriol; it is an enormous mass of iron ore, that attracts the vitriolic acid, which penetrating through the ferruginous rock, dissolves the metal, and exhibits on the surface, small laminae of green, blue, and white vitriol. Opposite to this hill on the other side of the river, another similar rock produces a quantity of vitriol solely of a pale yellow, and though the colours green, blue, and yellow, may exist without any vitriolic acid, chemists are very well apprized from experience, that the common iron dissolved in this acid, crystallizes into green vitriol, called copperas, forms blue crystals, with copper, and white crystals, or allum, when united with argillaceous earth, and of the same colour when it dissolves zinc, and produces yellow, when it coagulates with the phlogiston of common sulphur, which abounds so frequently in the three kingdoms of nature. The most remarkable circumstance, is to meet these colours in the Biscay mines, which neither contain copper, alum, zinc, nor sulphur; nor is it an easy matter to account for it, without supposing that the pure elementary water, has a part in composing these crystals, and that its evaporation, either by heat, or air, alters the consistency, and destroys the green colour of the vitriol of the iron, taking away that proportion of water, which constituted it, and that as soon as it loses it, it begins to change colour, and passing through the various tints of green, and yellow, terminates in white, when all the water is gone: when it is come to that state, and has resemblance to flour, it is called sympathetic powder, on account of its styptical quality, so readily staunching the blood, in hemorrhages, and curing of wounds. Whoever chooses to verify this theory, need only to pour water on this powder,

4 O

der,

* A Spanish ducat, worth about four shillings and eight pence, English money.

der, and he will find that it crystalizes anew into green. If it be asked, why these matters do not unite, and form sulphur, when there is so much acid, and iron in these mountains, and the iron contains so much phlogiston? the answer is, that for this event to take place, the vitriolic acid, and the phlogiston, should be perfectly concentrated, and dry; whereas the reverse happens in these mountains, where they are so overwhelmed with moisture, that the abundance of this acid, has perhaps been the cause, of many of the mines above Bilboa, being neglected, as of course they would yield so brittle an iron. This then would be the time to use a calcareous substance, to correct this defect. It is for this reason, the Swedish iron is preferred to the Spanish, as the latter is so apt to redsear; that is, to crack, between hot and cold. At a small distance from this great ferruginous rock, an engineer lately cut away a considerable part of the hill, to improve the public walks, near the town of Bilboa, and as he made a perpendicular cut of about eighty feet depth, he discovered a vein of iron ore, lying in perfect strata, which, at times, dipped in a direct line, and at others, obliquely, bearing some similitude to the roots of a tree, occasionally of an inch diameter, or the size of one's arm, with infinite variety of ramification, according to the more or less resistance of the earth, to the passage of

water; there being no doubt of this mine being alluvial. Here the very circumstance has happened, which Don Antonio de Ulloa judiciously imagined, would follow in the great hill of Potosi, were it possible to lay it open and examine its contents.

It appears therefore, that the mines of Biscay are in veins, strata, and masses. The *Hematites*, so frequently seen in the hollow parts of the veins, are remarkable for their different sizes and forms; when broken, every grain was found to have the shape of a star, which proves solution, deposition, and a slow crystallization. These hematites are exceedingly heavy, and if calcined give proofs of containing two or three times more iron, than the ore of Somorrostro, but of a brittle and intractable nature. Besides these hematites, there are in this mine, many cavities of different sizes, from two inches to two feet, lined with a great deal of ferruginous matter, from one to three fingers thickness; this coating appears to be a true emery, and from hence, issue cylinders of striped hematites, as large as the feathers of a pigeon, two or three inches long, not unlike a hedgehog; others have various and fanciful appearances, that would make objects of singular curiosity in the collection of a mineralogist, or in a cabinet of natural history.

CHAPTER VI.

The Source of the Tagus and its Environs described—Of the barren and wretched District of Batuceao, in Estramadura.

IN going from Molina de Aragon, to the westward, you cross over mountains filled with petrifications, which appearance lasts for two or three leagues. At the third league there is a salt spring which serves the people of Molina. The ascent is continual, through a wood of fir, and over mountains, till you reach the village of

Paralejos on the banks of the golden Tagus, so often sung by the poets, so frequently extolled by historians.

At Paralejos, the Tagus is only fifteen paces wide, and one foot deep. The petrifications are observed again in the village, and the river runs through a narrow channel it has made for itself,

* Hematites, or blood-stone, is a hard mineral substance, red, black, or purple, the powder of which is always red, sometimes of an intermediate figure, and sometimes spherical, semispherical, pyramidal, or cellular, that is, like a honeycomb, consisting of pyramids generally small, the apices of which, appear in a transverse section in the centre. It contains a large portion of iron; forty pounds of

this metal have been extracted from a quintal of the stone, but the iron is obtained with such difficulty, and is of so bad quality, that this ore is not commonly smelted. The great hardness of hematites, renders it fit for burnishing and polishing metals.—*Dictionary of Chemistry, translated from the French. London, 1777.*

* Pyrites is a mineral substance, of a subcubic form, in its great mass, in which it is found in great quantities. From it have been extracted iron, and sulphur, and it is now used in the

between

mine being particularly divided near a hundred feet high. Each mountain is a solid block, without either horizontal, or perpendicular fissure, if we except those casual crevices, occasioned by the enormous pieces which now and then detach themselves, and roll down to the banks of the river. Such as have tumbled down on the south side, have crumbled into good earth, and as the water filters through them, the soil is fertile, covered with grass, and different sorts of plants. The opposite mountain is bare, without moisture, earth, plant, or moss, being a stupendous rock resting on a bed of marble, mixed with white gypsum, veined with red, and prismatical stellated spots. About three quarters of a league to the southward of Peralejos, you meet the highest hill in those parts called Sierra Blanco; its top is capped with calcareous rock, its body of white stone, not calcareous, decomposed in the same manner as the former, with veins of imperfect jet, of the thickness of one's finger, with soft grainy pyrites* of the colour and odour of those found in the clays of Paris. Veins of bituminous wood extend from a finger to a foot in thickness, and contain pieces of jet, as large as one's head, others less, but always with vitriolic pyrites, dispersed in the very substance, and interstices of the jet. It seems clearly to be wood, as some pieces have still the bark on, exhibiting the knots, fibres, and other parts, with little alteration, still preserving their ligneous origin, mixed with that which composes the true and solid jet. What is still more extraordinary, veins of a lead mine are likewise found in it, following the oblique, or direct crevices of the wood, while other veins of lead traverse its fibres, in a perpendicular line, as well as horizontally, and some small lumps are fixed in the very substance of the wood. In a word, the four principal orders in mines, may be observed here in a small compass, as it were in miniature, viz. perpendicular veins, cross veins, strata, and masses. These veins are the more extraordinary, if we consider the manner in

which the metal must have introduced itself into the timber, for it cannot be said to have made its way through the pores, when the lead was in a fluid state, because pieces of wood are found, whose exterior parts do not shew the least particle of lead, yet on breaking them, some portion of this mineral is discovered within, which could only introduce itself there, when the sap first formed the wood, and made shot of the lead, that runs from it; which serves to kill hares, partridges, and other kinds of game, with which the country abounds. The source of the Tagus is about a league from the hill of Sierra Blanca, in the highest situation of Spain, for the waters of this river run down to the ocean, and those of the Guadalaviar, whose source is contiguous, fall into the Mediterranean. The waters called *Vegas del Tago*, are at a league and a half from hence, in a valley, formed by a river, which has its source in a copious spring, called *Fuente de la Abrega*. This brook, for here it deserves no better appellation, meanders so often, that it must be crossed four times in the space of half a league. Many have thought the source of the Tagus was at *Fuente Garcia*, which is five leagues higher up, but Mr. Bowles assures us to the contrary, adding, that *Fuente Garcia* is a trifling spring, which he covered with his hat, being no more than a small quantity of water, collected in the trunk of a hollow tree, placed there to hold what issues from a puddle of standing water; which three paces further, loses itself in the adjacent valley, without a drop of it reaching the Tagus.

Half a league from *Fuente Garcia*, there is a salt spring which supplies the town of Albarracin, and eighteen villages in its jurisdiction, with salt. The country from hence to the true source of the Tagus, is an elevated plain, rather uneven, with a good carpet of grass, and a great many brambles, whose berries afford an ample repast for the black birds. It is also well stocked with that tree called in Spain *Cedro Hispanico*, the juniper thurifera of Linnaeus, a tall stout tree, with ber-

by some marcasite. Perhaps no other kind of natural body has had so many appellations. Persons curious to know the other names less used, may find them in Henckell's Pyrologia; we think with that celebrated chemist, that the subject has been perplexed by this multiplicity of names, for before his great and excellent work, the notions concerning Pyrites were very confused and inaccurate.—*Dictionary of Chemistry.*

ries.

* Pyrites is a mineral resembling the true ores of metals in the substance of which it is composed, in its colour or lustre, in its great weight, and lastly, in the parts of the earth in which it is found, since it almost always accompanies ores. From the property of striking sparks from steel, they have been called Pyrites, which is a Greek word signifying fire stone; they were formerly used for fire-arms as they now use flints, hence it was called carbine stone, still

ries like the juniper tree of the large sort. The snow remains on the ground in these cold regions, until June, and the country is a continued chain of hills, known by the name of *Sierra*, replete with various singularities. From *Perales* hither, different petrifications are found, sometimes in the rock, and at others in the earth. If the sea deposited them there, it will be difficult to explain how this should have happened in the highest situation in Spain.

To return to the *Tagus*: this noble river passes by the royal palace of *Aranjuez*, the city of *Toledo*, *Almaraz*, and *Alcantara* in *Estramadura*; then enters *Portugal*, at *Abrantes*, and rolls its waters with dignity into the ocean at *Lisbon*. *Philip II.* opened the navigation of the river; the first boat dispatched by his majesty arrived at *Aranjuez*, from *Lisbon*, January 19, 1582, and then returned to *Toledo*, to proceed down the river again; but successive events, and an alteration of dominion under *Philip IV.* put a final period to these improvements.

The territory of *Batuecas*, situated on the confines of *Castile* and *Estramadura*, near *Portugal*, has given ample scope to the fanciful conceits of different writers, relating to its imaginary discovery, and whether or not, as supposed, it was an unknown land, inhabited by *Pagans*, blinded by ignorance, without the least knowledge of the *Christian* religion. This district, which we are now going to explore, is fourteen leagues to the southwest of *Salamanca*, about eight leagues eastward of *Ciudad Rodrigo*, and twelve to the northwest of *Placencia*, forming a plain, or more properly, a most dismal and horrid gully at the foot of that famous mountain, where stands the noted convent called *La Penu de Francia*. The situation of this place inspires every idea of gloom and melancholy, closed in by jagged mountains, where hardly a tree is to be seen, or the least appearance of vegetation: on the contrary, numberless precipices, occasionally choaked up by broken masses of stone, detached insensibly from the rocks, form the most frightful scene the mind can conceive. Such is the true state of *Batuecas*, horrid by nature; rendered still more so, by ignorance and folly. The itinerary from *Placencia* to *Aigal* four leagues; *Mohedas* one; *Casa de Palomero* one; *Cambrancio* two; *Vegao de Coria* two; *Las Mestas* one; and to the convent of *Batuecas* half a league.

Between *Placencia* and *Aigal*, the hamlets of *Oliva* and *Gijo de Granadilla*, appear on the right, and *Santibanez el Baxo*, on the left, with woods of oak and cork trees. You cross the river *Ambroz*, or de *Caparra*, and pass by the *Puerto del Gamo*, before you reach *Casar de Palomero*. Then enter the melancholy district of the *Jurdes*, being a division of what is generally called *Batuecas*; but in any part of this wretched country, if you ask whereabouts is the *Jurdes*, some will tell you, a little further on, and when you proceed, another informs you, it is at a small distance behind; nobody being willing to acknowledge himself an inhabitant of the unhappy country of the *Jurdes*.

The town of *Alberca* is the principal place in the territory of *Batuecas*, and not above a league distant from this valley: the whole of this district may properly be reduced to an intersected valley of about a league in length, sometimes so confined as just to leave room for the passage of the river that gives name to the valley. This then was that unknown country so surprizingly dreaded, where it is certain no other dwelled but a few wretched shepherds, and some miserable peasants in forlorn huts, surrounded by precipices, divested of all intercourse with their neighbours, in a wild romantic situation, which the most fanciful pencil would find difficult to delineate, or even the language of *Shakespeare* to describe.

The other valley called, "of the *Jurdes*," which may be about four leagues long, and three in breadth, yields not to the former in wretchedness and misery. During the whole journey from *Alberca* to *Batuecas*, nothing is to be seen but repetition of jagged and ill-shapen rocks, with their rugged peaks, like so many turrets and battlements, towering one over the other, as far as the eye can extend, forming dreadful gullies when the river forces its way, whose waters are clear abounding with trout, and having grains of gold in its sands, which the peasants know well how to look after, and sell at *Placencia*, *Ciudad*, *Rodrigo*, and *Salamanca*, which is a great resource to them in this sorrowful vale; where, during winter, the sun's rays can hardly penetrate for above four hours in the day. To increase still further the horror, the hills are perforated with dismal caves one above the other, and some so extensive, that three or four hundred sheep may easily take shelter there: to complete this picture of distress

et it suffice to add, that this country is the resort of numerous birds of prey, and affords shelter to bears, wolves, wild cats, and weazles, which destroy all the hares and rabbits, with the addition of snakes, serpents, and many noxious reptiles, particularly one sort of serpent, which starts at its prey with great violence, and perhaps may be of that species called *Jacula*, or *Jacula serpens*, described in the acts of the Leopoldine academy, which mentions one of these to have darted from a ditch, to a considerable distance, and fixed itself upon the arm of a peasant. But why need I enlarge any further on so dreary a spot, or describe so barren a country, where even grass is not to be seen! here and there solitary cistus, and nothing but furze, the only

resource of goats and some bees, who are of service merely on account of their wax, as their honey is neither valuable for its colour nor flavour, having all the bitter taste of their food.

In this wretched country the Carmelite Friars pitched upon a little plain on the banks of the river, and built their convent in 1599, but their house has nothing worthy of description; and though the very sight of a distressed traveller at their gates, should be sufficient to engage the benevolent minds of these holy fathers, they are seldom in a hurry to open their doors, and none are admitted or entitled to hospitality, but such as are provided with letters of recommendation and positive orders from the provincial or general of their order,

CHAPTER VII.

The Convent of Juste, in the Vera of Placencia, famous for the Retreat of the Emperor Charles the Fifth—Remarkable Objects in the Course of a Tour from Guadalecanal to the City of Seville—Journey from Merida to Malaga.

AFTER quitting the city of Placencia, and crossing the river Xerte, you pass over the hill of Calcones, opposite the city, then descend into the territory of the Vega, leaving on your left the villages of Garguém, Barrado, and Arroya Molinos; you next go through the village of Pasaron, five leagues from Placencia, and come to a pleasant situation called La Magdalena, where there is a good farm house, which formerly belonged to the Jesuits: you are now a league distance from Juste, and to go there you traverse a woody country with a few chestnut trees, and pass several brooks, where they catch excellent trout. The convent of Juste is situated nearly in the centre of the Vera, on the brow of a steep hill, which protects it from the north wind, and with other mountains forms that chain which is called the Puerto de Tornavaças, joining with the hills of Arenas, Puerto del Pico, and others. Neither the convent nor church have any thing remarkable, and would have passed on to future ages in oblivion, had it not been for the distinction shewn them by the great emperor who ended his life in this solitary place. Over the largest altar in the church, they have a copy of that famous picture called

the glory of Titian, which stood formerly here, and was removed to the Escorial by express command of the emperor, who ordered that the original should be fixed in the same church with his remains. The following inscription is seen on the wall, in a corner of the garden, under the arms of the emperor.

“ EN ESTA SANTA CASA DES. HIERONIMO DE JUSTE SE RETIRO A ACABAR SU VIDA, EL QUE TODA LA GASTO EN DEFENSA DE LA FE Y CONSERVACION DE LA JUSTICIA, CARLOS V. EMPERADOR REY DE LAS ESPENAS, CHRISTIANISIMO, INVICTISSIMO. MURIO A 21 DE SETIEMBRE DE 1558.”

That is, “ *In this holy house of St Jerom of Juste, ended his days, he who spent the whole of them in defence of the faith, and in support of justice, Charles V. Emperor, King of Spain, Most Christian, invincible. He died on the 21st of Sept. 1558.*”

These are the only traces left here of that great emperor, who once filled the world with the glory of his deeds. The ruined decorations of the garden and ponds seem to intimate their pristine state in happier days, and the several plan-

tations in the Vera, watered by numberless brooks, might once have exhibited a more pleasing appearance.

A distinction must be made between the *Vera of Placentia*, and the *Valle de Placentia*. The valley extends from the city to the Puerto de Tornavacas, upon a straight line from east to north, the length of nine leagues, and so level, that the whole extent lies open to your view, as far as the Puerto, closed by high mountains, dividing on the right the *Vera* from the *Valle*, and on the left the hills between the valley and the road to Banos, and finally those of Tornavacas, whose high tops are always covered with snow.

The villages belonging to the valley are Asperilla, Casas del Gastanar, El Torno, Valde Astilla, Cabrero el Rebollar, Navaconcejo, Cabezuela, Badillo, and Xerte, which gives name to the river, as Tornavacas does to the Puerto, but at present every branch of cultivation is at the lowest state, without even the appearance of an orange or a lemon tree, if we except two or three blighted ones at the convent of Santa Cruz de Tabilla, where the country is a desert: and what is still worse, the mountains and passes are filled with assassins and robbers, to the great terror of the inhabitants and travellers. The *Vera* is no better, and affords the most melancholy aspect imaginable*.

In travelling to the eastward from Guadalcanal you come in two hours to the town of Alanis, which gives its name to a lead mine about half a league from it to the south east, which at present is abandoned.

Going forward from this place brings you to Cazalla, where there is a mine about half a league from the town, at Puerto Blanco. The vein does not appear above ground, but a few feet from the surface there is a stratum of extraneous earth, different from the other earth seen hereabouts. In this mine they find virgin silver, copper pyrites in the quartz, and a little iron.

* Amongst the various experiments to destroy the worms that ruin the chestnut trees, fire was the last expedient, inasmuch that the trees, scorched and half burned, now resemble the oaks struck by the thunder of Jove, instead of the golden age of the poets, and their whole agriculture is reduced to the sowing a few peas, with some miserable scraps of a vineyard.

† Some years ago an inhabitant of Constantina undertook

Two leagues and a half from Cazalla, there is a high mountain called *Fuente de la Reyna*, where the Constantina mine is to be seen, so called from a village of that name, about two leagues distant, and not derived from the emperor Constantine, who never was in Spain, nor was the founder of it, according to the popular errors which prevail on that subject. In former times this mine was worked with great judgment, as appears from the remains of their shafts and galleries. The vein runs from north to south across the direction of the slate, and as the miners term it, has its hat of iron, with pyrites and blend of silver and lead in the spar. Lower down they found silver, called by the Spanish miners *Plata helada*, "frosted silver," and a mine of lead in a small tessallated form†.

Two leagues west of Cazalla, there is a copper mine, at a place called *Canada de los Conejos*, which from its appearance should be rich, the vein running from north to south in a pyritous quartz. Half a league from Cazalla there is a mine of vitriol, at *Castunarcos*. The stone is pyritous and ferruginous, with deep efflorescences or spots of a greenish yellow, and a kind of white powder, which is vitriol divested of the water that crystallizes it.

After crossing a mountain, two leagues in length to the westward of Cazalla, you come to *El Real de Monasterio*. Half a league from this place, there is a mine of black lead proper for pencils, a species of the *molybdena*, but not of the true sort of *molybdena nigricia fabrilis*, like that from Cumberland, so famous abroad, that in France it goes by the name of *crayon d'Angleterre*; they give the name of *lapis* in Spain, to those black lead pencils, a term they likewise apply very improperly to black chalk used for drawings, which is a soft stone called *ampelitia*.

The country about Monasterio abounds with good oak, of which there is a wood of about a league square, with a great many cork trees, from which they strip off the bark every four years, as far as a white sap which they leave on

the working of this mine, sunk two shafts, and made galleries on the top of the hill, but abandoned it soon after, perhaps for want of skill, or sufficient capital to go on with the works, though it was thought to deserve more attention, as the ore was good, and they had fuel at hand, with a brook at the foot of the mountain, in a fruitful country, with plenty of vineyards.

the tree. A liquid humour afterwards issues out again, which thickens with the sun and air, and forms a new bark in about four years more*.

From Real de Monasterio it is a journey of three hours to Callero, about a mile from whence there is a round insulated hill, capped with a vein of calcareous stone running from north to south, where there are both white and grey load-stones. There is also an iron mine divested of any magnetic quality. The whole country is covered with oak and cork trees, some of which are so bulky as to be 50 feet in diameter, but most of them, as well as the oaks, are hollow within, from having been improperly stopped.

Leaving Cazalla and crossing several bleak mountains, it requires nine hours to reach Cantillana, on the banks of the Guadalquivir, the Sierra Morena terminating three leagues before the narrow pass of Montegil. After crossing the river at Cantillana, the face of the country is totally changed; the terebinthus, cistus and lentiscus are seen no more, nor the mountainous plants observed before between Almáden and this place, from whence one may conclude that hitherto the soil was much of the same nature, for in coming from the Pyrenees to the southward, these sierras are common, but going northward towards France, it is just the reverse, and no real mountains are to be seen in the interior parts of that kingdom, the country consisting chiefly of strata of earth one over the other.

An extensive plain reaches from Cantillana to the city of Seville, which requires five hours to pass over, consisting of poor land, without any stones, but producing a great deal of dwarf palm, or palmetto, which covers the ground like fern: the leaves being tied together serve to make besoms sufficient to supply the whole

* When the bark is taken off, it is piled up in a pond or ditch, and loaded with heavy stones to flatten it, and reduced into tables, from whence it is taken to be dried and tied up in bundles for exportation, being then in a proper state for the different purposes for which cork is applied.

† In this plain there is a great number of olive trees, whose trunks are scarcely any thing better than bark, from their bad method of planting these trees, they doing no more than taking a stake of an olive tree, of the size of one's arm, slit at the bottom six inches into four parts; they put a stake between the slits, and then set it about two feet under ground, making a trench round it to keep in the water; the top of the stake being uncovered, the rain penetrates that way, and by degrees with the warm air rots the inside.

kingdom; two sorts of wild asparagus also grow here with a very thin skin, one green and the other white, which before they bud their leaves have a multitude of flowers as white as snow†.

The ancient and famous city of Seville has been fully described by modern travellers; its streets are paved with pebbles brought from a great distance, for there are none hereabouts. The old Roman walls which are of earth are now so well cemented, that they are become as hard as stone. In the Alcazar, a palace built by king Peter in the fourteenth century, there are baths which were designed for his favourite Dona Maria de Padilla, in a retired situation shaded with orange trees, which still continue to give fruit‡.

In the winter season storks are very numerous in Seville, almost every tower in the city is inhabited by them, and they return annually to the same nests§. The cathedral of Seville is a fine gothic building, with a curious steeple, or tower, having a moveable figure of a woman at top, called *La Giralda*, which turns round with the wind. This steeple is reckoned one of the greatest curiosities in Spain, and is higher than St. Paul's in London||. The first clock made in the kingdom was set up there in 1400, in presence of king Henry the IIIrd, when the oldest clock we have in England that is supposed to go tolerably well, is in the palace of Hampton Court, and of the year 1540. Nothing can be more delightful than the prospect of the country round Seville, beheld from the steeple above-mentioned, its beautiful and fertile plains, with its delightful gardens and orange groves, convey every idea of fertility and pleasure, with the addition of the river Guadalquivir, which brings ships up to the walls of the city.

It is a journey of seven hours from Merida to

‡ The *solano* wind or south-east, is very troublesome here and all over Andalusia, turning the head and heating the blood in such a manner as to cause various excesses, and were not precautions taken to prevent its effects, they would still be more sensible in youth of both sexes.

§ They destroy all the vermin on the tops of the houses, and pick up a great number of snakes, so that they are welcome guests to the inhabitants, and looked upon with peculiar veneration. It is said in some parts of Spain, that if they do not appear by St. Agatha's Day, (the fifth of February,) the people fling stones at them when they come and drive them away.

|| This beautiful tower is 350 feet high. St. Paul's in London, 344. St. Mark's, at Venice, 337 feet. Salisbury steeple, 400 feet; and St. Peter's, at Rome, 432 feet.

Talavera

Talavera* through a sandy plain, traversed by the Guadiana, which has a great many islands covered with flocks of sheep, and numerous herds of cattle, that are often carried away as well as the shepherds by the sudden increase of the river: the plain from Talavera to Badajoz produces nothing but broom. At this last city the soil changes again, and the calcareous earth, stone, and rocks make their appearance once more. Estremadura is the only part of Spain where they have neither salt springs nor rock salt, which obliges the inhabitants to procure those articles from their neighbours. This large and fertile province, reputed about fifty leagues in length, and forty in breadth, so happily situated for every branch of culture, and where the Romans seem to have taken such delight, is now thought not to contain above a hundred thousand inhabitants, a number comprised in many capital cities; but if their numbers are small, they value themselves on the quality of their heroes, having furnished a Cortez, a Pizarro, and the unfortunate though great Velasco Nunez de Balbao.

The ancient city of Badajoz, the *Par Augusta* of the Romans, called *Badaugos* by the Moors, and now Badajoz, is the frontier town next to Portugal. The bridge over the Guadiana has twenty-six arches, and was built by Philip the Second. Numerous families of negroes and mulattoes are settled in this country between Badajoz and Zafra.

Proceeding from Zafra to Sta. Marta, the country improves for about five leagues to Zarza del Angel; then you pass by Monasterio to Puente de Cantos, where the Sierra Morena

* Different from *Talavera de la Reyna* on the Tagus in New Castile, famous for its fine earthenware and silk manufacture: these belonged to the crown till sold in 1762, to a merchant of the name of Ulstariz, for 7,410,000 reals, value £83,362 10s. sterling. Their annual consumption is 21,000 lb. of silk, 4000 marcs of silver, and 60 of gold, having 336 looms, and about 1438 workmen, chiefly Spaniards. They make annually 55,000 varrs of gold and silver lace, 560,000 varrs of ribbands, 5000 pairs of silk stockings, 32,000 varrs of taffety, 8200 varrs of velvets and velverets, 2300 varrs of gold and silver stuffs, 3000 varrs of velverets mixed with silk, 10,500 varrs of damask, tabbies, &c. exclusive of gold and silver twist buttons, handkerchiefs, and other less articles. The greatest encouragement is giving to the raising of mulberry trees for the silk worms; many plants of which have been distributed by the proprietor, at his own expence, to all the villages round him.

begins: Sta. Olalla is the first village in the kingdom of Seville, it being a dismal and melancholy journey of ten hours over these dreary hills to Castel Blanco, with the same plants as at Almaden, to which may be added the wild germander. Considerable efforts have been made to improve the waste lands of this horrid Sierra, and give a new face to the country, for which purpose foreigners have been invited to settle there, and great exertions have taken place for some years past. In 1767, eleven towns and five villages were already formed in the Sierra Morena, as well as four towns and fifteen villages in that part which divides the kingdom of Cordova and Seville, making all together 2460 families, consisting of 10490 persons, of which 8173 were labourers, and 2217 mechanics, exclusive of journeymen and servants. They have built twenty-four parish churches and chapels, 2200 houses, and fifteen inns, planted 200,000 olive trees, above half a million of mulberry trees, and as much more of various kinds of fruit trees, elm, vine, &c. their harvests consist chiefly of wheat, barley, peas, and beans, producing one year with another five hundred thousand *fanegas*; the vines begin to prosper, and are expected to become a considerable object, and they have moreover established many branches of silk and woollen manufacture.

After traversing the Sierra Morena it is no small relief to enter the extensive and fertile plain of Seville, which leads to that capital city, and makes some amends to the traveller for the scene of desolation he has passed. Going through a beautiful country for three days, you come to Antequera, situated on a hill at a league distance

They have remarkable processions here at Easter, which go by the name of *mondas de Talavera*, when all the country people assemble and form a procession with garlands of flowers, each division guided by a person carrying a staff covered with flowers at top, and making an offering of them to the Blessed Virgin, according to the custom of the Pagans, who used to do the same to their gods; perhaps the difficulty of abolishing these ceremonies, says Don Antonio Ponz, has engaged the clergy to convert them into obsequious rites to the Blessed Virgin, as the church has wisely done with other heathenish customs equally difficult to eradicate. *Piaje de Espena, tom. 7. Madrid, 1779.*

Two leagues from *Talavera de la Reyna* you find *Talavera la Vieja*, famous for the remains of a temple as well as several Roman inscriptions and other antiquities, which have been described and published with copper plates, at Madrid, in 1762, by Don Ignacio de Hermostilla at the secretary of state's office for the West India department.

from a high mountain, consisting of an entire block of flesh-coloured marble, which must be crossed on horseback, to go to Malaga; several springs which issue from it form themselves into rivulets.

The hills are covered with vineyards, and as you descend into the low lands, the eye is enchanted with the most beautiful objects; the dreary month of January in a northern climate here a scene of delight; which continues to Malaga, an ancient and celebrated city, taken

from the Moors, in 1487, by Ferdinand and Isabel, after a most vigorous defence, and having been 772 years in their possession. A city not less remarkable for its opulence and extensive commerce, than for the luxuriance of its soil, yielding in great abundance the most delicious fruits; whilst its rugged mountains afford those luscious grapes which give such reputation to the Malaga wines, known in England by the emphatical name of *Mountain*.*

CHAPTER VIII.

Describing the Country between Malaga and Cape de Gat—Excursion from the City of Granada to Cordova and Anduxar, in Andalusia—Observations made in a progress from Cadiz to Carthagea—The face of the Country between Carthagea and Alicante.

THE first remarkable place eastward of Malaga is Velez Malaga. A few leagues further is the little port of Herradura†.

Further on Motril is another little sea-port. In different parts of this coast, almost as far to the westward as Gibraltar, there are above twelve sugar-mills, called Ingenios. In Motril only there are four of them, which cost at least eighty thousand pistoles each, sugar having been made here time immemorial, as perfect, according to the opinion of good judges, as any imported from the West-Indies, which is not so extraordinary when we consider that the first slips of the cane were sent from thence to the Canary Islands, from whence Nicholas de Ovando, governor of Spaniola, introduced them, in 1506, into his government, where they thrived surprisingly: in Spain their cultivation is disregarded.

These valuable mountains have moreover a peculiar advantage, that the drought which is so prejudicial to corn, amends principally to the goodness and flavour of the cane, as the surrounding mists afford every necessary refreshment, and are more serviceable than rain, which would injure the roots, by washing away that light coat of earth with which they are so springily provided. Here are produced those excellent and remarkable potatoes peculiar to this district, and in so great esteem in other parts of Spain: they are equally an American production, though different from the common potatoe, which is only known of late years at Madrid, and not in any other part of the kingdom, except Galicia, where they are common, as having been first brought there by the Spaniards. About three miles to the westward of Malaga, there are

With respect to sugar, it has been neglected through political motives, and the canes have been rooted up to make way for the vine; even the pine-apple, which was first introduced from the Spanish settlements, was unknown in the royal gardens of their monarchs till within these few years, that Boutelou, the king's undergardener raised them at Aranjuez.

From Motril to Almeria you range along the mountains, many of which are of marble to the very summit, the strand is level and sandy, with very little earth, except near Almeria. They make salt-petre at the first boiling at Almeria, which is sent to Granada to undergo a second process, without the assistance of fixed alkali, nor does the earth from whence it is collected contain any gypsum.

About half way towards Cape de Gat there is

gardens about a hundred paces from the sea, and on a level with it, inclosed with the Indian fig or prickly pear, and with the aloe, whose sharp pointed leaves serve as an excellent fence against cattle. Further on to the westward, about two leagues from Malaga, there is a cavern where the water forms enormous pieces of calcareous spar, which takes a beautiful polish, and much of it has been used in the royal palace of Madrid.

† This town is not laid down on Lopez's map of Spain, but may be seen on the French chart of the Mediterranean, dedicated to the duke of Choiseul in 1764, by Joseph Roux at Marseilles, hydrographer to the king, and is an exact copy from Michelot, who was pilot of the galleys to Lewis the XIVth.

a large plain so full of garnets that a ship might be loaded with them; they are likewise to be found in a gulley formed by the waves at the foot of a hill in that neighbourhood. The sea sometimes throws up worms hereabouts four or five inches long, and one broad near the belly, with circular loins and the body divided into ringlets, which emit a purple liquor flowing from every part when cut in pieces.

The famous mountain of Filabres is about three leagues from Almeria, but it takes ten hours in going to it, the road is so turned by the many hills to be passed before one reaches it*.

On the side towards the village of Machael, lying at the foot of this mountain, a great part of the kingdom of Granada is discovered, which is mountainous, and resembles the waves of the sea in a storm. On the other side the mountain is cut almost perpendicularly, and from its prodigious elevation affords a most awful prospect with the city of Gandia, which, though at a distance, if considered with a bird's-eye view, seems only half a league off. The Sierra de Gador is another immense mass of marble, of which they make excellent lime. It dissolves entirely with acids, without leaving the least residue of clay or other matter, whereas the stone in other parts of Spain, particularly in Valencia, has a mixture of clay or sand.

Cape de Gat is a huge promontory consisting of an enormous rock, of a singular nature, different from any other appearance in Spain, eight leagues in circuit and five broad; the first object that strikes the eye is a rock two hundred feet high, and about fifty paces from the sea, all crystallized in large stones of the size of a man's leg, with four or five plates chased one within another of a rincreous colour, from eight to fourteen inches long, with a large grain that will take a good polish. Precious stones are said to be found in the mountain of Bujo, in a cavern with an entrance about fifteen paces wide and twenty feet high, where the agitation of the waves is very great in bad weather: Mr. Bowles went in there but could discover nothing of consequence. On the outside a large white patch serves as a land mark to mariners, and from thence called *Vela*

* This amazing and stupendous mountain is a solid block of white marble about a league in circuit, and two thousand feet high, without the least mixture of any other stone or earth, the marble appearing in many places where neither

Blanca. This is what is properly called Cape de Gat. Near the *Torre de las Guardas* there is a bed of jasper of a white ground veined with red, and further on, near the *Torre de Nese*, a lower rock is seen almost covered with a stratum of white cornelian. In the centre of this promontory there are four hills near to each other, called the Sacristan, the Two Friars, the Captain, and the White Mountain, but nothing remarkable is to be observed from their outward appearance. The other side of the promontory, after passing these four hills, is called *El Puerto de la Plata*, where the Moorish Corsairs lie lurking for Spanish vessels to intercept them, and carry their crews into dire captivity. There is a rock near this *Puerto*, which extends towards the sea, and is called *El Monte de las Guardas*, where they find amethysts, but still more abundantly in a stratum of quartz of very difficult access, being in a precipice twenty feet high. The true amethyst resembles a pyramid reversed, while the rock crystal has six faces, and is larger at bottom than at top.

In going from Granada to Andalusia, the first stage is at Loxa, a journey of ten hours, through that beautiful plain called *La Vega de Granada*, and then ascending a mountain, through another cultivated vale. Loxa is a middling town pleasantly situated on a high hill of conglutinated stone, which forms a kind of breccia or pudding-stone, in the centre of olive ground having plenty of fruit, notwithstanding its elevated, cold, and dry situation.

From Loxa to the westward, the country is fertile, producing wheat and barley, in a light soil well furnished with oak. The soil of the hills seems to proceed from the decomposition of former rocks, many of which appear in broken lumps, intermixed with the arable land. Alameda is the first town in the kingdom of Seville; a few corn fields are seen in the low lands, but in general the western boundaries of Granada are made up of steep rocks and craggy mountains. The *Solano* winds prevail much here, and do a great deal of mischief, destroying the harvest if they blow early in the season†.

The country is extremely pleasant to Herr-

the wind, rain, nor any of those causes which destroy the hardest rocks, have yet made the least impression.

† The country people are fond of tobacco, and they have near them those excellent wines of Malaga

called Cape de Gata, there is a fertile soil, so common in other parts of the kingdom. Estepa, about a league from Herrera, stands in a picturesque manner, on the top of a hill surrounded with olive trees. The olive of Estepa is small, but delicious, and gives an oil as clear and delicate as that of Valencia*.

The olives are gathered from the middle of October to the middle of November. If a good year they sell from 20 to 24 reals the arroba (about 5s. 4d. sterling) but in years of scarcity will rise to 36 or 40 reals. A *fanega* of olives will yield an arroba of oil. In the South of France they are not gathered till they are perfectly ripe, and have acquired a reddish hue inclining to black; if this period passes, they wrinkle, moulder, and rot. Those that are green, give a bitter taste to the oil, and they carefully separate such as are worm-eaten, which would vitiate the flavour of the sound ones, they grind them as in Spain, then the substance is laid under the press; the first juice that runs out is called virgin oil, and is the most delicate for the table, its goodness arising from the freshness of the fruit. The second sort is obtained by pouring boiling water on the substance remaining in the press; but this oil is like that of Spain, acrimonious, and subject to corruption.

It is five hours journey from Herrera to Ecija, agreeably situated, but one of the hottest towns in Spain. The horses of Ecija are reckoned the best in Andalusia; and remarkable for the goodness of their hoofs, owing to the dryness of the ground, while at Seville, and in the flat country on the banks of the Guadalquivir, they are spongy, and liable to crack in hot weather; but in point of shape, the beautiful horse of Cordova is the most perfect, though of late their studs are greatly neglected.

Xerez, they seldom or ever drink them, preferring distilled liquors, without any visible prejudice; for the men are robust, and the women have good features, with lively sparkling eyes, full of expression and fire.

The Seville olive, though often as large as a dove's egg, does not yield near so good oil, for which reason they are more frequently pickled. Even so far back as the days of Cicero they were in high estimation, for in writing to his friend in Andalusia, he compliments him on being intendant of so fertile a province, and reminds him to send him some Seville olives to Rome. They are very careless notwithstanding in making their oil, leaving the fruit a long time collected in heaps, so that it rots before it is ground, part

Nothing can be more delightful than the face of the country from Ecija to Cordova, a space of nine leagues, yet without a single village, or even a spring; for which reason they must have a great deal of rain to have any crop: but when they are blessed with plentiful showers their harvest is very great. The city of Cordova is seated on the banks of the Guadalquivir, about a league from the Sierra Morena, and has ever been famous for the magnificence and splendour of its nobles. Even the Jews in former times are said to have vied with the others in pomp and parade. Its cathedral is famous for its antiquity and structure, with numerous pillars of different marble, which seems to have been taken from old Roman structures. The country from Cordova to Anduxar is extremely well cultivated, and beautifully varied with corn, olive, and vines.

The city of Cadiz is built on a peninsula upon rocks, stretching out into the sea composed of a great variety of matter, such as marble, spar, pebble, and shells incorporated in the sand, and combined together by a glutinous substance in the sea, which seems powerful in this place, as may be observed by the rubbish thrown into it, insomuch that bricks, stone, sand, shells, &c. after a certain time become consolidated and form one single mass. In old Spanish chronicles is called *Calia*, from whence our English mariners generally call it Cales.

The *Salano* wind is still more troublesome here than in Seville, and when it has blown for eight or ten days, introduces such an acrimony into the blood, and causes such a tension of the fibres, as to have the most alarming effects on the fair sex, with very unpleasant symptoms, like the Sirocco in Italy.

In the capuchin's garden there is a dragon tree, supposed to be the only one in the kingdom, though it grows naturally in the Cape de Verde

of the oil turns into mucilage, and acquires a rank and disagreeable flavour, and as there are few mills in proportion to the quantity of fruit, each person is obliged to wait for his turn, sometimes for months, from whence in this warm climate a fermentation ensues, which of course occasions bad oil. Others deceive themselves through a principle of avarice, for though the olive yields more juice from having lain by for some time, it is at the expence of its quality, such thin fermented matter hardly deserving the name of oil, for which reason, and from their little care in putting it into proper vessels, and carrying it about the country in skins, the oil in general is wretchedly bad at Madrid,

islands,

islands, as well as at the island of Madeira. Modern writers have fully described the extensive commerce, affluence, and hospitality of the citizens of Cadiz; they are badly supplied with water, and their flesh market is indifferent, but the bay affords them a variety of excellent fish.

Port St. Mary is a large and handsome city, on the north side of the bay, from whence it is a journey of three leagues to the city of Xerez, remarkable for its excellent wine so well known by the name of *Sherry*.

Medina Sidonia is six leagues from Xerez, then the city of Arcos, seated on a craggy rock, at the foot of which runs the river Guadalete; a route of ten hours through a stony country leads to the village of Algodonales lying under a high mountain pierced through from east to west.

The city of Ronda is six leagues from Algodonales, on a very high situation, it being a continual ascent from Xerez, which continues as far as Gibraltar: the country about Ronda is remarkably fertile, and supplies Cadiz with all kinds of fruit and vegetables, the soil is of a reddish colour with pebble, and resists the heat of the fire, for which reason it is much used in furnaces for fusing iron*.

The district of Ronda furnishes the fierce bull, the ravenous wolf, and other noxious animals; its rocks serve as a retreat for the eagle, the osprey, and kite; yet notwithstanding such numerous enemies, its soil makes ample amends by its unbounded fertility.

The *Sierra Vermeja* is a range of hills which runs westwardly towards Malaga, and affords a singular curiosity; for though they run parallel, and so close that their bases join, yet one is red and the other is white; snow will not remain on the highest, while it constantly covers the other. The waters of the white hill are martial and vitriolic; those of the red sulphureous, alkaline, and with a strong smell like those of Cotterets in France. Near this place is the last village on the Carthagena side.

* Amongst other curiosities with which the country of Ronda abounds, that little animal called the gennet is one of the most extraordinary, and not to be found in any other part of Europe except Turkey. It is smaller than the civet, has a long body, short legs, a sharp snout, and a slender head; under its tail there is a long bag, which emits a perfume. Its fur is soft and glossy, of an ash colour marked with black spots, which unite upon the back and form stripes which run longitudinally from the neck backward, with a long tail diversified with ringlets of black and white:

Near Lorca there are two ancient mines of lead and copper, and in the *Sierra* towards the sea near Carthagena, the village of Almazara is famous for its fine red earth without any mixture of sand, and is a principal ingredient used in Spanish snuff, to give it that fine colour and softness to the hand; and to fix its volatility. It is sometimes called after the name of the village, but more commonly *almagre*, and is likewise used in the glasshouse of St. Ildefonso instead of *tripoli*, to give the last polish to glass, as others use *colcothar of vitriol*, the *caput martis*, or residue left at the bottom of the vessel after the distillation of vitriol. Near Almazara the remains of a silver mine are to be seen, which in former times is reported to have yielded great quantities of silver. A plain of six leagues with reddish soil, like the neighbouring hills, leads to Carthagena, and is so fertile in corn in rainy seasons, that it produces sixty for one; but this seldom happens, as the country is frequently scorched up, and they suffer from droughts; however their plentiful harvest of *barilla* makes them ample amends, requiring little water, and being in great demand in England, Ireland, and France, for making crystal glass, hard soap, and for bleaching. Besides these advantages, the kingdoms of Granada and Murcia, yield together annually 700,000 lb weight of raw silk, which is now totally consumed in the manufactories of Spain. They make cables in the arsenal of Carthagena with hemp from the kingdom of Arragon, the use of which was introduced under the direction of admiral Don Jorge Juan, and they imagine them to be equal in goodness to any imported from abroad†.

In going from Carthagena to Alicante, you cross the rich vale of Murcia, covered with mulberry trees, and pass through a delightful country to Orihuela and Elche, remarkable for its numerous groves of palm trees, the branches of which are a lucrative article of trade. The fer-

the fur was formerly in esteem, but of late has been counterfeited by tinging grey rabbit skins with black spots, and is now out of fashion.

† Amongst the stone at the bottom of the harbour, the fishermen bring up the *Pholades*, which a few years ago were not known there, the people not suspecting they could subsist in the centre of these rocks, without any visible aperture to get in at; at present they are searched as a delicate morsel, and are to be found in most places of the Mediterranean coast.

utility

ty of this country, particularly round Orihuela, exceeds all description, their harvests of wheat are very great, and they are reckoned to have the best bread in Spain. The castle of Alicante stands on a limy rock above a thousand feet high, giving shells half petrified on its summit. The plants of the vallies grow also on its top, the seeds which were probably dropped by birds, or brought by the winds. The *Huerta de Alicante* is a beautiful plantation, about one league long and two broad, full of vineyards, which they are sometimes obliged to water; the grape nevertheless affords excellent wine.

The city of Alicante forms a crescent, on the sea-side, and is well known for the luxuriancy of its environs, as well as its extensive and lucrative commerce.

A chain of hills are discernible at Alicante, extending from Murcia forming a semicircle of six leagues extent from the city, and close in with the sea about four leagues from each other, putting in a fine vale. The western side is uneven, full of stone, and consists of a white calcareous soil, whose surface is covered with large shells more perfectly petrified than those on the shore.

On doubling the first point of land to the westward of Alicante, the bay and harbour of St. Paul presents itself, with a view of the ancient castle of the duke of Arcos. Here the ships come to an anchor and load salt from the *Mata*, a great lake from the sea-side, but without any

visible communication with it. The quantity of salt collected here is immense, and is the property of the king, costing little more than the labour of heaping it, being in a manner produced naturally. The high bank which separates the sea from the *Mata* appears natural; the lake is bounded on the land-side by mountains, and is formed by the torrents of rain-water that rush down in winter, which evaporating gradually by the heat of the sun, added to the nature of the soil, become a mass of salt, so plentiful, that some years the exports have amounted to near one hundred thousand ton weight, chiefly for Holland and the Baltic; considerable quantities also are in demand for curing of fish, particularly for Newfoundland and New England. The cost is about eleven shillings sterling per ton, on board; and the king, in order to encourage the export, permits the price always to remain the same. The soil and air in general, on the coast of Valencia, Murcia, and Granada, is impregnated to a very uncommon degree with salt, and considerable salt-petre works are carried on in many parts, particularly at Murcia and Lorca, collected from the earth in the fields, the very dust on the roads and in the streets; from which, after extracting the quantity of salt-petre, the same dirt, thrown up in large heaps, serves again in four or five years, for the like purpose, and furnishes a fresh supply. This circumstance renders the soil so peculiarly favourable for the culture of *barilla*.

CHAPTER IX.

Observations made in the City of Valencia and its environs—Journey from Barcelona to the Mountains of Montserrat.

THE city of Valencia is happily situated about three miles from the sea on the west side of the river Guadalaviar, with five stone bridges over it, which afford a variety of agreeable outlets from this pleasant city, exultingly

Two leagues to the south-west of Alicante, there is an isolated calcareous mountain, at the eastern foot of which are found small crystals, red, yellow, and white, with two like diamonds as regularly cut as if done by a lapidary. The red and yellow are hyacinths.

There are eight or ten different sorts of plants in the

rising out of a forest of mulberry-trees, which bring an immense wealth to its citizens.

I shall not enter into a detail of the manifold branches of cultivation in the environs of Valencia, where nature always smiles, and where the

plains of Alicante, whose ashes serve for making glass and soap; but the *barilla* is the principal and best sort: the method of making it is well described in Miller's Gardener's Dictionary, and is much the same as used in the North of England in burning kelp. An acre may give about a ton.

very air is constantly embalmed with the fragrant perfume of an infinite number of fruit trees and odoriferous herbs. The cedrats are so large as sometimes to weigh more than six pounds, when the tree that produced them is not above two or three feet in height: the grapes are the most delicious imaginable, with bunches sometimes fourteen pounds weight, and every grape as large as a nutmeg. The grapes of Valencia and Grenada have the preference to all others in Spain. They cannot, it is true, from their distance, be sent fresh to England like those of Portugal, but they ship off large quantities of raisins at Malaga*. The raisins of the sun, as they are called, are still more delicate, having the stalk half cut through while the bunch remains suspended on the vine, and partakes of the heat of the sun, as the sap cannot penetrate after they are dried; they are packed up in boxes. This is the method used in Granada, which makes them more luscious and delicate, and justly gives the preference to the Malaga raisins.

There is a pleasant village about two leagues from Valencia, consisting of four streets inhabited chiefly by potters, who make a pretty earthen ware of a copper colour with gilding, that serves the country people both for ornament and use, it is made of an agillaceous earth, very similar in

* They prepare them in Valencia with the lixivium of seeds whose salt augments the heat of the water in boiling. The grape is dipped for a moment in this lixivium, when the skin bursts on every side, and the juice gushing out candies in the air, after which the bunches are hung to dry in the sun. The cold weather afterwards perfects this crystallization, so that when they get to England, they become so many cakes of sugar, infinitely better than when first shipped off.

† This earthen ware is very glossy, and remarkably cheap, but is far from being the best ware in Valencia; another manufacture has been lately set up at *Alcora*, by the count de Aranda, a grandee of Spain, which for the fineness of the clay might vie with other manufactures of the kind, were its varnish less liable to crack and scale off.

It goes by the name of Count Aranda's ware, and is sold at Madrid.

§ The following sketch exhibits the value of the principal products of Valencia.

	£ Sterling.
Silk crop annually about 1,500,000lb. of 12 ounces, which sells on the spot at a price equal to 10s. -	750,000
400,000lb. weight English, or 20,000 ton of rice for home consumption, at 15s. per cwt. -	300,000
For exportation s. d.	
150,000 Barilla - - at 10 6 -	75,000
80,000 Raisins - - - 7 6 -	30,000

quality and colour to that of Valencia, in which virgin mercury is found †.

It is an agreeable to urof five leagues from Valencia to Morviedro, famous for the remains of the ancient *Saguntum* and its Roman theatre described by dean Marti as well as by several English travellers as have passed that way. The view from the top of the hill is most beautiful with an extensive prospect of the vale and city of Valencia and the Mediterranean. At a few leagues distance from hence to the south-east beyond a chain of hills, consisting of red marble and lime rock, the Carthusian monks have a convent situated in a perfect paradise, where they make excellent wine. There are two copper mines near this convent.

To return to the plains of Valencia, it would be an endless theme to enlarge upon its produce, they cultivate great quantities of lucern which is acceptable to horses, and makes excellent hay. The Spaniards call it *alfalfa*. Its roots make little brushes for the teeth, that are sought after by dentists. The *chirimoya*, a very fine fruit from South America, thrives and bears fruit in Valencia; in a word, every production of nature may be said to prosper in this kingdom. Here we find corn, wine, oil, honey, flax, sugar, cotton, rice, silk, besides fruits, and plants, pro-

	Brought over	1,150,000
10,000 Kernels of Almonds 40 0 - -	200,000	
10,000 Pipes of Brandy £10 0 0 - -	100,000	
10,000 Wine - - 4 0 0 - -	40,000	
	£1,310,000	

Besides great quantities of wool, aniseeds, cummum and many other smaller articles, and a large quantity of for home consumption. Nothing is mentioned in this count, of cotton, which is a considerable article. I now state the whole, as given us by Mr. Swinburne, to reduce it into English money, as it makes the annual venue much more considerable.

	Dollars
Silk crop of 1775, one million of pounds, at four dollars per lb. (though a good deal of it sells for three dollars) - - -	4,000,000
Fruit of different kinds - - -	2,000,000
Hemp at 3 dollars per arrovo - - -	300,000
Rice at 10 dollars per load - - -	1,400,000
Cotton 450,000 arroves - - -	1,350,000
Vintage of 1767 wine, at 5 reals per measure -	861,133
	9,911,133

Which sum of 9,911,133 dollars, at forty pence sterling dollar, is £1,655,855 10s. sterling.

have more beautiful environs. The *Alameda*,
public walk, is one of the most pleasing in
in.

The city of Barcelona is generally reckoned
of the most agreeable places in Spain. Its
asant situation, its commerce, with the ac-
ty and industry of its inhabitants, contribute
make it a place of splendour and affluence.
this city the traveller will find a curious ca-
et of natural history belonging to a private
zen, Mr. Salvador, an eminent apothecary,
o shews his collection to strangers with the
most urbanity.

The first stage from Barcelona leads to the
n of Martorel, at the conflux at the rivers
ya and Lobregat; here you are sensibly struck
h the tremendous appearance of the grand and
enn mountain of Montserrat, impressing on
mind the most exalted ideas, in viewing this
nderful effort of nature. You seem quite
se to it, but have still three hours, in the usual
h of travelling in Spain, to approach its
is, and as many more after to climb up to its
mit. There is a famous bridge over the
regat at Martorel, with an arch at its foot.

Martorel is a large town, replete with indus-
us inhabitants, all employed and constantly
ork; the women in making black lace, and
men in various useful and laborious occu-
ions; a little further on, at the village of Espa-
guara, there is a manufactory of cloth, which
ntains numbers of families; the same spirit of
our and application is universal every where
Catalonia; but we now draw near to the lofty
ountain of Montserrat, the most singular per-
s in the world for its appearance, composi-
p, and productions; as much the admiration
the naturalist, as revered by the natives in
eral, from the renown of its sanctuary, fa-
us for miracles and the extraordinary favours
nted by our lady of Montserrat to its nume-
s votaries.

The whole extent of this mountain may be
ut eight leagues in circumference, its chief
erials consisting of round limestone, firmly
glutinated with a yellow calcareous earth and
d, not unlike the *Brechia* or pudding-stone of
ppo, only that the grain is coarser and the
es larger than that of the Levant, with a fur-

ther addition of round white quartz streaked with
red, as well as touchstone, all cemented together,
forming one perfect solid mass, and according to
the natural bitumen which united all these toge-
ther, has occasionally given way in the course of
fleeting years, various torrents of rain water have
rolled down and washed away the earth, the re-
sult of their decomposition, and have split the
mountain into an infinite variety of shapes and
singular appearances, forming in some places the
most amazing clefts and frightful precipices: in
others, huge pieces of blanched and bare rock
shoot up into sharp cones, pillars, and jagged
forms, from twenty to a hundred feet high, ex-
hibiting wonderful aspects that strike the eye
with surprize, and the mind with astonishment!
its wildness increasing in proportion as you ad-
vance higher, insomuch that on reaching the
summit of this enormous pile, human reason is
lost in conjecture, but the sight is gratified with
the most splendid prospect, looking down on an
extensive kingdom beneath you as on a map, ex-
hibiting a fertile country to the south, studded
with villages and watered with rivers; the eye
stretching out further over the Mediterranean, the
landscape is rendered still more striking from the
contrast on the north and east, bounded by the
bare and dark mountains of the Roussillon, and
the snowy tops of the Pyrenees. On these inhos-
pitable cliffs of Montserrat, amidst the constant
inclemency of jarring elements, dwells the pale
hermit, with hairy gown, wrapt up in silent con-
templation. Here he has hewn a solitary dwell-
ing, and offers up his fervent prayers, and takes
his lonely walk, lifting up his eyes, musing

Of every star that heav'n doth shew,
And every herb that sips the dew.

But though the elements have wreaked their
fury upon these elevated peaks, the indulgent
hand of nature has not been sparing in her gifts
to this surprising mountain, as numberless ever-
greens and deciduous plants serve to adorn the
various gaps and breaks which its singular shape
admits of, rendering it a curious repository of the
vegetative kingdom. The lower part of the
mountain has decomposed much sooner than the
upper parts and turned into soil, productive of
corn, vineyards, and olive, while the shelving
rocks facilitate a passage to the summit, and ex-
hibit to the botanist a view of above two hundred
sorts.

sorts of trees, shrubs, and plants that shoot up spontaneously, gracing this hoary and venerable pile. The direction of this great mountain is from east to west. It is impossible to view this amazing mountain without the utmost admiration; its name has been extended to one of the British islands in the West Indies, and its fame

is universal: its prodigious clefts impress the mind with such wonder, that it has given rise to the opinion in common with Gaeta in Italy, that these tremendous rocks were suddenly rent in this manner when our Saviour gave the ghost on the cross, when "*The earth quaked, and the rocks rent.*" *St. Matth. xxviii.*

CHAPTER X.

Return to Valencia and Castile—Mine of Sal Gemat Mingranilla—Source of the River Guadiana—Mine of Antimony near Santa Cruz de Mudela in La Mancha.

IN going from Barcelona towards Valencia you cross a fine bridge, lately built, over the Llobregat at Molino del Rei; further on, another bridge over a deep valley has been attempted with a row of arches at an immense expence, the foundation has given way, and a long time must pass before it is completed. The new road was finished in 1778, as far as Villa Franca de Panades. The country is hilly and affords a variety of rural prospects. The ancient city of Tarragona stands near the sea, on an eminence that commands a fine prospect over a beautiful vale. The city exhibits several remains of Roman antiquities and inscriptions. Proceeding from Tarragona the next town is Reus, a commercial place, which of late years has greatly increased in buildings and population. Here the merchants of Barcelona have their factors and warehouses, and ship off their wines and brandies as the ships come to an anchor in the road of Salo, about three miles from Reus. Catalonia fur-

nishes annually thirty-five thousand pipes of brandy, which require a hundred and forty thousand sand pipes of wine to make them, besides which near two thousand pipes of wine are also annually exported; and of fruit about thirty thousand sand bags of hazle nuts every year chiefly to England, and worth about twenty shillings a bag on the spot. It is a few hours excursion across the country to the northward, through Monblanc to the royal convent of Poblet, founded by Alfonso first king of Arragon, in the twelfth century, for monks of the Cistercian order; the abbot is a temporal baron and has an extensive jurisdiction with a considerable revenue. Several of the kings and queens of Arragon are buried in the church with state monuments, as well as some of the dukes of Medinaceli, and Cardonat.

It is a tedious journey from Reus to Tortosa on the banks of the Ebro, where there is a bridge of boats that is crossed in passing to Valencia. I shall now resume the itinerary in going for-

* The singular rock of Gaeta in the kingdom of Naples, has an amazing cleft from the top to bottom, and is totally rent asunder, which they tell you happened at the death of our Saviour; a large block of marble has fallen in between, on which they have built a little chapel, dedicated to the Trinity, and ships passing near salute it; this place is held in great veneration, particularly in Spain; during the wars in Italy *La Santissima Trinidad de Gaeta* was greatly resorted to, and was a place of constant invocation. There is a good plate of this rock in the "*Remarks on several Parts of Europe*, by John Breval Esq. London, 1738.

† On viewing these tombs the emotions are only to be felt by an Englishman, that occur when he perceives in an obscure corner on an humble stone, the name of an English peer, Philip, duke of Wharton, an unhappy nobleman; at the pinnacle of glory in the down of life, but alas! whose evening was clouded with misery and scorn. After leaving his native country, he meanly crouched to the pre-

tender, assumed the insignia of the order of the golden bore arms against his country; abandoned and despised all, he was kindly received in the last moments of wretchedness, and was interred by the hospitable abbot of Poblet. Thus ended Wharton, an exile and an outcast, shewing how little availed the highest dignities, fortune, talents, without love and virtue for his country. His is extinct, and the faint inscription on his tomb, at present nearly effaced, will soon be totally obliterated, while energetic lines of Pope, so descriptive of his character, hand down his failings as an example to posterity. The inscription on his tomb in the church of Poblet is as follows and is said to be of the duke's own composition.

Hic jacet Exs. Dom Philipus Warton, Anglus, et Marchio et Comes de Warton, Marchio Marburgensis et Episcopus Ratheasrem. Vicecomes de Winchester, Baro de Winton. Eques Sui. Georgii alias de la Geratera, obiit in Ecclesia Catholica Romana Poruleti, die 31 Maii, 1733.

encia towards Castile; the ground continues to rise gradually as far as the chain of hills that divide that kingdom from La Mancha, with a steep ascent at the *Puerto de Bunol*. The ascent still continues to Villagorda, through a rugged country, broke up every where by gullies, occasioned by torrents that gush from the mountains. On the highest of them there is a quarry of grey marble, veined with red; the river Carrión runs at its foot. At its summit there is a hot spring, where they make salt with a boiling heat. It is a constant descent from these hills to the village of Mingranilla: half a league from the village, there is a district of limy soil, with the hillocks about half a league in circumference, having below this bed of lime, a solid mineral, equal to the superincumbent stratum; the depth is not known, for when the excavations reach three hundred feet, it becomes very expensive to extract the salt; the mines frequently run dry, and fills with water, which obliges them to abandon the shaft and work another near the whole country being an enormous body of lime, sometimes mixed with a limy substance, and others pure or reddish, mostly crystalline. The ground has been perceptibly carried away by torrents that have discovered the mine, for pebbles and hyacinths are dispersed in the gullies, which are now seen firmly conglutinated in the lime, forming hard rock, yet leaving no doubt of their having fallen at some period, from the summit, by what may be observed on their summit. From hence an easy descent, for about four leagues, leads into the extensive plains of La Mancha, those regions of fancy which Cervantes has rendered immortal. They have plentiful crops of saffron at San Clemente, and the best saffron grows in La Mancha. The saffron remains in the ground for five years, producing annually flowers; then the roots are taken up and replanted; and the soil becomes excellent for wheat, but twenty years must pass before any wheat is cultivated again.

La Mancha produces great quantities of lavender, cotton, said to be the same with the famous

moxa from China, imported constantly by the English and Dutch; while the Spaniards, if this be the same plant, have it at home and know nothing of the matter.

The greatest part of La Mancha may be considered as one continued plain so far as the eye can extend without a single tree; as the villages are large, and the churches have lofty steeples, they make a good figure at a distance, but when you draw near, their mud walls with many houses in ruins convey quite a different idea. The inhabitants, for want of wood, burn thyme, southernwood, and worinwood, and though they have few springs they console themselves with drinking good wine: when one considers their manner of living in these silent villages, added to their natural simplicity, they seem to have lost little of their original character. At Socuellanos they get water about two or three feet from the surface; but at Tomilloso, four leagues further, the wells are a hundred feet deep. From hence it is an hour's journey to Luegar-nuevo on the banks of the famous Guadiana, and only three leagues from its source; there are many lakes hereabouts which communicate with each other, produced by springs whose waters form a river, which, having run for some leagues, disappears in the meadows near Alcazar de San Juan. In summer this river is trifling, but in winter it is necessary to go over the bridge at Villarta. The river disappearing there, shews itself again a few leagues off, in other lakes called (*Ojos de Guadiana*, "The eyes of Guadiana;" from whence the proverbial expression of *a bridge where many herds of cattle are constantly grazing*. On that part called *The Bridge*, they have sunk wells for travellers and cattle, and always find water. When the Guadiana issues out of the lakes, it turns several mills, is a hundred feet broad, and about four in depth. It passes afterwards by Calatrava, Ciudad Real, Medellin, Merida, Badajoz, and Ayamonte, where it enters the ocean, dividing Spain and Portugal*.

Before I quit the territory of La Mancha, whose

Professor Link, speaking of the river Guadiana, says, how beautiful would the banks of the Guadiana be, were but well cultivated! But the destructive ravages of the converted every thing into a naked common, which is first not unpleasant, but at length fatigues the eye. It is situated very near the banks of the Guadiana, vol. II. No. XCII.

being an open town of moderate size, full of small miserable houses like Truxillo, and, like that place, shews traces of having once been more thriving. The ruins here render this place remarkable; the remains of a Roman aqueduct are still seen, and of a wall describing a circle in the open fields; part of both are still in good preservation, and they

whose fame will never perish so long as wit and humour remain, I must once more investigate the bowels of the earth, and speak of a mine of antimony near Santa Cruz de Mudela, at the foot of the *Sierro Morena*, which, since 1774, has been successfully worked by Don Antonio Sancha, an eminent printer at Madrid, who, after having been at a considerable expence, now gets lumps of regulus of antimony of an enormous size, one weighing a hundred and fifty *arrobos*, and many of twenty or thirty, the smallest of four or five,

for which he has considerable demand: he established a manufacture of *regulus* of antimony, and has wrought up above six hundred *arrobos*, so white and chrystaline, as to look like silver, being superior to that of France and Hungary; it is a valuable article in different manufactures, particularly among printers making types, and is in great request at Madrid, where the art of printing is now brought to remarkable perfection.

greatly enliven this open and cheerful country. At Merida (he continues) we passed the Guadiana over a handsome stone bridge. Over a few open pastures, at the foot of the last granite mountain, we came to a market town called Lobon; which, with its ruined castle, is situated on some hills at a small distance from the river, and concealed amid olive trees. The Guadiana winds along fertile but uncultivated plains. Between Merida and Badajoz, on the plain which borders on the Guadiana, is another small town full of small wretched houses, and called in the maps *Talavera la Real*, but in the "Guide des Couriers" *Talavera*

del arroyo, and by the inhabitants *Talaruela*, a name more appropriate than either of the former. Badajoz, a considerable town, being the capital of Estramadura, a frontier fortress towards Portugal. The streets are in part straight and well paved; but there are few houses. The Guadiana flows close to it. But let not the traveller expect to find in this capital of Estramadura more inns than in any large village. In the best, or, as the governor expressed himself, the least bad, every thing to be sent out for as in the smallest village, as nothing can be found in the house."

SECTION I.

Entrance into Portugal—Elvas—Portuguese Military—From Elvas to Estremoz—Arrayolus—Montemor o novo.

THE Portuguese frontier fortress of Elvas is but three Spanish leagues from Badajoz, upon before the gate of which it is distinctly seen upon its hill. A small brook called the Cayo, which may be forded in dry weather, forms the frontier, which is in few places marked by nature, but is therefore more clearly drawn by art. In this side, the approach to Portugal appears uncommonly pleasing. Instead of wide-extended open sheep-walks, and far-dispersed villages, the country is adorned with detached houses here and there, which seem to indicate a superior state of cultivation. Before we came to Elvas we saw the first orange-garden, lying open along the road, though a great quantity of this fruit is grown round Badajoz. The dress of the inferior people is better; and the women are more friendly and communicative than those of Castile. They wear their hair, like the women of Biscay, uncovered and only lightly bound with a ribbon, or handkerchief. Their politeness, and their easy, gay, and friendly manners pre-
dice a stranger more in favour of the Portuguese than of the Spaniards; nor is this judgment altered, so long as the traveller is only acquainted with the lower classes, though he forms an opposite judgment so soon as he begins to know the higher orders.

We had scarcely passed the Cayo, before the regular tone of the Portuguese language began to sound in our ears. Most of the words are

nearly the same as Spanish, but the pronunciation is extremely different.

On entering the inn at Elvas, we found the apartments and furniture similar to those of both the Castiles and of Estramadura; nay both were perhaps still worse. The houses are generally better, and more convenient in Spain; but here we had no occasion to send out for what we wanted, or perhaps ourselves to fetch every piece of bread or glass of wine, as both food and drink are supplied in every Portuguese inn, provided the traveller is contented with Portuguese fare.

Elvas is a city, and it first acquired that appellation in the reign of Dom Manuel, although it is said to be rebuilt by Dom Sancho II. who granted its *foral*.* It has four parish churches, six religious houses, besides a monastery of capuchins without the gate. The town and district contain twelve thousand inhabitants. The streets are narrow, irregular, and so full of dirt, that it is difficult to wade through them even in dry weather. The Spanish towns, even Badajoz itself, are in general much cleaner and neater. The country is pleasant; the hill on which the town stands is covered with olive-trees, and in the neighbourhood are a number of kitchen-gardens and orchards of oranges. The aqueduct, which is a very fine work, and a Portuguese league in length, consists (in the neighbourhood of the hill of Elvas, where it passes through a

* That is, laws or titles of creation, and of the conditions under which the settlers accepted the lands.

valley,)

valley,) of four rows of arches, one upon another, of a considerable height.

Elvas is governed by a *corregedor*, a *provedor*, and a *juiz de fora*, being the chief town of a *corregimento**. It is the first and most important fortress in the country. The town itself is strongly fortified, and defended by two citadels situated on neighbouring hills; one called *o forte de S. Luzia*; the other erected by the Count of *Lippe Bückeburg*, and from him called *o forte de Nossa Senhora de graça de Lippe*. In the town of Elvas every thing, as far as could be perceived, was in good order, in the spring of 1798; the fort was strongly garrisoned, and new works were carrying on. In Badajoz, on the contrary, all was empty and forsaken; and it was evident that Portugal was in fear, but not Spain. The troops at Elvas, especially the officers, had a truly military appearance, and a Prussian officer who should see them on guard would almost have taken them for colleagues in service, whereas the Spanish troops at Badajoz he would probably have disowned.

This improvement in the Portuguese army is entirely the work of count de Lippe, an extraordinary man, who lives in the remembrance of every inhabitant of the country. The whole nation held him in unbounded veneration, considered him as the creator of their army, and felt more than can be conceived on this side the

Pyrenees, that he was a true knight, according to the ancient sense of that phrase.

The Portuguese troops are far from bad, and I know regiments that exercise and fire extremely well, even when compared with the troops of the various nations I have seen reviewed. It cannot, however, be denied that the officers are not respected as they deserve in a country which has long kept its ground by its military energy. It is true, commandants of fortresses who reside at Lisbon and have at most seen their forts once in their lives, and generals who are never with their regiments, do not much contribute to the improvement.

The uniform of the Portuguese infantry and cavalry is dark blue: that of the hussars light blue; the marines green; and the sailors are dressed like the English. But the blue or cloth breeches of many of the regiments, and the black Manchester breeches of the officers, have an unpleasing appearance. Generals and other officers wear a suit of scarlet richly embroidered with gold. The cavalry, like that of Spain, on stallions, and their horses are in better condition. They are not bad riders, but their uniforms become them. The soldiers are but poorly paid: a private receives two *vinteins*, or forty about two-pence sterling; from which something is deducted for clothing†.

But enough of the Portuguese military. The

* Originally every town and village in Portugal had its particular judge, who pronounced sentence in the first instance, and was chosen by the inhabitants. These judges are still found in some villages and market-towns in remote parts, as for instance, near Cape St. Vincent's, &c. and are nearly the same as the German *dorf-schulzen*, or *burg-liffs*. They are called *juizes de terra*, or country justices. But by small degrees, as the power of the crown increased, and these officers perhaps giving occasion to some disturbances, judges were appointed by the crown, at first in the great towns, and then in the small, and even in great villages. These judges were required to have studied at some Portuguese university, and were called *juizes de fora*. All civil causes are in the first instance brought before them, and in small places they also have cognizance of criminal processes; for which, in the larger towns, a *juiz de crime* is separately appointed. Portugal is divided both into provinces and districts, which last are commonly called *comarcas*, or *corregimentos*; in the chief town of which is a *corregedor*, before whom civil and criminal processes are brought in the second instance. He has also the superintendence of the *juizes de fora*, whom they can suspend from their office. If the *corregimento* depends originally from the crown it is called *corregido*; but if from *donatarios*, it is called *ouvidoria*. Thus Braganza is still an *ouvidoria*, the dukes

of Braganza being the original *donatarios*; and as most the *ouvidorias* depend on royal houses, the distinction between those two kinds of *corregimentos* is only attended in official papers, not in the word *ouvidor* yet used in common language, but *corregedor*, and in official *corregedor ouvidor*. The seat of the *provedor* is also in the chief town of the *comarca*; but he is totally independent of the *corregedor*, and has not only the superintendence of the execution of wills, guardianships, &c. but of the revenues in the district. Under him also, in the great towns, as to what regards the former, is a *juiz dos orfãos*, judge for orphans, from whom appeals lie to the *juizes de fora*. These are the most important judicial officers in the provinces, under whom are a variety of inferior officers, such as *alcaldes*, *veredores*, *metralhes*, and *escribaes*.

† This is extremely miserable pay in so dear a country as Portugal, particularly at Lisbon. Bread, a sack and but wine, are the constant and daily food of these who seldom or never taste meat or vegetables. In the year 1798 many young men were pressed; and many of the regiments increased by five hundred men; they were torn from the fields and kidnapped every where, and the government promised rewards to the *juizes de fora*, who should furnish them most recruits. In consequence of this, whole numbers of considerable length were often met travelling

Vol. II. N

ill on which Elvas stands is formed of a granite consisting of white quartz, felspar, and mica, and in some parts containing steatite. On the activity, this granite is covered with a whitish, grey, foliated, lime stone, in which are interspersed sulphurous pyrites and fahlerz. The vegetation here is similar to that of Spain. We saw every where the beautiful *antirrhinum amethystinum*, first described in Lamarck's Encyclopædia; and the beautiful *tris alata*, which we had already seen near Badajoz.

The beautiful country round Elvas soon departs the traveller. Most of the towns in Portugal lie like islands in the midst of a desert sea. Not far from Elvas we climbed a naked, barren mountain, where we saw a few single houses, but no villages. Farther on, toward the *venda do senhor jurado*, the mountains are covered with cistus ladaniferus, and consist of slate, with veins of quartz. This slate, which is extremely common in Portugal, is often clearly a sandstone, and not unfrequently bears traces of its origin from granite, and grains of mica and felspar; sometimes it approximates to clay-slate, and changes wholly into that substance. It forms gentle (not lofty) hills, which often show signs of containing ore.

The *venda* is a very small and miserable house, in a wretched country, and, indeed, a *venda* may generally be expected to be surrounded by a kind of desert. Beyond this spot we came to a wood of cork-trees, which is seldom seen in the middle of Spain. Towards Estremoz, which is seven leagues† from Elvas, the country becomes more pleasant, is better cultivated, and bears more live-trees. The mountains rise again, and a

criminals with their hands bound. It was painful to behold these unfortunate people, who perhaps could live happily and comfortably at home on the fruit of their labour, now brought by force to starve in the towns. At Lisbon I have often been solicited in an evening for charity by men among the guard at the barracks of the regiment of *Gomez Freire*, who had the greatest claim to my compassion. But can any man blame the natives of a country for shunning military service under such circumstances?

The slate mountains have always an arid barren appearance; and are usually, in the southern parts of Portugal, covered with cistus ladaniferus, a plant, without being acquainted with which, it is impossible to form an adequate idea of the appearance of these parts. It is about four, and sometimes six, feet high, the leaves have nearly the form of those of the *oleander*, are of a shining dark green, and not deciduous in winter; a very sweet-smelling gum covers the young buds and leaves, and diffuses, parti-

whiter, or even a blacker, foliaceous limestone, which produces a very good marble, is seen in rocks in large quantities.

Estremoz is a small fortified town, and *praya de armas*, which has therefore a governor, but belongs to the *corregimento* of Evora. The number of inhabitants may amount to six thousand at the utmost. It is an ill-built place, but in the middle has a large cheerful square. There is a castle on an eminence, and the town has also some out-works. In other respects it has been a considerable place, as the number of religious houses shews, there being five in the town, and a sixth in the neighbourhood. There are a hospital and a casa de misericordia in almost every considerable town in Portugal; but generally in such a state that they are of very little use. The country, particularly on the side toward Lisbon, is very pleasant, and well cultivated. Three leagues from Estremoz we came to an inn called *A venda do duque*, where however no duke could lodge. We did not perceive any cultivated lands till within a league of Arrayolos, an open villa with about two thousand inhabitants, a large monastery in which reside the canons of St. John the Evangelist, and a monastery of Franciscans. This place is six leagues from Estremoz, yet not a village is seen throughout that distance, nor any but single houses. The soil is sometimes granite in masses, sometimes slaty granite.

From Arrayolos the road lay through Montemor o novo, which is three leagues farther, over naked mountains, and then through a cultivated vale. After this we ascend high granite mountains covered first with evergreen oaks, and then

cularly in the evening, a very pleasant fragrance that seems to fill the air. These plants do not form a very close bush; but stand so close together, that it is difficult to force through them, and thus cramp the growth of every other plant. Hence it is very rare to find any beneath them. The flowers are uncommonly beautiful; but scarcely blow before they fall off. Each of the petals is almost three inches long by two broad, pure white, and some way in on the under side have a dark purple-red spot, resembling a drop. The whole plant is also uncommonly beautiful; but its uniformity, and the lonely desert forms, render it at length extremely irksome. It serves for nothing but fuel and charcoal; though, were this country populous and industrious, the gum perhaps might be employed in various ways.

† The Portuguese league is various in different provinces, but always exceeds the Spanish, which is three thousand rods or fathoms.

with myrtles. The myrtle is not here a beautiful shrub, for where it covers a large tract of ground its growth is diminutive and ugly. It is only beautiful by the side of brooks, where it grows taller, and is extremely charming, when covered with its beautiful white flowers. Toward Montemor o novo the country again becomes more cultivated. This open place, or villa; is gay and lively, containing above four thousand inhabitants, four religious houses, and being very pleasantly situated on fertile granite hills. On this side we approached the town by a large and beautiful meadow; to the left we saw on a high hill an old ruined castle; and on the other side, toward Lisbon, many gardens, followed by

woods of ever-green oaks; a tree which constitutes the riches of the neighbouring country and affords food to a great number of men. The acorns are roasted for use, and have by no means an unpleasant flavour, but are only consumed by the poor. No attention is bestowed on the cultivation of this tree, but its propagation is left entirely to nature. The wood is reddish, solid and good, but is chiefly used by cart-wrights for the charcoal is also much valued.

The granite mountains continue a league beyond Montemor, and then lose themselves in a plain which extends to the banks of the Tagus, and is every where covered with sand and ratchil.

SECTION II.

Heaths in the Province of Alemtejo—General Remarks on that Province.

THE province of Alemtejo derives its name from *Alem*, beyond; and *Tejo*, the Tagus*. Alemtejo according to its natural limits, may be divided into three parts, the high or mountainous, the flat or heathy, and the *serra de Arrabida*.

We had now arrived at those great heaths which extend as far as the river, along it upward to *Salcaterra*, and downward to the sea. To the southward they extend as far as the Algarvian mountains, and to the eastward to Beja and Evora. In the midst of this plain is the Serra, or high range of mountains ending in the cabo Espichel above St. Ubes. These heaths, like that of the Lunenburg heaths, consist of innumerable small hills which give the whole an undulating appearance. The soil in some places, particularly near the river and the sea, is so sandy that we sunk deep into it; but in others, on the contrary, it is covered with coarse gravel and ratchil, which render it very solid. Swampy places are very rarely found, for in general the

great aridity of the soil is the cause of the barrenness of this extensive tract.

Here and there are seen woods of pines, especially in the neighbourhood of Lisbon. In the south of Europe two varieties of the pine are common, the first, *pinus pinca*, a very fine tree the stem of which grows high, strait, and stiff, and the branches bend upward, so as naturally to form a thick, large, round crown. The leaves are longer than in our *pynus sylvestris* and its green colour is much darker. The other variety is the sea-pine (*Pinus maritima* Gerard) which never grows so high as the former, or as our German pine, has strait branches not bending upward, and therefore forms a pyramid like the fig-tree instead of a crown. Its leaves are longer and greener than in our pine, and it wants its red bark. But although it does not grow so high and handsome, yet this last property gives it a preference to ours, the small bluish-green leaves and its red bark giving it a dead and melancholy appearance†.

* It is to be lamented that the natural frontiers of this province from the river to the range of mountains which divides Algarvia are not the same as the political; for several corregimientos on the south side of the Tagus belong to the province of Estremadura.

† Both these trees are very useful; their wood is good, and yields a great deal of resin, for which reason, in consequence of an order of the minister of marine, they have

of late been burnt for tar. The fruit of the pine contains a pleasant almond-like kernel which is very commonly eaten and used in cooking. Another use is also made of this tree which however being injurious to the woods, is prohibited but the prohibition, as usual, is not attended to. The fishermen of Seixal, Costa, and Trafferia, tear up the roots of the young trees to give a brown colour to their nets.

Four

Four leagues from *Mortemor o novo* is a small village called *Vendas novas*, which contains a hunting seat of the prince of Brasil; three leagues farther is another very small village, called *Os Pegoes*, both of which were first established when Philip II. came to Lisbon; and five leagues farther we reached the bank of the river, where, at a market-town called *Aldea Gallega*, it is usual to embark for Lisbon. On an eminence a league from *Aldea Gallega* is a church dedicated to *Nossa senhora da Atalaya* (our lady of the watch-tower), to which the negroes in Lisbon annually make a pilgrimage, and a great concourse of people go there to see this black procession.

Antonio Henriques de Silveira says, "Alentejo is the least populous province of Portugal; for though thirty-six leagues long, and nearly as broad, it contains only four cities, one hundred and five towns (*villas*), three hundred and fifty-eight parishes, and about three hundred thousand inhabitants*. The towns are very populous, comparatively more so than the rest of Portugal; but there is a scarcity of villages, which generally contribute most to cultivation, many of the inhabitants of towns leading idle lives. One cause of the thin population of this province arises from its having always been the theatre of war between Spain and Portugal. It also contains a great number of fortresses, maintains ten regiments of infantry, and four of cavalry, which are constantly recruited there, and form a fourth part of the military establishment of the whole country. Every town and village in the province, except these fortresses, now contain fewer inhabitants than in the beginning of the last century, and in all of them are empty houses.

"The best means of improving this province would be that the crown should establish small villages of about twenty houses, or grant permission to private persons to form such establishments, granting them the manorial rights and privileges.

"To this proposal it is objected, first, that there is a scarcity of water; but this is by no means universal, and might be obviated by sinking wells, as is already practised in many places in this province: secondly, that the soil is too bad; but wherever it will afford pasture for cattle, corn may be produced, at least rye and even maize, especially on the banks of the rivers:

thirdly, that the population is too scanty; but the province of Minho is so populous that many of its inhabitants annually migrate into other provinces; how easy therefore would it be to employ those men in such establishments: fourthly, that the quantity of cultivation would not be increased if these men were settled on lands already cultivated; but if these lands were divided into small lots or parcels, the soil being nearer their habitations would be better manured and cultivated, and would not be suffered to lie fallow two following years, being sown only once in three years, as is now practised, but would be sown during the two years, and fallowed the third: fifthly, that no one would be willing to embark the capital requisite for establishing such villages; but so much money is spent in pursuits of luxury and distinction, that it cannot be doubted that many would be willing thus to employ some part of their money in purchasing the title of lord of a village. To raise a company of cavalry costs eight thousand crusades, in consideration of which the king grants a captain's patent (or commission), and yet when it was known that five companies were to be raised in Algarvia no less than one hundred and fifty-four candidates offered.

"The lands in Alentejo are far from being well cultivated. In that province are three kinds of soil; fruitful black solid fat earth is found in the red clay of *Elvas*, *Campomayor*, *Oliveira*, *Fronteira*, *Estremoz*, *Beja*, and *Serpa*; a lighter earth mixed with a little sand forms the soil round *Eyora* and *Arrayolos*, where the bad kinds of wheat, barley, and rye succeed very well, and cork trees and evergreen oaks also grow; and a sandy barren soil forms the heaths of *Cantarinho*, *Ponte de Sor*, *Monte Argil*, *Tancos* and *Vendas Novas*, a tract of country about thirty leagues in circumference. They were once full of cork-trees, but these have been sold to the charcoal-burners, and thus the woods have been destroyed, excepting at a distance from the rivers. These heaths serve only as pasture for goats, and yet at a depth beneath the surface lies a solid stratum of clay, which might be brought up by the plough, and the soil thereby rendered better for cultivation. More pines also should be planted, and defended from goats, though not in the neighbourhood of the roads on account of robbers. Further on are marshy tracts near

* According to the last lists they amount to 339,355.

Rio frio, Relva, and Barroco de Alva, which might be drained.

"The rivers in Alemtejo, particularly in winter, are very rapid, and do much damage. The banks therefore ought to be planted with trees to confine them in some measure within their beds.

"The south side of the Serra de Ossa is very fertile but almost entirely uncultivated; the north side is quite naked, but might be planted with chesnuts.

"The whole province is full of vagabond beggars who beg or steal by day, and at night sleep in the huts of the husbandmen. At a wedding or christening from eighty to a hundred often appear, and through a mistaken piety or vanity the rich peasants feed them, while others who perceive the absurdity of these prejudices likewise feed them through fear, lest they should set fire to their corn. Hence these vagabonds are very coarse and rude.

"The nobility have too large herds of small cattle as sheep and goats, for which reason they do not have the heaths cultivated, but hire other lands besides their own which are thus likewise deprived of cultivation. Some of these, who do not possess pasture for above eighty sheep keep above a thousand, the land of their neighbours supplying the deficiency. The law indeed endeavours to prevent these robberies by appointing sworn watchmen; but this only increases the evil, as these men always have an understanding with the offenders, and the poor neighbours cannot obtain justice against criminals of rank and power. The nobility generally find various means of evading the penalties which the poor are obliged to pay. In the war of 1762 many of the peasantry who had only two carts were stripped of both, whereas from the nobles, who had many, not one was taken.

"The numerous fast-days are also very prejudicial. Permission ought to be given to work after mass, as the bishops of Coimbra, Lamego, Portalegre, and Oporto have done gratis.

"Many estates belong jointly to several proprietors, one of whom called the *Senhorio* or *Posseiro* has a right to make all the contracts, and to let the estate when and how he pleases, and the other proprietors (*quinhellos*) only receive their share, whether fixed or contingent. Meanwhile they are bound to pay a fourth part of all necessary expences in proportion to their shares, but not to any disbursements; the

object of which is to improve the estate. This regulation is evidently prejudicial. It is an old custom to dispense with some part of the taxes in bad years; but with this regulation it does not take place, as the copartners are willing to participate in the profits, but not in the losses.

Many parts of Alemtejo are ill adapted to growing corn, as for instance the heaths along the banks of the Tagus; the soil of which is a deep fine sand. These heaths are so well adapted for bees, that Portugal might supply foreign countries with wax and honey; but this branch of husbandry is neglected, because the bees destroy the grapes.

There are also hills covered with *cistus* that are incapable of cultivation, there being too little mould in the soil, which consists of a very coarse sand. Here too bees might perhaps be advantageous, as might the cultivation of the kermes-oak, were the population more numerous, both on account of the cochineal and of the sweetness of its fruit. On the other hand a quantity of land which is covered with *cistus* in the corregimento of Ourique, between Mertola and Serpa, and in other places, clearly shows that with good cultivation the soil will produce corn. But two circumstances operate against it: the first, so long as numerous monasteries oppress and drain the country with continual contributions, no improvements can be expected. This every Portuguese well knows, and even confesses in conversation, though no one dares to print it. The other impediment arises from the badness of the roads, a great part of Alemtejo round the Campo de Ourique being wholly destitute of carriage-roads; which, where they exist, are extremely wretched. The small districts round the Beja and toward the Serra de Monchique, where the traveller to his great astonishment suddenly meets with high-roads, are so small as scarcely to deserve mentioning. The prince of Brasil, when he met the king of Spain at Elvas, patiently bore the jolting of this wretched high-road into Spain, instead of having a road made for his royal father-in-law.

Throughout Portugal travellers are uncommonly safe from robbery, excepting that a part of Alemtejo, particularly on the frontiers of Spain, and especially the high road into that country, had acquired a bad character in this respect. The danger however is by no means so great as in many parts of Spain.

SECTION III.

Lisbon, Description of that City, and the Country round about it.

THE view of Lisbon, if the traveller pass the river either from the river Aldea Gallega, or Casilhas, is uncommonly fine; nor do I know any large town that forms so majestic an appearance. The vast expanse of water, a river in many parts more than nine English miles broad, the great number of ships, the wide-extended city adorning an amphitheatre of hills that lie contiguous to the river, together with a crowd of churches, cultivated heights covered with country-houses, monasteries, churches, gardens, and olive-trees, are certainly an extraordinary assemblage of uncommon beauties. At great distance, where the limits of the town can scarcely be distinguished, the whole bank of the river seeming as it were one city, the majestic, pointed, rocky mountains of Cintra form the back ground of the landscape, after the lofty Serra de Arrabida among the heaths on the south side of the river have already surprised the spectator. But as he approaches he at length more distinctly perceives the town which covers the hills to the top, the beautiful Praça do Commercio, or Merchant's-square, the new streets, the arsenal, and the corn-market. He perceives the river narrowing towards its mouth, and pouring its waters into the sea between the hills, which here also rise on the south bank, though elsewhere flat, while large ships cover its surface. He admires these hills, which, on the north side, are adorned by the villages of Belem, Judá, and its brilliant churches, together with the royal menagerie; and on the south side by a market-town called Almada, whose church stands on the summit of the first hill.

According to the last observations Lisbon is situated in $38^{\circ} 42' 58''$ north latitude, and $11^{\circ} 29' 15''$ west longitude from Paris. The Portuguese compute the length of the city two leagues; and indeed the distance from Belem to the eastern extremity appeared to me a full German mile (four miles and a half English.) This distance renders it necessary to add that every computation of latitude and longitude is taken from the Praça do Commercio in the middle of Lisbon. The breadth of the town is very various, often but small, and sometimes quite

inconsiderable, not exceeding one street, but never much more than half a league.

The population is here, as throughout Portugal, very difficult to ascertain. Only the number of houses is accurately known, and the number of inhabitants must be thereby calculated; for that of communicants is very uncertain, as many frauds are practised in this respect. If enquiry be made in the small towns of the corregedores, they give a round and generally exaggerated number, in order to magnify the consequence of the place where they live. According to the last decennial census in the year 1790 the forty parishes of Lisbon contained 38,102 fire-places or hearths; which includes the suburbs of Junqueira and Alcantara, but not the villages of Belem and Campo-grande; though they also, particularly the first, are connected with the town, being in the termo of Lisbon. If we reckon Belem, a market-town which completely joins Junqueira, the population may be estimated with confidence at above 300,000, exclusive of the military.

Lisbon is quite open on all sides, having neither walls nor gates, nor even any fortifications, except a small castle in the middle of the town, and a number of batteries or small forts on the river. The ground is very hilly, and, according to the Portuguese writers, the city stands, like ancient Rome, on seven hills; I shall consider it as standing on three.

The first hill, or rather mountain, begins at the bridge of Alcantara, forming the proper western limit of the town, and extends to the *rua de San Bento*, or St. Benedict's street. This hill is unquestionably the highest, being much celebrated for its salubrious air for which reason one of the streets bears the Spanish name of Buenos Ayres, instead of the Portuguese words *Bons Arcs*. At the western extremity it is but little cultivated, but farther to the eastward up to its summit, forming also to the eastward a plain, on which stands the new monastery. In many parts it is so steep that it is a labour to walk the streets, and even the lower street, which runs along the river, rises and falls considerably. During the heavy rains the water rushes down the

streets with such violence that they are often impassable, and at the bottom of the *calzada de estrella* some *gallegos*, i. e. porters, post themselves at these times, and convey the passengers for a trifle. This inconvenience, however, is attended with the advantage of washing away the filth, and cleansing the town. Immediately after the earthquake this hill was more built upon, as the shocks were much less severe there. Foreigners also prefer these situations, both on this account and for the salubrity of the air. Hence many handsome houses are interspersed in various parts. The streets are irregularly built, ill paved, often narrow, and not unfrequently full of new but small and wretched houses. On this hill the queen has built a church and convent (dedicated to the heart of Jesus), to which she is much attached. It is generally called *o convento novo*, or the new convent. The church is handsome, its excellent and beautifully white limestone giving it a very cheerful appearance, though the architecture is bad, and overloaded with ornament. Not far from this convent, on the other side of a square is the protestant burying-place, in which are many monuments, particularly that of Fielding, who died here. This cemetery is planted with cypresses and judas-trees, a combination much used for such situations in the south of Europe, and originally an oriental custom. Not far from thence, leaving the houses behind us, we came to a pleasant plain, called *Campo de Ourique*, separated from the neighbouring hills by deep valleys, which is used as a promenade by the lower and middling classes.

The second hill is only a continuation of the first, from which it is separated by a valley of no great depth. It extends from the *rua de San Bento*, to the valley in which are the three new streets built by Pombal. Excepting a few of the principal streets, the rest are crooked, narrow, and wholly destitute of regularity; the small streets leading to the bank of the river are horribly dirty, the filth being heaped together, so that the passenger must be well acquainted with the narrow paths that run among these heaps, to be able to walk the streets. At the foot of the eastern side of this hill the earthquake did great damage, in consequence of which many handsome new-built houses adorn it, and here, as in many other places, traces of that convulsion appear in ruined churches and monas-

teries. On this eastern declivity is the opera-house and the residence of Quintella, the great dealer in diamonds and richest merchant of Lisbon. Above the public promenade beyond the *Praça de Rocio* this hill rises to a considerable height, and is very steep towards the next valley. The view from this eminence is uncommonly fine. In the valley beneath appears the best part of the town; to the left are olive-gardens interspersed with country houses, monasteries, and churches; opposite to the high steep hill on which the castle stands, and to the left the Tagus covered with ships.

This hill is succeeded by an even valley of considerable length and breadth, which forms the broadest part of the town. This valley was totally destroyed by the earthquake of 1755; after which it was entirely rebuilt. On the bank of the river the valley begins with the large and handsome square called *Praça do Commercio*, formerly the terrace or parade of the royal palace, which is six hundred and ten feet by five hundred and fifty. The quay and the groups of people where the ships and boats are landing and taking in their cargoes, are objects that far exceed the quays of London and Paris. The east side is formed by a large building with an arcade ending toward the water, in a pavillion which is used as an exchange. The ends of the three streets which terminate in this square are unfinished, nor does there appear any probability of their being completed, as they have been long neglected. The three principal streets which were rebuilt since the earthquake lead from this square to that of Rocio. They are straight and broad, provided with causeways; and not built as separate houses, several of them forming large buildings, which make a very handsome appearance; but the upper stories seem proportionably too small, the windows too narrow, the panes of glass too diminutive, and the balconies are an impediment to a beautiful form. In the middle street, *rua Augusta*, live the gold and silver-smiths and in the two others the artisans of other metals who, as is usual in the south of Europe, work on the ground floor close to the door, and therefore make a most intolerable noise. The line that divides east and west Lisbon, which is an ecclesiastical distinction, (the former belonging to the bishopric of Lisbon, and the latter to the patriarchate,) passes through this part of the town. The *Praça de Rocio* is large, and like the

Praça do Comercio is much more here is the east of the market-place, and of the market, and *Riberia Nova*, a promenade. The third which is the *les Mouras*, some interruption of the sudden attack consists of a neat house from the style part of Lisbon high, containing gothic ornaments the apartment entrance no less. Praça do Commercio unpaved in the middle; but much more incumbered with filth and puddles. Here is the great palace of the inquisition. To the east of the Praça de Rocio is a large market-place, called a *Figueira*, to the westward of the Praça do Commercio is the fish-market, and near it another square, called a *Riberia Nova*, which is much more frequented as a promenade than the Praça do Commercio.

The third hill begins with an eminence, on which is the castle of Lisbon, called o *Castello de Mouros*, from which it continues, with some interruptions of plains, to the eastern extremity of the town. The castle is a small fort, and could only serve to defend the town against a sudden attack. This part of the town also consists of narrow, irregular, ill-paved streets, with a neat house here and there. It appears from the style of building that this is the oldest part of Lisbon; the houses being narrow, but high, containing many stories, and bearing gothic ornaments. The interior disposition of the apartments is as bad as in Spain, and the entrance no less shocking.

Following the river to the eastward of Lisbon small houses continue almost all the way, and one village succeeds to another. To the west Belem so nearly joins Lisbon that it is difficult to discover the separation, and the suburb of Alcantara is only divided by a bridge over a small brook which here falls into the Tagus. This suburb is only separated by an artificial boundary from that of Junqueira, as is the latter from the town of Belem. A foreigner, however, going to Belem, would not suppose he had quitted Lisbon. It is a considerable market-town where many persons of property and tradespeople of the higher classes have houses. Formerly the royal family resided there, but the castle being burnt they removed to Quelus. In Belem is a monastery of Hieronymites instituted by Dom Manuel, the architecture of which is very striking, for instead of endeavouring to preserve symmetry the greatest pains have been taken to avoid every external appearance of regularity, one pillar being made intentionally different from another. The adjoining church, however, is in a gothic but grand style, and affords no unpleasant impression. There are besides in Belem two new-built neat and handsome churches. Near to one, that of Nossa Senhora de Ajuda, is the

botanic garden and museum, and farther on a royal garden, with a menagerie at the entrance and several aviaries. It is opened for a trifling fee to persons of condition as a promenade; but in itself, like the menagerie, is very insignificant. Beyond Belem is a park of considerable size belonging to the prince, the trees and bushes of which are olive-trees and broom. The chace on the north of the river is confined to the prince, but that on the south is free for the public.

The Tagus washes the foundations of the houses throughout Lisbon. Toward the eastern part it is about two leagues broad, or, if the breadth be taken to the end of the reach, three leagues. Its bank consists of heaths, and to the west, nearly opposite to the Praça do Commercio, it grows narrower, and as far as its mouth is only about a league broad: the opposite bank, at the same time, rises, forming steep precipices toward the stream. The river is often covered with ships, and large men of war may lie opposite the town, the views in many parts of which are uncommonly fine; the market-town called Almada, with its church on the summit of the hill, and the English hospital at the foot of it, give life and interest to the picture.

The side of Lisbon toward the country consists entirely of hills, from which are seen only the highest edifices of the town, and the traveller suddenly arrives in the city before he is aware of it. The greater part of the country round Lisbon, particularly on the east and north sides, to a considerable distance from the town, are covered with large gardens surrounded with high walls, between which it is insufferably tedious to travel, sometimes for leagues, without seeing any other object, and in continual danger of mistaking the road. These gardens are often of considerable extent and laid out rather for use than pleasure, generally containing plantations of orange and olive-trees, and sometimes even corn fields and vineyards. A pretty large garden-house is attached to them, and families are accustomed to spend a part of the summer there. One of the best gardens of the new French taste round Lisbon is that of the Marquis de Abrantes, in a market-town called Bemfica. The gardens round Lisbon please strangers on account of the plants they produce; those which with us are reared with great pains in pots and houses, grow here wild and high.

Beyond

Beyond the western part of Lisbon the country is not so well cultivated, and there are naked and rocky hills. But where these are not too stony they are luxuriantly fertile, and render the flora of the capital the richest throughout the country*.

The soil round Lisbon consists of lime-stone and basalt; the former lying at top, and being here and there very white, close, and excellent for building, but breaking too coarse for the statuary. A singular species of lime-stone, which only forms a mass of petrification, appears at a depth in both banks of the river, lying beneath the other strata. The basalt begins at the bank not far from the sea, and then proceeds through Quelus toward Bellas; meanwhile a branch of the basalt mountain extends beyond the city by the aqueduct, and unites with the forementioned chain toward Bellas. From thence the basalt country extends as far as Cabeça de Montachique. It properly forms only one mass of basalt, which is here and there covered with lime-stone. It is particularly striking that basalt is only found in those two parts of Portugal, Lisbon and Cape St. Vincent, where the earthquake of 1755 was most violent; and this circumstance is thought to confirm the opinion that basalt covering great strata of coal furnishes materials for subterraneous fires, and thus gives rise to earthquakes and volcanoes; but it must not be forgotten that Belem, which partly stands on a basalt hill, suffered less from that earthquake than some parts of the town evidently founded upon lime-stone. Portugal however is rich in warm springs, which are doubtless the effect of subterraneous fires. Such springs are found even in Lisbon, though the warmth is very slight; also, at Cascaes a few miles from Lisbon.

Close to the north side of the town, is that

* The hills form the meadows of Lisbon. Meadows such as the inhabitants of northern climates may suppose, and covered with grass, are rarely seen here, thick verdure being uncommon in the low and hot countries of the south of Europe. The blades of grass stand single and scarce, but on the other hand the soil is covered with various kinds of trefoil and similar plants. But our common clover is here very rare.

† Near the town it passes over a deep valley, and the works are planned with great magnificence. It rests on several bold arches, the largest of which is 230 feet 10 inches French high, and 107 feet 8 inches broad. The

bold and grand work of art, the aqueduct called *os arcos*, by which water is brought from several springs situated at a distance of three leagues and near the village of Bellas, being in some parts conducted under ground†.

The water enters the town at a place called da Amoreita, where it divides into several other aqueducts, and supplies the fountains, which are often very ornamental, though in a bad taste. Here the Gallegos draw water in small barrels, and cry it about the streets. The water is very good, containing a portion of oxygenated calcareous earth, its sources being in limestone hills. The Portuguese being inhabitants of a warm climate, cannot be blamed for loving good water. In summer, it is sold by the glass throughout Spain and Portugal, in the public squares and promenades; and among both these nations an excellent method is used, to keep water and other liquors cool in summer. Earthen vessels are made of clay containing lime and iron, so as to be very porous, but without glazing. These vessels which are called *ucaros* or *alcarruzes*, suffer the moisture to pervade their substance in the form of a fine dew, which is continually evaporating, and thus producing cold. At first they give the water an unpleasant earthy taste, which however it soon loses by use.

The trees that grow here on the north side of Lisbon, are chiefly olive and orange-trees; but other fruit-trees are more scarce, and even almond-trees are not numerous. Cypressess, judas-trees, elms, and poplars, appear here and there. Oak, oaks, beeches, and linden-trees, there are none, and willows are extremely rare. The orange-tree is most striking, although near Lisbon it does not grow very high. It requires much water, which is supplied to plantations by channels, which are filled by water-wheels. The earth is heaped up at their roots, and the water

view is singular when the spectator stands beneath it, and the pointed arches seem changed into a majestic vault that echoes every sound. The whole length of the aqueduct is 2400 feet. In the middle is a covered arched way, of seven or eight feet, where the water flows on each side through a tunnel of stone. Without this arched way and on each side is a path, where two persons can conveniently walk abreast with a parapet, over which they may look down to its base. The small towers perhaps disturb the general effect, but could not be dispensed with, for they serve as ventilators.

conducted between these heaps. They are propagated by seed and afterwards grafted*.

Besides the orange groves, strangers are particularly struck with the hedges of American aloes and Indian figs in the southern parts of Spain and Portugal; both of which are easily planted, forming hedges impenetrable to cattle,

but easily destroyed by men, though difficult to confine within bounds. They will grow also on extremely bad sandy soil. In July and August, when the aloes are in bloom, these high stems covered with flowers form a very beautiful object, whereas in Germany, a single aloe in bloom is publicly advertised in the newspapers†.

SECTION IV.

Climate of Lisbon—Provisions there—Police, and Description of the Portuguese.

THE climate of Lisbon is very salutary and pleasant to those who are accustomed to it. The winter, as to vegetation, is the end of July, the month of August, and the beginning of September; at which time every thing is parched up, not a green blade of grass to be seen, and the foliage of the evergreens is shrivelled up and has a melancholy appearance. The heat continues incessantly with the sky almost always serene, though it is much relieved by sea-breezes. In summer the north wind prevails in Portugal, but its direction being changed by the mountains of Cintra it becomes a north-west, which considerably cools the air. In September, the evenings are frequently cold, though at noon the air is proportionably too hot. The greatest heat always accompanies the east wind; and in the summer of 1798 Fahrenheit's thermometer rose to 104° (32° of Reaumur). A heat equal to 6° of Fahrenheit is not uncommon in Portugal; and from comparative observations it appears, that the climate is hotter there than in Rio

Janeiro in Brasil, though the heat does not continue near so long. From Midsunmer-day to the middle of September rain is extremely uncommon, and even in the beginning of that month very scanty: the drought often continues much longer. Immediately after the first rains follow the autumnal flowers, the meadow saffron, the autumnal snow drop, the sweet-smelling *ranunculus bullatus*, and many others. These appear in the higher lands round Cintra, where the rains are earlier than in the lower parts round Lisbon. Immediately after the autumnal flowers come the spring plants, owing to which the interval between spring and autumn is scarcely perceptible. In October the young grass springs up and the new leaves shoot out, rendering it the pleasantest month of the year. In November and December fall heavy rains with frequent storms. Days of perpetual silent rain are very rare; for in general it comes down in torrents. The brooks round Lisbon, which it was a little while before easy to step over, and

* In December and January, the oranges begin to turn red, and at the end of January, and in February, before they are ripe and sweet they are gathered for exportation. Toward the end of March, and in April, they are very good, but delicate persons will not eat them till the beginning of May; at which time they begin to be perfectly sweet and well flavoured. They continue throughout June and July till August, and at length become scarce and over-ripe. At the end of April and in May appear the blossoms, the fragrance of which extends far and wide; the quantity of golden fruit amid the dark branches, and increased still more by the white blossoms, which at the same time adorn them continually, excite new admiration, though the same object daily recurs. One tree frequently bears 1,500 oranges, and examples are not wanting of their bearing 2,000, and sometimes, though rarely, 2,500. Those from Lumar are particularly good, and some

knights of Malta have assured me that these, and the oranges from Condeixa near Coimbra, are by no means inferior to those of Malta. I have also found those of Vidigueira in Alemtejo uncommonly delicate. At Lisbon they are not cheap, but in the provinces excellent oranges may be bought for about half a farthing sterling each. Oranges are sold wholesale, on the trees, and there are people who understand how to appreciate the number they bear. They are then gathered, carefully packed in chests, and shipped. The greater part are sent to England, or conveyed in English vessels to other parts, but some of the rich merchants who have long dealt in them, assured us that they do not yield any great profit, and often leave a loss. Other acid fruits, as for instance lemons, are scarce at Lisbon, but more abundant in the colder regions of Portugal.

† We may add, that this is the case in England likewise.

which wholly disappear in summer, now rush like torrents down the hills*.

In January cold clear weather often prevails, but becomes milder in February, which is generally a very pleasant month. Snow is so extremely rare, that, fourteen years ago, some happening to fall, the common people were so alarmed that they run into the churches, and thought that the end of the world was coming. In February the sun becomes strong, and thus causes a great many severe catarrhs, called by the Portuguese *constipações*. The equinox is followed by heavy rains accompanied with storms, as if all nature were falling in ruins. From this time till June is the most changeable season of the year. The weather is sometimes rainy and cool, sometimes dry and hot, till the accustomed heat and drought that follow midsummer day complete the circle. Storms scarcely ever happen in the middle of summer; they are confined to winter or the equinoxes, but are then violent, and the lightning is sometimes destructive.

The genial temperature of the air is very favourable to agriculture, and it depends entirely on the quantity of rain whether the year be fruitful or the contrary. Wheat is commonly sown in the neighbourhood of Lisbon, but rye is scarce and only grown for cattle; barley is also sown, but I never saw any oats. The usual variety of wheat is that with long-pointed calices, named by Haller *triticum sicutum*, which requires the best soil. The harvest is in May, and the corn is threshed as with us; but in some parts is trod out by horses or oxen, for which purpose a floor is made in the fields. Manure is not commonly used, or at most putrified plants are laid on. Rye is often in ear in February and March, but is cut down before it is ripe generally for fodder.

The Portuguese live principally on meat and fish, but are not fond of vegetables. In Lisbon the bread is generally bad. It is usually made of wheat-flour, sometimes of maize, but never of rye. Water-mills are not used; but wind-mills are numerous, and, being furnished with triangular sails, form a singular appearance on the hills round Lisbon. Potatoes are not at all cultivated, but imported from England and Ireland.

* This swelling of the streams renders travelling extremely difficult at that season, and would, without doubt, re-

However, Spanish potatoes, which are far less nutritive, are grown here and there. In March young green peas and beans are eaten, but in these warm climates are not so well flavoured as with us, having always a dryness and insipidity. A small kind of beans, brocoli, and cauliflowers are very common, also lettuces and succory; but other species of cole are more scarce, and brown cole is not to be found. The chick-pea, which constitutes the chief food of the lower classes in that country, and is certainly preferable to dried peas, is but little cultivated near Lisbon. The common people eat lupins in great quantities. These are sown in fallows, and the pulse are soaked in running water to destroy their bitterness before they are dressed. On days of procession, bull-fights, and similar occasions, they are sold in the market-place, boiled, but cold to the common people, who eat them out of their pockets. They have a mealy insipid taste, but are very cheap. Rice is also, both in Spain and Portugal, a very common species of food, and much liked by all classes. It is imported in great quantities from Brasil, and sold at a reasonable price, but is not much cultivated in Portugal.

Butcher's meat is very good; but calves are not allowed to be slaughtered in order to preserve the cattle, so that veal is very rare. It may be easily imagined, however, that this law contributes as little to its object as other similar restrictions, and therefore is not obeyed. The oxen are, throughout the peninsula, of a size and beauty seldom seen elsewhere. Pork is also very good; and the Portuguese hams are much esteemed. The swine of this peninsula are of a particular kind, being short-boned, broad-backed, and having thin black hair, which forms no bristles on the back. The mutton is the worst kind of meat. Game is rare, except rabbits and red partridges, which are extremely common, but not so tender as ours. It is remarkable that in Portugal no fresh butter is made excepting in a few private houses in the country, Irish and Dutch butter being commonly used. Dutch cheese is also most common and cheapest; and milk is no where found but in great cities, excepting goat's milk upon some of the mountains.

Fish constitute the principal nourishment of

tard the operations of war as much in winter as the drought in summer.

common people and the delicacies of the rich. Both consume great quantities of bacalaho, of which the English export thither to the value of a million and a quarter of dollars. There are immense warehouses of this fish, which on fast-days supply the tables of the rich and poor. In consequence of the war between England and Spain, great quantities were sent over-land to that country; but the stock-fish simply cured, which in Germany is the most common, is not so usual in Portugal. Another fish, which is taken in immense quantities on the coast of Portugal, is the *Sardinha*, or pilchard (*Sardinia-clupea* *prattus*, Linn.*), which is the food and comfort of the poor. It is often also given as food to wine. Bread, wine, and sardinhas, form the dinner of the common soldiers, labourers, and similar classes; and I have often seen beggars rub their children's bread with a sardinha to give it a taste. Were this fishery properly carried on, it might supply the place of bacalaho, and would then supply Portugal with fish-oil. The other kinds of fish eaten here are the sole, the turbot, the chad, the conger, the mackarel, and the sword-fish, some of which are very good.

ourishment of

Among the spices used for culinary purposes I shall only mention cassia from Brasil, which supplies the place of cinnamon, and the pichurim-bohne, which is used instead of nutmegs; the taste is pleasant, somewhat resembling that of annel, but very different from nutmegs.

The first object that must strike every foreigner on entering Lisbon, is the badness of the police; the filth of the streets lies every where in heaps, which, in the narrow streets where the rain does not wash it away, require great skill in walking, to avoid sinking into them. In one of the most frequented streets on the river leading to the Ribera nova, there is only a narrow path winding near the houses; and the reader may form an idea of the number of people who daily use it, the gallegos with their very heavy burthens, which a passenger cannot avoid; while the carts pass as near to the houses as possible, that the horses may not go in the deepest part of the mud; and thus all the dirt and filth is blindly splashed upon the passengers, in the worst manner conceivable. As to the night, the city was formerly lighted, but now this practice has ceased; and, as the window-shutters are shut

early, there is no light to diminish the darkness of these dirty, narrow, ill-paved streets. A host of dogs without masters, and living on the public, wander about like hungry wolves; and, still worse than these, an army of banditti. Our friends often expressed their astonishment at our venturing into Portugal in these times of war; but I assured them it was by no means so bold an undertaking, as to go at midnight from Belem to Maravilhas, at the eastern extremity of the town.

The government is said annually to appropriate a considerable sum to cleansing the streets; but how this money is disposed of is best known to the intendant of the police of Lisbon and of the whole kingdom, Dom Diego Ignacio de Pina Manique.

The amusements of the carnival are always governed by the ruling taste of every nation. Of what then should they consist at Lisbon? Both high and low delight in throwing all kinds of dirt and filth on the passengers, who in conformity to custom, and to avoid quarrels, must bear it patiently.

The high walls of the quintas in the town, the vacant and deserted grounds, invite to robbery and murder, which are still farther favoured by the badness of the police. These crimes are always perpetrated with knives, though all pointed knives are prohibited.

Murders mostly arise from revenge or jealousy; robbers are generally contented with threats. The spring is the most dangerous time, and I have known every night marked with some murder. The boldness of the assassins is astonishing. On a fast-day, in a procession in honour of St. Rochus, a man was murdered in open day in the throng, at five o'clock in the afternoon. In the summer of the same year a man was robbed at noon, between the walls near the prince of Waldeck's, who was witness to the transaction. The robbers were even so bold as to attack coaches. But the criminals almost always escaped, the compassion of the Portuguese being such, that every one assists him in his flight. They exclaim Coutadinho! or, alas, poor man! and every thing is done to assist him. The punishment of death is entirely done away, and the culprit is sent to the Indies or Angola; a punishment which by no means gives

same as the sprat of the north. This is evident, from those which are daily exposed for sale in England.

the

* In this name I have followed Brüniche and Vandelli, though I do not believe the sardine of the south to be the

the impression of death, though the climates of both are so unwholesome that destruction is certain.

A great part of these robbers are negroes, of whom there is a greater number here perhaps than in any other city of Europe, not excepting London. Many of them get their bread as tradespeople, not unfrequently become good and respectable citizens, and instances occur of their arriving at a high degree of skill as artisans. A larger portion are beggars, thieves, procurers, and procuresses. Every negro who has served his master seven years in Europe is free, and then not unfrequently becomes a beggar unless he has had a very good master. Great numbers of them are employed as sailors, and I do not see any reason why they are not also enlisted as soldiers.

There is a great number of vagabonds in Lisbon, for all idle people from the provinces come in bodies to the metropolis, and are permitted to live in the open town without impediment. Hence arise the immense number of beggars, who partly rove about, and partly remain in fixed places, crying out continually, and promising to mention this or that person to Nossa Senhora in their prayers. A physician might here meet with an uncommon number of remarkable cutaneous disorders; I have often observed a true leprosy, and endeavoured by observations of this kind to render myself insensible to the disgust they inspire. These beggars receive a great deal in charity, through a mistaken sense of piety, prevalent in catholic countries. They also often practise artifices to obtain charity. I remember an old man who fell down before us through hunger, as he afterwards said, and thus immediately obtained from my youthful companion a considerable piece of gold; while I, somewhat colder, remarked his theatrical performance, withheld my charity, examined into the affair, and found my suspicions grounded. Another class of begging is that for souls in purgatory. The religious fraternities, to whom it properly belongs to collect these alms, and to have masses performed in a certain church for that purpose, farm out this employment to certain people, who post themselves in the neighbourhood of this church to beg for which they generally pay eight milrees annually, and by this contract frequently gain one hundred milrees a year. Every thing is done in Portugal *pelor amor de Deus e*

pelas almas, (i. e. for the love of God and of the souls). The monasteries send their fruit, usually grapes, to be sold in the streets, as it were, by auction, in order to perform masses for the money. They are cried about the streets *as uvas pelas almas* (grapes for the souls); and when the price is asked, the answer is generally considerable. In the *Calzada de Estrella* sat a beggar, who always cried snuff for the souls. Snuff is a great article of necessity for all ranks, for both sexes, for every old man, and in short for the whole nation. Nor is it difficult to obtain the partiality of any of the common class of people, if the traveller but offer him a pinch of good snuff. I saw a beggar-woman put some snuff to the nose of her child who was still in arms. On a botanical excursion near Lisbon I met a well dressed lady, who asked me for a pinch of snuff, as she had lost her box; and when I told her that I never used one, she replied, with an expression of the most violent grief, *estou desesperada* (I am quite in despair).

The porters, water-carriers, and most of the servants, come from the Spanish province of Galicia, and are called Gallegos. These useful men leave their poor native country, migrating partly into the other provinces of Spain, partly into Portugal, to earn money by the severest labour, and, in many provinces of Portugal, assist in the harvest. They are extremely laborious, and, though avaricious, honest. This character, however, is not entirely unspotted. Sometimes they settle in Portugal, and open small tipping and eating houses, or grocers' shops, but generally return home with the money they have gained.

The dress of the common people is a vest of various colours, as blue, black, dark brown, &c. over which they wear a mantle with hanging sleeves, like the Spaniards, but a three-cornered hat, and not a brown cap, which is peculiar to the Gallegos. Young ladies also wear a similar mantle, as do both men and women of considerable rank, only that they wear them of various colours, and often figured. Beneath this mantle a fashionable dress is often concealed, similar to that of London or Paris. Great coats and round hats are quite unusual among the natives. Women of the lower classes wear a handkerchief wound round their head, so that a corner hangs down behind; some wear the Spanish net, but never the Spanish veil. Among the rich, who

other respects pursue European fashions, we
 ere and there saw one with her hair tied flat be-
 and with a ribband. The female peasants
 round Lisbon come to town in a red jacket and a
 black pointed velvet cap.

They who would judge of the nation by Lis-
 on run the risk of committing frequent errors;
 for this city is a rendezvous for all the vagabonds
 of the whole kingdom, and a great part of the fo-
 eigners of the lower ranks are also the scum of
 their nations. I know that these last are some-
 times very docile, and easily fall into the custom
 of hiring themselves as banditti; for I know cer-
 tainly of serious proposals of this kind being
 made. But I must confess that, notwithstanding
 the numbers of bad people among the lower
 classes, and the unworthy manner in which fo-
 reigners often act toward the inhabitants, exam-
 ples are not wanting of a true and disinterested
 hospitality among the common people. Round
 Lisbon and in the villages, however, the true
 Portuguese character not unfrequently again ap-
 pears, to which I bear testimony of full appro-
 bation.

Both the higher and lower classes are fond of
 profusion of compliments, which flow in a tor-
 rent from every mouth. A common peasant
 meeting another takes off his hat quite low down,
 holds him a long while by the hand, enquires
 after his health and that of his family, and does
 not fail to add, I am at your commands, and
 your humble servant. This is not a remark
 taken from a single instance, for I have heard it
 extremely often from ass-drivers and others of
 similar classes. The rich are said to conceal a
 false heart beneath a profusion of polite expres-
 sions. I have nothing to say in defence of the
 higher classes; they are as inferior to the
 Spaniards as the common people excel them.

The male sex are not handsome; and a tall
 man is rarely seen, the generality being short,
 fat, and square-made. Their features are also
 seldom regular, turned-up noses and projecting

lips being so common as to suggest an idea of a
 mixture with negroes. The difference between
 the Spaniards and the Portuguese is extremely
 striking, the latter being fat, the former meagre,
 the noses of the latter turned up, those of the
 former arched downward, so that they only
 agree in their yellow complexions and black eyes.
 Of the fair sex, the author of the *New Picture*
of Lisbon, who was a Frenchman, and his Ger-
 man editor at Leipzig, Tilesius, differ; the
 former praising, and the latter censuring them.
 In fact, they have the same defects as the other
 sex, being of too low a stature and inclined to
 corpulency; but their countenances are expressive,
 and their manners animated and friendly; which,
 with very fine eyes, long and uncommonly strong
 hair, very white teeth, full breasts, and extreme-
 ly beautiful feet, form, in my opinion, a charm-
 ing assemblage, and compensate other irregula-
 rities. Although in Lisbon, as in every other
 great city, there is no scarcity of courtesans,
 and though, as their doors stand open, every one
 may enter, yet they are far less importunate than
 in London, or the Palais Royal at Paris. But
 to return to ladies of condition. The softer
 graces which adorn the beauties of the north are
 rarely seen in Portugal; and perhaps they might
 as ill become the fire of Portuguese eyes as a
 burning climate can give them birth. Great
 beauties, however, may be seen in Lisbon, par-
 ticularly when the slender northern shape and the
 white fine skin of those climates are united with
 the advantages of the south, producing as it were
 the most beautiful work of nature.

From this charming subject I am obliged to
 pass to the uncleanness of the Portuguese.
 On leaving England and entering France every
 species of uncleanness becomes greater and
 greater in proportion as we travel southward.
 The apartments grow constantly more dirty, the
 privies are more horrible, or totally disappear,
 and a host of vermin of all kinds swarm round
 the traveller in his sleep.

SECTION V.

The Amusements of Lisbon—Public Institutions at that City.

THE society of Lisbon is dull and melancholy,
 especially when compared with that of
 large Spanish cities. The inhabitants neither

walk nor ride. In all respects there is very little
 luxury, nor are there any fine equipages; and
 the coaches, which every rich person keeps, are
 4 Y made

made on the ugly Spanish model, and drawn by mules. The desire of keeping many servants, that species of luxury so destructive to every country, here also prevails. They are, however, poorly clad and ill fed, having rice almost every day. The rich keep within the circle of their own families, and the tranquillity of their courts is scarcely ever disturbed. They spend a part of the year in their quintas (gardens;) and in August and September go to Cintra, where they see more of each other. It is a trait of their character, that at places, where the richest part of the town assemble together, they dance to one violin. In general the Portuguese are not fond of dancing, which is seldom seen among the common people, except in the market-places sometimes a *fossa*, or Spanish *seguedilla*, is danced, and by travellers mistaken for the *fandango*. For foreigners and the principal Portuguese, as for instance the ministers, a public assembly-room is built, where is a dance every Thursday. But this is rather an amusement for the foreigners, who form here a separate class of society; the lower orders assemble in coffee-houses, (*lajes*) of which there are several in every street, and often a considerable number. They are small, dirty, and ill-contrived, and afford wretched coffee, bad punch, and other refreshments. The chocolate is bad throughout Portugal, and mixed with a disgusting fat. In short, it is infinitely inferior to that of Spain. There is only one tolerable coffee-house, which is visited by people of condition, and where at that time every thing that could be desired might be had, and of excellent quality. The lower classes resort to the numerous wine houses (*tavernas*), where a red wine is sold, which round Lisbon is very bad. I have both here and in Spain observed that the inhabitants do not accustom themselves to drinking wine, but are intoxicated by a quantity which a German or an Englishman, after a short residence in this country, would scarcely feel.

One of the principal amusements of the rich is the Italian opera, which is not supported by the court, but by private individuals. It was at that time in all respects excellent, and the singers have rendered every other opera to me insipid. The best of these performers was added to it at the time, when the French occupied Rome and turned out the *Castrati* from the great opera. The house is large and handsome, the disposition

of its parts excellent, and the attention of the manager, that every one should be in his proper place, very exemplary. Sometimes also, Portuguese operettas are performed, generally farces, as afterpieces, in which the Portuguese language has a pleasing effect in the Italian mouth of Zamparini.

Besides the opera-house called *teatro de Carlos*, there is a Portuguese play-house called *teatro do salitre*, situated in a narrow little street behind the public promenade: it is much less than the opera-house, very narrow, and is but little visited by persons of condition. Under such circumstances little can be expected. Here no women perform, their parts being filled by men who can scarcely conceal their beards. The players are frequently artisans. A shoemaker who had been at work all day performed among other comical old characters, and was not the worst of the actors. The pieces represented are generally translations from the Italian, less frequently from other languages, and still more rarely original. But I have never myself seen or heard announced even on this stage, The Portuguese merry-andrew who is called *gracioso*. All the tragedies and serious plays are bad or ill-performed, nor can any thing be more wretched than the principal lovers. The after-pieces are wretched farces.

Near this theatre is the place used for bull-fights. It is moderately large, quadrangular and surrounded with wooden balustrades and benches. On one side are boxes for persons of rank, and one for the *corregedor*, who has the superintendence of it; the rest of the seats are divided into two parts, the shady, and the sunny side, the former of which is the dearest, and consists of wretched wooden benches rising in an amphitheatre above each other. In summer there were bull-fights almost every Sunday; from twelve to fifteen beasts being killed in an afternoon. During the winter this very cruel amusement entirely ceases. They stab the beast with pikes, and hang oblong pieces of wood with sharp iron hooks on his body, and frequently in such numbers, that the blood rushes from him like a torrent. There is nothing fine in this exhibition, but the rushing forth of the enraged beast, or the pauses he sometimes makes in the middle of the square, where he tears up the earth and roars aloud as in defiance.

Now that I am speaking of amusements, I

* I was agitated, who last-day, or the general a pared to the nation nor th Of this I could not myself St. Ubes, w Englishman, off their hat guenze sailo their hats o they are En

attention of the Portuguese, and he is in his proper place. It is also a part of the Portuguese character, that they are generally far from being fastidious in language, and Italian mouths are not so fastidious as the Portuguese. The *teatro de Ca* play-house called the *Teatro de Ca* is a narrow little street, and it is much less crowded, and is in a better condition. Under the benches, which are being filled by the Portuguese, the Portuguese are being filled by the Portuguese. A shoemaker performed among the Portuguese, and was not the Portuguese. The Portuguese represented an Italian, less free, and still more so. The Portuguese er myself seen of the Portuguese. The Portuguese called *gracioso* are bad or ill, and more wretched after-pieces are used for bull-fighting, and quadrangles and balustrades are used for persons of the Portuguese, who has the Portuguese of the seats are the Portuguese and the sun is the Portuguese the dearest, and the Portuguese rising in the Portuguese. In summer, the Portuguese Sunday; from the Portuguese in an after-noon, the Portuguese cruel amusement, the Portuguese the best of the Portuguese, and frequent rushes from the Portuguese fine in the Portuguese of the enraged Portuguese makes in the Portuguese tears up the Portuguese. In summer, the Portuguese Sunday; from the Portuguese in an after-noon, the Portuguese cruel amusement, the Portuguese the best of the Portuguese, and frequent rushes from the Portuguese fine in the Portuguese of the enraged Portuguese makes in the Portuguese tears up the Portuguese. In summer, the Portuguese Sunday; from the Portuguese in an after-noon, the Portuguese cruel amusement, the Portuguese the best of the Portuguese, and frequent rushes from the Portuguese fine in the Portuguese of the enraged Portuguese makes in the Portuguese tears up the Portuguese.

must not forget the religion of the country, which throughout this peninsula constitutes an important part of these. For in fact people go to the ceremonies of religion as a pastime, and follow processions as they would go to an opera. In every book of travels in Portugal we find accounts of amours, to which the mass has given occasion, and as usual this is also exaggerated. The young women scarcely ever go out but to church, it is natural to suppose that love would not neglect this single opportunity, and it is equally natural that the female heart should be attached to those places, where it first experienced the pleasing emotions of passion, and of devotion. In the country the object of an evening walk is frequently an image of the virgin, where people kneel down to pray, then rise up, and laugh and joke as before. In general the Portuguese very strictly observe the external signs of religion, even perhaps more than the Spaniards; and none eat meat on a fast day, but those who are considerably enlightened*.

The inclination of the Portuguese merely to observe the ceremonies of religion is evidently the cause of this diminution of fanaticism, and also of several good customs that prevail. Whoever has any money buys a permission to work on fast-days, in consequence of which the fields and vineyards round Lisbon are full of labourers on some rather important fasts. In regard to public business, Sunday is observed much more strictly in London than in Lisbon. This inclination, indeed, of the people is attended with much greater disadvantages: for, hence they continue always ignorant, and are the dupes of an equally ignorant priesthood.

Lisbon is by no means destitute of literary institutions. The first and most important is, doubtless, the academy of sciences, founded by the present queen immediately after the beginning of her reign, that she might contribute something to the advancement of literature, which Pombal had not. The president is the duke of Lafões, of the royal house of Braganza, generalissimo of the forces, and one of the first personages in the country. The duke has travelled abroad, is a favourite of learned men, and, although he has many peculiarities, is by no means unenlightened or destitute of talents. The secretary is Dom Jose Correa da Serra, now in London, where I had the pleasure of becoming acquainted with him, and found him to be a man whose science, talents, and enlightened mind, do honour to his country. With these qualities it was natural he should have quarrels with the inquisition, in consequence of which he thought it prudent to live abroad. He continues, however, to enjoy his office, and his substitute is Dom Francisco de Borja Garção Stockler, who also had some trouble on account of his eulogium on D'Alembert, which was too free and well written for this country. The academy have already done much for the advancement of science, and have published six volumes of *Memorias da Litteratura Portuguesa*, consisting in great measure of papers on the history and laws of Portugal. Then follow three parts of *Memorias economicas*, among which are many excellent papers, and two parts of prize memoirs, the first on the method of cultivating and manuring land, and the second on the vine. For some years past these publications have been interrupted. In 1797, appeared the first volume of their larger treatises, in quarto, very handsomely printed, in which are several papers that deserve attention. Added to

these, I was once much amused at hearing a question agitated, whether it was a greater sin to eat meat on a fast-day, or to violate the sixth commandment; when the general answer was, that the latter was a trifle, compared to the former. Notwithstanding this, neither the nation nor the common people are so fanatical as in Spain. Of this I could relate many individual traits, but I will content myself with a few. I was present at a procession at St. Ubes, where two captains of ships, a Dane and an Englishman, suffered the host to pass them, without taking off their hats. Of this no one took notice, except a Portuguese sailor, who asked who were those people with their hats on. The answer was *sao Inglozes fideputas*, (they are English sons of b—s), and nothing more was

said. When the Prince of Waldeck was buried, I heard one of the common people say, "he was a heretic, but a very good man." Upon this I mixed with the crowd, and heard nothing but praises of the worthy prince, who was even carried to the heretic cemetery. I heard also, that he had refused on his death-bed the accustomed solicitations to become a catholic, and found, to my great astonishment, his conduct generally approved, "because every one should live and die in his religion." The Portuguese consider every foreigner as a heretic, yet are polite, and ready to serve them, and even express surprise when they meet with a foreigner who is a catholic. This trait shews how much of their antient bigotry this nation have lost, owing probably to their commerce with the English.

these,

these, the academy have in their printing-office several works for publication, of which I shall name the *Flora Cochinchinensis* by Loureiro*.

In January, 1799, was instituted a geographical academy, particularly relative to Portugal, the members of which have already completed a new map of that country now ready for publication. All the maps of Portugal are extremely defective.

The college of the nobles, in a very handsome and extensive building, founded in 1761; the *academia real das guardas marinhas*, founded in 1782, the *academia real da marinha* in 1779, and the *academia real da fortificação* in 1790, have also their professors, called *lentes*; but all these institutions are in a weak and lingering state. Besides these there are, at Lisbon, professors paid by the government for the instruction of youth. There is in fact no want of means, the defect is in the choice of them, the requisite taste for knowledge not having yet been found, and no one knowing how to impart it.

There are public libraries in Lisbon, which, though far from ranking in the first class, are by no means so bad as some travellers would describe who had merely taken a cursory view of them. But it is very unjust to complain, because we happen to be too much alarmed at the voluminous *Acta Sanctorum*, to take the trouble of asking for any other book. The principal of these libraries, which is in the large building in the Praça do Commercio, contains many works of importance, and even some papers on natural history. I am better acquainted, however, with the library in the benedictine monastery of Nossa Senhora de Jesus, as I lived nearer to it. Here is a very complete collection of Portuguese and modern Spanish literature; nor is there any want of French works, as, for instance, a complete set of the *Encyclopédie par Ordre des Matières*. Next to French literature that of Italy is most abundant, still more, though it might not be expected, than the English, which the Portuguese seldom learn, though they are always reading French. In short, both these libraries may be compared with many of the public libraries in considerable towns in Germany. A third library, that of the monastery of San Vin-

* All books treating of scientific subjects are printed at the expense of the queen, the number of readers being too small for any bookseller or printer to gain by them. Hence

cente de fora, is indeed not open to the public; but it is sufficient to be once introduced to be always admitted. It contains a very complete collection of even the smallest Portuguese works.

There are many booksellers' shops in Lisbon, the masters of which, however, have no foreign business. I shall only name the widow Bertrand and son, near the church of Nossa Senhora dos Martyres acima do Xiado. New Portuguese works are easily procured there, and at the prices marked in the printed catalogue. Each book has a price prefixed, and the bookseller is contented with a moderate profit.

The royal museum at Ajuda deserves also to be seen. It will not, indeed, bear a comparison with that of Paris, or even that of Madrid; it is small, not a single class is well stocked, and it contains fewer specimens from Brasil than might be expected. There are, however, some curious specimens; and, among others, one very singular of copper ore, found in a valley two leagues from Cachocira, and fourteen from Bahia. Its weight, according to Vandelli, is two thousand six hundred and sixteen pounds, its greatest length being three feet two inches, its greatest breadth two feet and half an inch, and its greatest thickness two feet four inches. The upper surface is uneven, being here and there covered with malachite and iron ochre, and on one side it is foolishly polished, and bears an inscription. Hence mineralogists will perceive how singular this specimen is of its kind.

Besides the royal museum, that of the Marquis of Angeja contains some specimens worth seeing, especially some diamonds from Brasil embedded in argillaceous iron-stone, as near as I could judge. There is another museum in the monastery of S. N. de Jesus, chiefly consisting of shells, but containing many specimens of value.

The royal hospital of San Jose is a very good institution, and the sick are well attended. In the beginning of 1797 there were, according to the Court-calendar, one thousand and eighty-eight patients; during that year, fourteen thousand, eight hundred and eighteen persons were brought in, of whom thirteen thousand, two

hundred and eighty were cured, and the remainder died. The hospital is in its infancy, little being written, and literary fame unknown; nor can any thing serve literary men but family or other connexions.

hundred and thirty-five were dismissed cured, a thousand five hundred and seventy-nine died, and one thousand and ninety-one remained. Besides the account of it in the calendar, which must not always be trusted, it has in its favour common report, even that of foreigners, who generally complain of every thing in Portugal. There is, besides, an English and a Danish hospital supported by individuals of those nations. Every physician must have studied at Coimbra, and procured a licence from the protomedicus of Lisbon to practise physick in Portugal; but it is not requisite to take a doctor's degree, which they seldom do. In Lisbon itself, as usual, they are less strict than in other towns, and foreign

physicians are suffered to do as they please. Edmund More, an English physician, was at that time in the highest repute. It must not, however, be supposed that all the Portuguese physicians are altogether ignorant, for here and there is a clever man, and the university of Coimbra is not entirely barbarous. Many also pursue their studies at Paris, and, of late, even at Edinburgh. Almost in every street is a small apothecary's shop; but these are under no regulations, and frequently very bad. Many of them, however, after trials I have made of them, did not deserve the censures which some travellers have, without examination, bestowed on them.

SECTION VI.

Villages round Lisbon—Quelus, the Royal Residence—The Mountains of Cintra.

ON the south side of the river, notwithstanding the sandiness of the country, and the continual succession of heaths and pine-forests, the village follows another, being generally situated on creeks of the river, and supported by the traffic carried on by that medium with Lisbon. Round these places is a great quantity of garden-fruit, and very good vines are grown here and there, which, with attentive cultivation on the sandy plains of this warm country, succeed very well. It is to be lamented, there is no access to these places but by water, and that during several swamps appear, which, particularly in summer, corrupt the air. Barroco de Alva is well known for its insalubrious air, nor is Conna by any means a healthy place. On the last creek to the eastward, is a market-town called Aldeia Salgada, of which I have already spoken, and on a creek not far from thence a market town called Monta, through which lies the road to St. Ubes, a considerable place, though not so closely built as the former. Farther along the bank of the river itself are the beautiful market-towns of Alhosvedros, Lavaradio, celebrated for its good wine, and Barreiro. Here begins a second creek, which extends to the market-town of Conna, through which is the road to Azeytao. Near this place quicksilver has been found in the sand, which here alternates with strata of clay containing some iron, for which reason trenches are cut, and it is intended to make some farther attempts of this kind.

Then follows the last creek, with the market-town of Seixal, which is the least of all, and through it lies the road to Cezimbra, a town which supplies Lisbon with a great quantity of fish. In the angle where the stream grows narrow, is the market-town of Casilbas, the usual landing place in going up the river from Lisbon, as the landing is always good there without waiting for the flood. The market-town of Montella, and the small town of Almada, are only a quarter of a league from Casilbas. Thus in a space of five leagues, or about four German miles, are no less than ten considerable, well-built, and populous market-towns, without reckoning the numerous villages and hamlets; from which an idea may be formed of the lively scene the banks of this river afford.

Below Almada on the bank of the river, is a large English hospital for sailors, particularly for the fleet, and a considerable magazine of wine. From hence the bank continues high and hilly, the towns and villages lying in the hollows between the hills. A tower strengthened by a few cannon and soldiers, called *torre velha* or old tower, answers to the opposite tower of Belem. A village called Porto Brandaõ, the landing-place in crossing the river from Belem, lies in another hollow; but the houses continue for a league inland to Caparica, where good wine is also produced. Close to the mouth of the river is the great fishing village of Trafferia, and round the point of the village of Acosta consisting

of only small houses, which have the appearance of wooden sheds, and are dispersed along the beach. The inhabitants are a bold half-wild race of fishermen, who venture far out to sea, and are considered at Lisbon as the refuse of the nation. From the point, a sand-bank, which is covered at flood, runs out into the sea as far as a large fortified tower, which with the opposite fortification covers the entrance into the harbour. It is properly called the fort of San Lourenço, but generally the torre de Bugio, serving as a place to keep prisoners, till they are sent to the Indies or Angola.

To Aldea Gallega, Mouta, Couda, Casilhas, and Porto Brandão, daily packet-boats take passengers for a trifle. In windy weather, this conveyance is very dangerous, as the stream is very rapid, and the boat-men uncommonly careless; so that misfortunes frequently happen. The north bank of the river extends much farther into the sea before it forms the cape, or cabo de Rocca*.

Fort San Julião, and fort San Antonio, are the only two of any importance round Lisbon. These are sufficient to prevent a fleet from entering, but, if once entered, it would have all Lisbon at its mercy, and might with perfect ease level it with the ground†.

Between Oeyras and the village of Carcavelos, the sweet wine is produced which in England is called Lisbon, and in the country itself wine of Carcavelos. The vineyards are enclosed in gardens, on a gentle declivity toward the sea, and the must is generally sent to Lisbon, where it is made into wine.

Two leagues beyond Belem among high hills,

* The following are the principal places along this bank; below Belem is a square tower called Torre de Belem, fortified with cannon, which no vessel must pass till it has been visited. Near this tower are several batteries, as also along the bank from hence to fort San Julião. This small irregular fort, commonly called San Gao, is built on a rocky point, and extremely well covers the entrance of the harbour: the passage into which is difficult, being very narrow, and a bank of stones called os cachopos, lying obliquely before the entrance; but if the forts and batteries are not very strong, nature has done much for the protection of the harbour. A quarter of a league from it, inland, is the small town of Oeyras, and, two leagues farther down, the small town of Cascaes, rather a considerable and not ill-built place, standing on a strip of land under which ships may lie. Near this town is the small fort of San Antonio; but from hence a considerable way to the northward, is a high broken rock without any landing-place; the bank to the southward is skirted with considerable sand-banks.

† It is therefore somewhat singular, that both these

in an enclosed solitary vale, is the royal residence of Quelus. Neither the castle, nor the adjoining quinta are worthy of remark, but the road planted with magnolias, geraniums from the cape, and similar plants, which here succeed well. There are a few small houses round the castle, which, however, do not form a village. Here the court resides in the greatest tranquillity excepting on a few fixed days, which are days of gala: but the queen at this time, in consequence of the melancholy state of her mind, no longer appeared. The prince regent was not brought up for the throne, of which he first came to the expectation on the death of his elder brother, a prince who was much beloved and lamented, and who died of the small-pox.

Half a league from Quelus is a market-town called Bellas, with a pleasant quinta belonging to the Conde de Pombeiro and a very good inn. Beyond this place, toward Cintra, are some mineral springs, near which is a house for the reception of invalids. A quinta serves as a promenade, but very little use is made of it. The whole country round is basalt or lime-stone, and sand-stone also appears, and from these the springs arise, which, from the opportunities had of trying them, appeared vitriolated, without having much oxygen. These springs are enclosed that they may not be used to procure abortion, as has sometimes happened. On the opposite side of Bellas, at about a league distance, amid lime-stone hills, the water for the great aqueduct of Lisbon is collected from various sources within the same building. The hills are very dreary and barren.

To the north-west of Lisbon rises a high range

and the towns of Oeyras and Cascaes, should be garrisoned by English troops, or such at least as are in the English pay. In general all the emigrant and English regiments are collected in and about Lisbon; the regiment of Dillon was at Cascaes, an English regiment of infantry at Oeyras, English dragoons at Belem and Oeyras, a Swiss regiment in the English pay and the royal émigrés at Belem and the regiment of Montemar and Castres at Lisbon after the departure of general Stuart with many troops for the expedition against Minorca. Many political events in 1797 and 1798 may be explained by these circumstances; for hence appears the reason why Portugal could not raise an advantageous peace with France, Lisbon and its harbour being in fact in the hands of the English. It appears singular that the Portuguese government should thus suffer its hands to be bound; yet it must be allowed that with great address they bound the hands of the French during that critical period. Certainly, however, to leave Portugal, that most important country to England, in peace with the greatest of the follies the French at that time committed

the royal residence, nor the adjoining, but the road, anions from which here succeed houses round the not form a village, the greatest tranquillity which are days, e, in consequence mind, no longer was not brought the first came to the elder brother, ed and famed.

is a market-town, quinta belonging to a very good man, tra, are some market-house for the residence serves as a place made of it. The it or lime-stone from these the opportunities, vitriolated, with these springs are used to procure opened. On the out a league distant water for the lected from the building. The is a high range

of mountains full of peaks, forming the background of a charming landscape. These are the mountains of Cintra, which lie North-east and South-west, ending in the Cabo de Rocca. The distance from Lisbon to the market-town of Cintra is four leagues. The country on this side of Lisbon is far from pleasant, the road lying across arid stony hills of lime-stone or sand-stone. The range of mountains itself consists of granite composed of clear white quartz, a somewhat reddish felspar, and black mica, against which leans a white or foliaceous lime-stone, or a proper stink-stone. The south side toward Lisbon is arid, naked, parched up, consists of bare heaped-up rocks, and affords a wild, desert, dreary prospect. But every thing is changed when we pass round the mountain to the north side of this range, and enter Cintra. Here the whole declivity is to a certain height covered with country-houses and charming quintas, forming a shady wood of the finest trees, such as oaks of various kinds, pines, lemons, and other fruit-trees. Every where streams issue from the rocks, and form cool mossy spots. Toward the summit of the mountain naked rocks are wildly heaped together. On one of the high points, floating as it were in the air, is seen a monastery, and on another the ruins of a moorish castle. Where the quintas cease begins a thick but low coppice of strawberry tree, privets, buckthorn, and the rare sweet willow, which, with other vegetable inhabitants of the island of Madeira, have strayed hither. A fine prospect of the well-cultivated valley of Colares, of the great monastery of Mafra, and of the sea, complete the beauties of the scene.

The houses at Cintra lie dispersed in a picturesque manner over the declivity of the mountain. Here also is a royal castle, formerly the residence of several kings. Cintra is the summer residence of the rich inhabitants of Lisbon, but especially of the foreign merchants, and of the Portuguese who are connected with foreign houses. Here also are seen a great part of the ministry, and other diplomatic persons of high rank. The months of August and September, when every thing is parched up round Lisbon, are passed here on mountains that abound in water, verdure, and shade. It would not be believed that art has done any thing to render this abode agreeable, nor has it, except in forming shady quintas.

The country houses are very indifferent when compared with their inhabitants, being generally small and inconvenient for persons of rank. The promenades alone are formed by nature. Cintra is the abode of love; for in the midst of summer the coolness of the nights is charming, and the dispersion of the houses, the rocks, gardens, and woods, afford innumerable opportunities for amorous solitude. Cintra is less celebrated in Portuguese poetry than might be expected; but foreigners love it very much, and have laid out the best spots. Camoens speaks of this mountain with a miserable conceit: "Cintra," says he, "where the concealed naiads fly from the sweet bonds to the cool fountains, where love, however, softly binds them in his net, and lights up flaming fire-brands even in the water."

To the west of Cintra, at the foot of this range of mountains, is a market-town called Colares, celebrated for its orchards, chestnut woods, and wine. A great part of the fruit that is consumed in Lisbon comes from hence. Apples are particularly abundant and good, and the best table-wine is produced there. Parties of pleasure are frequently made from Cintra to this place. Upon this lofty mountain, to the westward, is a small monastery of capuchins, built between rocks, and called Cork monastery, the rocks being cased with cork. The loneliness of the scene, the naked and dreary range of mountains, from which the spectator has an extensive view of the sea, and this poor little monastery, sometimes entice foreigners away from Cintra; and hence it has undeservedly acquired its reputation. Its elevation and vicinity to the sea cause a great accumulation of clouds and moisture, to remedy which the coating of cork upon the walls is very useful. In winter snow is not unfrequent here, though it never lies. Toward Cabo de Rocca the mountains become lower and lower, ending in a flat, desert, naked, lonely ridge, which forms the cape. Near the extremity is a light-house, and not far from it a small chapel. On this naked plain the storms rage with great violence, the sea bursts with vehemence against the rocks, and is very deep in their vicinity. From hence are seen the mountains of Mafra; and opposite is the corresponding cape, Cabo de Espichel. Farther to the northward is another chain of mountains, parallel to those of Cintra, with which it unites by high and detached mountains, the Cabeça de Montachique

Montachique and others. From the sea these mountains appear like a lofty amphitheatre. This chain of mountains consists of thick and

foliaceous lime-stone. On the part which run toward the sea is the castle of Mafra with its immense monastery.

SECTION VII.

Journey to St. Ubes, Alcacer do Sal, Grandola—Description of the Serra da Arrabida—St. Ubes—Journey into the Northern Provinces—From Lisbon to Caldas de Rainha.

IN April, 1798, we crossed the river to Couna, which is generally considered as a distance of three leagues, and thence proceeded to the small town of Azeytao. The road lies chiefly across sandy heaths and pine-woods, the soil being better cultivated only round the town. There are many cork and olive-trees, and at length vineyards and fields. The town consists of small houses, has a manufactory of cottons, a dyehouse, five hundred and fifty-two houses, and two thousand three hundred and forty-two inhabitants, or less than five to a house.

I cannot forbear here to introduce a remark on the population of Portugal. According to the last lists, the present minister of police found the number of houses in Portugal to be seven hundred and forty-four thousand nine hundred and eighty. In Lisbon and Oporto alone can we reckon five or more inhabitants to each house, in the maritime towns generally about five, but in the inland towns certainly not so many. The small houses of these country towns are occupied only by one family, frequently consisting only of a man, his wife, and one child; nor are the common people very prolific, not having the means of supporting many children. Of this Azeytao is an example. It is a manufacturing place, which also carries on a considerable trade in wine and oil, being situated between the two harbours of Lisbon and St. Ubes; yet the population is very small, not being sufficient for the harvest, for a hundred and eighteen labourers come annually from Aveiro in the province of Beira, to assist them.

Close to Aldea dos Mouros rise pleasant hills covered with a grove of laurel and laurustinns, upon which are also the remains of a ruined castle. Here the Serra da Arrabida appears in front to the southward rather as a high, steep, and naked range of mountains. The valley between these

hills and the mountains is a heath of the better kind, entirely covered with beautiful tall grass and other rare plants. The Serra da Arrabida rises to the eastward, at Palmella, very rapidly out of the sandy plain, takes a due westerly direction, forming the Cabo Espichel, and consists of a grey close lime-stone which breaks in shivers. The part beyond Aldea dos Mouros is the highest. On the north side the mountains are steep and not covered with rocks, but, like most lime-stone mountains, with small loose stones, which render the ascent extremely difficult; nor is any fine and luxurious vegetation seen, excepting in the hollows where the brooks take their rise. The south side rises strait out of the sea, is entirely covered with coppice, and has likewise in the hollows pleasant groves. Here is the monastery of Arrabida, from which the range of mountains and the province take the name of these Franciscans. This high mountain, covered with trees and thickets, rising immediately out of the sea, forms a singular and novel view; and the prospect from the highest point is magnificent and surprising.

The lime-stone from this part is very marbly, and was employed in building the monastery of Mafra. The north side of the mountain furnishes pasture for goats and sheep, but was formerly a chace, as the south side is now. These flocks of sheep are considered as the cause of the want of cultivation.

At the eastern extremity this range of mountains rises suddenly with the round and almost conical mountain on which is the considerable monastery of Palmella, of the military order of Santiago, with a village, and is seen at an extraordinary distance, on this, for the most part, naked mountain. The prospect from this eminence is very extraordinary and singular in its kind. At the foot of it lies St. Ubes with its harbour and

extremely well cultivated plain; directly in front
a high, naked, stony ridge of mountains; to
the right is Lisbon, with its river, harbour, and
rich high bank; and, if the spectator turns
round, he discovers the black desert waste of
Alentejo: Such a range of mountains, with two
considerable harbours, a desert, and very fertile
tracts of country, form a most striking contrast.

This range of mountains extends from hence
all farther to the westward, between St. Ubes
and Azeytao: then between Aldea dos Manros
and the sea onward. To the southward of the
mentioned place, along the north side of the
mountain, lies the fine estate of Calheriz, the
owner of which, Dom Alexandre de Sousa, con-
tributes much to the improvement of rural
economy.

Still farther to the westward, but on the south
side of the mountains, in a hollow surrounded
by steep rocky naked summits, and close to the
sea, is the small town of Cezimbra. The har-
bour is small and ill-protected, and close behind
the town, on a mountain, is an old castle, which
seen far and wide. This part is uncommonly
steep and barren. The town is supported by
a fishery, and sends a great quantity of fish to
Lisbon.

The higher summits of the mountains here
consist of limestone, then follow strata of rounded
marble, or large-grained sand and slate-clay, in
which appear coal; pyrites, and native sulphur.
This range of mountains ends in the Cabo de
S. Michel, which with the Cabo de Rocca forms
the mouth of the Tagus. The height of the
former cape is much more considerable than that
of the latter; but it is only on the south side,
broken off quite abruptly. On the west side the
declivity indeed is very steep, but may be ascend-
ed and is covered with bushes and rocks. On
the farthest point, besides the light house, is a
small church, with a miraculous picture of the
Virgin. This church, dedicated to Nossa Sen-
hora de Cabo, forms the centre of a building,
in which long wings extend on each side,
consisting of two stories, and containing a great
many small apartments, furnished with wooden
chairs and tables, but without windows, for the
use of the devout, who come hither as pilgrims.
At the beginning of May, every year, there is a
procession of them from Belem to Porto Brandao,
and thence through the desert heaths and pine-
woods; and sometimes the prince of Brasil takes
part in these pilgrimages, passing his time in
hunting. This cape indeed is the pleasantest in
Portugal, the country round is well cultivated,
single houses being every where interspersed, the
hills cheerful and gay, and the naked summit
adorned with the above mentioned building.

Here also the upper stratum is entirely lime-
stone, and beneath is a stratum of sand-stone, in
which, especially on the declivity toward the
sea, we found abundance of charcoal. Under
this is lime-stone with substances appearing like
petrifications, as also happens at Porto Brandao
and even on the north side of the Tagus round
Lisbon.

St. Ubes* is situated at the extremity of the
Serra da Arrabida, on the south side, where the
country is very pleasant through the variety it
exhibits. To the westward the mouth of the
Sado is so wide, that it appears a considerable
bay formed by a strip of land on the opposite
side, which, with this high range of mountains,
also constitute the narrow entrance of the har-
bour. As far as the eye can see, a high steep
declivity, covered with thickets and woody
hollows, extends along the sea. To the north-
east, toward the charming mountain of Palmella,
is a fertile spot watered by brooks and adorned
with quintas, plantations of orange-trees, and
vineyards. Black heaths and pine-woods to the
southward and eastward increase by contrast the
charms of this rich prospect.

A fort, called San Philipe, covers the harbour,
and a tower fortified with cannon, called Torre
de Outao, together with a light-house, are situated
in the hollow of the mountains, besides which
several bastions are raised here and there. The
entrance is also difficult, and the channel very
narrow, so that the fortifications may fully
answer their purpose. The town is small, con-
sisting of narrow dirty streets and small houses;
but the strand is broad and neat, being adorned
with superior houses occupied by the rich in-
habitants, who mostly reside in this part, and pro-
vided with a good pavement along the water's
edge. The walls of the old town and its gates
still remain. St. Ubes is the seat of a corregedor,
and contains five churches and nine religious
houses; a large number in proportion to not
much above two thousand houses.

The trade of St. Ubes consists in wine, which

Vol. II. No. XCIV.

5 A

is

* In Portuguese Setuval. The ancient name was Cetobrica. T.

is here very good, and various kinds of it are exported. Good muscadell is here also produced. Oranges are likewise exported; but the best trade of St. Ubes is in salt, which is taken principally by Danish and Swedish ships. The salt-pans lie in great numbers along the Sado and its branches, being called in Portuguese *marinhas*. They are dug square, about three feet deep, and salt-water is introduced on one side from the sea, at flood, through canals which extend in innumerable branches, and are shut when the pans are full*.

The fishery of St. Ubes was formerly much celebrated, but has since greatly fallen off. In former times the towns of Sinos, St. Ubes, and Alcacer were much connected in the fishing trade†.

Opposite St. Ubes, on the narrow strip of land that forms the entrance of the harbour, are the remains of an ancient city called Troya. Many walls are still seen, and a number of square pavements, formed of small angular stones bound together with cement, being probably either the sites of houses or the courts belonging to them. Similar ornamental paved courts are found in the remains of old moorish buildings‡.

We ascended the Sado to Alcacer do Sal (or

* The water is often previously collected in large reservoirs, called *gozernos*, from which it is afterwards distributed into the *marinhas*, where, being evaporated, the salt is collected in the month of June, and kept either in wooden sheds or in heaps, which are protected against the rain by rushes. Of this salt a considerable quantity seemed to be in store. It is large-grained, becomes but little moist in the air, and excels in purity the marine salt collected in other provinces of the south of Europe, or in other parts of Portugal. Thus a quantity of salt is prepared on the banks of the Tagus above Lisbon, round Aveiro, &c. The salt-trade to Brasil is farmed by the government to a merchant.

† In 1796, the following ships entered and sailed from the port of St. Ubes, viz. seventy-one Americans in, seventy-two out; four from Bremen in, three out; a hundred and forty-five Danish in, a hundred and forty-seven out; one Spanish inwards; ten Hamburgers in, six out; forty-six English in, forty-five out; eight Lubeck in, seven out; eight Oldenburg in, six out; thirteen Portuguese in, nineteen out; sixty-eight Prussian in and out; four from Papenburg in, three out; two Ragusan in and out; a hundred and seventy-seven Swedes in, and a hundred and seventy-three out.

In 1797, the following ships entered Lisbon: one hundred and fifty-four American and one man of war in, one hundred and sixty-one out; ten from Bremen in, eleven out; two hundred and eighteen Danish in, two hundred and twenty-nine out; one French in and out;

Salt-castle) the banks of the river being full of salt-pans, and cultivated to some distance, behind which the desert heaths begin. The town of Alcacer consists of about six hundred and fifty houses, but mostly small. It has one *juiz de fora*, and belongs to the Comarca of St. Ubes. Travellers generally pass through this place to Beja and Algarvia, as they can go from St. Ubes to Alcacer, a distance of eight leagues by water. Much corn also from upper Alentejo is shipped here for St. Ubes and Lisbon. Near this town are the remains of a castle much spoken of in Portuguese history. The country is everywhere excepting a few hills of sand-brecia.

From hence to Grandola, we had three leagues of desert sandy heaths and pine-woods, and very little cultivated land. This town (or villa) is said to contain eight hundred houses, but there excepting two, are small and bad, and this place compared with Alcacer, is very dead. Some wheat and oranges however are produced in the neighbourhood. Beyond the town, the Serra de Grandola proceeds in two ranges, one behind the other, from east to west, forming the last mountains as far as the frontiers of Algarvia. The Serra is not high, but extremely arid, and consists of a fine-grained argillaceous sand-stone

nine Genoese in, thirteen out; forty-three Hamburgers in and out; three Spanish in, four out; one Imperial in and out; five hundred and thirty-three English in, four hundred and sixty-six out; two hundred and twenty-five English men of war in, two hundred and twenty-five out; nine from Lubeck in, ten out; nine from Morocco in, ten out; four Neapolitan in, three out; six from Oldenburg in, eight out; two from Papenburg in and out; two hundred and sixty-eight Portuguese in, three hundred and nine out; sixty-one Portuguese men of war in, seventy-nine out; eighty Prussians in, eighty-six out; twenty-two Ragusan in, twenty-three out; one hundred and thirty-five Swedes in, one hundred and forty-eight out; nineteen Venetian in, twenty-four out. From these data the trade of St. Ubes may be compared with that of Lisbon; and thus it appears that the former is not inconsiderable; but the number of Portuguese mercantile houses in Lisbon exceeds two hundred, and that of foreigners exceeds one hundred, while there are only fifteen in St. Ubes.

‡ Tradition says that this place was buried in sand through the impiety of its inhabitants, and that only a small church, called *Hermita*, remained. It is certainly probable that the place was deserted on account of the sand, and that the inhabitants went over and built St. Ubes on the opposite side. Lima, in his map, lays down a place called Vanda in this spot, and places Troya on the other side of the creek that does not exist; in which he is followed by Lopez, and other modern maps. For this Vanda we required in vain.

which often breaks slaty. On the second range, not unfrequently are found copper pyrites and red-copper ore, whence this range of mountains is called in the maps *Serra de minas de cobre*, but by the inhabitants *Serra de Grandola*.*

From Grandola we followed the sea-coast for some distance over very tedious heaths covered with deep sand to Comporta, a place consisting only of a church, a large but bad inn, and a few small huts. From this place we returned to St. Ubes, having travelled over a most dreary country, from which we derived no other benefit than a few fine plants, and some corrections for the map of Portugal.

We left Lisbon in May 1798 to explore the northern provinces of Portugal, and directed our course to Torres vedras, and the baths of Caldas.

The country beyond the eastern part of Lisbon I have already described; but Campo grande, a suburb of Lisbon, Lumiar, and Carmide also deserve mention. We only saw hills with short interruptions, and covered with olive-trees, on the plain ground orange-gardens, along the brooks meadows full of oaks and poplars, and here and there corn-fields. The oranges of Lumiar are high in esteem. Equally charming is the valley of Loures: where the hills rise still higher, the valley itself becomes wider, and one village succeeds to another. The traveller may go through Bemfica, Campo grande, Carmide, and Lumiar for several miles constantly between houses, without perceiving he has quitted Lisbon.

Beyond Loures the level of the country rises considerably, and we ascended the high chain of mountains, which extends to Mafra, consisting of basalt covered with lime-stone; but on the heights, and on the north side, a compact fine-grained sand-stone appeared. The first shelf is formed by a mountain called de Montachique; after which the level is lower, as far as a village called a Pora. The road, though paved, was bad every where, and had doubtless not been mended for a century; the towns and villages are uncommonly small and wretched. Round Pora are many fruit-trees; a proof of a high and

* At the time when we found these mountains as laid down, we had been seeking in vain for a lake placed in the maps between Alcaccer and Grandola, under the name of *Lago Alva*, of which no one throughout the country could give us the least intelligence. Equally in vain we sought in

cool situation. Beyond that village the mountains again rise, and become bare and dreary, with a quinta only here and there. On these mountains is the village of Enxara, with a fine estate of the Conde Redondo. Toward Torres vedras the mountains again cease, and we travelled between cheerful hills; but the little cultivation that appears shows the distance from Lisbon. The hills consist of a coarse-grained sand-stone, here and there is basalt, and sometimes strata of rounded flints.

Torres vedras is a small town, seven leagues from Lisbon, surrounding a hill on which are the ruins of an ancient castle. It contains somewhat above six hundred houses, four parish churches, and three religious houses without the town. These give it an appearance of greatness, which we afterwards found it did not possess. In ancient times it was a celebrated fortification, and is still the chief town of a *Corregimento*. The country round is pleasant and well cultivated, being full of gardens and vineyards, and watered by the small river Sizandro. On one side sand-mountains and pine-woods soon again begin, while on the other are only gay lime-stone hills covered with coppice. At the foot of these rises a luke-warm spring containing some carbonic acid gas. Coal is also found here in a stratum of clay.

From Torres vedras to the neighbourhood of Obidos, a distance of five leagues, we passed through an ill-cultivated desert country, exhibiting, first pine-woods, then heaths, and only a couple of wretched insignificant villages. The mountains every where consist of sand-stone and ratchil. Round Obidos the prospect is pleasanter and more varied, being full of short hills formed of a close yellowish lime-stone, frequently rough and rocky, covered with cheerful coppice and surrounded by brooks. Obidos itself is a small insignificant town built round a hill, on which are the ruins of an ancient fortification celebrated in history, and the walls of which are still kept in very good order. Within it, amid ruins and rocks, are some houses inhabited by persons belonging to the police.

This country for the *Montes azules* of Lopez, which not an inhabitant knew, and the place of which is occupied by a sandy heath. Such errors regarding countries at no great distance from a capital, and in laying down a place of trade so well known as St. Ubes, are very striking.

A league

A league from Obidos is the small town of Caldas, much frequented for its sulphureous waters. The town is small, being built in an irregular quadrangular form; but is continually increasing. The houses are small, generally consisting merely of a ground-floor, and only a few have windows. The flooring is very bad almost throughout, and those who would have other furniture, than bad wooden tables and chairs, must bring them. As to beds, table cloths, and other conveniences, they are wholly wanting; in

short every article of furniture must be provided. The company who come to bathe always live in private houses. Such are the accommodations prepared for the rich merchants and principal nobility of Lisbon, who visit Caldas twice a year; namely in May and September. The rich pass the hot season at Cintra, and travel from thence to Caldas; for which reason the company are frequently more brilliant in autumn than in spring*.

SECTION VIII.

From Caldas to Coimbra, through Alcobaca and Batalha—Coimbra—The University—Causes of the Backwardness of Portuguese Literature.

WE set off from Caldas for San Martinho, a small market-town two leagues from Caldas, over low hills, and through a sandy country, and pine-woods. Close to the sea, rise hills consisting of sand-stone and lime-stone with a small quantity of gypsum. Between these is the narrow entrance into the harbour, which is pretty large, almost completely a round basin, which has a very fine appearance; but only small ships can enter, and we counted but three two-masted vessels. Most of the inhabitants are supported by the fishery, and carry on a coasting trade.

To the eastward of San Martinho, a chain of sand-stone hills runs parallel to the sea. The summits and western declivities are naked, but the eastern sides are covered with frequent and

considerable pine-woods. The country also becomes more mountainous. At the northern extremity, concealed in a valley, so that it can only be seen on a very near approach, is the rich Bernardine monastery of Alcobaca, together with a market-town. The church is large and built in the gothic taste, which is called the new normanno-gothic. A number of curiosities (but of no great importance) were there shown us. I was only struck with some articles made of the first gold from Brasil, and an excellent black sculptured marble from Porto de Moz. The monastery is a large simple well-built pile, and the apartments have the air rather of a palace than of a monastery. The once celebrated archives were taken away by the Spaniards, when they conquered Portugal, and carried to the Es-

* In the middle of this plain over the warm spring, is a spacious and handsome bathing house, founded in the reign of the late king, and close to it a hospital for poor patients. Besides the spring used for drinking, three others supply four baths; that for the men is thirty-six feet long by nine broad, and two feet eight inches deep. The soil is covered with a white clay and washed sand. The company undress behind a curtain, put on bathing cloths, and sit upon the ground in the bath, so that the water reaches their neck. There are frequently twelve patients in the bath at the same time, and though the water is constantly flowing it is unpleasant to be obliged to bathe in company, especially to those who come last, to whom the water arrives after washing the rest. It is also unpleasant that strangers are admitted. Nothing however is paid for bathing, except a small present to the attendants. The poor are not suffered to bathe till about noon, when the other company are gone. The rest of the baths, even those appropriated to the ladies,

are regulated in a similar manner, except that the water in the bath for men is the hottest and of the strongest quality, being from 92° to 93° of Fahrenheit, (from 26° to 27° of Reaumur). The water from all the springs joins and turns a mill near the bathing house.

On entering this house the company come to a large floor, which serves for a promenade after bathing, and is generally full of people running to and fro with great violence. Here also is an apothecary's shop, and in the back-ground the spring used for drinking, the warmth of which is 91° of Fahrenheit.

The country round is well cultivated, but sandy and full of pine-woods. The place itself is situated on the western brow of hills very much flattened, consisting of a soft brownish sand-stone containing iron, and probably covering coal, from the combustion of which the heat of the water may arise.

curial.

* Here, in the Spaniards throne. He is a son of the emperor; for D. Maria II. daughter who ground for a with Portugal of Campo de C. Portugal. Camo- tely describ- language. No.

VOL. II.

curial. The library is far from bad. We also saw here a magnificent copy of the English translation of Camoens's *Lusiad*, which was presented by lady Bute to this and other institutions in various parts of Spain and Portugal, as a token of remembrance. In short this library did not at all resemble most German monastic libraries, and a new and excellent apartment is now preparing for its reception.

Alcobaça is a very considerable market town or villa, and carries on various manufactories, the oldest of which is in the monastery, where Pombal established it, probably in order to turn the monastery to some account. Cambrics and other fine linen manufactures are made here, but the woollen manufactory is more important, as also one for spinning wool, belonging to Messrs. Guillot, natives of France. That part of it which can be done by machinery is so performed, such as carding, spinning, &c. and the ingenious construction of these various machines excites general admiration. This manufactory enjoys a good sale, although woollens are also made in Lisbon, and a spinning manufactory is established at Tamar. The Guillots are a respectable house, both here and at Lisbon.

The common people have a great talent for fine delicate works; and imitate with the greatest accuracy. We saw here extremely fine thread, spun at Santarem, which M. Guillot showed us as extraordinary in its kind.

Alcobaça is surrounded by mountains. To the south-west, and to the northward, sand-stone mountains press close round it. To the westward rises a high naked range of mountains, which for a considerable distance runs parallel with the coast, being connected, though by detached ridges, with Monte Junto to the south-east, and Lousaõ to the north-east. A part of this range is called Porto de Moz, and affords excellent marble. The country however round

Alcobaça is cheerful, containing much coppice and meadows, and being also far cooler than the flat lands to the southward.

From Alcobaça to Batalha, a distance of three leagues, we approached the chain of mountains to the eastward, where they become higher, more crowded together, and in many parts covered with pines. We now came to a market-town called Aljubarota, on the long flat summit of a mountain. It is a pretty large place, but consists entirely of very small houses*.

Toward Leiria, the hills are still lower, consisting of sand-stone, and bearing olive-trees. At the foot of them, on a plain between the small rivers called Lix and Lena, and two leagues from Batalha, is the city of Leiria with its suburbs. The number of houses does not amount to much more than one thousand; but there are some neat ones, and many persons of easy fortune reside there. It is a very old city, was formerly much celebrated, and though it has considerably diminished since 1417, it still continues the capital of a *corregimento*, and the seat of a *corregedor* and bishop. It consists of two parishes, and contains four religious houses. On a hill is a once much-celebrated castle, and the city has been the residence of some of the kings, especially of the wise Dom Diniz, whose palace still exists. The surrounding country is pleasant, the valley fertile and well cultivated, and old venerable pine woods adorn the hills.

Barren heaths, covered with ratchil, and here and there with pine-woods, continue as far as Pombal. During these five leagues we did not see a single village, and only a few detached houses; but were much surprised at finding in some parts a good road, which is a striking and novel sight that always reminds the traveller of the name of Pombal. The market-town of Pombal, contains some neat houses, and is situated on the bank of a river in a well-cultivated

it, having previously engaged the great men of his country to support their new king. In memory of this victory, his majesty founded the monastery and church *da Batalha*, but at some distance from the field of battle, that it might enjoy a convenient situation and plenty of water. The mountains near this monastery are indeed lower, but it is so much concealed between hills that we did not perceive it till we approached very near. The singularly-built and open transparent tower strikes the eye, and pleases by its noble proportions.

* Here, in 1386, John I. gained a great victory over the Spaniards, by which he maintained himself on the throne. He was a natural son of Dom Pedro his predecessor; for Dom Fernando the last king having only left a daughter who married the king of Castile, this was sufficient ground for a jealous king of that country to make war with Portugal. It was this battle, that, together with that of Campo de Ourique, established the Independence of Portugal. Camoens, in the fourth Canto of the *Lusiad*, minutely describes this battle in beautiful and truly picturesque language. Nuno Alvarez Pereira distinguished himself in

and very cheerful country. A capuchin church with a very celebrated miraculous picture of the virgin, the ruins of an old castle on a hill, and the palace of the famous marquis of Pombal, which is a neat but not a striking edifice, are the principal objects that deserve notice. Here the marquis of Pombal ended his days, as it were in banishment.

Similar hills to those from Leiria to Pombal, continue from thence to Condeixa, though not so entirely barren, and better cultivated. We also came to a market-town called Atouguia, a place of some consideration, but consisting of small houses. At length we approached the high naked mountains to the eastward, which extend hither, and consist of a whitish-grey lime-stone. In some parts is found red iron-ore, which might be very well smelted into iron. On this road we quitted the province of Estremadura and entered that of Beira.

Condeixa, which is five leagues from Pombal, is situated near that chain of mountains in a very pleasant and cultivated country. The place itself is larger than Pombal, gay and lively, and many persons of rank reside there. The oranges of Condeixa are celebrated for their excellence and cheapness, and it is called a fruit-basket; a pleasing name for a pleasant place. The young women here appeared extremely beautiful and freer than they generally are in small Portuguese towns, the cause of which may be the vicinity of the students of Coimbra. Here also the ancient Colibria or Colimbria, from which Coimbra took its name, is said to have stood.

A fertile hilly country watered by brooks, well peopled and cultivated, continues as far as Coimbra, which is but two leagues from Condeixa.

Coimbra, like almost all great cities in Portugal, is built on the declivity of a hill, which in this instance is considerably steep; only a small part of the town being situated on the plain. The Mondego in its wide bed winds along in front close to the hill, and over it is a long stone bridge. The traveller does not perceive the town till he descends into the valley; but then it forms a fine and surprising view, in the midst of a charming country, which it adorns with innumerable monasteries and churches, along the declivity of the mountain. But he has no sooner entered Coimbra than all his expectations are reversed: for the streets are extremely narrow,

crooked, and full of angles, ill-paved, very dirty, and frequently so steep that it is difficult to climb them. There is a single broad street on the plain; but even that is not inhabited by the rich, because it is deemed unhealthy in summer. The Mondego swells in winter, overflows its banks, and in summer leaves marshes, which, as in all hot countries, produce unwholesome vapours. There is not a single open place in the whole town, nor any promenade, but such as nature offers. The great quinta of the Augustines is alone used as such, and those who wish to see Indian laurels from Goa (*laurus indica*) in their greatest perfection, should visit this spot. But this is not all. In no large town throughout Portugal are the inns so bad, strangers being lodged in wretched apartments with miserable beds and food, the dressing of which requires the appetite of a herboriser to overcome. Hence perhaps it is, that all travellers hurry through this place, observe it but cursorily, and give little or no information relative to its very celebrated university.

The farther northward the traveller proceeds, the better disposed and more industrious are the common people, and robberies and thefts are here very uncommon. Neither sex however is beautiful; and the female far from pleasing, compared with their neighbours of Condeixa. The lower classes of women wear on their heads a long black cloth.

Coimbra is a very old city, and had suffered many sieges, previous to the time when Count Henriquez took possession of Portugal. The towers and walls still remain; but in other respects the place is quite open. Since the year 1419, Coimbra has declined. It is however the see of a bishop, who is always count of Arganil, not only in name but in reality; also of a corregedor, a provedor, and a juiz de fora. It consists of something more than three thousand houses, being divided into eight parishes, and has no less than eight monasteries and eighteen endowments.

The most important object at Coimbra, is the university founded at Lisbon by Dom Diniz in 1291, but transferred hither after a period of sixteen years. It was afterward again removed to Lisbon; but in 1537, John III again transferred it to Coimbra, where it has remained. Under Pombal its regulations were considerably altered,

altered, and certainly much to its advantage. But regulations are not all, and will not supply the want of an animating spirit; for where that fails, the sciences cannot flourish. They require liberal funds, encouragement, and a just estimation of their important uses; means whereby an inferior constitution will produce more effect, than the best regulations in the world. But as the state of this university is little known, I shall here speak of it more at large.

The university is under the government of a rector (reytor) nominated by the king, but not from among the members of the academy. He is generally a priest, and from this office is promoted to be a bishop; being only appointed for three years, but after the expiration of that period, almost always continued till another promotion. The chancellor of the university is the principal superintendant in matters of learning. He confers the degrees at all promotions, and presides at the examinations of students. This place belongs to the prior and chief of the Augustine canons regular at Coimbra.

Various public institutions now occupy the buildings of the ancient college of the Jesuits, which Pombal gave to the university. It is situated like all the other university-buildings in the highest part of the town. The museum is inconsiderable, containing but few remarkable specimens, which Vandelli, when he superintended this institution entirely arranged, even the minerals, according to the Linnæan system. But the collection of philosophical instruments is good and considerable, including many entirely new, especially from England. Those made in Portugal are chiefly of very fine brasil-wood, adorned with gilding, and so arranged, that this collection is one of the most brilliant of its kind. In mechanics it is very rich, but extremely poor in electrical apparatus. The chemical laboratory is also very good, capacious and light, and, be-

sides the objects generally found in such establishments, there is a pneumatic apparatus, and a collection of chemical preparations according to the new nomenclature. This building also contains a collection of chirurgical instruments.

The public library fills a small church, the interior of which is very little altered; but it is not easy to judge of a library without studying the catalogue. The number of volumes is considerable; and from the description of the professor of botany, Brotero, it seems not to be deficient even in new works. Accordingly it is much visited and used by the students.

The observatory is well built in an excellent situation in the upper part of the town, and is very convenient and neatly arranged. It only wants instruments.

The botanic garden is not very large, and the green-house is small; but through the industry of its superintendant, the professor of botany Dom Feliz de Avellar Brotero, is excellently regulated. This garden is without comparison more interesting than the royal botanic garden at Lisbon. Beside every plant is a stick bearing its name, as in the garden of Paris, and at first sight the spectator might almost imagine he is viewing its counterpart. Besides many exotics, there is a considerable collection of plants indigenous in Portugal, on which this excellent superintendant has made a number of very important botanical remarks, and no botanist can visit it without instruction.

In short the various institutions of the university of Coimbra are far from bad. It far excels the Spanish universities, not excepting that of Salamanca, if I may judge from what I have heard, both in Spain and Portugal, from the best judges. There are indeed very many universities in Germany, which in this respect are far inferior to this their Portuguese sister, whom they despise.

SECTION IX.

The Country round Coimbra—Agricultural Economy—Aveiro—Oporto.

THE country round Coimbra is uncommonly beautiful, and, though mountainous, extremely well cultivated. The mountains are

covered with small pine-woods and even German oaks, the vallies watered by brooks, and full of gardens, quintas, neat summer-houses, and even monasteries,

monasteries, and adorned with olive-trees, orange-trees, and the beautiful Portuguese cypress in abundance. The Mondego winds before the city; and on both sides of it is a narrow and very fruitful vale, which this rapid stream inundates in winter. In the distance on one side are seen the high mountains of Lousa; and on the other the high mountain of Bussaco, whose solitary summit is adorned with a celebrated monastery of Carmelites, and its quinta with high shady cypresses. Those to whom the ascent is not too laborious, will here find the richest variety. Opposite to Coimbra, on the bank of the river, is the *Quinta das lagrimas*, or garden of tears, with a fountain of the same name, which rises at the foot of a hill shaded by fine Portuguese cypresses*.

The mountains round Coimbra consist partly of a coarse-grained sand-stone, alternated with a grey lime-stone. At a distance began high slate-mountains, and here also a yellowish grey argillaceous slate changes to a sand-slate, and this to a mica-slate, which ends in a granite. The flora of this part is uncommonly beautiful. On the slate-mountains grow the plants of Entre-Douro-e-Minho. In the pine-woods and sand-mountains are found the plants of the Portuguese heaths, and on the lime-stone mountains an abundance of orchides, and of the plants of the Serra da Arrabida. When we came to the oak-woods, we fancied ourselves in the smaller forests of Germany.

The land is well cultivated; better than elsewhere, except in Minho. Much oil in particular is produced here. The olive-tree, indeed, is very common all over Portugal, from the northern frontier mountains of the serra de Gerez to Algarvia, but most abounds in these midland parts, where the traveller may sometimes pursue.

* Tradition says that Dona Inez de Castro lived there, and was there murdered. This lady, who was a Castilian by birth, Dom Pedro son and heir apparent to Alphonso IV. loved, and is said to have secretly married, at Braganza. He gave her this spot for her residence, frequently visited her, and she bore him three sons and a daughter. The passion of the prince at length transpired; and his enraged father, instigated by his courtiers, came suddenly, while the prince was hunting, from Montemor o velho, not far from Coimbra, where he happened to stop, and caused her to be murdered. When Dom Pedro came to the throne, he gave orders to disinter the object of his passion, and with his own hands placed the crown on her remains. He was

his way during whole days without seeing any other tree. There are several varieties of it; but in general the Portuguese oil is better than that of Spain, though the olives are smaller. The olive-tree is planted by sets (*tanchos*), or it is grafted on the wild olive (*azambujeiro*), which is by no means scarce in many parts of Portugal. The latter method affords a more durable stem. The sets are cut off from old trees in autumn, from which time they are kept in moist earth, and are set from the beginning of January to the end of April, according to the situation of the soil. In the first years they are hoed, to destroy weeds, and the land is sowed with corn; but this method of cultivation is not common except in Algarvia. While the trees are young the superfluous branches are cut off; but the olive-tree bears very late, not till its fifteenth year. Hence appears how injurious war is to this branch of agriculture, and how horrid the revenge recorded in sacred history of cutting down the enemy's olive-trees. The olives are ripe in December and January, at which time men climb the trees and beat them with long poles, while the olives are received in extended cloths, or gathered up from the ground. It would certainly be better were the olives plucked by the hand as in the south of France. Some press them immediately on their being brought home in baskets; others shoot them down in heaps, throwing salt between them, and suffering them to ferment in order to produce more oil, of which however the quality is inferior. The presses are worked by oxen; but the want of cleanliness, both in these machines and throughout the whole process, contributes much to render the quality of the oil much worse than it might be. In this country, where oil is used instead of butter with all kinds of food, and fat is burnt in large quantities in lamps, and

very severe toward those who had stimulated his father to commit this murder, and even continued this severity throughout his reign; from which circumstance he was called a justiceiro, signifying, not the just which is *justo*, but the severe. This appellation was particularly used by the priesthood, who were unfavourable to him. Inez and Dom Pedro showed great taste in the choice of this little spot, where Coimbra with the charming country around displays itself to the eye. In the romantic valley of the Mondego, the quinta of tears forms a spot, over which fancy seems to hover in all her sportiveness, and if poetry has ever sent forth a few sparks of radiance in Portugal, it has been the offspring of this charming vale.

ap prepared from it, besides other uses, that article is an object of great consumption, and is carried from Coimbra into the other provinces. The Portuguese pickle only the ripe brown olive; but at good tables the large Spanish unripe olives alone are seen, as they are every where preferred. The wood of the olive-tree might be very useful, being yellow, close-grained, and beautiful; but only employed as fuel, the woods from Brasil having superseded all other kinds of timber.

The olive-tree is subject to two diseases, the one, called a *gafa*, arises in damp situations, shrivelling up both leaves and fruit; the other, called *ferragem* (or rust), is very prevalent in the midland and southern part of Portugal. In this disorder the leaves shrivel, are covered beneath with a black clammy substance, and a great number of insects belonging to the family of *coccus*, but not yet established as a separate species. Hence the tree sickens, and bears smaller fruit and in less quantity. Complaints are every where made of this disorder, which employs the attention of the learned and of economists as much as the dry-rot or the caterpillars, called *nommen-nuque*, occupy the German naturalists and foresters. Hitherto no other remedy has been discovered than cutting off the infected branches, which is too severe a mode of cure; for probably this insect, like all such animals, has its period, and would at length cease of itself. In the economical treatises of the academy, vol. I. p. 8, Vandelli has given his opinion, that the insect is a *coccus*, and advises, besides cutting off the branch, to sprinkle the tree with salt-water. In vol. III. p. 154, another method is proposed on this subject by Antonio Suares Barbosa, who first gives the natural history of the insect, and then proceeds to show that the black clammy substance does not arise from the insect, but from an overflow of sap (*chyromania*).

Round Coimbra are grown various kinds of wheat, white, red, and summer-wheat (*trigo tremez*), but the latter only when the Mondego, as often happens, rots the seed in the ground. It is sown from November to March, at three different times. When it grows in fields amid olive-trees, the ground is turned in winter, if not in May, and it is ploughed only once in October after the first rains. The plough used here has two wheels, a share, a mould-board, and a coulter, which may be raised and lowered.

VOL. II. No. XCV.

Barley is also sown; but no oats, and little rye. In general, Coimbra is obliged to import wheat and barley from other provinces. Rice is grown in the marshes along the Mondego, but not in any considerable quantity.

Maize or Indian-corn is very commonly cultivated here, and throughout Beira, where it is produced in larger quantities than in the southern provinces, in which the soil is too dry, and too light. The land is ploughed fourteen days before sowing time, which continues from April to the end of May. When the young plants have four or five leaves, the ground is hoed, the superfluous plants destroyed, and immediately afterwards the earth is heaped up round those that remain. In the fields it is harrowed fourteen days after, by which the leaves are torn off, and the young plants frequently quite covered with earth, which makes them thrive better. The maize when ripe is cut, and great numbers live on the bread made of it, called *broa*, which is of a fine yellow colour, but heavy and sweetish. The maize bread in the south of France is far lighter, but much dryer. Maize also affords good fodder for cattle, and is grown round Coimbra in such abundance that great quantities are exported to other provinces. It is called *milho*, and according to the Portuguese writers was first imported from Guinea. Millet (*panicum miliaceum*) is called *milho miudo*, and Italian pannicle (*panicum italicum*) *milho painço*.

The oranges produced here are excellent, and are exported to foreign countries, even from the small harbour of Figueira at the mouth of the Mondego. The wine is moderate, yet is sent into other provinces. Garden-fruits are produced in great abundance, and of a very good quality, especially common beans, and another kind of beans, called *feijao fraydinho* (monk's beans), which are met with in great quantities all over the kingdom. These beans much resemble the common beans, but are smaller, and do not taste quite so good; yet the cultivation of them is said to be very productive. Some flax is also grown round Coimbra.

Notwithstanding this good cultivation, the common people are very poor, the cause of which strikes the eye of the traveller, even before he approaches the town, in the number of monasteries and churches it contains. The town itself is supported by the university, its trade being

giving it, in a considerable place called Villanova do Porto, where he descends a steep street to the bank of the Douro, and beholds on the opposite declivity the city of Oporto.

Excepting Lisbon, Oporto is the largest city in Portugal; the chief town of a corregimento, and the seat of a corregedor, a provedor, and a military governor, being a place of arms; it is also the see of a bishop who chiefly resides at Mexanfrío. The population is about three hundred thousand, as the corregedor himself assured us. Oporto has four suburbs, seven parishes, and twelve religious houses. On one side the remains of the walls and gates still exist; otherwise the town is quite open and has no fortifications. It is also the seat of the high tribunal for the northern provinces.

The quay on the river is built without the least art; on one side is a street, the other side is walled and raised, though merely for the purpose of making ship's cables fast. From the strand rises a broad well-paved street with causeways on the sides, leading to an equally handsome oblique street. The rest of the streets along the declivity of the hill are narrow, crooked and dirty; but upon the hill we again found many fine broad straight streets, with a great many new and handsome houses. We seemed almost to have quitted Portugal, and to be suddenly transported to England; so regular, so light, and neat are all the buildings. Generally speaking, Oporto is without doubt the cleanest town in Portugal. The steep declivity of the hill on which the city is built, renders walking and riding on horseback or in carriages more laborious than in Lisbon. On the east side of the town are houses built against so steep a part of the declivity over the stream, that they can only be entered by steps cut out of the rock. This inconvenience is indeed compensated, at least to a stranger, by the romantic situation they enjoy, and the prospect of the opposite bank with its towns, villages, monasteries, and pine-woods.

At Oporto the manners of society are taken from the English, who are here more numerous and considerable, in proportion to the other rich

inhabitants, than at Lisbon. They have a kind of casino in a handsome building, which is extremely well regulated, and very much contributes to bring foreigners together. Among the English merchants are several who possess both knowledge and the love of science.

A short time ago a considerable play-house was built at a large expense, but the architect has unfortunately so contrived it, that the audience in the boxes cannot hear. In other respects it highly merits approbation. Here Portuguese plays are performed by tolerably good actors. Thus it is not impossible that Oporto may soon have a better theatre than Lisbon. Another uncommonly extensive building, the royal hospital, was at this time in the same unfinished state as when Murphy saw it.

The trade of Oporto, which is well known to be chiefly in wine, has suffered much in consequence of the war. The vicinity of Vigo in Galicia, where the French privateers take refuge, have kept this place in great awe, and the harbour of Oporto is very ill-adapted to be a station for ships of war, on account of the difficulty of its entrance. Hence French privateers have almost always been hovering within sight of it; and this circumstance has ruined many houses in Oporto, which can be said of very few at Lisbon. In front of the town the river is very deep; two-masted vessels can come to the town itself, those with three masts within a quarter of a league, and the great Brasil ships alone unloaded their cargoes in the road*.

The mountains suddenly cease toward the coast, and the land is lower at the mouth of the river; but here and there rocks rise out of the sand, rendering the entrance into the harbour extremely narrow and very dangerous. The sea also is very boisterous on these coasts during the rainy season, and the river very rapid. The sand which the streams brings with it is retained by the rocks, and thus more and more chokes the passage; so that, unless great and powerful means are employed, the harbour will at length be rendered totally useless. Endeavours, however, are made to keep the stream in one place,

beck in and out; thirty-five Portuguese in, forty-two out; twenty-seven Prussian in, twenty-six out; one from Papenburg in and out; thirty-two Swedish in, and twenty-nine out. From which it appears that the English trade to Oporto far exceeds that of all other nations.

* In 1796 the following ships entered and sailed out of this port: ten Americans in and six out; from Bremen two in and out; fifty-one Danish in, fifty-two out; two Spanish in and out; thirty-six Hamburgese in, thirty-four out; eighty-eight English in, ninety-nine out; four from Lu-

so as to wash the sand away; and something has already been effected by labour. On the whole, however, little has been done, and much more can and must be performed, if this important harbour is to be preserved. It is a fearful sight to behold a ship, when the wind is at all strong, winding its way through this narrow part. A small fort called San João de Fez, near which is a small market-town, covers the entrance; besides this, on the coast to the northward is a bastion on the beach; opposite to which on the south side is also a very small fort, called Santa Caterina, with a few other batteries.

Immediately opposite to Oporto, on the south bank of Douro, is the appearance of a town not much smaller than Oporto itself. To the westward, along the declivity of a hill, are a number of detached houses forming the market-town of *Gaya*, a place remarkable both for its situation and name. Here in former times a place called *Cale*, of which the ancients speak, is said to have stood; but Oporto being afterwards built, as being more convenient for ships, by the greater depth of the water along that bank, it was called *Portus Cale*, or the harbour of *Cale*, whence was derived *Portugal*, and at length *Portugal*. Thus from this place the whole kingdom afterwards received its name according to this highly probable etymology, of which Resende is the author. *Portus Cale* was at length called *o Porto* (*the harbour*), which name the town of Oporto afterwards received. Advancing to the eastward, we came to a considerable and populous town or villa, called Villanova do Porto, inha-

bited by the lower classes of people, whereas the rich more generally live in Oporto itself. Between Villanova and Gaya, on a small plain along the bank of the river, are the immense magazines where wine is kept till exported. A monastery on a high, and, toward the river, very steep hill, completes the circle of this bustling view to the eastward. We were told that the number of inhabitants at Gaya and Villanova, including the detached houses reckoned as part of both places, was about twenty thousand.

The climate of Oporto is in winter damp and foggy in consequence of its mountainous and woody situation; whence also the air is cooler than elsewhere, though it seldom freezes. On the contrary in summer the heat is great both in this narrow valley and the town, which is situated on a southern declivity. Here, as also along the lower coasts of Portugal, regular winds prevail in summer, viz. in the morning the east wind, which toward noon veers to the southward, and then to the west; which confers many advantages on navigation. The soil though well cultivated is not productive; but oranges are brought from Braga and Barcelos, wine from the Upper Douro, and, in short, all those productions which bear the name of this town are not grown round Oporto are beautiful and pleasant, and the plants of the Cape and of New Holland grow in the open air, with gooseberries, currants and other fruits of the colder countries of Europe which are not seen round Lisbon.

SECTION X.

Journey to Braga—Province of Entre-Douro-e-Minho.

CLOSE to Villanova do famelição six leagues from Oporto, behold one of the beautiful Minho-valleys in which that place is situated. Here small fields of maize, and even of rye and barley, but more rarely of wheat, are surrounded by high German oaks, chesnuts, and poplars, artificially watered by brooks, every tree supporting a vine which spreads over its crown, and not unfrequently reaches the summit of the high oaks; while a cool refreshing shade every where

abounds, adorning a cultivated populous country, and every valley resembles a fairy-land in closed between rocky desert mountains.

Minho is the most populous of all the provinces of Portugal. Within a space of eighty leagues in length and eleven in breadth, it contains three cities, twenty-five villas, nine hundred thousand inhabitants, and two hundred and twenty-three thousand four hundred and ninety-five houses. The whole province is a collection

of granite-mountains, the soil in the vallies being
alone fertile, and the eminences bare granite-
land, but on the other hand extremely well
watered, and therefore well cultivated. The
industry of the inhabitants is every where ap-
parent: they dig with great labour for water, so
that a stranger would suppose the ground to be
full of shafts of mines, and they divide the water
they find with great care among the fields and
meadows. Maize is chiefly cultivated, being
hoed twice a year, first when four or five inches
high, and afterwards when the ears are set.
The vine yields a very bad wine resembling
vinegar, the grapes that are shaded by the tops
of the trees not having sufficient sun.

Except some rich monasteries, very few large
estates are met with in this province; but hence
the peasants thrive the better, which ought to
convince every Portuguese, that under such an
order of things alone an adequate population is
practicable. Yet the increase of this industrious
and cheerful people is too great for their unfruit-
ful soil, and a great number annually emigrate,
some with an intention of finally settling else-
where, and others to acquire property and re-
turn. These men help the farmers of other pro-
vinces in their harvest and other branches of
husbandry, travelling about in considerable num-
bers under the command of a captain, and living
in huts. In this manner the inhabitants even of
the northern part of Beira round Aveiro, &c.
emigrate.

On quitting the valley of Villanova, we again
crossed arid mountains covered with heath before
we came to the valley of Braga. Here we saw to
the northward the high range of mountains that
divide Portugal from Galicia, called the Serra
de Gerês, with its high pointed summits. The
city of Braga is situated in a broad open vale, as
the Minho-vallies generally are, and like them
cultivated and shaded by trees. Here are many
cork trees, and close to the town orange-gardens.
The small rivers Cavado and Deste scarcely de-
serve the name, being mere brooks. Braga, the

* Among the objects of curiosity here is the large old
gothic-built cathedral with its antiquities and treasures;
also the church and monastery of St. Fructuoso, containing
a miraculous picture of the virgin, and rich in treasures and
relics, stand on a hill without the town, so situated as to
form a fine object, as seen from a broad handsome street.
The origin of Braga is lost in remote antiquity; the Romans
called it Augusta Bracharorum, and Roman coins are often

VOL. II. No. XCV.

chief town of the province, is under the arch-
bishop of that place, who enjoys a revenue of
above a hundred thousand crusades; and appoints
judges and two tribunals, the one spiritual, the
other temporal; so that this is the only city
where the king does not appoint a corregedor,
or a juez de fora. Braga contains about thir-
teen thousand inhabitants, five parishes, and seven
monasteries. Several of the streets are broad,
light, and open, but most of the houses are small,
as in all inland towns in Portugal*.

A league from Braga we came to a small vil-
lage called Ponte do Porto, on account of a
stone bridge there, over the Cavado. This
valley is extremely pleasant and charming: the
distance appears like a thick wood of high trees,
though these trees surround fields and gardens.
The houses, which are dispersed and embosomed
in thick shade, are concealed from the sight;
but the number of well-dressed persons, and
even of young ladies, we frequently met, an-
nounced their vicinity. We passed over granite-
mountains to the Bernhardine monastery of
Bouro, at a distance of two leagues. It stands
in a hollow at the foot of the mountains, is very
rich, the buildings are extensive, and by no
means ill-arranged. On a mountain not far
from Bourou, is a church with a miraculous
figure of the virgin, to which many pilgrimages
are made. It is called Nossa Senhora de Abba-
dia (Bouro being an abbey), not Nossa Senhora
da Badia, as it stands in the maps. According
to our barometrical investigations Bourou is situ-
ated five hundred feet above the level of the sea,
which is but a small height.

Beyond Bourou we ascended the spurs or fore-
runner-mountains of Gerez. As soon as we had,
with great labour, climbed its rough sides, the
road became uncommonly pleasant, leading
along the declivity of high and rocky mountains,
under a continual shade of oaks and chesnuts,
with streams every where rushing down or spread-
ing in artificial canals to water the meadows.
On one side we had a deep valley, the steep de-

found in the neighbourhood. Braga was a more consider-
able place in the fifteenth century than now. It has a hat-
manufactory which supplies a great part of Portugal with
hats for the common people; nor are the hats bad, though
they do not equal the English. There is also a manufactory
of knives which is inconsiderable. The women are every
where seen knitting, sewing, or making linen, and signs
of industry and activity every where appear.

5 D

clivity

clivity of which is converted with great industry into terraces, and extremely well cultivated.

From the declivity of this mountain we descended to a large village, called Villar de Veiga; and then followed the valley, which continues rising more and more. A roaring stream, called Rio das Caldas, pours down over rocks into the middle of the valley; the mountains become higher and steeper, and, after climbing them for a league, suddenly appears behind an eminence a small place in the same valley, consisting of forty houses, and celebrated for its warm baths, for which reason it is called Caldas de Gerez.

This valley is extremely narrow. To the eastward the houses lean against the mountain, a stream waters them to the west and also the foot of another mountain; to the northward the valley rises rapidly up the heights, and an eminence to the southward before it does completely incloses this dell. The mountains are very high, steep, and rocky, being chiefly destitute of wood; and trees are found exclusively on the banks of the river.

For some years past this spot has been more celebrated for its baths than formerly, and new houses are continually built; so that there will soon be no more room in this confined valley. The company come from the small towns of Minho, and many of the English from Oporto. As the surrounding country is very bleak, the inhabitants go in winter to Villar de Veiga, and return in May. The houses are of stone, but ill-built, having but one story, small inconvenient apartments, mostly without glass windows, and floors that can be seen through. The furniture consists of a rough wooden table and coarse chairs; every thing else, even to the smallest trifle, the company must bring. Nor must they expect either inhabitants or attendants; for in general an empty house is opened to the stranger, who is only put in possession of bare walls and of the tables and chairs above described. The place only affords young beef, or rather meat betwixt veal and beef, rice, oranges, sour wine of the country, sometimes Douro-wine which is better, and still more rarely fish. Sugar, spices, coffee, and every other necessary, must be procured from Villar de Veiga, which is a league distant, and even there not much is found. Even

the apothecary lives at that place, and no watering-place-physician is to be here expected.

The warm waters of this place rise to the eastward from a wall of granite rock at the foot of a high mountain. There are four springs, each bearing a different name. The bathing season continues from June till August. In this narrow valley the air is often very hot, though from time to time it is considerably cooled by the mists of the mountains.

The Serra of Gerez, generally speaking, extends from east to west, but sends out many branches to the southward. The valley where Caldas lies also pursues the same direction, rising continually toward the north, but only to a certain degree, after which it again somewhat sinks toward the frontiers of Galicia, which are only three leagues from Caldas. It continually becomes narrower, more rocky, and more woody, till at length the traveller enters a thick shade of fine lofty oaks, while brooks murmur around, high abrupt walls of rock appear, the mountain becomes wilder, and at length assumes an appearance of sublimity. Near the Spanish frontiers, the river Homem intersects the valley obliquely and passes into another. Here are the ruins of a Roman bridge, with many remains of pillars here and there belonging to a Roman way. A narrow and difficult foot-path now leads by this singular spot into a foreign kingdom.

In a pass called Portela de Homem*, where the ridges of the mountains leave a considerable opening, are the Spanish frontiers. The view of Galicia is far less beautiful than that of Minho; the mountains are still high, the vallies wider and more open, but not so well cultivated; the traveller however scarcely yet perceives, he has entered another country, as he still hears the Portuguese language; and beholds Portuguese manners and customs.

The highest of the mountains of Gerez is to the eastward of Caldas toward the town of Montalegre. We climbed a very steep ascent up this mountain, which, however, was very easy, as the path winds round the blocks of granite, and thus is free from danger even to those who easily become giddy, excepting in one short space. But should the traveller lose the beaten path, which is very possible, he will either come to

impassable thickets or extremely dangerous precipices. In the valley of Caldas the road rises toward Portela de Homem, by a convenient path leading to the heights, and a fine light oak-wood accompanies it three-fourths of the way up the ascent. The prospect to the westward is extensive, commanding a great part of Minho and the sea with the downs that skirt it; but the view is not distinct, as the eye cannot penetrate into the beautiful but narrow vallies, resting only on the barren heights. Toward the rest of the horizon the view is bounded by mountains. The farther we advanced to the eastward, the more rough and wild we found this range, and we met with vallies consisting almost entirely of naked impassable rocks. A sharp mountain-ridge here divides Spain from Portugal.

Wolves are here so numerous as to render this range of mountains dangerous; but the most remarkable animal is the Caucasian-goat, (*capra agagrus* Pall.) which is extremely rare on other European mountains. We saw several skins of them; and at length a three-year old he-goat that had been shot, was brought to Caldas, where the count of Hofmannsegg bought its skin, which was stuffed, and is preserved in his collection*.

A considerable quantity of cattle are fed among these mountains, the young bullocks being brought there in spring, and remaining till autumn. The neat-herds relieve one another from time to time. Draught-oxen are brought to the low pastures, when not employed in work, or at least every Sunday. The vallies, especially

* This animal is larger, stronger, and more muscular than the tame goat, particularly in the shoulders and parts near the heel. The forehead is higher, the horns rise straighter up and bend backwards, and the tail is not so long; the hair is shorter and thicker, being a mixture of grey and brown, and very similar to that of a stag. A black cross runs along the back and over the shoulders. The male as in tame-goats is furnished with a beard, and the female has no horns. We carefully took the measure of this animal, which in other respects fully coincides with the description of the writer on *capra agagrus*. It is no where found in Portugal, except on the mountains of Gerez, nor have I ever learnt that it is found in Spain. Whether it be a degenerate and wild variety of the tame-goat, or the wild parent stock of the latter, cannot with certainty be discovered, but it is evidently different from it. The last of these hypotheses appears to me most probable.

that of Caldas, are highly cultivated, and where it is practicable a little land has been gained from the mountains, so that between the rocks, in almost inaccessible places, fields of maize are frequently seen. The land on the declivities is often formed into terraces, and carefully watered, so as to constitute artificial meadows.

The mountains on the west side of Caldas are also very steep, but not so high. The path that leads directly from Caldas over the mountain to the village of Covide is very rugged. After passing the mountain toward this village, appear ruins probably of an old mountain-fort, which however the inhabitants assert to be the ruins of an old city, called *Chalcedonia*; but that is not probable.

Taking the road across this plain from Covide, to the frontiers of Galicia, we came to a large village called Villarinha do forno, close beyond which rises a range of rocky mountains, called Serra Amarella, which form the frontiers. Villarinha has many opulent inhabitants. Here we found much honey, which abounds on these mountains, as do milk and fresh butter, which are great rarities in Portugal. Oh that my weak voice could sufficiently praise the worthy people of the cottage, or house, where we lodged: their gratitude and good nature were beyond expression great. These are the people, whom many proud and ignorant travellers, and especially the English, have stigmatized and reproached! The common people in and about Caldas are richer than in many other parts of Portugal, and uncommonly gay and animated †.

It is found not uncommonly from hence to Montalegre, is hunted in great numbers by the inhabitants, and its flesh is so much esteemed, that the hunter who willingly sold us the skin would not part with the carcass. The skins are here frequently used as covers for mules, and the horns are put up as ornaments in houses.

† At night the guitar was every where, though the performances are monotonous and rude. I here saw some dances accompanied by songs which I found in no other part of the peninsula, and which represented a kind of drama; as for instance, a conversation between a father and his son, who, in a mimetic-dance, confesses he is in love, for which he is reproved by his father, whose forgiveness he at last obtains: or it consisted alternately of singing and mimetic dancing, till the procession had meanwhile moved through the village. The audience show their approbation by clapping their hands.

SECTION XI.

*Journey to Amarante—Serra de Maraõ—Peza de regua—Remarks on the national Dress—
The Culture of the Vine.*

FROM this range of mountains we returned to examine the second chief range of mountains in Portugal, Serra de Maraõ. We travelled directly southward through Villar de Veiga, where we saw uncommonly fine Minho-vallies along the river called Rio Caldo, and then through the village of Padrieros, Nossa senhora do Porto, a village containing a neat church and a miraculous picture of the virgin; to Fofe, a very large village, with many new-built and considerable houses, six leagues from Caldas. The vallies in this country are somewhat wider, and always excellently cultivated and well peopled. The ancient town of Guimaraens, which is not far distant, and the surrounding country, carry on some traffic in dried fruit, especially plums, which however are small and bad. Round Lixe the vallies become opener, but farther on the mountains are more naked and arid. This town which is well-peopled increases, and new houses are built; but the inhabitants are ill-spoken of. After passing Caldas the inns are good but dear. Before we came to Amarante, we had a view of this chain of mountains which run north-east and south-south-west, but appear far less pointed and grotesque at a distance than the mountains of Gerez. Hence the traveller already conceives it must consist of another species of stone than granite, which hitherto continues without ceasing.

Amarante is a considerable town or villa, four long leagues* from Fofe, situated on the Tâmega, which divides it from the suburb, and over which is a handsome stone bridge. This town belongs to the Corregimento of Guimaraens, but has only one juiz de fora. The town and suburb are said to contain above four thousand inhabitants. There are many neat houses, many noble families reside there, and the inhabitants praise the kind and friendly manners that prevail in the society of this place. The country is uncommonly pleasant.

* The leagues of Minho are much longer than in the other provinces, especially between Caldas and Fofe, where

Beyond Amarante we immediately ascended the spurs of the Serra de Maraõ, the summits of which are barren, but the vallies beautifully cultivated and enriched with shade. Here all is still granite. Beyond the village of Ovelha, we ascended the lofty Serra de Maraõ itself, and found the road steep, but not inconvenient. The mountains are naked and destitute of trees or bushes, being only covered with an arid meagre turf, without projecting rocks or the brooks and clefts of Gerez, but on the contrary more rounded; in short these are quite a different kind of mountains from those, being also much inferior in natural beauties: the species of stone of which it is composed is also different. Beyond Ovelha, slaty granite is still seen, but is soon followed by black argillaceous slate, which is very coarsely slated and mingled with mica. On the summit it forms bare rocks, and loses its slaty fracture, so that it might be taken for trap. We there discovered in it a remarkable and hitherto unknown fossil which we called maranite. The prospect from the summit is extensive, but not remarkable. We saw a part of the adjacent province of Traz-os-montes, with its considerable high, but naked and arid chains of mountains. In height the Serra de Maraõ is not inferior to that of Gerez, but probably exceeds it. The snow frequently lies on the summit during a month.

We descended the south of the mountain, and came to a large village called Campean, on a small mountain-plain which lies considerably high. This village with its woods and fields forms a charming island amid these naked mountains. The soil is moist, for at a certain depth water springs in every part, the plain being almost entirely surrounded with considerable eminences. The small woods consist of chestnut oak, and birch. We could almost imagine ourselves in the woods of Germany. The cold in winter is very severe, snow falls, and even the

summer-ights are for a long time very bleak. From Amarante to Campeon is reckoned a distance of only three leagues; but these leagues are very long. From the last-mentioned place we set off for Pezo da Regua. At first we met with fine chesnut hanging woods along the declivities of the mountains; but afterwards about a league from Campeon, at a small town called Santa Martha, began hills covered with vines, and continued two leagues without interruption, as far as Pezo, so that we almost imagined ourselves in the rich and hilly wine-country of France.

Pezo da Regua which is a market town (*concelho*) celebrated as a depôt for port-wine, and itself producing some of the best quality, is situated on the southern declivity of a hill close to the Douro, which here forces its way between steep banks consisting of thin strata of argillaceous slate mixed with mica. We beheld vine-covered hills, as far as our eyes could reach, sometimes adorned with neat houses. The bed of the river is stony and the stream in summer is navigable only for small boats, though in winter ships of considerable size can ascend it. The wine-trade renders this place very lively, though it is but small, containing only one thousand and forty inhabitants, and three hundred and fifteen houses. This town belongs to a tract of land on the banks of the Douro called Upper Douro (*o alto Douro*) commencing to the eastward at Villaverde, or more properly San João de Pesqueira, extending to the spot where the small river Mexicana falls into the Douro, and comprehending a tract of somewhat above four geographical miles in length, by three in breadth*. The situation of Pezo is very favourable to the vine. The steep hills slope to the southward, and consist of a blackish slate, which by

In 1781 the population amounted to forty-four thousand six hundred and sixty, there being twelve thousand eight hundred and ninety-five houses and seventy-eight parishes. This is the tract of land that produces port-wine, the annual produce of which is reckoned at ninety thousand pipes. Here we had an opportunity to observe the effects of heat on human society. At noon (this was at the close of July, 1798,) every thing appeared still and dead; at four the labouring classes began to appear; and after sunset the principal inhabitants were seen abroad. The night was occupied by a constant tumult; the women lightly dressed sat in their balconies to take the air, while their

its great heat contributes not a little to the general warmth of these parts, the valley is very narrow, the lofty Marão defends it from the north wind, nor can the sea-breezes reach it. In short this spot is very favourable to warmth in summer; as the neighbourhood of the snow-covered Marão is said to cause severe winters. The badness of the water renders this place unpleasant, and in the neighbourhood along the banks of the Douro are marshes caused by the inundations of the river in winter, which give rise to the agues that here prevail.

The culture of the vine is one of the most important means of support to the people of Portugal; for not only the wine from the banks of Upper Douro, that of Carcavelos near Lisbon, and that of St. Ubes are exported to foreign countries; but the other wines produced are either consumed in the country or shipped to the colonies. Portugal has by no means a proportionate variety to those of Spain, to which the wines of this country are also inferior in quality. In the commonest wine-houses in Spain are frequently found good and sometimes excellent wine; whereas in Portugal it is generally very bad. The Spanish wine has naturally a great deal of fire, a quality which is only communicated to that of Portugal by means of brandy.

The Portuguese are moderate wine-drinkers, and even at good tables are contented with bad, or at least very moderate wine; and if any thing more is brought it is port. Carcavelos is set on table together with Madeira, and as the latter may be had in Portugal of excellent quality, it often supersedes the use of the former. The wine of St Ubes is still more rarely drank.

Here, as every where else, hills and mountains are preferred for the culture of the vine, and at Pezo they are so steep that the earth is supported

beauty was enhanced by the darkness. The guitar was heard throughout the night accompanied by the elegiac, uniform, popular songs of the Portuguese, which continued till sun-rise. When these are heard at such a distance as not to distinguish the words, it is certainly far from pleasant to listen to their music. The first stanza indeed often surprises by its soft plaintive simple melody; but the hearer in vain desires variety; for the same notes are constantly repeated, and if the pipe of a beautiful woman excites some feeling, the screaming voices of the men totally overpower and destroy it; which is the more displeasing, as the women are seldom heard, and the men constantly.

by little walls so as to convert the sides of the hills into terraces (*geios*). But the vine is also frequently cultivated on plains, where, if the soil is sandy they succeed very well. Shady valleys and plains or stiffer soil produce even here but moderate wine, and should never be so employed. The vine is commonly short, growing up poles, those in Minho alone excepted, where, as I have already said, they are planted beside trees, round the branches of which they twine. This renders the country charming, but produces wretched wine. In the quintas they form covered walks, but even there they do not yield such good wine as the shorter vines, however pleasant and beautiful these walks may appear. In the province of *Tras-os-montes* alone are the vines planted at a distance from each other, with corn sown between them; and on the south bank of the *Tagus*, at *Lisbon*, garden-vegetables are grown in the vine yards. It is also extremely common at the first establishment of a vineyard, to sow the land the first year with corn.
