Market Study on Pollution and Environmental Control in Mexico.

INFORMATION FOR CANADIAN BUSINESSMEN
PREPARED BY THE COMMERCIAL DIVISION,

Market Study on Pollution and Environmental Control in Mexico.

This market guide booklet has been prepared with the problems inherent to the initiating exporter in mind. However it is not exhaustive; individual circumstances, interest and needs will dictate how companies should tailor their approach and strategy to the Mexican market. While every attempt has been made to ensure accuracy in this study, no responsibility can be accepted for errors or omissions.

Further assistance can be obtained by addressing requests directly to the Commercial Division of the Canadian Embassy in Mexico City located at Calle Schiller No. 529, Colonia Polanco, 11560 México, D.F. Telephone 254-32-88, telex 177 1191 and fax (sending from Canada) 011 (525) 545-17-69; or the Latin American Division Department of External Affairs, Industry Science and Technology Canada, 125 Sussex Drive, Ottawa, Ontario KIA 0G2, Phone 9950460 Fax (613) 996-06-77.

Market Study on Pollution and Environmental Control in Mexico.

This market quide booklet has been prepared with the problems inherent to the indisting exporter to mind. However it is not exhaustive; individual discumstances, interest and needs will distate how compenies show that tellor their approach and strategy to the hexican market. While every attempt has been made to ensure accuracy in this atual, no responsibility can be accuracy in this atual, or calculations.

Further assistance can be obtained by addressing requests directly to the Commencest Division of the Canadian Escasy in Mexico City Located at Calle Schiller No. 529 Colonia Polanco, 11560 Mexico, 8.F. Telaphone polance Canada, 177 1191 and 53x feeding from Canada, 811 (523) 545-47-69; or the Latin American Division Department of External American Division Department of External Canada, 125 Sussex Drive, Cotave, Cotave

MARKET STUDY ON POLLUTION AND ENVIRONMENTAL CONTROL IN MEXICO

NOEX

1. BACKGROUND

Mexico is one of the richest countries in the world in its ecological diversity. In its territory it has almost all existing climates and environments. Even though it is the 14th largest country in the world, it has 1,000 species of birds and 2,500 species of butterflies, as opposed to 650 and 700 respectively in all of the U.S. and Canada, and its 30,000 plant species are above those known either in the U.S., the USSR or China. These resources are in serious danger due to the extensive use of land for agriculture and for the very destructive cattle raising. Deforestation is advancing at 500,000 Ha. per year to open areas for cattle. This in addition to increased agricultural land, urban expansion and fires translates into one million hectars of natural vegetation lost annually. Despite all this, Mexico only has 48 officially protected areas and 39 in the process of being approved as such, for a total of 7.4 million Ha. or 3.8% of the Mexican territory.

The contamination of the environment in Mexico has reached an alarming state. Approximately 25 million people, or 30% of the country's population, live in the metropolitan areas of Mexico City, Monterrey and Guadalajara. Over 25% of all industry services and infrastructure. Some 52 thousand tons of garbage must be handled daily, public transportation services expel thousands of tons of harmful gases into the air, public transportation services expel thousands of tons of harmful gases into the air, Mexico City has suffered extremely high levels of air pollution in recent years, as a result inadequate combustion processes due to its high altitude and an increase in motor vehicles. Mexican citizens have been clamoring for strict corrective measures and the Government has finally responded with concrete actions aimed at fighting the onslaught of pollution, the most important of which is the Federal Law on Ecological Equilibrium and Environmental Contamination enacted on March 1, 1988.

When taking up office, president Carlos Salinas de Gortari pledged to publish increasingly strict regulations to reduce air polluting emmissions, waste waters and hazardous wastes. A major National Program of Ecological Conservation and Environmental Protection is under way, including tighter supervision of industrial pollutant sources, improvement of fuels, natural gas supply to thermoelectrical plants in the Mexico City area and improvement of the city's public transporation system. President Salinas has also relied on international and multilateral cooperation conferences and agreements and will continue to do so in the future.

1. BACKGROUND

Mexico is one of the richest countries in the world in its ecological diversity. In its territory it has almost all existing climates and environments. Even though it is the 14th largest country in the world, it has 1,000 species of birds and 2,500 species of butterflies, as opposed to 550 and 700 respectively in all of the U.S. and Canada, and butterflies, as opposed to 550 and 700 respectively in all of the U.S. the USSR or China. These resources are in serious danger due to the extensive use of land for agriculture and for the very destructive cattle raising. Deforestation is advancing at 500,000 Ha per apparation areas for cattle. This in addition to increased agricultural land, urban expansion and likes translates into one million hectars of natural vegetation lost annually. Despite all this, Mexico only has 48 officially profected areas and 39 in the process of being approved as such for a total of 7,4 million Ha, or 3.3% of the Mexicon remittory.

The contamination of the environment in Mexico has reaghed an alarming state. Approximately 25 million needs, or 30% of the country's population, live in the metropolitan areas of Mexico City, Monteney and Guedalajara. Over 25% of all industry a concentrated in the valley of Mexico, placing tramendous pressure on existing services and infrastructure. Some 32 thousand tons of garbage must be handled daily services and infrastructure of the services and infrastructure of the services and public transportation services expail thousands of tons of harmful gasses into the air, and services and and ocone public transportation services expail thousands, suspended particles, lead and ocone along the industrial development, increased demand for services, low fuel quality, disciplination proposesses due to its high altitude and an increase in motor destructes according to the most interpretation proposesses to the demand for strict corrective measures and the development has finally responded with concrete actions aimed at fighting the onstaught of polytion, the most important or which is the Federal Law on Ecological Equilibrium and Environment has finally responded with concrete actions aimed at fighting the onstaught and Environmental Contemporation enacted on Mexich 1, 1988

When taking up office, president Carlos Salinas de Gortari pladged to publish moteasingly sinct requisions to reduce air polluting entmissions, exate water and hazardous vestes. A major National Program of Ecological Conservation and Environmental Protection is under way, including tighter supervision of industrial pollutaris sources, improvement of fuels, natural gas supply to thermoelectrical plants in the Mexico City area and Improvement of are city's public transporation system. President Salinas has also relied on International and routilisteral cooperation confirmences and agreements and will continue to do so in the luture.

2. ECONOMIC ENVIRONMENT

Over the past two years, Mexican economic policy has featured a tough anti-inflationary program called the Economic Solidarity Pact, combining traditional austerity measures (tight fiscal and monetary policies) and non orthodox measures (price, wage and exchange rate controls). The program has been successful in reducing inflation, from an annual 159.2% in 1987 to 51.7% in 1988 and 19.7% by 1989. The general criteria for Mexico's macroeconomic policy in 1990, are to consolidate and fortify the progress made in price stabilization, to reaffirm gradual and sustained economic recuperation, to increase investment, both national and foreign, and to improve living standards.

Mexico's gross domestic product (GDP), after increasing 3.7% and 2.7% during 1984 and 1985 respectively, diminished by 3.6% in 1986. In 1987, it increased a moderate 1.6% and an additional 1.4% in 1988. Domestic economic activity recovered for the third consecutive year in 1989 with a growth rate of 2.9% in 1989 to reach \$200 billion (1). With an 84.5 million population, per capita GDP is estimated at \$2,375. During the 1990-1994 period GDP is expected to maintain an average annual growth rate of 2%-3%.

In an effort to revitalize and open the Mexican economy, the Mexican Government undertook a series of structural changes, including the accession to the General Agreement on Tariffs and Trade (GATT) on August 24, 1986 leading to an extensive trade liberalization process: import permits were eliminated on all but 325 of the total 11,960 tariff items on the recently adopted Harmonized System. Official import prices are no longer applicable, nor the 5% export development tax, and the maximum import duty has been lowered from a maximum 100% in 1982 to 20% in January 1988. The automotive and computer industries have also been liberated.

Major changes were made in the Foreign Investment Law, which now allows direct foreign investment of up to 100% in several sectors of the economy, previuosly restricted to a minimum 51% Mexican ownership.

According to official data from the Mexican Secretariat of Commerce and Industrial Development (SECOFI), Mexico's previous trade surplus changed to a deficit of \$1.7 billion in 1989. Total exports increased 10.7% totalling \$22.7 billion, while imports increased 24% from \$18.9 billion to \$23.4 billion. Imports of consumer products increased 82%, while those of intermediate goods grew by 17% and capital goods by 18% in 1989. Total Mexican imports from Canada increased 24% in 1989 to Cdn\$603 million. In 1989, total trade between Mexico and Canada was valued at Cdn\$2,301 million: Cdn\$603 million in the sale of Canadian goods and services to Mexico and Cdn\$1,698 million in Canadian purchases from Mexico. Mexico and Canada have traditionally been strong trading partners. According to Mexican figures, in 1989, 1.9% of Mexico's imports came from Canada, while 1.3% of its exports were to Canada. This makes Canada Mexico's fifth largest exporter and sixth largest importer.

^{1.} NOTE: All values in this report, unless otherwise stated (\$Mexican pesos, Canadian dollars Cdn\$, etc.) are quoted in United States dollar equivalents.

ECONOMIC ENVIRONMENT

Over the past two years, Maxican economic policy has featured a tough enti-inflationary program called the Economic Solidarity Pact, combining traditional austerity measures (program called the Economic Solidarity Pact, combining traditional austerity measures (price, wage and significance rate controls). The program has been successful in reducing inflation, from an annual 158-2% in 1987 to 51.7% in 1988 and 18.7% by 1989. The general criteria for Slexico's macroeconomic policy in 1990, are to consolidate and fortify the progress made in price stabilization, to reaffirm gradual and sustained economic recuperation, to reaffirm gradual and sustained economic recuperation, to reast increase investment, both national and foreign, and to improve living standards.

Mexico's gross domestic product (GDP), after increasing 3.7% and 2.7% during 1984 and 1985 respectively, diminished by 3.6% in 1986, in 1987, it increased a moderate 1.6% and an additional 1.4% in 1988. Domestic economic activity recovered for the third consecutive year in 1989 with a growth rate of 2.8% in 1989 to reach \$2.00 billion third consecutive year in 1989 with a growth rate of 2.8% in 1989 and at \$2.375. During the 1990-1994 period CDP is expected to maintain an average annual growth rate of 2%-

In an elicit to revitalize and open the Maxican economy, the Maxican Government undertook a series of structural changes including the accession to the General Agreement on Tariffs and Trade (GATT) on August 24, 1986 leading to an extensive trade liberalization process import permits were eliminated an all but 326 of the rotal 1,960 tariff frems on the recently adopted Hambonized System. Official import process on longer applicable, not the 5% export development tax, and the maximum import duty has been lowered from a maximum 100% in 1982 to 20% in January 1986. The automotive and computer industries have also been liberated.

Major changes were made in the Foreign Investment Law, which now allows direct totelgn Investment of up to 100% in several sectors of the economy, previously restricted to a minimum 51% Mexican ownership.

According to official data from the Mexican Secretariat of Commerce and Industrial Development (SECOFG, Mexica's previous hade surplue property to a set on the surplus of angel to a detait of \$1.7 billion in 1999. Total expons increased 10.7% totalling \$22.7 billion, while imports increased 24% from \$18.9 billion to \$23.4 billion. Imports of consumer products increased 25%, while those of Intermediate goods grew by 17% and papers products in 1986. Total Mexican imports from Canada increased 26% in 1968 to Canada increased 26% in 1968 to Canada having and Canada was valued at Canada based and finition in the sale of Canadian goods and services to Mexica and Canada have traditionally bean strong trading partners. According to Mexican figures, in 1989, 1.8% of Mexican figures, in

^{1.} NOTE: All values in this report, unless otherwise stated (SMexican pesos, Canadian dollars CdnS, etc.) are quoted in United States dollar equivalents.

3. MARKET ASSESSMENT

Total apparent consumption of pollution control equipment and instruments has grown at a very steady pace in the last three years, increasing seven percent, from \$188 million in 1987 to \$202 million in 1988, and an estimated eight percent in 1989. This was prompted both, by a growth in domestic production of equipment and by a major increase in imports.

Demand is expected to grow at an average annual rate of nine percent between 1989 and 1992, from \$217.7 million to \$280.4 million (see Table 1). Domestic production, which consists exclusively of equipment, is projected to grow from \$198 million to \$249.4 million by 1992 at an average annual rate of 8%. Imports represented approximately 12% of the total market or \$26.4 million in 1989. However, given the need for more sophisticated and specialized instrumentation, all of which is imported, and Mexico's trade liberalization policies, imports are expected to grow at a faster pace than local production. Imports are estimated to grow at an average annual rate of 15%, and reach \$39.8 million by 1992 or 14% of the total market.

The total pollution control market can be divided into two distinct areas: instruments and equipment. Instruments account for approximately two percent of the total market and amounted to \$5.3 million in 1989. By 1992 this segment of the market is expected to reach \$7.4 million, all of which will continue to be imported. The total market size for equipment, on the other hand, was \$212.4 million in 1989. Of this amount, \$198 million corresponds to equipment manufactured domestically, while \$21.1 million was imported. By 1992, equipment sales are expected to reach \$273 million, of which 12% or \$32.4 million will be imported.

APPARENT CONSUMPTION OF POLLUTION CONTROL EQUIPMENT AND INSTRUMENTS (\$000 U.S. dollars)

INSTRUMENTS	1987	1988	1989e	1992p
Production + Imports	3,191	4,388	5,276	7,412
- Exports = TOTAL	3,191	4,388	5,276	7,412
EQUIPMENT Production + Imports - Exports = TOTAL	174,475 13,020 2,558 184,937	186,709 16,684 5,700 197,693	197,977 21,077 6,649 212,405	249,394 32,412 8,850 272,956
TOTAL POLLUTION Production + Imports - Exports = GRAND TOTAL	N CONTRO 174,475 16,211 2,558 188,128	L EQUIPMENT 186,709 21,072 5,700 202,081	AND INSTRU 197,977 26,353 6,649 217,681	MENTS 249,394 39,824 8,850 280,368

Total apparent consumption of pollution control equipment and instruments has grown at a very steady pace in the last three years, increasing seven percent, from \$188 million in 1987 to \$202 million in 1986, and an estimated eight percent in 1989. This was prempted both, by a growth in domestic production of equipment and by a major increase in imports.

Demand is expected to grow at an average annual rate of nire percent between 1989 and 1992, from \$217.7 million to \$280.4 million (see Table 1). Domestic production, and 1992, from \$197.7 million to \$280.4 million to grow from \$198 million to \$240.4 million by 1992 at an average annual rate of 9%. Imports represented approximately 12% of the total market of \$26.4 million in 1989. However, given the need for more sophisticated and specialized instrumentation, all of which is imported, and Mexico's trade liberalization policies, imports are expected to grow at a faster pace than local production. Imports are estimated to grow at an average annual rate of 19%, and reach \$39.8 million by 1992 or 14% of the total market.

The total pollution control market can be divided into two distinct areast instructions and equipment. Instruments account for approximately two percent of the total market and amounted to \$5.3 million in 1969. By 1992 this segment of the market is expected to reach \$7.4 million, all of which will continue to be imported. The total market size for equipment, on the other hand, was \$21.2 a million in 1969. Or his amount, \$198 million corresponds to equipment manufactured domestically, while \$21.1 million was imported. By 1992, equipment sales are expected to reach \$27.3 million, of which 12% or \$32.4 million, which the imported.

APPARENT GUNGUMPTION OF POLICE CONSUMENTS AND INSTRUMENTS (\$000 U.S. CORES)

Three categories account for approximately 85% of expenditures in pollution control equipment and instruments: industrial wastewater, municipal wastewater and potable water treatment and air pollution control. These areas, together with noise pollution control, are the ones with the greatest market potential for imported products. At the same time, it is expected that these areas will grow at a proportionally faster pace in the coming years.

U.S. products dominate the market for both instrumentation and equipment, with an import market share of 72%. It is followed by West Germany (9%), Switzerland (3%), Japan (3%), France (2%) and Canada (1.6%). U.S. products are identified in the Mexican market as incorporating the latest technological advances and being of the highest quality. In addition, due to the geographical proximity of both countries, delivery and service are quick and trustworthy. Several U.S. companies have also established joint ventures with Mexican conmpanies to penetrate the market. These factors have allowed U.S. products to enjoy a high preference among Mexican users. Nevertheless, third country competitors are forcefully trying to gain a greater part of the market by offering lower prices, more liberal credit terms, more flexible licensing and joint venture agreements and increased servicing facilities. In order to keep or increase their market share, Canadian suppliers need to be more aggressive in the market and promote their products, particularly now that the market is expanding as a result of the increased awareness of pollution hazards and more stringent environmental regulations.

Source: Statistics Canada - International Trade Division

Table 2 lists Canadian imports to and exports from Mexico by product for 1988 and 1989. Since these are general categories of products, which can be used for many different purposes, these figures do not only reflect items used for pollution control exclusively. Based on these data, Canadian exports to Mexico of equipment related to pollution control increased 82% in 1989 to Cdn\$4.5 million. In the instrument sector, exports increased threefold to Cdn\$370,000. Canada is also a significant importer of Mexican products, in particular of gas purifying equipment. These data also show Mexican exports of certain instruments within general categories, but none of them are for environmental control specifically.

4. ENVIRONMENTAL PROBLEMS

4.1 AIR POLLUTION

It is estimated that over 23% of all air pollutants are concentrated in Mexico City, the largest city in the world, four percent in Guadalajara and three percent in Monterrey. Currently, around five million tons of pollutants are emitted into Mexico City's atmosphere through hydrocarbon combustion and suspended dust particles. SEDUE (The Secretariat for Urban Development and Ecology), the administrative and control body for environmental matters, attributes 83% of air contamination in Mexico City to the use of internal combustion engines by the public transportation system and private vehicles. Mobile pollution sources, including cars and airplanes, account for 100% of carbon monoxide emission, 63% of nitrogen oxides and 17% of sulphur dioxide. Industry accounts for the balance. Average nitrogen oxide levels in Mexico City are 0.047 ppm with a 0.322 maximum; sulphur dioxide levels average 0.043 ppm with a 0.075 ppm maximum; carbon monoxide levels average 18.1 ppm with a 31.6 ppm maximum (8 hour mean); and suspended particles 93.4 micrograms/m³ and 170 micrograms/m³ respectively. Recommended values are 0.13 ppm for sulphur dioxide, 0.21 ppm for nitrogen dioxide, 13 ppm for carbon monoxide.

Approximately 2.5 million motor vehicles circulate in the metropolitan area and emit non-combustible gases and suspended particles into the air, such as carbon monoxide, carbon dioxide, nitrous oxides, sulphates, lead and hydrocarbons. Slightly over two million cars are for private use, 280,000 are gasoline fueled public transportation

Table 2 lists Canadian imports to and exports from Mexico by product for 1988 and 1989. Since these are general categories of products, which can be used for many different purposes, these figures do not only reliect items used for pollution control exclusively. Based on these data, Canadian exports to Mexico of equipment related to pollution control increased 82% in 1989 to Cdn\$4.5 million, in the instrument sector, exports increased threefold to Cdn\$370,000. Canada is also a significant importer of exports products, in particular of gas purifying equipment. These data also show Mexican exports of certain instruments within general categories, but none of them are for environmental control specifically.

ENVIRONMENTAL PROBLEMS

4.1 AIR POLLUTION

It is estimated that over 23% of all air pollutants are concentrated in Mexico City, the largest city in the world, four percent in Guadalajara and three percent in Monterrey. Gurrently, around five million tons of pollutants are emitted into Maxico City's attmosphere through hydrocaroon combustion and suspended dust particles. SEDUE (The Secretarial for Urban Development and Ecology), the administrative and control body for environmental matters, attributes 83% of air contamination in Mexico City to the body for environmental matters, attributes 83% of air contamination in Mexico City to the public environmental matters, attributes 83% of air contamination in Mexico City to the varieties. Mobile poliusion sources, including cars and airplanes, account for 100% of varieties. Mobile poliusion sources, including cars and airplanes, account for 100% of industry accounts for the balance. Average nitrogen oxide levels in Maxico City are industry accounts for the balance. Average nitrogen oxide levels average 0.043 ppm with a 0.34.6 ppm 6.047 ppm with a 0.322 maximum; surphur dioxide levels average 18.1 ppm with a 31.6 ppm mixrograms/m respectively. Recommended particles eq.4 micrograms/m and 170 mixrograms/m respectively. Recommended particles are 0.13 ppm for sulphur dioxide.

Approximately 2.5 million motor vehicles circulate in the metropolitan area and emit noncombustible gases and suspended particles into the air, such as carbon monoxide, carbon dioxide, nitrous oxides, sulphates, lead and hydrocarbons. Slightly over two million care are for private use, 286,000 are gasaline fueled oublic transportation vehicles and 120,000 are diesel trucks and buses. Of these motor vehicles, 33% are over twelve years old and another 27% are between eight and twelve years old. Over 70% of all cars and buses are in poor mechanical condition and operate inefficiently due to the high altitude. In addition, almost none of the vehicles circulating in Mexico carry anti-pollution devices.

During the 1989-1990 winter season, four measures were taken to reduce air pollution levels in the Mexico City area:

- Additioning gasolines with oxigenated compounds to improve fuel efficiency in high altitudes:

- Replacing fuel oil by natural gas in the Mexico City area power plants:

- Reducing car circulation through the one day without a car ban;

- Mandatory semiannual exhaust emission vehicle inspection.

With these measures, SEDUE has estimated a global improvement of air quality in the Mexico City area of 10%-15% through a 23% reduction in emissions, or over 2,000 tons a day. During 1990, these measures will continue to be applied in addition to:

- Mandatory diesel vehicle smog check:

- Re-location of steel smelters and strict control over industrial emissions:

- Replacement of gasoline by LP gas on in-city cargo transportation truck fleets;

- Gradual substitution of fuel oil by natural gas in highly polluting industries;

- Installation of vapor recovery systems in receiveing terminals and gasoline stations;

- Launching of the reforestation and ecological restauration program for the valley of Mexico;

- Installation of catalytic converters in public transportation units and sufficient production of unleaded fuel:

- Begin investments to produce low-sulphur diesel and fuel oil and to set up two sulphur recovery plants in the PEMEX Azcapotzalco refinery.

In addition, by 1991 all new cars will have to be equipped with catalytic converters, provided PEMEX can supply the necessary unleaded fuel. Owners of old cars will also be persuaded to install anti-polluton devices and to use the cheaper unleaded fuel. Through these measures, SEDUE expects to cut down hydrocarbon emissions by 65%, carbon monoxide fumes by 70% and the release of nitrogen oxide by 40%.

An estimated 13% of air polution is generated by fixed sources, or industry, and the remaining four percent by natural sources. There are approximately 33,000 industrial sources of air pollution around Mexico City of which 15,000 have been classified as severe polluters, such as electrical energy generation plants, smelters and foundries, pulp and paper mills, soap and detergent manufacturers, asbestos plants, chemical plants, cement plants, refineries, plastic producers, ceramics producers, paint and solvent producers, food processing plants, textile industries, sugar refineries, bakeries and public baths. Industry is the main producer of sulphur dioxide, which is even more harmful to humans than the carbon monoxide produced by cars. SEDUE is periodically inspecting industries and has closed down several of them, forcing them to install antipollution equipment in their plants. It is presently estimated that only 30% of all industries in the valley of Mexico have installed any kind of anti-pollution equipment.

An important source of air pollution is the use of heavy fuel oil for industrial purposes. Two thermoelectric power plants located in Mexico City generate some 36% of the sulphur dioxide expelled into the air, through the use of heavy crude as fuel. The Federal Electricity Commission (CFE), the sole producer and distributor of electricity in Mexico, has converted 25% these to natural gas plants; however the necessary amount of gas is not yet produced to allow these changes to be made on a large scale. PEMEX, the national oil monopoly, is installing smokeless burners using natural gas

vehicles and 120,000 are diesel flucks and buses. Of these motor vehicles, 33% are over tweive years old and another 27% are between eight and tweive years old. Over 70% of all cars and buses are in poor mechanical condition and operate inefficiently due to the high altitude. In addition, almost none of the vehicles droutsting in Mexico carry arti-politition devices.

During the 1989-1990 winter season, four measures were taken to reduce air pollution

Additioning gasolines with exigenated compounds to improve tuel efficiency in high

Replacing tuel of by natural das in the Mexico City area dower plants

- Reducing our circulation through the one day without a car ben:

noitosgani alcinev noissiams tauranas lauransimas yriotadan.

With these messures, SEQUE has estimated a global improvement of air quality in the Mexico City area of 10%-15% invough a 25% reduction in emissions, or over 2,000 tons a day. During 1990, these measures will continue to be applied in addition to:

Re-location of steel smelters and struct control over industrial emissions:

- Replacement of gasoline by LP gas on in-city cargo transportation truck fleets:

capital substitution of mail of the last as gas in mighty politifing industries:

Installation of vapor recovery systems in receiving terminate and gasoline stationer.

Launching of the referention and ecological restauration program for the valley of

Protestion of unleaded fuel.

production of unleaded fuel.

 Begin investments to produce low-sulphur diesel and fuel oil and to set up two sulphur recovery plants in the PEMEX Accordingto refinery.

In addition, by 1991 all new cars will have to be equipped with catalytic conveners, provided PEMEX can supply the necessary unleaded fuel. Owners of old cars will also be persuaded to install anti-pollution devices and to use the cheaper unleaded fuel. Through these measures, SEDUE expects to out down hydrocarbon emissions by 65% carbon monoxide turnes by 76% and the release of nitrogen oxide by 40%.

An estimated 13% of air polution is generated by fixed sources, or industry, and the remaining four percent by netural sources. There are approximately 35,000 industrial sources of air pollution around Mexico City of which 15,000 have been classified as severe pollutions, such as electrical energy generation plants, smelters and foundries, pulp and paper milis, soap and detergent manufacturers, aspestos plants, chemical plants, refineries, plastic producers, ceramics producers, backenes advent producers, tood processing plants, textile industries, sugar refineries, balteries and public bains. Industry is the main producer of suiphor dioxide, which is even more harmful to numers than the carbon monoxide produced by cars. SEDUE is periodically inappeding industries and has closed down several of them, forcing them to install anticologically pollution equipment in their plants. It is presently estimated that only 30% of all industries in the valley of Mexico have installed any kind of anti-pollution equipment.

An important source of air pollution is the use of heavy fuel of for industrial purposes, two thermosledno power plants located in Mexico City generate some 36% of the surplur dioxide expelled into the sir, through the use of heavy crude as fuel. The surplur dioxide expelled into the sir, through the use of heavy crude as fuel. The sale producer and distributor of electricity in Mexico, has converted 25% these to natural gas plants; however the necessary amount of gas is not yet produced to allow these changes to be made on a large scale. PEMEX, the national oil monopoly, is installing smokeless burners using natural gas

instead of heavy fuel in several of its refineries and it is in the process of substituting natural gas or other light fuels for heavy fuel in its boilers and heaters in most of its facilities. At its Azcapotzalco refinery, it is already using natural gas, it installed internal membranes on its tanks to avoid evaporation and it regenerates carbon monoxide into carbon dioxide. By the end of this year, this refinery will reduce emissions by half through these measures.

Approximately 25 monitoring stations have been strategically located throughout Mexico City to measure the level of air contaminants such as sulphur dioxide, carbon monoxide, ozone, suspended particles and concentration of hydrocarbons. These readings, which are published daily in major newspapers, permit the identification of the level of contamination and its source, which further permits the elimination of emissions, installation of anti-pollution equipment and/or to temporarily or definitely close down the offending industry and evacuate people in case of emergency.

Best sales prospects for air pollution control are dust collectors and filters, silencers for exhaust gases, catalytic converters, respirators, gas, dust and particle sampling material, analyzers, monitors, metering instruments, controlling equipment, mobile laboratories, electrostatic precipitators, oxidation systems and gas absorbers.

4.2 WATER POLLUTION

Water contamination is due to three major sources: sewage from the cities, pesticides from agricultural activities and hazardous wastes from industry. Mexico City, Guadalajara and Monterrey together generate 62.7 m³/second of non-solid wastes. Mexico lacks the necessary waste treatment plants to process these materials. The total volume of waste waters generated is of 4,250 million m³ a year, equivalent to 136 m³ per second. Of these, 62% correspond to the population and 38% to industrial sources.

Water demand in the Mexico City area is 70 cubic meters per second, of which 62 cubic meters per second are actually provided, supplied from several sources. Of these, 30% correspond to domestic use in residential areas. Before entering the city, waters are treated and purified through flocculation, chemical treatment, chlorination, precipitation and clarification. There are some 2,000 purifying plants to make waters drinkable. There is, however, no control over the discharge of industrial and domestic waste into the urban water system. Untreated "black waters" cause serious pollution problems within and outside Mexico City, since these waters find their way, via the Pánuco river, all the way to Tampico on the Gulf of Mexico. The National Water Commission is working on the development of alternative technologies for making residual waters drinkable.

Many rivers in Mexico are being contaminated because of effluent discharge and untreated residual waters. Twenty of Mexico's 270 rivers concentrate 80% of total residual water discharges. SEDUE is beginning to install treatment plants in the neighborhood of the most polluted of these rivers, such as the Lerma, the Bravo and the Coatzacoalcos, and lakes, such as Pátzcuaro and Santiago-Chapala, as well as in Mexico's most important ports, including Zihuatanejo, Acapulco, La Paz, Puerto Vallarta, Progreso and Veracruz. A \$2 million project is underway to restore the Lerma river, the Guadalupe lake and the Laguna de Zumpango. The principal contaminants of residual waters come from industries, oil wells, petrochemical products, natural sources, chemical deposition, agricultural chemicals, biological and radioactive factors. The waters of many rivers need to be treated so that they may be subsequently reused for industry, agriculture, irrigation and drinking. At present, there are 220 treatment plants

instead of neavy fuel in several of its refineries and it is in the process of substituting netural gas or other light fuels for heavy fuel in its boilers and heaters in most of its fealities. At its Azcapotzaico refinery, it is already using natural gas, it installed internal membranes on its tanks to avoid evaporation and it regenerates carbon monoxide into carbon dioxide. By the end of this year, this refinery will reduce emissions by half through these measures.

Approximately 25 monitoring stations have been strategically located throughout Meuco City to measure the level of air contaminants such as sulphur dioxide, carbon monoxide, ozone, suspended particles and concentration of hydrocarbons. These readings, which are published deily in major newspapers, permit the identification of the level of contamination and its source, which further permits the elimination of emissions, installation of anti-politish equipment analytic to temporarity or definitely close down the ofiending industry and evacuate people in case of emergency.

Bast sales prospects for air pollution central are dust collectors and filters, silencers for extraust gases, catalytic converters, respirators, gas, dust and particle sampling extraust analyzers, monitors, metering instruments, controlling equipment, mobile taboratores, electrostatic precipitators, oxidiation systems and gas absorbers.

4.2 WATER POLILITION

Water contamination is due to three major sources: sewage from the cities, pesticides from agricultural activities and inexardous wastes, from industry. Mexico City, Guadislate and Monterrey together generate 62.7 m²/second of non-solid wastes. Alexico lecks the necessary waste treatment plants to progess these materials. The total volume of waste waters generated is of 4.250 million m² s year, equivalent to 136 m² per second. Of these, 62% correspond to the population and 36% to industrial sources.

Water demand in the Miscico City area is 70 cubic meters per second, of which 62 cubic meters per second are actually provided, supplied from several sources. Of these, 30% correspond to domestic use in recidential areas. Before entering the city, waters are treated and purified through flocculation, chemical treatment, chlomistion, precipitation and distriction. There its newever, no control over the discharge of industrial and domestic waste into the urban water system. Untreated "black waters" cause serious pollution problems within and outside Maxico City, since these waters find their way via the Pánuco niver, all the way to Tampico on the Guif of Mexico. The National Water Commission is working on the development of alternative technologies for making residual waters districted.

Many rivers in Mexico are being contaminated because of efficient discharge and centreated residual waters. Twenty of Mexico's 270 rivers concentrate 80% of lotal residual water discharges. SEQUE is beginning to install treatment plants in the residual water discharges. SEQUE is beginning to install treatment plants in the neighborhood of the most polluted of these rivers, such as the Lema, the Brave and the Coatzacoalcos, and lakes, such as Patzeuare and Santiago-Chapala, as well as in Mexico's most important ports, including Zihustanejo, Acapulloo, La Paz, Puerto Vallaria Progreso and Versonuz. A \$2 million project is underway to restore the Lema river, this Guadalupe lake and the Laguna de Zumpango. The principal contaminants of residual waters come from industries, oil wells, petrochemical products, natural sources, chamical deposition, agricultural chemicals, biological and redisective factors. The waters of many rivers need to be treated so that they may be subsequently reused for industry, agriculture, impation and dividing. At present, there are 220 treatment plants industry, agriculture, impation and dividing. At present, there are 220 treatment plants

for waste waters, which recycle 103 cubic meters per second. The heaviest industrial users of water are the sugar, paper and cellulose, chemical and petroleum industries. These industries have been approached by SEDUE to persuade them to treat and recycle their waste waters.

The process of treating residual waters consists of: 1) pretreatment to eliminate heavy solids; 2) primary treatment to separate oils, solids in suspension, colloidals and to control pH; 3) secondary treatment to eliminate harmful biological materials through the use of microorganisms; 4) tertiary treatment to eliminate organic materials, non-biological materials in suspension and salts; and 5) special treatments, for the elimination of muds, for example. The highest demand for equipment and instruments is in the areas of primary and secondary treatment. Equipment with best sales potential are aereators, pumps, scrapers and accessories, filter presses, screw conveyers, chlorinating equipment, absorption towers, band conveyers, screens, water clarifiers, cooling towers, demineralizers, flocculators, ionic interchangers, samplers, leak detectors, analyzers, spectrometers, colorimeters, polarimeters, refractometers, measuring equipment and laboratory equipment.

4.3 LAND POLLUTION

The daily production of garbage throughout the country is of 52,000 tons, of which 75% is collected, while the remainder lies scattered on streets, roads, empty land, etc. Of the total urban residues collected, 65% are deposited in open air, while only 35% is taken to landfills.

Industrial waste has been identified as one of the worst culprits in the contamination crisis. SEDUE is beginning to monitor and regulate industrial hazardous waste and municipal waste disposal. Since March 1989, all industrial waste producers are required to fill the Hazardous Waste Declaration consisting of a 15 point questionaire on what wastes the company generates and how it intends to dispose of them. The most polluting industries identified to date are petrochemical, pharmaceutical and chemical plants, foundries and smelters, cement and all industries using solvents, automobile, electronic, furniture, paint and other industries that treat metals. It is estimated that 900,000 tons of industrial hazardous waste is produced annually. Every day in Mexico City, 15,000 tons of domestic waste and 20,000 tons of industrial waste are produced, of which 5,000 tons are considered "highly dangerous". Of these, only one percent is properly treated or destroyed, the rest finding its way into the urban drainage system, clandestine dumps or industry backyards.

There are five ways of handling hazardous waste: using "clean technologies", recycling, treatment, incineration and landfills. In order to fight land pollution, SEDUE is encouraging the use of "clean technologies" to reduce the generation of pollutants through the use of new processes, technologies and raw materials and/or the optimization of existing plants. Waste recycling plants include six public plants processing 35 million liters of solvents a year in addition to 15 million liters processed by privately owned recycling plants, nine plants recycling 60 million liters a year of used oil, and other plants processing heavy metals and other hazardous wastes. Some companies, such as Química Omega, offer to buy industrial waste, which it then treats according to SEDUE guidelines. What the company can extract, it resells to other industries. The government publishes a list of companies selling off industrial waste products and a list of those eager to buy them.

Remaining hazardous wastes are either physically, chemically or biologically treated and stabilized, incinerated or buried in controlled confinements, of which there are

for waste waters, which recycle 103 cubic meters per second. The heaviest industrial users of water are the sugar, paper and cellulose, chemical and petroleum industries. These industries have been approached by SEDUE to persuade them to treat and recycle their waste waters.

The process of treating residual waters consists of 1) pretreetment to eliminate heavy solids; 2) primary treatment to separate oils, solids in suspension, colloidais and to control pH, 3) secondary treatment to eliminate harmful biological materials through the use of microorganisms; 4) tentiary treatment to eliminate organic materials, non-biological materials in suspension and satis; and 5) special treatments, for the slimination of musts, for example, the highest demand for equipment and instruments in the areas of primary and secondary treatment. Equipment with best sales potential are aereators, pumps, scrapers and accessones, lifer presses, screen conveyers, are aereators, pumps, scrapers and accessones, lifer presses, screens, water clarifiers, chilonnating equipment, absorption towers, band conveyers, screens, water clarifiers, cooling towers, demineralizers, flocoulators, ionic interchangers, samplers, leak detectors, analyzers, spectrometers, colorimeters, polarimeters, refractometers, measuring equipment and laboratory equipment.

AS LAND POLLUTION

The daily production of garbage throughout the country is of 52,000 tons, of which 75% is collected, while the remainder lies scattered on streets, roads empty land, etc. Of the total urban residues collected 65% are deposited in open air, while only 35% is taken to landifile.

industrial waste has been identified as one of the worst outputs in the contamination dries. SEDUE is beginning to monitor and regulate industrial hazardous waste and municipal waste disposal. Since March 1989, all industrial waste producers are required to fill the mastrous Waste Declaration consisting of a 15 point questionaire on what wastes the company generates and how it intends to dispose of them. The most polluting industries identified to date are petrochemical, pharmaceutical and chemical electronic, furniture, paint and other industries that treat metals. It is estimated that electronic, furniture, paint and other industries that treat metals. It is estimated that SOU, 10,000 fons of industrial hazardous waste are produced annually. Every day in Mexico of which 5,000 tens of domestic waste and 20,000 tens of industrial waste are produced, properly treated or destroyed, the rest finding its way into the urban drainage system, properly treated or destroyed, the rest finding its way into the urban drainage system, clap-assime dumps or thousary packyards.

There are five ways of handling hazardous waster using 'clean technologies', recycling, treatment, incharation and landfills, in order to fight land pollution, SEDUE is encouraging the use of "clean technologies" to reduce the generation of pollutants through the use of new processes, technologies and raw materials and/or the optimization of existing plants. Waste recycling plants include six public plants processing 35 million liters of solvents a year in addition to 15 million liters processed by privately owned recycling plants, nine plants recycling 60 million liters a year of used oil, and other plants processing neavy metals and other hazardous wastes. Some companies, such as Química Omega, offer to buy industrial waste, which it then treats according to SEDUE guidelines. What the company can extract, it reselfs to other industries. The government publishes a list of companies selling off industrial waste products and a list of those eager to buy them.

Remaining hazardous wastes are either physically, chemically or biologically treated and stabilized, incinerated or buried in controlled confinements, of which there are

approximately eight in use and five under construction. The government is encouraging private enterprises to operate landfills on a profit-making basis under the close scrutiny of SEDUE. A U.S.-Mexico joint venture called Protecol has proposed opening a stabilization plant and landfill on the dried-up bed of lake Texcoco within the Mexico City area. SEDUE is also proposing the repatriation of substantial amounts of industrial waste produced along the Mexican border by American businesses. New regulations regarding hazardous waste disposal are now in effect. All waste products listed by SEDUE and any that cannot prove that they are not corrosive, reactive, explosive, toxic of inflammable are considered hazardous and their improper disposal is subject to heavy fines, factory closure and imprisonement.

The chemical industry has a potentially high impact on the environmentis and major companies in the sector, such as Dupont, Dow Chemical, Colgate-Palmolive and 3M are facing stricter policies and legislation on health and environmental protection. In response, they are devising special technologies to adequately handle dangerous substances and their waste products, including recycling, cutting the amount of waste materials generation, waste incineration and directly working with training programs and community work.

4.4 NOISE POLLUTION

The most important sources of noise contamination are: industries using internal combustion engines, such as electricity generating plants, steel rolling mills, metal fabrication and paper mills, bus terminals, airports, recreational centers, airplanes, automobiles, trucks and buses, railroads and motorcycles. Noise control is mostly an administrative inspection activity undertaken by SEDUE with the objective of determining the source of noise and designing the action to control, reduce or eliminate it and to impose the sanctions applicable. Instruments and equipment with best sales potential for noise control are the following: noise dosimeters, analyzers, vibration monitors, recording equipment, calibrators, insulation materials, earmuffs and plugs.

5. ACTIONS AND PROJECTS

By presidential order, a comprehensive program to combat atmospheric pollution in the Mexico City area was published in 1989. It is based on five strategic areas:

- Rationalization and reorganization of the urban transportation system;

- Improvement of fuel quality;

- Introduction of alternative fuels;
- Installation of emission control systems for vehicles and industry;
- Ecological recovery of deteriorated areas.

The specific measures proposed along these guidelines, of which four have already been taken, are the following:

- Rationalization of vehicle traffic: one day without a car campaign and expansion of non-polluting public transportation services;

- Mandatory vehicle and diesel bus verification and tune-up;

- Ecological restoration of 26,000 Ha. in the Eastern and Southern areas of the city;
- Tune-up, overhauling, new buses and less polluting engines on the publicly owned R-100 bus lines;

approximately eight in use and five under construction. The government is encouraging private enterprises to operate landifils on a protit making basis under the close scrutiny private enterprises to operate landifils on the critic called Protect has proposed opening a stabilization plant and landifil on the direct-up bed of take Texcoco within the Maxico City area. SEDUE is also proposing the regardation of substantial amounts of industrial waste produced along the Mexican border by American businesses, New requisitors regarding hazardous waste disposal are now in effect. All waste products listed by SEDUE and any that cannot prove that they are not corrosive, reactive, explosive, toxic of inflammable are considered hazardous and thair improper disposal is subject to heavy fires, factory dosure and imprisonement.

The chemical industry has a potentially high impact on the environments and major companies in the sector, such as Dupont, Dow Chemical, Colgate-Palmolive and all are facing strotter policies and legislation on health and environmental protection. In response, they are devising special rechnologies to adequately handle dangerous substances and their waste products, including recycling, cutting the amount of waste materials generation, waste incineration and directly working with training programs and community work.

A A NOISE POLLUTION

The most important sources of noise comamination are: industries using internal combustion engines, such as electricity generating plants, steel rolling mills metal fabrication and paper mills, bus terminats, airports, recreational centers, airplanes, automobiles, frucks and buses, relinoads and motorcycles. Noise control is mostly an automobiles, frucks and buses, relinoads and motorcycles. Noise control is mostly an automobiles, frucks and edition activity undertaken by SEDUE with the objective of determining the source of from and designing the action to control, reduce or eliminate in and to impose the sanctions applicable instruments and equipment with best sales potential for noise control are the following: noise documeters, analyzers, vibration materials, recording equipment, calibrators, insulation materials, earmufts and plugs.

5. ACTIONS AND PROJECTS

By presidential order, a comprehensive program to combat atmospheric pollution in the Mexico City area was published in 1989, it is based on five strategic areas;

- -Rationalization and reorganization of the urban transportation system;
 - Applications with the display.
 - eliterative to all entering the state of the
 - installation of emission conirol systems for vehicles and industry:
 - Ecological recovery of deteriorated areas

The specific measures proposed along these guidelines, of which four have already been taken, are the following:

- Rationalization of vehicle traffic: one day without a par campaign and expansion of non-poliuting public transportation services;
 - Mandatory vehicle and dissel bus verification and lune-up
 - Ecological restoration of 26,000 Ha. In the Eastern and Southern areas of the city:
- Tune-up, overhauling, new buses and less polluting engines on the publicly owned R-

- Introduction of catalytic converters on the 15,000 official vehicles and 60,000 public transporation vehicles;

- Emission control in small businesses:

- Research and development of environmentally acceptable stategies, products and technologies;

- Manufacture of unleaded and low volatility gasoline;

- Sufficient supply of unleaded fuel for the 1991 model vehicles equipped with catalyitic converters;
- Replacement of fuel-oil by gas in thermo-electric power plants and in highly polluting industries;
- Establishement of an emission monitoring system at the PEMEX refinery in Azcapotzalco;
- Testing program for alternative fuels, oxigenated compounds and anti-pollution devices:

- Relocation of steel smelters outside city limits:

- Addition of oxigenated compounds to gasolines in the Mexico City area to compensate the low efficiency in gasoline burning due to the high altitude;

- Establishment of strict fuel control systems in refineries;

- Establishment of internal membranes in tanks at the Azcapotzalco refinery to reduce evaporation;
- Research projects to be undertaken with foreign institutions with respect to atmospheric photochemical phenomena;

- Replacement of gasoline by LP gas in 45,000 city cargo trucks;

Manufacture of low sulphur fuel oil;
Manufacture of low sulphur diesel;

- Expansion of the national storage, transportation and distribution system for new ecological fuels in PEMEX;

- Construction of oxigenated compound plants;

- Modernization of the existing PEMEX sulphur recovery plant and installation of a HC and a sulphur recovery plant;
- Fitting out measures for HC vapor recovery at receiving and distributon terminals and service stations throughout the valley of Mexico.

In the medium to long term the government plans to restructure the public transporation system and restore the ecological balance of the valley of Mexico. The total cost of the program is estimated at \$3 billion. Funding for this project is expected to come from loans by the Japanese and European governments and the Word Bank.

6. END USERS

The principal end users of pollution control equipment and instrumentation are government and industry. The government sector comprises municipal, regional and central government, port authorities, public utilities, hospitals and research institutes. This sector's expenditures amount to approximately 25% of total apparent consumption. The manufacturing and commercial areas include the following industries: chemicals, pulp and paper, textiles, oil and gas extraction and pipelines, petrochemicals, stone, clay and glass, primary metals, fabricated metal products and transportation. These industries' expenditures account for an estimated 75% of demand. Many of these industries are dominated by state owned companies such as the oil and gas, petrochemicals and electricity generation sectors.

7. REGULATIONS

Between 1972 and 1973 the Government enacted several regulations to specify limits on particulate emission levels from stationary sources and to regulate water pollution. Given the rapidly growing levels of industrialization and urban congestion in the major cities, these requirements were soon obsolete. In January 1984, as a result of increased pressure from the public opinion, the Government published a new set of laws and regulations to supersede, restate or cancel previous laws. Finally, on January 26, 1988 the new Federal Law on Ecological Equilibrium and Environmental Contamination was passed and enacted on March 1, 1988. This law supersedes and abrogates the prior federal law. The fundamental change in the law is organizational as it centralizes power within SEDUE while recognizing the need for inter-agency, state and municipal government participation for successful implementation.

The legal basis for ecological action in Mexico is found in its Constitution. Several articles cover the use of natural resources, human health, safety and pollution prevention and control, as well as the decentralization and definition of responsibilities regarding environmental protection and ecological equilibrium between the federal, state and municipal governments.

The new law covers the following points: cooperation of federal, state and municipal governments; major responsibilities of the Ministry of Urban Development and Ecology (SEDUE), the Department of the Federal District and the National Ecology Comission; general ecological policy and its instruments; creation and protection of protected natural areas; rational use of natural elements, including water and its ecosystems, soil and its resources, non-renewable resources and the effects of their exploitation; protection and control of the environment, including atmosphere, water and land; definition of risky activities, dangerous materials and residues; rules regarding nuclear energy, noise, vibrations, thermal and light energy, odors and visual contamination; promotion of social participation; security and controlling measures and sanctions, as well as regulations on testing and inspection, legal actions and fines. This law is patterned after those in effect in the U.S., Spain, Germany and Japan, and incorporate rules designed by the Environmental Protection Agency (EPA).

The new law touches on three basic aspects of environmental law: the use of natural resources, whether renewable or not, the necessary actions to avoid pollution, and ecological equilibrium to allow for further development. Fundamentally, the law states that any public or private activity which causes ecological desequilibrium or excesses must receive prior authorization from SEDUE. The substantive scope of the law sets forth ecological policy, planning and ordinance, and contains criteria for the promotion and regulation of economic, social and urban development. The law makes detailed provisions for the prevention and control of air, water and soil contamination by regulating vehicular and industrial emissions, depletion and contamination of the existing water supply, importation of hazardous toxic waste, herbicides, pesticides, fertilizers or other toxic substances prohibited in their country of manufacture. The storage, transportation, re-use, incineration or final disposal of waste products also require the prior authorization from SEDUE. Any company producing hazardous waste is legally responsible for its proper disposal in perpetuity. All contamination due to noise, vibrations, thermal energy, odors or visual effects, when it exceeds the limits established by SEDUE and the Secretariat of Health, is prohibited.

SHOUTA ILEGAN

Between 1972 and 1973 the Government enacted several regulations to specify limits on particulate emission levels from stationary sources and to regulate water pollution. Given the rapidly growing levels of industrialization and urban congestion in the major cities, these requirements were soon obsolete. In January 1984, as a result of increased pressure from the public opinion, the Government published a new set of laws and regulations to supersede, restate or cancel previous laws. Finally, on January 26, 1968 the new Federal Law on Ecological Equilibrium and Environmental Contamination was passed and enacted on March 1, 1968. This law supersedes and abordates the prior federal law. The fundamental change in the law is organizational as it centralizes dower within SEDUE while recognizing the need for inter-agency, state and municipal government participation for successful implementation.

The legal basis for ecological action in Mexico is found in its Constitution. Several articles cover the use of natural resources, human health, safety and pollution prevention and control, as well as the decentralization and definition of responsibilities regarding environmental protection and ecological equilibrium between the federal, state and municipal governments.

The new law covers line following points: cooperation of federal, state and municipal governments: responsibilities of the Ministry of Urban Development and Ecology (SEDLIE) the Department of the Federal District and the National Ecology Comission; general ecological policy and its instruments; creation and protection of protected natural areas; rational use of natural elements, including water and its ecosystems, soil and its resources, non-renewable resources and the effects of their exploitation; and its resources, non-renewable resources and the effects of their exploitation; definition of risky activities, dangerous materials and residues; rules regarding nuclear energy, noise, vibrations, thermal and light energy, odors and visual contamination; promotion of social perhicipation; security and controlling measures and sanctions as patterned after those in offect in the U.S., Spain, Germany and Japan, and incorporate patterned by the Environmental Protection Agency (EPA).

The new law touches on three basic aspects of environmental lawr the use of natural resources, whether renewable or not, the necessary actions to avoid pollution, and ecological equilibrium to allow for further development. Funcamentally, the law states that any public or private activity which causes ecological desequilibrium or excesses must receive prior authorization from SEDUE. The substantive scope of the law sets torth ecological policy, planning and ordinance, and contains oritate for the promotion and regulation of accommic, social and urban development. The law makes detailed provisions for the prevention and control of air, water and soil contamination by regulating vehicular and industrial emissions, depletion and contamination of the existing water supply, importation of hazardous toxic waste, herbicides, posticides entitizate or other toxic substances prohibited in their country of manufacture. The storage, transportation from SEDUE. Any company producing hazardous vaste require the prior authorization from SEDUE. Any company producing hazardous waste require the prior authorization from SEDUE. Any company producing hazardous waste require the prior authorization from SEDUE. Any company producing hazardous waste or equire the prior authorization from SEDUE. Any company producing hazardous waste established by SEDUE and the Secretariat of Heatth, is prohibited.

The application of these rules, their enforcement and the corresponding administrative and federal sanctions for their violation are contained in the law. Sanctions are potentially harsh: fines of up to 20,000 times the daily minimum wage may be imposed, plants may be shut down and involved individuals may be subject to imprisonement. Federal, state and municipal authorities may inspect and monitor activities to verify compliance. These inspections follow fairly specific procedures. The procedural requisites have also been formalized. All existing and planned operations exceeding the parameters specified in the technical norms require an authorization from SEDUE. An applicant for SEDUE authorization must provide the agency with an environmental impact statement of the project. After evaluating the application, SEDUE may grant or deny the authorization or condition it upon changes in operation or pollution controls.

Seven industrial categories are particularly scrutinized for their environmental impact:

- federal public works;

- water works, oil, gas, carbon and general transportation networks:

- chemical and petrochemical plants, iron and steel mills, paper factories, sugar refineries, manufacturers of beverages, cement, automotive parts, and electricity generating and transmission plants;

- mineral and non-mineral exploration, extraction, treatment and refining:

- federal tourism developments;

- hazardous (including nuclear) waste treatment, storage and disposal plants;

- exploitation of slowly regenerating vegetation in forests and tropical jungles.

To supplement the law and assist in its interpretation and application, various regulations and technical norms have been issued. The regulations outline the procedures required by the law, while the norms provide quantitative parameters for the evaluation of hazardous waste.

8. MARKET ACCESS

Sales in Mexico are usually made through local agents and distributors, normally operating on a commission basis. Decisions should be taken on whether to use an agent, joint venturing or licensing with a Mexican company. Mexico's market is highly competitive and companies which maintain an active presence in the market and establish a good track record by virtue of product performance, competitive price and service will do well.

All suppliers of equipment or services, whether local or foreign, to a Mexican Government entity must be registered with the Secretariat of Programming and Budget (SPP) and with the Purchasing Department of of the agency itself. All purchases over a specified minimum are subject to bidding.

As a result of Mexico's accession to GATT, the Mexican Government has gradually opened the economy to international suppliers. Import duties have been lowered from a maximum 100% in 1983, to 20% since December, 1988. The official import price system has been totally eliminated and import permits are required on only 325 of the total 11,950 items in the Mexican Tariff Act, none of which correspond to this industry. Mexico adopted the Harmonized System of Tariff Nomenclature on July 1, 1988.

Imports of pollution control equipment and instruments are subject to a 0% to 20% ad valorem duty assessed on the F.O.B. invoice value. In addition, a 0.8% customs

The application of these rules, their enforcement and the corresponding administrative and federal sanctions for their violation are contained in the law. Sanctions are potentially harsh; these of up to 20,000 times the daily minimum wage may be imposed, plants may be enut down and involved individuals may be subject to imprisonement. Federal, state and municipal authorities may inspect and monitor activities to verify compliance. These inspections follow fairly specific procedures. The procedural requires have also been formalized. All existing and planned operations exceeding the parameters specified in the technical norms require an authorization from SEDUE. An applicant for SEDUE authorization must provide the agency with an environmental ampact statement of the project. After evaluating the application, SEDUE may grant or impact statement of the project. After evaluating the application, SEDUE may grant or impact statement of the project. After evaluating the application or politicion or condition it upon changes in operation or politicion controls.

Seven industrial categories are particularly scrutinized for their environmental impact

- water works, oil das carbon and general transportation

chemical and petrochemical plants, from and steel mills, paper factories, sugar refigeries, manufacturers of beverages, cament, automotive pans, and electricity generating and transmission plants;

mineral and non-mineral exploration, extraction, treatment and refining

federal tourism developments

- nexardoux (induding nurses) waste treatment, storage and disposal plants; elemberation of slowly regenerating vegetation in torests and tropical jungles.

To supplement the law and assist in its interpretation and application, various regulations and technical norms have been issued. The regulations outline the procedures required by the law, while the norms provide quantitative parameters for the evaluation of nazardous waste.

MARIGET ACCESS

Sales in Mexico are usually made through local agents and distributors, normally operating on a commission basis. Decisions should be taken on whether to use an agent, joint venturing or licensing with a Maxican company. Mexico's market is highly competitive and companies which maintain an active presence in the market and establish a good reack record by virue of product performance, competitive price and service will do well.

All suppliers of equipment or services, whether local or foreign, to a Mexican Government entity must be registered with the Secretariat of Programming and Budget (SPP) and with the Purchaseing Department of of the agency itself. All purchases over a specified minimum are subject to bidding.

As a result of Maxico's accession to GATT, the Mexican Government has gradually opposed the economy to international suppliers. Import duties have been towared from a maximum 100% in 1933, to 20% since December, 1988. The official import price system has been totally eliminated and import permits are required on only 325 of the total 11,950 items in the Mexican Tariff Act, none of which correspond to this industry. Mexico adopted the Harmonized System of Tariff Nomenclature on July 1, 1988.

Imports of pollution control equipment and instruments are subject to a 0% to 20% advanced by seeses on the F.O.B. invoice value. In addition, a 0.8% oustoms

processing fee is assessed on the invoice value. A 15% value added tax is then assessed on the cumulative value of invoice plus the above taxes.

There are no official metric requirements applicable to imports into Mexico, However, since the metric system of units is by law the official standard of weights and measures in Mexico, importers will usually require metric labeling for packaged goods, although the English system is also used. Dual labeling is acceptable. Imported products should be labeled in Spanish containing the following information: name of the product, trade name and address of the manufacturer, net contents, serial number of equipment, date of manufacture, electrical specifications, precautionary information on dangerous products, instructions for use, handling and/or product conservation and mandatory standards. Mexico adheres to the International System of Units (SI). Electrical standards are the same as in the U.S. Electric power is 60 cycles with normal voltage being 110, 220 and 400. Three phase and single phase 230 volt current is also available.

Prepared by: Caroline Verut for the Canadian Embassy Mexico City July 1990 processing fee is assessed on the invoice value. A 15% value added tax is then assessed on the cumulative value of invoice plus the above taxes.

WHEN SELLING TO THE MEXICAN GOVERNMENT AND ITS AGENCIES, IT IS REQUIRED TO HAVE REGISTRY NUMBER AS FOREIGN SUPPLIER. FOLLOWING IS RELATED INFORMATION.

REGISTRATION WITH SECRETARIA DE PROGRMACION Y PRESUPUESTO

(SPP)

Following is a summary of Registration Procedures for Canadian Companies wishing to sell to the Mexican Government and its decentralized agencies.

Note: Registration procedures now cannot be done by the foreign (Canadian) supplier, and <u>must be done</u> by the company's official local agent/representative in Mexico.

To obtain registry, the following documents should be submitted to the Registro de Proveedores Office of the Secretaría de Progrmación y Presupuesto (SPP) (Ministry of Planning and Budgeting) located at the following address:

Registro de Contratistas y Proveedores de la Administración Pública Federal S.P.P. Av. San Antonio Abad No. 124 - Piso 1 Col. Tránsito 06380 México, D.F.

- a) Applications for registration of foreign supplier forms SPP in original and 3 copies, all signed separately.
- b) A copy of the company's balance sheet and profit and loss stateent with data not older than two months with respect to the date of application entry into the Foreign suppliers registry, also translated into Spanish and legalized by the Mexican Consulate.
 - Copy of power of company's legal representatives in Canada notarized, and certified by Mexican Consul (documents mentioning full name of person or persons, legally authorized to sign documents on behalf of company showing his (their) signature.
 - d) Copy of agency/representative contract in Mexico notarized and then certified by Mexican Consul.
 - e) Copy of a document that proves and guarantees legal existence of company in Canada.
 A certificate of incorporation from a Canadian -

RECUISED TO THE METICAL GOVERNMENT AND ITS ACRHOISS, IT IS RECUISED TO HAVE REGISTRY SURGEN AS PORSION SUPPLIED. FOLLOWING IS BREATED INFORMATION.

REGISTRATION WITH SECRETARIA DE PROGRAMOION Y PRESUPUESTO

(999)

Policying is a summary of Registration Procedures for Canadian Companies wishing to sell to the Mexican Government and its decentralized agencies.

Note: Registration procedures now cannot be done by the foreign (Canadian) supplier, and must be done by the company's official local agent/representative in Mexico.

To obtain registry, the following documents should be submitted to the Registro de Proveedores Office of the Secretaria de Prograsción y Fresupuesto (SPP) (Ministry of Planning and Sudgeting) located at the following address:

Registro de Contratistas y Proveedores de la Administración Pública Federal S.P.P. Av. San Antonio Abad Mo. 124 - Piso 1 Col. Transito 06380 México, D.F.

- Applications for registration of foreign supplier forms SPP in original and 3 copies, all signed separately.
- b) A copy of the company's balance sheet and profit
 and loss stateent with data not older than two
 months with respect to the date of application
 entry into the Foreign suppliers registry, also
 translated into Spanish and legalized by the
 Mexican Consulate.
- Copy of power of company's legal representatives in Canada notarized, and certified by Mexican Consul (documents mentioning full name of person or persons, legally authorized to sign documents on behalf of company showing his (their) signature
 - d) Copy of agency/representative contract in Mexico notarized and then certified by Mexican Consult
- e) Copy of a document that proves and guarantees lagal existence of company in Canada.

 A certificate of incorporation from a Canadian -

Chamber of Commerce or Industry Chamber. This letter must be presented in its original form and must state that interested company has been legally incorporated in accordance to the laws of the country and must include the date of incorporation. The letter cannot be more than six months old from the date it was issued. In addition it must be translated into Spanish and legalized by the Mexican Consulate.

- f) Limited power to local agent to act on behalf of foreign firm on disputes and collection matters.
- g) A photocopy of sample past invoices for each product to be supplied duly translated and legalized by the Mexican Consulate with the date and the names of the buyer and the seller underlined and highlighted.
- Once application forms and supporting documents are approved, registration number is issued in two to four weeks time. To claim registration number, foreign firm's representative will have to present original and copy of HD-1 form "Declaración General de Pago de Derechos" duly paid.
- 3. To obtain HD-1 forms.

 As first step, payment of \$366,000 Mexican Pesos (as of April 1990 and rate subject to changes) should be made at any office of the Secretaría de Hacienda y Crédito Público (SHCP) in cash, or with Mex. Peso bank draft in favor of the "TESORERIA DE LA FEDRACION" payable through a Mexican bank located in Mexico City and should be accompanied by four (4) payment forms DH1. Each form should be signed separately. Forms can be obtained at any SHCP's offices.

IMPORTANT

TO AVOID REFUSAL OF APPLICATIONS

- I Copies of documents b, c, d, e, f, g, must be translated into Spanish by certified local translator if done in Mexico. However if documents b, c, d, e, f, g and respective translations are done into Spanish in Canada, these do not have to be done by certified translator, as above, but documents and translations must be duly notarized, and then certified by nearest Mexican Consul in your area.
- Original and copies of application forms must be signed separately by company's legal representative.

- 5 -

Chamber of Commerce or Industry Chamber. This letter must be presented in its original form and must state that interested company has been legally incorporated in accordance to the laws of the country and must include the date of incorporation. The letter cannot be more than six months old from the date it was issued. In addition it must be translated into Spanish and legalized by the Mexican Consulate.

- for limited power to loral square to act on behalf of foreign firm on disputes and collection matters.
- A photocopy of sample past invoices for each product to be supplied duly translated and legalized by the Mexican Consulate with the date and the names of the buyer and the seller underlined and highlighted.
- Once application forms and supporting documents are approved, registration number is issued in two to four weeks time. To claim registration number, foreign firm's representative will have to present original and copy of HD-1 form "Declaration General de Pago de Derechos" duly paid.
- To obtain HDml Forms.

 As first step, payment of \$366,000 Mexican Pesos (as of April 1990 and rate subject to changes) should be made at any office of the Secretaria de Macienda y Credito Publico (SMCP) in cash, or with Mex. Peso beak draft in favor of the "TEBORERIA DE LA FEDERATION" payable through a Mexican bank located in Mexico City and should be accompanied by four (4) payment forms DH1. Each form should be signed separately. Forms can be obtained at any SHCP's offices.

IMPORTANT

TO AVOID REFUELD OF APPLICATIONS

- Copies of documents b, c, d, e, f, g, must be translated into Spanish by certified local translator if done in Mexico. However if documents b, c, d, e, f, g and respective translations are done into Spanish in Canada, these do not have to be done by certified translator, as above, but documents and translations must be duly notarized, and then certified by nearest Mexican Consul in your area.
- Original and copies of application forms must be signed separately by company's legal representative.

III Corporate name should appear exactly the same in all documents: (i.e.: spelling, company names which have changed over the years).

Legal representative's signature should be signed separately on following documents:

. DH-1 Payment forms

. Registry application forms (both pages)

- . Power of legal representative of company in Canada.
 - Copy of agency/representative contract in Mexico.
 - . Limited power to local agent.

While every effort has been made to provide the above information accurately, the Canadian Embassy cannot assume responsibility for errors, omissions or subsequent changes in procedure which may occur.
