Technical and Bibliographic Notes / Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming are checked below.

- Coloured covers / Couverture de couleur
- Covers damaged / Couverture endommagée
- Covers restored and/or laminated / Couverture restaurée et/ou pelliculée
- Cover title missing / Le titre de couverture manque
- Coloured maps / Cartes géographiques en couleur
- Coloured ink (i.e. other than blue or black) / Encre de couleur (i.e. autre que bleue ou noire)
- Coloured plates and/or illustrations / Planches et/ou illustrations en couleur
- Bound with other material / Relié avec d'autres documents
- Only edition available / Seule édition disponible
- Tight binding may cause shadows or distortion along interior margin / La reliure serrée peut causer de l'ombre ou de la distorsion le long de la marge intérieure.
- Blank leaves added during restorations may appear within the text. Whenever possible, these have been omitted from filming / Il se peut que certaines pages blanches ajoutées lors d'une restauration apparaissent dans le texte, mais, lorsque cela était possible, ces pages n'ont pas été filmées.
- Additional comments / Commentaires supplémentaires:

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

- Coloured pages / Pages de couleur
- Pages damaged / Pages endommagées
- Pages restored and/or laminated / Pages restaurées et/ou pelliculées
- Pages discoloured, stained or foxed / Pages décolorées, tachetées ou piquées
- Pages detached / Pages détachées
- Showthrough / Transparence
- Quality of print varies / Qualité inégale de l'impression
- Includes supplementary material / Comprend du matériel supplémentaire
- Pages wholly or partially obscured by errata slips, tissues, etc., have been refilmed to ensure the best possible image / Les pages totalement ou partiellement obscurcies par un feuillet d'errata, une pelure, etc., ont été filmées à nouveau de façon à obtenir la meilleure image possible.
- Opposing pages with varying colouration or discolourations are filmed twice to ensure the best possible image / Les pages s'opposant ayant des colorations variables ou des décolorations sont filmées deux fois afin d'obtenir la meilleure image possible.

This item is filmed at the reduction ratio checked below / Ce document est filmé au taux de réduction indiqué ci-dessous.

12x	16x	20x	24x	/	28x

The copy filmed here has been reproduced thanks
to the generosity of:

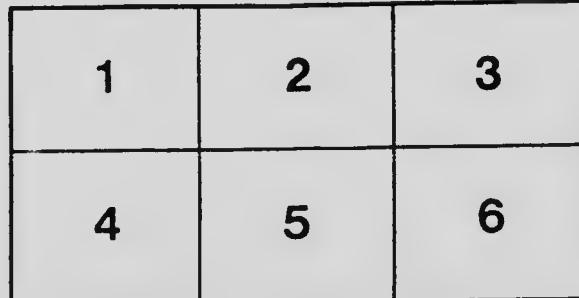

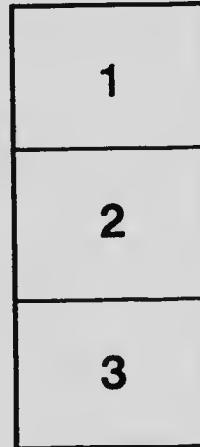

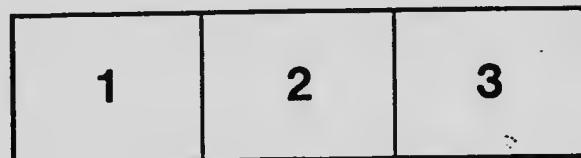

Library
Agriculture Canada

The images appearing here are the best quality
possible considering the condition and legibility
of the original copy and in keeping with the
filming contract specifications.

Original copies in printed paper covers are filmed
beginning with the front cover and ending on
the last page with a printed or illustrated impression,
or the back cover when appropriate. All
other original copies are filmed beginning on the
first page with a printed or illustrated impression,
and ending on the last page with a printed
or illustrated impression.

The last recorded frame on each microfiche
sheet contains the symbol → (meaning "CONTINUED"), or the symbol ▽ (meaning "END"),
which ever applies.

Maps, plates, charts, etc., may be filmed at
different reduction ratios. Those too large to be
entirely included in one exposure are filmed
beginning in the upper left hand corner, left to
right and top to bottom, as many frames as
required. The following diagrams illustrate the
method:

L'exemplaire filmé fut reproduit grâce à la
générosité de:

Bibliothèque
Agriculture Canada

Les images suivantes ont été reproduites avec le
plus grand soin, compte tenu de la condition et
de la netteté de l'exemplaire filmé, et en
conformité avec les conditions du contrat de
filmage.

Les exemplaires originaux dont la couverture en
papier est imprimée sont filmés en commençant
par le premier pied et en terminant soit par la
dernière page qui comporte une empreinte
d'impression ou d'illustration, soit par la seconde
pièce, selon le cas. Tous les autres exemplaires
originaux sont filmés en commençant par la
première page qui comporte une empreinte
d'impression ou d'illustration et en terminant par
la dernière page qui comporte une telle
empreinte.

Un des symboles suivants apparaîtra sur la
dernière image de chaque microfiche, selon le
cas: le symbole → signifie "À SUIVRE", le
symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être
filmés à des taux de réduction différents.
Lorsque le document est trop grand pour être
reproduit en un seul cliché, il est filmé à partir
de l'angle supérieur gauche, de gauche à droite,
et de haut en bas, en prenant le nombre
d'images nécessaire. Les diagrammes suivants
illustrent la méthode.

REVIEW OF CO-OPERATIVE WOOL SALES IN CANADA.

PREPARING WOOL FOR MARKET.

BY

T. Reg. Arkell and J. K. King.

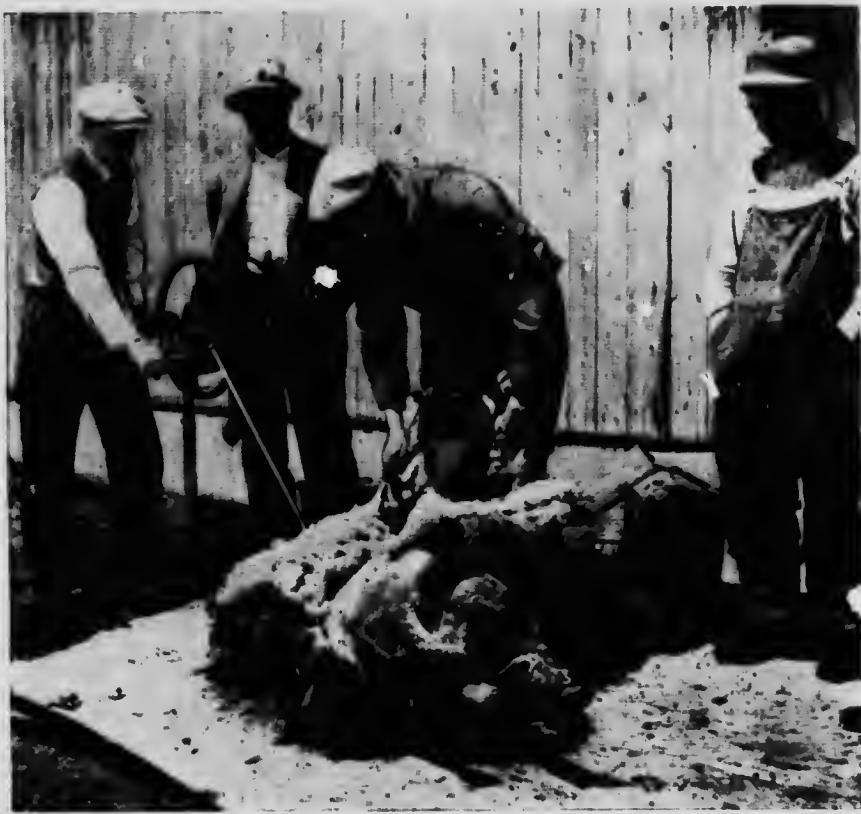

Sheep raising should represent one of the most important phases of live stock production in Canada. The climate is conducive to thrift in sheep, and conditions of agriculture obtaining here, although varying in mode in the different provinces are, in most respects, adaptable to the successful prosecution of some system of sheep farming. In fact, no country of relative area possesses so many natural advantages for their production. Yet the sheep industry has never occupied the prominent position in Canadian agriculture which its importance demands.

One of the reasons reflecting in the past a reactionary influence against the development of the sheep industry on a larger scale has been the low price of wool which until recently so generally existed. The sheep raiser receiving only a few cents per pound had little incentive to engage extensively upon its pursuit since the disposal of mutton would not be depended upon to return a justifiable profit to the producer; and in account many farmers possessing admirable conditions for the raising of sheep could not be induced to enter the business.

It has, therefore, appeared, that a greater remuneration from the sale of wool would act as a direct stimulus in creating a more favourable attitude by farmers toward sheep raising. As a means to this end, the minister, appreciating the importance of the sheep industry, instructed officers of the branch to undertake a study of the character of Canadian wool and determine what features pertaining to it placed it in such ill-repute for manufacturing purposes. Results of these investigations showed clearly that the principal objections obtained chiefly with condition. Inherently the quality of Canadian wool for those grades produced here was most satisfactory. These grades comprised mainly the medium and coarse classes, which possessed a distinct and serviceable place in manufacture, and although the scoured pound was not so valuable as the fine grades, yet to produce the latter would radically lower the standard of mutton characteristics. The innate character of the wool was not at fault. A ready sale for these grades did exist. They are closely akin to the British types, always in keen demand. The fault lay with the preparation of the wool and its condition. The low price did not really represent the price of low wool, but rather the price of wool made low through careless preparation, the inclusion of dirt and much other extraneous material which increased the cost of manufacture and created waste in the factory. Responsibility for this condition was due to a great degree to the manner of purchase, the flat price, which gave to the sheep raiser little encouragement or incentive to prepare a better article. The farmer's knowledge of wool was restricted.

Wool to him was merely wool. His neighbour's coarse grade, dirty and chaffy, brought the same price as his own fine medium wool, clean and light of shrinkage. Under these conditions the careful shepherd, in comparison with a less careful neighbour, was actually losing money. It was rather to his advantage to incorporate chaff and dirt in the fleece since this could then be sold for wool.

Disposal of wool on a flat basis was causing to the manufacturer as great inconvenience and loss as to the producer. He had to grade and afterwards sort the wool in his own warehouse, and frequently was forced to purchase, mixed in a lot, classes of wool which he did not want and could not use to advantage. With Canadian wool

Shearing Sheep by Hand Machine. Note canvas under sheep to keep the wool clean.

he never knew precisely what he was getting. Consequently, he could afford to take no great chances and was compelled for his own financial safety to purchase the wool on the basis of the poorest in the lot. When he imported from Great Britain, he obtained the wool graded and shrinkage declared and thus was assured in every respect of its character. He could utilize it immediately upon receipt without the delay always connected with the preparation of the home product. The flat system of selling was deeply inrooted in Canada and existed largely on account of the farmer selling individually either to small dealers or the country storekeeper whose business seldom extended to more than a few hundred or thousand pounds per year, which did not give him a sufficient turnover to compel more than a cursory interest in the venture. Besides, grading of small quantities cannot be satisfactorily pursued since each class

would contain but a small number of fleeces, which would make it an expensive operation not only with respect to labour and cost of sacking but warehousing facilities as well.

Grading can best be accomplished and return the most profitable results with a carload (20,000 pounds) or more. The greater the quantity, the better is the opportunity of disposing of it to advantage. With a hundred thousand pounds, for instance, each grade will be sufficiently large to permit of its sale separately since some manufacturers have not the facilities for using economically all grades and would, consequently, be in a position to pay a high premium for the grade which they actually need than under conditions which made it necessary for them to purchase all grades in order to obtain the selected one. If a single grade can make up a complete carload, a distinct saving in transportation is gained with a sale presented in this fashion.

Wool grading at a collecting point in Western Canada.

Sheep raisers, when they fully understood the conditions depreciating the price of wool and how these may to a great degree be rectified, were quick to take advantage of the benefits of grading and the disposal of their product on this basis. In 1913, an active educational campaign was inaugurated by the minister to introduce improved methods of preparing and caring for the fleece before offering it to the market. This was attended with such satisfactory results and the interest developed by sheep raisers so great that the next year seven associations were organized to pursue that year co-operative sale of their wool under the direction and grading system developed by the department. This movement was welcomed by the manufacturers and given their hearty support. In 1914, 266,129 pounds of wool were graded for societies organized in four provinces, namely, Quebec, Ontario, Manitoba, and Alberta. In 1915 the number of organizations formed for this purpose was increased to nineteen. Approximately 420,000 pounds were classified and offered for co-operative sale. In 1916 this amount had reached the total of 1,721,598 pounds with a value of \$5,9,678.69, and every province was represented. Reference to the tabulated statement will give a clear idea of the progress of this work.

It has been the distinct purpose of the department, in pursuing this work, to help improve the character of the wool clip and develop a national standard of wool grades. Accordingly the services of export wool graders are furnished, upon application to the Live Stock Commissioner, who classifies the wool for a group or society of sheep raisers and arranges it generally in a condition most acceptable for market. Associations organized for this purpose carry on and control through their own officers all business relating to the collection of the wool and the conduct of its sale. In some instances, however, independent action has been taken on the part of provincial departments and colleges of agriculture in loaning to the wool growers the use of warehouses and arranging for them financial aid during storage. This applies to the Manitoba, Saskatchewan and Prince Edward Island Departments and to Macdonald College.

Advantages of the co-operative movement and the success of the operations of these associations are clearly expressed in the rapid increase of amount of graded wool offered for sale since the inception of these activities. The adoption of grading has created a spirit of rivalry, in which each farmer endeavours to outdo his neighbour, or prepare his wool in a fashion which will grade higher, the results of which

Wool packed in bales ready for shipment.

are most wholesome and effective in obtaining a distinct improvement in the character of the product. This does not comprise the only respect in which beneficial results are exhibited. As the co-operative movement grew, a steady advance in the price occurred and the price of the classified product, sold through associations, exceeded during all three years that sold by individuals in the old way. The revenue to a member of a society, it has been demonstrated, was greater than that he could have received by selling at a flat price through the ordinary channels. It is estimated from sources as reliable as can be obtained of conditions of this nature that the average price last year of all graded wool was 5½ cents higher than the average price of other wool sold in the country. This is conservative and, although not definite, yet was gleaned from information derived from many wool men and farmers in close touch with market conditions and in a position to observe actual sales. There are many instances of wool being sold in almost the same district where an association existed at from 8 to 10 cents less. This increase alone was almost as much as many farmers obtained for their wool five years before, and manufacturers gladly paid the higher price, since the preparation was so much better than the ungraded it was actually as cheap, if not cheaper. In the first year of co-operative wool selling, 1911, the average price throughout the Dominion of graded wool was 20·7 cents; in 1915, 27·2

cents; and in 1916, 32.83 cents. Wools east of Port Arthur brought an average price per pound of 41.01 cents, and wool west of there 31.53 cents per pound. The difference in the price is explained by the lighter shrinkage of eastern domestic wools and their closer proximity to the consuming market. In 1913, and for many years before, western wool sold at approximately 12 cents per pound and eastern at 15 cents. Of course war conditions have influenced the general upward trend of prices, but the present reawakening of attention by farmers in the sheep industry is due equally as much to the interest aroused by means of co-operative activities.

Expense to the associations of handling the wool ranged from $\frac{1}{2}$ of a cent to 1 cent per pound. The average cost was 0.65 of a cent. The differences were due to local conditions, depending largely upon the expense attached to the renting of a warehouse, which is most variable, since it is required for only a short time. Sometimes, where scarcity exists, must be taken at a high rental. These prices include the cost of labour for handling the wool, sacks, paper twine and insurance. This deduction of a little over one-half of a cent is easily offset by the much greater price which grading and co-operative sale produce.

Defective cloth showing presence of Sisal Fibres. Used principally for tying Fleeces.

In 1916 a very strict and exhaustive system of grading was adopted, and classes were included which would cover the full range of Canadian wools. In the West the Range wool of Merino origin was separated from the Domestic or Down or Long wool origin produced under farming conditions. The latter was again classified according to condition into firsts and seconds; the former shrinking under 50 per cent in scouring, the latter, over 50 per cent. From these results a very thorough knowledge has been gained of the exact character of the wool in the different parts of the country, as exemplified in the accompanying charts or diagrams. This provides also the opportunity of recognizing the underlying type of sheep within a district. For instance, it will be noted that the wool in the Maritime Provinces is largely lustre and coarse. From this one knows that the sheep must be mainly long wool breeds or long wool foundation, inclining to the Leicester. Quebec and Ontario again show Down crosses most strongly in the preponderance of the medium combing grade. In Saskatchewan and Alberta the Range wools appear, exhibiting the introduction of Merino blood. Clothing wools or those less than 2 inches in length, remarkably absent in Eastern

Domestic, are present to a great degree in the Range types. Many of the grades representing but a small percentage of the total will another year in field grading be incorporated without difficulty or confusion with others closely allied in character to them.

THE GRADING OPERATION.

Grading represents the classification of wool in the fleece and should be done before the wool enters the mill. It consists of the separation of the entire fleeces into lots of similar character with relation to condition, quality and staple or length. Grading must not be confused with sorting, which is performed in the factory before scouring and comprises the breaking up of the fleece itself into unit parts. These operations are rendered necessary, owing not only to variations in character of fleeces produced from sheep within the same flock of similar breeding, but variations as well in length and quality within the fleece itself. For instance, a shorter wool will be found on the belly than on the thighs and the latter will be much coarser. These two sorts are used for different classes of manufacture.

Proper method of Folding Fleece clipped surface outside; turn in sides and roll from both ends.

Discussion of the classification of Canadian wool will involve an explanation of the following features:—

Grease or Unwashed.—Wool shorn from the sheep in the natural condition. The fleece should be offered for sale in this fashion only. The grade can be distinguished more readily and the manufacturer can sort it to suit his needs. The higher price which the washed or tubwashed product brings, as has been proven experimentally, is more than offset by the cost of labour and loss in weight. Besides, this operation can be performed much more effectively by scouring in the factory.

Washed.—Wool washed with soap and water upon the sheep's back. Washing removes only the foreign material or dirt and creates a shrinkage in weight from 15 per cent to 22 per cent on the average.

Unmerchantable.—Wool poorly washed or not shorn for some time after washing.

Tubwashed.—Wool scoured by hand with soap and water frequently containing a weak solution of caustic alkali, after it has been removed from the sheep. This repre-

sents a type of wool which is so bad that it cannot be used in the manufacture of ranges from 15 to 20 per cent occurrence.

Coarse.

Scouring.

Rejected.—Wool which is too dirty or contains too many foreign materials to be used in the manufacture of ranges from 15 to 20 per cent occurrence.

Cottled.

and is due to the presence of coarse fibres from the neck of the sheep which cannot be removed by scouring.

districts a higher quality.

in a higher quality.

sents a most objectionable practice. In tubwashing the various qualities of the fleece are so badly mixed as absolutely to prevent sorting. It represents an attempt to fulfil the same purpose as scouring, but the process is not as effective. Before the wool can be used in manufacture it must be rescouried, and, although the original loss in weight ranges from 36 per cent to 50 per cent, an additional decrease of an average of 15 per cent occurs in the mill.

Co-operative associations will not accept tubwashed wool for sale.

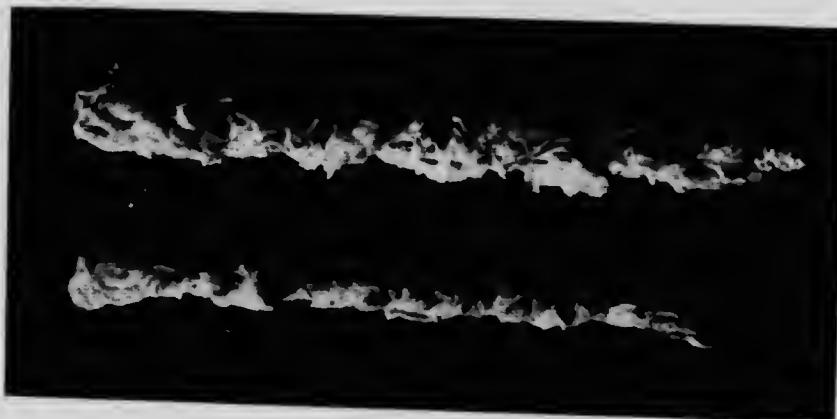

Scoured.—Wool thoroughly cleansed in the mill by efficient machinery.

Rejection or Reject.—Wool containing an excessive quantity of seeds, burrs, straw, hay or kemp.

Cotted Reject or Cots.—Wool matted together. Cotting is created by ill-health and is due to lack of sufficient yolk or grease in the wool, which ordinarily keeps the fibres from sticking together. Since the wool is already felted to some degree, it cannot be used effectively in manufacture.

Black or Grey Reject.—Wool containing numerous black, brown or grey fibres. The colour prohibits its use for light coloured fabrics.

Tags, Dung Locks or Stained Pieces.—Short locks covered or stained with manure. These are generally of no high commercial value and must be given special treatment in scouring.

Neck pieces improperly used for tying fleeces. These were so firmly twisted they could be unravelled only with great difficulty.

Pulled or Skin.—Wool removed from the pelts of slaughtered sheep by a mechanical or chemical agency.

Staple or Length.—Fleeces are separated very generally according to staple, into two lengths, combing and clothing. Two inches is ordinarily the dividing point. Combing is the long wool, intended for worsted purposes. Clothing is too short for the ordinary combs and must be carded entirely, mostly into woollen goods. Canadian Domestic wool, as may be recognized from a study of the charts, represents in the main combing lengths.

Quality.—Domestic wool is divided into five classes according to quality or fineness of diameter of the fibre. Of these the Medium and Coarse represent the basic grades and comprise the bulk of the wool of this class raised in Canada. In some districts a finer wool than the distinctive Medium is produced, which may be included in a higher class known as the Fine Medium, and considerable wool exists, coarser

than the Medium but not sufficiently so to be called a Coarse, which is graded effectively as a Low Medium. The Lustre class includes only the bright wool of glossy appearance shorn usually from highly bred Cotswold, Lincoln or Leicester sheep.

Coarse and Lustre are expressly long-fibred wools. Clothing lengths are representative mostly of the Fine Medium and Medium qualities.

Range wools, being of a Merino foundation, possess a decidedly finer quality than the Domestic and incidentally are of higher shrinkage. They can be divided into four classes: Fine, Fine Medium, Medium, and Low. The Fine is not represented in Domestic grades whatever. It is wool from the pure Merino. In reverse fashion Lustre does not appear in Range types, but is exclusively Domestic.

Fleece folding and tying box open showing inside surface.

It is difficult to correlate the types of wool produced by the different breeds with the foregoing grades, for the reason that within each breed there is always a wide range and great variety of qualities. Grading is performed entirely irrespective of breed type, and Shropshire or Hampshire wool may be included in the same grade with Oxford or Suffolk. Fleeces of several hundred sheep of one of the Down breeds, which are the most variable, may fill every category except Fine and Lustre. The wool of the Cotswold, Lincoln and Leicester is the most constant in quality and is never classed as other than Lustre or Coarse.

DIRECTIONS FOR PREPARING AND PACKING WOOL.

(1) Feed sheep well and regularly. Sheep poorly fed will possess a harsh fleece lacking in oil and frequently with a feeble or weak fibre. This does not constitute desirable wool for sale. Where sheep are starved for a period, the effects will be shown in the wool by a weak section which will break readily and, consequently, cannot be used satisfactorily for combing or worsted purposes.

(2) Every effort should be taken to keep the wool free from chaff, hay and burrs. This can be avoided by using proper feed racks and earo in preventing hay or straw dropping upon the sheep during feeding. Moreover, it should always be remembered in this respect that the more dirt there is incorporated in the wool, the higher will be the shrinkage; and wool is bought by the dealer upon the basis of the clean or scoured pound.

(3) Keep the wool well clipped behind at all times, especially if sheep are scouring, so as to prevent the formation of heavy dung locks.

(4) Endeavour to eliminate in breeding operations black sheep from the flock. Mate only sheep possessing pure white wool. Black wool is sold in the reject class and should be packed separately.

Fleece folding and tying box partially open ; Fleece tied.

(5) In marking sheep never use oil paint or tar, which are insoluble and will not scour from the wool. Paint locks must be cut from the fleece by the sorter in the mill and cannot be used in manufacture, thus representing a complete loss to the consumer. There are proprietary materials upon the market which will give a permanent brand under ordinary weather conditions, and yet scour perfectly in the mill.

(6) Sheep must be dipped in some reliable material at least once a year and better twice, in the fall before entering winter quarters and in the spring after shearing.

(7) Shearing should be done on a smooth board floor, never on the dirt, and the fleece should be kept as compact as possible.

(8) Fleeces should be tied only with paper twine, never with sisal or ordinary binder twine. Nor should the neck-piece be used for tying. Effects of cold weather frequently make the neck-pieces so hard, if tightly rolled for this purpose, that great difficulty obtains in unravelling them in the mill. Turn in the sides of the fleece with the skin or clipped surface outward. Then fold alternately the neck-piece and the tail portion until they meet in the centre of the fleece. This arrangement permits the use of a fleece box, which at the same time gives greater compactness and uniformity to the fleece.

(9) The wool should be packed in very closely woven jute, hemp or paper-lined sacks.

(10) Tags or dung locks should never be included with the fleeces, but always packed separately if the wool is adhering to them.

(11) The wool should be absolutely dry at shearing, and should never, subsequently, be permitted to become wet. Damp wool, in storage, will ultimately assume a yellowish colour, which will prohibit its use in the manufacture of white yarn. Besides, mildew may attack it, which will impair the tensile strength of the fibre. Manufacturers greatly dislike and prefer not to purchase wet wool except at a considerable reduction.

DESCRIPTION OF FLEECE FOLDING BOX

FOR USE IN TYING FLEECES.

It is necessary to keep the fleece as intact as possible during shearing. Fold sides and ends of fleece to centre with clipped or skin side out; then place on folding board after paper twine has been threaded on the board as shown in the accompanying illustration. The sides and ends of the box should then be brought into the position illustrated upon the cover page and held together by means of wooden cleats.

Material required will consist of a board 9 feet long by 1 foot wide and 1 inch thick, which may be cut into two pieces 3 feet long and three pieces 1 foot long. The pieces should then be hinged in manner shown in illustration of the open box. For convenience it is advisable to use springs to hold the end board upright when compressing the fleece.

The foregoing description represents the size most suitable for all grades of fleeces, except Coarse or Lustre. The latter will require a box of greater proportions. Two inches added to all dimensions will make it sufficiently large to contain without difficulty fleeces of the average size of these grades.

APPLICATIONS FOR ASSISTANCE.

Sheep raisers desiring to avail themselves of the assistance rendered by the Department should make application to the Live Stock Branch, Dominion Department of Agriculture, Ottawa, for a copy of pamphlet No. 7, in which are given full details respecting such assistance, as also regarding the organization of a wool growers' association.
