SPECIAL COLLECTION OF FRUIT.

Open to all—Professional and General.

The best collection, distinct from other entries (the excellence of the collection to consist in qualities and kinds) of named varieties of apples, pears, grapes, plums, peaches, crabs, and quinces, contributed by any one person, or any number of persons, or any society (the 12th rule not to apply in this case) The Hamilton Horticultural Society
—Diploma and..... \$50

EXTRA PRIZES—Wm. Irwin, London, 3 bottles currant wine, \$1; Ed. Little, Ilderton, 6 bottles Myatt wine, \$1; E. A. Deadman, Lambeth, English Filberts, \$1; W. J. Buttery, Strathroy, red currants, 50c.; W. G. Denison, Toronto, raspberry vinegar, \$1; W. G. Denison, Toronto, raspberry acid, \$1; T. H. Graydon, St. Catharines, Rogers' Hybrid grape wine, \$1.

REPORT OF JUDGES ON SECTION 41—The Judges, in awarding the prizes to entry No. 3, wish to note the particularly fine collection presented, especially in pears, comprising about 200 varieties, almost uniformly well grown, handsome specimens, properly designated. Of peaches, about 24 varieties were shown, generally very fine; some of the specimens seldom surpassed. The apples were in themselves a display worthy of particular notice.

The Judges regret that competing entry No. 2 was not fully placed on the table, owing to the sudden and

melancholy death of G. Z. Rykert, Esq., who had charge of the collection.

CLASS 28—GARDEN VEGETABLES.

760 ENTRIES.

| Tweed, winter, one piece, Barber Bros., Streetsville | 6 |
| 2nd do. Robb & Co., Strathroy | 4 |
| Tweed, summer, one piece, Barber Bros., Streetsville | 6 |
| 2nd do. Robb & Co., Strathroy | 4 |
| Winey, checked, one piece, Waterhouse, Bradbury & Co., Ingersoll | 5 |
| 2nd do. A. Carmichael, Nairn | 3 |
| Woollen cloths, tweeds, &c., an assortment, A. Paton, Manufacturing Co., Sherbrooke, diploma and | 10 |
| 2nd do. Barber Bros., Streetsville | 6 |
| Woollen shawls, stockings, drawers, shirts and mits, an assortment, Armstrong, McCrae & Co., Guelph | 10 |
| 2nd do., Donald Clark, Morriston | 6 |
| Yarn, white and dyed, 1 lb. of each, Armstrong, McCrae & Co., Guelph | 3 |
| 2nd do. Robb & Co., Strathroy | 2 |
| Yarn, fleecy woollen, for knitting, 1 lb., Armstrong, McCrae & Co., Guelph | 3 |
| 2nd do. John Richardson, North Pelham | 2 |
| Yarn, cotton, two pounds, Young, Law & Co., Hamilton | 3 |
| 2nd do. J. W. Whitehead, Peterborough | 2 |

EXTRA ENTRIES.—John Johnston, London, Imitation Brussels Carpet, \$3; John McKillop, Wardsville, Shepherd's Plaid, \$1; Armstrong, McCrae & Co., Lady's Underclothing, \$4; Geo. Copeland, Hamilton, Mannilla Twine and Cordage, \$5; A. C. Atwood, Dunceriff, Lambskin Overcoat, \$3; Donald Donogh, London, Fancy Table Cover, \$3; Waterhouse, Bradbury & Co., Ingersoll, Flannel, navy blue, \$2, and three pieces of shirting, \$3; G. B. Patrick, Birr, Shepherd's Plaid, \$2.

OUR SECOND VOLUME.

By referring to our advertising columns it will be perceived that arrangements have been made to publish the ONTARIO FARMER at Hamilton in future, Messrs. T. & R. White, of the *Spectator*, having purchased an interest in its proprietorship, and assumed charge of the business and publication department of its management. This change, involving as it does, a large accession of practical talent, energy, means and agency facilities, will be followed, we have no doubt, by a gratifying enlargement of our circulation. As intimated in our July issue, we have had every reason to be encouraged with the reception and patronage accorded to our first volume, and as

on our part, neither pains nor expense will be spared to render the ONTARIO FARMER worthy of continued and increasing support, we feel certain that our endeavours will be appreciated and seconded by the great farming public, whose interests we seek to promote. We bespeak the good offices of our friends in promoting the circulation of this journal, and would especially request members and officers of Agricultural and Horticultural Societies, to call the attention of those associations to the special inducement we offer in furnishing them with the ONTARIO FARMER, in clubs of any number, at Seventy-five Cents each, *postage pre-paid*.

THE ONTARIO FARMER.

(From the *Spectator*.)

We have pleasure in directing attention to the advertisement of the second volume of the ONTARIO FARMER, which will be found in today's paper. An interest in the paper has been purchased by the Proprietors of the *Spectator*, by whom it will hereafter be published. The Editorship continues in the hands of the Rev. W. F. Clarke, formerly editor of the *Canada Farmer*. Arrangements are being made for the improvement of the paper, and no pains will be spared to make it worthy the support of the agriculturists of the Province. The subscription price is so small, and the club rates so liberal, that it should be in the hands of every farmer. We solicit for it the cordial co-operation and support of all who appreciate the importance of a special organ of the farming interest of the country.

ONTARIO VETERINARY SCHOOL.

This School has now been in operation some half a dozen years, and if its growth has been slow, it has been constant, and therefore healthy. Commencing with four or five pupils, it has numbered for the past two or three years from sixteen to twenty-five, and it may now be fairly assumed to have attained to the condition of a permanent character. Considerable difficulty has been all along experienced in regard to a suitable room for the purposes of dissection, a branch of study that lies at the foundation of all correct knowledge of Veterinary science and practice.

Mr. Smith has, therefore, erected a new building, specially designed for the various purposes of teaching and anatomical demonstrations, in which practical dissection can be carried on in the coldest weather of winter. This building, which it is expected will be ready for occupation early in January, is situated close to the Infirmary, rendering it, therefore, very convenient for pupils to observe the method of treating disease and the performance of surgical operations, in which the more advanced students have to take part. The number of second and third years' students that have been in attendance on lectures since October, is sixteen, and several new ones are expected to enter after Christmas. When the constant and, of late, rapid progress which has been made in live stock in the Province of Ontario is considered, the importance of such an institution as this will become apparent, and the necessity of having spread over the country a class of Veterinary practitioners properly educated and qualified for the efficient performance of their valuable and necessary work.

AMERICAN DAIRYMEN'S ASSOCIATION.

The American Dairymen's Association offer a prize of \$100 for the best essay on "The claims of cheese as a wholesome, nutritious and economical article of food." No special conditions are imposed respecting the length of the article. It is designed to make use of the substance of the essay by publication, so as to lead to the large consumption of cheese as an article of food. Papers on the subject are to be sent to the Secretary of the Association, Gardner B. Weeks, Syracuse, N.Y., as early as Dec. 20. The awards will be announced, and the money paid, at the annual Convention, to be held in Utica, Jan. 12th and 13th, 1870.

The following are the topics of discussion that will come before the meeting:

Natural heat and odour of milk.

Rennet, its nature and varied effects.

The proper treatment of acidity in cheese-making.

Floating curds, their causes—best treatment.

Shall cheese-making continue to receive the entire attention of this Association, or shall its scope and field of operations and investigations be so extended as to include the subject of butter-making.

THE "LITTLE GIANT" THRESHER AND SEPARATOR.

*The Farm.*

The machine above represented supplies a want long felt by well-to-do farmers; enabling them as it does, to do their own threshing without the extra trouble and expense, incident to the employment of the larger machines that perambulate from farm to farm. The "Little Giant" is manufactured at Stratford, Ontario, by Mr. Joseph Sharman, one of our most intelligent and energetic farm-implement makers. A spontaneous mention of this machine in the *ONTARIO FARMER*, as having attracted our attention at the late Provincial Exhibition, sent the manufacturer some business, and led him wisely to advertise in our columns. To preserve a permanent record of it in our bound volume, we insert the cut and accompanying brief account of his useful invention in "The Farm" department of this journal. The "Little Giant" gives much satisfaction to those who have had in use. It will thresh from 200 to 300 bushels of wheat, or 400 to 500 bushels of oats per day, and delivers the grain in very clean condition, remarkably free from straw and chaff. The machine is of simple construction, having no canvas elevators, or sieves, and is easily managed by any person of ordinary capacity. It can be worked with four or six horses, takes up but little room on the barn floor, and is easily moved about, being provided with wheels. The price of the Thresher and Separator alone is \$160 cash, or \$105 on

credit. With horse-power in addition, the cost is \$180 cash, or 185 on credit. For further particulars, we refer our readers to the manufacturer.

EXPERIMENTS IN CROSSING WHEAT.

To the Editor of the ONTARIO FARMER.

SIR,—The crossing of different varieties of wheat is a subject that has occupied my mind for a number of years, and the practicability of the operation I have fully demonstrated, and shall, therefore, say nothing upon this point at present. But the utility of crossing wheat is of such vital importance to the agriculture of this continent that a little discussion about it with the readers of the *ONTARIO FARMER*, cannot, one would suppose, be otherwise than beneficial. That our cereals and vegetables have a tendency to degenerate and become subject to disease by long cultivation, but few persons of experience will, I think, deny. To these few, if such there be, I would merely put one question, viz.: Where are the different varieties of wheat and potatoes cultivated thirty or forty years ago, that were so remarkably healthy and productive at that time? But the cause of this degeneracy, disease, and the liability to the attacks of certain insects, are points upon which many intelligent persons will, perhaps, differ in opinion and feeling, that it is of vast importance that those who have charge of the agricultural departments of this country should thoroughly investigate this matter. I

proceed at once to give my views, hoping that some member of the Board of Agriculture for Ontario will put me right if I am wrong.

At the outset then, I venture the opinion that close interbreeding in the vegetable kingdom is, in some families of plants, just as injurious, if followed for a very long period of time, as it is in the animal kingdom. My experiments in crossing the grape and the raspberry have showed plainly that in most instances, health and vigour resulted from judicious crossing, and in some few cases greatly increased productiveness. Such, also, has been my experience in crossing wheat. Not that every kernel operated upon would prove valuable by any means; such was the delicacy of performing the operation that frequently the vital organs were injured thereby, consequently, tender and sickly offspring was the result. But if one plant in a thousand possesses all the desirable qualities, is not the country that cultivates this variety greatly benefited thereby? One of my new varieties yielded me (4,800) four thousand eight hundred kernels from the one first kernel, and this year the same variety gave me seventeen bushels two quarts and one pint from seven pounds of seed. Now, if any person will take some old variety that "has run out," as it is termed, or take either of the parents from which my wheat sprung, and raise as many bushels from the same quantity of seed, with ordinary cultivation, such as mine was, then I will admit that I have gained nothing in productiveness by crossing; but if, on the other hand, they cannot raise as much, then are they not equally bound to admit that crossing has increased its productiveness?

There are, in my opinion, other good qualities to be gained by crossing, and resisting the midge is one of them. It is very common to hear farmers say, this or that variety of wheat is too early or too late to escape the midge. From hearing this saying repeated so often by close observers of these matters, I at one time believed it, but am now convinced that the idea is erroneous. In my experimenting I had upwards of a hundred varieties of wheat, one row of each kind within eight inches of each other, nearly all in flower at the same time, yet one row would be completely ruined by the midge, and perhaps the row adjoining it that was exactly the same in regard to earliness, untouched,—the one taken and the other left. I therefore began to look in another direction for the cause, and I observed that some of the older varieties that had been

cultivated in this country for many years, although perhaps very luxuriant in growth of straw, appeared very weak in the generative and some other organs. Now, I do not believe as many people do that the midge ever punctures the chaff, but rather with its proboscis or something else it strikes where the two chaffs join, and where wheat that is perfectly healthy in every respect overlaps its chaff. In cultivating a few plants of the favourite White Soule's by the side of the red midge proof, and both varieties brought into flower at the same time, I found the Soule's completely destroyed by the midge, and why? Simply in my opinion because of its weakness through having been for so long a period of time, fructified by its own follen that it did not produce chaff large enough to cover its nakedness.

And again, while the healthy varieties that resist the midge open their chaff and expose their newly fructified pistils to the bright sunshine for a few moments only, the poor sickly degenerated Soule's remain open with its embryo fruit exposed to the attacks of the midge frequently for hours together.

But there are two other objects to be gained by crossing wheat that must prove of inestimable benefit to Canada, viz. : *hardiness* and *earliness*.

I have feared by crossing different varieties of grapes and raspberries that the perfect hardiness and the extreme earliness of the hardiest and earliest varieties, can be joined with the more tender varieties and so produce the rich luscious fruit of the latter, and to a certain extent the same results have been obtained by crossing wheat.

Now, if some member of the Board of Agriculture will make some enquiries as to the truthfulness of the above statements, he certainly will deserve the thanks of his constituents for so doing, and if the statements are true, the inference to be drawn therefrom, and it seems to me the unavoidable conclusions to be arrived at are, that a first class, more hardy and early white midge-proof wheat, with all that can be desired in strength of straw, &c. &c., and suited to almost every soil and climate, can be raised by judicious crossing.

And who will estimate the value of such a production? We read in several of our newspapers that in some northern townships of Ontario much of the spring wheat was ruined this season from early frost. Does any person ask how such a calamity could be avoided? I answer, either by raising a spring wheat that ripens earlier, or a fall wheat that will stand the winter in these townships and ripen earlier than the present spring wheat does, and I would have no hesitation in undertaking to raise just such a wheat if I could have a guarantee that my labours would be appreciated and rewarded, but not otherwise. It must be obvious to everyone that such an undertaking would require considerable time, much labour and expense to accomplish.

It is certainly very pleasing to know, that several members of the Board of Agriculture have

got their eyes *partly* open to the importance of improvements in this direction, and that one intelligent member has said that the results of my experiments in crossing wheat "are worth millions of dollars to this country," and another, that "the benefits to this country from this wheat are incalculable," and for another gentlemen (the highest authority in this continent) to say, "Go on my dear Sir, you are on the right track, success must crown your efforts, and posterity will bless your memory." This is all very gratifying certainly, but the great question after all must be with a person in my position *will it pay me?* I having satisfied myself that such improvements in wheat can be accomplished by the process above referred to, but the apparent impossibility of any person controlling the product until he should be recompensed for his labours, must deter him from undertaking it. But I will now close this rather long article, much longer than it was intended, but much shorter than the importance of the case demands, and shorter, perhaps than it should be, in order to make myself understood by persons who have paid but little attention to this subject. Permit me, however, in closing to record my opinion that the day is nearly past when the crossing of fruits, vegetables and meals shall be left to chance, or to the wind and a multitude of disinterested insects, and that orders will be hereafter given for new varieties of fruit, vegetables and grain, possessing certain described qualities, and that the orders will be filled with a precision approaching to orders given for a new garment or various other articles now in common use amongst us.

There being no patent rights or government

grants, and the unwillingness of the parties most directly interested in these matters to pay for value received, will be the sole preventative of this eventful period's immediate approach.

CHARLES ARNOLD.

Paris, November 11th 1869.

FARM GLEANINGS.

Flax is very generally raised in Minnesota this year. The common reapers are used in harvesting it.

About £60,000 worth of produce was sold in Guleph market on Thursday, Dec. 9, which speaks well for its prosperity.

Wild oats should always be pulled up in the spring, as soon as they show their heads above the wheat. Pull them up, there is no other cure. When young men sow wild oats, the same course must be taken with the product.

The farmers in Kansas are boasting of their enormous potato crop the present year, and a local paper rejoices with them because they are "excellent food for horses and cattle, and splendid for railroad labourers."

The *Nebraska Agriculturist* says that hedges of different sorts are growing luxuriantly in that State, and adds:—"The osage, of course, is here in all its glory. But in beauty it is far surpassed by the English hawthorn, which has proved a hardy and vigorous grower. It is the only one we have ever seen in Nebraska, and it is a model of fencely prosperity and beauty."

PREMIUM SOUTHDOWN EWES AT THE LAST PROVINCIAL EXHIBITION,

The Property of F. W. Stone, Esq., Moreton Lodge Farm, Guelph, Ont.

The Live Stock.

THE MORETON LODGE SOUTHDOWNS.

The above cut represents a trio of Southdown ewes, owned by Mr. F. W. Stone, of Guelph,

and winners of the first prize in their class at the recent Provincial Exhibition. Moreton Lodge Farm is noted for its fine flock of Southdown sheep, and the specimens figured in the accompanying illustration speak for themselves, and need no praise from us.

LARGE PURCHASE OF THOROUGH-BRED STOCK.

We learn from the *Canada Farmer* that the splendid herds of Short-Horn cattle of John White, Esq., M.P., and of his late partner, Mr. Joseph Kirby, have passed by purchase into the hands of the Hon. George Brown, and have been removed to Bow Park. These herds mainly trace their origin from the excellent old stock of the late Rowland Wingfield, and the late Hon. Adam Ferguson, of Woodhill, improved by such bulls as Ethelbert, Butterfly, Duke of Marleborough and Breadalbane. The purchase embraces, among other fine animals, the following well-known cows: Florence, Mercy, Iris, Flora, Mary, Phoebe, Miss Miller, Mountain Daisy, Young Countess, Magnet, Diadem, Dairymaid, Duchess 2nd, Blink Bonny, Buttercup, Duchess 3rd, White Rose, and Maid of Ontario. It also includes a number of beautiful heifers, such as Louisa. Blink Bonny 2nd, Butterfly Bloom, Victoria, Virtue, Duchess 4th, Myrtle, Memory, Dolly, Jenny, Agnes, Martha and Charlotte. The two year old bull Candidate, the yearling bull Young Duke of Marleborough, and three fine bull calves go with the herd.

Mr. Brown has also acquired Messrs. White & Kirby's famous flock of long-woolen sheep, including some of the finest Leicester and Cotswold ewes and ewe-lambs in Canada.

ENGLISH STOCK SALES.

We glean from our exchanges the following particulars respecting some recent sales of thorough-bred stock in England:—

The Short-horn herd of Mr. J. K. Fowler, Aylesbury, was sold by Mr. Strafford, Oct. 19th, when thirty cows and heifers, and nine young bulls were offered, and all sold but two of the cows. The prices obtained were generally good—the average on cows and heifers having been nearly £51, and on bull calves over £30. With two exceptions the highest prices were from sixty to eighty guineas, the only ones which exceeded those figures having been Fantail 2nd, which brought 120 gs., and Knightly Grand Duchess, which went to Mr. Loney for 210 gs. Two young bulls, the property of Lord Braybrook, were sold at the same time—Geneva's Duke, bringing 110 gs., and Cherry Duke, bringing 70 guineas.

At a sale of young Short-horns belonging to R. Welsted, near Cork, Ireland, seventeen bull

calves were sold, averaging over 24 gs., and three heifers at about the same average.

At the conclusion of the show of the Herefordshire Agricultural Society in October, a sale of Hereford cattle was held, embracing upwards of a hundred lots, from a number of different breeders of good reputation, and including some of the prize animals. The largest offering from a single herd was thirty cows and heifers, and eight bull calves—the former averaging a little over 26 gs., and the latter about 24 gs. On this list, but one animal exceeded 40 gs. Animals from other herds went at about the same rates, with the exception of three bulls that had taken prizes on this or other occasions, which went respectively for \$5, 190 and 96 gs.

LIVE STOCK GLEANINGS.

Horses, whether worked or not, should be kept well groomed and blanketed.

Large boxes for feeding are preferable to racks, and allow of less waste of food.

Milch cows are better to be dried off than kept on giving but a small yield of milk.

Hay that is cut and steamed, or even moistened, will go further than hay fed out uncut.

All kinds of grain will go fully one-third further fed to stock ground or crushed than whole.

Cut straw steamed or pulped with boiled roots will be relished by stock better than the best dry hay.

Regular feeding and watering, good shelter and bedding, should be points aimed at by every stock breeder.

All animals thrive better for getting some roots, be it ever so little; roots seem to give tone to the digestive organs.

After the Guclph cattle fair, on the 9th inst., forty-one car loads of cattle, and ten car loads of sheep were shipped for outside buyers.

Good ventilation of stables is a great preventive of disease, but the ventilation should be so arranged that there will be no cold draught over the animals' bodies.

Since the outbreak of the foot and mouth disease among milch cows in England, and the danger incurred in the drinking of milk drawn from diseased animals, there has been a great demand for milking goats as a substitute for cows' milk, and from 2½ to 4½ and 5 guineas are paid for young, healthy milch goats.

There was a large attendance at the Fergus fair on the 7th inst. The *News* says that about 230 cattle changed hands at an average of \$4 to \$4 25 per 100 pounds live weight. Of all the cattle on the ground, Mr. P. Rennie's steer, "Garafraxa," was the centre of attraction. Although only a three year old, this animal weighed 2,155 lbs., and was sold at 8 cents, live weight, his price being \$172 40.

Stock well summered are half wintered. If they go into the stable in good condition, have warm quarters and wholesome food, they will keep growing, and come out in good condition in spring, with less consumption of food than if stunted half the time.

The Guelph fat cattle fair on the 9th inst., was the best ever held there. The average price of cattle was about \$5 per cwt.; but superior beasts sold at \$7 to \$11, while Mr. Armstrong's prize steer was sold to Sachell Brothers, of Ottawa, for \$15 per cwt. The *Mercury* says the cattle came pouring in in a continuous stream, and as they came they were bought and sent to the weigh-scales. It was between 2 and 3 o'clock p.m. before the rush was over, and by that time, as an experienced buyer remarked, a large number of the finest beasts in Canada had been disposed of. Business was more than ordinarily active, cattle being bought up rapidly. There was scarcely a city in Ontario that did not send buyers, and it is almost certain that there is not one to which Guelph cattle will not be sent.

DISEASE AMONG CATTLE.—We notice in the *Rural New Yorker*, and one or two other agricultural papers mention, that a new disease has appeared among the cattle in Monroe County, N.Y. From the description given of it, it appears to resemble the foot-and-mouth disease, now becoming so alarming prevalent in England.

The Garden.

STRAWBERRIES FOR TEA IN OCTOBER.

The Horticultural editor of the *Globe*, D. W. Beadle, Esq., of St. Catharines, says :

"We are indebted to Mr. Whiting, the proprietor of the Mexican Everbearing Strawberry, for a basket of these berries, which we enjoyed with some friends at tea on the 20th of October. The perfume that filled the room was delicious. These berries had been gathered in Michigan, had been exhibited at our county fair in St. Catharines, and yet were very little bruised or mashed. In size they are not equal to most of the varieties cultivated in our gardens, yet large as compared with most of the Alpine sorts, are unusually long and cylindrical. These berries did not yield as high a flavour to the palate as the delicious aroma had led us to expect, and there was a dryness and pasty character to the pulp which reminded us of some Alpine sorts. How far that may be owing to the length of time that the fruit had been picked, we cannot say. At all events, if this do not prove to possess all the qualities to be desired in an everbearing strawberry, it is a happy starting point for the hybridizer, from which may yet come large and delicious strawberries wherewith to close the year."

We are inclined to think the above is a pretty fair account of the size and quality of the over-

much-be-praised Mexican Everbearing Strawberries. They are Alpines, rendered "unusually long and cylindrical" by extra culture. Their "aroma" is very agreeable, and their flavour very "so-so." There is plenty of room for hybridizers to improve upon this mean berry. Let Mr. Beadle try his hand in this direction. He has our best wishes for a much more brilliant success than he is likely to achieve.

TRANSPLANTING AT NIGHT.

John H. Klippart, Secretary of the Ohio State Board of Agriculture, writes to *Hearth and Home* in favor of transplanting plants at night. He says the plants he transplants at night live and grow as a rule, seldom wilting or withering, while almost all of those transplanted in sunlight wither, and many of them die. As an illustration he says he transplanted 1000 strawberry plants at night; their growth was apparently uninterrupted.

In transplanting vegetables in hot and dry weather, the importance of shading them from the direct influence of the sun's light and heat is well known and generally practiced; a precaution that will apply in some degree, no doubt, to the removal of trees. It will require, however, a number of experiments, repeated under varying conditions, before the theory involved in the preceding quotation can be reasonably accepted.

GARDEN GLEANINGS.

A correspondent of the *Rural New-Yorker*, writing from Springfield, Mo., says the fruit crop has been most abundant.

The *Rural World* speaks highly of the Martha Grape, but in the same number a correspondent says he does not find it fruitful.

Premiums were offered at Vineland for killing Curculios. As a result over 9,000 were reported killed; one man killed 4,400; one 2,700; one 1,300.

A committee appointed by the New York Grape Growers' Association to test the Walter Grape, reported it one of the best if not the very best wine grapes in America.

The *Country Gentleman* says the fine pear, Clapp's Favourite, is likely to have the drawback of rotting at the core. Early gathering is recommended to prevent this.

Dr. Hull says, in the *Prairie Farmer*, that the Curculio discovers its food by scent and finds it by flying against the wind. He insists that the only effectual protection yet discovered is the jarring process.

The Alton, Ill., Horticultural Society voted by a three-fourths majority "to wipe out the Catawba as a worthless rotten thing." There was a strong protest from the minority.

There is an extraordinary dearth of peaches this year in France. The market gardeners of Montreuil, the great source of their Paris supply, estimate the deficiency of their products as compared with an average crop, at £80,000.

In the latest edition of Downing's Fruit and Fruit Trees of America, Charles Downing gives the following list of Strawberries that have done well in his experience: Agriculturist, Charles Downing, Downer's Prolific, French's Green Prolific, Hovey's Seedling Jucunda, Longworth's Napoleon III, Royal Hautbois, Triomphe de Grand, Wilson's Albany.

GRAPES IN IOWA.—At a recent meeting of the Horticulturists at Greenwood, Iowa, whose proceedings are reported in the *Iowa Homestead*, the Martha, Hartford Prolific, Clinton, and Concord were all highly spoken of. The Catawba had no friends.

GRAPES IN MICHIGAN.—A correspondent of the *Michigan Farmer* says, the varieties that have done best in his locality the past season, are the Delaware, Iona, Concord, Hartford Prolific, Anna, and a black grape called Early July.

Our Country.

ORNITHOLOGICAL NOTES FOR DECEMBER.

December gales have swept from the trees the last remnants of their withered foliage, and except where relieved by the sombre green of the pine or the hemlock, the spruce or the cedar, the woods are bare and desolate.

The fields are covered with a deep mantle of snow, over which the keen north wind is blowing and piling up great drifts against fence and bank, yet are we not without the cheerful sounds of bird-life, despite the inclemency of the weather, and many "a feathered friend," may be seen, (by those who are observant of such matters) braving alike the stormy wind and drifting snow, and finding the means of subsistence and of enjoyment, even at this inhospitable season.

Among the first of our December visitors to attract attention are those beautiful little birds, the Snow Bunting (*Plectrophanes Nivalis*). Flying high over head, their white plumage glistening in the sun, and uttering their short cheery notes, they may be heard almost before they are seen. Suddenly the whole flock swoops down from their airy height,

and alighting on the ground, run quickly about, feeding upon the seeds of grasses or wild plants protruding above the snow, or picking up any oats or other grains which they may find among the droppings of the cattle on the road side.

These birds seem to prefer the most exposed localities, and are most frequently found roving over some bleak common, or sweeping in whirling flocks with the drifting snow along the storm-swept shores of our inland lakes.

Sometimes when food is more scarce than usual they will approach the farm yard or the barn in search of seeds or chance grain. They are generally, however, plump and fat, and are consequently esteemed a dainty morsel, and large numbers of these pretty birds, especially in Lower Canada, fall victims to the gun of the pot-hunter.

The flight of the Snow Bunting is both rapid and graceful. It sweeps through the air in long easy undulations, uttering as it flies, sometimes a quick rapidly-repeating chirp, sometimes a soft whistling call-note.

They are very nimble while on the ground, and quick and dexterous in procuring food, which consists of various kinds of seeds, the larvae of insects, and minute shell-fish, with all of which they frequently mix a little sand or fine gravel.

They are not known to breed in Canada, as they leave us in March, and wing their way to "the far north," and the business of incubation is probably carried on amid the dreary wastes of Greenland, or the wilds of Labrador. A single nest of this bird, however, has been found on a declivity of the White Mountains, of New Hampshire. It was seen by a Boston gentleman, and the circumstance is recorded by Audubon. It is described as being "fixed on the ground, amid low bushes, and formed like that of the song sparrow." It contained young ones. The plumage of these birds varies in different individuals; the young birds have more of the reddish-brown marking about them, and less pure white.

The head of the adult male is a brownish-white, the crown and ear coverts pale chestnut; hind neck, greyish-white tinged with chestnut; feathers of the back, brownish, margined and broadly tipped with light yellowish-red; the rump feathers white, tipped with the latter

colour. The whole under surface is white ; the sides of the neck and breast tinged with reddish-brown ; wing coverts on both sides and six outer secondaries white ; primary coverts white tipped with brownish-black ; primaries brownish-black, slightly margined and tipped with white and having a broad band of the same extending over the base, and enlarging inwards ; inner secondaries brownish-black, margined with pale reddish ; three outer tail feathers on each side white, excepting towards the end, where they are brownish-black, of which colour are the other feathers, all being tipped and edged with whitish ; upper tail coverts being brownish-black with a large white tip.

Rivalling the Snow Bird in hardiness and insensibility to the severest cold, but seen with us only at long and rare intervals, we have that curious bird, the Canada Jay (*Perisoreus Canadensis*) as an occasional winter visitor. Although common enough at this season in many parts of north-eastern Canada, it seldom extends its migrations to our Western Peninsula, except when driven here by unusually cold and stormy weather, and a consequent scarcity of food in more northern latitudes.

They make their appearance sometimes in twos and threes, and sometimes in flocks of fifteen or twenty, coming about yards and houses in search of crumbs or scraps of meat when pressed by hunger ; at other times roving through the woods, feeding upon seeds and berries, and the larvæ of insects, or frequenting the country roads, picking up the scattered grain from among the droppings.

They are very easily approached, showing but little fear of man ; indeed, they are said to be often very troublesome to the lumbermen and hunters, in those districts which they frequent, entering the camp of the former and helping themselves to anything in the shape of provisions which may be lying about, and stealing the bait out of the traps of the hunters.

The plumage of this bird is well calculated to enable it to resist the severest cold, the feathers on the body being particularly long, soft, and blended. The general tint of the upper parts is a dull, leaden grey ; the back of the neck black ; forehead and feathers covering the nostrils, brownish-white ; a sort of collar passing round

the lower part of the neck of a dirty white ; the margins of the quills and coverts dull white, as are those of the tail feathers, which are broadly tipped with the same.

In the fur countries, where these birds abound, they are said to build their nests and rear their young before the snow is off the ground. The nest is generally built in a fir tree, of sticks and grass. The eggs are blue, and the young brood, which are quite black, take flight by the middle of May.

That handsome bird, the Pine Grosbeak, (*Pinicola Canadensis*) although not so rare a visitor as the Canada Jay, is only seen occasionally in this neighbourhood. In some winters they have been very numerous in many parts of Western Canada, and then for several years in succession scarcely a solitary specimen has been seen. They make their appearance in flocks of from ten to fifteen or twenty, coming about the gardens and orchards, and feeding upon the tender buds of the cherry and the apple.

To the seeds of the latter fruit they are particularly partial, and withered apples left on the trees or lying on the ground are sure to be attacked by them in search of their favourite food.

Having observed one winter that a party of these birds paid frequent visits to some lilac trees growing close to the verandah of my house, apparently for the sake of the seeds which were still hanging upon the trees, and having before remarked their partiality for apple seeds, I had a quantity of broken pieces of apple scattered about the verandah. The next visit the birds paid the lilacs were speedily deserted, and they were soon busily employed, not only in extracting the seeds from the apple cores, but in feeding upon the fruit itself. I continued to have fresh supplies provided from day to day, and by degrees the numbers of my visitors increased, until there were sometimes as many as twelve or fourteen feeding together at the same time, and they ultimately became so tame as to allow any of the family to watch them from the windows, although hardly two feet from them. Notwithstanding their daily supply of apples, however, the lilacs did not escape, for, not content with the seeds, they stripped the trees so effectually of their flower buds, that the following summer

there was hardly a blossom to be seen upon them.

These birds are also very partial to the buds of the maple, and I have seen the ground beneath the trees on which they had been feeding, completely strewn with the outer covering of the buds which they had devoured. The berries of the mountain ash also constitute a very favourite food, and in some seasons, when these birds have visited us in great numbers, I have not unfrequently seen them feeding fearlessly upon the berries of the mountain ash trees in the streets of the town, undisturbed apparently by the noise and bustle around them, and the seeds being the part they preferred, they would scatter the skin of the fruit upon the ground beneath, where it was trodden by the feet of the passers by, until the pavement became almost crimsoned.

Audubon speaks of curious sores or excrescences which appear sometimes on the legs of these birds, produced, as he supposes, by the resinous matter of the fir tree, on which they principally obtain their food. I have never met with any instances of the kind among those shot here; but if the disease is caused, as Audubon supposes, by constant feeding on the resinous buds of the pine and fir, their diet when in this part of Canada is certainly sufficiently varied to prevent its occurrence.

The Pine Grosbeak has a particularly soft, musical call-note, and in its native woods it is said to sing very sweetly.

The plumage of the male bird is exceedingly handsome; the general colour over the head, neck, breast, back of the neck and rump being a rich carmine; the feathers of the back and scapulars, greyish brown, more or less tinged and edged with carmine; the abdomen and lower tail coverts, ash grey; wings, blackish-brown; the primaries and their coverts narrowly edged with white, the secondaries broadly edged with white; secondary coverts and first row of small coverts tipped with reddish-white; the smaller coverts edged with red; tail, blackish brown. In some individuals the colouring on the head, back and rump is more or less varied with shades of vermilion, orange and yellow, and there is often much difference in the general brilliancy of the plumage; indeed, I have seldom procured two specimens exactly alike. The female is much more sober in her attire than the male bird, the colouring of the head, neck and rump being generally a brownish-yellow, interspersed with a few brighter shades of orange; the feathers of the back, throat and abdomen are but slightly tinged with the same colours, the general tint being ash-grey.

Unlike the species previously described, the Crossbill (*Curvirostra Americana*), although more frequently seen in winter, is nevertheless an inhabitant, more or less common, of our pine and

hemlock forests throughout the whole year. It is in the autumn and winter months, however, that they are most frequently observed.

In cold and stormy weather I have seen them in little flocks of fifteen or twenty about barnyards and outhouses, sometimes descending to the ground to feed, like so many pigeons, and then settling, when disturbed, on the roofs of the nearest buildings, at other times alighting on the farm-house itself, and picking at the mortar on the walls.

They are said to very fond of any saline substance, and as salt is sometimes mixed with plaster or whitewash, it may in some measure account for their curious proceedings. But be this as it may, I have seen these birds clinging like so many plants to the wall of a cottage, busily at work picking off the whitewash, and although frequently disturbed, returning again to their employment, until the walls bore very evident marks of their visits.

Although thus tame and familiar at certain seasons, for the greater part of the year the Crossbills frequent almost entirely the pine and hemlock forests, feeding upon the seeds of the white pine and hemlock spruce, which their strong and powerful bills enable them to extricate from the cones with the greatest ease. They frequently stand on one foot only, and employ the other after the manner of Parrots, in conveying the food to their bills. These birds utter a clear, sharp and not unmusical note, the whole flock chattering as they fly. They pass through the air in a tolerably swift, undulating flight, capable of being protracted over a long distance.

The plumage of the Crossbill varies according to the age and sex of the individual. The general colour of the old males is a dull red, mixed more or less with orange and yellow on the rump, head and breast, the colouring being always brightest on these parts; quills and tail feathers, brownish black; the red colour is paler on the lower parts, passing into whitish on the belly. The colours of the young males are paler and duller, the upper parts a greenish-brown, with an admixture of yellow tints on the back, and more especially the rump. In the female, the upper parts are greyish-brown tinged with green; the sides of the head and neck of the same colour as the back; the under parts pale greenish-yellow, brighter on the fore part of the breast.

There is a very beautiful variety of Crossbill which is sometimes, though rarely, met with here: the White-winged Crossbill (*Curvirostra Leucoptera*). They are smaller than the common Crossbill, and the general colour of the plumage in the male bird is a dark crimson; the wings have two very distinct, well-defined bands of pure white.

There is a very graceful little bird frequently seen in company with the Crossbills, and resembling them somewhat in its habits: the Pine Finch or Pine Linnet (*Chorysomitis Pinus*), but which I have only met with in this neighbourhood during the autumn and winter months. It

feeds, like the Crossbill, on the seeds of the pine, the hemlock and the larch, and when so employed often hangs head downward, swinging from the end of the branch, like the Titmouse. They are said also to be very partial to the seeds of the thistle, feeding on them much after the manner of the American Goldfinch, which this finch resembles somewhat in its flight, and also in the character of its song, the notes of which are clear and sweet, and uttered frequently on the wing. It glides through the air in deep, graceful curves, emitting, like the Goldfinch, its common call-note as it rises and falls in its flight.

The general colour of the upper parts of the Pine Finch is yellowish-grey, streaked with dark brown; the wings and tail dusky, margined with greyish-white; the bases of the secondary quills, the tips of their coverts and the margins of the rump feathers, cream-coloured, brightening into yellow on the rump; the lower parts greyish-white, tinged with brown on the fore-neck, and all streaked with dull brown; lateral tail feathers yellow on the lower half.

The Lesser Red Poll (*Ægiothus Linaria*) is a more or less constant visitor at this season of the year, and may frequently be seen gleaning its scanty food of different kinds of seeds in our gardens and orchards, or feeding by the roadsides on the catkins of the elder and the birch. They generally move in little companies of seven or eight, sometimes as many as fifteen or twenty, flying somewhat in the undulatory manner of the Goldfinch and Pine Linnet, and uttering a call-note not unlike that of the latter bird.

Their food consists of the seeds of the larch, birch and alder, and of various grasses and wild plants. I have seen them also feeding, like the Goldfinch, on the seeds of the sunflower, and sometimes, though rarely, on the thistle. On alighting on a tree or bush they display great quickness and agility in searching for their food, picking at the buds while perched over them, or, swinging head downward from the end of a spray of birch or alder, extract the seeds from the pendant cones with the greatest dexterity. They are by no means a shy bird, but will allow themselves to be approached very closely before taking flight. If disturbed when feeding they will rise from the tree or stump, and after performing one or two wide, circling flights in deep undulations, will alight again nearly in the same spot, and after pluming themselves and chattering together for a few minutes, recommence to feed as before.

The plumage of the Red Poll is a rich crimson on the crown of the head; a band edging the forehead, the level space and the throat, brownish-black; the reversed feathers on the base of the bill, yellowish; the hind part of the head, the neck, the fore part of the back and the scapulars, yellowish-brown; the feathers on the hind part of the back margined with whitish and tipped with carmine; the wings and tail dusky, with yellowish-brown edges, and two transverse bands of the same on the tips of the first row of small coverts and the secondary coverts. The sides of the neck, its forepart, the breast and

flanks, rich carmine; the middle of the breast, the abdomen and the lower tail coverts, white, tinged with rose colour, the sides longitudinally streaked with dusky.

That beautiful bird, the Snowy Owl (*Nyctea Nivea*), is occasionally seen in this part of Canada during this and the two succeeding months. I have not met with a specimen in this immediate neighbourhood for many years, but at one time they were not uncommon on the Peninsula or Island forming the southern boundary of the harbour of Toronto. Its partiality for fish may, perhaps, account for its frequenting so bare and bleak a spot. It feeds also upon birds of large size, such as grouse and wild ducks, but condescends even to squirrels and rats and mice, when other game is scarce. Its pure white plumage, rendering it scarcely discernible from the surrounding snow, and its rapid, noiseless flight, make it a most formidable hunter, and it is but seldom that its destined prey escapes its resistless talons.

Of its place and mode of breeding but little is known. It is said to breed occasionally both in Maine and New Brunswick, but I have not met with any authentic description of its nest or eggs.

The plumage of the Snowy Owl is particularly soft and compact; the general colour, white; the face, forehead, nape, fore-neck, anterior part of the breast, abdomen and rump, unspotted; the upper part of the head and back marked with crescent-shaped brown spots, and the breast, sides and thigh coverts marked with transverse curved lines of the same colour; wing coverts, wings and tail, barred with transverse, oblong dark brown spots.

Of the birds I have just been describing, some, like the Snowy Owl, the Snow Bunting and the Pine Grosbeak, arrive at this particular season, and leave us again on the approach of spring; others, like the Crossbill, are more frequently seen in the depth of winter, although met with in some parts of Canada throughout the whole year.

In addition to both these classes, however, there are not a few of our summer friends, (many more perhaps, than most persons not observant of such things would imagine), whose notes and familiar cries are heard more or less frequently breaking the solitude of the woods and fields through all the dreary winter season.

The scream of the Blue Jay (*Cyanista Cristata*), one of the handsomest as well as the noisiest of the tenants of our woods, may be heard just as often in the depth of winter as in the middle of summer, his accommodating appetite enabling him to feed with as much apparent relish on beech nuts and acorns, the seeds of the pine and the berries of the mountain ash, as on his summer fare of strawberries, cherries, caterpillars and grubs.

Of the Woodpecker tribe both the Hairy Woodpecker (*Picus Villosa*), and the still smaller species, the downy Woodpecker (*Picus Pubescens*), may be seen hard at work in the very coldest weather, tapping away at the hollow trunk of

some old tree, or dodging from side to side, first of one branch, and then another, as if possessed with the very spirit of restlessness.

The cry, too, of the Nut-Hatch and the Tree Creeper may be heard, and the "chichadee-dee-dee" of the merry little Black Cap Titmouse is sure to meet the ear of the traveller as he journeys through the woods at this season, while little flocks of the Snow Bird (*Junco Hyemalis*), not the Snow Bunting, will cross his path, scuttling into the nearest pine bushes, and uttering their low, chattering notes.

Moreover, besides the handsome species already described, there are many others of the Owl family to be met with during the winter, although their stay with us is not like that of the snowy owl, exclusively confined to this season. The great Grey Owl (*Syrnium Cinerum*), the Barred Owl (*Syrnium Nervulosum*), as well as the great Horned Owl (*Bubo Virginianus*), that singular species, the Hawk Owl (*Sarnia Utula*), and the little short-eared Owl (*Brachyotus Cassinii*), are to be seen occasionally during this and the succeeding winter months in various parts of Canada.

The Bald-headed Eagle (although now a rare visitor), as well as more than one species of Hawk, frequent the woods and the shores of our lakes throughout the whole winter, and eke out, apparently, a very comfortable subsistence. If we add to this list, those of our game birds, such as the handsome Ruffed Grouse (*Bonasa Umbellus*), the rarer Spruce Grouse (*Tetrao Canadensis*), and the more familiar Quail (*Ortyx Virginianus*), which are all constant sojourners with us, but some, like the Quail, coming nearer to the haunts of man in winter, and we shall find (as I asserted at the beginning of this paper) that even at this inclement season of the year we are not without the cheerful sounds of bird-life, nor are our woods and fields ever entirely deserted, even in winter, by all their feathered denizens.

G. W. A.

Moss Park, December, 1869.

NOTES ON THE WEATHER.

November, 1869, has been unusually cold and stormy, and large quantities of root-crops have had to be left in the field ungathered, the frost setting in so suddenly and severely as not only to freeze them fast in the ground, but also injure them so much that if a thaw set in, they would still have been of little value as food for stock. From the same cause, very little fall ploughing has been done, and cattle have had to go into winter quarters nearly a month earlier than usual. A good deal of snow has fallen, and sleighing has been fair through most of the country a few miles north of the lakes, while along the belt between the lakes and the limestone ridge formation, there has been but little snow. A heavy gale on the 16th did an immense amount of damage to shipping all along the line of navigation from Kingston to Lake Michigan, many vessels being totally wrecked, and several lives lost.

The mean temperature of the month has been

32°7, which is 4°2 below the average, and 3°5 below the average of November, 1868. The highest degree of temperature was 58° on the 3rd, the lowest 13° on the 24th and 25th.

The amount of rainfall was considerable, though slightly under the average, being 2.540 inches, while of snow there have been 10.2 inches at Toronto, a very unusual amount for this month.

Rain has fallen on 9 days, and snow on 18. There have been two days clear, 7 partially cloudy, and 21 completely so. The prevailing winds have been North and West.—*Canada Farmer.*

Arts and Manufactures.

A PERFECT WATERPROOF.

The "Lounger" of the *Illustrated Times* says: "By the way, speaking of waterproof, I think I can give travelers a valuable hint or two. For many years I have worn India-rubber waterproofs, but I will buy no more, for I have learned that good Scottish tweed can be made entirely impervious to rain, and, moreover, I have learned how to make it so; and for the benefit of my readers, I will give the recipe: In a bucket of soft water put a half pound of sugar of lead, and half a pound of powdered alum; stir this, at intervals, until it becomes clear, then pour it off into another bucket, and put the garment therein, and let it be in for twenty-four hours, and then hang it up to dry without wringing it. Two of my party—a lady and a gentleman—have worn garments thus treated, in the wildest storms of wind and rain, without getting wet. The rain hangs upon the cloth in globules. In short, they were really waterproof. The gentleman, a fortnight ago, walked nine miles in a storm of rain and wind, such as you rarely see in the South; and when he slipped off his overcoat, his under clothes were as dry as when he put them on. This is, I think, a secret worth knowing; for cloth, if it can be made to keep out wet, is, in every way, better than what we know as waterproof.

CLEANSE THE CELLARS.

Every cellar should at least twice a year have a thorough cleaning out. Everything movable in it should have its position changed with this view, and the sides and ceilings of the cellar should be carefully brushed down and one or two heavy coats of whitewash applied. Early winter—we may say at this very time when outdoor labor is pretty much over—should be appointed for the first cleaning. The other should take place in April, when the vegetable matter and meat-pickle imperatively require attention.

In both cases the cleansing should be thorough, and the cellar made to appear as clean and sweet as any room in the house.—*German-town Telegraph.*

Hearth and Home.

A TALK WITH THE YOUNG FOLKS ABOUT THE MONTH.

Our talk about December will be "short and sweet," *short* because we are crowded for space; *sweet* because the topic suggested by the picture is music.

The accompanying picture shows a couple of youthful serenaders, wakening the echoes of a winter night, and "discoursing sweet music," by the light of the moon. Our private opinion is they had better be skating, than singing and fiddling by moonlight, at such a time of the year. However, we can't alter the picture; we can only comment upon it, but certainly we advise our young friends to do their serenading at a time of the year when they will not be in danger of catching cold. Artemas Ward says he serenaded "Betsey Jane" one night, whereupon she raised the "winder," and exclaimed, "cum into the house you old simpleton. To-morrer you'll be going round complainin' about your liver."

We echo "Betsey Jane's" counsel, and say to our young friends, all and sundry, "Cum into the house," and there enjoy yourselves to the full with music and singing. Cultivate a taste for music. It is one of God's best gifts to his creatures. It adds a precious charm to the family circle, and is a ready means of untold enjoyment. It is refining, elevating, and ennobling in its influence. It is one of the purest pleasures allotted to mortals, and should be indulged far more than it is both in town and country. The kitchen should resound with cheerful songs. The parlour should echo the strains of thrilling music. Farmers should make the welkin ring with glad notes, and every body's life should be a psalm and a song.

As music is God's gift, it should especially be employed in his praise. What more worthy use of hand or voice than that which celebrates the Divine Glory? "Let every thing that hath breath praise the Lord." "It is good thing to give thanks to the Lord, and to show forth thy praise O most High! Upon an instrument of ten strings, and upon the psaltery; upon the harp with a solemn sound." "For Thou Lord art good, and thy mercy endureth for ever."

Poetry. 82/100

ADDRESS OF WINTER TO THE FARMER.

[For the ONTARIO FARMER.]

I am coming, friend farmer, so put on your coat,
And meet my advance like a man;
Encourage your horses, and cheer up your boys,
And finish your work while you can.

I am not a mere novice, with sword new and bright,
I have striven and conquered before;

And many a one who has laughed at my might,
Has lain low when the conflict was o'er.

Come, cover your hay stacks, mend up that barn door,

Find a shelter for sheep and for swine;
Before many days I shall bluster and roar,
And all that I catch will be mine.

Then bring out your sleigh, make the harness more sure,

Let the merry bells jingle away,
While to market you go, thro' the frost and the snow,
And see how this year's work will pay.

But don't shut up your heart as you shut up your purse,

And hide away both till the spring;
But let your poor friend who has done so much worse,
Feel the joy that your kindness may bring.

And when with your dear ones you sit round the hearth,

And list to the pitiless storm,
Remember how safely I've wrapt up the earth,
In blankets so soft and so warm.

And gratefully think of the hand that has given,
The hand that could soon take away,
And while you are laying up treasure in heaven,
Do good on the earth as you may.

MARIE.

OWEN SOUND, December, 1869.
