METEOROLOGICAL SERVICE, DOMINION OF CANADA.

Monthly Weather Review.

VOL. XXIV

JULY, 1899.

No. 7

INTRODUCTION.

In compiling the present Review the principal data made use of are the telegraph reports of observations received at this office for the purpose of weather forecasting, and reports by mail from voluntary observers and storm signal agents. For the material used in tracing the paths of areas of high and low pressure in the United States, we are indebted to the Chief of the Weather Bureau, Washington, D.C.

REMARKS UPON THE WEATHER.

The weather of July like that of June did not differ much from average in Canada excepting in the rainfall, which was unusually heavy throughout the larger portion of the more eastern provinces. This heavy rainfall, coupled with much bright sunshine throughout the greater part of the Dominion, was most beneficial and although some districts suffered from drought vegetation generally was in about average condition on the 31st.

In the Province of British Columbia the weather was for the most part fine, warm and dry, but did not differ much from normal, and the condition of vegetation was excellent. Unusually high temperatures occurred on or about the 16th and 26th. 101°.5 being recorded at Griffin Lake, and 99°.4 at Kamloops on the 15th.

In the North-west Territories there was much bright sunshine, but in some districts much rain fell, whilst the mean temperature was about average. Thunderstorms occurred frequently, and in a few places, were accompanied by hail, though little damage appears to have been caused thereby. The maximum temperatures of the month occurred on the 17th or 18th. 102° being recorded at Chaplin, and at most places they were well above 90°. Vegetation was in excellent condition on the 31st.

The weather in Manitoba was normal, both the temperature and rainfall being about average, and other conditions differing little. Thunderstorms occurred at most places, and together with plenty of sunshine were most beneficial. The dates upon which maximum temperatures occurred varied, but the readings were much the same as in the Territories. Vegetation was in about average condition on the 31st.

The chief characteristic of the weather in Ontario was the exceptionally heavy rainfall in northern and eastern districts, and drought or light rainfall elsewhere, the latter conditions also prevailing in districts north of Lake Superior. Cool nights and in most districts comparatively cool days with much bright sunshine prevailed making altogether ideal weather. On July 11th, at about 4.45 p.m. a most destructive hail storm passed over the district, 15 miles north of the town of Chatham. The storm's path was from north-west to south-east, was chiefly confined to the township of Chatham, and although felt, more or less, 15 miles upon either side of its path the area devastated was not more than a mile in width. The usual electrical display and heavy rain accompanied the storm, but no damage appears to have been caused thereby. According to reports, hail fell in some places to a depth of six inches upon level ground, some of the stones being one and a half inches in diameter, and many as large as walnuts. As might well be supposed the destruction was enormous, the "smiling farms" as one observer puts it "were converted into barren fields" and in many cases farmers lost all their crops. Corn was torn and left in tatters, whilst wheat and other cereals were completely threshed out, the stalks only being left standing. A thunderstorm also passed over the country in the vicinity of Gravenhurst, doing much damage to farm property. Vegetation, where not affected by drought, was in very good condition on the 31st.

In the Province of Quebec the rainfall was above average, and the mean temperature somewhat below; there was much fine bright weather, which brought vegetation forward; nevertheless, plant life in most districts, was below normal. Maximum temperatures nowhere reached 90°.

00 SE M. 26 90

The weather conditions of New Brunswick were much the same as in Quebec the rainfall being even heavier and much exceeding the average. Low temperatures, and much cloud and fog on the coast prevailed making some exceedingly unpleasant weather; and added to several destructive thunderstorms, the conditions were not favourable to vegetation.

Up to the 21st in Nova Scotia there was some exceedingly unpleasant weather with much rain and fog; after this date, however, it became fine and continued so to the end of the month. Both the temperature and rainfall were above average in most places, and although vegetation was somewhat backward, it made great progress after the 20th.

In Prince Edward Island the weather was for the most part cloudy with much rain, and although the mean temperature was above average, vegetation was quite backward. The highest maximum temperature reported was 82°8 from Charlottetown.—F. F. PAYNE.

ATMOSPHERIC PRESSURE.

The mean atmospheric pressure was above average from the Rocky Mountains to Lake Superior, and average or a little below elsewhere over the Dominion, except along the Nova Scotian coast, where it was slightly above. The greatest amount above average '050 to '060 inches was recorded in Assiniboia, and the greatest amount below average '030 inches, was at Montreal.

LOW AREAS.

No less than ten depressions were sufficiently well marked to be charted, and there were others, of which the tracks were too doubtful. All of the ten travelled from the West or North-west either over the northern portion of, or to the northward of the Lake Region to the Gulf of St. Lawrence. The areas were also attended by much rain over nearly the whole of Canada, Southern Ontario proving the exception to the rule. The northerly track of the depressions may have been to a certain extent the cause of the paucity of the rainfall in Southern Ontario.

No. 1. A continuance probably of No. 9 on the June Chart. It was situated over Lake Superior on the morning of the 1st, and then moved quickly far north over Canada to the Gulf of St. Lawrence. During its presence thunderstorms were recorded on Lake Superior, and also over the Island of Anticosti. No. 2 was a very shallow depression, which passed over Manitoba to Lake Superior between the 2nd and 3rd, and then dispersed. It was attended, however, by local showers, and thunderstorms as far as the St. Lawrence Valley. No. 3 was first well defined on the morning of the 4th over the Upper Mississippi Valley as a very shallow depression. It was, however, attended by a very pronounced rain area, and as it moved slowly into the Lower Lake Region excessive rainfalls occurred on the 4th and 5th in the Georgian Bay District. It also caused heavy rains in the Ottawa Valley as well as in Quebec and the greater portion of the Maritime Provinces. No. 4 was situated in Northern Minnesota on the morning of the 6th; it formed in an existing low pressure trough. Its ultimate course was south-eastward over the Lake Region to the State of New York, and thence across the Maritime Provinces. It gave rain very generally from the Lakes to the Atlantic between the 7th and 10th together with moderate gales in portions of the Gulf and the Maritime Provinces. Between the 11th and 14th thunderstorms were numerous and heavy in the Ottawa and St. Lawrence Valleys and the Maritime Provinces and locally in the Lake Region attendant upon a shallow depression, which first appeared in the St. Lawrence Valley. No. 5 was a shallow depression, which moved into the Lower Lake Region on the 16th, from the Western States, thence down the St. Lawrence Valley and near the Straits of Belle Isle. It was attended by numerous showers and thunderstorms throughout its course, and by very strong westerly winds in the Gulf of St. Lawrence. No. 6 traversed the Territories and Manitoba between the 16th and 19th, accompanied by occasional showers and thunderstorms. Between the 20th and 21st, when it moved over Lake Superior to the St. Lawrence Valley where it dispersed, heavy rains and thunderstorms occurred in all localities to our Atlantic Coast except in Southern Ontario where there were local showers only. No. 7 was accompanied by numerous heavy showers and thunderstorms in the Territories and Manitoba between the 20th and 23rd, and it then passed far north over Canada reaching the Gulf of St. Lawrence on the 26th, showers and thunderstorms meanwhile occurring from the Lakes to the Atlantic, more especially in the Gulf and Maritime Provinces, where the rainfall was considerable. No. 8 passed into the Lake Superior district on the 26th from the Western States. thence to the Ottawa Valley and across the Maritime Provinces. Like many of its predecessors it gave numerous showers and thunderstorms from the Lakes to the Atlantic in nearly all localities except the southern portion of Ontario. No. 9 moved into the North Saskatchewan Valley during the night of the 26th, accompanied by high winds and showers. It travelled with great rapidity in a far northerly course and reached the Gulf of St. Lawrence on the 30th. Its accompanying showers and thunderstorms were locally experienced in Ontario, but very generally in Quebec and the Maritime Provinces, and it was especially noticeable for the high winds which it brought, these attaining the force of a gale in some localities, more especially perhaps in

the Georgian Bay Region. No. 10 was a shallow depression which moved into the North-west during the night of the 29th and then passed south-eastwards giving showers and thunderstorms generally from the Rockies to Manitoba.

HIGH AREAS.

There was very little high pressure during the month, four areas were charted but they were of feeble energy only.

No. 1 was a very moderate high which was situated in Northern Manitoba on the 7th whence it passed southward and dispersed on the 10th over the Middle States. No. 2 was another shallow high which was situated in Alberta on the 5th and then passed south-eastward to the Middle States where it also dispersed. No. 3 was a small area which appeared over Lake Superior on the 21st in the rear of low No. 6 and travelled south-eastward over the St. Lawrence Valley and the Maritime Provinces. No. 4 moved into the North-west Territories on the 28th from Northern British Columbia and travelled in the rear of low area No. 9 to the Lower Lake Region where it broke up. It was accompanied by quite cool weather, and when in the Territories and Manitoba, night temperatures dangerously near the freezing point were recorded.

TEMPERATURE.

Temperature was a little above average over British Columbia, Manitoba and the extreme eastern portion of the Maritime Provinces, and average or a little below in all the larger remaining portion of the Dominion. The greatest amount above average, namely 6°, was recorded at Port Simpson, B.C., and the greatest amount below average, 4°, was at Barrie.

The Highest and Lowest Temperature in each Province during July, 1899, were:

British Columbia,	101°.5 on 15th at Griffin Lake.	24°.0 on 114b at Daulesseelle
,		34° 0 on 11th at Barkerville.
North-west Territories,	102°.0 on 18th at Chaplin.	33°.0 on 2nd at Banff.
"	" "	" 28th at Alameda.
Manitoba,	96°.0 on 24th at Rosebank.	35°.0 on 30th at Barnardo.
Ontario,	97°.0 on 4th at Cottam.	28°.0 on 19th at White River.
Quebec,	89°.8 on 5th at Chicoutimi.	38°.3 on 22nd at Chicoutimi,
New Brunswick,	89°.7 on 2th at Fredericton.	40°.1 on 1st at Sussex.
Nova Scotia,	87.°0 on 27th at Halifax.	37°.8 on 21st at Truro.
Prince Edward Island,	82°.8 on 12th at Charlottetown.	47°.0 on 23rd at Charlottetown.

PRECIPITATION.

The distribution of rain over the Dominion during the month was, in many respects, very remarkable. This was especially the case in Ontario, where, in several counties contiguous to Lakes Erie and Ontario, and also on the southern portion of Lake Huron, the amount of rain was exceedingly small, while in more northern localities rain fell frequently and heavily, and in some places the total fall for the month was abnormally large. A striking instance in the discrepancy in the rainfalls over different portions of the Province is shown between Wooler, near the Bay of Quinté and Ottawa City; the former place records a total fall for the month of only 0.3 inches, the latter 7.6 inches, and Ottawa Experimental Farm as much as 9.9 inches. The rainfall was also much above average in many portions of the North-west Territories and throughout Quebec and the Maritime Provinces. At Montreal and Yarmouth the average amount was exceeded by 3.6 inches, and at St. John by 4.2 inches.

WINDS.

In British Columbia the general direction of the wind was on the whole westerly, on fourteen days fresh breezes were experienced and on two occasions there were strong winds. In the North-west Territories and Manitoba no one direction prevailed, there were, however, numerous fresh breezes and on three or four occasions strong winds were recorded. In the Lake Region light to moderate variable winds largely predominated, on several occasions, however, the winds became strong from the westerly direction, and between the 29th and 30th a moderate west to north-west gale was felt in many localities more so, perhaps, in the Georgian Bay Region than elsewhere. In the St. Lawrence Valley and the Gulf the winds were westerly on fourteen days and generally variable on others, there were eight days of fresh breezes, five of strong breezes and on one occasion a moderate gale was locally recorded. In the Maritime Provinces the direction was largely westerly, on twelve days the winds were fresh and on two strong.

BRIGHT SUNSHINE.

Bright sunshine was above average in all portions of Canada where sunshine observations are taken except at Fredericton, N.B., where it was a little below. It is also probable that the average amount of sunshine was not maintained in the more northern portions of Ontario. Toronto registered the largest amount, 68 per cent of the possible Victoria 67 per cent, Battleford 66 per cent, Winnipeg 64 per cent.

FORECASTS FOR JULY, 1899.

The forecasts issued by this office at 11 p.m. each night are posted up at every telegraph station in Canada, and are for the 24 hours beginning at 8 a.m. the following day.

The number of predictions issued during the month was 929. These were divided as follows:—

	No.	VERIFIED.								
DISTRICT.	Issued.	No. Fully	No. Partly	No. Not	Percentage					
Manitoba	91	60	25	6	79.7					
LAKE SUPERIOR	103	74	19	10	81.1					
LOWER LAKE REGION	116	87	17	12	82.3					
Grorgian Bay	114	80	25	9	81.1					
Ottawa Valley	103	80	11	12	83.1					
JPPER St. LAWRENCE	102	75	19	8	82.8					
LOWER ST. LAWRENCE	97	70	15	12	80.0					
FULF	98	72	22	4	84.7					
Maritime Provinces	105	77	23	5	84.3					
TOTAL	929	6 75	176	78	82 1					

In order to obtain the percentage of verification of the predictions, the number partly verified is divided by two and added to the number fully verified, and the result divided by the total number issued.

In ascertaining to what extent the predictions have been verified, the reports from the agents at all observing stations, as well as the telegraphic reports, are used.

R. F. STUPART,

Director.

Meteorological Office, Toronto, 26th August, 1899.
