THE ORIGINAL
ASTRONOMICAL OBSERVATIONS
MADE IN THE COURSE OF
A VOYAGE
TO THE
NORTHERN PACIFIC OCEAN,
FOR THE DISCOVERY OF
A NORTH EAST OR NORTH WEST PASSAGE:

WHEREIN

THE NORTH WEST COAST OF AMERICA AND NORTH EAST COAST
OF ASIA WERE EXPLORED.

In His MAJESTY's Ships the RESOLUTION and DISCOVERY,

IN THE YEARS MDCCCLXXVI, MDCCCLXXVII, MDCCCLXXVIII, MDCCCLXXIX, AND MDCCCLXXX.

BY CAPTAIN JAMES COOKE, F.R.S. COMMANDER OF THE RESOLUTION,
AND LIEUTENANT JAMES KING;

AND

MR. WILLIAM BAYLY,
LATE ASSISTANT AT THE ROYAL OBSERVATORY.

PUBLISHED BY ORDER OF THE COMMISSIONERS OF LONGITUDE,
AT THE EXPENCE OF WHOM THE OBSERVATIONS WERE MADE.

L O N D O N:

PRINTED BY WILLIAM RICHARDSON, PRINTER;
AND SOLD BY P. ELMESLY, IN THE STRAND; AND MESS. MOUNT AND PAGE, ON TOWER-HILL;
BOOKSELLERS TO THE SAID COMMISSIONERS.

I N T R O D U C T I O N.

THE discovery of a passage to the East Indies and China round the Cape of Good Hope was attended with such important advantages to the Portuguese, who claimed, and for a long time exercised, an exclusive right to that navigation, as to excite a strong desire in other maritime countries of Europe of opening to themselves a communication with those countries by some other means.

The discovery of the American continent, which also owed its rise to the same desire of possessing the riches of the East, appeared at first to be an unsurmountable barrier to those attempts, while the limits of that continent remained unknown. Several eminent Philosophers and Navigators flattered themselves that passages might be found either round its northern or southern extremity, or by the North of Europe and Asia : we find therefore that different expeditions were undertaken by the English, Spaniards, and Dutch, by those different ways. The first, for the discovery of a North West Passage, was made in 1497, by John Cabot, a native of Venice, in a ship belonging to Henry VII. fitted out at Bristol. After him, by the Captains Forbisher, Davis, Weymouth, Hudson, Button, Gibbons, Bylot, Fox, James, Gillam, Middleton, More, Smith, and others. The danger and difficulty attending those that went through the Straights of Magellan, or Cape Horn, to the South, and by Way-gats and Forbisher's Straights, to the North, confined the prospect of any advantageous passage into the Pacific Ocean to the large opening made by Hudson's Bay; but the voyages of James and Fox in the middle of the last century, and of Middleton and Ellis in this, have given little hope of any such passage to be found leading out of that bay. During the endeavours of these later navigators, the Russians, in 1648, Dishneff, Ankudenoff, and Alexeeff sailed out of the River Kolyma; in the years 1734, 1735, 1736, 1737, and 1738, the Lieutenants Moronieff, Prontshistsheff, Malygin, Shuakoff, Offzin, Koskeleff, and others, made unsuccessful attempts from Archangel, and the rivers of Siberia; as did Shalaroff in the years 1761, 1762, and 1764,

1764 *, made repeated trials for a navigable passage from Archangel, by the North of Siberia, into the Pacific Ocean, and with as little success.

All further attempts for a shorter passage to the East were now dropt ; for as sufficient had been done to satisfy those whose object had been commerce, such enterprizes as took their rise merely from a strong desire of gain were at an end ; but a new spirit of discovery has of late years prevailed, which, owing its rise to other motives, was conducted upon other principles, such as were grounded upon a desire to encrease and improve science by extending our Knowledge of the Globe.

It is unnecessary for me to say any thing concerning the two former Voyages performed by Captain Cooke, as they have been published by authority, and I imagine have given a full and entire satisfaction with respect to the South Seas, and ~~make our~~ knowledge of the globe in that quarter as complete as one could wish. To ~~make us~~ gain all parts equally perfect, there wanted only a Voyage to explore the Northern Pacific Ocean ; an opportunity naturally offered itself, when Omai, a native brought hither from the Society Islands, was to be carried home again ; and upon Captain Cooke offering his services the plan of the voyage was enlarged, and made to correspond with his great abilities : he was to endeavour, after landing Omai, to find out the so much sought for passage between the Northern Pacific and Atlantic Ocean, either by the North East or North West ; which would naturally lead him to explore the North West coast of America, and North East of Asia, hitherto so very imperfectly known, the distance between America and Asia, as also the seas between them, and whether, in that part of the world, there was any approaching the North Pole.

It is not my business to say how far Captain Cooke has succeeded in satisfying our rational enquiries, in regard to these capital objects, for the account of these things is preparing for the Public ; I have only to observe, that it was in the course of that Voyage the following Observations were made.

When His Majesty's pleasure was made known that a Voyage for the ~~above pur-~~ poses should be undertaken, under the command of Captain Cooke, the Board of Longitude, pursuing the same conduct as in the former Voyages, resolved upon sending proper persons on board the two Ships to make Astronomical and Philosophical Observations.

Captain Cooke, in conjunction with Mr. King, one of his Lieutenants, undertook to comply with their instructions, on board the Resolution, the ship Captain Cooke

* See Cox's Account of the Russian Discoveries.

commanded ;

I N T R O D U C T I O N.

commanded; and I engaged to do the same on board the Discovery, commanded by Captain Clerke: in the course of the Voyage, when, from the loss of these commanders, Mr. King took the command of the Discovery, I removed on board the Resolution, commanded by Captain Gore.

We were furnished with a proper Apparatus of Instruments of the best kind, and made by the best Artists. The following is a Schedule of those I had; and, excepting the Transit Instrument, and two portable Barometers, which I alone had, they were the same in both ships.

T H E S C H E D U L E.

| | | | | | |
|---|---|---|---|---|-------------|
| A Portable Observatory, | — | — | — | — | — |
| A Sailor's Chronometer Watch, | — | — | — | — | — |
| An Astronomical Clock, | — | — | — | — | by SHELTON. |
| An Altimeter, | — | — | — | — | by ARNOLD. |
| A Quadrant of one foot Radius, | — | — | — | — | by BIRD. |
| A Transit Instrument of four feet, | — | — | — | — | by Do. |
| A Singing Telescope of two feet Focus, | — | — | — | — | by Do. |
| An Achromatic Telescope of forty-six inches Focus, | — | — | — | — | by DOLLOND. |
| Two Night Telescopes, | — | — | — | — | by Do. |
| A fifteen-inch Hadley's Sextant, | — | — | — | — | by Do. |
| Five Thermometers, | — | — | — | — | by Do. |
| A Basin for holding Quicksilver, | — | — | — | — | by Do. |
| A fifteen-inch Hadley's Sextant, | — | — | — | — | by RAMSDEN. |
| Two portable Barometers, | — | — | — | — | by Do. |
| A Bucket to hold a Thermometer for trying the heat of the Sea, at different depths, | — | — | — | — | by Do. |
| A Marine Barometer, | — | — | — | — | by NAIRNE. |
| A Marine Dipping Needle, with six steel bars, | — | — | — | — | by Do. |
| An Hydrostatical Balance, with two bottles, for weighing sea water, | — | — | — | — | by Do. |
| Two small Variation Compasses, | — | — | — | — | by Do. |
| An Azimuth Compass of Knight's Construction, | — | — | — | — | by ADAMS. |

All, excepting the Marine Dipping Needle and Marine Barometer, and a Balance for weighing salt water, have been accurately explained by Mr. Wales, in his Introduction to the Observations made in the Voyage before this; these three Instruments differing from those we had in that Voyage, make it necessary to give a description of them.

THE DIPPING NEEDLE.

This Instrument was made by Mr. Nairne (on a plan of the Rev. Mr. Mitchell, F. R. S.) improved by himself, and is composed of the following parts. (See Plate I.)

A is a hoop or ring of brass $2\frac{3}{4}$ inches wide; *B* is a strong ring of brass graduated on one side, from the Horizon to the Zenith and Nadir, at 90° ; this ring is moveable by means of the screw *N*, till the index *P* in the Nadir points to 90° . *CC* two square bars of brass, with holes in the middle to receive two pins *ee*. In the small ends of these pins are holes of a conical form to receive the conical points of the axis of the Needle *D*. *nn* are two small screws which prevent the pins *ee* from removing, when they are adjusted at a proper distance ~~under by means of the small screws *mm*~~; *mm* is adjusted by means of four small screws, *mm*, placed at the small ends of the pins *ee*, each screw carrying two moveable balls. *xx* are two pieces of brass, which serve to secure the Needle, when not in use; these are moveable by means of the small screws *mm*. *xxx* are finger screws that fasten the brass ring which ~~is suspended on the stand *E*, by means of the hooks *rr*~~; the whole instrument is suspended on the stand *E*, by means of the hooks *rr*, whence it retains its vertical position at sea. ~~The stand *E* is divided into degrees, and the four cardinal points are also noted; the whole moves round with the Instrument. The index *a* is also moveable, which serves to direct the plane of the Instrument in the Magnetic Meridian, when once set to it, by means of a Compass, which is chiefly useful at land. The brass screws, *ss*, serve to secure the Instrument to the Binnacle, or some other convenient part of the Ship.~~

MR. NAIRN'S DESCRIPTION OF HIS MARINE BAROMETER.

The bore of the upper part of the glass tube of this Barometer is about three tenths of an inch in diameter, and four inches long. To this is joined a glass tube, with a bore about one-twentieth of an inch in diameter. The two glass tubes, being joined together, form the tube of this Barometer; and being filled with mercury, and inverted into a cistern of the same, the mercury falls down in the tube till it is counterbalanced by the atmosphere.

In a common Barometer, the motion of the mercury up and down in the tube is so great at sea that it is not possible to measure its perpendicular height; consequently cannot shew any alteration of the weight of the atmosphere: but in this Marine Barometer that defect is remedied. The instrument is fixed in gimmels, and kept in a perpendicular position by a weight fastened to the bottom of it.

The

The perpendicular rising and falling of the mercury is measured by divisions on a plate divided into inches and tenths, and by a Vernies division into hundredths of an inch, which is fixed to the side of the tube.

T H E B A L A N C E.

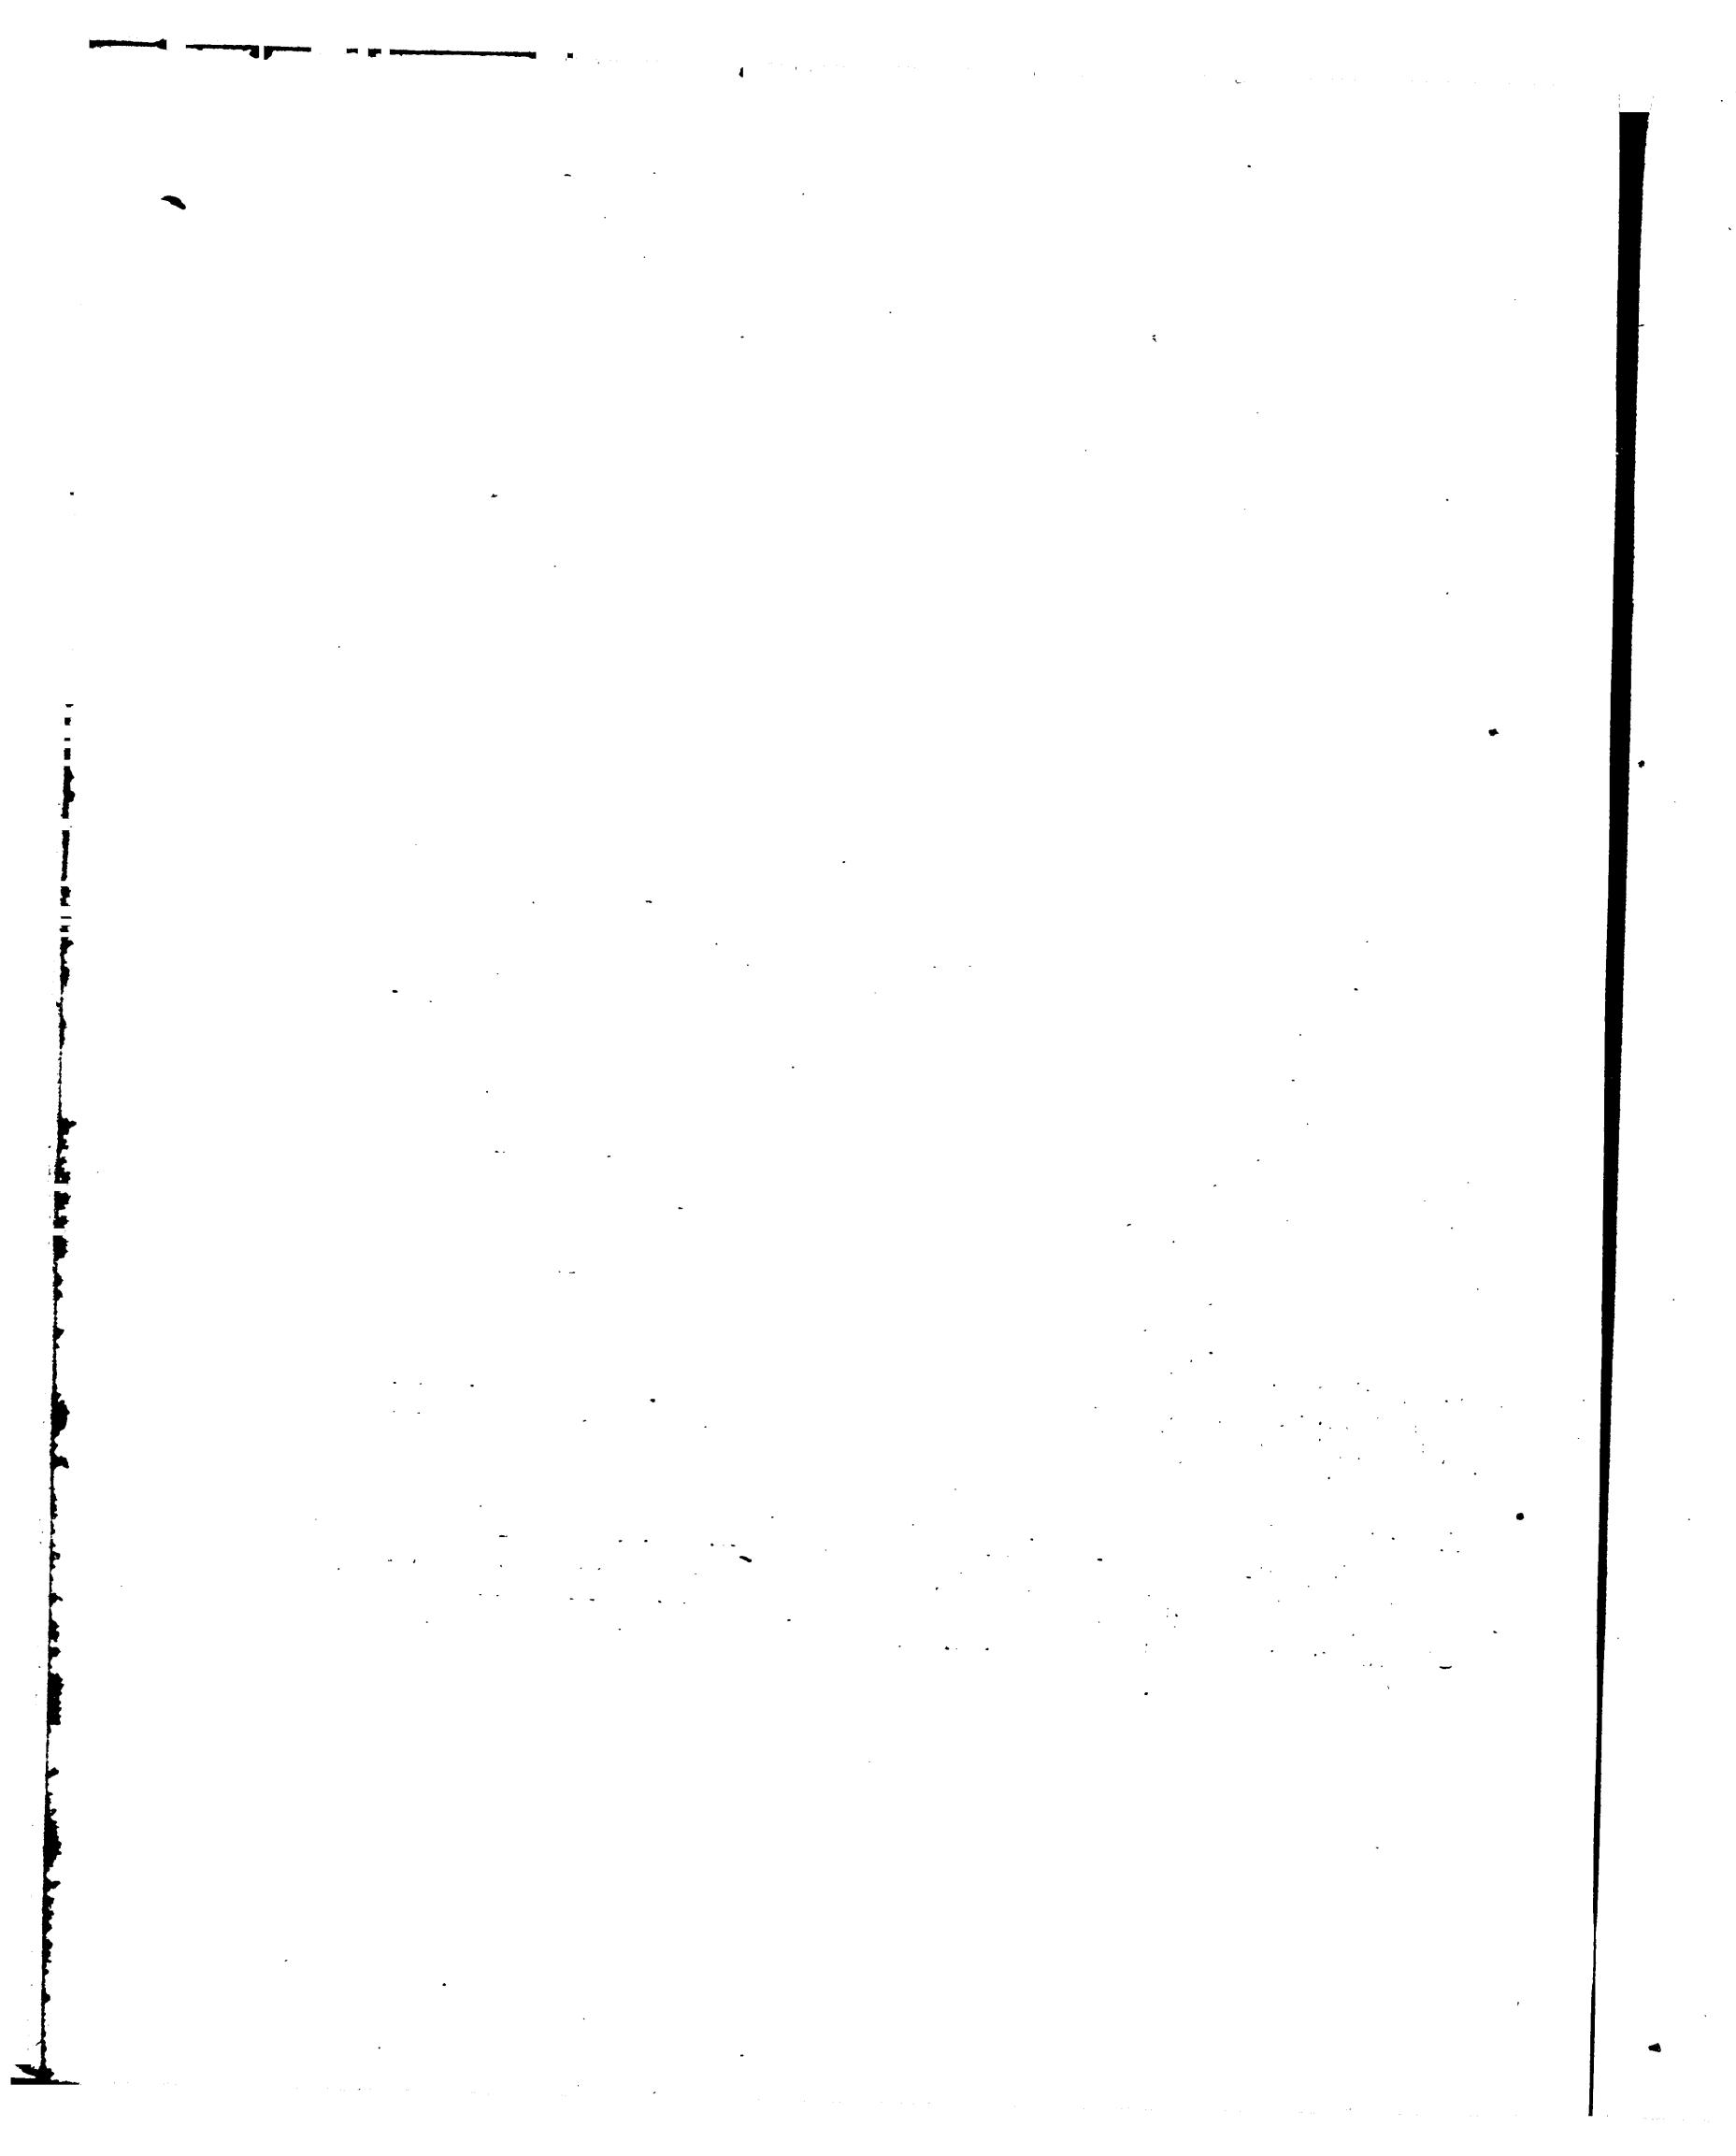

The Balance used for weighing Salt Water was of the common kind, with the addition of two bottles with small necks, on each of which was a mark ; by holding the bottle so that the mark was nearly the height of the Eye, the same quantity of water might be poured into it, certain to less than one grain in weight.

Note, In the following Observations every line is a mean of three, four, five, six or more single observations. These means were taken by two persons, and compared by myself, in which I took the greatest care, whence it is hoped that very few mistakes have escaped and corrected.—The results annexed to the observations, as deduced by Captain Cooke and Officers, were carefully transcribed without any alteration whatever; as also such remarks as I found with them.—The sheets were all read until no error could be found; therefore I hope very few have escaped; but it is highly probable there will be some among such a multiplicity of figures.

W. B A Y L Y.

ASTRONOMICAL OBSERVATIONS

MADE AT

DIFFERENT PLACES ON SHORE.

ASTRONOMICAL OBSERVATIONS.

1776.

- 6 June 11. Received Mr. Kendal's last made Watch from the Royal Observatory. At noon it was $2' 25''$, 97 too slow for mean time at Greenwich, and losing at the rate of $2'',71$ seconds per day on mean time. I then carried it on board the Discovery, and screwed it firm to a bracket that was fixed to the bulkhead of the great cabin for that purpose.

Observations at Drake's Island in Plymouth Sound.

Being informed by the commanding officer that our stay would be uncertain, and that I must hold myself in readiness for sea; I did not set up the Clock and Observatory, but went on shore with the astronomical quadrant and the time-keeper.

The gunner of the fort let me have a room in his house adjoining to his garden, where I observed equal altitudes for the going of the watch, in order to see if it kept the same rate as at Greenwich.

| 1776. | Time per Watch of apparent noon uncorrect. | Half Inter- val of Obser- vations. | Time per Watch at apparent Noon correct. | Watch too fast for Mean Time. | Daily Rate of the Watch. | Nº of Obser- vations | Object observed. |
|---------|--|--|--|-------------------------------------|--------------------------------|----------------------------|------------------|
| | H. ' " | H. ' " | H. ' " | ' " | " | | |
| July 7. | 0 19 0, 87 | 4 54 33 | 0 19 7, 1 | 1 14 39, 31 | Losing | 8 | Sun. |
| 4 — 11 | 0 19 28, 19 | 3 36 18 | 0 19 34, 9 | 1 14 31, 49 | — 1, 95 | 5 | Sun. |
| 5 — 13 | 0 19 39, 00 | 4 48 48 | 0 19 47, 0 | 1 14 29, 05 | 1, 22 | 7 | Sun. |
| 8 — 30 | 0 20 16, 14 | 4 32 20 | 0 20 32, 14 | 1 14 35, 63 | + 0, 38 | 11 | Sun. |

Between the 7th and 30th the watch was losing at the rate of $0'',16$ per day on mean time.

By comparing the result of the 7th with the comparison at Greenwich, the watch (allowing its rate of gaining to be $2'',71$ seconds per day) gave the longitude of Plymouth Sound $4^{\circ} 33' 56''$ West. But admitting that $4^{\circ} 17'$ is the true longitude West, as deduced from former observations, it must have kept the rate of mean time during the interval.

Observations of a Total Eclipse of the Moon, on Drake's Island in Plymouth Sound.
The Telescope used was an achromatic one of $3\frac{1}{2}$ feet focus by Dollond, magnifying power 90 times. During the whole of this observation the sky was very clear and free from clouds.

| 1776. | Time per Watch. | Mean Time. | |
|-------|--------------------|------------------------|--|
| | H. ' " | H. ' " | |
| | 10 8 30 | 9 53 54 $\frac{1}{2}$ | First appearance of the penumbra |
| | 10 11 6 | 9 56 30 $\frac{1}{2}$ | Beginning of the Eclipse } Very uncertain. |
| | 11 11 40 | 10 57 4 $\frac{1}{2}$ | Beginning of the total darkness. } These certain to a few seconds. |
| | 12 45 30 | 12 30 54 $\frac{1}{2}$ | End of the total darkness. } |

A

2 ASTRONOMICAL OBSERVATIONS.

Observations at Drake's Island continued.

| 1776. | Time per Watch. | | Mean Time. | | | |
|-------|-----------------|----|------------|------------|-----|------------------|
| | H. | ' | " | H. | ' | " |
| | 10 | 26 | 45 | 10 | 12 | 9 $\frac{1}{2}$ |
| | 10 | 33 | 30 | 10 | 18 | 54 $\frac{1}{2}$ |
| | 10 | 41 | 30 | 10 | 26 | 54 $\frac{1}{2}$ |
| | 10 | 43 | 35 | 10 | 28 | 59 $\frac{1}{2}$ |
| | 13 | 5 | 18 | 12 | 50 | 42 $\frac{1}{2}$ |
| | 13 | 19 | 37 | 13 | 5 | 1 $\frac{1}{2}$ |
| | | | | Aristotle. | Im. | |

By comparing the beginning and end of total darkness and the immersion and emersion of Tycho, with the same observed at Greenwich; a mean of the results give the longitude of Drake's Island, = $4^{\circ} 13' 44''\frac{1}{4}$ West.

| | | |
|---------------------|--|--|
| 1776. 8 July 30. | Occultations of two small Stars behind the Moon during the time of total darkness at Drake's Island. | |
| | | |

| | Time per Watch. | | Mean Time. | | | |
|--|-----------------|----|------------------|-----|--|-------|
| | H. | ' | " | H. | ' | " |
| | 11 | 8 | 26 | 10 | 53 | 50, 5 |
| | 11 | 39 | 2 $\frac{1}{2}$ | 11 | 24 | 27, 0 |
| | 11 | 25 | 17 $\frac{1}{4}$ | 11 | 10 | 42, 2 |
| | 12 | 33 | 57 $\frac{1}{4}$ | 12 | 18 | 21, 6 |
| | | | | Im. | This Star about the 7th Magnitude. It immerged near the Moon's South Limb. | |
| | | | | Em. | | |
| | | | | Im. | This about the 8th Magnitude. It immerged near the Moon's East Limb. | |
| | | | | Em. | | |

By comparing the above with the observations made at Greenwich, they give the longitude of Drake's Island = $16' 54''$, or $4^{\circ} 13'\frac{1}{4}$ West, deduced from the immersion of the second star.

Allowing the correction of the Moon's place deduced from the Nautical Almanack to be (o) in long. and $31''$ subtractive from the Moon's South lat. and lessening the Moon's diameter by $4''$.

Dip of the Magnetic Needle observed at Drake's Island.

| 1776. | Dip of the N. end of the Needle with the Face of the Instrum. | | | No. of Observations | |
|-------|---|---------|---------------------|---------------------|--|
| | East. | West. | Mean. | | |
| | 75° 20' | 70° 16' | 72 48 | 12 | In observing the dip of the Needle, ten or more single observations were always taken with the face of the Instrument to the East, and West alternately; then the Poles of the Needle were changed, and the observations repeated. |
| | 73 4 | 73 35 | 73 29 $\frac{1}{2}$ | 12 | |
| | Mean of the whole = 73 8 $\frac{1}{4}$ | | | | |

ASTRONOMICAL OBSERVATIONS.

This Time-keeper N° 1. was too slow for mean time at Greenwich—3' 31",29 on the 11th of June at noon, and was losing 1",209 seconds per day on mean time.

By a mean of these 15 results, the daily rate of the time-keeper losing on mean time is 2",261 seconds. And on the 21st of November was slow for mean time 1" 20' 57",66 at the Cape of Good Hope.

Equal Altitudes observed with an Astronomical Quadrant for finding the Rate of the Astronomical Clock, N° 1. by Captain Cooke and Lieutenant King.

| 1776. | Time per Clock at apparent Noon uncorrect. | Half Inter- val of Obser- vations. | Time per Clock at apparent Noon correct. | Clock fast for Mean Time. | Daily Loss of Clock on Si- deral Time. | % of Err. in observations. | Phenomena and Remarks. |

A mean of all the above = $22^{\circ} 6' 35''$ the variation West.

6 ASTRONOMICAL OBSERVATIONS.

Observations at the Cape of Good Hope continued.

Dips of the Needle observed on shore at the Observatory by Captain Cooke.

| 1776. | Facing East. | Facing West. | | | | | |
|--|--|--|---------------------------------------|----------------------|------------------------------------|--|--|
| | o | r | o | / | | | |
| | 45 | 11 | 45 | 28 | Marked end South. | | |
| | 44 | 39 | 45 | 07 | Marked end North or Poles changed. | | |
| | Mean of all $45^{\circ} 6\frac{1}{4}$ the true dip.—Capt. Cooke remarked that each of the above numbers were a mean of a great many observations taken between the 12th and 18th of November. | | | | | | |
| Nov. 10. | On my arrival at the Cape of Good Hope found that Capt. Cooke had set up his Tent Observatory near the Fort, a place very much exposed to the S. E. wind that blows very strong at times, and brings such clouds of sand along with it as to render the instruments useless in a few minutes. Capt. Cooke advised me to set up my Tent Observatory near his, and not go to the usual place, which I consented to, for the convenience of comparing the Watches and Clocks with each other.—He also told me that he would go to sea in seven or eight days at most. | | | | | | |
| Nov. 11. | Went on shore with the Observatory and instruments, and set up my Observatory near that of Captain Cooke.—Set up my Astronomical Clock, and set it a going with the same length of pendulum as when going at Greenwich. A cask was filled with sand for the Astronomical Quadrant to stand on. | | | | | | |

Mean rate of the Clock losing on Sidereal Time 1 3,564; and 7,965 { Watch losing per Day on mean time.

The 24th at noon the Watch No 2. was 1^h 21' 26", 56 too slow for mean time at the Cape.

Dip of the needle: the South Pole.

Mean of all taken on board the Discovery at anchor in Table Bay } = 46° 44' 40" with the balanced needle.

Mean of all d° taken on shore with the balanced needle

46° 43' 30"

Mean of all d° on board with the plain needle

46° 16' 28"

Mean of all d° on shore with the plain needle

46° 18' 7 $\frac{1}{2}$

Each of the above numbers were at least a mean of 40 observations, with the poles changed one or more times in every set.

Observations made at Queen Charlotte Sound in New Zealand.

Equal Altitudes for the Going of the Clock and Watch, No 2.

| 21. | 22 7 3,6 | 4 19 32 | 22 7 17 20 | 11 43,33 | 40,27 | 20 Sun. |

By a mean of these 5 results the daily rate of the Clock losing on sidereal time is 40",239.
The pendulum of N° 1. vibrated 1°:35' at a medium.

ASTRONOMICAL OBSERVATIONS. 9

Observations at Queen Charlotte Sound continued.

Rate of the Watch No 1. deduced from the foregoing Observations, and the Comparisons with the Clock No 1.

| 1777. | Mean Time when Comparison was made. | Time by Watch. | | Watch slow for Mean Time. | Daily Rate nearly. | Daily Rate on Mean Time. |
|----------|-------------------------------------|----------------|---|---------------------------|--------------------|--------------------------|
| | | H. ' | " | | | |
| Feb. 14. | 20 15 54,60 | 8 25 38,5 | | 11 50 16,1 | 1,67 | 1,43 |
| 15. | 24 26 55,28 | 12 36 37,5 | | 11 50 17,8 | 4,58 | 4,47 |
| 16. | 24 41 1,71 | 12 50 39,35 | | 11 50 22,3 | 0,34 | 0,32 |
| 17. | 25 42 22,70 | 13 52 0,0 | | 11 50 22,7 | 1,11 | 1,17 |
| 18. | 24 12 23,81 | 12 22 0,0 | | 11 50 23,8 | 3,78 | 3,75 |
| 19. | 24 26 27,59 | 12 36 0,0 | | 11 50 27,6 | 5,72 | 5,53 |
| 20. | 25 16 51,82 | 13 26 18,5 | | 11 50 33,3 | 4,78 | 4,64 |
| 21. | 26 0 38,10 | 14 10 0,0 | | 11 50 38,1 | | |

By a mean of these results the Watch No 1. was losing 3",04 per day on mean time.

Mr. King computes, that on the 22d at noon it was 11^h 50' 37",4 too slow for mean time at Charlotte Sound.

A mean of all these 41 sets is $174^{\circ} 23' 32''$ for the longitude East.
A mean of 16 sets, taken to the West, and reduced to Charlotte Sound by means of the Watch N° 1, gave $174^{\circ} 35' 17''$ East.
A mean of 36 sets, taken to the East, gave $174^{\circ} 11' 14''$ East, when reduced to Charlotte Sound by N° 1.

Dip of the Magnetic Needle.

A mean of all gives 174° 5' 18" for the longitude East.

A mean of six sets taken to the West, and reduced to the Sound by means of the Watch N° 2. gives 174° 12' 50" Do.

By six taken to the East give the longitude when reduced to the Sound = 174° 23' 30" East.

Azimuths observed with a Compass of Dr: Knight's Construction.

| ⊕ June 7. | 9 46 44, 7 3 22 | 4 9 46 47, 2 2 11 30, 6 | | | | 16 | Sun. | |

By comparing the Observation of May 5th with that of June 7th, the Watch N° 2. gained 4", 70 in 33 days, or at the rate of 0", 145 per day on mean time.

May 4. A mean of three altitudes of the Sun's L. L. observed with different Hadley's Sextants was 53° 33' 13", the eye being 9 feet above the water—whence the latitude is 20° 15' 04" South.
A mean of the results of observations made May 5th, 6th, and 8th with the Astronomical Quadrant is 20° 14' 23" South.
Correction of the line of collimation 1' 1" additive; whence the mean of all four latitudes = 20° 15' 18" S.

All the Lunar Observations taken near this island, and reduced to it by means of the Watch N° 2. give its longitude = 185° 0' 14" East.

The variation of the compass observed = 8° 32' on shore.

From a number of observations it appeared to be high water on the full and change days at 18^h 50' apparent time; or 5^h 10' before the Moon passed the meridian. The water rose 5 feet 1,3 inch at greatest, which was the fourth tide after the change. In general the day tides rose higher

ASTRONOMICAL OBSERVATIONS. 13

Observations at Annamocka continued.

than the night, by 4 and 5 inches. The flood came from the E. by S. nearly. The water flowed and ebbed 6 hours and 6 hours very regular. These observations were made at a point of the bay near the sea.

Equal Altitudes of the Sun for finding the Rate of the Watch N° 1. made by Captain Cooke and Lieutenant King at Annamocka.

| 1777. | Time of Noon per Watch, uncorr. | Half Interval of Observations. | Time of Noon per Watch, correct | Watch slow for Mean Time. | Daily Rate of Watch. | $\frac{6}{23}$ | Phenomena and Remarks. | |

| | | | | | | 22 | Sun. | |

Mr. King remarks that by the Observations on the 5th, 7th, and 10th, the Watch N° 1. was gaining 0", 52 seconds per day on mean time, and on the 7th slow for mean time 12^h 34' 56", 5 : on the 7th of June it was slow for mean time 12^h 35' 12", 8, and losing 0" 54, per day on mean time.

He found the correction of the line of collimation of his Quadrant — 1' 30". On the 8th of May observed the Zenith Distance of the Sun's lower limb 37° 6' 30" from whence he computes the latitude 20° 14' 48" South.

Lunar Observations at Annamocka by Captain Cooke and his Officers.

These observations were made on shore with an Astronomical Quadrant of one foot radius, by Bird.

The correction of the line of collimation was found to be — 15" seconds.

The latitude of the Observatory = 21° 8' 19" S.

ASTRONOMICAL OBSERVATIONS.

15

Observations at Tongataboo continued.

Equal Altitudes for the Going of the Clock and Watch N° 1. by Capt. Cooke and Lieut. King.

By a mean of all the above the Clock N° 2. was losing on sidereal time 1' 40",66 per day.

From the above Observations, and the Comparisons of the Clock N° 1. with the Watch N° 1. its rate is reduced.

Captain Cooke's Remark.

The weather was thick and hazy, with small rain for many days before, and the morning of the 4th was very rainy till between 8 and 9 o'clock, when the sun appeared, and some altitudes were taken. The weather became cloudy, with rain at times, but as the clouds cleared away sometimes the Telescopes were got ready, and Mr. King observed the beginning of the eclipse at 6^h 6' 37" per Clock N° 1. 23° 46' 28" apparent time. He used a Dofond's 3½ feet Telescope, magnifying power 150 times.

The foregoing diameters of the enlightened part were observed by Mr. King with an Hadley's Sextant. Mr. King deduced the longitude from the beginning to be 184° 47' East of Greenwich, or 175° 12' West.

Lunar Observations made by Captain Cooke and his Officers.

| | | | | | | | | | | | | 144 49 30 | Do. |

A mean of the above results is $184^{\circ} 52' 25''$ the longitude of the Observatory at Tongotaboo.
 Captain Cooke remarks that a mean of 131 sets of observations made among the Friendly Islands, and reduced by means of the Watch N° 1. give the longitude of Annamocka $= 185^{\circ} 11' 18''$ E. and that of the Observatory at Tongotaboo $= 184^{\circ} 55' 18''$ E. of Greenwich.

Azimuths observed at Tongotaboo by Captain Cooke.

In the morning observed the following altitudes of the Sun's center.

| Time per Clock | Zenith Dis- tance of the Sun. | | |
|----------------|-------------------------------------|--------|-----|
| | | H. ' " | 6 , |
| 3 23 23, 3 | 61 44 | | |
| 3 31 11, 0 | 60 25 | | |
| 3 40 25, 7 | 58 54 | | |

From these the Clock is computed to be $35' 22'', 6$ too slow for sidereal time at noon, and losing $1' 39'', 8$ per day.

Some Observations of the Eclipse of the Sun at Tongataboo, July 5th. By W. B.

The morning was very rainy with a strong wind at S. by E. a little after 8 A. M. it ceased raining, and the clouds cleared away soon after, which enabled me to get the above altitudes of the Sun. It then came cloudy, and I saw the Sun no more till $6^h 8' 16''$, or $23^h 50' 31''$ per Clock mean time, when I perceived the eclipse was begun. By observing the progress it made in half a minute of time, I suppose it begun about 15 or 18 seconds before I saw it; therefore I call the beginning $5^h 8' 0''$ or $23^h 50' 16''$, 0 mean time.

20 ASTRONOMICAL OBSERVATIONS.

Observations at Tongotaboo continued.

I then applied the object glass Micrometer to my Telescope, and made the following Observations. These cannot be well depended on, the Sun being covered with thin clouds nearly all the time.

| Time per Clock. | Mean Time. | Micrometer Divisions. | Nonius. | Deg. Min. &c. | |
|-----------------|------------|-----------------------|---------|---------------|--|
| H. ' " | H. ' " | ' | ' | ° ' " | |
| 6 26 11 | 0 8 23,8 | 2,5½ + 9½ | 16 | 16 41 29,1 | |
| 29 4 | 11 16,3 | 2,7½ + 1 | 17 | 17 53 11,7 | |

| | ,7 | 4 32 59 | | |
| | ,8 | 5 11 58 | | |
| | ,9 | 5 50 58 | | |
| | ,05 | 0 19 39 | | |
| | | — | 0 0 46½ | |
| | | | | or one division of the Nonius. |

The value of the Micrometer Scale was found thus:

I first made two rods, each five feet long, taken from the Micrometer Scale, with which 100 feet was exactly measured on a flat sand (where the sea flowed over at times) at each end of the line a pile was drove into the sand, and a point made on the upper surface of each, so that the two points were 100 feet asunder. Over one of these points the center of the object glass of the telescope was placed (by allowing for its thickness). Over the other point, on the pile, the surface of a board was placed at the same height with the center of the Telescope, at right angles to the line joining them. On this board was pasted a sheet of paper, with strong black lines drawn on it, exactly five inches asunder. By separating the glasses until these lines covered each other, I found a mean of 50 measures to be 2,2 inches + 1½ divisions of the Nonius; these measures agreed within one division of the Nonius or $\frac{1}{2}$ of a second.

A S T R O N O M I C A L O B S E R V A T I O N S. 21

Observations at Tongotaboo continued.

By measuring a small space I found the error of the Micrometer Scale to be plus $\frac{1}{4}$ of one of the Nonius divisions. Then say, as: 100 f. : 5 f. :: 206265" seconds (equal to radius) : 859 $\frac{1}{2}$ seconds = 14' 19" $\frac{1}{2}$ the value of 2,204 inches of the Micrometer Scale, from whence the above table was made by even proportion.

July 17, The Sun's diameter measured 4, 8 inches + 20 Nonius = 31' 27" 25" $\frac{1}{2}$ by the above table.

The Telescope used was an achromatic one of 3 $\frac{1}{2}$ feet focus by Dollond. The beginning with a magnifying power of 150 times; but all the measures were made with a magnifying power of 90 times.

Computation of the Rate of the Going of the Watch N° 2.

During my residence at Otaheite, I made daily observations on the tides with my instrument placed at the Rock (C). September first (the day of the change) it was high water at noon nearly; the water rose 12,2 inches perpendicular that day; but the second it rose 14,5 inches, which was the greatest rise during my stay.

The time of high water did not exceed 3 hours from noon, at any time; the day and night tides were nearly the same as to quantity and time both.

26 ASTRONOMICAL OBSERVATIONS.

Observations at Otaheite continued.

Observations made at Otaheite by Captain Cooke and Lieutenant King.

| | E. | W. | E. | W. | |
| | ° / | ° / | ° / | ° / | |
| | 27 26 | 30 40 | 28 35 | 28 37 | 28 49 $\frac{1}{2}$ Plain Needle. |
| | 27 33 | 29 26 | 31 53 | 26 59 | 28 57 $\frac{1}{2}$ Balanced Needle. |

A mean of the two = 28° 53' 37" for the dip.

The water rose and fell 10 $\frac{1}{2}$ inches, at most, at full and change, and 6,1 inches at the quadratures, on the full and change days it was high water 10 minutes before noon, or at 11^h 50' apparent time. The time of high water did not vary more than two hours during a revolution of the Moon, it being at highest some time between 11 in the morning and 1 in the afternoon, or a kind of solar tide.

The observations were made between October 14th and 30th, when the Sun was near the Zenith.

ASTRONOMICAL OBSERVATIONS. 35

Observations made at Ulietea.

38 ASTRONOMICAL OBSERVATIONS.

Observations at Ulietea continued.

Dip of the South Pole of the Needle.

| Mark End North. | | Mark End South. | | |
|-----------------|---------|-----------------|---------|--|
| E. | W. | E. | W. | |
| ° / | ° / | ° / | ° / | |
| 29° 36' | 28° 20' | 26° 44' | 33° 26' | Plain Needle — mean $29^{\circ} 31' \frac{1}{2}$ |
| 31° 20' | 28° 13' | 29° 24' | 29° 5' | Balanced Needle — mean $29^{\circ} 25,1$ |

Mean dip $29^{\circ} 28' 18''$.

During my residence on shore, I made constant observations on the tides. The water rose and fell 5 inches at the quadratures, and $9\frac{1}{2}$ inches at full and change. The time of high water varied from 10 in the morning to one in the afternoon, and that in the two following days, which seemed owing to different winds; for in general it was high water 9 or 10 minutes before the Sun was on the Meridian; from whence it should seem that the Sun had great influence on the water, it being near the zenith of the place.

Equal Altitudes of the Sun by Captain Cooke and Lieutenant King.

Capt. Cooke rejected the 5 first results, and took a mean of the last 15 which gives 7",0 for the rate of the Watch N° 1. losing per day on mean time. He also computes it to be 16^h 00' 58",45 slow for mean time the 16th of April at noon, at King George's Sound.

Lunar Observations made at King George's Sound by Captain Cooke and Lieutenant King.

| | 11 36 26 | 21 45 9 | 57 42 37 | 46 2 | 23 39 | D. | -0 30 | | | C | | 233° 11' 45" | Do. |
| | 11 36 26 | 21 45 9 | 57 42 35 | 46 2 | 23 39 | R. 2. | -0 30 | | | K | | 233° 9° 0 | Do. |
| | 11 56 22 | 22 4 41 | 57 37 50 | 43 44 | 22 34 | R. 4. | -3 0 | | | C | | 233° 29' 45" | Do. |
| | 11 56 22 | 22 4 41 | 57 34 7 | 43 44 | 22 34 | R. 3 | 0 0 | | | K | | 233° 9 45 | Do. |
| | 12 0 11 | 22 8 50 | 57 33 32 | 43 19 | 22 19 | R. 3 | 0 0 | | | C | | 232° 54° 0 | Do. |
| | 12 0 11 | 22 8 50 | 57 35 35 | 43 19 | 22 19 | R. 4 | -3 0 | | | K | | 233° 0° 0 | Do. |

A mean of these 9x results gives the longitude = 233° 10' 24" East. Captain Cooke remarks that by taking a mean of 20 results observed at sea (before we made the Sound) and reduced to it, by allowing the rate of the Watch N° 1. = 5", 6 westward, gives 233° 26' 18"; and 24 results of observations taken after we left the Sound, gives 233° 7' 12" E. a mean of the whole is 233° 17' 18" E. the longitude, or 126° 42' 4" W.

| | 5 18 40 | | | 37 5 | y { Ursæ major. | |

From the above the correction of the line of collimation is $54''\frac{1}{2}$, and the mean latitude $49^{\circ} 36' 5''\frac{1}{4}$ North.

Note, I always examined the line of collimation of the Quadrant by means of a distant object, and made it apparently correct; but the celestial observations constantly gave its correction to be near a minute.

Dips of the North Pole of the Needle observed by Captain Cooke.

A mean of these 31 results, viz. 17 on the west side, and 14 on the east side of the Moon, gives the longitude of King George's Sound
= 233° 19' 30" East, or 126° 40' 30" West.

- 4 April 16. At 12^h 47' 28" apparent time observed an emersion of the 2d Satellite of Jupiter.
The Telescope used was a Dollond's 3½ feet Achromatic, magnifying 150 times.
At the time of observation a very heavy dew fell, so as to cover the object glass, and render Jupiter indistinct in a minute or two, which obliged me to wipe the glass frequently, in consequence the observation was dubious to near 20 seconds.
Observed an emersion of the 1st Satellite of Jupiter at 9^h 34' 35",5 apparent time.
By comparing it with the time set down in the Ephemeris gives 233° 13' 15" the longitude East.
At the time of observation the air was clear. I used a Dollond's 3½ feet Telescope, magnifying 150 times.

Azimuths observed at King George's Sound.

My Observatory stood on a small rock that was surrounded by the sea at high water. I observed a great number of Azimuths, a mean of the results gave 16° 4' for the variation East, which is near three degrees less than that deduced from observations taken on board the ship. The dipping Needle gave near two degrees more than on board the ship, from whence it is probable there was some magnetic power of attraction in the rocks.

From constant observations found the tides very regular. It was high water at 0^h 20' apparent time on the full and change days. The water rose 8 feet 7 inches perpendicular at greatest: and it rose 7 feet 3 inches at the quadratures. The water ebbed out much lower at the time of the quadratures than at full and change, which is contrary to what is generally the case.

Observations at the Island of Oonalastchka in Samgonooda Harbour.

The variation observed was $20^{\circ} 45'$ East.

ASTRONOMICAL OBSERVATIONS. 55

Observations at Samgonooda continued.

During the time we were at Samgonooda the weather was cloudy and wet in general, blowing very strong at times from S. E. to W. S. W. which caused the tides to be very irregular; the time of high water varying 3 $\frac{1}{2}$ hours in two following days, which seemed owing to a shift of wind. The flood came from the S. S. W. or S. W. by S. On the full and change days, it was high water at 2^h 30' apparent time. The water rose and fell from 2 feet 4 inches to 4 feet 2 inches, but this was not regular; a S. W. wind caused the highest tide. As far as I was able to judge from appearances, the water rose 3 feet 7 or 8 inches at most, when unaffected by the wind. I also found both here, and all up the coast of America, to the North of these islands, there was only one tide in 24 hours. W. B.

Mr. King remarks, that a mean of the above six results is 7",65 the daily rate of the Watch losing per day on mean time: but as the rates seem to increase gradually, and the Lunar Observations made for some time after require it to be greater than the above mean, and agree very well with supposing it as at the last days; the true rate is therefore assumed at 9",60 losing on mean time, to be used.

Equal Altitudes for the Going of the Watch N° 2.

Jan. 18. Set my Astronomical Clock up, and a going nearly with sidereal time. But the natives seemed disposed to be troublesome, whence Captain Cooke ordered me to pack it up again, and send it on board the ship, and make observations for the going of the Watch only.

64° 13' 39" Mean dip on board.

64° 29' 21" Mean dip on shore.

The tides were very regular every 12 hours; on the full and change days it was high water at 4^h 36' apparent time, the water rose 5 feet 8 inches perpendicular at greatest. The time of high water was sooner by at least two hours on the east coast than in the harbour of St. Peter and Paul; the flood came from the south up the coast.

W. B.

Lieutenant King's Remarks concerning the Watch No 1.

1779.
April 26.

A little before noon found the time-keeper No 1. stopt, it shewed 7^h 52' 15"; not knowing the cause of its stopping we wound it up, in doing which it took about four turns, but we did not set it agoing.

Signed { CHARLES CLERKE,
J. KING.

29.

The ship being in the harbour of St. Peter and St. Paul without any motion, and the day remarkably fine, and no fire in the cabin, we thought it the best time to permit Benjamin Lyon, a seaman on board, who had served his time to Richard Gibbs of Plumtree Court, Holborn, watch-maker, who appeared to us sufficiently knowing in his business from having repaired and cleaned watches during the voyage, to look into the time-keeper; not finding any of the work broke, he took the cock and balance off, and cleaned both [the pivot] holes, which he found very foul, and the inside of the time-keeper rather dirty; he also took the dial-plate off, the wheel that leads into the second hand, between two teeth, found a piece of dirt, [and between two teeth of the wheel that carries the second hand found a piece of dirt] which he thinks to be the principal cause of its stopping; he afterwards put the work together, putting the least oil possible in the cock and foot [holes] when the watch appeared to go free and well.

Signed { CHARLES CLERKE,
J. KING.

May 22,
to June 5.

The time-keeper was frequently opened by Benjamin Lyon (Lieutenant King present) altering the regulator [and balance spring] and comparing it with the clock in order to get it to time: on the 5th of June, after having gone 24 hours very well, it stopped, and the pendulum spring was found broken.

Signed { CHARLES CLERKE,
J. KING.

** In the passage from Sandwich Islands to Kamtschatka, the pendulum spring of the clock No 1. in the care of Lieutenant King, became rusty and broke, which rendered it in a manner useless during the remaining part of the voyage.

In all the foregoing distances the error of the Sextant is not applied.

But in the following the errors are all applied, and the distances set down correct.

The above results of Stars are each a mean of three nights observations taken between the 1st and 7th of September.

By a mean of the above 28 results, the latitude of the Observatory is $53^{\circ} 0' 38''$, 9 North.

A mean of all the above results = 6° 18' 40" E. for the variation.

Observations made in the River Canton, China.

Captain Gore did not think it proper for me to go on shore with my Observatory, Instruments, &c. as the Chinese might not like it. I therefore carried my Astronomical Quadrant and Watch on shore every morning and afternoon on a point of an island near the ship, far distant from any of the Chinese habitations, and, as soon as I had done observing, packed up my Quadrant and carried it on board again; by this means I was able to make a few observations in the day only. W. B.

| 8 —— 12. | This day altitudes were observed in the morning only, and the time computed from them. Whence the Watch No ^a 2. was slow for mean time at noon, = 12 ^b 24' 14", 3, and rate since the 3d losing 10", 06 per day. Between December 7th and January 12th it lost 6' 22", 6 on mean time, or at the rate 10", 6276 per day. | | | | | | |

By a mean of a number of observations of meridian altitudes of the Sun taken with my Astronomical Quadrant, and Hadley's Sextants, the latitude of the Typa is 22° 9' 22" North, and that of Macao harbour by the town 22° 12' North.

The Typa is 3 miles South from the town, and it is one mile West of it.

78. ASTRONOMICAL OBSERVATIONS.

Observations at the Typa continued.

On the full and change days it was high water in the Typa at 5^h 15' apparent time, and at 5^h 50' in the harbour of Macao; the water rose 6 feet 1 inch perpendicular at greatest. The flood appeared to come from the south eastward, but that is a little uncertain, it being hard to determine, on account of a great number of islands and broken land in the mouth of the river Canton.

Lunar Observations taken on board the Discovery when at Anchor in the Typa.

A mean of the above results is = 106° 44' 29" E. for the longitude.

Meridian Observations for the Latitude.

21. Observed the meridian altitude of the Sun's L. L. above the horizon of the sea, the eye being elevated 9 feet.

6 1 8 latitude = 8° 39' 55" N. this is a mean of the results of 3 Sextants.

26. 27 12 latitude = 8° 40' 59" N. Note. 38" must be added to each zenith distance for the correction of the line of collimation.

The Dip of the North Pole of the Magnetic Needle was observed to be 2° 1' and its Variation 0° 14' West.

On the full and change days it was high water at 4^h 16' apparent time, from which time the water continued at a stand for 12 hours without any material alteration, viz. till 4^h in the morning, or 16^h hours apparent time, when it began to ebb, and at 22^h apparent time it was low water. The change from ebbing to flowing was very quick, or in less than 5 minutes. The water rose and fell 7 feet 4 inches perpendicular, every day the same while we lay there. The time of high water fell back every day about 50' or 55' minutes, or nearly at the usual rate.

W. B.

Observations at the Cape of Good Hope.

1780.
April 13

Went on shore with my instruments in order to get them conveyed to the Cape Town, but found the road so very rough and stony, that there was great danger of breaking some of them, especially the clock. Captain Gore had informed me that he intended to put to sea as soon as the ship's rudder was repaired, which I was informed would be in eight or ten days at most; whence I thought it most advisable to set up the instruments at False Bay.

8 — 14

In the morning set my astronomical clock a-going, with the same length of pendulum as when going at Greenwich; also set up the transit instrument, &c.

9 — 15.

One of the piles that supported the stand of the clock sunk in the sand, and the clock stopped; put it upright, and set it going again.

10 — 16.

Begun to observe equal altitudes as follow,

| Time of Noon per Clock uncorrect. | Half Inter- val of Obser- vations. | Time at Noon per Clock correct. | Clock slow for Sidereal Time. | Daily Rate of Clock. | No of Obs- servations | Phenomena and Remarks. | |

A mean of the above rates is 9",77 losing per day on mean time.

By taking the comparison of the 16th of April, and that of the 5th of May, the Watch lost 3' 1",18 in 19 days; or at the rate of 9",535 per day on mean time.

Set the minute hand of the clock forward 10 minutes.

ASTRONOMICAL OBSERVATIONS. 83

Observations at the Cape of Good Hope continued.

Observed Times of the Transits of the Sun, Moon, and Stars over the Meridian.

1780. In the morning set up a meridian mark half a mile distant from the instrument,
8 April 19. not being able to discover any well defined object on the distant hill at that time;
the instrument was adjusted to this mark till the 23d.

Phenomena and Remarks.

Emer. 1st Satellite of Jupiter at $13^{\text{h}} 42' 10''$ per clock, or $11^{\text{h}} 53' 6''$ appar. time.
This seemed certain to $5''$ or $6''$ the air being clear.

The telescope used was an achromatic one, made by Dollond, of 46 inches focus, magnifying 150 times.

When I examined the adjustment of the transit instrument, found it a little west of the meridian mark; I examined the post on which the mark was fixed, but did not perceive it to be moved or any ways disturbed, therefore concluded that the error lay in the instrument, and re-adjusted it to the mark as it then stood.

○ — 23. | 55 59— | 56 44 | 1 57 28 | 58 13½ | | ○ 1 L.
 | 58 55+ | 1 59 40+ | 0 25½ | | ○ 2 L.

By the above transit of the Sun I find the post that carries the meridian mark had been moved somewhat easterly, which being nearer the meridian I let it remain.

Observations at the Cape of Good Hope continued.

Observed Times of the Transits continued.

| | | | | | | Emersion of the first Satellite of Jupiter at 12 ^h 55' 37" per clock, or 10 ^h 12' 40" $\frac{1}{2}$ apparent time, used a Dollond's achromatic telescope of 46 inches focus, magnifying power 150 times. |
| | | | | | | In the morning packed up all my instruments, having received orders from Captain Gore to get every thing on board. |

Observations at the Cape of Good Hope continued:

Some Observations of an Eclipse of the Sun at False Bay.

| | |
|-----------------|---|
| 1780. May 1. | Examined the micrometer, and adjustments of the eye tubes. Measured the Sun's horizontal diameter as follow; |
| | Inches. Nonius. |
| | 4, 8½ + 8½ |
| | 9 8½ — 8½ = 31' 38" 15" |
| | I. 4, 8½ + 8, 73 = — the Sun's diamet. |
| | Inches. |
| | 4, 8½ + 8 |
| | 9½ 9½ 8½ — 8 9 |
| | I. 4, 8½ + 8, 72 = 31' 38" 14½ = Sun's diamet. |
| 4 — 4. | The above measures of the Sun's diameter were reduced to minutes and seconds, &c. by the table I had constructed when at Tongotaboo. |
| 4 — 4. | From the first to the fourth the weather was hazy and dull; the fourth in the morning the weather was fine and free from clouds; I got my telescope ready, and computed the part of the Sun's limb where the eclipse would begin, and the time by the clock nearly. |
| | At 11 o'clock the sky became overcast with thick clouds, which continued so until half past twelve, or noon, when the clouds began to clear away; at 3 ^h 52' 25" per clock, or 1 ^h 11' 15" apparent time, I saw the Sun through thin clouds with the finder of the telescope, and could perceive a small impression of black on its limb; by noting its increase, I suppose the eclipse began about 2' or 2' before I saw it. It was a considerable time before the clouds cleared away so as to enable me to make use of the micrometer. |

Measures with the Micrometer.

| Time per Clock. | Apparent Time | Distances of the Cusps in Parts of the Micrometer Scale. | Time per Clock. | Apparent Time. | Verified Sines of the unclipped Part, in Parts of the Micrometer Scale. |

| 6 23 34 | 3 44 6,2 | 3,2 $\frac{1}{2}$ | + 11 | | | | |

Clouds came over the Sun, which prevented my taking any more measures with the Micrometer. About 10 minutes before the end of the eclipse the Sun became free from clouds, and very clear. I observed the end at $6^h 45' 3''$ per Clock, or $4^h 5' 32''$, 6 apparent time.

Mr. Bligh, the Master, observed the end at $6^h 45'$ per Clock, or $4^h 5' 29''$, 6 apparent time.

Mr. Bligh used a 2 feet Gregorian Telescope made by Bird, magnifying power 90 times.

My Telescope was an Achromatic one made by Dollond of 46 inches focus, magnifying power 150 times. The time of the end seemed certain to 3 or 4 seconds.

From whence the long. of False Bay = $1^h 13' 23''$, or $18^{\circ} 20'$ E. by using Mason's new Tables of the Moon.

* * There being no corresponding observation made at Greenwich, the above long. may not be so accurate as that deduced from the observations of the transit of Venus. W. B.

A mean of all the above results is 18° 37' 19" East for the longitude.

On the full and change days it was high water in Simon's Bay, at 2^h 55' apparent time. The water rose and fell 5 feet 5 inches at greatest; and at neap tides it rose 4 feet and one inch. The day and night tides were nearly the same when unaffected by winds. W. B.

ASTRONOMICAL OBSERVATIONS

FOR DETERMINING

THE LATITUDE OF THE SHIP AND HER LONGITUDE,

BY A WATCH, N^o 1.

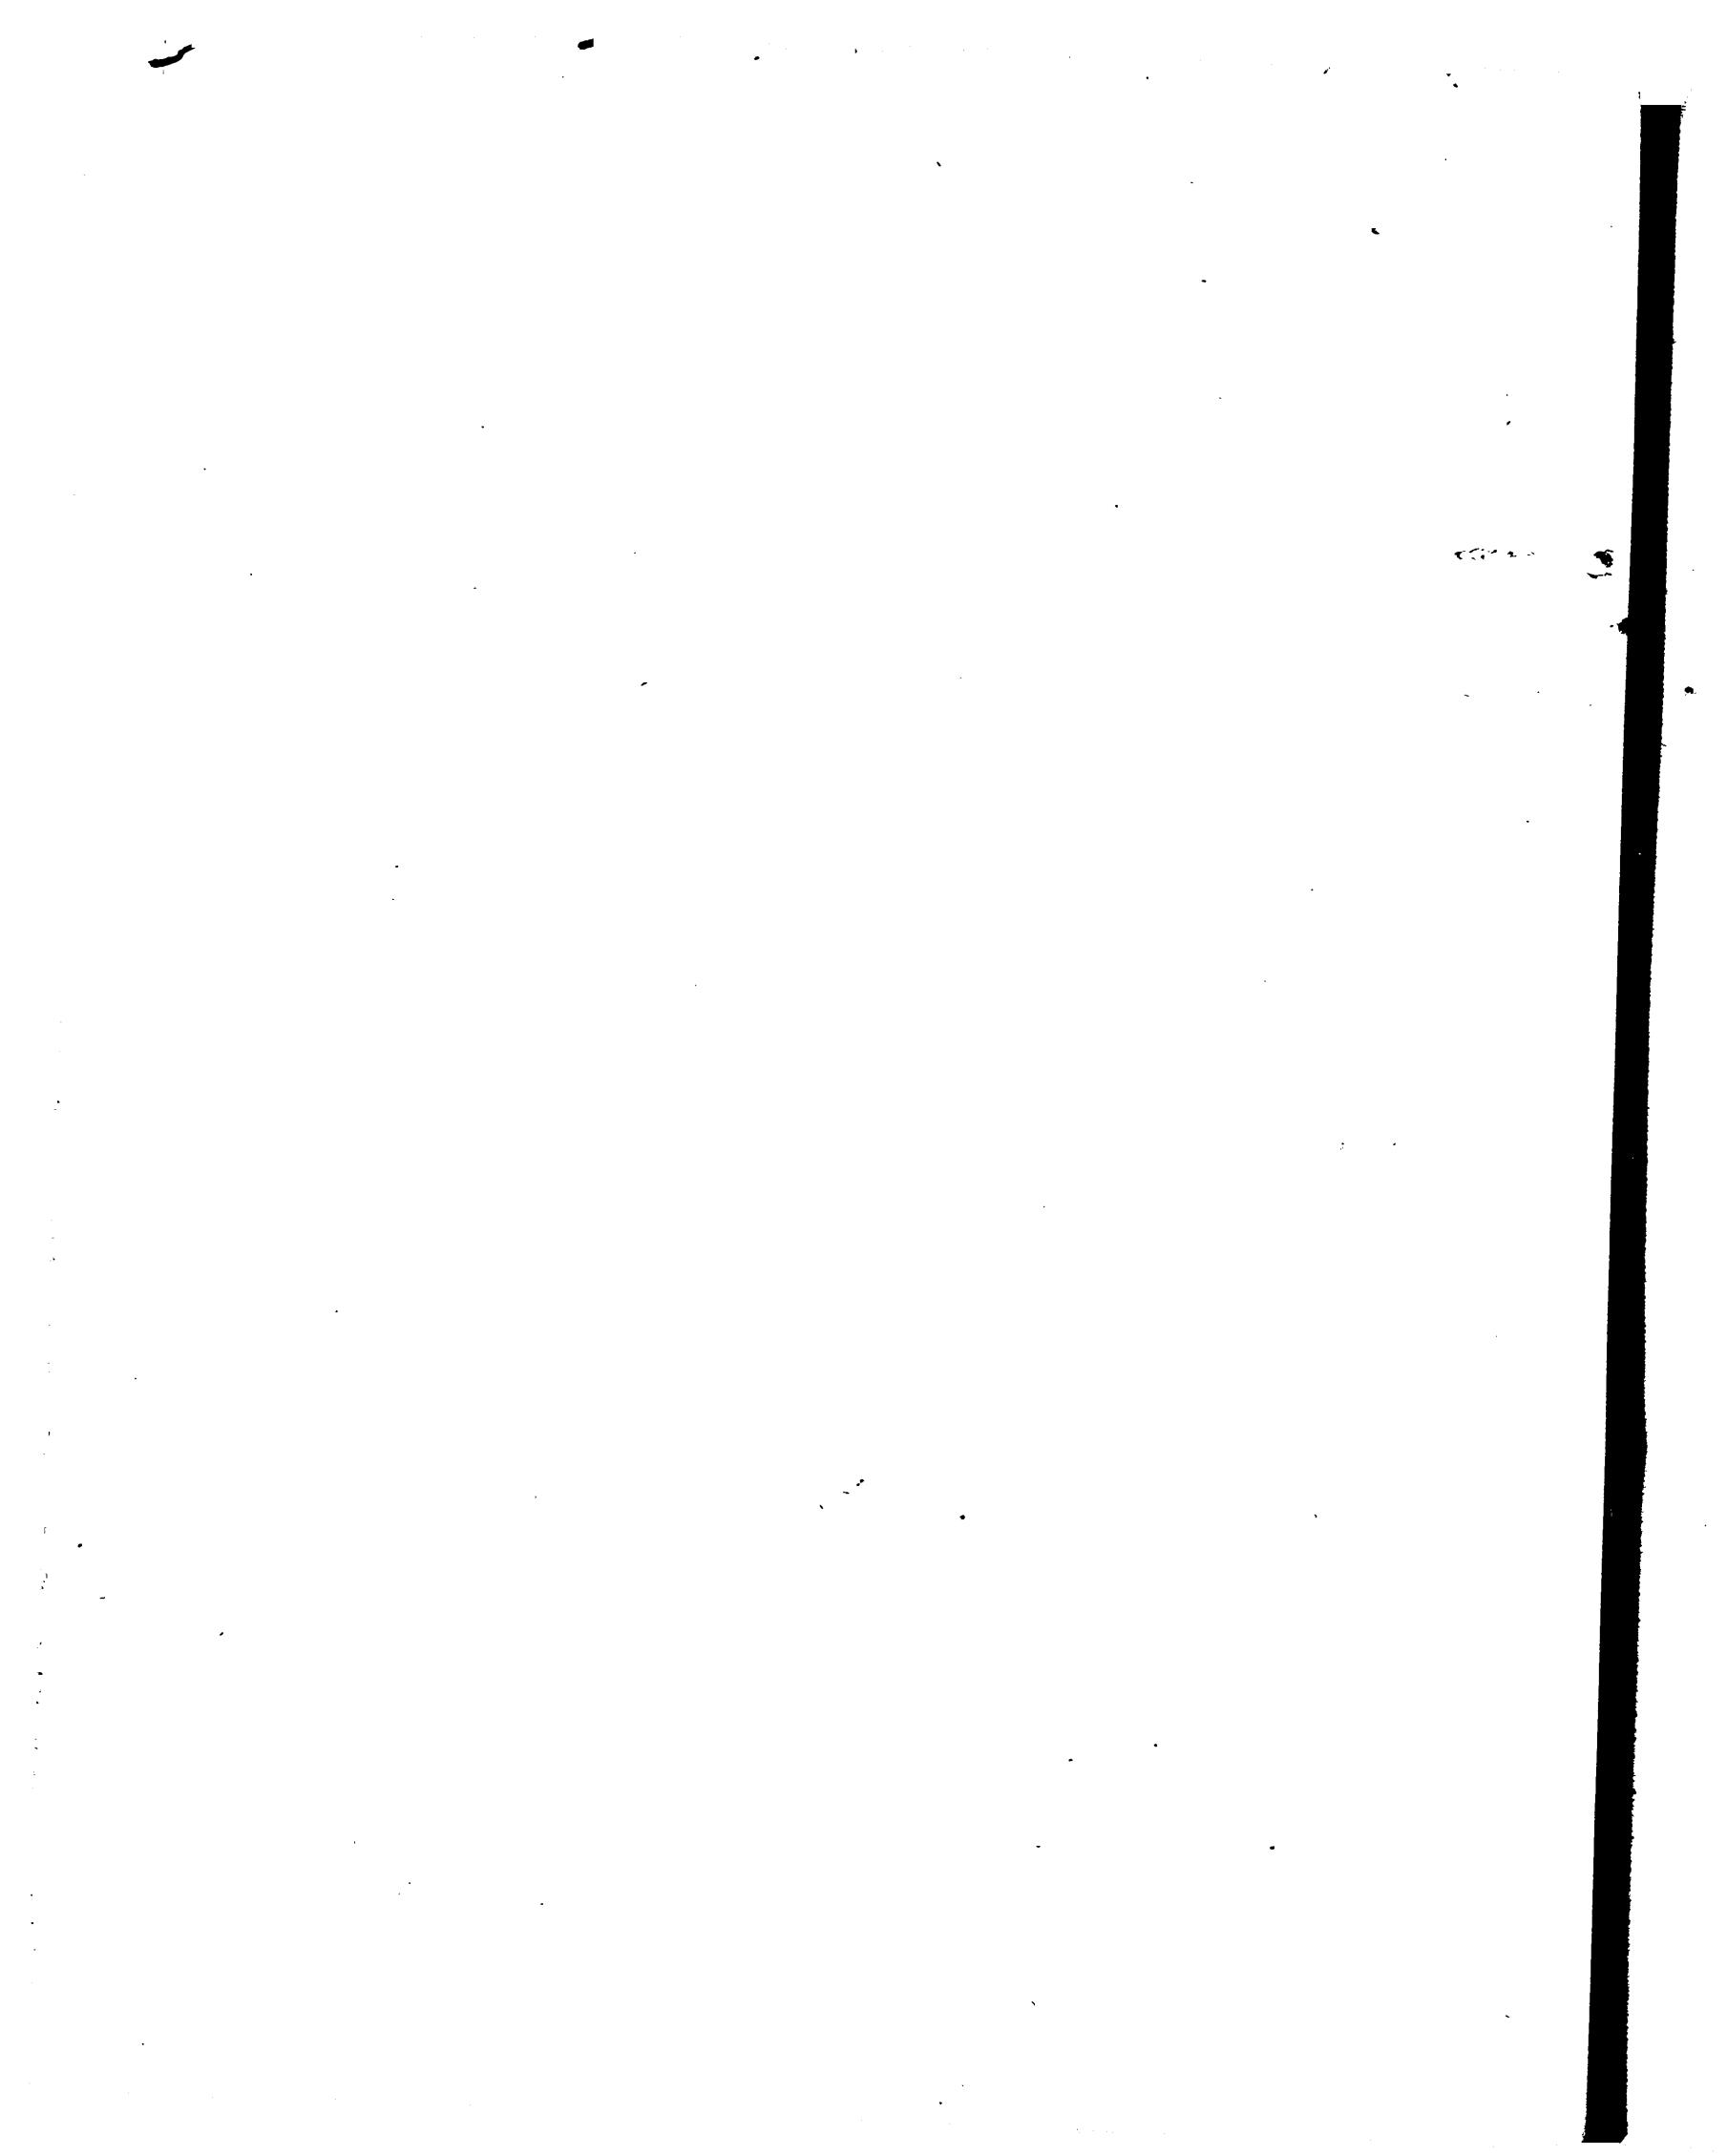

Made by Mr. KENDALL on Mr. HARRISON's Principles,

Made on Board His MAJESTY'S SLOOP RESOLUTION,

IN HER LATE VOYAGE ON DISCOVERIES,

IN THE YEARS 1776, 77, 78, 79, 80.

By CAPTAIN COOKE AND LIEUTENANT KING.

ASTRONOMICAL OBSERVATIONS, &c.

| Mr. King's Remarks. | | | | | | | | |
| <p>As he was observing the distance of Regulus from the Moon, both her limbs being bright and free from clouds, he perceived the limb a little darkened, and supposed it to be the beginning of an eclipse; and, on looking into the Ephemeris, found it to be so: it being too late to get a night telescope, and having the greater magnifying power of the Sextant telescope in use, continued to observe, keeping his eye on the part, and found that only the penumbra had entered: he observed the beginning at $2^h 48' 34''$ per Watch, or $= 12^h 34' 03''$ apparent time, from whence he has deducted the longitude $= 146^\circ 40\frac{1}{4}$ East. The end could not be observed for clouds. He thinks he could not be mistaken more than a minute.</p> | | | | | | | | |

| | 7 11 1 | 19 1 9 | 17 29,4 66 | 41 3 | 174 54 25 | 12 | | |
| By comparing the above longitude by the Watch N° 1. with a mean of the results of 122 sets of Lunar observations taken in Queen Charlotte's Sound, the Watch gave 35 $\frac{1}{4}$ miles too much, or East of the Lunar observations. | | | | | | | | |
| Mr. King computes the daily rate of the Time-keeper or Watch N° 1. while at Queen Charlotte's Sound, to be 2", 913 losing on mean time, and that it was slow for mean time 11 ^h 50' 37", 4 the 22d at noon; which numbers are used in determining the longitude by N° 1. as follow. | | | | | | | | |

| | 12 33 4 | 4 27 24 17 14, 7 59 49 33 | 232 50 48 | 4 | { At the entrance of King George's Sound. | | |

The above set was taken in the entrance of the Sound about 5 or 6 miles of longitude West of Ship Cove where the Observatories stood. Therefore the Watch No. 1. gave the longitude of the Observatory = 233° 56' E. but a mean of all Captain Cooke's lunar Observations taken there is = 233° 17' 30" E. or 38' $\frac{1}{2}$ W. of the longitude by the Watch. Captain Cooke deduced the mean rate of the Watch No. 1. (while at King George's Sound) to be losing 7", do per day on mean time; and to be 16^h 00' 58", 45 too slow for mean time on the 16th of April at noon.

These are the numbers used to deduce the longitude by No. 1. as follows:

In the column of Moon's Altitudes U indicates the upper limb was observed, L that of her lower limb.

In the column under observers, C. stands for Captain Cooke; K. for Lieutenant King, W. for Lieutenant Williamson; B. for Bligh, the Master; R. for Roberts, M. for Mackie, T. for Trevenen, Mo. for Monat, G. for Gilbert, V. for Vancouver, P. for Paul, and Ta. for Taylor, Midshipmen.

After the 14th of February 1779, C. stands for Captain Clerke.

Under Sextants, B. stands for Bird, D. for Dollond, R. for Ramsden; and the numbers 1, 2, 3, &c. for the different Sextants by the same makers.

AZIMUTHS OF THE SUN's CENTER,
TAKEN WITH DIFFERENT AZIMUTH COMPASSES,
TOGETHER WITH
THE ALTITUDES OF THE SUN's LOWER LIMB,
TAKEN AT THE SAME TIME WITH A HADLEY's SEXTANT,
FOR DETERMINING
THE VARIATION OF THE MAGNETIC NEEDLE.
By CAPTAIN COOKE AND OFFICERS,
On Board His MAJESTY's SLOOP RESOLUTION,
DURING HIS LAST VOYAGE
IN THE YEARS 1776, 77, 78, 79, 80.

DIPS OF THE MAGNETIC NEEDLE,

WITH THE

LATITUDE AND LONGITUDE

OF THE

PLACE OF OBSERVATION.

OBSERVED BY

CAPTAIN COOKE AND LIEUTENANT KING,

On Board His MAJESTY'S SLOOP RESOLUTION,

DURING HER LATE VOYAGE

IN THE YEARS 1776, 77, 78, 79, 80.

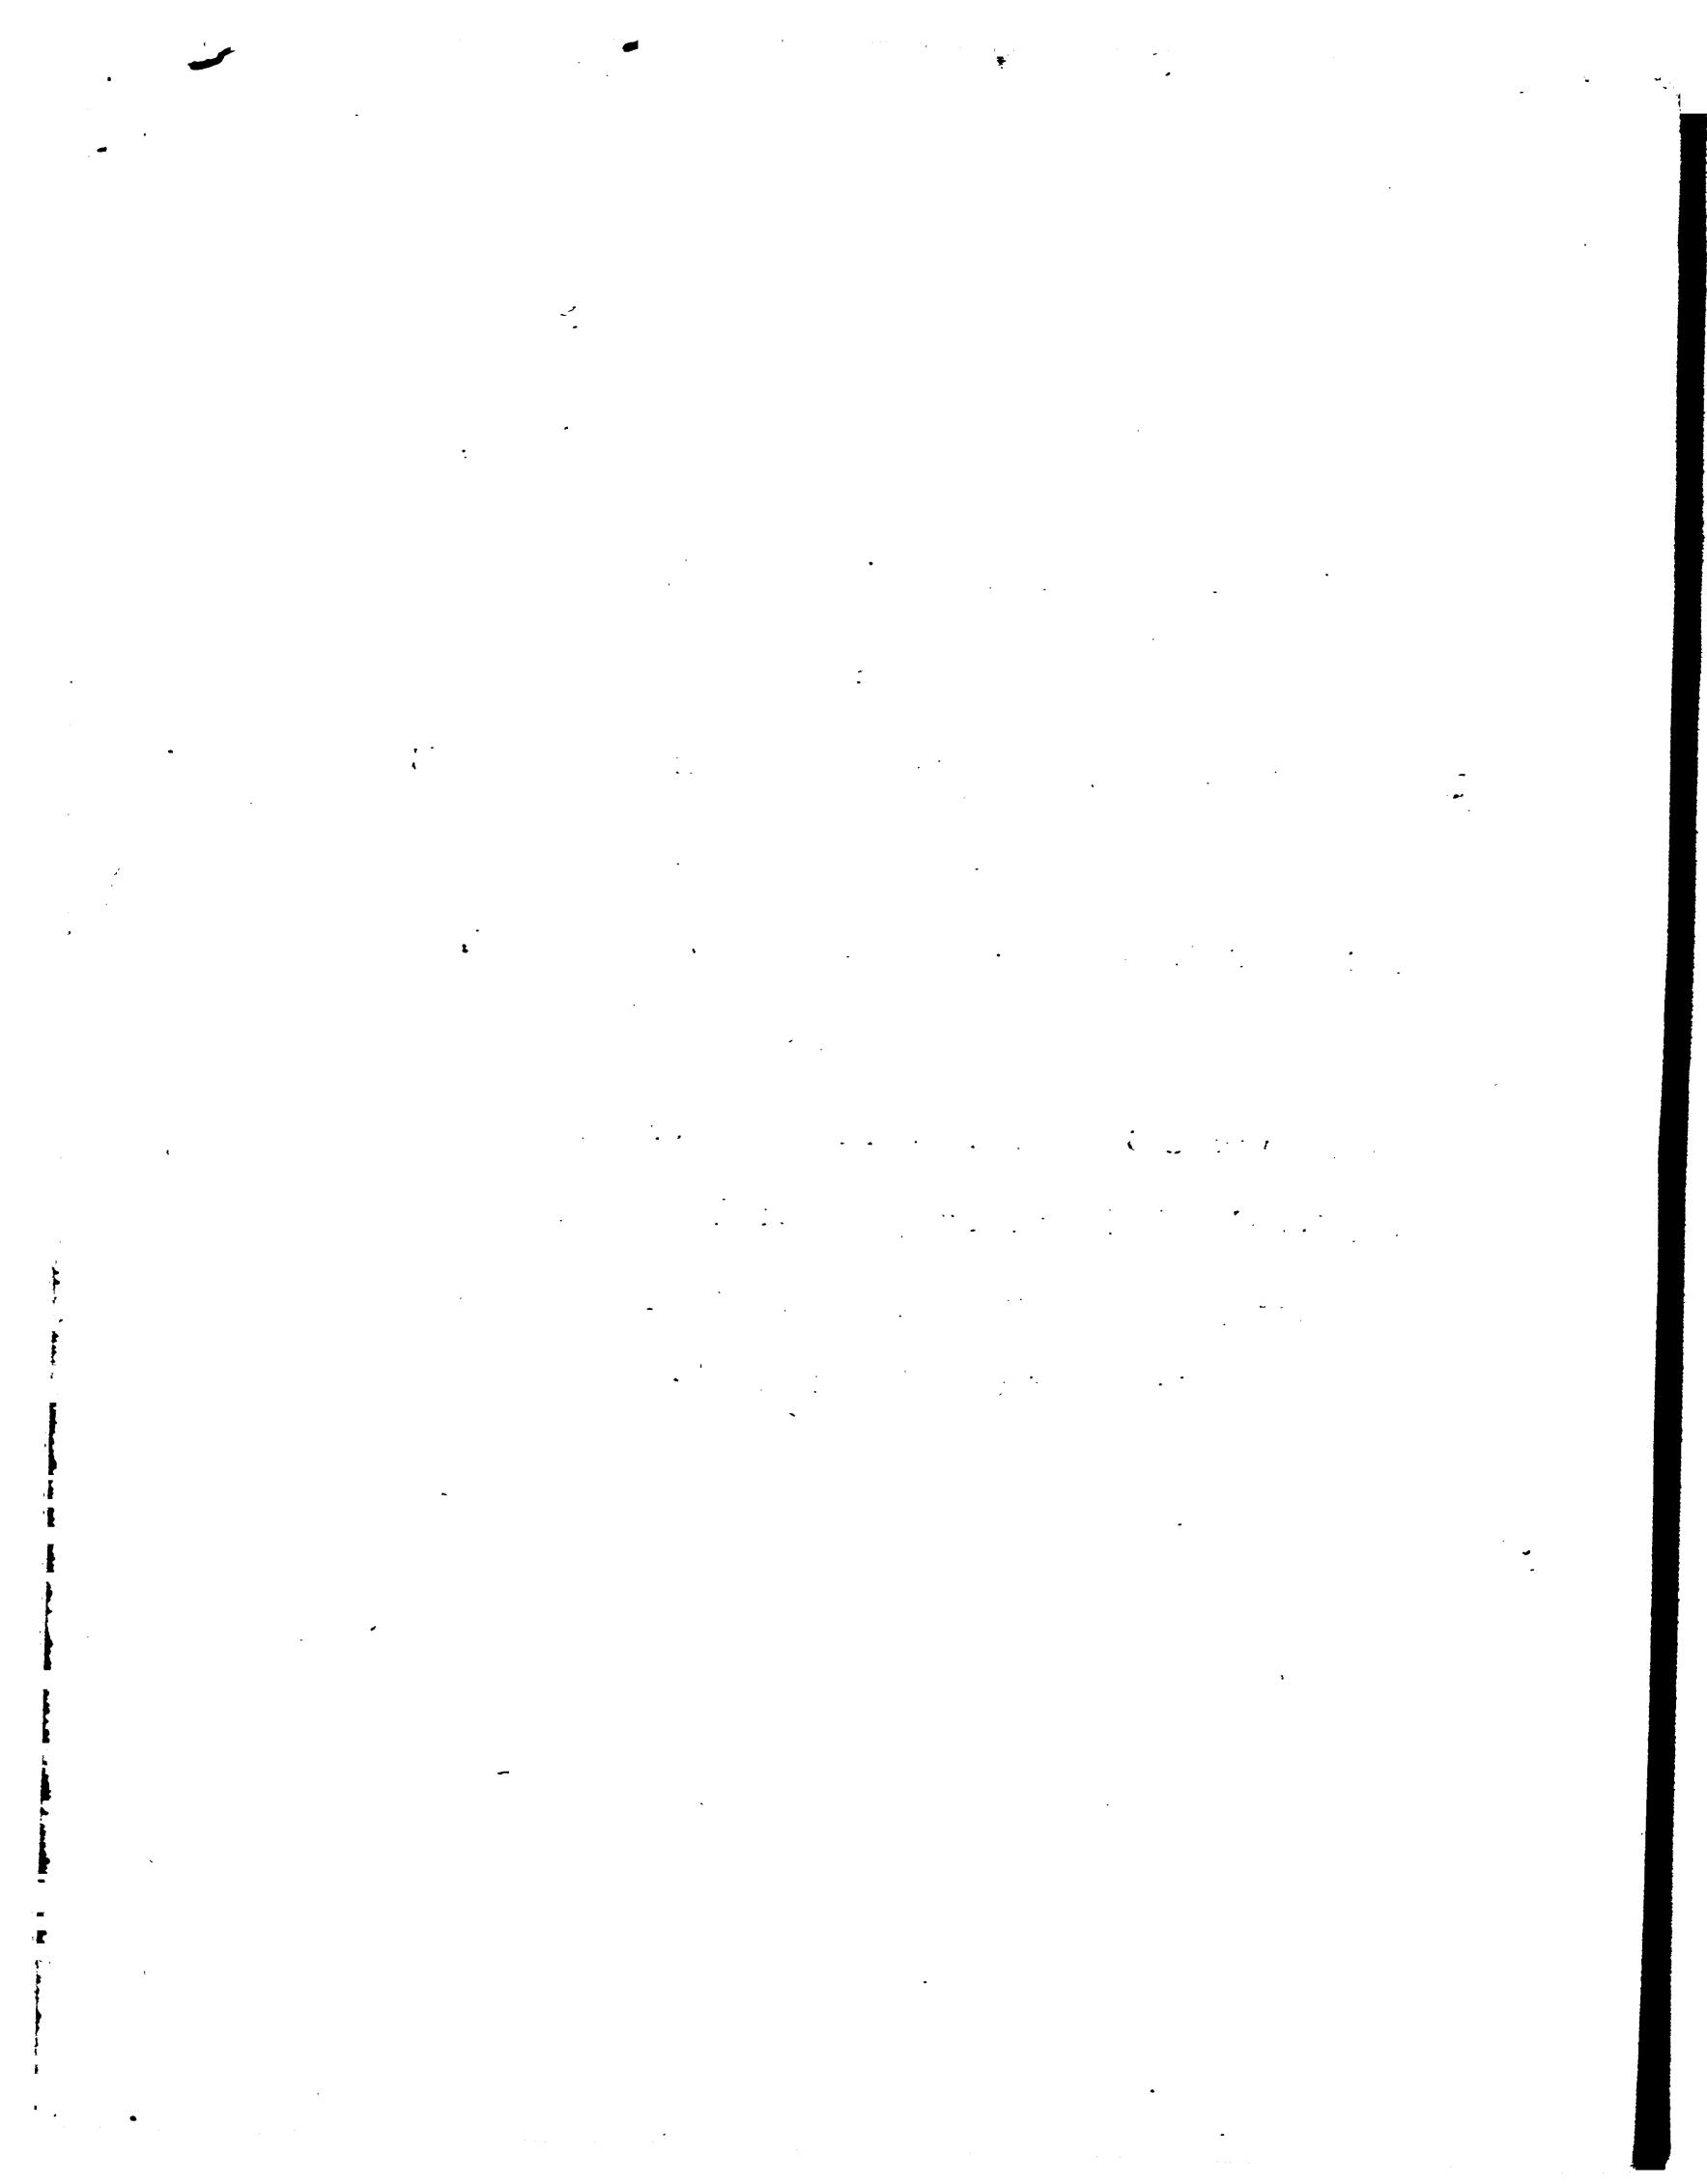

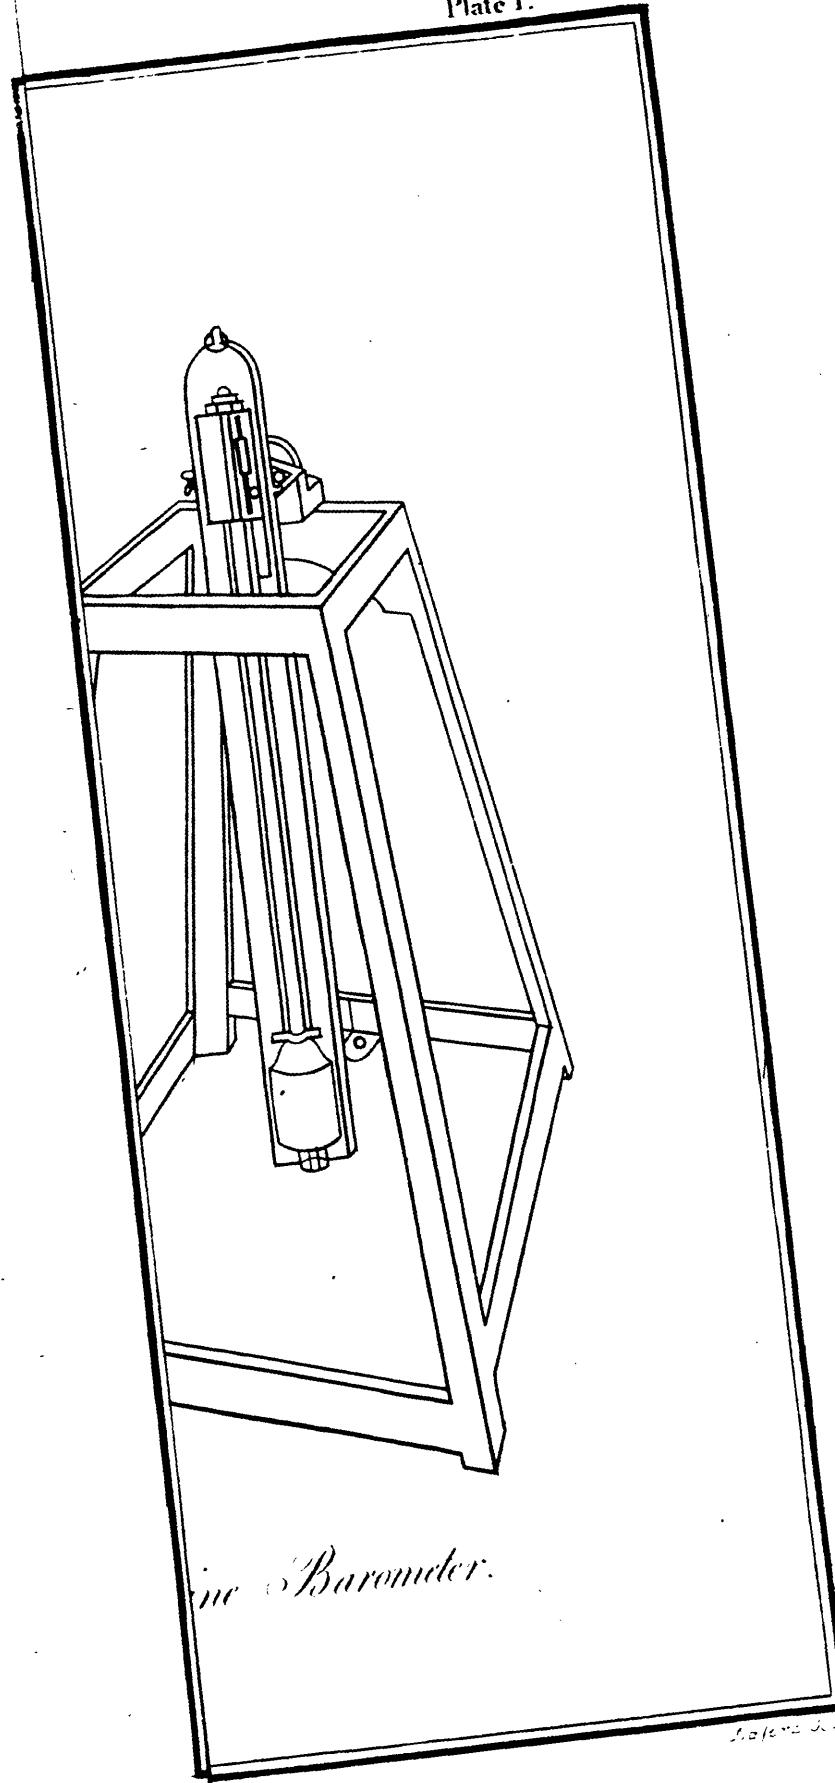

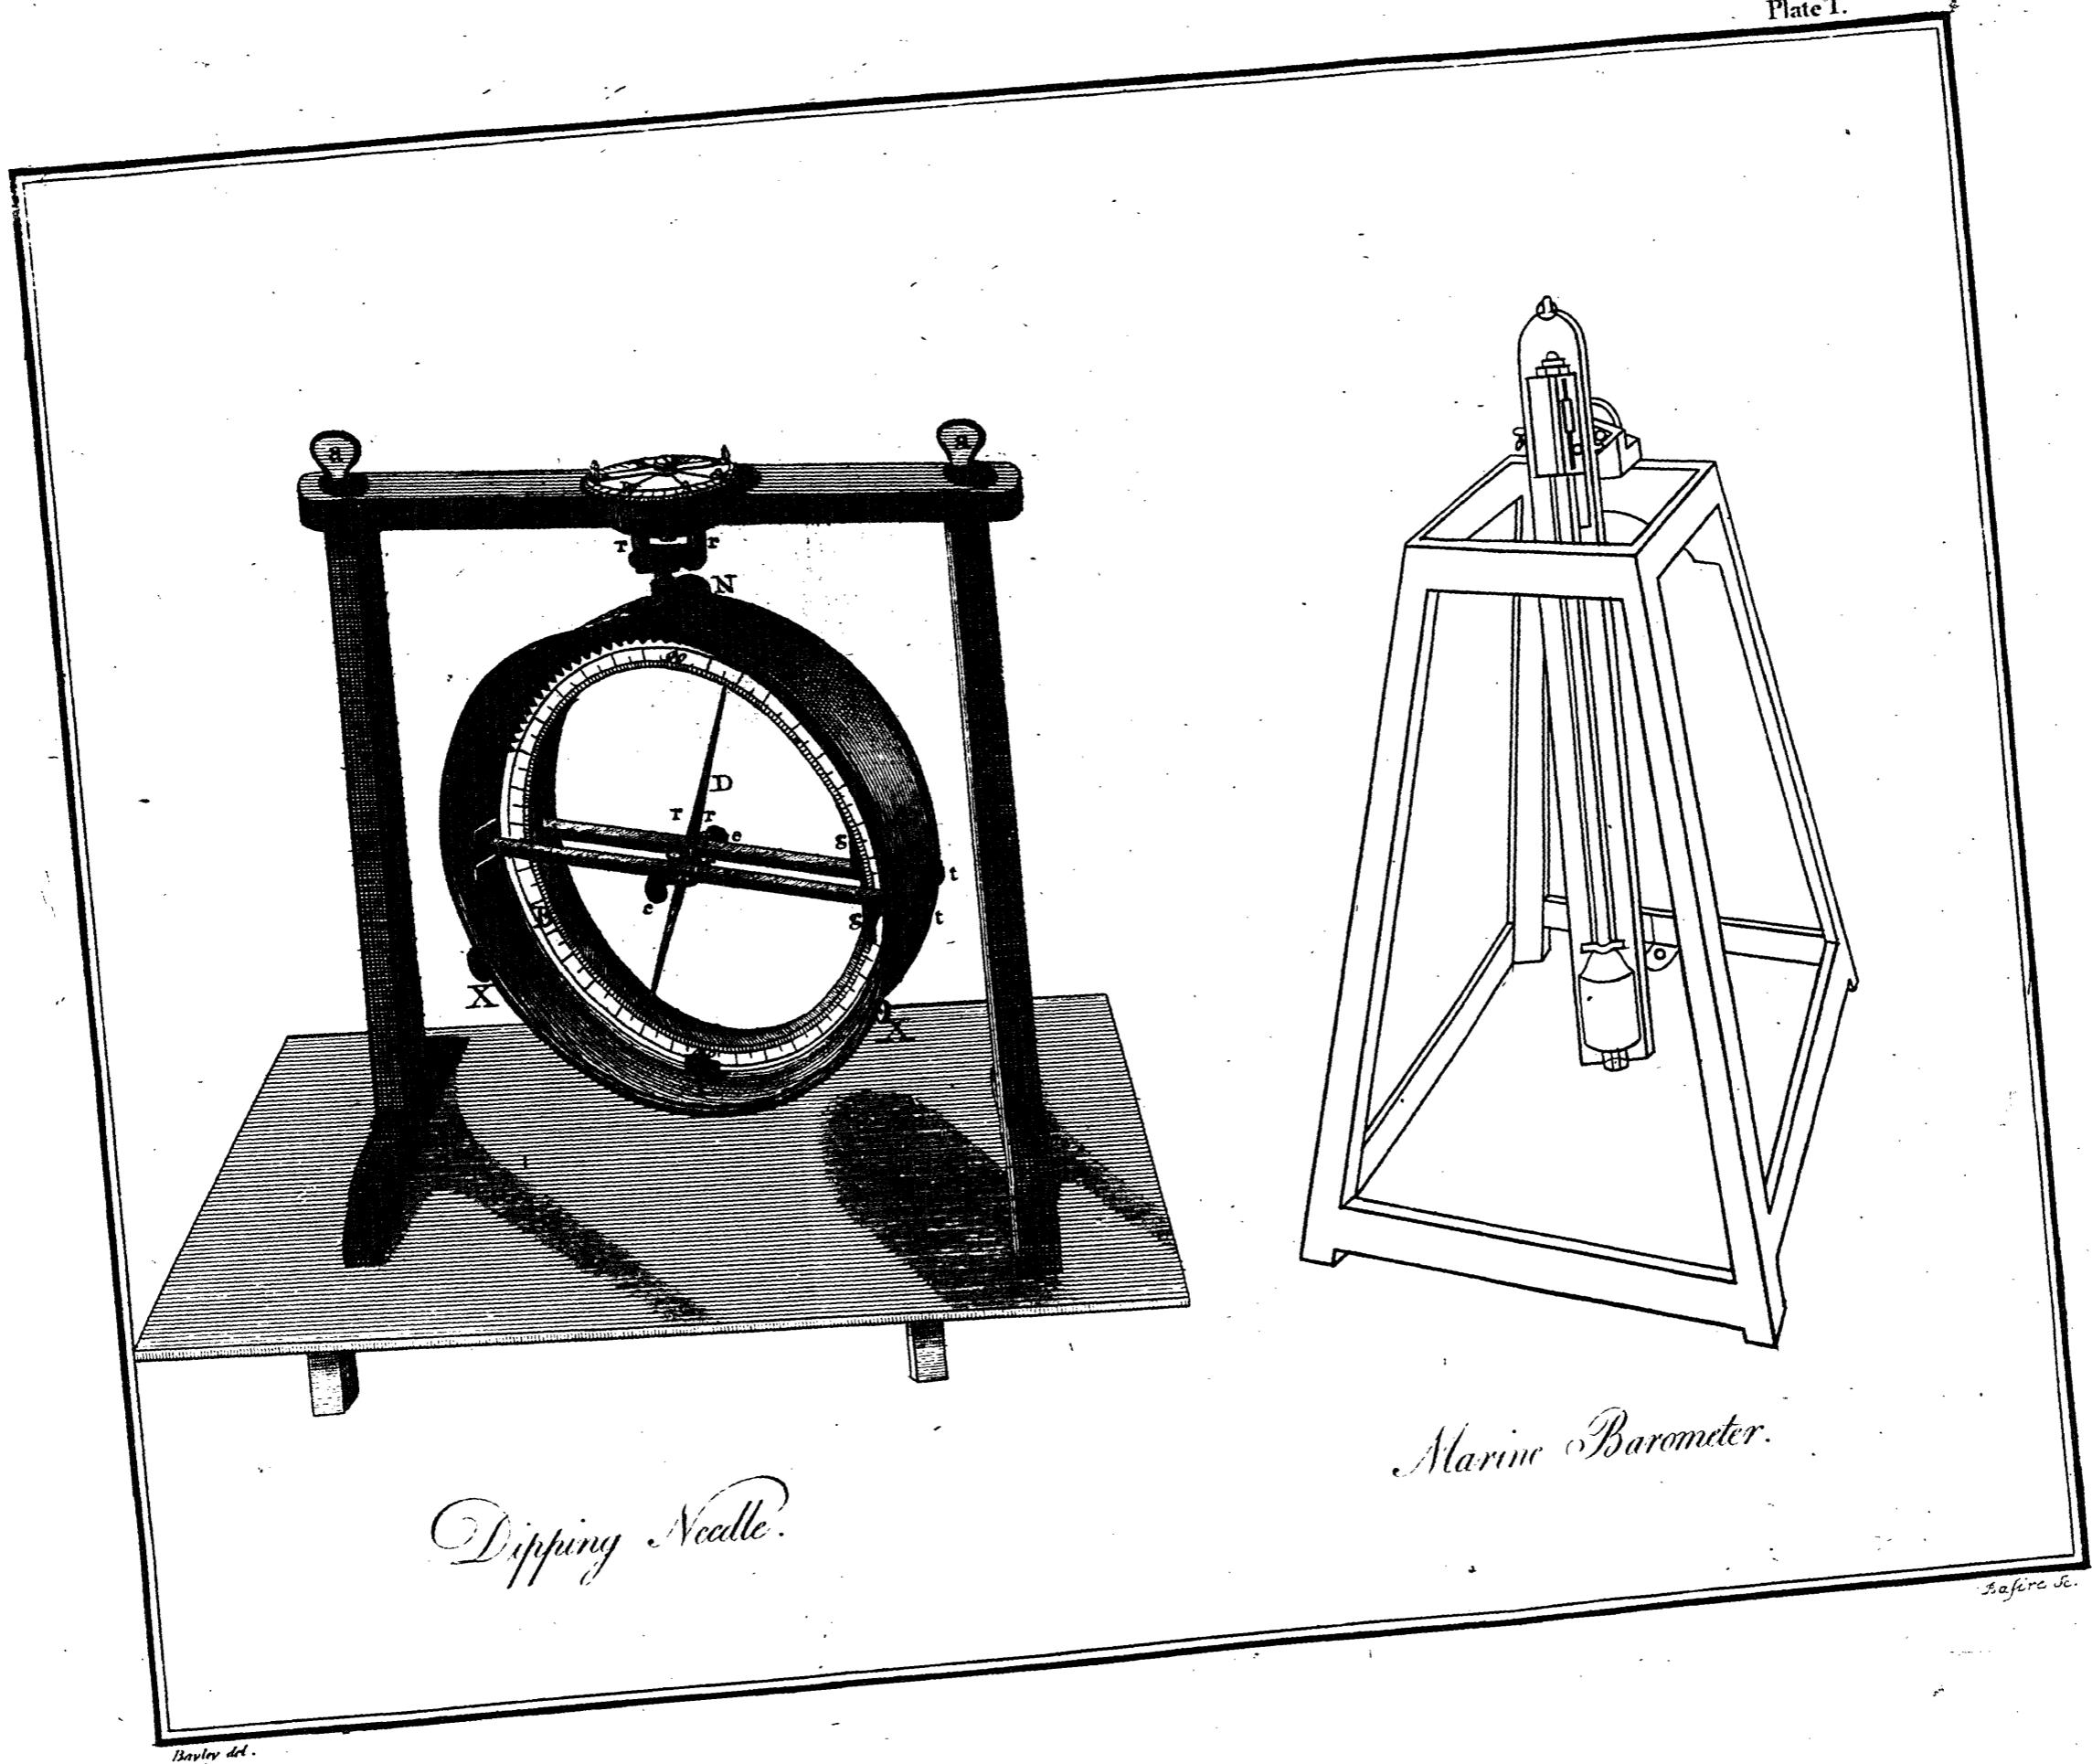

Plate I.

the Barometer.

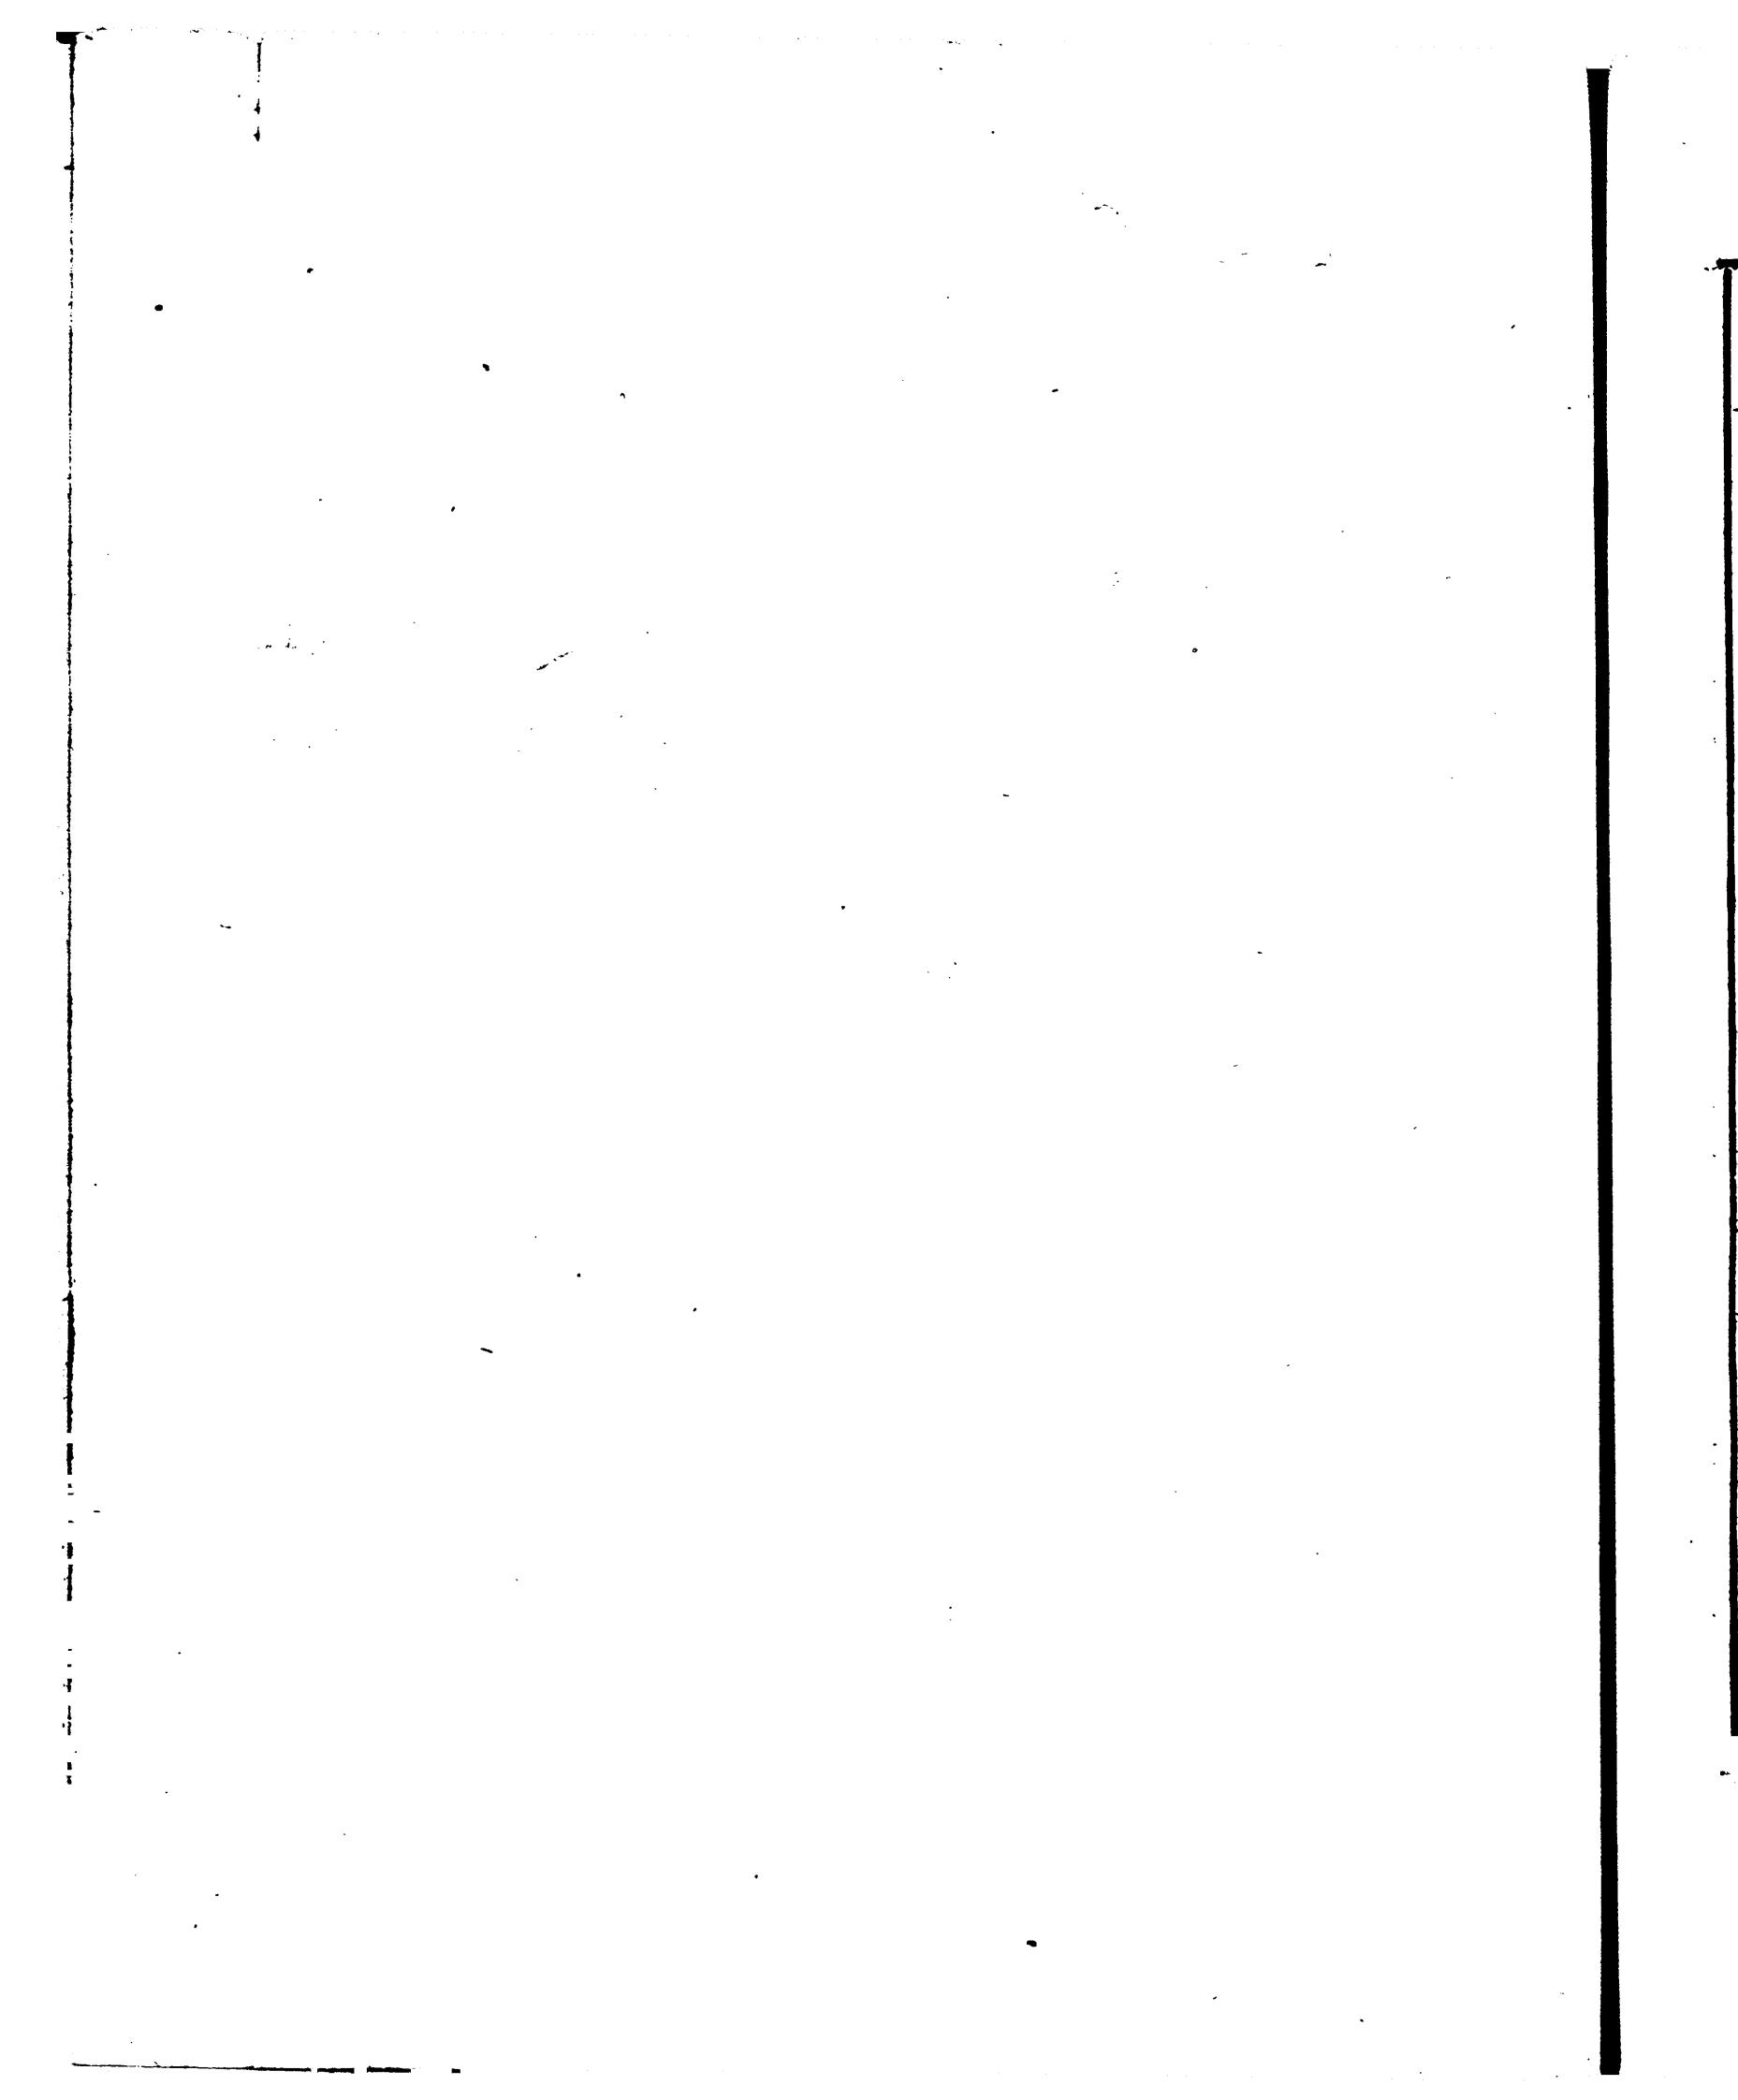

Dipping Needle.

Marine Barometer.

Bentley del.

Basire Sc.

ON BOARD THE RESOLUTION. 217

| 1776. | Face of the Instrument. | | Mean Dip. | True Dips. | | Latitude in. | Longitude in. | Remarks. |
|-----------|---|-------|-----------|------------|-------|-----------------|------------------|--|
| | East. | West. | | A. | A. | | | |

DIRECTIONS for balancing the MAGNETIC NEEDLE,
By the Honourable HENRY CAVENDISH, F.R.S.

THE method of balancing the needle, after it is magnetical, depends on the following circumstances, namely,

First, That increasing the distance of the uppermost side screw from the center increases the dip, and that increasing the distance of the uppermost end screw has the contrary effect.

Secondly, That the needles ought to be balanced in such a manner that the dip should be as great with one side screw uppermost as the other, and also the one end screw uppermost as the other.

Thirdly, That the side screw which is uppermost when the face is turned to the west, is lowest when it is turned to the east.

If the needle is laid horizontal with the cross uppermost, and the marked end pointing to the north, I call that side screw which points towards the west No 2. and that which points to the east o; I also call that end screw, which is toward the marked end of the needle, the screw No 3. and the opposite screw No 1.; this being premised, the method will appear best by an example.

N.B. The screws or buttons are marked one dot (.) two dots (..) three dots (...) and a pointer to each to tell the number of the revolutions.

Suppose that with the marked end of the needle to the north, and the face {east} and consequently with No 2. {uppermost 71 10} {lowest 72 20} the dip.

I then change the poles, and find that with the marked end to the south or uppermost, and the face {west} and consequently with No 2. {uppermost 72 50} {lowest 72 40} the dip.

By comparing the mean of the first and third observations with the mean of the second and fourth, it appears that the dip is 1° 10' less when No 2. is uppermost, than when it is lowest, or the dip is 35' too small when No 2. is uppermost.

In like manner by comparing the mean of the first and second with the mean of the third and fourth, it appears that the dip is $1^{\circ} 20'$ too great with the screw N° 3. uppermost.

In order to find how much the screws should be altered, I find how much the dip is altered by moving one of the side screws a number of revolutions, and also how much it is altered by moving one of the end screws; for example, I move N° 2. three revolutions further from the center, the face still continuing west, and find the dip 72° , so that as the dip before that alteration was $73^{\circ} 40'$, altering N° 2. three revolutions, alters the dip $100'$. I then restore that screw to its former position, and move the screw N° 3. seven revolutions further from the center, and find the dip $72^{\circ} 10'$.

So that altering the screw N° 3. seven revolutions alters the dip $90'$. I then restore that screw also to its first position, it is indifferent which of the two screws N° 2 or 0, or of the two screws N° 3. or N° 1. you move, but it is best moving them in such manner as to make the dip approach nearer to the true dip, rather than the contrary way; hence, as it was found that the dip was $35'$ too small when N° 2. was uppermost, it follows that N° 2. must be moved $3 \times \frac{35}{700}$ or $1 \frac{1}{20}$ of a revolution further from the center; and for the like reason the screw N° 3. must be moved $7 \times \frac{35}{700}$ or $6 \frac{1}{2}$ revolutions further from the center.—So far Mr. Cavendish.

The NEEDLE may be readily balanced as follows:

TAKE all the magnetism out of it, or so far that it may not affect a fine sewing needle, which may be done by a few trials.

Place two of the cross wires, which carry the adjusting balls, in the direction of the needle, and the other two will be at right angles thereto; place the needle in an horizontal position, and balance it there by means of the two balls on the wires that are in the same direction with it; place the needle in a vertical position, and adjust it there by means of the balls on the wires that are at right angles to it—the needle being well balanced in these two positions, will rest in any other—give it magnetism, and it will be fit for use.

W. B A Y L Y.

The Method of correcting the observed Dip when the Poles are not changed.

By the Hon. HENRY CAVENDISH, F.R.S.

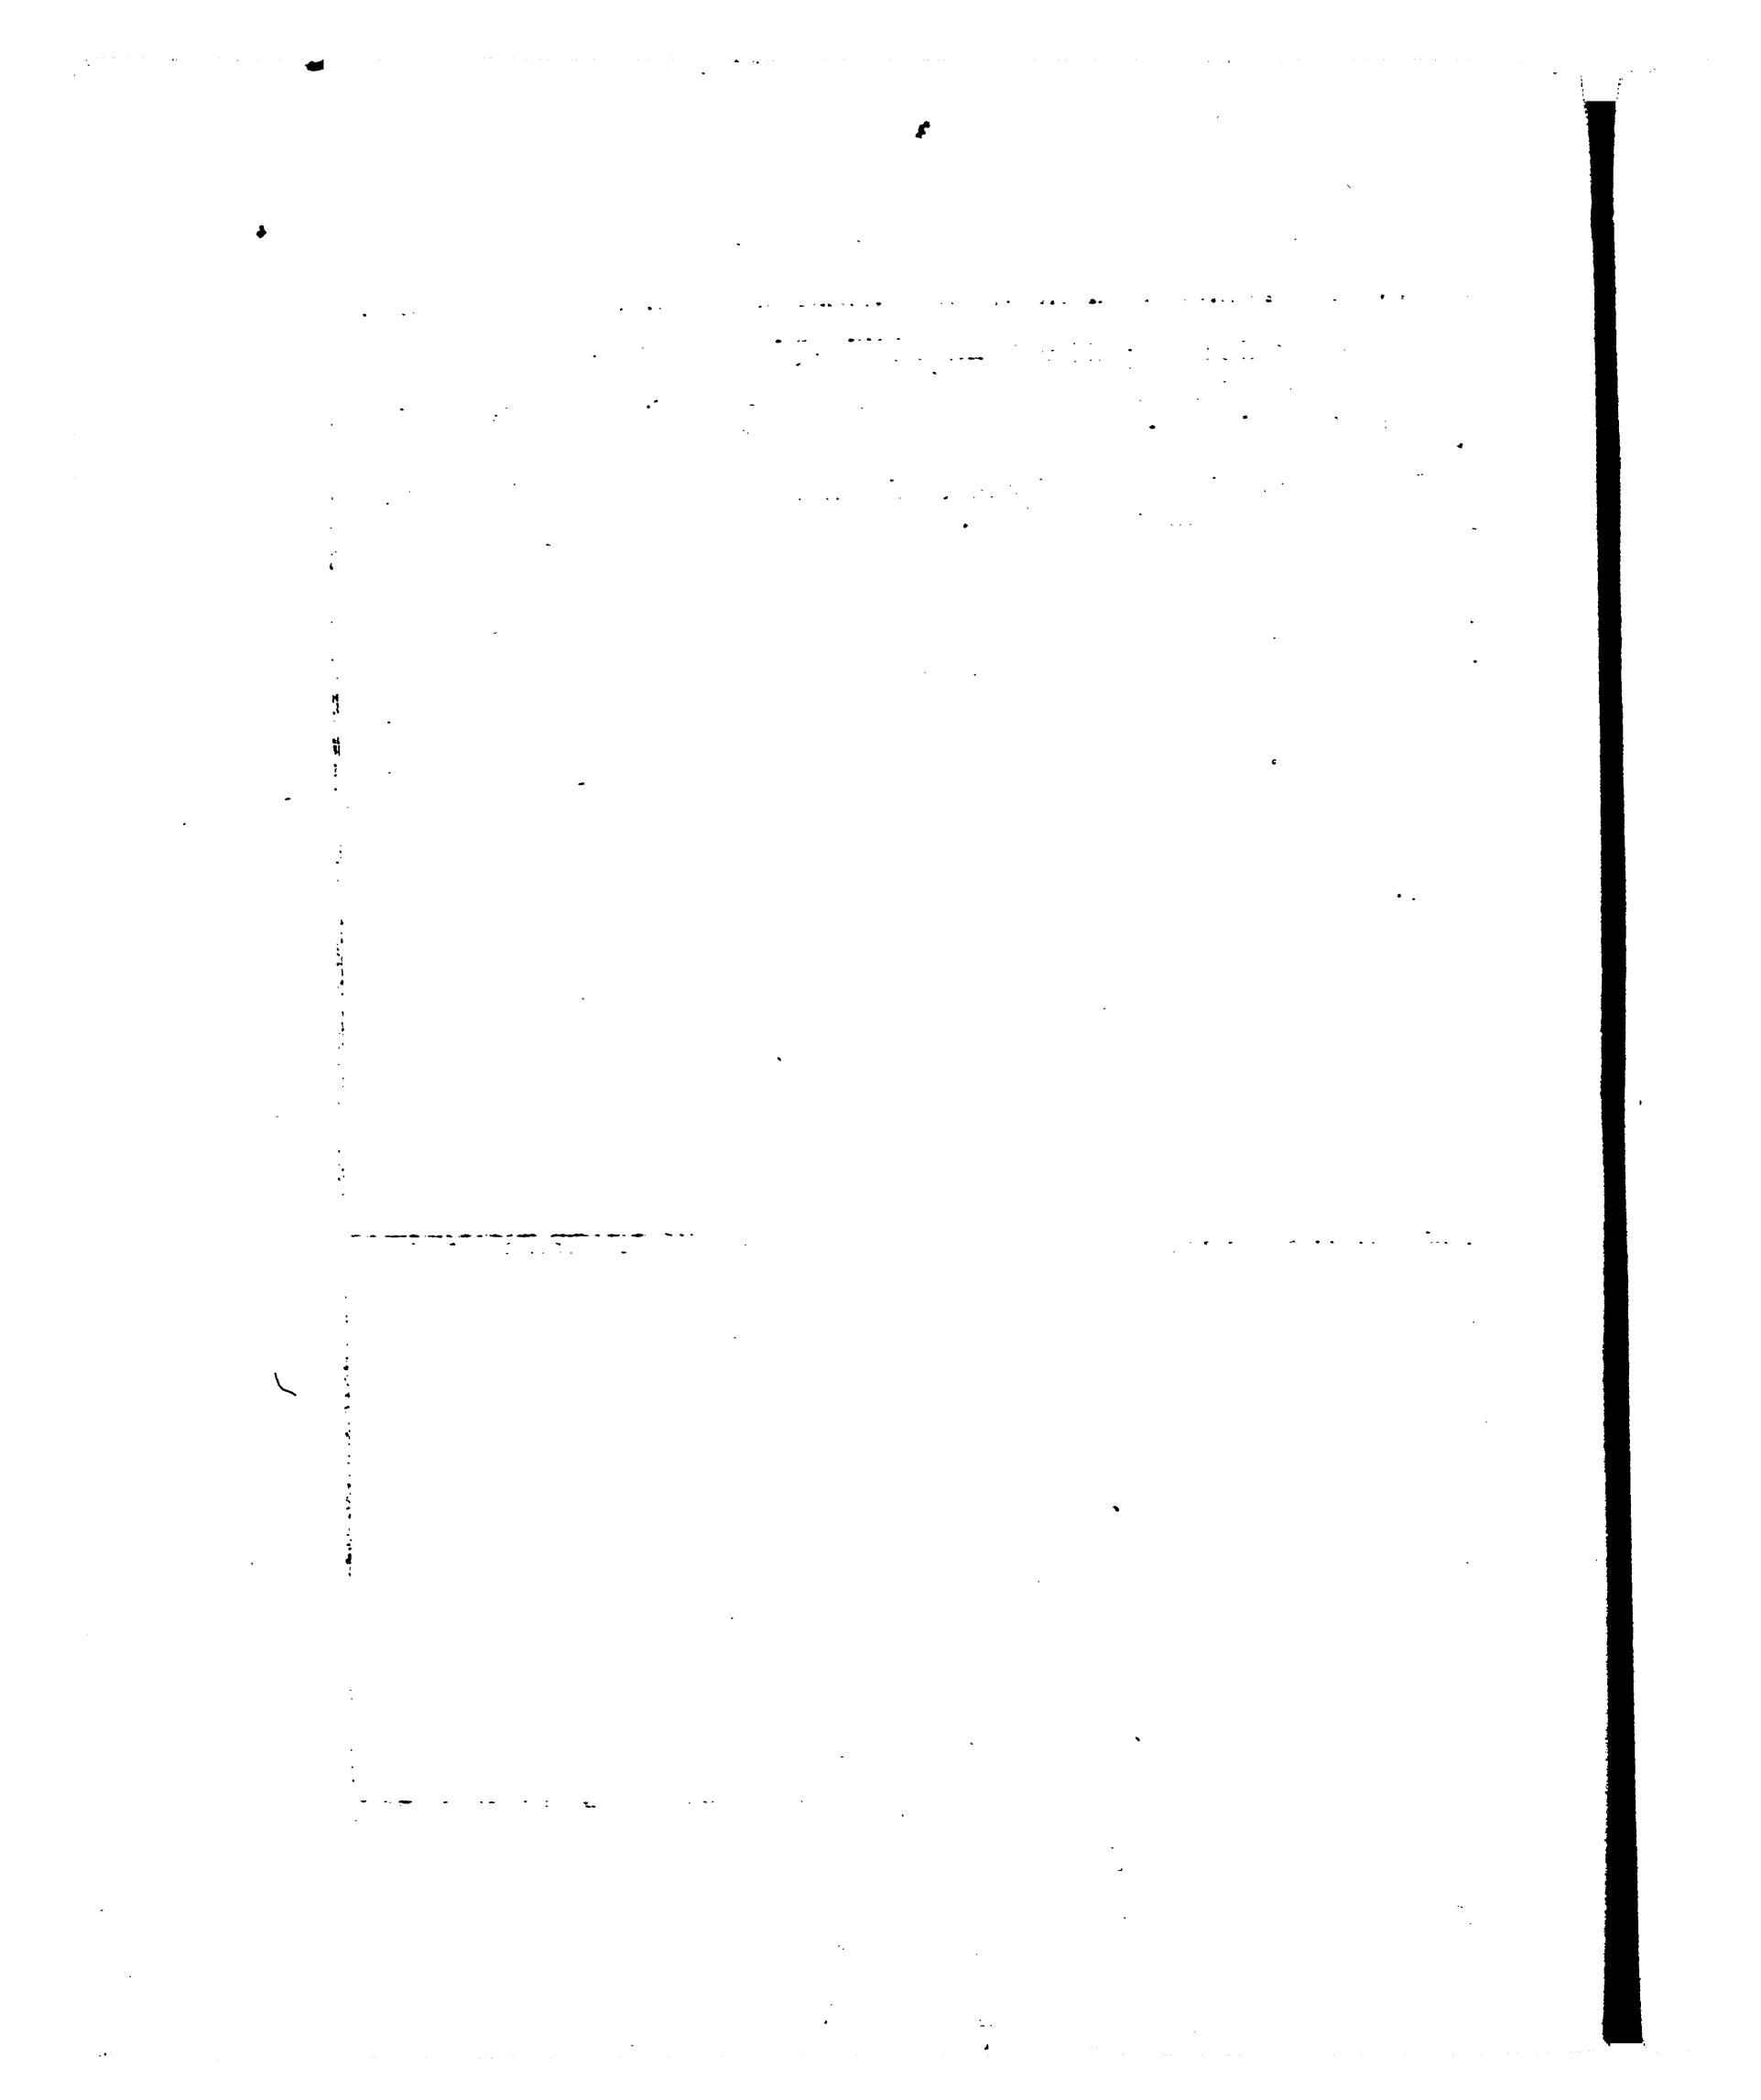

WHEN the poles are changed, and the dip observed with each face to the east, the mean of all four observations is the true dip. The mean of the two observations with the marked end of the needle pointing to the north, I call the mean dip with the mark to the north.

I imagine now that the excess or defect of the mean dip with the mark to the north, above that with the other end to the north, will be nearly in proportion to the co-sine of the dip.

Suppose therefore that you find on reversing the poles at any time, that the mean dip with the mark to the north exceeds that with the other end to the north by $40'$, the true dip being 72° ; according to this experiment it should seem that the mean dip with the mark to the north exceeds that with the other end to the north by $130'$, multiplied by the co-sine of the dip; for $40'$ equals $130'$ into the co-sine of 72° . Suppose also, that the next time you change the poles, you find that the excess of the mean dip with the mark to the north above that with the end unmarked to the north is $2^{\circ} 19'$, the true dip being 5° . By this observation the mean dip with the marked end to the north exceeds that with the unmarked by $150' \times$ the co-sine of the dip. By the mean of both observations it is $140'$ into the co-sine of the dip. Therefore in all the observations made between these two times I would correct the mean dip according to this supposition; for example, if at any place you find the mean dip with the mark to the

north to be 60° , the true dip will be $60^\circ - \frac{14^\circ}{2} \times \text{cos. } 60^\circ$, or $59^\circ 25'$; or if you find the mean dip with the unmarked end to the north to be 60° , the true dip will be $60^\circ + \frac{14^\circ}{2} \times \text{cos. } 60^\circ$ or $60^\circ 35'$.

N.B. If you should have omitted to correct the mean dips in this manner while you are at sea, it may be done when you come home.

ASTRONOMICAL OBSERVATIONS

FOR DETERMINING

THE LATITUDE OF THE SHIP AND HER LONGITUDE,

BY A WATCH, N^o 2.

The Third made by Mr. KENDALL for the BOARD OF LONGITUDE,

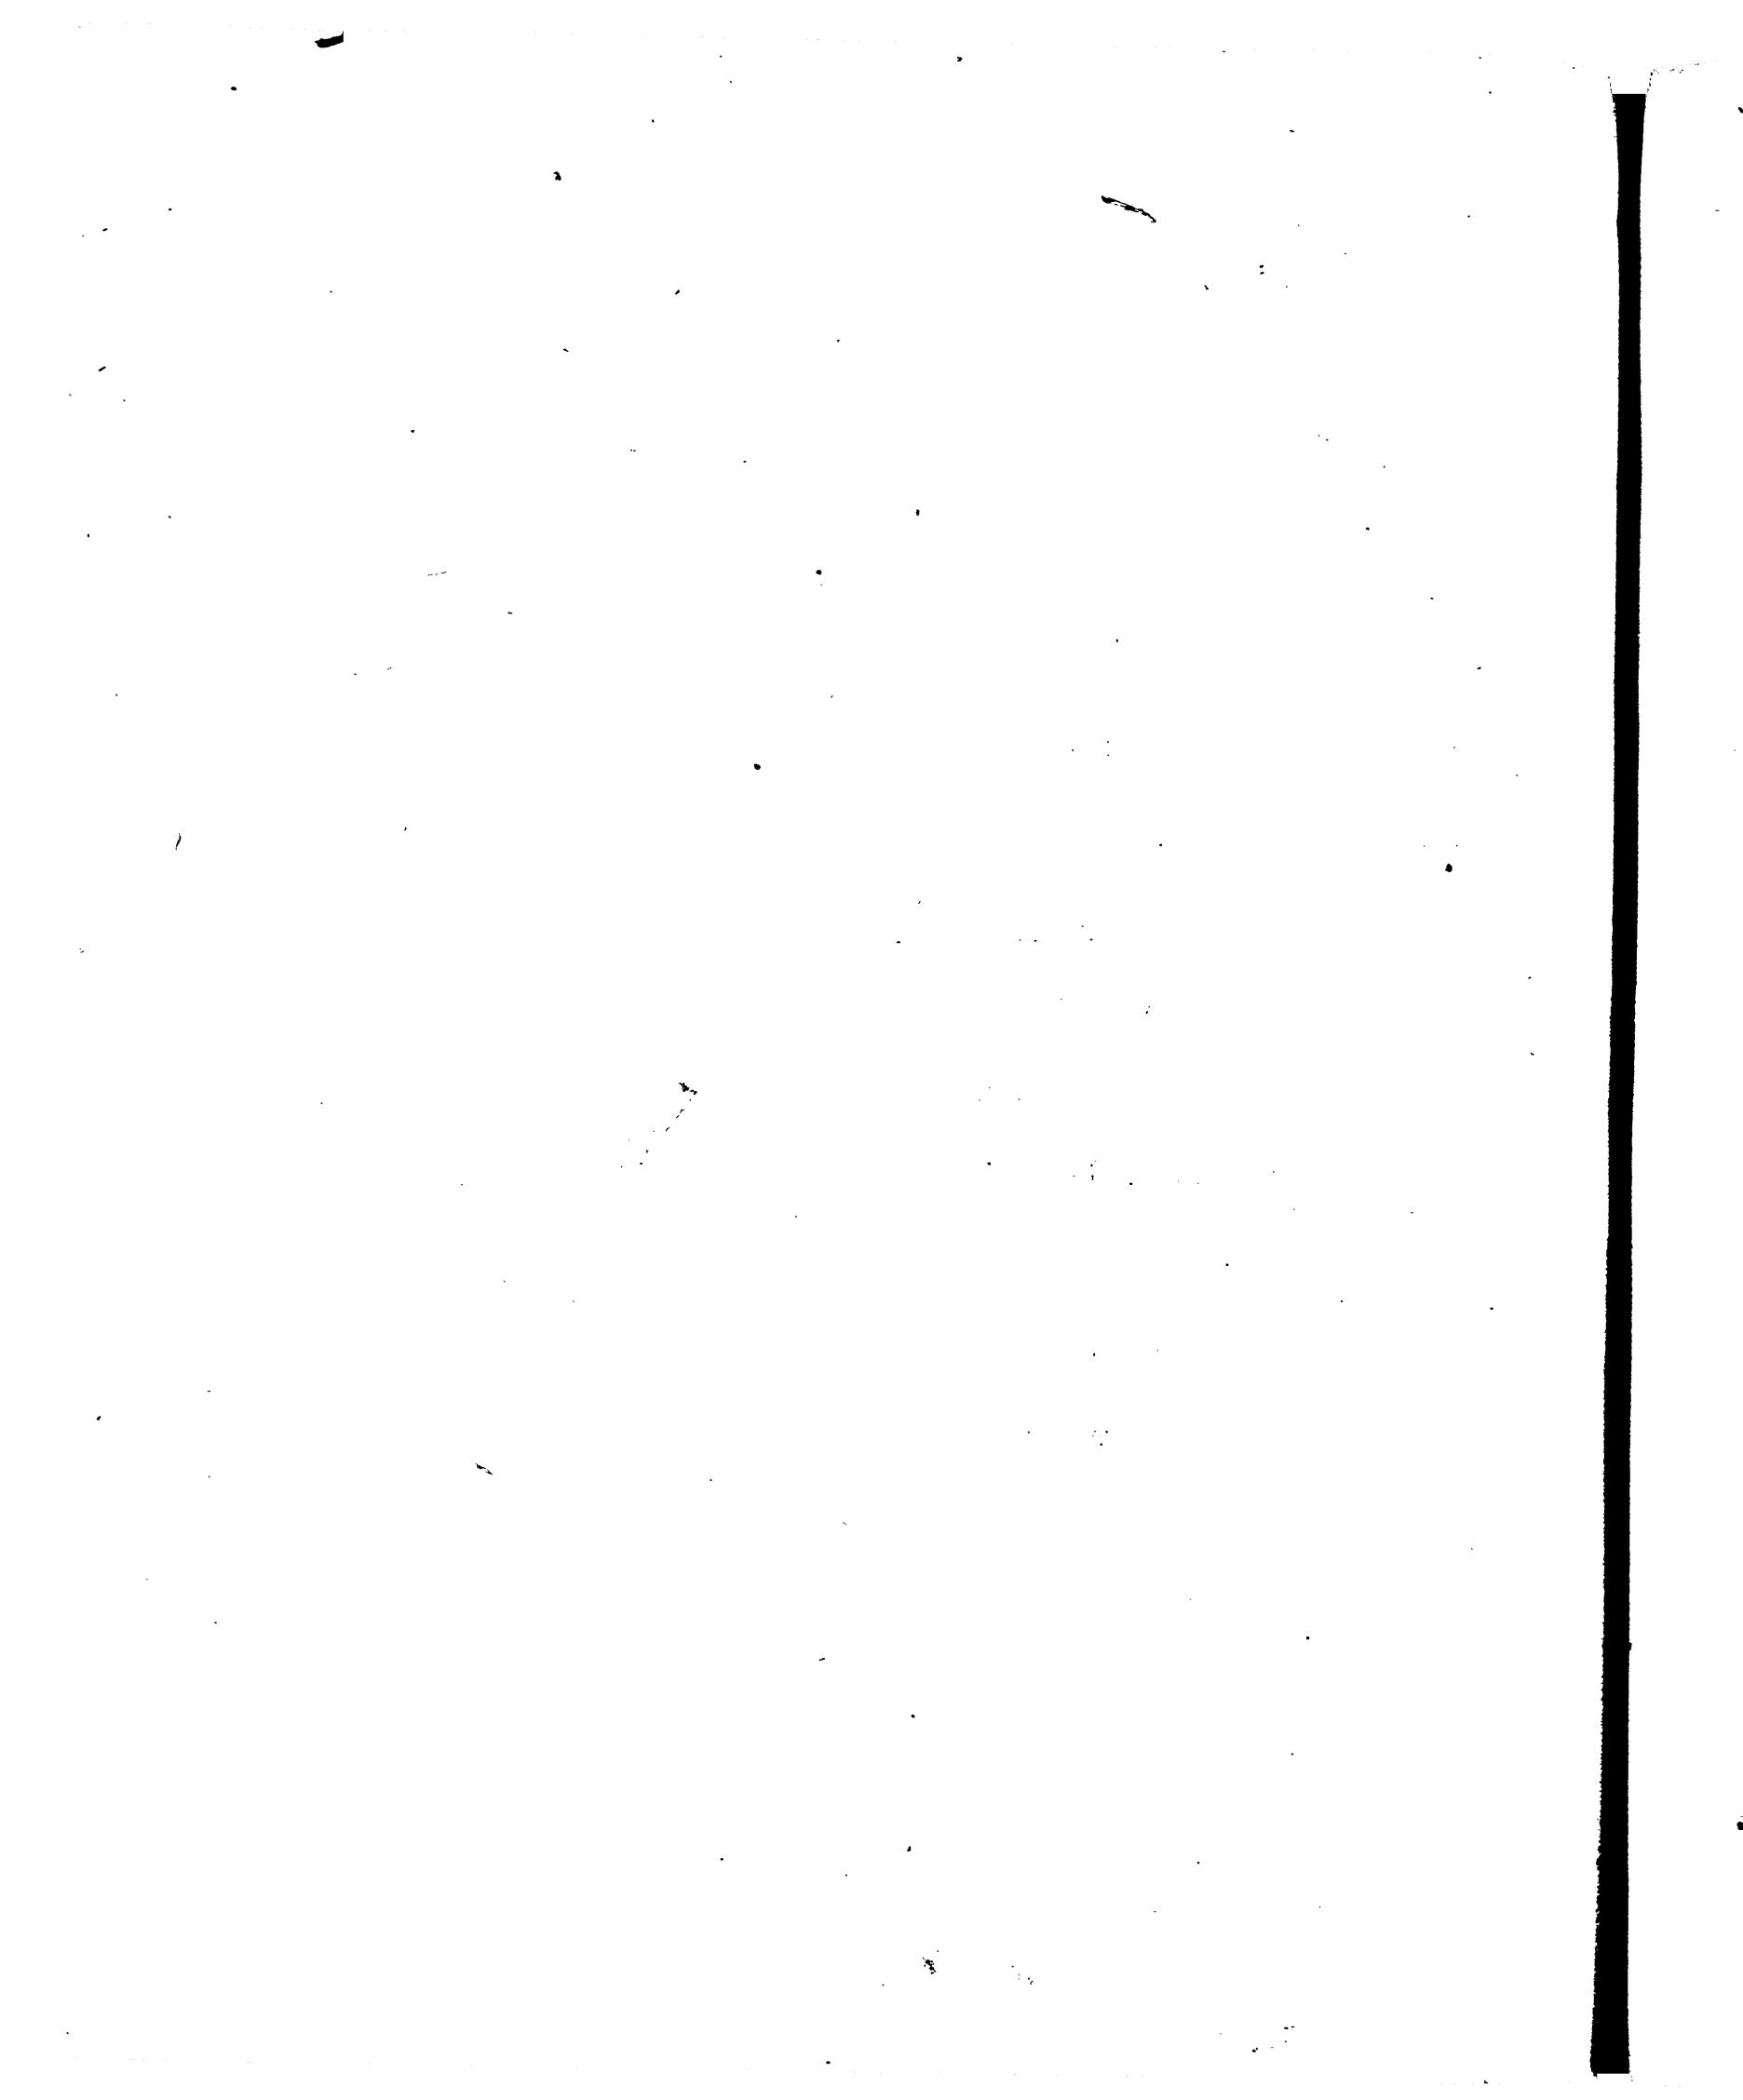

ON HIS OWN CONSTRUCTION,

Made on Board His MAJESTY's SLOOP DISCOVERY,

IN HER LATE VOYAGE ON DISCOVERIES.

IN THE YEARS 1776, 77, 78, 79, 80.

BY WILLIAM BAYLY.

A mean of all the latitudes is $1^{\circ} 57' 3''$ North.

A mean of the longitudes by the Watch is $= 202^{\circ} 10' 28''$ East,
or $157^{\circ} 49' 32''$ West.

At Turtle Island.

Observations of an eclipse of the Sun at Turtle Island, Lat $1^{\circ} 57'$ N.

Dec. 29. Early in the morning I went on shore in company with Capt. Cooke and Lieut. King; the sky was cloudy, so that we saw the Sun at times only.

At 21^h 30' apparent time, when the clouds cleared away, I found the eclipse was begun some time, I suppose three or four minutes.

| The Watch N° 2. gave the longitude 1° 21' $\frac{1}{2}$ East of the truth when we arrived at King George's Sound. During our stay there it was losing 9", 187 per day on mean time, and was 17 ^h 24' 41", 5 too slow for mean time the 23d of April at noon. The longitude of King George's Sound in time is = 15 ^h 33' 47", 3 East of Greenwich. | | | | | | | | | |

** The Zenith distances were observed with an Astronomical Quadrant of one foot radius made by Bird.

AZIMUTHS OF THE SUN's CENTER,

TAKEN WITH

AN AZIMUTH COMPASS OF KNIGHT's CONSTRUCTION,

TOGETHER WITH

THE ALTITUDES OF THE SUN's LOWER LIMB,

TAKEN AT THE SAME TIME WITH A HADLEY's SEXTANT,

FOR DETERMINING

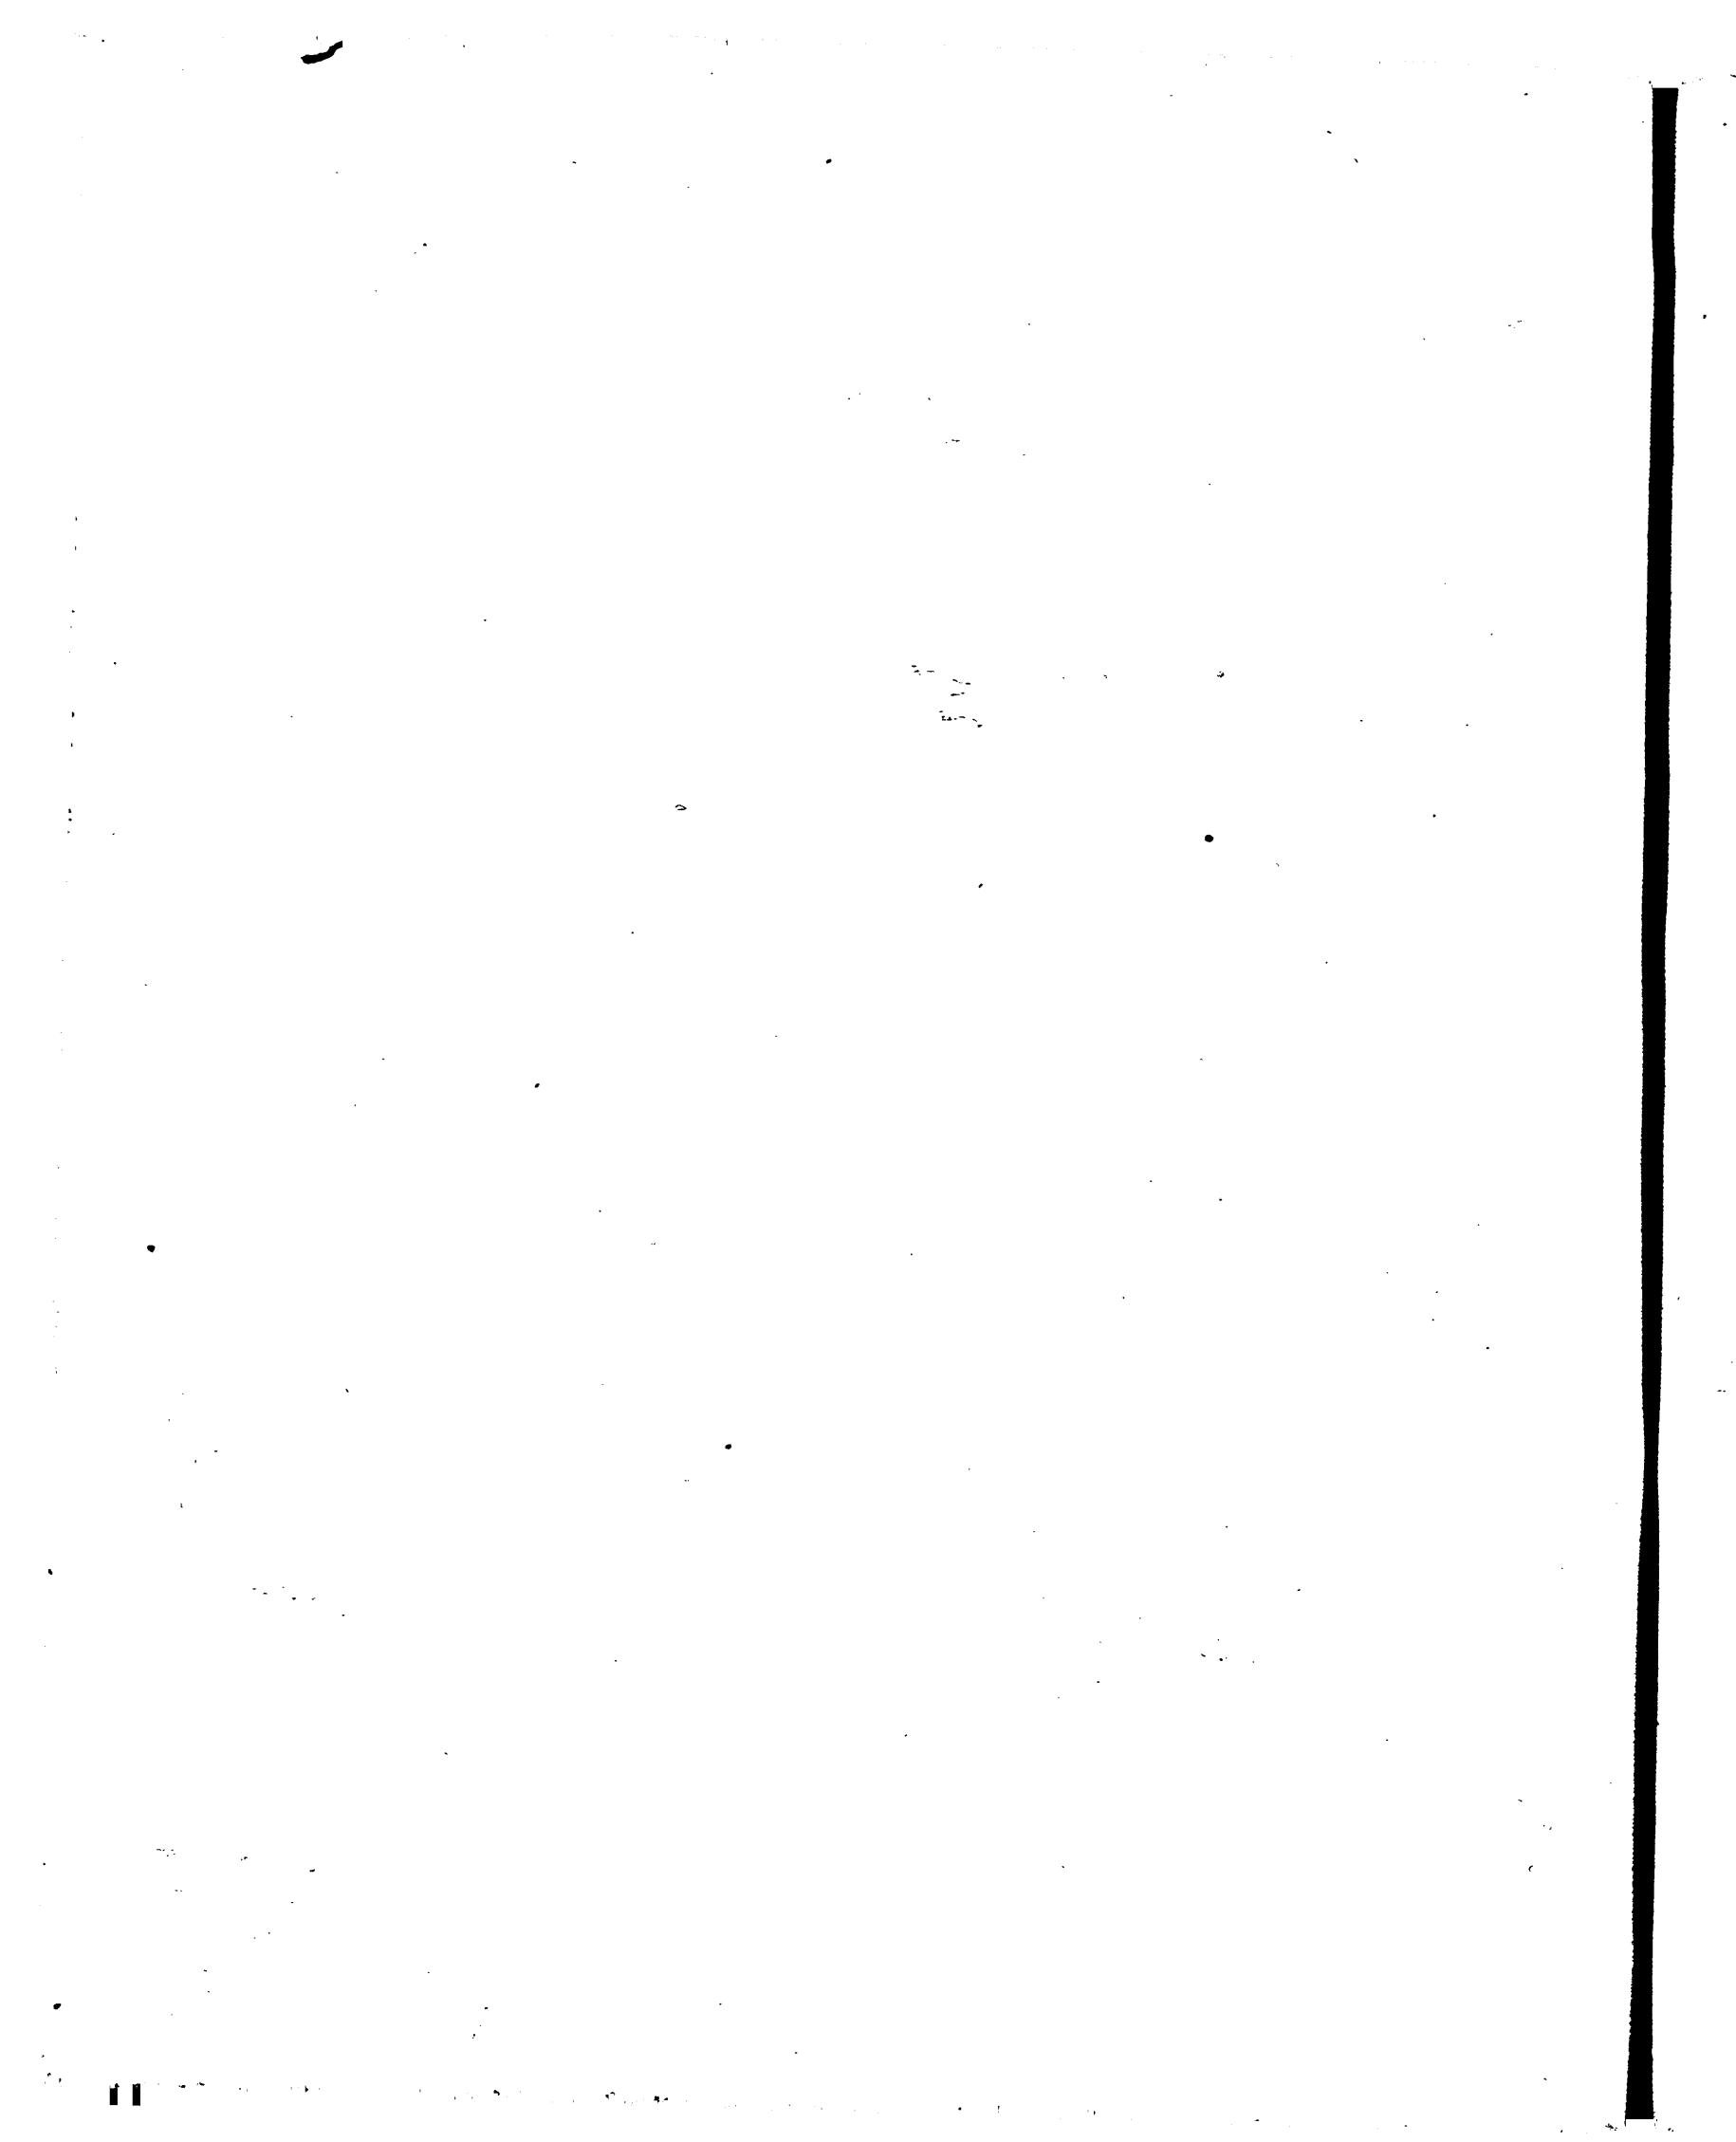

THE VARIATION OF THE MAGNETIC NEEDLE.

By WILLIAM BAYLY,

On Board His MAJESTY's SLOOP DISCOVERY,

DURING HER LATE VOYAGE ON DISCOVERIES,

IN THE YEARS 1776, 77, 78, 79, and 80.

ASTRONOMICAL OBSERVATIONS, &c. 291

DIPS OF THE MAGNETIC NEEDLE,

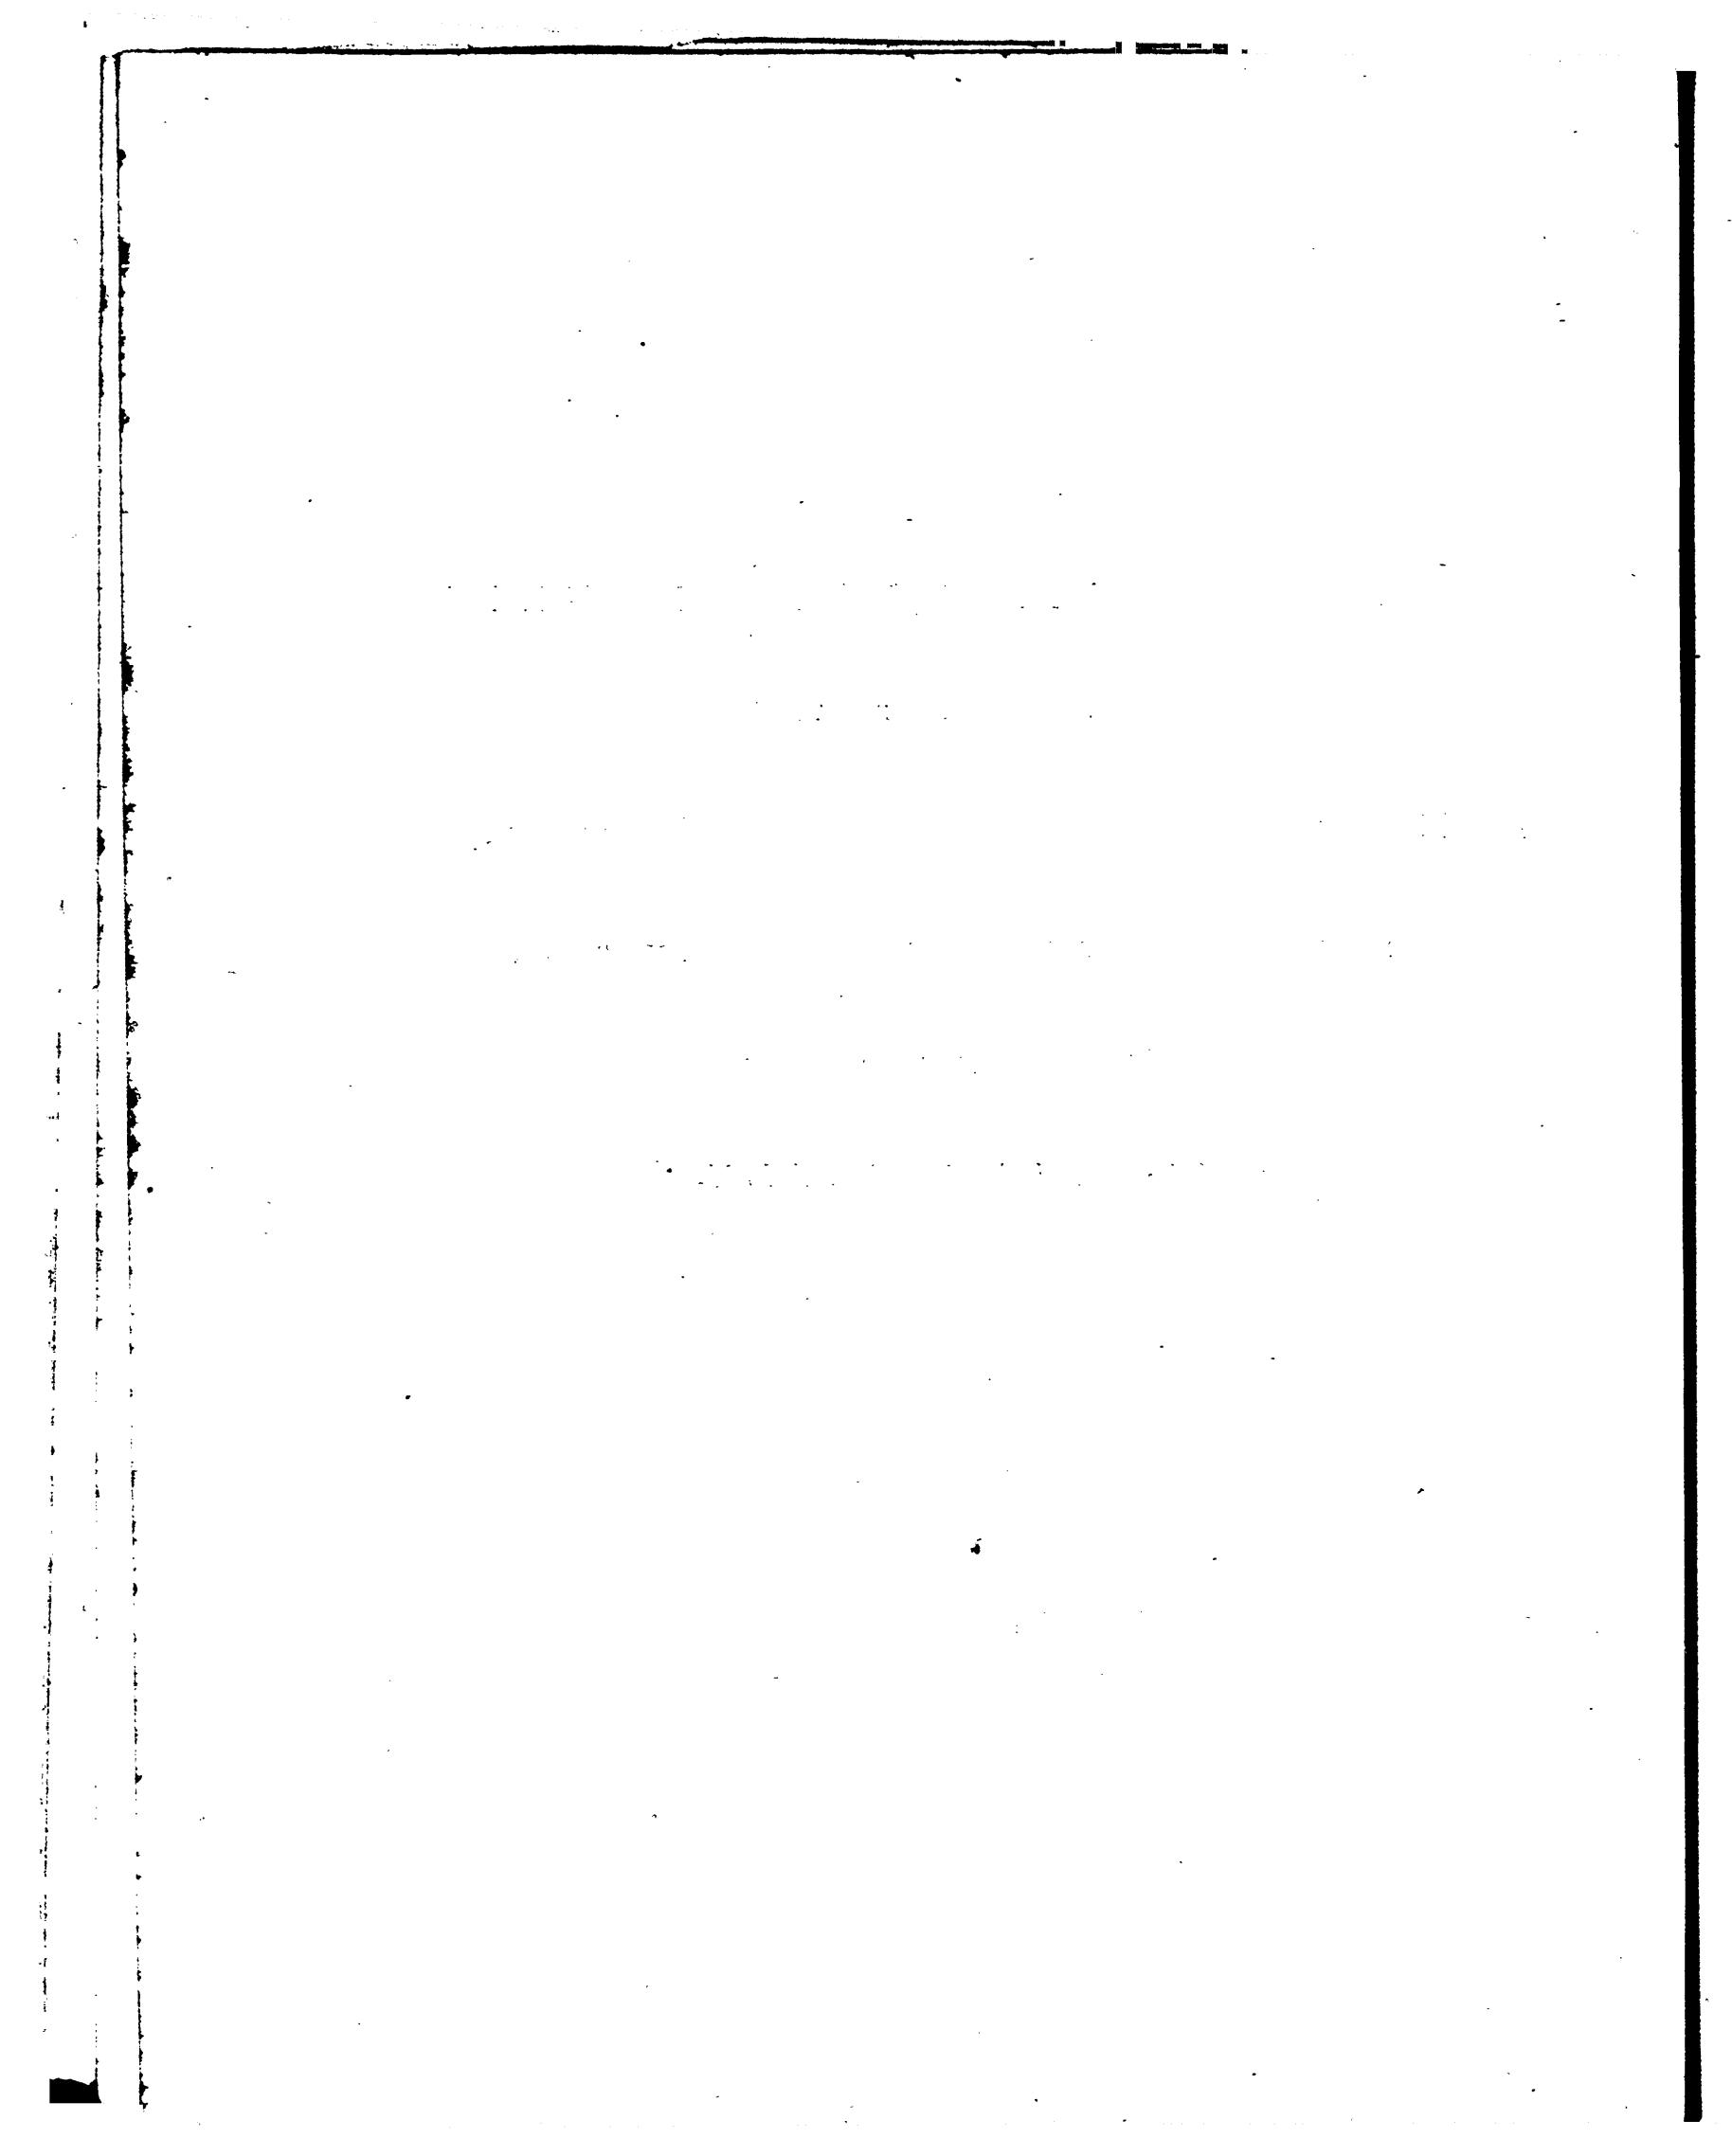

OBSERVED ON BOARD

His MAJESTY'S SLOOPS RESOLUTION and DISCOVERY;

DURING THEIR LATE VOYAGE ON DISCOVERIES,

IN THE YEARS 1776, 77, 78, 79, and 80.

BY WILLIAM BAYLY,

DIPS OF THE MAGNETIC NEEDLE, &c. 303

In making these observations care was taken to place the instrument as far as possible from iron, therefore it was generally placed on the binnacle, the steering compasses being removed to a considerable distance during the time; those that were not taken on the binnacle were taken in the great cabin, with the instrument placed on a three-legged stand, so that it was elevated near four feet above the deck. I made many observations both in the cabin and on the binnacle when at anchor, but never found a greater difference than that of two sets taken at the same place would frequently give. I also made observations both on board and on shore at most of the places where we anchored, but seldom found any great difference. When at sea the needle seldom rested quite steady, but vibrated one or more degrees each way, therefore a mean of at least 20 of the extreme vibrations were taken for one observation; and after 10 observations were made with the instrument facing the East and West alternately, the poles were changed and the observations repeated, and a mean of the whole taken for the true dip.

W. B A Y L Y.

The Honourable Henry Cavendish, F. R. S. found by experiment that the bottles

oz. dwt. grs.

$\{ A. \}$ holds $\{ 3 3 10\frac{1}{4} \}$ of distilled water, at the heat of 58° .—The specific gravity of sea water diminishes .00015 by 1° of heat.—Sea water whose specific gravity at 52° is = 1.0241 contains .0322 of its weight of salt. Therefore water whose specific gravity at 52° is $1+x$ contains $x \times \frac{1}{1.0241} = x \times 1.0361$ its weight of salt, whence the 3d and 4th columns were computed.

O B S E R V A T I O N S

F O R

Determining the Quantity of SALT in SEA WATER,

By CAPT. COOKE and LIEUT. KING.

| | | 6 48 S | 105 5 E | Java, the most easterly point, } |
| | | 58 56 N | 3 31 $\frac{1}{3}$ W | Strumness, at the Orkneys. |

The uncertainty of distances run by the ship, of estimated distances of land, of bearings taken with the best compasses, and the differences between the bearings taken with different compasses, will often occasion two observers to differ considerably in their determinations, both of the Latitudes and Longitudes of headlands, and other points seen at a distance: this will account for the difference of the Latitudes and Longitudes, as determined by Capt. Cooke, Lieut. King, and myself.

W. B A Y L Y.

T H E E N D.

E R R A T A.

- Page 4, last line but 2, for Long. $10^{\circ} 20' 0''$ read $18^{\circ} 20' 0''$.
 9, for N° 1. losing 3.04 read 2.913.
 15, last line, for $12^{\text{h}} 33' 33''$, 2 read $12^{\text{h}} 34' 33''$, 2.
 19, last line but 3, after $6^{\text{h}} 18' 16''$ or $23^{\text{h}} 50' 31''$ per Clock read $6^{\text{h}} 8' 16''$ per
 Clock or $23^{\text{h}} 50' 31''$ mean Time.
 21, line 4, for 5 Feet read 5 Inches.
 line the last, for N° 2. 14^{h} was $10' 3''$, 7 read N° 2. was $14^{\text{h}} 10' 3''$, 7.
 25, for mean Latitude $17^{\circ} 19' 58''$ S. read $17^{\circ} 29' 58''$ S.
 line last but 4, after Cook C. read see Plate 3d to the Observations of the
 former Voyage.
 28, Sept. 25, in column of Thermometer, for 10° read 80° .
 32, line 18, for 5^{h} read 5° .
 39, line 3, for Friendly read Society.
 40, for the Month read November.
 42, line last but 2, for $27'$ read $57'$.
 45, line 2d, after King George's Sound read called Nootka by the Natives.
 53, line the last, for .67 read .37 and for .524 read .481.
 62, against June 8, for $12''$ read $:2'$.
 line the last, for $7''$ read $7'$.
 99, for $2'', 02$ losing read $2'', 261$.
 106, line 13 from the bottom, for deducted read deduced.
 107, line last but one, for $14^{\text{h}} 13' 56''$, 1 read $14^{\text{h}} 13' 56''$, 43.
 112, line 6 from the bottom, read April.
 123, line the last, for Lunar Observations read Capt. King's Journal.
 192, at top of the column of Variations, for W. read E.
 193, March 5, read S. W. for the Azimuths, and for E. read W. for the Ship's Long.
 in the 3d set, for 86° read 80° in the Azimuth column. $\left\{ \begin{array}{l} 14^{\circ} 32' \text{ E.} \\ 14 \ 48 \\ 12 \ 36 \\ 12 \ 9 \end{array} \right.$
 The Variations should be
 194, 195, and 196, for East read West Longitude.
 196, at top of the column of Variations, for W. read E.
 202, the 8th day, for 132° read 142° in the Longitude column.
 204, the 13th day, line 4, for 16° read 26° in the Variations.
 208, at the head of the Azimuth column, for Centre read observed.
 212, January 16, for 4° read 1° in the Variation column.
 217, at top, for the right hand A. read B.
 219, Feb. 19, for $174^{\circ} 10'$ read $174^{\circ} 23'$.
 235, after Islands of Desolation read Kerguelen's Land.
 243, for 443 read 243.
 255, for July read January at top.
 263, for Pulo Candore read Pulo Condore.
 312, for 1777 read 1776.
 322, Dec. 27, for 39° read 30° in the Barometer column.
 325, April 28, for 47° read 49° in the Latitude column.
 326, June 9, for 29° read 30° in the Barometer column.
 334, at top, for 1778 read 1779.
 335, July 19, for 53° read 33° in the Thermometer under B.
 345, Sept. 13, for .0271 read .0371.
 30, for .5366 read .0366.
