           |                                         |       |                 | 4 40.1      * Declinometer moved to clean the glasses, and replaced with the foot screws in the same holes of the stand. Increasing numbers denote a movement of the North end of the needle towards the West. MAGNETICAL OBSERVATIONS.

# FORT CONFIDENCE.

Abstract of Hourly Observations during the months of November and December 1848.

t At 17th day noon moved soon afterwards to 0° 29'. Unifilar Magnetometer in motion from 520 to 540. Red tints of aurora in the evening. (See Notes on Auroræ.)

## METEOROLOGICAL OBSERVATIONS

# BY SIR JOHN RICHARDSON.

The following meteorological observations were made at Fort Confidence, on Great Bear Lake, in connection with the magnetic experiments. The fort (a mere log-house) stood on the banks of the lake, on limestone strata about ten feet above the level of the water, in lat. 66° 54' N.; long. 118° 48' 45" W. of Greenwich or 8h 35m 01.5 W. of Göttingen. The observatory (a small log building, without a fire-place) was built for the reception of the Declinometer and Unifilar Magnetometer, in front of the house, or between it and the The temperature of this isolated apartment was regularly lake. recorded as often as the Declinometer was observed. On the north end of the store-house (which formed the west side of the square or yard of the house, and was parallel to the observatory), were hung a dozen spirit thermometers, constructed by Adie, for the observation of the temperature of the atmosphere in the shade. These were generally compared with each other at each observation, but one was selected for record which stood, in a mean of various trials, at  $-36^{\circ}$ when plunged into freezing mercury. The temperature of a thermometer, having a bulb blackened with China ink and indigo, and enclosed in a glass bottle exposed to the sun's rays, was also noted hourly during the day. Delcros's barometer was suspended in my sleeping apartment, with the cistern about 14 feet above the surface of the lake. This barometer is constructed with a moveable brass scale, which is adjusted to the surface of the mercury in the cistern by an ivory point. The degrees were read off on the millimeter scale, and a correction made by the addition of 0.34 mill. as the mean error for capillarity and deviation from the standard barometer of Fortin.* The actual indication of the barometer was written down at the time, with the temperature shown by the attached thermometer in contact with the mercurial column; the corrections were made afterwards, and for December, January, and February were reduced to English inches for each hour, and corrected for temperature 32° Fahr. by Schumacher's table appended to the Report of the Committee of the

The corrections for the barometer furnished by the maker were, more exactly, Correction moyenne totale de capillarité - - - + 0,446
 Correction du baromètre 269 donné par bar. typal. - -0,108

Equation des Observations brutes - - + 0,338 or as applied on the tables + 0,34.

Royal Society for 1840. In that form they are presented in the tables for these three months. For October, November, March and April, the observations are printed on the millimetric scale after the correction for the mean error; and at the bottom of each column the reduction to English inches with the corrections for temperature 32° are added. Care was taken to suspend the barometer in a part of the room out of the direct radiation from the fire, and where it was sheltered as much as possible from currents of air; but it was unavoidably exposed to rapid fluctuations of temperature, since the fire when well built up heated the room rapidly, but when the door of the apartment was left open for the ten minutes which the bringing in of the daily supply of fire-wood occupied, the temperature would fall at once to the amount of 30 or 40 degrees, if at the time the external air happened to be very cold. These rapid transitions were doubtless the occasional cause of more or less error. As the surface of the mercury in the cistern tarnished rapidly, that fluid was thrice cleaned by filtering through paper in the course of the winter, the construction of the instrument permitting this to be readily done without disturbing the mercury in the tube. The wooden cistern, however, was found to shrink considerably in the extremely dry air of the apartment, and it was necessary to wind a little floss silk round it to cause it to fill its place accurately; this may perhaps have produced a little change in its capacity, but as the scale was a sliding one the error of its indications could be very triffing. An aneroid barometer was hung alongside Delcros's instrument, and a record kept of its indications; but as it was one of the earliest of its kind, and in some degree imperfect, it has not been thought necessary to print the observations made by it. In December, January and February, the aneroid stood generally between 0'020 and 0'060 inches below the Delcros's barometer when the latter was corrected for temperature 32°, no correction being made for the aneroid, but the differences were not uniform, and sometimes exceeded 0'100 inches. No correction for temperature was furnished to us with the aneroid.

The thermometers employed for ascertaining the temperatures were constructed by Mr. Adie of Edinburgh. On former expeditions I had used thermometers made by London artists of great eminence; but finding that the instruments varied greatly from each other at very low temperatures, I applied to Professor Forbes of Edinburgh, who kindly undertook to superintend the making of instruments which might be more comparable with each other in great degrees of cold. The following is an extract from a letter written on the subject by him subsequent to my return from America :-- " My Dear Sir,

Edinburgh, 10th April 1851.

"My idea was in constructing the thermometers (or rather in superintending their construction) to ensure comparability, and definiteness in the principles of graduation, which you are aware does not exist in alcohol thermometers as usually made, both from uncertainty in the density of the spirit used and, especially, because only one fixed point (freezing water) is employed, the other points being taken by comparison with a mercurial thermometer. But as alcohol and mercury do not expand alike, the value of 1° of the alcohol thermometer will depend upon the point of comparison with the mercurial one.

"What I intended, and should recommend in principle, would be to use *absolute alcohol* (or as nearly so as possible), to fix the freezing point of water and of mercury, to call the latter  $-40^{\circ}$  either on the centigrade or Fahrenheit's scale (which here coincide), and to divide the space uniformly, and also to graduate uniformly above 32°. There can be no possible harm in defining freezing mercury to be at 40° Fahrenheit.

"I intended to verify these fixed points myself, but I was rather seriously unwell that winter, and as your time was limited, I abandoned the freezing of mercury on a large scale, and satisfied myself with general instructions to Mr. Adie, which, I think, the results show to have been well carried out.

"The alcohol was prepared on purpose by Dr. George Wilson, chemist, and his report is enclosed. It shows that the alcohol is very nearly absolute. The tubes had round bores, and were examined in the usual way, by passing columns of mercury along them; a variation of the apparent length of the column of mercury, amounting to  $\frac{1}{50}$  inch, and that, in any part of the tube, causing the rejection of the tube.

"The fixed points were 32° in ice, and 62° by comparison with a carefully corrected mercurial standard thermometer. The degrees were run up and down to the same measure.

"As you have accurately ascertained the freezing point of mercury on these thermometers, it would be easy to infer the change which my proposed method of graduation would have produced.

"Yours sincerely,

"(Signed) JAMES D. FORBES."

# " 'EXTRACT of a LETTER from Dr. WILSON to Professor FORBES.""

" ' Dear Sir,

"'I enclose a note* of the specific gravity of the alcohol, with such other particulars as it seemed desirable to put on record for the sake of subsequent comparison, should that be made. The uncoloured alcohol was determined with a 1,000 grain bottle. The residual coloured spirit amounted to little more than 100 grains. Its Sp. Gr. was ascertained with a bottle containing 124.18 grains of distilled water at 60°. The unused coloured alcohol, barely amounting to a quantity equal in volume to 1,000 grains of water, could not be made to fill entirely a 1,000 grain Sp. Gr. bottle when transferred from the vessel containing it; I thought it best, therefore, to determine its density in the bottle made use of for the residual alcohol. The coloured alcohols are thus directly comparable; and as the balance was delicate, and three hours were spent on the two determinations, which were repeated in each case three times, I think the results may be considered tolerably accurate.

" 'It is gratifying to perceive that the difference in density between the coloured alcohols is so small, that when spread over the twentyfour thermometers (which may be supposed to contain an increasing dense spirit, in the order of their formation), it will be inappreciable.

" 'Yours very sincerely, " '(Signed) GEO. WILSON."

The mean height of the mercury in Delcros's barometer at temp. 32° Fahr. for seven months,  $\dagger$  observed sixteen or seventeen times daily (the hours between 10 P.M. and 6 A.M. being omitted), was 29 046 inch. The lowest pressure recorded in the seven months occurred at 7 A.M. on the 25th of October, being 28 265 inches, and the highest at 8 P.M. in January, being 29 900 inch, which gives a range of 1 635 inch within little more than half a year. The last page of Table I., however, shows that the mean horary variation is very small, being only 0 006 for the same period. As during the very low winter temperatures of that locality the atmosphere

 $\dagger$  In the first nine days of October the barometer was rarely examined, and less regularly during the remainder of that month than in the six following ones.

holds very little moisture in solution, the very small diurnal oscillation supports the opinion that it depends on the presence of vapour. The depression is greatest at night, and at noon, and in the afternoon; but the regular recurrence of two daily maxima and minima cannot be made out either in the individual months or in the aggregate of the seven months. The casual fluctuations arising from snow storms and other sudden changes in the constitution of the atmosphere appear to overlie and conceal the diurnal curves.

As there are no corresponding observations on the Arctic Sea for comparison, we can scarcely venture to assign the height of Fort Confidence from these observations. By employing Sir Edward Parry's observations at Winter Island, in latitude 66° 11' N.* made in 1821-22, we may indeed get, as a very rough approximation, 640 feet for the altitude of Bear Lake above the sea. This is liable to the errors arising from the great distance between the places of observation, also to that from the annual fluctuations of pressure, and to the differences which most probably existed between the barometers, which were not compared with each other, nor with the same standard. From calculating the rate of descent of Bear Lake River, and of the Mackenzie below its influx, when compared with other rivers whose velocity and rate of descent were known. I had assigned 500 feet as the altitude of the lake above the sea; but this estimate is also liable to much error.

All the metcorological instruments were observed at the exact hours mean time at the station, kept by chronometers whose rate and errors were frequently ascertained by astronomical observations of the fixed stars. Göttingen time was used only on the term days, for observations on the magnets.

During the winter dense clouds or *cumuli* were never seen. The clouds generally were of the nature of thin *stratus* and *cirri*, or rarely *cirro-cumuli*, and the mean extent to which these overspread the blue sky is shown in Table VII. Very often the *stratus* was so rare that the stars shone through them previous to the rising of the moon, and their actual existence and extent became known only in the bright moonlight. It seems to be a cloud of this kind which forms the dark space near the horizon from behind which the arches of the Aurora Borealis are frequently observed to spring. On several occasions an arch of filmy cloud, of a greyish hue, was observed in the twilight crossing the magnetic meridian at or near a right angle. On watching this until daylight had wholly departed, it was seen to assume

### 328

^{*} The mean height of the mercury in the barometer at Fort Confidence for seven months is 29'046 at 32° Fahr., the mean temperature of the air in the shade being -12'28 Fahr. At Winter Island the mean height of barometer for one year (1821-22) was 29'798 at 32° Fahr., and the mean annual temperature +9'8 Fahr.

gradually the yellow hue and brilliancy of the usual auroral arch. The clouds which accompany the most brilliant displays of the aurora are seldom so dense as to hide the larger stars, except when the moon is shining. Sometimes the stars shone through sheets of auroral light, at other times they were altogether obscured by it. I am inclined to believe that the appearance or non-appearance of the stars during displays of the aurora depends on the density of the accompanying stratus cloud. This cloud may be so rare as merely to communicate a greyish tinge to the apparently clear sky, and yet become sufficiently visible by the refraction of the moon's rays to show its true nature and extent.

Several times during the winter the auroral light was seen, both by myself and Mr. Rae, to pass in front of a mass of cloud. As we were both aware of the ease with which the eve may be deceived in such observations, we watched the displays of the phenomenon with sufficient scepticism to keep the attention on the alert, and no doubt remained on our minds of the reality of the fact. In former years I had seen seen similar occurrences more frequently, and even more Thirty years previously I had entertained the belief manifestly.* that the aurora was connected with the formation of cloud, and other changes in the constitution of the atmosphere, and the nightly observations of this winter all tended to strengthen that opinion. The great dryness of the winter atmosphere in the interior of Arctic North America may, perhaps, be the cause of the more frequent emissions of the electric light than in more southern and moister Fine spiculæ of ice or minute snow were often seen localities. falling from a clear sky, especially after a brilliant display of This I had also noticed many years ago. auroral lights.

I have written out *in extenso* the descriptions of the aurora at the hours of observation for two months. To have done so for the whole seven months would have occupied too much space. A few brief notices are substituted for the months in which the full details have been omitted. The compass bearings hereafter mentioned are true, not magnetic, unless when so expressed.

October (1848).—Aurora observed on the 1th, 13th, 17th, 18th, 19th, 20th, 21st, 23rd, 24th, 25th, 26th, 27th, 28th, and 30th. Did not occur or was not noted on the other evenings. On the 19th, after the sky had been overspread for the first half of the night by a very thin stratus, scarcely obscuring the blue vault, and from which fine icy spiculæ fell, between three and four in the morning there was a bright blue sky with flocculent clouds,

* These appearances are, however, to be understood as very rare in comparison with the common phenomenon of the auroral light issuing from behind a cloud.

which occasionally became luminous, sometimes in one quarter of the sky, sometimes in another. At 7½ P.M. in the evening of the 23rd the Declinometer was observed to move suddenly 10', simultaneously with some quick flashes of auroral light. The aurora disappeared in a few minutes, and the needle remained On the 29th the Declinometer fluctuated stationary afterwards. upwards of 1°, the sky being wholly obscured during the whole day, without any auroral light shining through. A small snow fell in the evening. On the 31st the Declinometer ranged 2°. During the previous night there was a deposit of moisture from the atmosphere, and all the instruments in the observatory were found to be encrusted with fine crystals of ice, particularly the rough lines and lettering of the scales. The auroral arch in the evening crossed the magnetic meridian at right angles, and the light as it flashed over the stars was bright enough to dim their lustre, but not to hide the larger ones.

November 1.—Fine snow falling for seven or eight hours in the day. At 6 P.M. all the northern and part of the western horizon banked by luminous clouds, through which stars of the first magnitude shone. A few patches of light in the south also. Fine snow falling from a cloudy zenith. At 7 P.M. a curtain-like arch of the aurora, bearing north about  $25^{\circ}$  degrees high, partially in motion. A faint sheet of light spread over the rest of the sky, here and there obscured by cloud-like dark patches. Stars visible through the aurora in every part, except in the northern arch which hid them. At 8 an arch about  $80^{\circ}$  high, on the south side of the zenith. At 9 the arch in same position but fainter.

November 2.—At 6 A.M. an auroral arch, rather faint, crossing the zenith in a due east and west direction. At 9 P.M. an auroral cloud bearing south, emitting the usual yellow light. Elsewhere an uniform haze or cloud overspread the sky. At midnight a remarkably deep blue cloudless sky, with bright stars, an auroral arch rising in the N.N.W. point of the horizon, crossing the zenith, including the whole constellation of the Little Bear, and passing over Orion in the east. The arch, which often changed its form, occupied a considerable breadth of sky, and was generally made up of oval oblique bars. The moon had set before this hour.

November 3.—At 9 P.M. sky cloudless. Bright moonlight. Stars somewhat dim. An auroral arch, composed of parallel beams of light rising in the N.N.W. to the height of the Great Bear only. Auroral clouds at a greater altitude bearing north-east. At 8 P.M. several arches of light rising from one point near the N.N.E. horizon, and crossing the sky at various altitudes, so as to occupy

あって、あるという 大学の まいいちょう しょう

most of the northern half of the heavens, and part also of the southern half. They became fainter after passing the zenith, and were lost in a diffused sheet of light which spread over the eastern part of the sky. The principal arch, which was brighter and more continuous than the others, passed over the tail of the Great Bear, covered the whole of the Little Bear, and as it descended in the east made a curve to the north. At 9 the aurora faint.

November 4.—At 6 P.M. aurora hanging like a curtain in the northern sky, at an altitude of about 15°, and spreading from N.N.W. to N.E. Beams of light shooting upwards from the curtain, the largest ones bearing N.N.E., but some also bearing north. The sky cloudless, and still tinged red in the west, though the sun had been set three hours. At 8 P.M. long variable streams of light rising from the N.N.W. and north to the zenith. At 9 a narrow auroral arch, extending from N.N.W. to S.S.E., its crown having an altitude of about 80°.

November 5.—At 8 P.M. oblique bars of auroral light, lying over each other, and rising from the horizon in the N.W. by N., and then dividing into several arches, one of which, crossing the Great Bear, kept to the north of the zenith. Another crossing Cassiopeia and passing to the south of the zenith, and others, which were brighter, taking a still more southerly course, but disappearing before they reached the south-west horizon. Bright moonlight in a cloudless sky. Stars not shining brightly. At 9 aurora fainter, and the arches lying for the most part to the south of the zenith.

November 6.—At 5 A.M. sky clear, with bright stars, except a dark space skirting the southern horizon, and looking like a heavy cloud, but one bright star shining through it. Along the upper border of this dark space the auroral light had the form of a series of cumulo-stratus, above which there was a light blue sky. At 11 A.M. some light cirri clouds in the north and west resembling some forms of the auroral light.

November 7.—At 1 P.M. a halo round the sun, with red rays reflected from a cloud on each side, forming small segments of an arc.

November 9.—Faint arch of the aurora in the west at 5 A.M.

November 10.—At 7 A.M. the moon, when near the horizon, had a very oval shape, the long axis being transverse. At 6 P.M. the aurora in cirrus-like streaks, 30° high, bearing south. At  $6\frac{1}{2}$  P.M. a falling star passed from east to west, close by Lyra. A low auroral arch terminating abruptly, as if rolled back on itself on reaching its greatest altitude in the magnetic meridian, but becoming some time afterwards more lengthened out, and at the same time fainter. The ice in the lake, which was frozen over everywhere within six or seven miles, making a rumbling noise. At 7 P.M. the aurora was in It generally formed a complete arch, along which active motion. waves of light moved rapidly, and most so about 15° above the southern horizon. The beams lay at right angles across the magnetic meridian, but their wave-like line of motion was in that meridian. The compass needles steady; sky cloudless. At  $7\frac{1}{4}$  P.M. a slender auroral arch, waving to and fro, extended from the N.W. to S.E., passing across the zenith. The magnet, suspended in the Unifilar Magnetometer and loaded with the large ring (No. 5.), which was previously steady, began at this time to vibrate from 315 to 380, and the Declinometer moved from 4° 35' to 4° 25'. At 7.50 The unifilar magnet was now vibrating the aurora wholly gone. from 270 to 340, and the Declinometer had gone back to 4° 35'. Sky clear. At 8 no aurora. Sky cloudless. Declinometer 4° 30'. At 9 P.M. a faint auroral arch lying to the south of the zenith. The Declinometer vibrating from 4° 30' to 4° 35'. At 10^h 45^m long banks of auroral light in the south resembling stratus cloud, the uppermost of them arched, assuming at times a brighter hue, but always yellowish; the end of the arch curling back like cirro-stratus, but in a contrary direction to the light wind then blowing.

November 11.—At 5 A.M. a narrow auroral arch in the west, 30° At 6 P.M. the moon in the north-east quarter of the heavens high. grazing the upper edge of a cloud-bank, which produced a burr round The bank sunk below the horizon on the north point. her. Auroral light in detached masses and beams, the latter in form of arcs, which cross the magnetic meridian in various directions. These cloud-like masses resembled thin clouds illuminated by the moon, but were distinguishable by their variableness both in form and in the intensity of their yellowish light. At 7 P.M. the sky generally overspread by a rare stratus cloud, most visible in parts directly opposite the moon, permitting the blue sky to be seen through it elsewhere. Auroral light in arcs and streaks. The moon surrounded by an imperfect halo, 22° in semi-diameter, produced by somewhat oblique The paraselenæ yielded prismatic tints. At 71 P.M. stratus clouds. the aurora suddenly became active and variable, the great body of light being in the southern half of the sky. Of the prismatic tints exhibited yellow was the predominating colour, but green was occasionally seen, and the lower ends of the fringes when most vivid were crimson. In its motions the auroral light resembled the folds of a curtain made to wave to and fro; that is, the prismatic tints became visible and disappeared again in rapid succession along an arc or bar of light, first in one direction, then back in the opposite one.

This kind of motion has been denominated by some writers pulsation. After a continuance of this phenomenon in a variety of forms and places, the southern ends of the arches and of the banks of light lying to the eastward began to twist and curl on themselves, and to sway backwards and forwards before the stratus cloud, which they concealed in their passage. The cloud was strongly illuminated by the moonlight, and would have been seen had the auroral light been beyond it. In the course of the rapid evolutions of the lights, large sheets of it seemed several times to pass before the cloud, entirely concealing it, and consequently appearing to the eye to be much nearer. The needle of the Declinometer was steady at 7 P.M., but when the aurora began in the eastern part of the sky to exhibit prismatic light, it vibrated from 4° 32' to 4° 25', and at 7h 45m it had settled quietly at 4° 49', the aurora at that hour having become comparatively inert. At this period a streak of auroral light crossed the stratus clouds under the moon, traversing the blue spaces between the clouds, and forming a continuous line in front of them, well defined on their The upper bar of the lunar halo had disappeared by surface. this time; the space within the limb of the halo, which was now three quarters of a circle, being mostly blue sky. The oval paraselenæ still gave out prismatic tints. At 8 P.M. the moon, having risen into a blue space in the heavens, the stratus cloud was less visible. The prismatic paraselenæ now emitted rays of light outwards, and a beam of auroral light stretching towards the north, and, passing near the zenith, cut off a portion of the circumference of the halo. At this time the Declinometer was vibrating slowly from 5^h 10^m to 5^h 15^m, the numbers increasing slowly. At  $8\frac{1}{2}$  P.M. fine snow or minute spiculæ of ice falling, occasioned a haze sufficiently dense to conceal the blue sky, but not to prevent the stars of the first magnitude from appearing. The lunar halo was this time complete, the paraselenæ distinct, and an arc showing above the halo at the distance of a quarter of its diameter. Aurora in arcs faintly seen through the mist. At 10 P.M. hazy, circle of the lunar halo very distinct, but the paraselenæ scarcely to be made out. Stars invisible, and no auroral lights.

November 12.—Hazy. At 4 P.M. the Declinometer vibrating from  $4^{\circ}$  15' to  $4^{\circ}$  20'.

November 13.—Hazy.

November 14.—At 4 A.M. auroral clouds, emitting yellow light near the zenith. At 5 P.M. clear blue sky; a complete auroral arch from N.W. by N. to S.E. by S., crossing the magnetic meridian in the zenith at right angles; the arch composed of oblique yellowish beams, often moving and changing. At 6 P.M. the auroral arch occupying the same general position, but waving backwards and forwards; a few scattered masses of light in other parts of the sky. Needle steady. At 7 clear blue sky. No auroral light. At 8 a north-east wind setting in, the mercury in the barometer fell suddenly to a small extent. At 9 small, round, fleecy clouds, not dense, covering most of the sky, with blue intervals. No aurora.

November 15.—At 5 A.M. light N.E. winds, clouds coming from the N.W. At 1.40 P.M. the sun set in a halo. At 5 P.M. a broad auroral arch rising at its summit, about 18° or 20° above the southern horizon, vivid on its lower border, with quick motion backwards and forwards along the line of the arch. The upper border not defined, but fading gradually away. At 6 P.M. auroral arch in the same position, but not so bright. At 7 P.M. an auroral arch springing from the S.S.E. horizon and crossing to the N.N.W., occupying in the middle a space extending from near the zenith to within 16° of the S.S.W. horizon, but tapering towards the ends. The arch was composed of brighter streams of light, lying in the direction of its length and connected by fainter diffused lights. No auroral light was emitted from any part of the sky north of the zenith. At 8 P.M. only a few patches of auroral light remained; no clouds were visible. but the sky, generally, was greyish-blue. At 9 P.M. masses of auroral light shone dimly through the haze in the southern quarter of the sky. A very fine and slight deposition of snow, more readily felt than seen, was taking place at this hour.

November 16.— Air to-day inclined to part with moisture, evinced by the parchment windows becoming slack.

November 17.—This day the magnetic needles moved much. At 11 A.M. the magnet, suspended in the Unifilar Magnetometer, was vibrating between 520 and 540, and, subsequently, beyond the scale; and at noon the Declinometer moved suddenly from 1° 21' to 0° 29'. At 6 P.M. clear blue sky, with some stratus cloud near the horizon, above which there was a bank of luminous clouds, having a slightly reddish tint, resembling clouds tinged with the rays of the setting sun. Shortly afterwards the red tints became more vivid. and the quick east-and-west to-and-fro movement of vertical bars was exhibited. At 7 auroral light spreading from south to west. A falling star shot from east to west past Altair, having an apparent angle of descent of 40°. At 8 the Declinometer needle was 5° 5', but ten minutes afterwards returned to 4° 45', the auroral light having then disappeared. At 9 P.M. a dark cloud, concealing the stars in the southern quarter of the sky, to the height of 8°. Along the arched edge of this bank a yellowish light was emitted. Unifilar magnet moved back to 95. At 10 P.M. the auroral light diverged

from a point in the sky, adjoining Cassiopeia, to all parts of the horizon. The beams of light varied and moved rapidly. Soon afterwards the light had disappeared from the southern sky, and the auroral light was mostly in the north-west quarter. At the hour the Declinometer stood at  $1^{\circ}$  50', but moved quickly to 5°, and at  $10^{\circ}$  15^m the northern rays of the aurora had vanished, and then the needle had moved to 6° 28'.

November 18.—At 5 A.M. an auroral streak crossing the zenith from east to west.

November 19.-Snow. Sun very dimly seen at 1.

November 20.—At 6 P.M. an arch of the aurora, much like the *via lactea*, crossing the zenith from N.E. to S.W. At 7 auroral arches, having the above direction. At 8, and subsequently, no aurora.

November 21.—A burr round the crescent moon at 5 and 6 A.M. At the latter hour faint auroral light in the zenith. At 6 P.M. a bank of clouds along the southern horizon, emitting a white light. At 8 a broad low bank of yellowish light extending along the southern sky, and indented by dark clouds. Higher up several auroral arches crossed the blue sky, barred at their origin in the south-west by stratus clouds, and seated therefore beyond them. These arches did not go much beyond the zenith, but curved there in various directions. Stars pretty bright. The Declinometer moved 30' after the aurora shone out.

November 24.—At 6 and 7 P.M. faint auroral light near the zenith. At 11 auroral clouds. At midnight a patch of an arc to S.E. by E., and another bearing S. by W., about 8° high.

November 25.—At 2 A.M. patches of auroral light in many parts of the sky. At 4 many auroral arcs. At 5 and 6 A.M. patches and beams of auroral light. At 4, 6, 7, and 8 P.M. auroral light in various forms, banks, beams, and arcs, mostly of a yellowish hue. At 9 P.M. a more than usually fine auroral display. A great curtain extended from the east to the north-west quarters of the sky, at an altitude of about 60°, appearing as if suspended from a deep blue starry sky. This luminous curtain waved up and down, narrowed and expanded, and rolled back on itself at the ends. In the south part of the sky there were clouds, from behind which flashes of light were occasionally seen to shoot.

November 26.—At 9 AM. a mackerel sky, that is, short cirro-stratus lying across a line running north and south, and a long tract of cloud stretching from the N.W. in a S.E. direction, commencing about 12° from the horizon, and rising to about 70°; very thin and delicate, so as to be almost transparent, but appearing to the eye to

lie under the mackerel sky which it crossed. Part of this cloud had a wavy and flickering motion like the ordinary auroral light, and in a few minutes it faded entirely away like the aurora. It re-- appeared again more to the south somewhat altered in form, and in a minute or two vanished again. The motions of this stratus identify it with the auroral light, but had it been stationary it could not have been distinguished from a filmy cloud. I have no doubt but this variable cloud would have been luminous in the absence of daylight. At 4 P.M. an auroral arc, having a direction from N.W. to S.E., composed of detached and somewhat oblique and twisted bars. This arc occupied the site of the aurora-like cloud seen in the morning. Elsewhere a clear blue starry sky. At 5 P.M. much of the sky occupied by patches and banks of light. Several nearly contiguous arches crossed the zenith in a N.W. and S.E. direction, their ends uniting into single twisted stems as they approached the horizon. At 6 P.M. the whole sky nearly covered with auroral lights in different shapes. At 7 P.M. an arch crossing the zenith in the ordinary N.W. and S.E. directions. Patches of light elsewhere; all more or less changeable. At 9 P.M. several concentric arches, covering all the southern half of the sky from the zenith downwards. Brilliant fringes of light rising obliquely from the upper borders of the arches in continual motion; the lower edges of the arches were of more continuous light. At 10 р.м. а continuous sheet of light spread over all the southern half of the sky, but was traversed by brighter arches; a space near the horizon was the only dark part.

November 27.—At 6 A.M. auroral light in various quarters of the sky. At 7 A.M. banks of auroral light bearing south. Dawn just appearing in the east.

November 28.—At 4 P.M. an auroral arch crossed the zenith. Sky greyish; a few stars visible. At 9 a sheet of light shining faintly through clouds in the southern quarter of the sky.

November 29.—At 4 A.M. faint sheets of light in the S.W. At 5 and 6 A.M. auroral light as before, and at 7 auroral streaks still visible though the day was breaking. At 10 A.M. the suspended magnet moved in the course of two or three minutes from 330 to 350, with quick minor vibrations. At noon the magnet was vibrating in arcs of 12', and at 4 P.M. in arcs of 10'. At 5 P.M. beams of aurora rising in the north and tending to the east, the greatest altitude 15°. At 6 P.M. a bright curtain-formed arch rising to 50° in the north, extending from N.W. to N.E. with oblique fringes of light rising from its upper edge, and inclining to the eastward. At 7 P.M. two arches rising in the N.W., and crossing the magnetic

336

meridian; their ends on attaining the zenith curling back. At 8 P.M. an auroral arch; and at 9 P.M. an arc, not very bright, rising in the N.W., and holding a flexuouse course to Cassiopeia, where it terminated. Several rays diverging from its end there towards the south, north, east, and west.

November 30.—At 5 A.M. faint auroral beams. At 8 dawn. Suspended magnet vibrated all day in arcs varying from 5' to 15' in extent; and had a progressive but not uniform motion from 309' to 254'. At 5 P.M. a broad auroral arch crossing the sky in a N.E. and S.E. direction, passing over the zenith. At 6 P.M. auroral light in patches. At 7 P.M. the arch interrupted in places, having a direction from N.W. to S.E., and touching both horizons. It was composed of detached bars and masses of light, not uniform in direction, but mostly crossing the general line of the arch obliquely. Clear blue starry sky. At 9 P.M. a faint arch having a direction from N.W. to S., and reaching both horizons; its greatest altitude about 70°. A dark cloud ranging along the southern horizon, and emitting pale light from its upper edge.

On the 7th the Declinometer fluctuated 1°, and the aurora was active in the evening. On the 8th the fluctuation was even greater. On the 17th the Declinometer ranged from 1° 20' to 6°, its motions being unusually great. On the succeeding day it fluctuated about 3°.

December 1.—At 7 A.M. no aurora. At 9 A.M. was able to write comfortably by daylight near the window. Sun hidden at noon by Fishery Island, but visible from a gentle eminence behind the house. Aurora invisible till 8 P.M., when an arch of yellowish lights about 16° high stretched from N.W. to N.E. The arch on a north bearing was a broad sheet of light, but near the N.W. horizon it was a twisted stem. Several broad pale sheets of white light. like the Milky Way, in the northern and eastern quarters of the heavens. At 9 P.M. the sky clear and starry, several arches of light springing from the N.W. horizon, and passing through the northern half of the heavens to the E.S.E. or S.E. by E. point of the horizon. The uppermost crossed the constellation of the Great Bear, passed a little south of Cassiopeia, and faded away in the S.S.E. Elsewhere some streams and banks of yellowish near the horizon. light existed. These arches vanished, and re-appeared at short intervals, and also moved from their sites, but had little internal motion.

December 2.—At 4 A.M. faint auroral light in the north and west. At 5 an auroral arch bearing south, at an altitude of 14° and extending for 160°. At 7 A.M. considerable deposition of rime on the thermometer scales. Arch of light bearing north, 16° high; also beams of light near the zenith. Dawn of day at 7, being an hour earlier than on the 30th November. Open water in the lake producing mist. At 6 P.M. auroral light near the northern horizon. At 8 and 9 P.M. faint auroral light, ditto.

December 3.—Mercury froze solidly this day. At 5 P.M. rays of auroral light in the north 10° high. At 7 P.M. an arc of the aurora in the east, and also one in the north-west, the middle part of the arch being deficient. Deep blue sky at 8, little activity in the auroral lights.

December 4.—At  $4\frac{1}{2}$  A.M. bright auroral arch, with patches of light in the W. At 6 A.M. patches of yellow light near the zenith, and also in the N.W. At 7 fragments of an arch shooting up from the N.W. horizon to near the zenith, and having a direction at right angles to the magnetic meridian. [At  $6\frac{1}{4}$  P.M. Dr. Rae, being then in latitude 67° 12' N., longitude 118° 16' 24" W., saw a falling star descending vertically on a nearly due north bearing, and passing a few degrees to the eastward of the pointers of the Great Bear.]

December 5.—[At  $6\frac{1}{4}$  A.M., in latitude  $67^{\circ}$   $7\frac{1}{2}^{\prime}$  N., longitude 117° 58', a falling star was observed by Mr. Rae, about 10° from the horizon, a little to the westward of north, travelling horizontally towards the east.] At 5^h 40^m A.M. an auroral arc, directed towards the east, rose from the west as high as the zenith. At 6 л.м. а bright beam of yellowish light rose from the N.E. horizon, to the height of 20°. At 7 first appearance of dawn. Mercury crystallizing in the open air in the middle of the day. At 5 P.M. faint beams of light rising from the N.W. to the height of 18°, vanishing and reappearing rapidly. At 6 P.M. a curve of auroral light, rising abruptly and interruptedly by steps in the N.W., continued to the S.E. in a parabolic curve, but formed throughout of slender vertical rays in motion. At 7 P.M. a faint belt of light crossed the zenith at right angles to the magnetic meridian. At 8 P.M. an arch crossed the zenith from N.W. to S.E., being nearly at right angles to the A few minutes before 9 P.M. a rather brilliant magnetic meridian. The light rose in the N.E. in successive steps, like the folds aurora. of a curtain hanging obliquely, and then dividing into three streams, held on across the zenith, and making a bold convex bend to the S., the ends curved to the N.N.W., but did not approach within 30° of The light had a yellowish colour, and a quick lateral the zenith. pulsation of the fine vertical rays of which the streams were composed.

December 6.—At 6 A.M. a broad beam of light rising from the N.W. horizon to  $30^{\circ}$ , and in the S. a dull bank of light occupying the space between the horizon and  $6^{\circ}$  altitude. At 9 A.M. was

1.

able to write near the window by daylight, and at 2^h 12^m P.M. was unable to do so distinctly,—the window looking S.S.E.

December 7.—Great refraction this morning. At 7 P.M. a slight burr round the moon. Faint streaks and bands of auroral light near the zenith, the masses mostly lying across the magnetic meridian. At 8 P.M. no aurora. At 9 bright moonlight. Blue sky, with stratus cloud near the southern horizon only, an auroral arch springing from the N.W. and crossing the magnetic meridian at right angles. It frequently changed place, being sometimes in the zenith and at other times more to the southward.

December 8.—Considerable refraction; distant land much raised. At 5 P.M. a stream of auroral light rising from the N.W., crossing the zenith at right angles to the magnetic meridian, but not going onwards to the S.E. Soon afterwards this stream moved to the southward and vanished. It had an internal waving motion. At 6 P.M. a broad arch of yellowish light, extending from N.W. by W. to S. by E., and having an altitude of 20° at its crown, rose from the N.W. horizon, and without anywhere exceeding an altitude of 20°,... bent round to the S. in a flexuose band, with obtuse projections to the E.S.E. It exhibited rapid changes of form, during which the suspended magnet vibrated 30', and the Declinometer was also in At 8 P.M. a broad sheet of light, including two brighter motion. arcs, now occupied the place of the above-mentioned band, but did not extend farther to the eastward than a south bearing. At 9 only a small part of an auroral arch remained, including merely one point of the compass, and bearing S.W. and S.W. by W.

December 9.—At 7 this morning, on approaching my hand to the iron latch of my bedroom door, a spark was emitted. I was then dressed merely in my night dress, with flannel drawers. At 9.10 A.M. able to read minion type of a bible by daylight. At 4 P.M. a series of bars of light, rising obliquely in the S.E. by E., and a similar steplike succession of bars in the N.W.; there was no continuous arch across the zenith connecting these two groups of bars, but in place of it a very narrow streak of light curved boldly and convexly to the north in the zenith, and a mass of yellowish light lay more to the south. At 5, 6, 7, 8, and 9 P.M. no auroral light. Moon very clear and bright.

December 10.—At 6 A.M. bright moonlight; no aurora. At 7 A.M. some thin sheets of light distributed irregularly, several of them in the S., S.E., and S.W., having a convergence towards the zenith. At this instant the suspended magnet was observed to be moving from 390' to 405', and, after vibrating somewhat irregularly in a mean arc of 10°, to settle for a time at 420°. The Declinometer was then 3° 17'. After recording this observation in the bedroom, and returning to the open air, the aurora had ceased to be visible, and the suspended magnet was found at 370'. A burr at this time round the moon. At 8 A.M. faint streaks of light near the zenith, stretching to S.S.W., or nearly in the magnetic meridian; these streaks vanished and reappeared with rapidity. Burr round the moon. At 9 and 10 mist near the horizon. At 11 and noon the sun below horizon, but beams of light shooting up from it into the sky. Full moon at 3^h 48^m this morning, Fort Confidence time. At 6 P.M. an auroral arch from N.W. by W. stretching across the zenith, and disappearing on a S.E. bearing. A burr round the moon, but the sky elsewhere cloudless blue. 7, 8, and 9 P.M. no aurora.

December 11.—At 5 and 6 A.M. no aurora. At 7 a faint burr round the moon; and at 8 and 9 paraselenæ. At 10 great refraction. At 11 redness in the sky above the sun's place, bright and circumscribed, the sun itself hid by Fishery Island. At noon a parahelion seen to the east, where the island is lower; the sun itself invisible. At 1 the same appearance, but less distinct. (At 6.15 P.M., in latitude 67° 6', longitude 118° 22', Mr. Rae saw a bright falling star in the west, making in its descent an angle of 45° with the horizon. It vanished when about 14° high. At  $6^{h} 40^{m}$  he observed another star falling from near the zenith towards the west, and passing to the south of Lyra. At 7^h 10^m he saw a falling star in the same quarter of the sky as the one he noticed at 6^h 15^m, and taking the same direction.) At 8 and 9 P.M., at Fort Confidence, an arch of clouds in the S.W., brightly illuminated by the moon, and not to be distinguished from some exhibitions of aurora in the absence of that luminary.

December 12.—[At  $2^h$   $32^m$  A.M., in latitude  $67^\circ$   $6\frac{1}{2}'$  N., longitude 118° 22' W., Mr. Rae saw a falling star descending almost vertically, or slightly inclined northwards.] At 6 A.M., at Fort Corfidence, the sky almost wholly overspread by a filmy stratus, which was rendered visible by the bright moonlight. Stars of the first magnitude visible through it. At 7 A.M. a general mistiness, with a deposit of fine snow. A dim lunar halo, with a semidiameter of 22°. Snow occasionally in the day. At 4 P.M. a broad yellowish auroral arch rising from the S.E. horizon, and passing south of the zenith in a S.W. direction, but terminating in a luminous cloud, at an altitude of 60°. At 5 P.M. two parallel arches of light rising in the S.E. and proceeding to the N.W., occupying a middle height between the southern horizon and the zenith. Considerable motion, resembling that which would be caused by a

340

dark bar carried with extreme rapidity towards the west in front of the light. At 6 P.M. the arches of the aurora rather lower and not in motion. Their crowns are in the magnetic meridian. At 7. P.M. an arch of the aurora bearing south, and reaching from the S.E. to N.W. its crown about 20° high. It was rather broad, yellowish, and nearly motionless. At 8 P.M. two broad and fainter arches, partly blended into each other in the south, about 12° high; also some masses of light near the zenith. At 9 P.M. the southern arch now reached from N.W. only to about S., where it terminated at the height of 25°. There was no auroral light in the S.E.; but five or six arches passed from N.E. to N.W., the uppermost of them crossing the zenith, and the lowest one running near the horizon.

December 13.—At 7 A.M, early dawn. No aurora until 9 P.M., when a broad arch of yellowish light in oblique bars extended between the N.W. and S.E. horizons, passing about 30° to the north of the zenith.

December 14.—No aurora in the morning. Some fine snow deposited about noon. At 6 P.M. sky greyish, but no visible clouds; a few stars shining out. A faint but broad arch extending from N.W. to S.E., appearing and disappearing in 'rapid succession. At 3 P.M. a belt of pale light about 10° broad, extending from N.W. to S.E. horizons, and crossing the zenith. Sky clearer and bluer, with more stars, but a fine snow continuing to fall;—the stars shining through the auroral light. At 9 minute snow. Sky not quite so clear. Arches of light bearing south, and some masses scattered over the sky.

December 15.—About a quarter of an inch of fine snow fell in the night. At 7, 8, and 9 A.M. lunar halos. At 10 A.M. there was a light air from the W.S.W. at the height of twenty feet, and one from the N.N.E. nearer the ground, as shown by a zig-zag column of smoke from our chimney. At 6 P.M. O Sextantis occulted by the moon. No aurora this evening. Deep blue sky, with many stars. Fine spiculæ of snow falling thickly.

December 16th. — At 5 P.M. a sheet of pale light like the Milky Way, overspreading the southern half of the sky, with dark, narrow, oblique bars crossing it. The rapid shifting of these dark bars across the light showed it to be the aurora, otherwise it might have been thought to be twilight lingering in the sky. At 6 P.M. faint streaks of aurora rising from the N.W. horizon to past the zenith in a S.E. direction, but ending short of the Pleiades. In a few minutes this stream changed into several fainter rivulets, having the same direction, and occupying greater breadth in all. Sky dark blue, and starry. At 10 P.M. a broad luminous arch in the south.

December 17.—At 1 P.M. temperature of the atmosphere,  $-61^{\circ}$ . Long prismatic crystals were formed in nitric acid, having the strength recommended in the London pharmacopeia, and at 3 P.M., when the temperature had fallen to  $-63.8^{\circ}$  Fahrenheit, almost the whole of the acid in the vial (2 oz.) was frozen. Sulphuric acid had frozen solidly long before. Mercury at this time could be cut with a knife more easily and more smoothly than lead. At 7 P.M. two bright auroral arches to the southward, having a curtain-form, and a rapid to-andfro bar-like movement; the highest was 20° from horizon. At 8 only a few patches of dull light in the south. At 9 two bright arches in the south; very changeable. They reached from W. to S.S.E., but did not in general rise above 20°. Sometimes they appeared as if twisted and bent or broken, occasionally sending shoots down towards the horizon, and exhibiting in their upper borders the quick bar-like motion, with fringes shooting upwards ometimes to the extent of 15° or 20°, or nearly half-way to the zenith. The Declinometer varied 35' between 8 and 9. The temperature of the atmosphere was now  $-61^{\circ}$  Fahrenheit; the nitric and sulphuric acids, and of course mercury, remained solidly frozen. Muriatic or hydrochloric acid was perfectly fluid.

December 18.—At 5 A.M. beams of aurora in the west. The temperature of the air at 9 A.M. was  $-63^{\circ}9^{\circ}$ , being the lowest observed in the winter.* Sulphuric acid had an opake white colour. At 6 P.M. a slender auroral arch from N.W. to S.E. passed across the zenith. At 7 and 8 no aurora. At 9 faint beams of light shooting towards the west from near Cassiopeia. The mean temperature for forty-eight hours was  $-61^{\circ}$  Fah., or  $93^{\circ}$  below the freezing point of water. We had travelling parties out at this time.

December 19.—At 7 A.M. two beams of light rising in the west, one of them taking a course to the S.E., the other diverging from it to the E., or E. by N. They did not reach the meridian, but approached it. At noon the suspended magnet was vibrating irregularly. At 7 P.M. two broad arches crossed the zenith from N.W. to S.E. Sky generally bluish-grey. Abundance of stars overhead; none within 20° of horizon. No other sign of clouds. At 8 P.M. five broad streams of light rising in the E.S.E., and diverging in their ascent so as to spread over most of the sky. The light more dilute towards the edges of the streams, which in some points touched each other. The central streams crossed the zenith. The arches were rapid in their changes of form and extent.

* A spirit thermometer by Nosotti, constructed probably in the ordinary way alluded to by Professor Forbes at page 40, stood at  $-81.5^{\circ}$ , having sunk nearly to the bulb.

December 20.—At 10 A.M. could not write by daylight at this hour. Sulphuric acid freezing partially at a temperature of  $-8^{\circ}$  Fahrenheit. Nitric acid limpid. At 6 P.M. faint auroral light in the north. At 7 no aurora. At 8 P.M. faint arches rising N. by W., and extending towards the south. At 9 two faint arches of light in the south, having an altitude of 14°, and 6° at their crowns. At 10 the arches had an altitude of from 40° to 45°. At midnight patches of auroral light scattered over the sky.

December 21.—At 1 A.M. stars shining very brightly. A brilliant aurora in rapid motion, and momentarily changing its form. Its lower edge had a fine lake colour, and it was brightest on the S.W. and the W. bearings. At 2 A.M. a very bright display of auroral light. Declinometer and Dipping Needle vibrating much. At 4 A.M. faint beams of aurora in the north. At 6 A.M. curtain-shaped aurora extending north and south, with active motion. At 7 A.M. no aurora. Light variable winds. Temperature, 47^{'3°}. At 7 P.M. a faint auroral arch rising from the N.W. to past the zenith. At 8 P.M. an auroral arch rising from the S.E. for  $35^{\circ}$ ; some short beams in the N.W. At 9 P.M. a beam of light in the north.

December 22.—No aurora observed in the morning. At 5 P.M. beams of light on a S.E. bearing, and some also bearing N.W. At 6 P.M. beams in the same quarters more faint. At 7 P.M. faint auroral light bearing north. At 8 an arch of faint light crossing the zenith from the N.N.W. to the S.S.E. At 9 P.M. an arch 10° high in the S.W. extending from S.S.E. to N.N.W.

December 23.—At 5 A.M. a broad arch of light standing from W.N.W. to E.N.E. and crossing the zenith. At 6 A.M. faint rays of light in the N.W. and also to the east. At 7 A.M. an arch of light 6° high bearing S.S.W. Was able to write by daylight, when close to the window, this day for  $4\frac{1}{2}$  hours, viz., from 10 A.M. to  $2\frac{1}{2}$  P.M. At 5 P.M. auroral light rising vertically from the north horizon. At 6 P.M. a broad, irregular, and broken arch of light having a direction from N.N.W. to S.S.E., and passing south of the zenith. Its greatest altitude, 45°. At 7 P.M. a mass of light in the S.S.E. about 6° high. At 8 P.M. beams of the aurora in the south and S.W. At 9 P.M. auroral light bearing S.S.W.

December 24.—At 6 A.M. rays of light rising vertically from the eastern horizon. At 7 A.M. a faint auroral arch, its crown bearing north, and having an altitude of 12°. Another arch bearing S.W. with an altitude of 7°. At 10 A.M. stratus cloud along the E.S.E.; horizon beautifully tinged red by the sun's light. Intervals of

mountain green sky in that quarter. Rest of the heavens grevish blue. At noon the sky very bright on the southern meridian for some distance above the horizon. The southern sky retained the red tints of a rising and setting sun from 10 A.M. till 2 P.M. At 6 P.M. an arch of light formed of oblique rays crossed the zenith and reached the N.W. and S.E. horizons. At 7 P.M. a similar arch in the same portion, with its tranverse bars in motion. Masses of light near the horizon all round the sky. At 8 P.M. curtain-shaped, interrupted arcs of light directed across the magnetic meridian at right angles. One of them lay a little to the south of the zenith; the others were situated a little more to the northward. The arches were separated from each other, and also interrupted in the direction of their lengths, by vertical dark spaces, which were continually changing their places and dimensions, but did not exhibit the rapid to-and-fro bar-like motion so conspicuous on other occasions. Stars moderately bright. New moon. At 9 P.M. there existed five handsome curtain-formed arches more or less twisted and uneven. One crossed the zenith; the rest were more to the southward. They occupied the whole southern half of the sky, and were directed at right angles across the magnetic meridian. The brightness of the arches varied continually, and they were occasionally connected by beams of light shooting between the contiguous arches.

December 25.-At 5 A.M. snow drift. Masses and beams of light bore E. and N.W. At 6 A.M. an auroral arch whose crown, 6° high, bore S.W. At 7 beams of aurora in the N.E. having a direction to the S.W. At 8 A.M. dawn. At 5 P.M. a bank of auroral light extending near the horizon from the N.W. by N. point of the compass round to N. and onwards to E. by N. Numerous beams shot up from it to the height of from 8° to 12° or 14°. At 6 P.M. rounded and oblong patches of auroral light near the zenith, and also in other quarters of the sky, particularly in the north. A bank of light lying along the southern horizon. At 7 P.M. faint patches of auroral light. At 8 P.M. a horizontal band of light at the height of 30° in the north. A stream of brighter light rising in the north joined the west end of the band. Faint patches of light existed elsewhere. At 9 A.M. irregular masses of aurora-like columns of mist resembling smoke in various parts of the sky; the most conspicuous are rising from the N.W. by N. points of the horizon.

December 26.—At 4 A.M. a fine auroral arch having an extent of 80° and rising in the south to an altitude of 20°; also masses of light in the east and vertical beams in the N.N.W. At 5 A.M. faint rays having a N.N.W. and S.S.E. direction. Their changes of position were rapid. At 7 A.M. aurora in masses and beams in the S.W.

quarter of the sky. Faint appearance of dawn in the east. At 7 P.M. two faint arches crossing the zenith and having a direction of from S.E. to N.W.

December 27.—At 21 A.M. a patch of light in the N.W. at an altitude of 45°. At 7 a narrow arch crossing the zenith from the eastern to the western horizon. At 4 P.M. temperature of the air, -43'9° Fahrenheit. Nitric acid crystallized in beautiful clear crystals. At 6 P.M. a broad, yellowish, quiescent arch, extending from the N. by W. horizon to the N.E. one. Its summit not rising more than 9°. Many rounded cloud-like patches of polar light between Cassiopeia and the Great Bear. At 7 P.M. the arch near the northern horizon continued, and there was an inverted cone of light, having its base elevated 12°, and its apex touching the N.W. horizon. Also some patches of light near the zenith. At 8 A.M. the arch in the north less complete and less bright. Large masses of yellowish light lying a little to the west of the zenith. Some beams rising from the S.E. horizon and a solitary one from the N.W. At 9 P.M. two bright arches springing from the N.W. by N. point of the horizon, and spreading wider as they rose towards the zenith, where they covered 40°; thence narrowing as they advanced to the S.E.

December 28.—At 5 P.M. masses of pale light in the north forming a low, broken arch. A few patches to the north of the zenith. At 7 a dull yellowish arch from the N.W. to S.E. passing to the north of the zenith. No clouds visible, but only stars of the first magnitude shining out. At 8 P.M. the same arch, more interrupted and also connected with large cloud-like patches of light. Sky dullish, not cloudy. At 9 no aurora.

December 29.—At 4 A.M. an arch of light standing across the zenith, with patches in the S.W. and N. by W. At 5 A.M. faint patches in the east and north and near the zenith. At 6 A.M. no aurora. At 4 P.M. sky tinged yellowish in the western horizon by the sun's rays, though that luminary was considerably under the horizon. At 7 P.M. an arch of light from N.W. to S.E. passing a little to the north of the zenith. It was barred across near the zenith by layers of stratus cloud. At 8 P.M. the extremities of the arch had the same bearings, but its crown had passed to some distance south of the zenith, against the wind. At 9 P.M. five arches covering the sky from  $30^{\circ}$  north of the arches converged in the N.W. and S.E. points of the horizon. Some internal motion existed in the arches.

December 30.—At 5 A.M. auroral rays rising vertically from the N.N.W. horizon. At 6 A.M. an arch of light crossing the zenith

from east to west. At 7 A.M. an arch from W.N.W. to S.S.E., rising about 20° above the southern horizon. A cloud-like patch of light in the N.W. by W. near the horizon, and a slender curved stream passing from the same point towards the arch. A pale sheet of light diffused over the northern half of the sky, and widely spread in the east also. At 9 temperature of air  $-39.6^{\circ}$ . Mercury wholly Nitric acid solidly crystallized. Sulphuric acid solid, and fluid. semitranslucent. Hydrochloric acid fluid. At 10^h 40^m temperature of the air  $-40.5^{\circ}$  Fahrenheit.* About the fifth part of the mercury exposed in a shallow basin frozen; the solid part lying at the bottom, and having serrated edges as usual. At 11 A.M. rays of light shooting up from the sun's place. The men who went for meat two days ago, in passing over a hill saw the sun a good way above the horizon. At 2 P.M. a bright vertical beam of light rose from the sun's place. The quantity of frozen mercury has rather increased, the temperature of the air having been for two hours  $-39.5^{\circ}$  Fahrenheit. At 4 P.M. red sky in the S.W. At 5 P.M. broad vertical beams of auroral light in the north, extending from N. by W. to N. by E., separated from each other by considerable intervals of blue sky, but arranged so as to form a low interrupted arch, whose summit was 18° high. The westernmost beams were midway between the horizon and Great Bear. At 6 P.M. the interrupted arch in the northern sky had risen to the elevation of 35°. It was broadest and brightest in the N.E. At 7 P.M. two bright contiguous arches, emitting yellowish light, spanned the sky from N.W. to S.E., the uppermost of the two crossing the zenith. Their breadth varied greatly, and their limbs in approaching the horizon were much curved and twisted. At 8 P.M. a bright arch crossed from N.W. to S.E. passing above 20° south of the zenith. It was composed of oblique beams of yellowish light, and was twisted near the horizon. Two pale arches, of the intensity of the Milky Way, and covering about 30° in breadth, existed to the north of the zenith. At 9 P.M. two arches springing from the N.W. by N. part of the horizon, became fainter as they rose to near the zenith, where one disappeared; the other, passing a little north of the zenith, was prolonged to the S.E.

December 31.—At 5 A.M. rays of light bearing S. and S.W., in rapid motion. At 6 A.M. patches of light and rays in the S., S.W., and W. near the horizon. At 8 P.M. vertical beams of light in the N., and N.W. by N., and a horizontal bank bearing north. At 9 P.M. an obscure but broad arch of the aurora bearing south,

^{*} The temperatures noted in these remarks were corrected for the error of the thermometer on the assumption that  $-40^{\circ}$  is the proper freezing point of mercury. The temperature actually read off at  $10^{h} 40^{m}$  A.M. was  $-36\cdot8^{\circ}$  F.

with large inactive masses of light a little way above it. Stratus cloud running all round the horizon.

On the 1st of December the Declinometer fluctuated 1°. On the 20th the fluctuation amounted to  $1\frac{1}{2}^{\circ}$ , the sky being cloudless, but a deposition of crystals of ice on glass and rough metallic surfaces going on. On the 10th the fluctuations of the needle exceeded a degree. On the 18th it was as great. On the 26th it was  $1\frac{1}{2}^{\circ}$ . On other days it was generally below a degree, as may be observed by a reference to the table of variations of the Declinometer, the most remarkable movements only being pointed out in this summary.

On the 4th January 1849 the Declinometer fluctuated 1°. No aurora was visible, a thin haze overspreading the sky in the evening. During the low temperatures of the 6th and 7th there was little fluctuation of the needle. On the 11th the movement of the card exceeded a degree, and in the evening sheets of auroral light, with considerable changes and flashes, overspread the sky. On the 16th the needle moved 2°. Only faint appearances of aurora were observed, and the sky was perfectly cloudless all day and in the evening. On the 25th the movements of the needle again exceeded a degree; the sky was completely obscured. A fine snow fell in the evening, and no aurora was visible. This was one of a number of instances in which the needle was observed to be affected considerably when the sky was inclined to deposit a minute crystalline snow.

The aurora was comparatively seldom seen in this month. It was noticed at the hours of observation, only on the 10th, 11th, 14th, 15th, 16th, 17th, 19th, 20th, 22nd, 23rd, 24th, 27th, 28th, and 30th.

February, 1829.—The aurora was visible at one or more hours on the 1st, 2nd, 10th, 11th, 12th, 13th, 16th, 17th, 19th, 20th, 21st, 23rd, 24th, 25th, 26th, and 27th.

On the 13th the movement of the Declinometer exceeded 1°. Mackarel sky, with sheets of auroral light. On the 20th the movement was  $1\frac{1}{4}^{\circ}$ , and there were considerable displays of auroral light at all the hours of observation in the evening. On the 21st, at 3 A.M., the temperature of the air in the shade, when corrected for the error of the thermometer for the freezing point of mercury at  $-40^{\circ}$ Fahrenheit, was  $-56^{\circ}7^{\circ}$  Fahrenheit. At this time an ounce of nitric acid, which had been standing in a vial with a glass stopper in the open air all night, was fluid; but at 5 A.M., when the temperature of the air was  $-56^{\circ}4^{\circ}$ , it was solidly frozen. Sulphuric acid was also at the latter time frozen, and its upper part of an opake white colour. A bottle of creosote (4 oz.), which had been out of doors all day, began to show round opake balls at the bottom. At 4 P.M., the tempe-

rature of the air having then risen to -35 7° Fahrenheit, two or three round flat cakes existed at the sides also of the creosote bottle; the rest of the fluid was transparent, but thicker than usual. Each of the round patches was marked with concentric rings of a darker colour, like the frond of *ulva pavonia*, or a section of maple wood. At 7 P.M. these cakes had augmented in size, and had a central point. The appearances of the aurora this day are detailed in the term day observations.

On the 22d February the fluctuation of the Declinometer amounted to  $1\frac{1}{2}^{\circ}$ , the sky being overcast most of the day and no auroral light visible. On the 23rd at 3 P.M. the phials of sulphuric and nitric acids and of creecote were wholly frozen, the temperature of the air being  $-39^{\circ}$  Fahrenheit, and colder than it had been previously in the day. On the 27th the fluctuation of the Declinometer was  $1\frac{1}{2}^{\circ}$ and there were some curtain-shaped, arch-like displays of the aurora.

March 1849.—The auroral light was visible on the 1st, 3rd, 6th, 8th, 11th, 12th, 14th, 15th, 17th, 18th, 19th, 20th, 21st, 22nd, 24th, 25th, 26th, and 30th.

The fluctuation of the Declinometer amounted to 1° on the 6th. The sky was wholly obscured most of the day, but in the evening there was an arc of aurora extending from the N.W. to the S.E. horizon, and passing about 50° south of the zenith; the sky then being almost cloudless and Venus shining most beautifully. On the 18th the next fluctuation of the needle to the same extent was observed, the displays of aurora being very faint, and in the southern quarter of the sky. On the 19th the Declinometer varied more than 2°. At 9 P.M. an arch of the aurora sprang from the N.W. horizon, and, passing over the zenith, descended to the S.E. On the 20th the fluctuation was  $1\frac{1}{2}$ °. A cloudless sky with streams of auroral light and long fringes in the S.E. part of the sky. Also at 10 P.M. curtain-like expansions, rolling occasionally inwards like a scroll, and expanding again.

On the 21st the fluctuation of the Declinometer at the hours was more than  $1\frac{1}{2}^{\circ}$ . The appearances of the aurora are detailed in the term day observations. On the 22nd the Declinometer varied more than  $1\frac{1}{4}^{\circ}$ , and a few patches of aurora early in the morning were all that were seen; the sky remaining perfectly cloudless the whole 24 hours. On the 24th the Declinometer varied 2°. The sky was obscured wholly till 7 P.M., when it cleared up entirely, and as had been observed in such cases, the north end of the needle then moved more towards the east. The displays of the aurora in the evening were faint.

348

April 1852.—From the extent of daylight in this month the aurora was seldom seen before 10 P.M., at which hour our observations ceased for the day. It appeared, however, on the 4th, 8th, 13th, 14th, 15th, 18th, and 21st. The Declination observed by eight sets of azimuths in the fore and afternoon of March 31st, was found to be  $50^{\circ}$  16' 52 '7" easterly, the Declinometer being 4° 22'. On the 16th the Declination was by the mean of six sets of azimuths, 51° 58' 52", the north end of the Declinometer having at the time a mean direction of 3° 37'. The needle fluctuated much during these observations. On the 21st the mean variation deduced from six sets of azimuths was 49° 54' 36" E., the mean direction of the north end of the Declinometer being 4° 25' The mean easterly variation by the three series was 50° 44' 14 '2", and the mean direction of the north end of the Declinometer during the observations for azimuth, 4° 04 '1'.

On the 2nd of April the fluctuation of the Declinometer was 2° 28', the sky being obscured the whole day, and no aurora visible. On the 3rd the fluctuation was  $1\frac{3}{4}^{\circ}$ , the sky continuing obscured, On the 4th the sky was nearly cloudless the whole without aurora. day; only a faint arch of aurora at one time in the evening; but the fluctuations of the needle were 3° 40' in the day. On the 6th the fluctuation of the Declinometer exceeded 1°. The sky, which was cloudless all day, was obscured after sunset. On the 9th the Declinometer fluctuated 31°. The sky was partially cloudy in the day, quite cloudless after sunset, and no aurora was seen. On the 10th the fluctuation exceeded 1°. The sky, as on the preceding day, being cloudless till 7 P.M.; after which it was more or less cloudy, but no auroral light was seen. The red tints of the setting sun had scarcely departed entirely from the sky before 10 P.M., when our observations ceased. On the 14th, the Declinometer varied more than 1°. The sky was wholly cloudless till 10 P.M., when three-tenths of the vault was cloudy, and an auroral arch crossed the zenith, having a direction from N.W. to S.E. On the 16th the fluctuation of the needle exceeded 11°; the sky being almost wholly covered with clouds till 10 P.M., when seven-tenths of it was cloudless; no aurora was seen, On the 18th fluctuation to the extent of  $1\frac{1}{2}^{\circ}$  occurred. The sky was wholly cloudless, and a faint auroral arch was seen at 10 P.M. in the usual direction, or crossing the magnetic meridian at right angles. Daylight not wholly gone, and the red tints of the western sky extensive.

On the 19th the Declinometer varied 1°. A cloudless sky, and no aurora. On the 20th the fluctuation was also about 1°, the sky being wholly covered with clouds till 10 P.M., when it cleared up, nine-tenths becoming blue, but no aurora was seen. On the 21st the Declinometer varied  $1\frac{1}{4}^{\circ}$ , and very suddenly at 9 P.M., when the sky, after being quite cloudless, had become rapidly overspread. Some of the clouds resembled auroral arches; but emitted no light, the daylight not having gone. At 10 P.M. auroral arches contended with the twilight, and half an hour later their peculiar light was more apparent. After this date no aurora was recorded, the daylight being too powerful for its display at 10 P.M. The degrees of the thermometer could be read in the open air by daylight between 9 and 10 P.M. on the 23rd. The fluctuations of the Declinometer exceeded a degree on some of the subsequent days of the month, as may be perceived by a reference to the tables.

On a review of the observations made during the seven months, many instances of the simultaneous occurrence of fluctuations of the needle with movements in the auroral light were noticed; but there were also examples of fluctuations of the needle in the absence of the aurora, and very numerous ones of brilliant auroras accompanied by a stationary or sluggish needle. I cannot therefore venture to ascribe the movements of the needle in any case to those of the aurora, or to any particular direction of the beams and arches. I think, however, that the needle varied more frequently during the sudden formation of clouds than at other times; and I am also inclined to say that the formation of clouds often followed brilliant and active auroras. It is a popular belief in the fur districts that very fine displays of the aurora presage windy weather.

With respect to sounds of the aurora, the belief prevails in the arctic regions that it is occasionally audible when very bright and active, at which times it is believed by the natives to be near the earth. Having witnessed the phenomena some thousands of times without hearing it, I have become sceptical of its ever producing sounds audible on the surface of the earth. The sounds it is said to cause are likened by many to the rustling of silk; and I may observe that the curtain-like appearances and motions of the brightest auroras are likely to be associated with the remembrance of such sounds, and also that the formation of minute icy spiculæ in very cold clear nights is accompanied by a crackling in the air.

Haslar Hospital, 12 January, 1852.

The temperature observed in December is reduced to 32° Fahrenheit,

and corrected for deviation from Paris Standard Thermometer.

### FORT CONFIDENCE-continued.

# Abstract of Hourly Observations in the months of January and February 1849

	FORT CONFIDENCE—continued.
ruary 1849.	Abstract of Hourly Observations in the months of January and February 1849.

METEOROLOGICAL OBSERVATIONS.

Day.	Centigrade Thermometer, attached to Delcros's Barometer corrected												for mean deviation from Paris Standard Thermometer, and reduced to Fahrenheit Scale.

Calm Hours -	27	15	49	58	75	63	7	294

Table of the Mean Force of the Winds at Fort Confidence.

The force of the wind is denoted by figures, as recommended by Rear-Admiral Sir Francis Beaufort, K.C.B. Thus, 12 denotes a hurricane, 11 a storm, 10 a whole gale, and 1 a light breeze, just perceptible. It will be observed, by looking at Table, that though the N.E., East, and E.S.E. winds were most frequent, they were comparatively light, and that the N.W. winds were stronger.

### TABLE III.

Table of the Mean Extent of Cloudy Sky at Fort Confidence for each Month, and for Seven Months, with the Number of Hourly Observations.

Periods.	October.	November.	December.	January.	February.	Márch.	April.	Seven Months.
Proportions of cloudy sky -	8.42	6'25	2*34	4*87	<b>4</b> *65	<b>3*</b> 74	4*36	<b>4</b> •95
No. of ob- servations	} 241	492	510	557	502	534	¢ 515	3,351

Note.—A sky totally covered with clouds, whether rare or dense, or obscured by mist or snow, so that the blue sky is wholly hidden, is denoted by 10.00.
