                 Visible aurora.
 ^b This day is omitted from the Mean at the foot as being imperfect.
 Means by the observations furnishing complete 8-hourly series. ^d Takon eight minutes late.

# MAGNETICAL OBSERVATIONS.

# LAKE ATHABASCA-continued.

Abstract of Hourly Observations made during the months of November and December 1843.

October, 15^d 21^h, Gött.—Faint aurora in hands from W. to F. 22^h. Fuint diffused aurora both N. and S. of the zenith, in motion. 23^h. Aurora brighter, and gathered tow corona near the zenith at 16^d 0^h. Two parallel arches of aurora in the N., brightest at the extremities E. and W., and striated. At 1^h, brightest portion of aurora to the S. of the zenith ; faint auroral bands in the E. 2^h. Very faint aurora still visible in the E. Co-ordinate mean values, declination, 413' 3; bifilar, 257' 1; inclinometer, 133' 8,  $\begin{array}{c} 0.147\\ 0.082\\ 0.082\\ 0.134\\ 0.096\\ 0.050\\ 0.025\\ 0.004\\ 0.0010\\ \end{array}$ 2000 0048 0006 .0074 ١,  $\begin{array}{c|c} +3.0\\ 119.2\\ 2225333442\\ 2225333544\\ 2225333544\\ 2225333554\\ 222533356\\ 22253333554\\ 22253333556\\ 22253333556\\ 22253333556\\ 22253333556\\ 22253333556\\ 22253333556\\ 22253333556\\ 22253333556\\ 222533356\\ 222533356\\ 222533356\\ 222533356\\ 222533356\\ 222533356\\ 22253356\\ 22253356\\ 22253356\\ 2225356\\ 2225356\\ 2225356\\ 2225356\\ 2225356\\ 2225356\\ 2225356\\ 2225356\\ 2225356\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\ 222556\\$ + 2256.7 2256.7 2256.9 2275.1 2275.1 2275.1 2275.1 353.5 353.5 253.5 253.7 253.7 253.8 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 253.7 132°5 123°9 86°9 115°1 115°1 134°1 134°1 134°1 135°5 155°6 155°6 ò 80 243 150. 0048 0054 0055 0065 0065 0025 0039 0039 0039 0057 0057 0057 · C015 - IRREGULAR FLUOTUATIONS.

 $\mathbf{234}$ 

ATHABASCA, 1843.

LAKE

MAGNETICAL DISTURBANCES,

IRREGULAR FLUCTUATIONS.

235

16⁴ 18⁴. Bright arch of aurora in the N. 19⁴. A broad arch or band of aurora extending across the zenith; a brighter arch to the N. 20⁴. A very faint arch of aurora in the north. 21⁴. A faint auroral arch extending from N.E. to N.W., brightest at the extremities; a few faint detached patches in the N.W. 22⁴. Arch less distinct; a broad hand of aurora to the S. of the zenith. 23⁴. Appearance of aurora nearly the same as before. 17⁴ 0⁴. Auroral arch much brighter than before at its N.W. extremity. 1⁶. Faint arches or bands across the meridian in the zenith.

## IRREGULAR FLUCTUATIONS.

Oct, 17^d 15^h. Faint auroral arch, clevation 12°, extending from N.E. to N.W. 16^h. Arch stationary, appearance of aurora little changed. 17^h. The same as before, 18^h. Arch slightly risen, altitude 17°, and broader. 19^h. Arch rising ; at 19^h 6^m began to break up into waves in quick motion, but receded from the zenith to the N. 20^h. Detached masses of aurora resembling circous clouds in the zenith, and to the S. ard E., which disappeared before 20^h 40^m. 23^h. Faint circous aurora visible.

Magnetical Disturbances, Lake Atlabasca, 1843-continued.

fainter at elevation 13°. 17b. A faint auroral arch, elevation 5°, to the East of North. 18^b. A faint auroral arch at an elevation of 37°, lightly overcast to the South. 19^b. A faint auroral arch, elevation 5°. 20^b. Aurora in heavy masses of moderate brightness, in little motion, long streamers extending to the zenith. 20^b 40^m. Two long beams nearly stationary, altitude 54° and 60°, brightest to westward of the zenith favouus masses and unconnected streamers in N.N.W. and N.E. 21^h. Aurona faint, diffused like thin vapour, in the zenith, with moderate rapid motion to the E., streamers somewhat brighter in the N, faint streamers and factous masses to the E. and N.W. 29th. Aurora very faint, streamers screely perceptible. 22^h 30^m. No aurora vibible. 27^h O.⁴ Affeeh display of antora, ising rapidly from the northern horizon and extending itself from an altitude of 20° N. to 40° S.; at 0^h 30^m. No aurora vibible. 27^h O.⁴ Affeeh display of antora, ising rapidly from the northern horizon and extending itself from an altitude of 20° N. to 40° S.; at 0^h 30^m. No aurora vibible are arous bright aurora in flexuous masses to S. and S.E. of the zenith, an arch at elevation 36° extending from N.E. to N.W. 27^d 1^h. Lightly clouded to S, and E.; patches of aurora of various brightness; at 1^h 5^m a large mass of aurora passing to the zenith, where it became faint, in flexuous streaks, without perceptible motion. 2^h. No aurora.

									n 4

242

Magnetical Disturbances, Lake Athabasca, 1843--continued.

IRREGULAR FLUCTUATIONS.

243

Correction to declinometer differences,  $+0^{\prime}$ . 50.

Co-ordinate mean values, declinometer, 416'1'; bifilar, 207'6; in linometer, 120'4.

Clouded, with snow.

## SIR JOHN RICHARDSON'S MAGNETICAL OBSERVATIONS

#### REDUCED AND DISCUSSED

## BY CAPTAIN YOUNGHUSBAND, R.A.

THE Magnetic Instruments supplied to Sir John Richardson for observation in North America were—

1. An Azimuth Compass.

2. A Declinometer for observing Changes of Declination.

3. An Inclinometer, fitted with Deflection Apparatus. This instrument is constructed for observing the Magnetic Inclination or Dip in the usual manner, and then, by deflecting the dipping needle by another magnet, results are obtained from which (combined with an observation made with the Unifilar) the total force can be obtained in absolute measure.

4. A Unifilar Magnetometer for determining the absolute Horizontal Force, and to be used as a Declinometer in observing Changes of Declination.

Instructions for the use of these instruments in the observations recommended to be made with them were contained in the following letter and memorandum addressed by Colonel Sabine to Sir John Richardson previous to his starting on the expedition:—

## From Colonel SABINE to Sir JOHN RICHARDSON.

My dear Sir, I hope that you will find the subjoined directions sufficient for the use of the magnetic instruments with which you are supplied; and it remains only that I should indicate to you the points which it appears to me are most deserving of your attention.

1. Azimuths everywhere; we cannot have too many determinations in the quarter to which you are going, on account of the convergence of the lines, and the importance of ascertaining the point or points towards which they converge.

2. I hope that you will find the Declinometer of service in enabling you to record some of the principal disturbances of the Declination during your winter residence. It will in particular enable you to observe the movements of the magnet accompanying momentary auroral phenomena.

3. The diurnal variation of the Declination, both in amount and in turning hours, would be an important determination, especially if you should find it convenient to determine them for each of the months of winter and of spring.

4. The determination of the Horizontal and Total Forces in absolute measure at your winter residence, is of an importance which I will venture to say will recompense all the time you bestow upon it. It would probably be referred to for centuries to come in connexion with the secular changes of the magnetic elements.

5. If you should be able, without too great a sacrifice of time or convenience, to obtain a second good determination of the absolute total force in a longitude more to the east than your winter residence, say between  $90^{\circ}$  and  $100^{\circ}$  west longitude, it will be extremely valuable. You will see by the directions that this may be done without carrying about the Unifilar Magnetometer.

Most cordially wishing you and Doctor Rae health for your noble enterprise, and a safe return to England, either with Sir John Franklin, or to be welcomed by him on your route.

I remain.

Sincerely yours, EDWARD SABINE.

#### MAGNETIC DIRECTIONS for Sir JOHN RICHARDSON.

Woolwich, 22d March 1848.

The magnetic instruments furnished to Sir John Richardson are four in number; viz.

An Azimuth Compass.

A Declinometer.

A Dipping Needle, with Deflection Apparatus.

A Unifilar Magnetometer.

1. Azimuth Compass.—No directions respecting this instrument are considered necessary, except the caution that the magnet should always be lowered very gently on its support, for fear of injuring either the cup or the point, which are very carefully worked. The point is of steel, and a spare one is also sent which is of iridium. When azimuths are observed, the wooden stand on which the instrument is placed should be correctly levelled.

2. Declinometer.—This instrument is intended to serve the double purpose of observing the diurnal variation of the Declination and the fluctuations of the Declination in times of magnetic disturbance. The magnet may be used either on a point or suspended by a silk thread. The point support is preferable, except it should be found that in very high magnetic latitudes the friction on the point impairs the free movement of the magnet, and thus prevents its taking up its true direction. In such case the silk suspension must be resorted to.

The instrument being placed on its support, the bottom plate levelled, and the suspension tube in its place, screw in the steel point, place the magnet upon it, and fit on the top cover; then raise the point support (and with it of course the magnet) until the opposite portions of the graduated ring are seen in good focus in the two microscopes. The instrument is then ready for use.

If it is found that the magnet when resting on the point does not return after vibration in small arcs to (nearly) the same division in successive trials, it may be necessary to employ the silk suspen-In such case, the magnet resting on the point support, lower sion. the support as far as it will go, lift the magnet off it, lower the screw attached to the thread, so that there may be no danger of breaking the thread whilst the screw is fastening; having then attached the magnet by the screw to the suspension thread, replace the magnet on the point support and raise the support as high as it will go, then shorten the thread until the magnet is relieved from the support and lower the support; now examine if the magnet must be either raised or lowered (by the thread), in order that the graduation on the ring may be in focus. When in focus, examine whether the suspension be truly central as regards the microscopes; it is so when the ring is seen in each microscope in about the same part of the field, and when precisely opposite divisions of the ring are cut by the two microscope wires. If this adjustment be not. correct, make it so by moving the suspension either way by means of the adjusting screws which act on the suspension tube; fasten on the top cover, and the instrument is ready for use.

The magnet and ring are correctly balanced at present for the Dip at Woolwich; in any other Dip the balance may require to be adjusted afresh, by means of the cross of wires attached to the magnet. This adjustment is proved by the graduation being in distinct focus in both microscopes at the same time:  $1^{\circ}$ , when the magnet is in its natural position; and  $2^{\circ}$ , when it is deflected by another magnet 90° from its natural position. The instrument must be correctly levelled when this adjustment is made.

When the magnet is suspended by a silk thread the influence of torsion should be ascertained in the usual manner, *i.e.* by turning the torsion circle through an angle of  $90^{\circ}$ , first in one direction and then the other, and noting the difference of the readings in the microscopes in the three positions of the torsion circle, viz., before the torsion circle is turned, and when it is turned  $90^{\circ}$  on either side.

The agreement or otherwise of the diurnal variation observed by this instrument and by the Unifilar Magnetometer will assist in judging whether the friction on the point support operates unfavourably or not.

3. A Dip Circle, with Apparatus for Deflection.—This instrument is to serve the double purpose of observing the Dip, and of determining the ratio of the magnetic moments of each of the two 3 67 inch magnets of the Unifilar Magnetometer to the total force of the earth's magnetism. As the latter determination is novel, and as circumstances have prevented Sir John Richardson's practice with the instrument, full directions may be required.

Two dipping needles are supplied, A 1 and A 2; both are to be used and the same observations made with each. I shall therefore describe the process with A 1, only premising that a precisely similar process is to be pursued with A 2.*

4. If Sir John Richardson should have leisure to make a determination of the Total Force at any other than the winter station, deflections of the dipping needle will suffice, and the Unifilar Magnetometer

need not be employed on that occasion; but the values of m X and  $\frac{m}{X}$ 

must be ascertained by experiments with the Unifilar Magnetometer, either at the same or some other station, as soon after as leisure and circumstances will permit.

Be very careful at all times to pack the magnets S and C with their *opposite* poles adjacent to each other, and attend to the same precaution with the dipping needles A 1 and A 2. The deflecting tube and its counterpoise are only to be screwed on the vernier plate during the experiments of deflection, as if left on during travelling they might strain the instrument. The temperature should be noted at each determination of u or u'. The thermometer should be near the deflecting magnet.

Unifilar Magnetometer.—This instrument is supplied for the purpose of determining the absolute value of the horizontal component of the magnetic force, and (in conjunction with the deflection apparatus accompanying the dipping needle) the absolute value of the *total* magnetic force. Sir John Richardson is already furnished with printed instructions, in a paper entitled "On Magnetic Observations, by Lieutenant-Colonel Sabine," containing directions for the use of the Unifilar; and for his further guidance he is referred to the observations of the absolute Horizontal Force, which have been made at Woolwich by Captain Younghusband with the instrument supplied to Sir John Richardson, and have been entered in the

^{*} The process is the same which has been subsequently printed in the "Admiralty Manual," pp. 34 to 39, and 44 to 48; and is therefore omitted here.

register books furnished for the record of the observations in America.

There are two deflecting magnets, C and S, each 3.67 inches in length, which will require to have their respective moments of inertia carefully determined. For this purpose three inertia rings are supplied, and each of the three will have to be used with each of the magnets C and S. The observations for this purpose may be made at any time in the winter when most convenient.

Instead of the distances between the magnets named in Lieutenant-Colonel Sabine's paper (above noticed), Sir John Richardson had better employ those adopted for this occasion by Captain Younghusband, viz., 1'1 foot and 1'4 foot. Should it be convenient to make one determination of the values of m and X early in the winter, and a second towards its close, the two determinations may suffice. Six repetitions of the experiments at the two distances (*i.e.*, six at each distance) may be considered to constitute a determination of the values of m and X with the Unifilar.

When not employed in experiments on the magnetic force, the Unifilar Magnetometer may be used for determining the diurnal variation of the Declination, and should give results in accordance with those of the Declinometer. The hourly observations for this purpose need not be carried on through the twenty-four hours. From 6 or 7 A.M. to 8 or 9 P.M., on days on which it may be otherwise inconvenient to observe *hourly*, will probably suffice.

EDWARD SABINE.

The instruments were adjusted at Fort Confidence on Great Bear Lake, situated in 66° 54' north latitude, and 118° 49' longitude west of Greenwich; this being the first opportunity afforded to Sir John Richardson for employing the instruments since arriving in America, owing to the rapid rate he found it necessary to travel, so as to be able to explore the coast lying between the Mackenzie and Coppermine rivers, and reach Fort Confidence before the close of the season.

#### DECLINATION.

Absolute Value.—The absolute value of the Declination at Fort Confidence was determined in March and April 1849, with the Azimuth Compass. The observations are as follow, and show the reading of the Declinometer corresponding to each absolute observation.

Date.	Absolute Declination.	Correspond- ing Reading of the Declination Magnet- ometer.	Date.	Absolute Declination.	Correspond- ing Reading of the Declination Magnet- ometer.

Erom the mean of these observations it appears that the Declination was 50° 42′ E. at the period referred to, and that this Declination corresponded to the reading 4° 17′ of the Declinometer scale; whence, having the mean reading of the Declinometer for each month of observation, we may obtain the mean absolute values of the Declination for the same periods. Table II. contains these values.

Diurnal Variation.—The Declinometer with which the principal series of observations was made has been fully described in Colonel Sabine's memorandum above; the instrument was used as directed by the instructions, and nothing further seems necessary to be stated with reference to it, except that of the two modes of adjusting the needle of which the instrument is capable, that was chosen in which the magnet is made to traverse upon the steel point instead of being suspended by a silk thread; this is now to be regretted, as the observations show that the friction was so great as to impede the free movement of the needle. The observations made with another magnet, suspended by a silk thread in the Unifilar, prove that the range of movement of the Declinometer Magnet was limited by the friction on the point, but that the *direction* of the movement was recorded faithfully. The additional observations with the Unifilar extend over a portion of three months, and are valuable as confirmatory of the general accuracy in direction of the movements of the Declinometer Magnet, and as affording a truer value of the extent of the diurnal change in those months than can be obtained from the impeded action of the Declinometer Magnet.

Observations were made with the Declinometer during the months: of October, November, and December, 1848, January, February, March, and April, 1849, commencing at 6 A.M. and continued hourly until 9 p.M. Occasionally, observations were taken at 4 and 5 A.M.; and on two days generally in every month an observation was made at the night hours omitted on ordinary occasions. These observations are given in full, pp. 28 to 35, Table VIII.

The mean monthly diurnal variation appears in Table III.

Mean Diurnal Variation in the several Months of Observation.

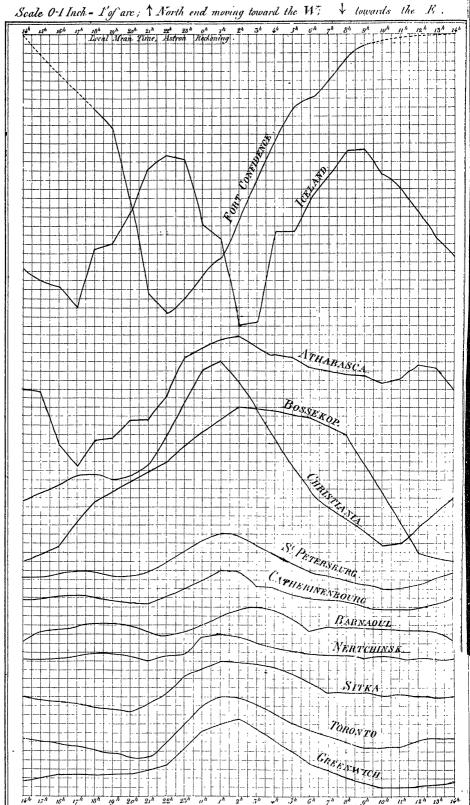

From these observations, it appears that on taking the first observation in the morning, the north end of the needle was found to be proceeding eastward, that the easterly extreme was attained by a rather rapid movement about  $22^{\text{h}}$  (the time varied in the different months between  $20^{\text{h}}$  and  $0^{\text{h}}$ ), that the north end then moved westward and continued a tolerably uniform movement until  $9^{\text{h}}$ , after which no observation was made. The westerly extreme was attained some time in the course of the night, but from no observation having been made later than 9 P.M. the exact time is unknown, the north end of the magnet being found moving eastward, as has been already stated, on taking the first observation in the morning.

If we compare these movements with the diurnal variation in middle latitudes in the Northern Hemisphere, we find a very striking dissimilarity, and the difference is worthy of attention, because it appears probable that the diurnal variation of the Declination needle in high latitudes follows a law differing materially from that of the diurnal variation in middle latitudes, now well known and established. The principal feature of the diurnal variation in middle latitudes of the Northern Hemisphere is the attainment by the north end of the magnet of its extreme westerly position about 1 o'clock P.M. daily, whereas, as stated above, at Fort Confidence the extreme easterly position occurs at 11 A.M., from whence a movement westward takes place, continuing until the latest hour at night at which any observation is made, the extreme being attained between 9th and 18th.

So few observations of the diurnal variation of the Declination in high latitudes are up to this time at command, that not even an approach can be made towards indicating a general law of the phenomena in such localities; we can only present those facts that have been already obtained, and direct attention to points of similarity and of discordance from movements in middle latitudes. In the accompanying plate is drawn the curve of the diurnal variation of the Declination at a number of places, for the purpose of showing the diurnal movement at Fort Confidence and at other stations in high latitudes in comparison with each other and with the movement It is thus shown that at Reikiavik in Iceland. in middle latitudes. the extreme easterly position is attained at 2 P.M., which is about the hour that the westerly extreme is attained at every other station from which we have observations, with the exception of Fort Confidence; thus presenting, perhaps, as strong an instance as could be ound of the widely differing phenomena of the diurnal variation in high from middle latitudes. The curve at Reikiavik differs also from that at Fort Confidence in the westerly extreme, which occurs in I celand at 22^h, the same hour that an easterly extreme is attained at Fort Confidence. It is true that the observations at Reikiavik

Plate 11Showing the Diurnal Variation of the Declination at

Fort Confidence, from Oct." 1848 to March 1849. Iceland, from 21st to 28th August 1836. Catherinenbourg, from Oct." to April: 1841 to 184 Barnaoul, from Oct." to April: 1841 to 184 Nertchinsk, from Oct." to April: 1841 to 184 Sitka, from October to April: 1842 to 184 Toronto, from Oct." to April: 1843 to 1848 Greenwich, from Oct." to April: 1841 to 1846

#### MAGNETICAL OBSERVATIONS.

include only one week's series, in the month of August 1836, taken hourly; they are, however, very accordant, and the curve drawn from the observations proceeds from a maximum to a minimum and back again in a regular continuous progression.

Plate II. contains the curves of the diurnal variation at several stations in the Northern Hemisphere; it illustrates better than any verbal description the great change that takes place in the law of the diurnal variation when advancing into high latitudes. The stations are :---

		Latitude.		Longitude.
Fort Confidence	-	66° 54′ N.	-	118° 49' W.
Reikiavik, Iceland	-	64° 08' N.	-	21° 55' W.
Athabasca -	-	58° 41′ N.	-	111° 18' W.
Bossekop -	-	69° 58' N.	-	21° 10′ E.
Christiania -	-	59° 55′ N.	-	10° 34' E.
St. Petersburg	-	59° 57' N.	-	30° 19′ E.
Catherinenburg		56° 50' N.	-	60° 34' E.
Barnaoul	-	53° 20' N.	-	83° 27' E.
Nertchinsk -	-	51° 18′ N.	-	119° 21' E.
Sitka – –	-	57° 03′ N.	-	135° 18′ W.
Toronto -		43° 39' N.	-	77° 05′ W.
Greenwich -	-	51° 29' N.	-	00° 00′

By this plate we perceive that at Christiania, St. Petersburg, Catherinenburg, Sitka, and Toronto the extreme westerly position of the north end of the magnet was attained at 1^h for the period included in the observations; at Athabasca, Bossekop, and Greenwich at 2^h, and at Barnaoul at 3^h, while at Reikiavik a westerly maximum was reached at 22^h, and again at 8^h, and at Fort Confidence some time in the course of the night between 9^h and 18^h; thus at once pointing out the irregularity in the law of diurnal movement in high latitudes, and the marked contrast from the persistent general law of movement which everywhere obtains in middle latitudes. The curves are all drawn to the same scale, and show the relative amounts of the daily excursions at each place.

We may now examine in more detail the diurnal movement at the several stations. At Reikiavik we find the north end of the needle at its extreme observed westerly position at  $9^{h}$ , from whence it proceeds uniformly to a secondary east at  $17^{h}$ , thence to west at  $22^{h}$ , again to east (the maximum) at  $2^{h}$ , then back again to west at  $9^{h}$ ; the double curve is very fully exemplified by the two excursions (west to east and back again), being very nearly the same in extent.

297

The observations at Athabasca are those of Captain Lefroy, printed and discussed in the second part of this volume. They comprise hourly observations made in the months of October, November, and December, 1843, January and February 1844; the several months' observations accord with each other, and having been made regularly at each hour in the twenty-four, very valuable evidence is afforded of the diurnal movement at that station; the results may perhaps with advantage be again stated in this place for the sake of making the account of the comparison more complete. At Athabasca we find the easterly extreme occurring at  $17^{\rm h}$ , viz., the same hour at which one of the easterly extremes was attained at Reikiavik; a fact specially worthy of notice, because at no other station is this period of the day marked by a similar position of the magnet.

From  $17^{h}$  the (north end proceeds pretty uniformly to extreme west at  $2^{h}$ , showing an accordance in this respect with the general law of the diurnal variation; thence again to east at  $17^{h}$ . An interruption occurs from  $10^{h}$  to  $13^{h}$ , when the north end turns and moves west, but the retrograde movement is insignificant compared with the whole diurnal excursion.

At Bossekop a single curve is formed. Extreme west at  $2^h$ ; extreme east at  $14^h$ .

At Christiania a double curve. Extreme west at  $1^{b}$ ; extreme east at  $10^{h}$ ; a secondary west at  $17^{h}$ ; a secondary east at  $19^{h}$ . This curve is similar in form to that at St. Petersburg and several other places, but the amount of the excursion is much greater, as, for example, at Christiania, 20'; at St. Petersburg, 6'. It must, however, be remarked, that the months of observation are not the same at the two stations; they are June to November at Christiania, and October to April at St. Petersburg.

At Catherinenburg the curve is nearly the same as at St. Petersburg, showing at these two places the evening easterly extreme greater than the morning easterly extreme. At Barnaoul, Nertchinsk, Sitka, and Toronto, the morning easterly extreme exceeds that of the evening, while at Greenwich we have the morning easterly movement nearly obliterated, and the extreme easterly position at 10^h.

It will now be seen that there are no general characteristics of the diurnal variation of the Declination in very high latitudes; also, that in middle latitudes there is a consistent law, the most prominent feature of which is the occurrence in the Northern Hemisphere of the maximum westerly Declination during the day at  $1^{h}-2^{h}$ . This is invariable. There is, also, a distinction between the character of the movement on the Siberian from that on the American continent, particularly if we study the law of the variation during the several

seasons of the year; but such considerations are not relevant to the present discussion, and need not be here further noticed. All the base is . It is necessary to mention that every observation made has been included in forming the mean results upon which the discussion of the phenomena of the diurnal variation at Fort Confidence is founded, consequently the diurnal variation spoken of includes the modification to which it is subject, caused by the disturbed observations remaining, these disturbances having themselves a distinct, and different law. Now it may be reasonably assumed that the effect due to disturbance varies considerably at different stations, and it seemed not improbable that, from the position of Fort Confidence, the effect there might be greatly magnified, even so much so as to cause the diurnal variation, without the disturbances, to present a very different aspect from the curve drawn from all the observations without omission. It may therefore be satisfactory to state that the process of eliminating the disturbances was undertaken, and that the diurnal curve of the residual observations was found only modified in the extent of range, but not altered in general character.

## ABSOLUTE HORIZONTAL FORCE.

The instrument employed by Sir John Richardson in observing the Absolute Horizontal Force was a portable Unifilar Magnetometer of the usual construction, viz., one in which the deflecting magnet is kept at right angles to the suspended magnet, and the angle of deflection read on the horizontal circle. Two magnets, 3.00 inches in length were supplied for suspension in the deflection apparatus. The deflecting magnets were C 1 and S 1, each 3 67 These magnets were also employed as deflecting inches in length. magnets in Dr. Lloyd's Inclinometer for determining the Total Force in absolute measure. The distances from the suspended magnet at which the deflectors were placed were, in the Unifilar 1'1 and 1'4 feet, and these two distances were employed whenever experiments of deflection were made. The nearer distance, 1.1 feet, was chosen as being just beyond the limits of the quantity expressed by three times and a half the length of the longer magnet, and the second distance is in proportion to the first as 1.3 to 1 nearly.

For the experiments of vibration the magnets were suspended in the wooden box allotted to this purpose; the same stirrup was used during the whole series, and the moments of inertia of the magnets and stirrup determined by means of Dr. Lamont's Inertia Rings. The temperature coefficients of the deflecting magnets were determined after the instruments had been returned to Woolwich; and as the range of temperature to which they had been exposed during the winter had been very great, involving consequently very large corMAGNETICAL OBSERVATIONS.

rections, the experiments for determining the coefficients were conducted with particular care, and it is believed that the value of the coefficients at different parts of the thermometric scale is known with sufficient accuracy. The observations made at Fort Confidence included temperatures varying from  $-36^{\circ}$  to  $+70^{\circ}$  Fahrenheit.

The value of the coefficient P, depending upon the distribution of magnetism in the suspended and deflecting magnets, was found to be inappreciably small when the suspended magnet was one of the 3 0 inch Unifilar magnets, but to have a sensible value when the dipping needle was suspended; the corrections on this account have been applied in calculating the value of the Total Force.

Table I. contains the data from which the values of K, the moment of inertia of the deflecting magnets, C 1 and S 1, were calculated. Three rings were employed in their determination, of which the weights and dimensions are as follows:

	Outer Diameter. Inches.	Inner Diameter. Inches.	Weight. Grains.
Ring 5	- 3.286	2.921	1493 14
" [°] 6	- 3.026	$2^{\cdot}472$	960.14
,, 8	- 3.005	2.477	638.64

The value of K' for each ring was calculated by the formula  $\mathbf{K}' = \frac{1}{2} (r^2 + r^2) w$ , when r and r, denote respectively the outer and inner radii of the rings in decimals of a foot, and w the weight in grains; whence we have

For Ring 5; K'=27.949 - - Log. = 1.44636,, 6; K'=12.724 - - Log. = 1.10461,, 8; K'= 8.397 - - Log. = 0.92412

#### TABLE IV.-continued.

The deduced values of K for each magnet, and from the observations with each ring, are as follows :---

	MAGNET C 1.	
With Ring 5.	With Ring 6.	With Ring 8.
4'2941	4'4053	4'4626
4'1890	4'1444	4.1682

The mean of all these is  $4^{2772}$ ; = Log. 0⁶³¹¹⁶, which is the value employed in the calculations.

		1	MAGNET S 1.		
********	With Ring 5.	· . •	With Ring 6.	With Ring 8.	
	4.2774	,	4.3399	4 3300	
	$4^{\cdot}3582$	; ·	[3 7693]	$4^{\circ}2751$	, ,

Some undiscovered source of error existed in the second series of experiments with Ring 6 and Magnet S 1; the result has therefore been omitted in taking the mean. The mean of all the others is 4.3161;  $\pm$  Log. 0.63509, which is the value of K employed in the calculations with this magnet.

Temperature Corrections.—The experiments for ascertaining the temperature coefficients of magnets C 1 and S 1 were conducted according to the method of deflection. The suspended magnet employed was 3 00 inches in length, and the deflecting magnet was placed at right angles to it at a distance of 9 inches; the mean deflection produced was  $25^{\circ}$ . The angle of deflection, by magnet C 1, was ascertained at the following temperatures, viz. :—

At 36° 57, 55° 42, 73° 62, and 90° 79; and by a second series of experiments, at  $32^{\circ}$  71,  $53^{\circ}$  39,  $72^{\circ}$  47, and  $88^{\circ}$  99; and the coefficient q determined as follows :—

q = 00	00 <b>412</b> at a	mean temperature	44°'5
= .00	00488	"	63° 7 .
= .00	0496	**	81°'5

For magnet S 1, the angle of deflection produced by it was ascertained at the temperatures  $32^{\circ} \cdot 61, 52^{\circ} \cdot 89, 71^{\circ} \cdot 34$ , and  $88^{\circ} \cdot 91$ ; and by a second series of experiments, at  $32^{\circ} \cdot 04, 50^{\circ} \cdot 82, 70^{\circ} \cdot 45$ , and  $88^{\circ} \cdot 69$ ; from whence the coefficient q for this magnet was determined, viz. :—

	q =	.000309	at temperature	42°'0
		<b>`0003</b> 75	-	61°'3
1	=	000382		79°`8

The rapid decrease in the value of the coefficient between  $64^{\circ}$ and  $44^{\circ}$  in the case of one magnet, and between  $61^{\circ}$  and  $42^{\circ}$  in the case of the other, rendered it desirable that the coefficient should be ascertained at lower temperatures than those just stated. Accordingly an attempt was made, by subjecting the deflecting magnet to temperatures varying between  $0^{\circ}$  and  $32^{\circ}$ , to ascertain the angles of deflection at low temperatures, which should be known with tolerable exactness. A mixture of pounded ice and salt was employed to surround the magnet, and the temperature reduced to  $-6^{\circ}$  (as indicated by the thermometer employed, whose index error at that temperature was not, however, precisely known). Deflections were observed at  $-6^{\circ}$ ,  $14^{\circ}$ , and  $32^{\circ}$ .

3.)

Zr.

The observations are subject to some degree of error, dependent upon the rapid changing of the temperature of the freezing mixture at a degree so much below the natural temperature; but great pains were taken to sustain a constant circulation.

The final results obtained were for Magnet C 1-	)
q = 000361 at temperature 4° 6	:
and $q = 000366$ , 23°.8	*
For magnet S 1, the results were	1
$q = 000298$ at temperature $14^{\circ} 3$	}
and $q = 000328$ , $21^{\circ} 8$	1
	1

After allowing for the probable amount of error occasioned in these values from the cause already mentioned, it appeared evident that the coefficient did not diminish in value in the same rapid ratio below 42° as it was proved to do between 42° and 62°, and it was considered that the temperature coefficients were sufficiently well obtained for every purpose of correction in the observations under calculation. The experiments were continued in the hope of ascertaining more precisely the law of change with the change of temperature; but it is sufficient here to mention that the conclusions previously arrived at were substantially confirmed.

The magnetic moment (m) of the deflecting magnets was found by combining together the values of  $\frac{m}{X} = \frac{1}{2}r^3 \sin u$  obtained from the experiments of deflection, and of  $m X = -\frac{\pi^2 K}{T^2}$  from the experiments of vibration; here some difficulty occurred on account of the experiments of deflection and of vibration having been conducted in separate series on different days. A mode of grouping the results of each experiment was eventually adopted, which gave, it is believed, the most satisfactory value of the magnetic moments of the bars that could be obtained from the observations, as well as the rate of the loss of magnetism, which it was found had occurred largely in the case of each magnet. A value of m has accordingly been calculated for every day on which observations were made. The Horizontal Force (X) was then found by the usual formula.

Total Force.—The values of  $\frac{m}{\phi}$  were calculated by the formula

$$\frac{m}{\phi} = \frac{1}{2} r^3 \sin u \left( \frac{1}{1 + \frac{P}{r^2}} \right)$$

 $r_{,i}$  and  $r_{,i}$ ,  $u_{,i}$  and  $u_{,i}$ , &c. being substituted in the formula for the value of  $\frac{m}{\phi}$  at the second and third distances.

Three distances were employed in the experiments of deflection, viz., 8°0, 9°2, and 10°5 inches. It was found, in making the calculation for the value of P, that the formula for two distances was preferable to that which it is intended should be employed when deflections at three distances are observed; and accordingly P was calculated for each combination of two distances that can be formed, viz., at 8°0 and 9°2, 8°0 and 10°5, and 9°2 and 10°5 inches; the results are as follows:—

## Magnet C.1.

								- '0193	
8'0 and	10'5	,,	-	-	-	$\mathbf{P}$	=	- '0153	
9'2 and	10'5	,,	-	-	-	$\mathbf{P}$		-'0094	,

#### Magnet S.1.

8'0 and	9 <b>`2</b>	inches	-	-	-	$\mathbf{P} =$	- '0156
8'0 and	10'5	,,	-	•••	-	$\mathbf{P} =$	- '0173
9'2 and	10'5	,,	-	-	-	P =	-'0091

The mean values were employed, viz.,---

For magnet C.1, P = -0147. For magnet S.1, P = -0140; and from them the following factors were obtained:—

Magnet C. 1.  

$$1 + \frac{1}{1 + \frac{P}{r^2}}$$
 Log. =0.01459.  
 $\frac{1}{1 + \frac{P}{r_{r_{1}}^{2}}}$  Log. =0.01099.  
 $\frac{1}{1 + \frac{P}{r_{\mu}^{2}}}$  Log. =0.00842.

Magnet S. 1.  

$$1 + \frac{1}{r^2}$$
 Log. =0'01389.  
 $1 + \frac{1}{r_r^2}$  Log. =0'01046.  
 $\frac{1}{r_r^2}$   
 $1 + \frac{1}{r_r^2}$  Log. =0'00801.

The quantity m was derived from the observations of absolute Horizontal Force, the value being calculated for the particular day on which the deflections of the dipping needle were observed.

The Total Force  $\phi$  was found by the formula

Log. 
$$\phi \equiv \log m - \log \frac{m}{4}$$

Log. *m* receiving the necessary correction to reduce it to the same temperature as that of *m* in the quantity  $\frac{m}{\phi}$ .

Inclination.—The Inclination was observed by direct reading of the needle, forming results independent of those deduced from the deflection experiments.

Table VII. contains the particulars of these observations. All were made with the same needle, A.1, except in a few instances, when A.2 was employed.

From the whole number of observations, it was found that the mean readings of "poles direct" and "poles reversed" differed by a very small amount, and less than the probable error of a single mean; so that the half determination, whether "poles direct" or "poles reversed," has been taken as an observation of the Inclination, and the monthly means found from all the observations in the month without any correction.

The monthly mean results of the Inclination are-

	o ·	1
October	$\theta = 84$	49'4
November	$\theta = 84$	51.1
December	$\theta = 84$	50'0
January	$\theta = 84$	48'8
February	$\theta = 84^{\circ}$	53.9
March	$\theta = 84$	50'4

Mean by direct observation 84° 50' 6

The monthly means, by the method of deflections, are not so regular, and somewhat less in amount, viz. 84° 45''9.

The Horizontal Force experiments were made in series at certain periods, and not at regular intervals; there are therefore some months in which no observations are made, and others that contain very few. Taking, however, monthly means of all that were observed, the results are as follows:---

October	1848	-	-	-	- '	-	X = 1.235
November	,,	•	-	-	- '	-	X = 1.198
December	,,	-	-	-	-	-	X = 1.177
March	1849	-	-		-	_	X = 1.210
April	,,,	-	-	-	-	-	X = 1.198

The Total Force for these months, derived from the horizontal component multiplied by the secant of the Inclination, is as follows :---

October	1848		-	-	-	$\phi = 13.640$
November						$\dot{\phi} = 13^{\circ}231$
December	"					$\dot{\phi} = 12.999$
March	,,	•	-	~	-	$\phi = 13.364$
April	,,	-	-	-	-	$\phi = 13.231$

The values of  $\phi$ , found by the direct method for the several months, are—

October	1848	-	-	-	-	$\phi = 13.402$
November	,,	<del>,</del>				$\phi = 13.998$
December	وو	-	-	-	-	$\phi = 14^{\circ}243$
January	1849	-	-	-	-	$\phi = 14.025$
February	,,	-	-	-	-	$\phi = 13.849$
March	,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,	-	-	-	-	$\phi = 13.801$

The mean Horizontal Force during the whole period is 1'205, which, multiplied by sec.  $84^{\circ}$  50''6, is equal to 13'407. The mean of the whole of the values of  $\phi$  by the direct method, is 13'886. The mean of both determinations is 13'646.

# TABLE VIII.

Contains the hourly observations made with the Declinometer in the months 1849. These observations show correctly the direction of the diurnal movesuspension of the Declinometer needle, as stated in page 7. In the months same object were made with the Unifilar Magnetometer, the magnet of correct amount as well as direction of the diurnal variation. These obserin *direction*, but indicate that the range of the diurnal variation is nearly are those of mean time at the station.
