## Technical and Bibliographic Notes / Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming are checked below.

- Coloured covers / Couverture de couleur
- Covers damaged / Couverture endommagée
- Covers restored and/or laminated / Couverture restaurée et/ou pelliculée
- Cover title missing / Le titre de couverture manque
- Coloured maps / Cartes géographiques en couleur
- Coloured ink (i.e. other than blue or black) / Encre de couleur (i.e. autre que bleue ou noire)
- Coloured plates and/or illustrations / Planches et/ou illustrations en couleur
- Bound with other material / Relié avec d'autres documents
- Only edition available / Seule édition disponible
- Tight binding may cause shadows or distortion along interior margin / La reliure serrée peut causer de l'ombre ou de la distorsion le long de la marge intérieure.
- Blank leaves added during restorations may appear within the text. Whenever possible, these have been omitted from filming / Il se peut que certaines pages blanches ajoutées lors d'une restauration apparaissent dans le texte, mais, lorsque cela était possible, ces pages n'ont pas été filmées.
- Additional comments / Commentaires supplémentaires:

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

- Coloured pages / Pages de couleur
- Pages damaged / Pages endommagées
- Pages restored and/or laminated / Pages restaurées et/ou pelliculées
- Pages discoloured, stained or foxed / Pages décolorées, tachetées ou piquées
- Pages detached / Pages détachées
- Showthrough / Transparence
- Quality of print varies / Qualité inégale de l'impression
- Includes supplementary material / Comprend du matériel supplémentaire
- Pages wholly or partially obscured by errata slips, tissues, etc., have been refilmed to ensure the best possible image / Les pages totalement ou partiellement obscurcies par un feuillet d'errata, une pelure, etc., ont été filmées à nouveau de façon à obtenir la meilleure image possible.
- Opposing pages with varying colouration or discolourations are filmed twice to ensure the best possible image / Les pages s'opposant ayant des colorations variables ou des décolorations sont filmées deux fois afin d'obtenir la meilleure image possible.

This item is filmed at the reduction ratio checked below / Ce document est filmé au taux de réduction indiqué ci-dessous.

10x	14x	18x	22x	26x	30x
12x	16x	20x	24x	✓	28x

The copy filmed here has been reproduced thanks  
to the generosity of:

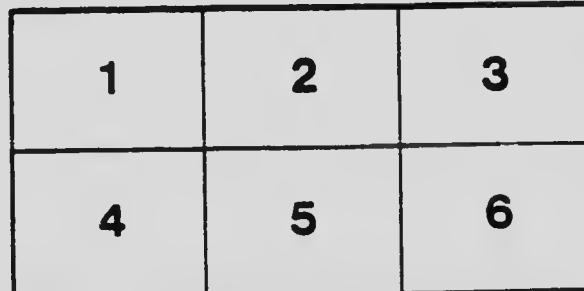

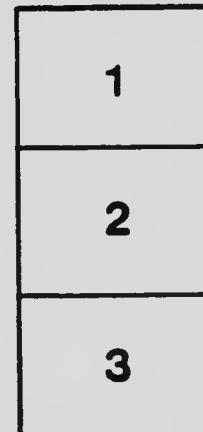

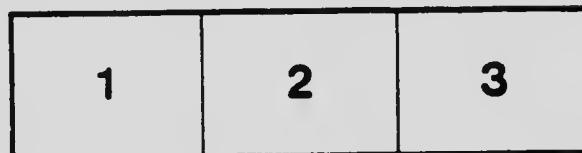

National Library of Canada

The images appearing here are the best quality  
possible considering the condition and legibility  
of the original copy and in keeping with the  
filming contract specifications.

Original copies in printed paper covers are filmed  
beginning with the front cover and ending on  
the last page with a printed or illustrated impres-  
sion, or the back cover when appropriate. All  
other original copies are filmed beginning on the  
first page with a printed or illustrated impres-  
sion, and ending on the last page with a printed  
or illustrated impression.

The last recorded frame on each microfiche  
shall contain the symbol → (meaning "CON-  
TINUED"), or the symbol ▽ (meaning "END"),  
whichever applies.

Maps, plates, charts, etc., may be filmed at  
different reduction ratios. Those too large to be  
entirely included in one exposure are filmed  
beginning in the upper left hand corner, left to  
right and top to bottom, as many frames as  
required. The following diagrams illustrate the  
method:

L'exemplaire filmé fut reproduit grâce à la  
générosité de:

Bibliothèque nationale du Canada

Les images suivantes ont été reproduites avec le  
plus grand soin, compte tenu de la condition et  
de la netteté de l'exemplaire filmé, et en  
conformité avec les conditions du contrat de  
filmage.

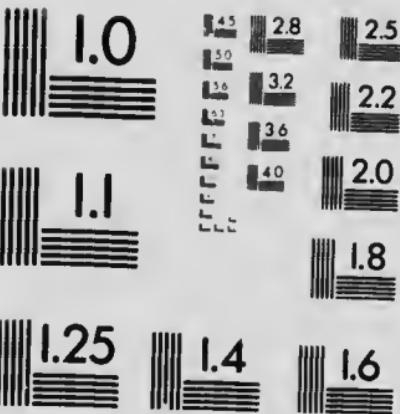

Les exemplaires originaux dont la couverture en  
papier est imprimée sont filmés en commençant  
par le premier plié et en terminant soit par la  
dernière page qui comporte une empreinte  
d'impression ou d'illustration, soit par la second  
plié, selon le cas. Tous les autres exemplaires  
origineux sont filmés en commençant par la  
première page qui comporte une empreinte  
d'impression ou d'illustration et en terminant par  
la dernière page qui comporte une telle  
empreinte.

Un des symboles suivants apparaîtra sur la  
dernière image de chaque microfiche, selon le  
cas: le symbole → signifie "A SUIVRE", le  
symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être  
filmés à des taux de réduction différents.  
Lorsque le document est trop grand pour être  
reproduit en un seul cliché, il est filmé à partir  
de l'angle supérieur gauche, de gauche à droite,  
et de haut en bas, en prenant le nombre  
d'images nécessaire. Les diagrammes suivants  
illustrent la méthode.

#### **ACKNOWLEDGMENT.**

The data for compiling this bulletin have been gathered largely by correspondence from the different wood-using industries of the province. In most cases this information was given without hesitation when it was made clear that the individual reports would be treated confidentially. The Forestry Branch wish to thank the manufacturers for the interest they have taken in the matter and for their kindness in filling out the schedules sent to them.

## **LETTER OF TRANSMITTAL.**

FORESTRY BRANCH,

DEPARTMENT OF THE INTERIOR,

OTTAWA, November 1, 1912.

Sir.—I beg to transmit herewith a report on the 'Wood-using Industries of Ontario,' and to recommend its publication as Bulletin 34 of this Branch.

This report contains an account of the quantity, value, and source of supply of the different kinds of wood used by the industries of Ontario. It includes detailed descriptions of the different classes of industries and of the properties of the woods used in those industries. A classified directory of the manufacturers who supplied the data used in the compilation forms an appendix to the bulletin.

I have the honour to be, sir

Your obedient servant,

R. H. CAMPBELL,

*Director of Forestry.*

W. B. Cory, Esq., C.M.G.,

Deputy Minister of the Interior,

Ottawa

# WOOD-USING INDUSTRIES OF ONTARIO.

---

The primary object in compiling this bulletin has been to show the numerous ways in which wood is used in various manufacturing industries.

Before considering the advisability of adopting a rational forestry policy, it is necessary to ascertain the economic value of the forest. Leaving aside the discussion of the effect of a forest-cover on climate and water-flow, we must consider the need of wood as a manufacturing material. It can be safely stated that there is practically no industry that does not use wood in some shape or form. In many cases other materials, such as steel, concrete, brick or stone, can be substituted to advantage where wood is now used, but in other cases the use of wood, and perhaps of one particular kind of wood alone, is imperative. Axe-handles cannot be made of steel or any other material but a hard, tough, elastic wood like hickory. Barrels to contain alcoholic liquors must be made of white oak, as no other wood is strong enough to stand the pressure and rough usage a barrel is subjected to and still hold the liquor without impairing its taste. Even red oak is too porous for this purpose.

As our supply of wood is being rapidly exhausted, new uses are found for woods hitherto considered as inferior species. Manufacturers demand certain kinds of wood for certain commodities. In many cases this demand is merely the result of habit or accustomed use of that material, or of mere prejudice in its favour. It is very often the case that some other cheaper and more abundant material will serve the purpose just as well. This bulletin may show some manufacturer that his commodity is being made by another manufacturer from a cheaper material and in just as satisfactory a way.

A firm may be in the habit of purchasing its material from one certain district, thinking that it cannot be obtained elsewhere. This bulletin shows where material for different industries is purchased, what quantities are used annually and what they cost the manufacturer at his factory.

One of the most important parts of forestry is the closer utilization of raw material and the prevention of waste. Scores of examples can be cited where one manufacturer is actually throwing away exactly what another manufacturer needs. An attempt has been made in this bulletin to show how waste is utilized from various industries, in the hope that this information may be of use in saving some of the valuable so-called waste that is annually burned under the boilers of our wood-working establishments or sold as kindling wood. The Forestry Branch has had inquiries from manufacturers asking for information both as to the disposal of waste and as to the possible purchase of such material. In some cases it has been possible to put buyers and sellers of waste into communication with each other to their mutual advantage. It is hoped that this bulletin will result in many more such inquiries, as the Forestry Branch is prepared to give them careful consideration.

## ECONOMIC ADVANTAGES.

Reports were received from over twelve hundred firms using wood in their business. Some of these produced commodities made entirely of wood, others made articles partly of wood and partly of metal, and others used wood only as a means of manufacturing their commodities, as in the case of foundry men, who used wood for patterns and moulding boxes, or manufacturers who made boxes and crates to pack their products in.

On a brief consideration of the capital invested in these industries, the money spent in purchasing raw material and keeping up these factories, the army of men and women employed who are dependent on them for a living—to say nothing of the dealers who handle the products and the consumers who buy them—the importance of perpetuating these industries is realized.

A forestry policy for the province, which has as its aim the management of forest lands to produce a steady supply of wood in continuity, is the only solution of the problem of how to perpetuate the wood-using industries of Ontario. Canadians cannot count on foreign countries to supply them forever, although there are certain species of trees that will not grow in the climate of this country and whose wood must be imported. The economic balance of exports and imports must be insured by the growing of trees adapted to this climate in sufficient quantities to supply the local demand and to provide a surplus for exportation to other countries. In this way the loss entailed to Canadian manufacturers by the necessary importation of certain kinds of wood from other countries can better be afforded. There are millions of acres of land in Ontario that are unfit for agriculture and still are suitable for growing forests. Such lands should be withheld from homestead entry and managed as forests. In some parts of the province large areas of deserted farm lands are found and lands that are not suitable for growing crops but which are being held by farmers who are too poor to move to more fertile regions and who lack the ambition to learn new trades. This land should be managed as forest land and the owners encouraged to take up more fertile farms in the newer parts of the province. There is enough potential forest land unfit for agriculture in Ontario to supply the future needs of wood-using industries, were the population of the province ten times as great as it is now—provided the land were properly managed under a rational forestry policy.

#### PRICES OF WOOD.

The scarcity of wood and its rapidly increasing price is being felt by every industry using wood. In the case of some of the hardwoods, such as white oak and hickory, the native supply is practically exhausted with the exception of odd trees and groups of trees in farmers' woodlots. The prices of these two species have increased in late years at an alarming rate, and even in the United States where the bulk of the supply comes from, a shortage is being felt and the centre of production is constantly shifting to new regions.

It is probable that the price of each kind of wood will continue to increase until it equals or exceeds the cost of growing that particular wood in the forest.

## KINDS OF WOOD.

A total of thirty-four different kinds of wood was reported as having been used by the industries in Ontario. Some others were bought in small quantities for special uses and are not included in the tables, but are mentioned in the description of each industry and included in the list of uses of different woods. Some of the names are names of distinct species, others are commercial or trade names, while others are generic names and include different species. The attempt has been made to follow trade names in the tables as far as possible without going into details as to grades or such distinctions as 'quarter-cut,' 'rift-sawn' or 'sliced veneer.'

Table A shows the summary of the kinds of wood used in Ontario, together with the quantities used annually, average cost, total cost, and the proportion purchased in and outside of the province.

TABLE 'A.'

## SUMMARY STATEMENT OF WOODS USED IN ONTARIO.

Kind. of Wood.	Rank.	Quantity used Annually.	Per Cent.	Average Value.	Total Value.	SOURCE OF SUPPLY.

It is probable that less of this material is actually grown in Ontario than the figures would seem to indicate. Many manufacturers report wood as having been purchased in Ontario when it was imported from outside and purchased by the manufacturer from an Ontario dealer. It would be difficult to determine the exact origin of all the material used by the manufacturers of the province.

Table B shows the details of the consumption in Ontario of wood purchased outside the province, with the quantities purchased annually and the percentage of each kind purchased in the different regions of supply.

TABLE 'B.'  
STATEMENT OF WOOD PURCHASED OUTSIDE OF ONTARIO.

#### DETAILED DESCRIPTIONS OF KINDS OF WOOD.

##### PINE.

The designation 'pine' in these tables includes three species which are used in Ontario. White pine (*Pinus strobus*) is used in greatest quantity; red pine (*Pinus resinosa*) comes next, and jack pine (*Pinus Banksiana*) is used locally and sometimes mixed with white and red. The reason for grouping these three species, whose

woods have quite different qualities, is because of the fact that they are sold mixed on the market, and many of the users of the material do not distinguish between the species.

White pine is the best material of the three for most purposes, its most valuable qualities being its softness, lightness and comparative durability, coupled with the ease with which it can be worked and the fact that it holds its place with little shrinkage or swelling. Red pine is a harder material, containing more resin and having greater strength for structural purposes. Jack pine has the bad qualities of being weak, very resinous, hard, difficult to work and perishable.

Pine is used by Ontario's industries to the extent of over one hundred and seventy-five million feet a year, forming 21.7 per cent of all the wood used. It is probable that the use of this material is decreasing relatively, on account of the substitution of cheaper woods like spruce, hemlock and balsam fir; spruce especially is being used in place of white pine wherever possible. Clear white pine is now almost impossible to obtain even in Ontario, Canada's premier white pine province. It might safely be stated that the bulk of the white pine of the province has been cut and that the few remaining forests of this material will not last many more years at the present rate of consumption and destruction by fire. The grade of material now being sold grows poorer each year, and the standards of grading are being constantly lowered because first-class material can no longer be obtained. The price of \$25.60 per thousand feet board measure is fairly high for a native-grown wood and is highest among the coniferous woods of the province.

This material is used by twenty-seven of Ontario's industries, and used in greatest quantities by builders, factories, and manufacturers of boxes and box shooks. Pine heads the list in nine of the industries.

The bulk of the material is home-grown, although 3.4 per cent is bought outside the province. The eastern provinces supply two-thirds and the United States one-third of the material purchased outside Ontario, which amounts to almost six billion (6,000,000,000) feet. Only five other woods are imported in greater quantities.

#### SPRUCE.

White spruce (*Picea canadensis*) forms the greater part of the spruce used by Ontario's industries. The other species are red spruce (*Picea rubra*), black spruce (*Picea mariana*) and Sitka spruce (*Picea sitchensis*).

White spruce grows in Canada from Newfoundland to the Yukon and is Canada's main pulp species, on account of its long, tough, colourless fibres. It is gradually taking the place of white pine for dimension timber and boxes, and in many other places where white pine is now the favourite material. Compared to white pine, spruce is less durable, harder to work and not quite so strong, but it is tougher, has a finer grain, is lighter in colour, and, being non-resinous, is tasteless and odourless, and therefore more valuable for boxes and barrels for food-stuffs.

Red spruce comes from the Maritime Provinces and is the most valuable species on account of its fine texture. The black spruce is usually a small tree and its wood is little used. Sitka spruce is brought from British Columbia for a few special uses, such as piano and organ sounding-boards, and masts and bows for large vessels.

Spruce is used in Ontario to almost as great an extent as pine, forming 19.1 per cent of the total. These two woods together make up two fifths of the total and stand well above the other materials on the list.

There is probably more spruce of commercial size in Ontario than any other species, and the supply, while being rapidly depleted by axe and fire, is still very considerable. Its use for pulp is in a sense a wasteful one, as balsam fir, poplar, white birch and jack pine can be made into pulp while they are of little value as lumber.

This wood is used in twenty-one industries, but is the chief wood only in pulp manufacture. Pulp-mills and planing-mills use the greatest quantities, seven-tenths

of the material going into pulp. Spruce comes third on the list of woods purchased outside of the province. Twelve per cent of the spruce used is brought in from outside. Of this the bulk comes from Quebec and the Maritime Provinces with small quantities from British Columbia and the United States.

#### MAPLE.

Maple is the most important hardwood used by Ontario's industries, over three-quarters of a billion (750,000,000) feet being used every year. This wood comes third on the list, with a consumption of eleven per cent of the total. The wood is divided into two classes by manufacturers: hard maple (*Acer saccharum*) and soft maple (*Acer rubrum* or *Acer saccharinum*).

Maple is a hard, stiff material, and its value depends chiefly on these two qualities. It is difficult to season and shrinks considerably and checks badly; it is also quite perishable, but it does not warp or twist after being properly seasoned. The soft maple is slightly tougher but softer and lighter than hard maple, and is not used in very large quantities.

Accidental forms with the grain curled and contorted, known as curly maple and bird's-eye maple, are common and are highly prized for decorative work.

Maple does not grow in any quantity north of the 49th parallel in Ontario, and is practically confined to the basin of the Great Lakes. It seldom grows in pure stands like pine or spruce, and the quantity still standing would be difficult even to estimate. The material is used by twenty-eight industries, heading the list in six of them. The greatest quantities are used for hardwood flooring, wood distillation and furniture. For these purposes and for all others where strength and stiffness are not of paramount importance, birch could be substituted in many cases, and is being substituted more and more each year, as the supply of maple decreases.

Fifteen per cent of the maple used is purchased outside Ontario, mostly from the United States, with a small quantity from Quebec. This wood comes fourth in the list of woods brought in from outside Ontario.

#### HEMLOCK.

Eastern hemlock (*Tsuga canadensis*) is the only species of this genus growing in Ontario and probably the only one used by the industries. The western species (*Tsuga heterophylla*) has not been imported into the province as yet, although it is a much superior material and is cut in great quantities in British Columbia.

Hemlock, the third most important native conifer used in Ontario, forms 9.2 per cent of the total. It is in reality a very poor material, being coarse, brittle, and cross-grained; it is difficult to work, is liable to cup-shakes and other defects and has a tendency to warp and twist. It is, however, stiff and non-resinous, holds nails well, and comes between pine and spruce in durability. The greatest points in its favour are its cheapness and abundance. Ninety per cent of the hemlock is used in building construction for framework or rough sheeting. Ten other industries use small amounts of the material for rough purposes.

Hemlock is not found in Ontario north of a line from Michipicoten Harbour, to the head of Lake Timiskaming, but in its range it is very abundant, and the native supply is still quite adequate for the demand. The province still supplies 97.3 per cent of the material used, and the supply from outside comes half from Quebec and half from the United States.

#### OAK.

More oak is imported into Ontario in a year than any other material, hardwood or softwood. Almost sixty per cent of the annual consumption, or a total of about 36,000,000 feet, was reported as having been purchased in the United States. This

leaves an apparent amount of 24,000,000 feet purchased in the province. The cut of oak lumber in Ontario in 1911 was only a trifle over 6,000,000 feet, and the difference is probably made up of material purchased in the log or in billet or forms other than lumber, and also of material purchased from dealers in Ontario who themselves imported their stock from the United States.

The cut of oak is steadily decreasing and the price increasing in the province, the supply being restricted to small groups and isolated trees in farmers' woodlots. There are so many cases where oak is used because it is the best and often the only material suitable for a particular purpose, that it is a wonder manufacturers have not realized the fact that the species in Ontario is now commercially extinct. The importations from the United States now come chiefly from Tennessee, but the centre of production is constantly shifting and the supply there is being also rapidly exhausted.

The most valuable species of the genus is undoubtedly white oak (*Quercus alba*) and this forms the greater part of the oak used. Next in importance comes red oak (*Quercus rubra*), and small quantities of scrub white oak or "blue" oak (*Quercus macrocarpa*). In addition to these three, there are a number of other species occasionally used for lumber but of no commercial importance.

The general qualities of white oak are well known and its value as a wood has long been recognized. It is strong, hard, heavy, tough, dense and durable, and possesses a fine even grain and texture. It is, however, rather difficult to season. Red oak is neither as strong nor as durable as white oak, but it is more easily worked. Its density is much less than that of white oak, and its porous nature prevents its use for the better classes of tight cooperage. Scrub white oak, or blue oak, is the hardest and toughest of the three species, but is scarce and has only a limited use in the industries. Oak is one of the most expensive native hardwoods in Ontario used in quantities of over a million feet, board measure. Wood distillation uses oak in greater quantities than any other industry, but does not use much of the timber-sized material. The bulk of the lumber is used by the manufacturers of house-trim and household furniture.

Oak is used by twenty-six out of the thirty-seven classes of industries and heads the list in five of them. Manufacturers reported having purchased 59.9 per cent of their oak outside of the province, and of these purchases ninety-eight per cent were made in the United States and only about two per cent in eastern Canada.

#### ELM.

Elm is one of the most universally popular hardwoods in Ontario, and is used for almost every purpose for which a hardwood can be used. Elm and basswood are equally important in this respect, entering into forty-one of the industries.

The elm used by Ontario's manufacturers is mostly white elm (*Ulmus americana*) with some rock elm (*Ulmus racemosa*) and a little soft or slippery elm (*Ulmus fulva*).

White elm is probably the toughest of the native hardwoods; it is heavy, hard (when dry) and strong, and has a coarse grain but fine texture; its chief fault lies in the fact that it is not durable and is difficult to season, being liable to warp and twist. This species has a very wide distribution and is fairly abundant all over Ontario south of the Height of Land. It is used locally to an enormous extent. Farmers possessing a few good trees will cut them and haul them to the nearest custom mill to be sawn for their own use or sold. The supply is now pretty well confined to isolated trees or groups, as no extensive elm forests exist in the province.

Rock elm is the most valuable wood of the three, being harder, tougher, stronger and more durable than any other of the American species of elm. It is restricted in distribution and scarce through its range being found only in southern Ontario.

Soft, red, or slippery elm is the poorest material of the three, being soft, and coarse-grained, shivering along the annual rings into cup-shakes. It has a wider

distribution than rock elm but is not abundant in its range, and is little used in the industries. Of the thirty-one industries using elm, six use it more than any other material. Over a half billion (500,000,000) feet of elm is used annually in Ontario, and ninety-six per cent of it is purchased in the province. On the list of woods purchased outside the province, elm comes thirteenth with a little over 2,000,000 feet. Three quarters of this is bought in eastern Canada and one quarter imported from the United States. Almost half the elm is taken by the slack-cooperage industry, but the makers of furniture, boxes and fruit packages also use large quantities.

#### BASSWOOD.

Only one species of basswood (*Tilia americana*) grows in Ontario, but the material bought in eastern Canada and the United States may contain small amounts of less important species found in these regions. Basswood heads the list of what might be termed the soft hardwoods—broad-leaved trees with soft, light wood, such as basswood, chestnut, poplar and tulip. This wood is soft, light, weak and non-durable, with a coarse grain, a fine even texture and a lack of taste and odour. Its value lies in the fact that it is easily worked, does not warp or check and is very tough, holding nails and taking paint well. It is used by thirty-one industries in Ontario and is the chief material in four of these. The greatest quantities were used by slack-cooperage and box factories, demonstrating the popularity of the wood for food-containers on account of its lack of taste and odour. Basswood, like elm, is largely purchased locally in Ontario and cut in small custom mills or worked up from the log in cooperages. Over ninety-six per cent is bought in the province; of the remainder, four fifths come from eastern Canada and about one fifth from the United States.

#### BIRCH.

Ontario's consumption of birch is probably made up of three species. The bulk of the lumber sold is sweet birch (*Betula lenta*), and this is the material that is largely used for hardwood flooring and furniture. Yellow birch (*Betula tutea*) has a wider range of distribution, is used for wood distillation and often substituted for sweet birch. White birch (*Betula alba*, var. *papyrifera*) is the commonest species of the three, but does not usually grow to timber size and is of little commercial value, being used for turnery, spools and small woodenware. Birch is Canada's most abundant hardwood and is rapidly gaining in favour as the supply of the more expensive hardwoods is exhausted. It is fairly hard and strong with a fine grain; it is easily worked, takes a high polish and can be stained to imitate more expensive woods like mahogany, cherry or walnut. 'Wavy' birch is an accidental form due to cross-grain, somewhat similar to 'curly' maple, and is highly prized for ornamental work. Birch is difficult to season, being apt to shrink and check, and is very perishable. This material is also largely purchased in the province, about nine tenths of the supply being bought in Ontario. Two thirds of the remainder is brought from the United States, and consists mainly of sweet birch from Tennessee. Some sweet and some yellow birch are bought in the eastern provinces. Thirty of the industries use birch in making their products, the makers of hardwood flooring and chairs buying the largest quantities. The only manufacturers using more birch than any other wood are the makers of half-tone blocks, but the amount they use annually is almost negligible.

#### BEECH.

Beech is one of Ontario's cheapest hardwoods, probably the cheapest used as lumber. There is only one species used in Ontario (*Fagus grandifolia*), the only one, in fact, growing in America.

The wood of this tree is not a first-class material. While it is hard, strong, tough and moderately stiff, it is often cross-grained, is very perishable and is most liable to shrink, warp and check even after seasoning.

This timber is fairly common in Ontario, south of Lake Timiskaming, and is at present used chiefly for firewood. The supply, while not unlimited, is still sufficient to supply certain industries for some years to come if properly utilized. While eighteen industries use the wood, none of them use it in very great quantities except the manufacturers of miscellaneous products, and here most of it is used for distillation. This is the only industry where beech heads the list. Over four million feet are used annually for hardwood flooring, with birch and maple. This is an economic use of the wood that should be encouraged, as beech makes an excellent floor and takes a high polish. Only about two per cent of the beech used in Ontario was purchased elsewhere. About five hundred thousand feet were brought from the United States and a few thousand from eastern Canada.

#### HARD PINE.

This wood does not grow in Canada, but is imported entirely from the Southern States. The importations are made up of the wood of four distinct species: longleaf pine (*Pinus palustris*), shortleaf pine (*Pinus echinata*), Cuban pine (*Pinus heterophylla*), and loblolly pine (*Pinus taeda*). It was estimated that, in 1911, sixty per cent of the United States cut of hard pine was composed of longleaf and Cuban, although the latter formed probably less than five per cent. The remaining forty per cent was composed of loblolly and shortleaf in about equal quantities. It is probable that these proportions are found in the hard pine imported into Ontario. The wood of all four is alike in general appearance and cannot be separated with certainty by structure. The finer-grained material of all species is sold as longleaf pine, while the coarser wood with wider rings due to more rapid growth is sold as shortleaf pine. Loblolly pine in reality is stronger than shortleaf, but is softer and less durable. Cuban pine has practically the same qualities as longleaf, these two being the strongest and most valuable. Hard pine is sold under a number of trade names, such as Georgia pine, Southern pine, yellow pine and Carolina pine, but it is all made up of these four species. Over twenty-seven million feet of this material was consumed in Ontario by the wood-using industries in 1911, oak alone being imported in greater quantity. The wood of genuine longleaf pine is the heaviest, hardest, strongest and most durable of the four, and is used as a structural timber; it is found in large dimensions, free from defect. It competes with Douglas fir in many cases, the strength values of the two are practically identical, but Douglas fir is probably the lighter of the two materials. Shortleaf pine is not so strong but is less resinous. Loblolly is the poorest material of the four, being very coarse-grained, brittle and perishable.

Hard pine is used in greatest quantities by the manufacturers of building material, agricultural implements, cars and vehicles. It is used altogether by twelve industries and is the leading material in three of them.

#### ASH.

Ash is another native hardwood characterized by its wide range of use and universal value. Two species make up the bulk of the material and their qualities and uses are quite distinct. White ash (*Fraxinus americana*) is the most valuable species and one of the most valuable of Ontario's hardwoods. The wood is moderately hard, heavy and strong, with a coarse straight grain and fine texture. Its chief value lies in its toughness and elasticity, as it is not a durable wood. It is used chiefly for framework of all sorts in vehicles, carts and agricultural implements, and is also extensively used for long handles of agricultural tools. Black ash (*Fraxinus nigra*) is a much softer, weaker wood and is more valuable for decorative

work. More ash is used for interior finish of houses than for any other purpose, and this is mostly black ash. The wood has an attractive grain, is often stained to imitate plain oak and is easily seasoned and worked. It is more durable than white ash, and is used to a considerable extent for basket veneers. Altogether twenty-five of the industries use this material, refrigerator manufacturers buying more ash than any other wood. The lack of taste and odour makes this material specially valuable for food-containers, such as baskets, barrels and boxes.

About thirty per cent of the ash used was purchased outside the province, one quarter of the importations coming from Quebec and three quarters from the United States. The supply of ash in the province has dwindled down to a few restricted districts, although scattered groups of this tree are found all over its range. This lies south of Lake Nipissing for white ash, and almost as far north as James Bay for black ash, but the trees north of the height of land are small and unfit for timber.

#### BALSAM FIR.

Balsam fir (*Abies balsamea*) is primarily a pulpwood species, ninety-five per cent of the wood being used for this purpose. It is also used to a slight extent for slack cooperage and rough lumber. The wood is soft, weak and perishable, but has the long, tough, colourless fibres that make it valuable in paper-making. It is being substituted for pine and spruce for these purposes, and could be used more extensively. All the wood is purchased in Canada, eight per cent coming from Quebec.

#### HICKORY.

Hickory is Ontario's most valuable structural hardwood, and the supply in the province is now commercially exhausted. Only 8.3 per cent of the hickory used by the manufacturers was reported as having been purchased in Ontario, and even this may have been partly imported by Canadian dealers. The wood is a very valuable one, apart from its scarcity, on account of its extraordinary hardness, strength, toughness and elasticity, in which it exceeds all other native hardwoods. There are a large number of species which are not separated in the trade, the bulk of the wood being shagbark hickory (*Carya ovata*) and pignut hickory (*Carya glabra*). Manufacturers distinguish between 'red' and 'white' hickory, discriminating against the red heartwood and favouring the creamy white sapwood. The difference in strength between 'red' and 'white' hickory has been greatly exaggerated. The wood is used chiefly by makers of vehicle supplies and tool handles. Hickory is the best known material for wheel spokes and axe handles. Nine industries reported having used this wood, the largest quantity being used by the vehicle-supply manufacturers.

#### CYPRESS.

Bald cypress (*Taxodium distichum*) is a native of the southern States, and does not grow north of southern Delaware. It is a swamp tree inhabiting flood lands along the coast that are partly submerged for most of the year. The trees grow very slowly and average two hundred years for saw-timber, so that when the existing supply has been cut over, the timber will become commercially extinct. The wood is light and soft, with a fine straight grain and fine texture. It is rather difficult to season, but once seasoned it holds its shape well and is the most durable softwood on the market. It is used wherever contact with moisture is liable to cause decay, and outlasts all the native woods in such situations. Its grain and figure are bringing it into popularity for interior decoration. It is used by eleven industries, almost half the total going into building construction, a quarter into laundry accessories and over ten per cent into tanks and vats. Over 5,000,000 feet are consumed annually by Ontario's industries, cypress being seventh in the list of imported woods.

Canadian jack pine (*Pinus Banksiana*) is sometimes miscalled 'cypress' in eastern Canada, but should not be confused with the true bald cypress.

## GUM.

This material has only lately become commercially important on account of the difficulty in seasoning it. The tree is known as sweet or red gum (*Liquidambar styraciflua*) and is not a native of Canada, growing in the United States, south of Connecticut only.

The wood is moderately soft and fairly tough. It is cross-grained, but has a fine uniform texture and takes a good polish. The colour of the wood is not uniform, but runs in irregular streaks. This fact is often taken advantage of in staining red gum to imitate Circassian walnut. It is sometimes called 'satin walnut.' The wood needs careful steaming direct from the saw in order to prevent warping and twisting. It is used in Ontario chiefly as a substitute for basswood and tulip for inside work in furniture manufacture and body-work in vehicles. Gum can be obtained in greater clear widths than most native woods, is cheap, easily worked and easily bent, and if properly seasoned is a very useful material. Twelve of the industries reported using this wood, the furniture factories consuming over half the total amount imported.

## CHESTNUT.

Sweet chestnut (*Castanea dentata*) is an important furniture wood, largely imported from the northern States. The wood has a very attractive grain and a beautiful figure, but is quite soft and weak and is usually defective, the tree being subject to attack by a destructive beetle. Most of the chestnut used in Ontario is a grade known as 'sound wormy,' which shows the galleries of the insect larvae, but is otherwise sound. It is used largely for veneer core, as it holds glue well, and in this way it enters largely into the manufacture of pianos, veneered furniture and doors. Its durability and appearance make it also a favourite wood for coffins and for interior trim.

Chestnut grows only in the southernmost parts of Ontario, along the north shore of Lake Erie and in the Niagara Peninsula, and even there it is not found in commercial quantities, most of the trees having been cut some time ago. This tree is not found farther east in Canada. Three quarters of the amount consumed annually is imported from the United States.

## POPLAR.

The different species of poplar other than the cottonwoods are usually mixed indiscriminately on the market. The most important species in Ontario are balm poplar or balm of Gilead (*Populus balsamifera*) and aspen (*Populus tremuloides*). These woods are used chiefly for pulp but balm poplar is cut into lumber in Ontario and used for rough box-work and slack cooperage. The wood is soft, light, weak and very perishable, but is fairly tough, easily worked and is both tasteless and odourless. If properly seasoned it could be substituted in many cases for the rapidly disappearing basswood and the expensive imported tulip or whitewood, which is often called 'yellow poplar.' The supply of poplar in Canada and in Ontario is enormous, although some of the standing timber is defective. It is highly probable that new uses will be found for this wood when the prejudices against it are overcome.

## TULIP.

Tulip or yellow poplar (*Liriodendron Tulipifera*) is another tree whose northern range just crosses the boundary of the province, being found with chestnut in the southernmost part of Ontario.

This wood is often called whitewood, and is probably the best hardwood in America to hold its shape after seasoning. It is similar to basswood in structure, but is much softer, has a finer grain. Its chief use is for paneling and steam bent-work, as it is easily steamed to any shape and takes paint well. It is

characterized by a wide range of uses but is purchased in greatest quantities for vehicle bodies, piano framework and car sheeting. Fifteen industries use the wood which is largely purchased in the United States.

Tulip costs the manufacturers \$53.96 a thousand, which makes this material the third most expensive native hardwood in the province.

#### IRONWOOD.

Ironwood is not an important lumber as the trees seldom reach sawlog size. There are two species called ironwood in Ontario, namely, hop hornbeam (*Ostrya virginiana*) and blue beech (*Carpinus caroliniana*). They are used mostly for charcoal making and wood distillation, some of the *Ostrya* (to which the name 'ironwood' is more properly applied) being used locally for vehicle supplies and miscellaneous purposes. The wood is very strong, hard, heavy and tough, but difficult to season and liable to warp and check. All the ironwood used is grown in the province.

#### DOUGLAS FIR.

This is primarily a construction timber, and competes with the imported hard pine for this purpose. Lately it has grown in popularity for more decorative purposes, such as interior finish, flooring, paneling and doors. It has an attractive grain and figure, and readily lends itself to staining. Commercially, the tree is found only in British Columbia and the western American States. It grows to a large size, and material of good dimensions is obtainable. While there is in reality only one species (*Pseudotsuga menziesii*), the lumbermen usually differentiate between 'red fir,' the coarse-grained heart of mature timber or fast-growing small trees, and 'yellow fir,' the softer, finer-grained wood of slower growth.

The bulk of the material is divided between the manufacturers of boats, cars, building material and wooden pipes, although large quantities are used for ties, bridge timbers, piles and rough construction work not included in this bulletin. The price paid is high and makes the wood at present more expensive than the imported hard pine.

#### CEDAR.

Cedar is the most durable of the native softwoods, and on this account is used to an enormous extent for ties, poles, shingles, fence-posts and rails. Its chief competitor as lumber is the imported cypress from the southern States, which is supplanting the rapidly disappearing cedar. There are two commercial species, Eastern white cedar (*Thuya occidentalis*) and Western red cedar (*Thuya plicata*) from British Columbia and the western States. The wood of both species is soft and weak, but possesses a remarkably straight, fine grain and fine texture. It is easily and rapidly seasoned, easy to work and splits evenly. The Western species grows to larger sizes and is more abundant and more important commercially than the Eastern tree, but is lighter, softer, weaker, less durable and more spongy in texture. The Eastern species is largely used in the round, or cut into dimension stuff, owing to the scarcity of saw-log sizes. Eastern cedar lumber—wide boards or plank—is almost impossible to obtain in any quantity. Almost half the cedar goes into house construction for verandah and foundation work and siding. Cedar has always been a favourite material for small boats, canoes and launches owing to its lightness and durability. One quarter of the wood used goes into this industry.

Three quarters of the cedar used in Ontario is purchased in the province and nearly one quarter is brought from British Columbia—this being Western red cedar. Small quantities come from eastern Canada, but none is imported from the United States.

## MAHOGANY.

This is in reality only a trade name for the wood of a number of tropical species, the bulk of the imports being the wood of the American mahogany (*Swietenia mahogani*). This is the most expensive wood used in Ontario, with the exception of Spanish cedar and ebony. Practically all of it is used for decorative work, furniture, desks, pianos and interior finish of cars and vehicles. Its chief value is due to its colour, grain, figure and surface or to its appearance in general, although its mechanical qualities are also excellent.

## COTTONWOOD.

This is a somewhat loose term applied to three species of poplar, none of which grows in Ontario. The wood is valued on account of its toughness and is largely used for vehicle-body work. The importations from the United States are largely of swamp cottonwood (*Populus heterophylla*). The wood purchased from Quebec is common cottonwood (*Populus deltoides*). The wood reported as purchased in Ontario must have been imported by the dealers from Quebec or the United States.

## TAMARACK.

There is only one eastern species of this tree (*Larix laricina*) which is used commercially in Ontario. The western species are important in the west, but do not enter the eastern market. The wood of tamarack is similar to that of hard pine in physical properties, but is more durable and is used more for ties and poles than for lumber. The manufacturers of building material use most of the tamarack that is sawn, for house framing and flooring. It is also used for boats, pumps and tanks. Ontario supplies the demand for this material from her own forests.

## CHERRY.

Black cherry (*Prunus serotina*) is the only species of cherry used commercially. Apart from its beautiful appearance and its scarcity, this is a very valuable material in its technical qualities. It is heavy, hard and strong with a fine straight grain and close texture; it splits easily and is easy to work, takes a fine polish and keeps its shape well. There seem to be still a few trees or groups of trees in farmers' wood-lots that are bought up each year and sawn in custom mills. The car manufacturers favour this material above all others for the interior work of the better class of coaches. It is also used for office desks and furniture. Only 44.5 per cent of the wood is purchased outside the province and this comes almost entirely from the United States.

## WALNUT.

Black walnut (*Juglans nigra*) is the most expensive hardwood native to Ontario and is more or less of a curiosity at the present time. A few years ago walnut for furniture was in fashion as oak and mahogany are now, and what little supply the province had was quickly exhausted. The wood is mostly imported from the United States and is used almost entirely for piano and organ-case work.

## SPANISH CEDAR.

Spanish cedar (*Cedrela odorata*) is the most expensive wood on the list excepting ebony. The high price may be partly due to the fact that the material is purchased chiefly in veneer for cigar boxes and in reducing the surface feet of veneer to board feet no allowance is made for waste. The material is all imported from Mexico.

## BUTTERNUT.

Butternut (*Juglans cinerea*) is sometimes called 'white walnut,' and resembles the more valuable species in grain and texture, but is much lighter in colour and is both soft and weak. It is used by the boat-makers for planking and finishing. Fifteen per cent of the total is purchased in Quebec.

## APPLE.

Apple wood is used for special purposes like the handles of tools, and is purchased locally in Ontario. The wood may be of any species of the subgenus *Malus*.

## WILLOW.

Willow (*Salix nigra*) is used exclusively for artificial limbs, on account of its lightness and toughness and the fact that it is unaffected by atmospheric changes.

## SYCAMORE.

Sycamore (*Platanus occidentalis*) is not a valuable wood, being cross-grained, coarse and perishable and difficult to season. It is largely used for furniture, having a peculiar silver grain, and for handles of tools. The tree is confined to a part of the Western peninsula of Ontario which forms its northern limit. It is of more commercial value in the United States.

## RED CEDAR.

Red cedar, aromatic cedar, or more properly juniper (*Juniperus virginiana*) grows in Ontario, but is not used to any extent on account of the scarcity of commercial sizes. It is imported from the United States for moth-proof chests on account of its aromatic odour. It should not be confused with Western red cedar (*Thuja plicata*), or with jack pine (*Pinus Banksiana*), which is sometimes called 'juniper.'

## EBONY.

Ebony is imported from different foreign countries and is cut from the heart of different species of the genus *Diospiros*. It is used in Ontario for toilet-brush backs and some smaller musical instruments.

## SUMAC.

Sumac (*Rhus hirta*) is a small tree with orange-coloured wood streaked with broad green rays. It is of no commercial value, but has been used for decorative panels on small boats. It is a native of southern Ontario, but seldom grows to a twelve inch diameter, even farther south where it reaches its highest development.

## MINOR SPECIES.

The following few woods are used in Ontario for special purposes and in small quantities, so small that they are not included in the tables:—

GRENADILLA or cocoswood (*Brya Ebenus*) is sometimes called Jamaican or West Indian ebony, although it is not a true ebony. It is purchased by the pound and is very expensive, being used only for flutes and clarionets.

Rosewood is a trade name for a number of tropical species whose wood is rose-coloured and fragrant. African rosewood is most common, and is known as *Pterocarpus erinaceus*. It is used for the more expensive kinds of decorative work on pianos, furniture and cabinets.

TEAK (*Tectona grandis*) is a native of India, and at one time was used extensively for ship-building. The wood is hard, strong and very durable and keeps its

shape almost indefinitely. It has now become scarce and expensive, and is used in Ontario only for electrical apparatus and interior finish in launches.

Lignum-vite (*Guaiacum officinale*) is a tropical American wood of special value on account of its extraordinary hardness, heaviness and durability. It is used for wooden bearings, mallets and dowels.

Boxwood (*Buxus sempervirens*) comes from Turkey and is used for making wood engravings.

## WOOD-USING INDUSTRIES.

### INDUSTRIES DEFINED.

This bulletin contains statistics on the wood used by manufacturers in Ontario where such material is purchased in the form of logs, bolts, billets or rough lumber and worked up in the factory to form the various commodities. The figures in the tables do not include ties, poles, piles, bridge-timbers, mine-props, shingles or lath, nor do they include rough lumber purchased from saw-mills and used in building and other structural work without further manufacture. They do include, however, the products of planing-mills and builders' factories.

Manufacturers who purchase their material in a partly finished form or who merely assemble parts in their factories that have been manufactured elsewhere are not included. It has been necessary to exclude such manufacturers to prevent duplication of reports.

Where three or more factories produce a similar commodity it has been called an industry and has been described separately. For example, there are a large number of factories that manufacture chairs exclusively, so chair-making has been treated as a separate industry from furniture manufacture.

Where less than three firms make one commodity, the details of the industry are included under the heading of 'Miscellaneous' in order to avoid disclosing the identity of the individual firms. Where a number of firms manufacture similar commodities and use similar material, these have been grouped to form an industry, (as with bee-keepers' and poultrymen's supplies), although their products are not identical. The classes are described separately and the description will make the classification clear.

Table C gives a summary of the wood consumed by the different industries, with the total quantity used annually, the percentage distribution to each industry, the average value per thousand feet, the total value, and the percentage supplied by each region.

<sup>1</sup> Less than one tenth of one per cent.

Under this heading are included the manufacturers of implements used in tilling the soil, such as ploughs, harrows, cultivators, etc., and farm machinery used in harvesting the crops and preparing them for market, such as harvesters, binders, threshing machines, fanning-mills and horse-powers. Nineteen kinds of wood were used in this industry, imported hard pine leading with over 35 per cent of the total. The woods used in greatest quantities are chosen for their strength, toughness and durability, as products of this nature are subjected to rough usage. Maple, oak, elm, ash and hickory have been the most popular woods in the past, but imported hard pine is being rapidly substituted for these native hardwoods in many instances. Pine and basswood are used largely for box work and parts of implements where ease of working is of more importance than strength. As many factories purchase the gears of their implements and assemble these, manufacturing only the tops and box parts, the importance of these two softer woods is readily explained. The material is purchased chiefly in the form of rough lumber from one to four inches in thickness and in dimension sizes, all of the best grades. Of this material 52.1 per cent is purchased in Ontario, 1.5 per cent in Eastern Canada and the remaining 46.4 per cent in the United States.

The industry uses 29 per cent of the hard pine used in Ontario, more than any other industry except the manufacturers of sash and doors, and pays more for it than any other industry except the manufacturers of heavy machinery. The manufacturers bought the most expensive hemlock. Ontario's agricultural implements are exported to all parts of the world. Many of the larger factories are branches of American firms established in the province to satisfy the Canadian demand.

TABLE 2—BEEKEEPERS' AND POULTRYMEN'S SUPPLIES.

Kind of Wood.	Per cent.	Quantity.	Value.	Average Value.	SUPPLY BY REGIONS.

Spruce.....	13.7	75	1,380	18.40	75	.....	.....	.....

The commodities manufactured by this industry are chiefly incubators, brooders, bee-hives, poultry-crates, portable poultry-houses and fittings, such as nest-boxes, food-hoppers, roosts, etc. Three species only were reported, pine leading with 67.4 per cent. The requirements of a material for this industry are softness, lightness, ease of working, comparative durability and permanency of form in the finished product.

The material is purchased in the form of rough inch and inc. lumber, all coming from Ontario where the bulk of the products are sold.

<sup>1</sup> Less than one tenth of one per cent.

Manufacturers included in this class make canoes, skiffs, row-boats, dingy sail-boats, yachts, launches, tugs, steamboats and large sailing vessels. The bulk of the industry consists in the manufacture of canoes and gasoline launches.

Twenty-two kinds of wood were used in making these products in Ontario. Spruce headed the list with almost twenty per cent of the total. Pine, cypress, basswood, mahogany, butternut and tamarack are used for planking smaller vessels such as launches, row-boats and canoes; oak, pine and Douglas fir are used for planking heavy tugs and steamboats; oak, elm, maple, tamarack, ash and birch are used for framework, and oak, mahogany, butternut, ash, beech, cherry, tulip, chestnut, basswood, walnut, Spanish cedar and gum are used for interior work, decorative finish, gunwales and decking. The small item of sassafras is also for decorative work. With the increase in steel-ship construction this industry is gradually becoming confined to smaller pleasure craft, although large quantities of wood will always be used for decking and interior finish, even in steel-hulled vessels.

This industry used 85.9 per cent of the butternut used in Ontario—more than all other industries combined. Only the manufacturers of sash and doors used more cedar than the boat-builders. The industry paid the highest average price for the species (basswood, beech, elm, spruce and tamarack) and paid an average price of \$15.60 for their material in general. This average price is exceeded only by four other industries. The material was purchased in various forms. For interior finish and decorative work all sizes from  $\frac{1}{2}$ -inch veneer to inch lumber was used—mostly of the oak being quarter-cut. One and two-inch lumber was used for planking, and dimension sizes for framing. Two thirds of the wood was purchased in Ontario, 2.4 per cent in Quebec, 15.1 per cent in British Columbia, and 13 per cent in the United States and foreign countries.

Canadian canoes are known the world over, from the Thames in England to the Zambezi in Africa. Most of these are the famous Peterborough model, made around the lakes in the highlands of Ontario. Launches built in the province are shipped as far west as Vancouver, B.C.

Boxes and box-shoos made in regular box factories, boxes and crates made by the manufacturers who use them, crating for furniture, machinery, pianos, &c., cigar boxes, trunks and sample-eases are all included in this industry. Pine leads with 61.3 per cent of the total, taking this position probably on account of its lightness and cheapness, a large proportion being jack pine and the poorer grades being used in most cases. Spruce comes next in importance with 18.6 per cent. Spruce boxes are used instead of pine for food containers, on account of the lack of odor or taste. Basswood is also used for this reason, but is rather expensive for the cheaper kinds of boxes. Elm, maple and ash are used for heavier products and for crating machinery and stoves. Elm and Spanish cedar are used for cigar boxes. Basswood, white pine and soft elm are used for trunk-boxes.

The use of paper boxes and cartons and the packing of food stuffs in tin containers is reducing the need of wood for this purpose to some extent. Box-making, however, is an industry that uses wood which would otherwise be burned in the saw-mills and is a great factor in close utilization of wood. Many saw-mills are now running box-factories in connection with the plant and accomplishing in this way, a great saving of wood that would otherwise go to the burner or be sold as fuel.

Only the makers of slack cooperage use more basswood than the box-makers, who use 14.4 per cent of the total annual consumption of this material.

Box-manufacturers, with 26.7 per cent, use more pine than any other industry except the sash and door factories; they use 93.2 per cent of the Spanish cedar for the better class of cigar boxes.

This industry uses 9.5 per cent of all the wood used in Ontario annually and comes third on the list. It pays the small price of \$18.53 per thousand for its material, buying the cheapest ash, cedar, chestnut, cottonwood, gum and Spanish cedar. The material is purchased mostly in the form of rough lumber or box-boards, although the heavier crating is sometimes purchased in larger sizes.

The Spanish cedar and some of the birch, basswood and elm for smaller boxes are purchased in the form of veneer; 95 per cent of the material is bought in Ontario 4.2 per cent in Eastern Canada, and 0.8 per cent is imported. All the boxes are used locally in the province.

The manufacture of brush-blocks is another industry that serves as a factor in close utilization of wood and reduction of waste. These factories use material in small pieces of various sizes, and can take material that other factories would, in many cases, waste. From blocks for heavy stable-brushes to others as small as a

pencil for toilet brushes, a wide range of material can be used. Many manufacturers of other commodities cut their waste to certain sizes for brush-blocks for this industry. Wood for this purpose should be tough (to withstand splitting when bored for bristles) and hard (to withstand rough usage). For scrub-brushes and stable-brooms durability is a necessity; for the finer class of toilet-brushes, finish and appearance are more important.

Nine woods were reported, elm heading the list with 38 per cent. Elm, maple and birch together form nearly nine tenths of the total. Although these manufacturers can use small material, they demand the best grades, as is shown by the price of \$25.07, which is above the general average. This industry takes all the ebony imported with the exception of a little used for musical instruments. It bought the cheapest mahogany at \$80 a thousand, purchased as rough lumber. Most of the material is purchased in the form of rough lumber, but some factories purchase selected hardwood blocks of various sizes. Over ninety nine per cent is purchased in Ontario and the remainder is imported from foreign countries.

As an industry this is not important from the standpoint of quantity of material used, which is below a million feet a year, but it is important on account of the close utilization possible and the wide use of the commodities manufactured.

Ironwood.....	1	1	50	50.00	1	.....	.....	1

<sup>1</sup> Less than one tenth of one per cent.

The figures in table 6 include returns from manufacturers of passenger coaches, baggage, express and freight cars for steam railways, cars for electric lines, and the wooden parts of locomotives, such as running-boards, cab-seats and pilots. Nineteen kinds of wood were reported, with imported hard pine heading the list, forming almost one quarter of the total amount of material used. Hard pine is used for the sills of cars because of its strength and comparative lightness and the fact that it can be obtained in large sizes, clear of defects, and in sufficient quantities for the purpose. Douglas fir, which is now used only to the extent of five per cent, is employed

for the same purpose and could be used more extensively, as innumerable tests have proved that there is practically no difference in the strength values of the two woods, and Douglas fir is probably the lighter. Oak and maple are used for cross-sills and bumpers; ash, elm, hickory and ironwood are used for framework; hard pine, spruce and maple, for flooring; basswood, tulip, cottonwood, cedar and chestnut, for body-work and veneer backing; pine, spruce and hemlock for freight-car boxes; birch (stained to imitate mahogany), cherry and mahogany for interior finish.

Material for framework is purchased in dimension sizes; for body-work, boxes and interior finish it is usually in the form of rough lumber up to two inches in thickness. Veneers of tulip for cross-banding and of birch and mahogany for finish are also used.

This industry uses 51.7 per cent of the cherry, or more than all the other industries combined. It also uses 24.4 per cent of the Douglas fir—more than any other one industry. Only the vehicle and musical-instrument makers use more tulip than the car manufacturers who take 10.3 per cent of the total at the high price of \$73.71.

These manufacturers buy good grades and pay an average price of \$35.12 a thousand for their lumber, which is above the general average. They pay a higher price than any other industry for their ash, cottonwood and ironwood. More than half of their material is imported; 34.7 per cent is purchased in Ontario; 9.2 per cent in Eastern Canada, and 5 per cent in British Columbia.

Cars and coaches built in Ontario are used on Canadian railways all over the Dominion, but more especially in Ontario and the western provinces.

Chair manufacture has been separated from household-furniture manufacture because so many factories make chairs exclusively. These range from the cheap, rough, kitchen variety made of elm or beech to the more expensive hand-carved, parlour and office chairs of mahogany and quartered oak.

Ten kinds of wood are used in the industry. Elm, which leads on account of its cheapness and abundance, is used for cheaper grades of chairs and for the framework of more expensive ones. Beech is the cheapest hardwood in Canada and forms 28.4 per cent of the chair material. Oak is the most popular material for mission-style and office chairs. Maple, birch and ash are used for cheaper grades and framework, chestnut for veneer core, and gum and tulip for seats and backs. The material is purchased in all thicknesses from  $\frac{1}{8}$ -inch veneer to 3-inch plank. Very little veneer is used, as most of the parts of chairs have to be solid. Approximately seventy

one per cent of the material is purchased in Ontario, seven per cent in Quebec and twenty-one per cent is imported. Almost 90 per cent of the oak used is purchased in the United States. Nine per cent of the beech consumed in Ontario was used in chair-making, manufacturers of miscellaneous products and of hardwood flooring alone exceeding this use. The field of trade of these commodities is largely in Canada and Newfoundland.

The commodities manufactured by this industry include highly decorated caskets finished in natural wood, cloth-covered coffins, and rough boxes, shells, or shipping cases.

Coffins and shells form a large percentage of the product, as is shown by the quantities of pine, spruce, basswood and chestnut used by the industry. Oak, birch and mahogany together form only 6.4 per cent of the total amount of wood used and these are primarily casket woods. Pine and hemlock are used chiefly for rough boxes and shipping cases.

Nine kinds of wood were reported in all, chestnut and cedar being used chiefly on account of their durability in contact with the soil. A considerable quantity of quartered oak is used by the industry.

This material is practically all purchased in the form of inch lumber of the best grades. The general price paid of \$23.84 is close to the average paid by all the industries for their materials. Of this lumber 77.1 per cent is from Ontario, 10.2 per cent from eastern Canada, and 12.7 per cent is from the United States and foreign countries. Ninety per cent of the chestnut and 85 per cent of the oak come from the United States. Three other industries use more chestnut than the coffin manufacturers who take 13.3 per cent of the total amount. They pay average prices for all their material except cedar, which they buy at \$18, which is much below the general average of \$39.97. The field of trade is largely confined to the Dominion, although some Canadian caskets and coffins are shipped to the West Indies, British Guiana and other colonies.

<sup>1</sup> Less than one tenth of one per cent.

Tight cooperage includes watertight barrels for containing whisky, wine, syrup, cider, vinegar and oils.

Of the five kinds of wood reported as having been used in this industry oak forms 87.6 per cent of the total. It is well known that white oak must be used for barrels to contain alcoholic liquids, which form a large percentage of the tight barrels manufactured. Eighty per cent of this oak is imported from the United States, and this importation forms 70.2 per cent of all the wood used in the industry. Barrels to contain oils can be made of metal; cider and vinegar can be bottled; syrup can be sold in cans or jars, but wood is necessary for aging and storing alcoholic liquids, although they are sold in bottles to the ultimate consumer. The supply of white oak in Canada is limited to groups of trees in farmers' woodlots and will not last for many years. The users of white oak barrels cannot rely on importations, as the foreign sources of material are being as rapidly depleted as the domestic. It is stated that some of the larger breweries are contemplating the purchase of land for growing white oak for their own use in the future, but most of them seem satisfied to rely on the United States for their supply. The material is purchased in the log or in bolt form as with slack cooperage. Tight cooperages purchase 6.5 per cent of the oak used by Ontario's industries and pay the highest price for it.

In 1911 Canada imported over a hundred thousand barrels and over seven million oak staves which clearly indicates that the local cooperages cannot begin to supply the demand. The majority of the barrels used are either assembled in barrel factories, which import their stock ready-made, or are assembled from imported stock in the factories of the users themselves. Such stock is not included in this report, which deals only with manufacturers who use raw material or rough lumber. The bulk of the tight cooperages sell their barrels locally and practically none of these barrels are exported, or even shipped out of the province.

TABLE II.—DAIRY MACHINERY.

MATERIAL	Kind of Wood	Per Cent.	Quantity	Value	Average value	SUPPLY BY REGIONS			
						Ont.	Eastern Canada	B.C.	Foreign
			M.F.L.B.M.	\$	\$	M.F.L.B.M.	M.F.L.B.M.	M.F.L.B.M.	M.F.L.B.M.
1,121	Total	100.0	5,448	150,577	27.44	4,013	—	—	505
3,121	Basswood	30.2	1,641	43,533	26.48	1,641	—	—	—
	Maple	30.2	1,613	44,341	26.99	1,613	—	—	—
	Elm	30.1	1,610	46,130	28.13	1,610	—	—	—

	Hard Pine	0.9	50	1,750	35.00	—	—	—	50
	Pine	0.3	16	632	39.50	16	—	—	—
	Tulip	0.1	5	345	69.00	—	—	—	5

Under the heading of Dairy Machinery are included all such commodities as churns, butter-workers, butter-tubs, cream separators and machinery used in cheese-making. The basswood is used for butter-workers; maple for butter-moulds, elm and cypress for churns, white pine for covers, and tulip for butter-worker rollers and trays. Yellow pine is used for framework only.

Materials for this purpose must be both tasteless and odorless, which accounts for the extensive use of basswood, maple and elm. Tulip would be more popular but for its price, which is the highest of the seven kinds of wood used.

The material is purchased in the form of inch boards of medium grades, and comes chiefly from Ontario; only 9.3 per cent is imported from the United States, these imports consisting of cypress, hard pine and tulip.

This industry uses the most expensive white pine at \$39.50 a thousand. The bulk of this machinery is sold locally in the province or in the Dominion, but New Zealand, Australia, England and Italy are among the foreign countries to which Ontario dairy machinery is exported.

	Poplar	0.2	10	120	12.00	10	—	—	—

Fruit baskets and crates, berry boxes, cheese boxes and vegetable packages are all enumerated in Table 12.

Eleven kinds of wood were used in this industry, elm forming almost half of the total amount. Soft elm in the form of veneer or thin lumber is used for the sides, rims, hoops and handles of baskets and fruit boxes, and is also used exclusively for cheese-box sides. Basswood is made into covers and bottoms of baskets and crates, cheese heading and berry boxes. Maple is used for sides and bands of crates and for some cheese-box sides. Pine, spruce and tulip go into basket bottoms and cheese heading. Ash, beech, birch, hemlock, tulip and balsam poplar are made into fruit crates. The use of inferior species and of the veneers of more valuable ones is a good example of close utilization. While these industries use only about five and a half million feet of material annually, they have practically no waste.

The material is purchased either in the log, to be cut into veneer, or in the form of lumber or veneer already cut. The average price is low, at \$16.53, but the best grades are used in most cases. The material is purchased in Ontario to the extent of 96.4 per cent; 2.8 per cent comes from Eastern Canada and 0.8 per cent (42,000 feet of tulip) is imported from the United States.

This industry uses the cheapest hemlock, pine, poplar and tulip. The output of the factories is sold locally in the province.

TABLE 13—HALF-TONE BLOCKS.

Kind of Wood.	Per cent.	Quantity.	Value.	Average value.	SUPPLY BY REGIONS.			
					Ont.	Eastern Canada.	B.C.	Foreign

Mahogany.....	38.1	8	660	82.50	.....	.....	.....	.....
Cherry.....	9.5	2	200	100.00	1	1	1	.....

This industry comes last on the list for quantity of material used annually, but pays the highest average price for its stock, namely, \$84.52 a thousand.

Four kinds of wood were used, of which birch formed 52.4 per cent, birch and mahogany together making up the bulk of the material. A few thousand square inches of boxwood were imported from the United States at a price of 4 to 5 cents per square inch for making wood-engravings. Mahogany is used for mounting engravings and cuts, for electrotyping, stereotyping and blocking, birch for blocking and mounting electrotypes, and cherry for mounting.

The material is all bought in the form of inch lumber and over half of it supplied by Ontario; about 5 per cent is purchased in Eastern Canada, and the mahogany, forming 38 per cent of the total, is all imported.

The prices of birch and cherry are the highest paid by any industry as only the best selected stock is used. The field of trade is confined to Canada.

Maple is the favorite material for the longer handles of hay-forks, brooms, mattocks and pike-poles. Ash is also used for these and for shorter handles of whisks, hammers and shovels. Hickory forms the bulk of the axe and hammer handles. Basswood, birch, beech and sycamore are used for small, short handles where great strength is not required. Elm and oak are used for heavy handles of agricultural implements such as plow and sculler handles. Apple is used for saw handles and mallets and cherry for handles of dies, seals and rubber stamps. For the more expensive handles where straight grain is imperative the material is purchased in the log and split into bolts. Other manufacturers purchase their bolts ready cut to suit the size of the handles they produce. For smaller stock lumber down to three eighths of an inch in thickness is used. About sixty five per cent of the wood used is purchased in Ontario. About three per cent (part of the maple) comes from Eastern Canada and about 32 per cent from the United States; from the last-named source comes also over ninety per cent of the hickory, the native supply fit for this purpose being almost exhausted. No better material than hickory has been found for axe and hammer handles and the manufacturers are at a loss to prepare for future supplies, as the American sources are also becoming rapidly depleted.

Handle factories consume all the apple wood used by Ontario's industries, and 31.3 per cent of the sycamore (coming second to furniture factories in this respect) 12.1 per cent of the hickory (coming second to the manufacturers of vehicle supplies) and 13.7 per cent of the ash.

The average price paid for handle woods is \$29.99, which is above the general average. These manufacturers buy the cheapest sycamore and hickory, but their ash costs \$43.27, a price only exceeded by that paid by the ear manufacturers. The more expensive grades of ash were used for shovel handles.

Ontario-made tools are shipped to the western provinces and other parts of the Dominion and are exported to Australia, South Africa, Argentina, New Zealand and Great Britain.

<sup>1</sup> Less than one tenth of one per cent.

Hardwood flooring is separated from other planing-mill products because some mills make flooring exclusively, and the product, when tongueed, grooved, end-matched and hollow-backed, is a more highly manufactured article than mere finished lumber. The flooring is finished in different thicknesses from three eighths of an inch to four inches, although the majority is seven eighths of an inch in thickness and of different lengths. Seven kinds of wood were used for the better class of flooring, maple and birch forming 83.2 of the total. Birch and beech on account of their cheapness are becoming more popular as the supply of oak and maple decreases. The most expensive flooring is three eighths of an inch, quarter-cut white oak, which goes as high as \$86.00 per thousand. Elm is used chiefly for stable flooring.

Thirty six per cent of the maple and thirty per cent of the birch used in Ontario go into hardwood flooring, no other industry using as much. Only the manufacturers of miscellaneous commodities use more beech than is used for flooring.

The material is purchased in the form of rough lumber by the factories that make flooring exclusively and in the size that best suits the thickness of the flooring to be turned out. Many planing mills connected with saw-mills make flooring as a sideline and use the rough lumber as it comes from the saw. The manufacture of hardwood flooring, as an industry, comes fifth on the list in Ontario with a total consumption of over fifty two and a half million feet of raw material. The average price paid for this was \$24.86, which was very little above the general average. Over 70 per cent of the lumber was purchased in Ontario, 0.2 per cent in Quebec and 29.2 per cent in the United States. The prices paid for different species were average ones in most cases. The product of the industry was sold almost exclusively in Canada.

<sup>1</sup> Less than one tenth of one per cent.

The furniture industry as a whole, including the manufacture of household furniture, office furniture, pianos, organs and players, chairs, tables, school, edge and church furniture, kitchen cabinets and refrigerators consumes over eighty million feet of lumber annually. The household furniture branch of the industry uses over thirty seven million feet, coming seventh on the list. The commodities manufactured under this classification include bedroom furniture (beds, dressers, chiffoniers, bureaus, washstands, cheval stands and wardrobes), dining-room furniture (including sideboards, buffets, dinner-wagons, and china cabinets) and such general household furniture as couches, settees, divans, lounges, house-desks, bookcases, music and medicine cabinets, and hall clocks. Eighteen different kinds of wood are used in making this furniture, with seven hardwoods heading the list.

The wood used may be divided into two classes, according to where it is used in the final product. Woods for 'inside' work are used in making framework of furniture to be upholstered or covered, drawer parts, partitions, posts and backs and all parts of cheaper furniture. These woods are maple, basswood, elm, birch, gum, ash, pine, beech, spruce and butternut. The woods for 'outside' work, where appearance, grain and color are more important, are oak, black ash, chestnut, mahogany, walnut, cherry and butternut.

In the manufacture of the better class of veneered furniture the core stock is usually chestnut with considerable quantities of black ash, basswood, soft maple, and tulip. The crossbanding, which is glued at right angles to the grain on both sides of the core-stock, is usually a thin veneer of tulip. The veneer proper is glued at right angles to the grain of the crossbanding on the face of the piece of furniture, and some cheap veneer of elm or tulip glued in a similar position to the back to counteract the shrinkage of the face veneer. This makes a total of five thicknesses of wood with their grains running at right angles and is a certain preventive of warping or shrinking. Furniture made in this way keeps its shape better than that of solid construction.

Red cedar is imported from the United States and made into washboards and nests, on account of its pungent odour.

Birch and gum are used to imitate, respectively, mahogany and walnut, and are then used for 'outside' work.

Household-furniture factories consume the bulk of the gum (50 per cent), sycamore (62.5 per cent) and red cedar (100 per cent) used in Ontario in a year. They use the second largest quantities of butternut, walnut and mahogany. Over twenty seven per cent of their material is imported, the imports consisting of the oak and chestnut and all the gum, mahogany, tulip, red cedar and sycamore.

The raw material used is lumber, in all sizes and grades, and varies, more of the oak being quarter-cut. The greatest part of the furniture is sold locally and the remainder in the Dominion and Newfoundland, little or none being exported.

The manufacture of kitchen cabinets and safes is a branch of the furniture industry which uses the cheapest materials. The woods are selected for utility, ease of working and permanency of shape, rather than for appearance. Eight woods were reported, with two of them, maple and basswood, forming three quarters of the total. Maple, oak, ash and hard pine are used for framework; basswood, cypress and spruce, for table-tops; gum for partitions and inside work, and oak (quarter-cut and plain) and black ash for face-work. This industry uses only a little over a million feet of material a year, coming seventh from the bottom of the list. The general average price paid for material was \$25.65, and the prices of each separate kind of wood were all average ones also. The import of raw material, all from the United States consisted of 162,000 feet, or 14.3 per cent of the total, comprising the large proportion of the oak and all the gum, hard pine and express. The finished commodities are sold locally or in Canada, but not exported.

TABLE 18.—LADDERS AND RUNGS.

Kind of Wood	Per cent.	Quantity	Value	Average Value	SUPPLY BY REGIONS.			
					Ont.	Eastern Canada	B. C.	Foreign

Douglas Fir. . . . .	0.6	2	95	47.50	—	—	2	—

Lightness and strength are the essential qualities for wood to be used in the manufacture of ladders, whether ordinary building ladders, fire ladders, extension ladders or step ladders. Of the five woods used by the industry, hard pine leads with 43.5 per cent, on account of its strength and the fact that it can be obtained clear in long pieces. Imported hard pine and native red or Norway pine are used for the sides of extension ladders and for the longer step ladders. Douglas fir is used altogether for fire ladders, as it is lighter than hard pine and usually equal to it in strength. Soft elm and basswood are used for step ladders and rock elm for ladder rungs or rounds. The hard pine and red pine and Douglas fir are purchased as rough lumber from  $1\frac{1}{2}$  to  $1\frac{3}{4}$  inches in thickness, the soft elm and basswood as inch boards and the rock elm for rungs as  $1\frac{1}{2}$ -inch rough boards. All the hard pine and two thousand feet of rock elm were imported from the United States, the Douglas fir came from British Columbia and the remaining 55.3 per cent of the material was bought in Ontario. This industry ranks next to last in quantity used but the prices paid for material are above the average. The majority of the ladders were sold in Ontario, Quebec and the Northwest.

This class of products may be divided into home laundry accessories and machinery used in power and steam laundries. The first division includes washing machines, mangles, wringers, wash-boards, tubestands, ironing-boards, clothes-horses and curtain stretchers. The second division comprises all the heavy machinery used by a commercial laundry, such as steam mangles, motor washing-machines, ironing tables and dry-rooms.

Basswood was used in greatest quantity and covered 29.4 per cent of the total, being all purchased in Ontario. Cypress was used to an almost equal extent forming 18.6 per cent of the total, all of which was, of course, imported.

Basswood was used on account of its quality of retaining its shape and the ease with which it can be worked. It, along with the beech, was made chiefly into wash-boards and clothes-dryers. Cypress was used on account of its extreme durability for washing-machine lids, tubs, tanks and frames. Hard pine was used for other washing machine parts, with maple, beech, soft elm, pine and cedar. Maple alone was used for wringers and mangles.

While these manufacturers use only about ten and a half million feet of material annually, they are the largest users of cypress, with the exception of the sash and door factories, and pay one of the lowest prices for this wood. The material is purchased as lumber from one to two inches thick. Owing to the extensive use of cypress and hard pine, a large percentage is imported altogether 47.2 per cent. The products of the factories are sold in Canada and exported to Australia, New Zealand, Great Britain, South Africa and the United States.

Wooden mantles for coal or gas grates are necessarily a part of interior house finishing, but some factories produce this product alone, so they are made into a separate class. Six kinds of wood go to form the final product, with oak forming over half the total amount used in a year. A large percentage of this oak is quarter-cut and is used for face-work. Stained birch and mahogany are also used on account of color, grain or appearance. Chestnut is used for veneer cores, and basswood for carvings and turnings on account of its easy-working qualities. The industry as a whole uses about half a million feet of wood in the form of inch lumber, three-inch plank, and veneers of oak and mahogany. Approximately seventy per cent of the material (all the oak, chestnut and, of course, the mahogany) is imported. Birch and basswood are the only native woods used.

The manufacturers of tight cooperage alone pay a higher price for their oak than the mantle makers. The product is sold locally and in the Dominion, but not exported.

<sup>1</sup> Less than one tenth of one per cent.

Pianos form the bulk of the product of musical instrument factories in Ontario. Piano-players and organs, with benches and stools, also form a part of the product. Many factories manufacture keys and actions alone, while others confine their operations to case-making. Firms that buy parts and merely assemble them in their factories are not included in this bulletin.

Fifteen different woods are used in the industry in amounts of over one thousand feet. Two imported woods, ebony and grenadilla or cocobolo, are used in making smaller wooden instruments, such as flutes, piccolos and clarinets, but, as these are used in very small quantities and purchased by the pound, they are not included in the tables.

Maple, elm, basswood and pine are used in approximately equal quantities and form together over half the total amount. These, with gum, birch and tulip, are used for the interior parts of pianos, organs and players, including the keys and actions, frame-work and inside case-work. Chestnut, black ash and tulip are used for core-stock; pine, gum and spruce for organ pipes; spruce for sounding-boards; and oak, walnut, mahogany, cherry and Spanish cedar for outside case-work, carvings, legs and moulding. The mechanical qualities of the different woods are understood and appreciated in this industry, and each material is used because its qualities fit it for some certain purpose. These manufacturers purchase only the best grades of wood and kiln-dry much of it themselves before using it in the final product. They use chestnut, tulip and walnut in greater quantities than any other industry.

The raw material is purchased in the form of lumber for case-work and actions, and as plank or dimension stock for frame-work, legs and posts. Some of the birch, walnut, oak, mahogany and maple is purchased as veneer for case-work and some tulip veneer is used for cross-banding.

The first four woods on the list, which form over half the total amount used, are native woods. Two thirds of the raw material comes from Ontario, 7.5 per cent is purchased in Eastern Canada and fifty thousand feet of Sitka spruce is brought from British Columbia for sounding boards. The remainder of the wood, 29.3 per

cent, is imported from the United States and tropical countries. Piano makers pay the highest prevailing prices for their imported woods, buying the most expensive gum, mahogany and Spanish cedar.

Canadian pianos and organs are sold all over the British Empire and in European countries.

Toys and wooden articles of stationery are included under the caption of novelties. Thirteen kinds of wood are used in quantities of over one thousand feet, and two others, ebony and rosewood, are used in smaller amounts. Most of the products are made as side lines or as a means of waste utilization in wood-working factories, and the wood is not usually selected on account of any particular quality it may possess. The elm and basswood, which form over fifty per cent of the wood used, are made into childrens' toy vehicles, such as sleighs, express wagons and doll carriages, and childrens' toy furniture, chairs and tables. The oak, mahogany, walnut, ebony and rosewood are used for pen-racks, ink-stands, rulers and other desk fittings.

The materials are purchased in all forms and sizes and the greater part is what would otherwise be factory waste. Ninety five and a half per cent of the material is purchased in Ontario and four and a half per cent is imported. This industry buys the most expensive hickory, the bulk of which is used in making log and board rules.

This is another branch of the furniture industry and consists of the manufacture of desks, office chairs, filing cabinets, tables, bookcases and sections thereof, and such fixtures as partitions, shelves, show-cases, wall-eases, counters, bars and railings. Sixteen kinds of wood are used, practically the same as those used for household furniture. In this industry, however, oak leads, instead of maple, and forms 38.2 per cent of the total, being mostly quarter-cut. The products are usually of a superior class where only the best woods are used. Chairs, filing cabinets and fixtures are frequently made of solid material even of the more expensive woods. The best desks, however, have five-ply veneered tops, as this insures permanency of shape even more than a solid construction. The woods are used for 'inside' and 'outside' work and for end stock and crossbanding just as in the household-furniture industry. The cypress included is used in bar fittings and drip-boards and work-boards where the material is liable to come into contact with water.

This industry used 20.5 per cent of the cherry, coming second only to the car industry, and 15.7 per cent of the chestnut. These manufacturers used over a third of the mahogany brought into the province, more than any other industry. They imported more of their material than the household-furniture factories, only 56.7 per cent of the lumber being purchased in Ontario.

Canadian desks are exported to some extent, but most of the office furniture is consumed locally or throughout the Dominion.

Wood used for patterns, moulding boxes, flasks, follow-boards and foundry work generally and for parts of heavy machinery and for skids is all summed up in Table 24. Pine forms 61.3 per cent of the total, and over two million feet of this wood is used in making patterns. In fact, white pine is so well suited for this purpose that it is often known as 'pattern pine'.

Other woods used for this purpose are black ash and basswood, with cherry and mahogany for very fine work. A good pattern-wood must be soft, with a close, fine, straight grain, and must not warp or check after being worked into shape.

For moulding boxes, flasks, follow-boards and foundry boxes a poorer grade of material is used, hemlock, maple, pine, poplar and spruce predominating. Any strong sound timber does for making skids. Maple, birch and elm are used for heavy pieces, and red white and jack pine with hemlock, spruce and hard pine for lighter machinery. Oak, ash, hickory and Douglas fir are used for parts of heavy machinery, elevator frames and guide-strips, scale pillars, handles and framework of all kinds. Cypress is used for pulp machinery and tulip for flour machinery. Small amounts of walnut, teak and lignum-vitae are used for electrical apparatus. Eastern and British Columbia cedar, cypress and white pine are also used for tan leaches and drums. Twenty one species, in all, go to form the total of over five million feet of lumber, one eighth of which is imported from foreign countries. This industry uses a good class of material, paying an average price of \$33.42 for the different kinds of woods used and buying the most expensive hard pine, cypress and maple. Patterns are used locally, but machinery is sold in all parts of Canada and exported to a large extent.

The making of picture frames and picture moulding might be considered as a part of the furniture industry, but some factories make this class of material alone. The industry is another of those which can be classed as factors in close utilization, as small pieces of wood, edgings, trimmings, and factory and saw-mill waste could often be used to advantage.

Basswood, birch and gum are used for the cheaper painted frames; for gilded or carved frames basswood is the favorite material. Quartered and plain oak, black ash and elm are used for stained or natural-finished frames.

Only six kinds of wood are used, but the total amount exceeds a million feet annually. Three quarters of the lumber is bought in Ontario and one quarter imported.

Rock Elm .....	0.1	1	50	30.00	1	—	—	100

Wooden shaft-pulleys, split or solid, wooden blocks and sheaves and hay pulleys are included in this class. Maple forms the bulk of the material, of which over a million feet is used annually. For the rims of shaft pulleys soft maple is the favorite material, on account of its toughness and close grain, and the fact that it turns smoothly across the grain and glues well. It is also used for pulley blocks. Hard maple is used for the arms of shaft pulleys and for sheaves. Rock elm is used for hay pulleys. Only seven and a half per cent of this material is imported, the bulk of it coming from Ontario.

The statistics for pulpwood consumption in Ontario are given more fully in the annual bulletin on Pulpwood for 1911 (Forestry Branch Bulletin No. 30). This publication gives the figures for the whole of Canada and also discusses the pulp making industry in detail. The figures in Table 27 were largely derived from this bulletin. Four species were used in making pulp in Ontario, but spruce, with 90.4 per cent of the total, forms the bulk of the wood used. Fifty-two per cent of the spruce was made into pulp by what is known as the mechanical process, where the wood is ground up mechanically and not treated or partially dissolved by chemicals. The remaining 47 per cent was made into chemical pulp by the sulphite process. Of the balsam fir equal quantities were made into mechanical and sulphite pulp. Poplar was the only wood treated by the soda process and 85 per cent of the poplar was so used. Basswood and elm were made entirely into mechanical pulp and used mostly for fibre wall-boards.

Pulp manufacturers used 11.8 per cent of the total amount of wood used by the industries, coming second on the list with a consumption of over a hundred million board feet of raw material. They used practically all the balsam fir, the greater part of the spruce, and 13.8 per cent of the poplar used in the province. Only one other industry paid a lower average price for all its lumber than the pulp manufacturers. They bought the cheapest balsam fir, basswood, elm and spruce that were used by the industries.

All the material was purchased in Canada, 90.8 per cent coming from Ontario and 9.2 per cent from Eastern Canada. Pulpwood is bought by the cord in the form of round sticks four feet in length and of varying diameters. A cord measures 4 ft. x 4 ft. x 8 ft. and contains, on an average, about 90 cubic feet, or approximately 554 board feet, at a cord. Ontario exported to the United States in 1911, 89,050 cords of pulpwood or approximately 49,333,700 feet, board measure. All this material was cut on private lands, as export of unmanufactured wood cut on Crown lands in Ontario is prohibited.

Canada exports large quantities of manufactured wood-pulp every year. In 1911 over 99 per cent of these exports went to the United States; about two thousand tons went to the United Kingdom and an odd eighty tons went to Newfoundland. The total exports amounted to over a quarter of a million tons.

† Less than one tenth of one per cent.

Pumps and parts thereof, tanks, cisterns, well curbing and covers, windmills, silos, vats and water-troughs are all used more or less in contact with water and therefore must be made of durable woods. While white pine is only fairly durable it is easily worked and holds its shape well. Cypress, cedar, oak, tamarack and hard pine are all noted for durability in moist situations, and are used for all large water-containers.

Of the twelve woods used in this industry pine forms over half the total amount, and imported cypress comes second, with almost a quarter of the total. Spruce is used mostly for silos; hemlock for well curbing and covers; and elm, maple, birch and hard pine for pump-plungers and working parts, the logs and caps being made chiefly of white pine, cedar, or tamarack. Although pine is the wood most commonly used, this industry only consumes 0.8 per cent of the pine used by all the industries combined. The prices paid for lumber were high on the average and the grades of material were all of the best. Boards and planks up to four inches in thickness were purchased in most cases. Squares of pine from five to eight inches were used for pump-logs, and squares of the hardwoods from one to three inches for plungers and rods. Over sixty per cent of the material came from Ontario, 8.2 per cent from British Columbia, 0.8 per cent from Quebec, and 27.1 per cent from the United States.

This is properly another branch of the furniture industry and might be included under kitchen furniture but for the fact that several factories specialize in these products. The class includes small refrigerators and ice-boxes and cold storages for stores, hotels and restaurants.

Black ash is the favorite material for outside finish in this industry, and makes up 30·9 per cent of the total quantity of wood used. Spruce is used for lining on account of its lack of taste and odor and forms 30 per cent, practically the same quantity as the ash. Soft elm, plain and quartered oak and birch are used for outside finish or framing and pine and chestnut for box-work and lining. The ash used by this industry forms seven per cent of the general total. Some ash and spruce are purchased in Quebec and 200,000 feet of oak is imported from the United States, but 83·7 per cent of the material is purchased in the province.

In this class, the largest and most important of all, are included practically all the planing mill and builders' factory products. This means all wood material used in house and building construction, with the exception of shingles, lath and rough timber purchased direct from the saw-mills.

The material can be roughly divided into general classes. Material for framework, such as joists, studding, sills and roof stringers, forms one division, and for this hemlock is the chief material, with pine, spruce, yellow pine, Douglas fir and balsam fir. Foundation timber and verandah and pergola material must be made of durable wood, as it is used in moist situations and cypress, cedar and tamarack are largely used for this purpose. For outside work, such as siding, clapboarding, ridge-poles, shutters, blinds and storm doors and sash, pine is used in greatest quantity with hemlock, spruce, basswood, cypress and tamarack. Roof sheeting and side sheathing are made usually of the poorer grades of pine, hemlock or spruce. For all sorts of interior finish, such as doors, inside sash, stair-work, paneling, ceiling, cornice, base-boards and flooring, the cheaper woods such as pine, hemlock and spruce are used only when cheapness is the greatest consideration, and in such cases are usually painted or varnished and grained.

The more ornamental hardwoods, such as plain and quartered oak, black ash, maple, chestnut, soft elm, mahogany, cherry, butternut and sycamore, are used where the natural grain of the wood is exposed under varnish or stain. Yellow pine, birch, cypress, beech, Douglas fir and red gum are used for this purpose, either varnished, stained or painted. Basswood, gum, chestnut and tulip and the softer hardwoods are

used largely for cornice, panels and carved work. Hardwood flooring is separated and forms a class by itself.

This industry used 31.3 per cent of all the lumber used in Ontario in a year, in spite of the use of brick, stone, steel, cement and other wood substitutes in house construction and the use of wood-pulp in the form of fibre wall-boards.

This industry consumes over 250,000,000 feet of lumber annually, costing over six million dollars. It uses the largest quantities of ash, cedar, hard pine, hemlock, pine, cypress and tamarack, and purchases 86.5 per cent of its raw material in Ontario. Hard pine, oak and cypress are imported in the greatest quantities, but the imports amount to scarcely ten per cent of the total. The builders' factories pay moderate prices for their material, the average being \$21.59 a thousand. They buy the most expensive chestnut and the cheapest Douglas fir and tamarack. Many of the planing mills are run in connection with saw-mills and take their raw material as it comes from the saw. Others purchase rough lumber or dimension stuff and work it up in the factories for sash, doors and stair material.

Ontario exports large quantities of planing mill and builders' factory products to all parts of the world, in addition to supplying a large local demand.

Pine, birch, oak and ash, the first four woods in this industry, form together over eighty per cent of the total. Pine is used for the cheaper class of church pews and school seats. Birch is used mostly for school desks. Black ash, oak (plain and quartered), maple, chestnut and mahogany are used for decorative work of all sorts in church and lodge altars, pews, seats and hymn-boards. Basswood, chestnut and tulip are used for carvings and core stock. Boxwood, rosewood and ebony are employed in small quantities for inlaid work and for gavels, ballot-boxes and other small articles of lodge paraphernalia.

This is another branch of the furniture industry, uses the same materials in the same form and has approximately the same field of trade.

Materials used in making bowling alleys, billiard and pool tables, baseball bats, hockey and lacrosse sticks, billiard cues, toboggans, bicycle rims and gun stocks are included in Table 32 under the name of sporting goods.

Elm and maple form two thirds of the wood used and head the list of fourteen species. Rock elm is the best hockey-stick material, and over half a million feet of rock and white elm are used annually for this purpose. Maple is used chiefly for billiard cues and some toy baseball bats. Billiard tables are built like any other heavy table with a frame of oak, maple, hard pine or rock elm finished in quartered oak, black ash, mahogany or walnut, with inside work of birch, tulip or basswood and chestnut and tulip for core-stock.

Bowling alleys are built of maple, hard pine and hemlock. Second-growth white ash and hickory are supposed to be the best material for baseball bats and 30,000 feet of hickory are used annually for this purpose and for lacrosse sticks. Yellow birch for toboggans, maple for bicycle rims and walnut for gun stocks complete the list.

Nearly two million feet of material is used annually for this class of goods, and the prices on the whole are above the general average. The material is purchased in all forms, grades and sizes and in many respects closely resembles the handle-making industry, purchasing squares or billets for bats, hockey and lacrosse sticks and billiard cues. Billiard-table and bowling-alley material is purchased in the form of dimension stock, lumber or veneer. Maple, hard pine, tulip, mahogany, white pine and chestnut are imported to the extent of a quarter of the total consumption.

Hockey and lacrosse sticks are exported to all parts of the Empire, but the heavier articles are made for home consumption and are sold in Canada only.

Under this branch of the furniture industry are included office and store tables, parlour, library and bedroom tables and kitchen tables. Oak furniture is fashionable now, just as walnut and cherry were a few years ago, and oak forms almost two fifths of the material used in table-making.

For the best class of tables, the tops are made of oak, preferably quarter-cut, or of black ash, soft elm, mahogany or walnut, with birch and gum stained to imitate mahogany and walnut. The framework and inside parts are made of maple, beech, birch, elm or ash, and the legs and any parts that show in the finished product are usually of the same material as the top. Basswood and cypress are used for the tops of black ash, soft elm, mahogany or walnut, with birch and gum stained to imitate used for core-stock in veneered table-tops.

The greater part of the material for tops is purchased in the form of inch boards, while framework is made from boards or plank. Legs are turned out of squares or small dimension stuff. Half the table material is imported, ninety per cent of the oak coming from the United States. The same country also supplies some of the maple and all the cypress, chestnut, gum, hard pine and walnut.

The industry buys the cheapest cypress at \$26.43 a thousand, and exports its products to all parts of the Empire.

<sup>1</sup> Less than one tenth of one per cent.

This industry uses more different kinds of wood than any other, and in most cases the material is used because of its physical properties, such as strength, toughness, or elasticity, and because it has been found to serve the purpose better than any other material. In few other industries are the qualities of different woods so well understood and appreciated.

The products manufactured are heavy vehicles, such as lorries, wagons, carts, coaches, drags, bob-sleighs and logging-sleighs. Light vehicles include buggies, sulkies, cabs, carriages, hearses, casket wagons and light sleighs and cutters. The wooden parts of automobiles, artillery wagons and gun carriages are also included and might be classed as heavy vehicles.

Many of the carriage and vehicle factories buy their gear-stock from factories which specialize in vehicle supplies. (See Table 35.) When this is done, the factory assembles the gear parts and itself manufactures only the box or top parts of the vehicle. This probably accounts for the large percentage of basswood used by this industry, as basswood is a favourite material for panels, boxes and top parts and forms 17.2 per cent of the wood used. The other materials used largely for this purpose are gum, tulip, cottonwood, pine, spruce, hemlock, beech, cypress, balsam fir, balm, poplar and cedar.

Cherry, mahogany, butternut and walnut are used for decorative work on hearses and casket wagons or in automobile bodies.

Yellow pine, tamarack and Douglas fir are used for poles, reaches, and hay and stock-racks, and ironwood for spokes and whiffletrees. The other woods, oak, elm, ash, maple, birch and hickory, are used for gear-stock and vehicle supplies, and will be more fully described in Table 35.

This industry leads in consumption of cotton-wood, and comes second in its use of gum and tulip. The box and body material is purchased in the form of rough lumber. The prices for all kinds of material are fairly high, and the best grades are used in most cases. The industry buys the most expensive Douglas fir and poplar, and the cheapest butternut, hard pine and walnut. Canadian vehicles are sold throughout the Empire and exported to foreign countries.

Pine.....	0.4	75	1,087	14.49	75	.....	.....	.....

In this industry all parts of a vehicle, except the body or box, are manufactured and sold to vehicle factories to be assembled. Gear-stock refers primarily to wheels, axles, sills, reaches and hounds. Another class of vehicles supplies is known as 'trees and pole' and consists of the wagon-pole, with singletrees, double tree and neck-yoke. In addition to these the industry turns out shafts, whiffletrees, sleigh runners, bobsleighs, bunks and side-bars. The industry consumes more wood than the vehicle factories proper, and comes ninth on the list with over 21,000,000 feet of lumber.

Seven species are listed, oak leading with almost half the total quantity. The bulk of the oak goes into spokes, bent rims, bolsters and tongues for heavy wagons and lorries. Hickory is the favourite for lighter spokes and rims or felloes and for shafts and light poles. It is also used for automobile spokes and rims. Maple is undoubtedly the best material for axles, rock elm and birch for hubs, and ash for poles.

Spokes are often purchased in the rough form of billets. Hubs are bought in tree-sections with the centres bored out. Rims and shafts are steam bent; poles, reaches, bunks and the heavier parts are cut or turned from selected dimension stock.

This industry consumes over three quarters of the hickory used in Ontario, and also buys 17.2 per cent of the oak, coming second only to the manufacturers of miscellaneous products in this respect. Few industries import a greater percentage of their material than the manufacturers of vehicle supplies. They buy two thirds of their material in the United States, importing the bulk of their oak, hickory and birch, although birch is Canada's chief hardwood. The product is sold locally to carriage factories and much of it is also exported. Canadian gear stock is very popular in Australia.

Cherry.....	0.2	9	225	25.00	9	....	....	....	....

The bulk of the product of this industry is made up of bakers' woodenware, such as bread-boards, racks and proofs, dough troughs and bakers' peels. It also includes spools and bobbins, pails and tubs and other small articles made entirely of wood.

Pine, maple and basswood are used in greatest quantities making up over 93 per cent of the total of the twelve woods used. Bakers' woodenware is made mostly of cottonwood, basswood, tulip and maple. Spools and bobbins are made of birch, beech, basswood and hard maple. Basswood, cedar and white pine are made into pails and tubs.

In many cases the material is purchased in the form of lumber, but the smaller articles are usually made as side lines in other wood-working establishments and are simply means of utilizing small waste pieces. Fifty thousand feet, or scarcely one per cent of the material, is purchased outside of Ontario. This consists of cottonwood and tulip only.

<sup>1</sup> Less than one tenth of one per cent.

Whenever less than three manufacturers make one class of product or where commodities cannot be grouped or treated separately they are included in this class.

A large part of the material is used for wood distillation in the manufacture of charcoal, wood alcohol, grey acetate of lime and other wood chemicals. This industry uses hardwoods, such as maple, beech, oak, birch and ironwood, and buys its material by the cord. Matches are made of white pine and basswood; wooden pipes of spruce and Douglas fir, wooden taps of cherry, artificial limbs of willow, hat blocks of tulip, wood matting of beech, sewing machines of oak and chestnut, and awning rollers, poles and other small commodities out of small waste material of every description.

This group of industries comes fourth on the list with a total consumption of over fifty-six and a half million feet of raw material, making up seven per cent of the total consumption of wood used by the industries. The manufacturers of these miscellaneous products consume the greatest quantities of beech, ironwood and oak and all the willow used in Ontario.

They buy 97.8 per cent of the material in Ontario, importing only a little oak, chestnut, and tulip. They purchase the cheapest wood of all the industries, and buy the least expensive beech, birch, cherry, ironwood, maple and oak, but the most expensive tulip.

TABLE 38—WILLOWWARE.

Material.	Quantity used.	Value.	Average Value.
Willow.....		\$	\$ per
Rattan.....	266,000 lbs.	9,225	0.035
Reed .....	38,908 "	3,657	0.094
Rush .....	3,000 "	600	0.200
Bamboo.....	67,000 yds.	335	0.005
	21,500 poles	1,398	0.065

Wickerwork is a general term for all commodities made of plaited or woven withes or reeds. The products so manufactured include furniture and baskets of all descriptions. The material is not purchased by any standard that can be converted into board feet, and on this account the statistics for this industry are not included in the summaries. Willow is used for the cheaper baskets and furniture and is largely native grown. Many manufacturers of these products own small willow farms which yield about four tons of green willow per acre annually. Some willow is imported from England.

Reed is the core of rattan after the cane or bark is stripped off. The rattan is grown in the South Sea Islands and shipped to the United States or Germany, where it is made into reed and shipped in bundles to the manufacturers. Reed is made into fancy baskets, cradles, bassinets, stands, coffins, tables, chairs and other light furniture. The cane when stripped off the core is used for weaving into chair-seats and for binding furniture. Rattan is also used for handles for leather goods, shawl-straps, whips, and for re-inforcing shin-guards and gauntlets.

Rush is used for chair seats and bamboo for whip-handles and light furniture.

### PROPORTION OF KINDS OF WOOD USED BY INDUSTRIES.

Table 'D' has been compiled for the purpose of showing to what extent each of the thirty-four kinds of wood is used by the different industries. The sign '<sup>1</sup>' following a figure in the table indicates that the industry purchased the greatest percentage

## WASTE UTILIZATION.

Many manufacturers reported having used their small waste pieces, short ends and trimmings in various ways other than for fuel.

Small pieces are first sorted out and resawn and used in the factory for small parts of the factory's own products. The remainder is sold to other industries if a market can be found, or manufactured on the premises into small articles as side-lines. The utilization is seldom carried beyond this point, although many factories bale their shavings and sawdust and sell them for bedding and for fibre and pulp manufacture, and for meat curing.

There is a good field open for manufacturers of wood-distillation products, such as wood alcohol, acetic acid, turpentine and charcoal, in the use of this smaller waste which is usually burned under the factory boilers. The details of these economies are given below.

Sash and door factories sell or use their short ends and trimmings for the manufacture of apple, fish, and other boxes, bathroom fittings, baskets, bobbins, brush-blocks, butter moulds, dowels, firework woods, heading, game boards, insulator pins, ladder rounds, match-blocks, novelties, skewers, spindles, spikes, stakes and wooden ware. They bale their common sawdust and sell it to butchers for floor covering to manufacturers of composition novelties, and to screw factories for cleaning screws. They sell shavings for bedding, packing and for drying wet land. Hickory and other hardwood sawdust is sold for smoking meats. Small waste pieces are sold for making ground wood-pulp, wood fibre for plaster work, and as a substitute for gravel in concrete masses.

Household-furniture factories utilize waste in the manufacture of boxes, brush-backs, crates, inkstands, jardiniere stands, wastepaper baskets, rosettes, stools, tabourets and toys, and utilize cuttings of quartered oak and mahogany for wood carvings.

Boat and ship building firms reported the use of their small waste in the manufacture of boxes, boiler blocking, crates, ladder rungs, pickets, plugs, surveyor's stakes, skids, skis, toboggans, tent-pegs, wedges and whiffle-trees. They sold shavings and sawdust for bedding.

Manufacturers of vehicles and vehicle supplies utilized their waste chiefly in the manufacture of handles for small tools, such as chisels, files, hammers or gimlets, and also for the manufacture of dowels, furniture squares, ladder rungs, pump handles and wheelbarrows. These manufacturers using large quantities of hickory should be able to sell their sawdust to meat packers who prefer hickory sawdust for smoking hams and bacon.

Agricultural-implement makers also have a good opportunity of manufacturing tool handles, which many of them take advantage of, using for this purpose mostly hickory and ash. They also utilize waste in the manufacture of washing machine parts and sell sawdust for concrete mixing.

Box and crate manufacturers use their material down to very small cuttings and consequently have little useful material left. They make butts of hard maple logs into meat blocks and manufacture some small handles and mouldings and sell their shavings for bedding.

Manufacturers of store and office fixtures make staffs for railway flags and use basswood in making mail-boxes.

Foundry men and heavy-machine manufacturers utilize their waste in making battery boxes, skids, crates, pulleys and small parts of patterns and sell shavings for bedding.

Novelty makers use small pieces of waste in the manufacture of 'producer gas.' They sell common sawdust for making pine-shion frames, hardwood sawdust for smoking meats, and pine and cedar sawdust for metal polish.

Sporting-goods manufacturers reported using waste for spindles, blind-roller parts, brush-blocks and nail-handles.

Handle manufacturers sell their finest hardwood sawdust for use in making a safety explosive and sell shavings for bedding.
