Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

- Coloured covers/

| 12X | 16X | 20X | 24X | 28X | 32X |

The copy filmed here has been reproduced thanks to the generosity of:

Library,
Department of National Defence

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol \rightarrow (meaning "CONTINUED"), or the symbol ∇ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

Bibliothèque,
Ministère de la Défense Nationale

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole \rightarrow signifie "A SUIVRE", le symbole ∇ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

SAINT JOHN:

PRINTED AND PUBLISHED BY HENRY CHUBB & CO.
PRINCE WILLIAM STREET.

1849.

692

PREFACE.

MANY alterations and additions have been made in this, the second number of "The Athenæum Almanac," which, it is hoped, will be considered improvements. It was part of the original design to vary the contents of the Almanac from year to year, and at the same time retain such parts as were of permanent importance; in this way it was believed that the interest of the work would be kept up, while the back numbers would still be of considerable value.

Though the Astronomical portion is chiefly designed for popular use, every care has been taken to ensure the accuracy of the information which it contains, in order that, in the absence of the Nautical Almanac, it may be of some service to the Astronomer and Navigator.

All the calculations have been adapted to "Mean Time," or that which is shown by a well-regulated clock. This differs from "Apparent Time," or that indicated by a sun-dial, by what is called the "Equation of Time."

The Equation of Time and the Sun's declination are given for Greenwich, mean noon.

The times of the Rising and Setting of the Sun and Moon have been computed for Saint John, in latitude 45° 16' N.; but for ordinary purposes they may be considered applicable to the whole Province.

It is hoped that the Provincial Chronology will be favourably received, as gleanings from a more extended series of Notes on Colonial History, which may hereafter appear, arranged in chronological order, and in a distinct form. The present scheme will tend to familiarize the public with the dates of many events which are of local importance, and might with advantage be much more generally adopted in Almanacs.

In order to meet the present circumstances of the Farming population in this Province, an article on Agricultural Chemistry has been prepared, upon the foundation of Professor Johnston's "Catechism of Agricultural Chemistry and Geology," a little work which is, perhaps, better calculated to extend the first principles of scientific agriculture among farmers, than any other yet written. Although parts of this little Catechism have been re-published here, it was thought that if a short paraphrase of the whole work, in a continuous form, appeared in this Almanac, it might give a better view of the scope and importance of Agricultural Chemistry than anything else which could be devised.

The article on Criminal Law is likewise but an abridgement of an abridgement.—The members of the legal profession are aware of the extreme value of the Act passed last Session of Assembly to consolidate the various Criminal Laws of the Province, but it was thought by presenting a summary of its contents on a plan somewhat different from that of the Act itself, that a sort of Tariff of Crime might be formed, which, while it familiarized the public with the penalties attaching to the various kinds of criminal offences, might, perhaps, tend to advance the cause of morality itself.

The Compilers neither expect nor seek for profit or remuneration; but it is obvious that the Publishers cannot continue to give so much matter for so small a price, unless the sale should be considerably more extensive than heretofore.

FREDERICTON, 15th Sept. 1849.

ECLIPSES OF THE SUN.

In the year 1850, there will be only two Eclipses, both of the Sun.

I. An Annular Eclipse of the Sun, February 11, 1850, invisible in New-Brunswick. The central line of this Eclipse passes over the Earth, from West to East, beginning in Southern Africa, in Lat. 10° 21' S., and Long. 22° 53' E., traversing the Indian Ocean, and East Indian Islands, and ending in the North Pacific, in Lat. 15° 49' N., and Long. 143° 6' E. The Northern limit, or the line traversed by the Northern edge of the Moon's Penumbra, begins in Lat. 24° 20' N., and Long. 25° 29' E., passes over the Southern part of Arabia and the Chinese Empire, and ends in Lat. 50° 3' N., and Long. 136° 28' E. The Southern line of simple contact begins in Lat. 46° 36' S., and Long. 7° 43' E., passes over the Southern Ocean and Australia, and ends in Lat. 17° 49' S., and Long. 155° 50' E.

II. A total Eclipse of the Sun, August 7, 1850, invisible in New-Brunswick. The centre of the shadow in this Eclipse passes over the Earth, from West to East, beginning in Lat. 12° 17' N., and Long. 150° 5' E., traversing the Pacific Ocean and ending off the Western coast of South America, in Lat. 9° 42' S., and Long. 80° 28' West. The Northern line of simple contact begins in Lat. 43° 8' N., and Long. 133° 30' E., passes over the North Pacific and South-Western parts of the United States, and ends in the Atlantic, in Lat. 41° 20' N., and Long. 66° 36' W. The Southern line begins in Lat. 18° 33' S., and Long. 156° 46' E., passes over the South Pacific, and ends in Lat. 40° 13' S., and Long. 98° 17' W.

TIMES OF THE MERIDIAN PASSAGE OF THE POLE STAR,

AND OF ITS GREATEST ELONGATION EAST AND WEST, ON THE FIRST DAY OF EACH MONTH.

The Pole Star does not occupy the true place of the Pole of the Heavens, but revolves round it at a distance of about $1\frac{1}{2}$ degrees, and consequently comes to the meridian only twice in 24 hours. On such occasions, but on no others, its bearing is exactly north. The following table, which gives the times of the Star's meridian passage, and also the times of its greatest elongation East and West, on the first day of each month, may be found useful to Surveyors, in obtaining the direction of the true meridian. As 3m. 55.91s. is the daily average change, the times for any other day in each month can be easily calculated from those given in the table.

DIRECTIONS FOR FINDING THE TRUE MERIDIAN AND VARIATION OF THE NEEDLE.

The variation of the needle should be noted on every survey with the compass, and then if the land be surveyed at a future time, the old lines can always be re-run. The meridian and thence the variation can be ascertained more correctly when the Pole Star is at its greatest elongation East or West than when due North, as any error in the true time at the place will not lead to the inaccuracy which would attend an observation not made at the exact instant of meridian passage. Knowing nearly the time of elongation, the true meridian and variation of the needle may be found in somewhat the following manner, by means of the compass:—

1. Drive two posts firmly into the ground, in a line nearly east and west; the uppermost ends, when so fixed, being about three feet above the surface, and the posts about four feet apart: then lay a plank three or four inches in breadth, and smooth on the upper side, upon the posts, and let it be nailed, to hold it firmly.

2. Prepare a piece of board four or five inches square, and smooth on the under side. Let one of the compass-sights be placed at right angles to the upper surface of the board, and let a nail be driven through the board, so that it can be tacked to the plank resting on the posts.

3. At about twelve feet from the posts, and in the direction of the Pole Star, let a plumb be suspended from the top of an inclined stake or pole. The top of the pole should be of such a height that the Pole Star will appear about six inches below it; and the plumb should be swung in a basin of water to prevent it from vibrating.

These preparations having been made, about twenty minutes before the time of elongation, place the board, to which the compass sight is fastened, on the horizontal plank, and slide it east or west, until the aperture of the compass sight, the plumb-

line, and the Star, are brought into the same range. Then, if the Star depart from the plumb-line, move the compass sight, east or west, along the plank, as the case may be, until the Star shall attain its greatest elongation, when it will continue behind the plumb-line for several minutes, and will then recede from it in the direction contrary to its motion before it became stationary. Let the compass-sight be now fastened to the horizontal plank. During the observation, it will be necessary to have the plumb-line lighted: this may be done by an assistant holding a candle near it.

Let, now, a staff, with a candle or lamp upon it, be placed at a distance of thirty or forty yards from the plumb-line, and in the same direction with it and the compass-sight. The line thus determined makes, with the true meridian, an angle equal to the azimuth of the Pole Star. The mean value of this angle, for the present year, for the latitude of Fredericton (which will serve roughly for the Province generally) is $2^{\circ} 9'$.

The variation of the needle is readily determined from the line above obtained, even without tracing the true meridian on the ground. Place the compass upon this line, turn the sights in the direction of it, and note the angle shown by the needle. Now, if the observation were made at the time of western elongation, and the needle pointed to the west side of the line, the angle shown by the needle, plus the azimuth ($2^{\circ} 9'$), is the true variation west. But, if the observation were made at the time of eastern elongation, while the needle still pointed to the west, then the angle shown by the needle, minus the azimuth, gives the variation west. When the elongation is east, and the needle also points to the east, the sum of the angles is the true variation east; but if the elongation is west, while the needle still points to the eastward of the line, the difference of the angles is the true variation, east or west, according as the angle shown by the needle is greater or less than the azimuth ($2^{\circ} 9'$).

It has been found by observation, that heat and cold sensibly affect the magnetic needle, and that the same needle will, at the same place, indicate different lines at different hours of the day. If the magnetic meridian be observed early in the morning, and then successively at other times of the day, it will be found that the needle will continue to recede from the meridian as the day advances, until about the time of the highest temperature, when it will begin to return, and at evening will make the same line as in the morning. This change is called the *diurnal variation*, and varies, during the summer season, from one-fourth to one-fifth of a degree.

ON THE RECENTLY-DISCOVERED PLANETS.

Till the discovery of Uranus, by Sir William Herschel, in the year 1781, six Planets only were known; viz., Mercury, Venus, the Earth, Mars, Jupiter, and Saturn. Kepler, from the comparatively great interval between the orbits of Mars and Jupiter, had suspected the existence of an intermediate Planet; and the discovery of Uranus, occupying an orbit in accordance with the supposed analogy among the distances from the Sun, tended to impress the idea more strongly upon Astronomers. In the year 1800, Baron Zach formed an Association of twenty-four observers, who divided the Zodiac into as many zones; and each observer engaged to examine one part, for the express purpose of finding this conjectural Planet. On January 1, 1801, Piazzi, the Director of the Observatory at Palermo, discovered in the constellation Taurus, a Planet, which he named Ceres; and on the 28th of March, 1802, Dr. Olbers, of Bremen, found another Planet in Virgo, which he called Pallas. Both of these were found to revolve in orbits situated between Mars and Jupiter, but being very small, they were conjectured to be fragments of a broken Planet, which had formerly circulated at the same distance from the Sun, and had been shattered by some internal convulsion. On this hypothesis, it was thought that there were other parts undiscovered, and the search was rigorously continued. On the 1st of September, 1804, M. Harding, at the Observatory of Lilienthal, near Bremen, disco-

vered Juno ; and on the 29th of March, 1807, Dr. Olbers, succeeded in finding Vesta. The two last mentioned were ascertained to move at about the same distance from the Sun as the preceding. Thus, within six years, four Planets were discovered ; and although the search was rigorously kept up till 1818, no other Planetary body was detected. But on the 8th of December, 1845, M. Hencke, of Driessen, saw a star occupying a position where, he felt assured, no star previously existed. This object proved to be a Planet, which was named Astrea, and was found to be one of the remarkable groups situated between Mars and Jupiter. The perturbations of Uranus having excited the attention of Astronomers, their cause was diligently investigated by Adams and Leverrier, and each of these eminent mathematicians came to the conclusion, that they were owing to the disturbing force of an exterior Planet. On the 23d of September, 1846, Dr. Galle, of Berlin, directed by such theoretical investigations, discovered the Planet Neptune in the very spot where he was desired to search for it, and thus confirmed, in the most striking manner, the theory of universal gravitation. On July 1st, 1847, M. Hencke discovered Hebe, and on August 13th, 1847, Mr. Hind, at Mr. Bishop's Observatory, discovered Iris. On the 18th of October, of the same year, Mr. Hind detected Flora, and on the 25th of April, 1848, Mr. Graham, at Mr. Cooper's Observatory, discovered Metis. On the 12th of April, 1849, a tenth Planet, named Diana, was added by Signor de Gaspari, at Naples, to the interesting group between Mars and Jupiter. The dimensions of all these Planets are so small as not to be distinguishable by the naked eye; and the most powerful telescopes have hitherto failed to measure their apparent diameter with even tolerable accuracy. M. Encke, speaking of the manner in which the presence of the new Planets has become known to us, says, "that the perfection of optical instruments led to the discovery of Uranus—precision of observation to that of Ceres—a remarkable acquaintance with the position of the heavenly bodies to that of Pallas—the perfection of the stellar maps of Harding to that of Juno—a bold but ingenious hypothesis, leading to the closer examination of a particular part of the sky, to that of Vesta—and the remarkable perfection of the Astronomical Maps of the Academy of Berlin mainly contributed to the discovery of Astrea." Diligent search, combined with an intimate acquaintance with the Heavens, has enabled Astronomers to detect the additional Asteroids. M. Hencke, however, regards the discovery of the Planet Neptune, in the exact spot predicted by theory and calculation, as displaying one of the most remarkable combinations of sound theory and careful observation that Astronomical science has ever presented. These several discoveries of Telescopic Planets lead us to suspect the existence of many such bodies yet unknown to us ; and there seems good reason to believe, that in a few years we shall have a large addition to the Solar system.

NOTE.—For a tabular view of the Solar system, see the N. B. Almanac and Register for 1849.

INFLUENCE OF THE MOON.

That the Moon affects the Tides, and, in like manner, acts upon the Atmosphere, all ought to know; but if any think it exerts a controlling influence over the weather, or the growth of vegetation, it is well to remind them of the results to which the late Dr. Olbers, the distinguished Astronomer of Germany, who discovered the Planets Pallas and Vesta, was led by an examination founded on *careful meteorological observations for fifty years*, in different countries. "I believe," he says, "that I have demonstrated that the influence of the Moon upon the weather is so small that it is *totally lost* amid the great variety of other forces and causes which change the state of our atmosphere, and that its pretended influence on men, animals, or plants, is, *all of it*, due to illusion or prejudice."

AGRICULTURE FOR THE MONTH.

The first and most important thing for the farmer in this month is to attend to his horses, cattle and swine. Let them be housed at night and in stormy weather. See that the stables are cleaned, the yards dry and well littered, the sheds warm and yet well ventilated. If hay is scarce, and labor is cheaper than fodder, it may be cut and mixed with chopped straw, corn-stalks, meal, bran, grain or roots; take care, at all events, that no fodder is wasted. Cut up a few potatoes or turnips for sheep, and mix a little salt with them. If there be sufficient snow, haul home wood for fuel and fences. Logs may be taken to the mill and made into boards for future use. Repair all tools, vehicles and implements, when obliged to stay in-doors. Thresh grain, clean seeds, and take farm produce to market. Take oats to mill. Take every opportunity of chopping and preparing new land for a crop. This is also a good time for breaking steers and colts.

ASTRONOMY FOR THE MONTH.

During this month the constellation Taurus is a conspicuous object in the Heavens. It contains 141 visible stars, including two remarkable clusters called the Pleiades and Hyades. The brightest star in the former of these well-known groups is Alcyone, which of late years has excited more than ordinary interest, on account of the researches of Mädler into the proper motions of the stars of our firmament, leading him to decide upon it as the centre round which all the others revolved. Aldebaran shines conspicuous among the Hyades, and belongs to the class of double stars. On the first of the month, he crosses the meridian at 9h. 42m. P. M., at an altitude of 62°.

AGRICULTURE FOR THE MONTH.

Continue to attend to the stock: remember that by keeping animals warm, you economise the food which would otherwise be applied to sustain the heat of the body. Curry the cattle and horses. Lice, which accumulate on over-crowded cattle, may now be destroyed by tobacco-juice, snuff, lard, fish-oil or soft soap. Hens will lay all winter if their houses be impervious to cold winds, and if with their grain they receive a supply of gravel and old mortar. Continue the hauling of fuel and fencing-stuff; cut up as much of the former as possible, and pile it away under cover for summer use: this seems novel, but the *farmer* will understand, though the *lumberman* may not. Finish the threshing of grain, and stow it away beyond reach of rat, mouse or weevil. Let the roots be assorted, keeping the best for house use and for seed. Prepare for making maple sugar. Take advantage of this season for hauling peat, swamp-muck, sea, river or pond mud, for making composts of.

ASTRONOMY FOR THE MONTH.

Orion is a beautiful object in the Heavens during the evenings of this month. When on the meridian, there is then above the horizon the most magnificent view of the celestial bodies that the starry firmament affords. The constellation consists of seventy-eight visible stars; of which two are of the first, four of the second, three of the third, and fifteen of the fourth magnitude. In the belt are three easily-distinguished stars, of the second magnitude, called in Job, *the Bands of Orion*. These point on one side to the Hyades and Pleiades, and on the other to Sirius, or the Dog-star. South of the belt there is a row of stars of the fourth and fifth magnitudes, forming Orion's sword-sabbard, in the centre of which is the celebrated "Fish-Nebula." Betelgeuse, the bright star above the belt, crosses the meridian on the first of the month, at 9h. P. M., at an altitude of 53°.

APOGEE AND PERIGEE OF THE MOON.

| | | |
|-----------------------------------|------------------------|------------------------------|
| Apogee, 8th day, at 4 hours, mor. | Semidiameter = 14' 44" | Horizontal Parallax = 54' 6" |
| Perigee, 21st " at 11 " aft. | " = 16' 16" | " " = 59' 40" |

AGRICULTURE FOR THE MONTH.

Make maple sugar. No trees of less than twelve or eighteen inches diameter ought to be tapped : they should be bored with an inch auger ; all the vessels used should be perfectly clean ; the sap should be first strained and reduced by boiling nineteen-twentieths of its bulk, then clarified by white of egg, boiled and strained again ; boil again, and then pour it into pans till it grains ; after this, dry it by placing it in wooden drains filled with gimlet-holes. Look well to the cattle, and give those with young an extra feed or mash occasionally. Manure may be hauled from town or elsewhere. Take every opportunity of hauling wood, and of carting manure to the fields. Let the yards be cleaned at regular times and new littered. Early lambs for market should appear in March, but very great care is required to preserve them.

ASTRONOMY FOR THE MONTH.

The constellation Gemini contains 85 visible stars, including one of the first (Castor), one of the second (Pollux), four of the third, and seven of the fourth magnitudes. Castor is the largest and finest double star in our hemisphere, and crosses the meridian on the 1st of the month, at 8h. 48m. P.M., at an altitude of 77°. It is, 11m. later, succeeded by Pollux, which is quadruple. Procyon, the principal star in Canis Minor, comes to the meridian 3m. earlier than Pollux, and is about 23° farther South. At about the same distance S. W. of Procyon, is Sirius, in Canis Major, which is double, and is the brightest of all the stars in the firmament. It is, however, so remote, that at its distance, the radius of the Earth's orbit (95,000,000 miles) would subtend an angle of less than 1/2", a quantity almost inappreciable.

APOGEE AND PERIGEE OF THE MOON.

| | | |
|------------------------------------|-------------------------|-------------------------------|
| Apogee, 4th day, at 11 hours, aft. | Semidiameter, = 13' 46" | Horizontal Parallax = 54' 12" |
| Perigee, 18th " at 8 " mor. | " = 16' 9" | " = 59' 15" |

AGRICULTURE FOR THE MONTH.

The farm should be plotted, and each field assigned its crop for the year. Manure should be all got out while the hauling is good. The cattle should not be allowed to wander on the road, fields or meadows, which does no good to themselves and much injury to the land. Let the drains be overhauled and cleared out. Continue the cutting, splitting and piling of wood. Prune and remove dead limbs and branches of fruit-trees, bushes and shrubs. Scrape off moss from apple-trees, and cut off black knobs on the plum-trees. All kinds of fruit and forest trees may now be safely transplanted. Transplanting must always be done before the leaves are out or after they have fallen; if a tree is covered with leaves when it is transplanted, the evaporation by their surface is so great that the vital moisture of the plant would be all dissipated before the roots had begun to absorb water from the soil. Break up the garden and sow the early vegetables. Commence ploughing in dry situations and on sod land as soon as the frost will allow.

ASTRONOMY FOR THE MONTH.

During the month, Leo, one of the most brilliant constellations in the winter hemisphere, is favorably situated for observation. It contains 95 visible stars, of which two (Regulus and Dinebola), are of the first magnitude, two of the second, six of the third, and fifteen of the fourth. On the 1st, at an altitude of 58°, Regulus crosses the meridian, at 9h. 17m. P. M., and 1h. 41m. later, is succeeded by Dinebola. Both stars are double, and nautical men make great use of the first mentioned for determining their longitude at sea by means of lunar distances. Regulus has also been used by the best astronomers of all nations for ascertaining the exact amount of the precession of the equinoxes. To the north of Leo is the lesser Lion, which contains 53 stars, but of these the largest is one of the third magnitude.

| Apogee, 30th " at 1 " aft. | " = 14' 44" | " " = 54' 6" |

AGRICULTURE FOR THE MONTH.

Set about ploughing the land. Early spring ploughing is the best for sod land, as the frost both pulverizes it and kills the weeds. Sow grass and plant the root crops. Steep and sow the grain crops. Corn may be sown after the grain crops and clover. Turn out the sheep and cattle, but not before the land is tolerably dry and the young grass has appeared. Cart out the remainder of the manure, and clear up the farm-yards. Manure will waste as much in the heap in one season as in the ground, and for the first you get nothing, for the other a great deal. Towards the close of the month the meadow-lands may be top-dressed with compost, gypsum or other manure. Mark spots for future drainage. Beets, mangold-wurtzel and Swedes may be sown with advantage after the other crops. Peas, beans, onions, turnips, carrots, parsnips, potatoes, radishes and spinach may be sown in garden and fields. Cabbages, cucumbers, cauliflower, lettuce, radishes, tomatoes and peppers may be planted out. Hedges and shrubs may be trimmed.

On the first of magnitude in the altitude of the year of the first. The constellation first, ten of the number of nebulae star, to the det Astronomers.

ASTRONOMY FOR THE MONTH.

On the first of this month, *b* Leonis (Dinebola, a standard Greenwich star of the first magnitude in the switch of the Lion's tail,) crosses the meridian at 9h. 4m. P. M., at an altitude of 59½°. On the 15th, *a* Virginis (Spica, a beautiful white-colored double star of the first magnitude,) crosses the meridian at 9h. 44m. P. M., at an altitude of 35°. The constellation Virgo contains, according to Flamsted, 110 stars, including one of the first, ten of the third, and ten of the fourth magnitude. It is remarkable for the great number of nebulae that are observed within its boundaries. *g* Virginis is a fine double star, to the determination of the orbit of which much attention has been paid by modern Astronomers.

APOGEE AND PERIGEE OF THE MOON.

| | | |
|-------------------------------------|------------------------|-------------------------------|
| Perigee, 11th day, at 3 hours, aft. | Semidiameter = 16' 24" | Horizontal Parallax = 60' 46" |
| Apogee, 27th " at 11 " mor. | " = 14' 42" | " " = 53' 56" |

AGRICULTURE FOR THE MONTH.

Finish sowing and planting. The seed-end of potatoes, cut rather deep, will yield the best crop. Ruta-bagas, or Swedes, may be sown after the potatoes. Four or five lbs. of seed are not too much for an acre,—that will allow some for the insect, and some for the land. Transplant so as to fill up spots where the crops seem to fail. Hoe, or set the cultivator going among the corn and root crops. Weed the garden, the grain and root crops, otherwise it will be fifty times more troublesome later in the season and next year. Weedy fields may be ploughed for summer fallow. Buckwheat land ought to be prepared. The earlier the chopped land can be well burnt the better. Prune, trim and transplant trees. After transplanting, the soil should be rendered mel- low and rich by *mucking in* for a considerable distance around; choose a moist or rainy day for the operation. Remove or destroy insects, lice and caterpillars on fruit-trees. Plant out cabbages. Transplant wild plants, bringing with them a portion of the natural soil.

ASTRONOMY FOR THE MONTH.

Boötes (The Bear Driver), one of the old forty-eight constellations, is a prominent object in the heavens during the evenings of this month. It contains fifty-four visible stars, including one of the first, seven of the third, and ten of the fourth magnitude. **Arcturus**, the principal star, is double, and crosses the meridian on the 1st, at 9h. 23m. P. M., at an altitude of 64°. It has been extensively useful in modern astronomy, and is remarkable as being the body by which the fine discovery was made that stars and planets may be advantageously observed during the sun's presence. Sanguine hopes of determining its parallax, and thereby ascertaining its distance, were at one time entertained, but every exertion met with disappointment.

AGRICULTURE FOR THE MONTH.

Hoe and weed corn, potatoes, and all other crops; run the cultivator through them when the opportunity offers. Buckwheat and even turnips may be sown as late as July. Make early preparation for harvesting; repair barns, vehicles; and tools. Get the best tools in the market: a man may earn the extra cost of good scythe or cradle in a single day's work. Procure a horse rake; by means of which a man with a steady horse can do the work of seven or eight men. Clover should be cut while it is in full bloom. Timothy and red-top do not ripen till a fortnight after clover: they should be cut while the seed is in full milk, and before it is so ripe as to shake out when handled. Weeds should be cut down or rooted out before seeding; transplant cabbages and turnips in field or garden; gather flowering herbs, and dry quickly in the sun.

AGRICULTURE FOR THE MONTH.

Finish hoeing and weeding, and prepare for grain harvest. Wheat, oats and barley are generally cut in this month: the best ought to be set aside for seed, and allowed to ripen fully while standing. The grain intended for consumption should be cut while still soft, for not only is the flour better, but there is much less top and waste in harvesting the crop. Lowland hay may be cut and made into stacks. If there is time, it is much better, at once, to get the low meadow hay beyond the reach of the river rather than to wait till winter. Make drains where required; gather seed and herbs; destroy weeds wherever they are to be seen; remove balls from potato vines, if thought necessary. Fall wheat may be sowed. If grain harvest be finished, fall ploughing for next season may be begun. A good farmer will be ploughing all summer long. Don't burn too soon, or the trouble will be greatly increased. Great care should always be taken to extinguish fires on new land; besides the real danger to all parties, the penalty, on conviction for not doing so, is £3.

ASTRONOMY FOR THE MONTH.

The constellation Hercules is finely situated for observation during the evenings of this month. It occupies a large space in the northern hemisphere, and contains 113 visible stars, including one of the second, nine of the third, and nineteen of the fourth magnitude. In it is located a large and brilliant cluster, or rather ball, of stars, which blazes up in the centre, and has numerous outliers in its attenuated disc. This superb and truly glorious object crosses the meridian on the 1st of the month at 7h. 55m. P. M., at an altitude of 81°. "Perhaps," says Dr. Nichol, "no man ever saw it for the first time through a telescope, without uttering a shout of wonder." α Hercules is a standard Greenwich star with a companion, and comes to the meridian on the 1st of the month, at 8h. 27m. P. M., at an altitude of 58½°.

AGRICULTURE FOR THE MONTH.

Carry on the harvesting of grain, corn, and root crops. Neglect not fall ploughing for a single day. Draining ought to be gone on with : let the drains be from 30 to 36 inches in depth, and placed about 20 feet apart. Grain may now be field thrashed. Do not take up potatoes until the vines have been killed by the frost, and are perfectly dry; keep them from sun and wet, and allow them to dry before housing ; let them be stored away in barrels or bins well protected from air. Early apples may be gathered by hand, wiped, and put away into bins or barrels, taking care not to bruise them : they should be kept in a dry, cool cellar, or upper room, where the temperature is not below the freezing point : should they, by any means, get frozen, they should be kept covered so as to let them thaw gradually. Trees may be budded in this month. N. E. farmers generally sow grass seeds (not clover) as early as possible after the summer crop. This is, likewise, a good time for the cow to go to the bull. Rams, again, should be removed from the sheep until the end of November or December

ASTRONOMY FOR THE MONTH.

Vega, the principal star in the constellation Lyra, crosses the meridian on the first of this month, at 7h. 49m. P. M., at an altitude of 83°. It is a very brilliant and insulated star of the first magnitude, " blazing with imperial lustre," and therefore stands in the same rank with Sirius, Canopus, and Capella. Yet by the experiments of Dr. Wollaston, it appears that the light it affords is not more than $\frac{1}{180,000,000,000}$ th part of that of the Sun, or about one-ninth part of that of Sirius. Efforts have long been made to ascertain its parallax, and Struve, who has furnished us with the most recent and accurate results, makes it only the eighth of a second, thus placing this beautiful star at a distance from us equal to one and a half million times our distance from the Sun. The same distinguished Astronomer supposes that stars of the twelfth magnitude are not nearer than 60,800,000,000,000 miles:—but how vast is space! What is beyond?

AGRICULTURE FOR THE MONTH.

Continue draining, fall ploughing, and securing corn and root crops. When potatoes are to be stored in the field, a dry, sandy spot should be chosen, on which they are to be laid in heaps, then put a layer of straw over them; thatch them carefully, and cover the whole with earth: two small orifices should be left, the one at the top, and the other at the bottom; these should be closed with a wisp of straw, and opened occasionally to permit the access of fresh air. If the soil of the field is a wet clay, a ditch ought to be dug round the spot where the roots are to be laid. Turnips may be either stored in a root house, or in pits three feet in breadth, and covered with straw and earth as above. Cull out the choicest animals for breeding and for use; sell or fatten the remainder. Trees may be set out for the ensuing spring as soon as the leaves have fallen, and the buds are fully formed. Small seedlings, however, are best transplanted in the spring. Fruit trees may now be propagated by layers or cuttings.

During the observation. one of the stars (Deneb) latitude of 82° 2' 30" N. Elements of the first precise and correct that light, within 10½ years to

ASTRONOMY FOR THE MONTH.

During the evenings of this month the constellation Cygnus is favorably situated for observation. According to the British Catalogue, it contains eighty-one stars, including one of the second, six of the third, and twelve of the fourth magnitude. The principal star (Deneb) crosses the meridian on the first of the month, at 7h. 55m. P. M., at an altitude of 82°. 61 Cygni has attracted much attention both as a double star—the components of which are supposed to revolve round each other in 540 years,—but also as being the first body, which by the splendid discovery of Siderial Parallax, led to more precise and definite conceptions of the vast distance of the stellar host. It is so remote, that light, which moves with the velocity of 190,000 miles in a second, would require 10½ years to traverse the interval which separates it from our Earth.

APOGEE AND PERIGEE OF THE MOON.

| | | |
|--------------------------------------|------------------------|-------------------------------|
| Apogee, 11th day, at 10 hours, morn. | Semidiameter = 14' 46" | Horizontal Parallax = 54' 11" |
| Perigee, 23d " at 11 " morn. | " = 16' 14" | " " = 59' 36" |

AGRICULTURE FOR THE MONTH.

Preparations must now be made for a long and severe winter. The summer vehicles and implements should be dried, cleaned and stowed away. The fences should be put in order, so that none of the field may be exposed to the poaching of cattle, sheep or hogs. The farmer should walk about daily with a hammer and a pocket full of nails, patching and repairing the barns and sheds where they require it. The yard should be well bedded with turf, peat muck, straw, sawdust, weeds, or other vegetable matters, at the same time they should be so constructed that the soluble parts of the manure, which are the best, shall not be lost. Finish digging and storing of roots and the fall ploughing. One good ploughing of clay land in the fall, is worth two or three in the spring. Husk the corn: make cyder: examine and make cuts for the drainage of surface water: underground drains are preferable to surface cuts. The children should be kept close at school, and the farmer should never forget that *more* attention is due from him toward the improvement of his children than to that of the land or stock.

ASTRONOMY FOR THE MONTH.

The constellation Pegasus, which is on the meridian during the evenings of this month, at a mean altitude of 65°, contains 89 stars visible to the naked eye, including three of the second, and three of the third magnitude. It is readily distinguished from all other constellations by means of four remarkable stars, about 15° apart, forming what is called the *square of Pegasus*. The two most western stars of this square (Scheat and Markab, whose declinations are respectively 27° 13' N. and 14° 21' N.) cross the meridian at 8h. 15m. P. M., on the first of the month. Of the two on the east, the most northerly is Alpherat, which belongs to the constellation Andromeda, and that to the south is called Algenib, which has the same declination as Markab, but comes to the meridian 1h. 8m. later. 3° south and 26m. in advance of Algenib is a fine globular cluster, which according to Sir William Herschel, is 243 times more remote than stars of the first magnitude.

APOGEE AND PERIGEE OF THE MOON.

| | | |
|------------------------------------|-------------------------|-------------------------------|
| Apogee, 6th day, at 7 hours, morn. | Semidiameter, = 14' 41" | Horizontal Parallax, = 54' 5" |
| Perigee, 21st " at 2 " morn. | " = 16' 29" | " " = 61' 25" |

AGRICULTURE FOR THE MONTH.

Stocks now require increased attention : they should be stall fed for the winter if possible, or put up in yard with a warm aspect, and with sheds attached, whereto they can resort in stormy seasons : they should be supplied with plenty of winter and salt, and fed about three times every day, and curried regularly. The sow may be taken to the boar in the month, and the ram allowed to return to the flock again. Let the farmer keep out of the woods, for farming is not a branch of lumbering, nor are active lumberers likely to make thrifty husbandmen. Once for all, let the farmer forswear the woods. He may now thrash grain, and take his produce to market : the good wife ought to have her quota ready of cheese, butter, fowls, hams, sausages, mittens, socks, cloth, wool and fashers ; these are all as good as money in town. Let all accounts be settled and debts paid : Every farmer ought to keep a book wherein he records his operations, and notes the effect of different kind and quantities of manure, seed &c. : the returns under each method ought to be recorded by measure and weight. The crops for each field ought to be arranged not only for the ensuing summer, but for several years in advance : let there always be a systematic rotation of crops on the farm : let every one take in and study an agricultural periodical, and strive to combine science with practice—practice with science.

PHASES OF THE MOON.

- New Moon, 3d day, at 0 hours, 52 minutes, afternoon. S.
- ☽ First Quarter, 11th " at 4 " 12 " afternoon. S. E.
- Full Moon, 19th " at 0 " 37 " morning. N.
- ☾ Last Quarter, 25th " at 6 " 0 " afternoon. N.

ASTRONOMY FOR THE MONTH.

About 2000 years ago, the constellation Aries opened the Astronomical year as " Leader of the heavenly host," and retained the office for a similar period. The charge is now resigned to Pisces, for Aries has passed more than 30° to the eastward of the point where the equinoctial cuts the ecliptic. This is owing to the *Precession* of the equinoxes, which amounts to little over 50" per annum. *a Arietis* performs important service for nautical science. The skilful navigator can, by measuring the distance between *Arietis* and the Moon, determine at once not only the spot he is in on the trackless ocean, but his true course and distance to any known harbour on the earth. Eight other conspicuous stars, which lie near the Moon's path, are also much used for the same purpose, and are hence called *nautical stars*. They are *Aldebaran*, *Pollux*, *Regulus*, *Spica Virginis*, *Antares*, *Altair*, *Fomalhaut*, and *Markub*. Their true places for every day in the year, are given in the Nautical Almanac.

the winter if possible to them, and salt, and fed taken to the board the farmer keep active lumberers wear the woods. wife ought to have cloth, wool and settled and debts rations, and notes turns under each field ought to be ence: let there be in and study an tice with science.

LIGHT HOUSES.

Board of Commissioners for the several Light Houses in the Bay of Fundy.—Robert W. Crookshank, John Ward, I. Woodward, John Wilson, Esquires; Hon. W. F. W. Owen, Lieutenant Charles Hare, R. N., and John James Robinson, Esquire, R. N.

Isaac Woodward, Esq., Surveyor of those Light Houses in the Bay of Fundy, belonging to New-Brunswick, and also of those belonging to Nova-Scotia, which are partly supported by this Province.

Cape Sable Seal Island Light.—The first Light on approaching the Bay of Fundy is on the South Point of Seal Island. This is a plain White Light, elevated about eighty feet above high water mark, and may be seen in approaching the Island from any point of the Compass. A very dangerous Rock, under water, but upon which the sea always breaks, called **BLONDE ROCK**, lies $3\frac{1}{2}$ miles S. by W. by compass, from the Light House. Between this Rock and the Island there are some dangers; the ground is rocky throughout, and large vessels, therefore, ought not to attempt passing between them.

Brier Island Light.—In advancing up the Bay, the next Light is situated on Brier Island, about half a mile N. E. from the N. W. point thereof.—A plain White Light.

Digby Gut Light.—The next Light on the coast of Nova-Scotia is placed on the West side of Digby Gut, from Brier Island North-Eastward. The coast is very bold and not indented; the Light is, therefore, chiefly intended as a guide into Digby Basin.—A White Light.

Gannet Rock Light.—This Light is intended to warn vessels of their approach to a very dangerous range of shoals and ledges, which extend from the Old Proprietor to the Seal Islands off Machias, a distance of about twenty miles. It is a flash light—**WHITE**—twenty seconds dark and forty light in each minute. The Light House is painted in stripes, vertical, black and white.

BEARINGS AND DISTANCES BY COMPASS FROM THE GANNET ROCK LIGHT HOUSE:—

This Light bears from the Light House on Brier Island N. N. W. $\frac{3}{4}$ W. 22 miles.
 From the Gannet Rock to the Old Proprietor, E. $\frac{1}{4}$ S. distance 7 miles.
 From the Gannet Rock to the Black Rock off White Head Island, N. E. $\frac{1}{4}$ E. 7 miles.
 From the Gannet Rock to the South West Head of Grand Manan, N. N. W. $6\frac{1}{2}$ miles.
 From the Gannet Rock to the Northernmost of the Murr Ledges, N. W. $\frac{1}{4}$ N. $2\frac{1}{2}$ miles.
 To the Southernmost of ditto, called St. Mary's Ledge, W. S. W. 2 miles.
 From the Gannet Rock to Machias Seal Island, W. and by N. $\frac{1}{2}$ N. $12\frac{1}{2}$ miles..

Between the Northernmost and Southernmost of the Murr Ledges, there is a range of dangerous rocks and shoals, many of them always above water, and which extend Westward from the Light-House about four miles; from this range, farther Westward, about six miles from the Gannet Light, lies a dangerous breaker, called the Bull. This may be avoided by keeping three remarkable headlands near the S. W. end of Grand Manan open.

From Brier Island Light to the Old Proprietor N. and by W. $\frac{1}{4}$ W. $18\frac{1}{2}$ miles.

The Blonde Rock from the Southernmost point of Cape Sable Seal Islands S. and by W. $3\frac{1}{2}$ miles distant.

Machias Seal Island Lights.—There are two fixed **WHITE** lights upon the Machias Seal Islands, elevated about 45 feet above high water, and bearing from each other E. S. E. and W. N. W. distant about 200 feet, by which circumstance of two Light Houses at the same station, they will be immediately distinguished from

all other light white. The

Quaco Lig Head, shewing any quarter w red in horizon

Cape Enro site Apple Riv and is painted

* The Ch

all other lights upon the coast, British or American. Both the buildings are painted white. The following are the bearings, by Compass, from them, viz. :—

- To the Southernmost Murr Ledge (St. Mary's) E. S. E. easterly.
 ,, Gannet Rock Light, E. by S. $\frac{1}{4}$ S. 13 miles.
 ,, Southern Head of Grand Manan, E. by N. $\frac{1}{4}$ N.
 ,, Northern Head of Grand Manan, N. E. $\frac{1}{4}$ E.
 ,, North-East Rock, distant 2 miles, N. E. by N.
 ,, Little River Head, N. by W.
 ,, Libby Island Lighthouse (American), N. W. by W.

Vessels standing to the Northward, between these Lights and the Gannet Rock, should tack or haul off the moment they bring these Lights into one, as they will be then not more than three-fourths of a mile from the Murr Ledges, if more than five miles to the E. of the Lights.

[It is recommended that the Ship's Compasses should be well compared and adjusted (particularly in new ships), before they leave Partridge Island, as serious errors have frequently occurred from want of attention on this point : and, as the variation in the Bay of Fundy is seventeen degrees Westerly (or $1\frac{1}{2}$ points), it will be found by the latest published Admiralty charts,* that the course from Partridge Island down the Bay, South Channel, between the Old Proprietor and N. W. Ledge, is S. W. $\frac{1}{4}$ S., but the course to be steered must depend on the direction of the wind on leaving Partridge Island.]

Head Harbour Light.—Next in order, after passing Grand Manan, and the plain white Light (American) on West Quoddy Point, is Head Harbour Light. This is placed on the North-East extremity of Campo Bello, and is a guide to vessels entering the main channel to West Isles, Moose Island, and the Inner Bay of Passamaquoddy; it enables vessels also, at all times, to enter Head Harbour. It is a fixed white Light. The building is painted white, with a red cross on it.

Point Le Preau Lights.—Upon this projecting head-land two Lights are placed, one above the other in the same house, and distant twenty-eight feet. Both Lights can be seen from every point of the Compass where they may be useful—both are fixed and white. The Light House is painted red and white, in stripes five feet broad each, horizontally.

Partridge Island Light.—This Light, at the entrance of the River and Harbour of Saint John, having been established above fifty years, requires no particular notice, further than that it is a fixed white Light, and the Light House is painted red and white in vertical stripes. The Light was enlarged in November, 1846.

Beacon Light.—Within Partridge Island, and upon a spit or bar which extends about half a mile S.S.E. of Sand Point, and which dries at two-thirds ebb, stands the Beacon Tower. Upon this Tower a Light is established, which is eminently useful to the coasting trade of Saint John, and to all other vessels having pilots on board, as it enables them to enter the Harbour at all hours of the night. A fixed white Light. The House is painted white and black, in stripes vertically.

Quaco Light.—A revolving white Light is placed on a small rock off Quaco Head, shewing twice full and twice dark in a minute. The Light can be seen from any quarter where a vessel can approach. The Light House is painted white and red in horizontal stripes.

Cape Enrage Light.—On the Point of that name in Westmorland, nearly opposite Apple River Harbour, N. S. The House is about 120 feet above the tide mark, and is painted white—a plain white Light.

* The Charts can be procured at the COURIER OFFICE, Book Store, St. John, N. B.

SIGNALS

Made at Partridge Island on the approach of Vessels to the Harbour of St. John.

- One Ball, close, for one square-rigged vessel.
 One Ball, half hoisted, for two square-rigged vessels.
 Two Balls, close, for three square-rigged vessels.
 Two Balls, separated, for four square-rigged vessels.
 A Pendant of any colour, for five square-rigged vessels.
 A Pendant under a Ball, for six square-rigged vessels.
 A Pendant over a Ball half-hoisted, for seven square-rigged vessels.
 A Pendant under two Balls, close, for eight square-rigged vessels.
 A Pendant between two Balls, separate, for nine square-rigged vessels.
 A Flag of any colour for ten or more vessels.

[The above are hoisted at the East or West Yard-arm, according to the quarter the vessels first appear in, and when their rig can be made out, the following descriptive colours will be hoisted at the mast-head:]

- A Union Jack for a Flag Ship, with or without a squadron.
 " with a Red Pendant over, for a two-decker.
 " with a Blue Pendant over, for a Frigate.
 " with a White ditto, for a small armed vessel.
 A Blue Pendant, for a Merchant-ship or Barque.
 A Red ditto, for a Merchant Brig or Brigantine.
 A White and Blue ditto, for a Foreign square-rigged vessel.
 A White ditto, without a Ball, for a topsail Schooner or Sloop.
 A Flag, blue and white horizontally, a neutral fleet.
 A Pendant, white and blue, a neutral Man-of-war.
 A Blue Flag, a neutral Merchant ship.
 A Red, White, and Blue Flag, an enemy's fleet.
 A Red, White, and Blue Pendant, an enemy's Man-of-war.
 A Union Jack over neutral or enemy's signals, the vessel is detained, or a prize.
 A White Flag over any signal, the vessel bears a flag of truce.
 A Red Flag pierced white, for a Steamboat from Digby.
 A Blue Flag pierced white, for a Steamboat from St. Andrews or Eastport.
 A Red Flag, with a white square, for a Steamboat from Boston.

A Ball at the masthead, the vessel is on shore, or in distress: should immediate aid be necessary, guns to be fired.

In thick weather, a gun will be fired at Partridge Island in answer to each gun heard at sea. There is a Fog-bell on the Island, which is rung in foggy weather to warn vessels of their approach to the shore.

When the vessel requires a Pilot, her descriptive Pendant will be shown at the Yard-arm instead of a Ball.

TIME FOR GOING THROUGH THE FALLS,

NEAR THE CITY OF SAINT JOHN.

The Falls are level, or it is still water at about three and a half hours on the *flood* and about two and a half on the *ebb* , so that they are passable four times in twenty-four hours, about ten or fifteen minutes at each time. No other rule can be given, as much depends on the floods in the River St. John, and the time of high water of full sea, which is often hastened by high Southerly winds. For a few days in the spring of the year, the height of water in the River Saint John renders the passage of the Falls extremely difficult.

The Collegiate or Grammar School of York receives an annual allowance of £375 (besides the services of a French Teacher) from King's College, and is placed under the control of a Committee appointed by the College Council.

The supervision of the other Grammar Schools is vested in Boards of Directors and Trustees, appointed by the Lieutenant-Governor in Council. The Government allowances are, £150 to the Saint John School, £50 to the School in charge of Mr. Sivewright, in Northumberland, and £100 to each of the others, on condition that the inhabitants pay the further sum of £50 to the Teacher.

The general management of the Parish Schools is by Act of Assembly 10 Vic. chap. 56, vested in the Lieutenant Governor and Executive Council as a Board of Education. The average number of Schools in the Counties has heretofore been limited to nine for each Parish; but the number may be increased to thirteen in any Parish, provided the whole number in the County does not exceed the established average. The Government allowance to the Teachers is £30 per annum for Teachers of the First Class; £22, Second Class; and £18, Third Class. The emoluments, exclusive of the Government allowance, range between £20 and £100, the general average being about £30.

FREDERICTON ATHENÆUM.

OFFICERS:—His Excellency Sir EDMUND WALKER HEAD, Bart., *Patron*; Hon. Judge Carter, *President*; Hon. Neville Parker, Venerable Archdeacon Coster, Professor Jack, and Dr. Toldervy, *Vice-Presidents*; J. Robb, M. D., *Secretary and Treasurer*.

REGULATIONS AND RATES.

1.—All Letters sent by Post in New-Brunswick and other Provinces of British North America, are charged by weight.—Prepayment optional, except on those for Bermuda, Newfoundland, and the United States.

2.—The scale of weight for charging postage is the same as that by which letters to and from the United Kingdom are charged, viz. :—

| | | |
|-------------------------------------------------|-----|---------|
| For a Letter not exceeding $\frac{1}{2}$ ounce, | ... | 1 Rate. |
| Ditto ditto 1 " " | ... | 2 " |
| Ditto ditto 2 " " | ... | 4 " |
| Ditto ditto 3 " " | ... | 6 " |

and so on, adding two rates for every additional ounce. After the first ounce fractional parts are not noticed; thus, if a Letter exceeds one ounce it becomes liable to four rates, and if it exceeds two ounces, six rates.

3.—The Rates of Postage on Letters are:—For a Letter not exceeding half an ounce (without regard to the number of pieces of which it is composed),

| | | |
|-----------------------------|-----|------------------------|
| Conveyed 60 miles or under, | - - | 0s. 4 $\frac{1}{2}$ d. |
| Ditto 61 " to 100 miles, | - - | 0 7 |
| Ditto 101 " to 200 " " | - - | 0 9 |
| Ditto 201 " to 300 " " | - - | 0 11 $\frac{1}{2}$ |
| Ditto 301 " to 400 " " | - - | 1 1 $\frac{1}{2}$ |
| Ditto 401 " to 500 " " | - - | 1 4 |

and so on, adding two pence sterling for every additional 100 miles.

4.—Letters to and from the United Kingdom are subject to a uniform charge of 1s. 1d. currency per single letter.

Letters to and from the United States are subject to a Provincial rate according to the scales of weight and distance above laid down, which must, in all cases, be collected in the Province.

Newspapers.—Colonial Newspapers, not exceeding two ounces, to or from any part of the British North American Provinces, pay one halfpenny, prepaid or not, at the option of the sender.

If sent to any British Colony beyond sea (not intended to pass through the United Kingdom), or to any foreign country, except the United States, one halfpenny, to be prepaid.

If sent to any part of the United States, one penny, to be prepaid.

Newspapers from the United States pay, on delivery, one penny, Provincial postage.

Colonial Newspapers sent to the United Kingdom, or to any British Colony by way of England, and British Newspapers from the United Kingdom to any part of New-Brunswick, will not be liable to postage. With exception of these last (which are not limited as to weight) a newspaper to pass under the foregoing regulations must not exceed two ounces, otherwise it will be liable to pamphlet postage, *i. e.* one penny per ounce.

British Newspapers can be re-posted in New-Brunswick, subject to one half-penny postage; but United States Newspapers, if re-posted in this Province, become liable to full Letter-postage.

Supplements charged as distinct Newspapers.

Votes and Proceedings in Parliament—If sent to the United Kingdom by packet, or to any part of British North America or British West Indies, one penny for every four ounces. If intended to be sent to the United Kingdom by private ship, double the above rates. No packet or cover containing votes or Legislative proceedings, permitted to be sent through the Post, if exceeding six pounds in weight.

Pamphlets and other Publications.—If printed in the United Kingdom, British North America, or British West Indies, may be sent to any place in British North America, the United States, or British West Indies, at the inland rate of one penny per ounce, in addition to sea postage, provided they do not exceed 16 ounces. If printed and mailed in the United States, they are liable, on delivery in this Province, to the same rate of one penny per ounce; but if re-posted in New-Brunswick, they are charged with full letter-postage.

Newspapers, Pamphlets, Publications, and Parliamentary proceedings, must be sent without covers, or with covers, open at the ends. If this is not done, or if there be any marks or writing on them besides the address, full letter postage will be charged.

Franking.—Postmasters, and other Officers of the Post-Office Department, not to receive or send Letters, &c., "free."

 demand from

the masters of such vessels 10s. per day, for every day of such detention, in addition to the allowance aforesaid.—Coasting vessels going from one part of the Bay of Fundy to another, (except square-rigged,) British steam-boats, or British vessels drawing under six feet of water, are not compelled to take pilots; when employed, they are to be paid according to the above rates.—For removing any ship or vessel from one place to another, within the harbour, and properly securing her,—for vessels not exceeding 100 tons, 7s. 6d.; over 100, and not exceeding 200, 10s.; over 200, and not exceeding 300, 15s.; over 300, 20s.

RATES OF WHARFAGE, established by Act 54, Geo. III. cap. 9.—For every decked vessel, or vessel of the description called wood-boats, not exceeding 50 tons, 1s. 6d. per day; 50 tons, and not exceeding 100, 2s. 6d.; 100 tons, and not exceeding 150, 3s. 6d.; 150 tons, and not exceeding 200, 5s.; 200 tons, and not exceeding 300, 7s. 6d.; 300 tons, and not exceeding 400, 10s.; 400 tons and upwards, 12s. 6d.

By an Act passed on the 4th April, 1842, the following rates of Wharfage are established in the City of St. John and Parish of Portland:—For every decked vessel or wood-boat of the burthen of 40 tons and under, 1s. 6d. per day; above 40 tons and under 50, 1s. 9d; 50 tons, and under 60, 2s.; 60 tons, and under 70, 2s. 3d.; 70 tons, and under 80, 2s. 6d.; 80 tons, and under 90, 2s. 9d.; 90 tons, and under 100, 3s.; 100 tons, and under 120, 3s. 6d.; 120 tons, and under 150, 4s.; 150 tons, and under 180, 4s. 6d.; 180 tons, and under 200, 5s.; 200 tons, and under 220, 5s. 6d.; 220 tons, and under 240 6s.; 240 tons, and under 260, 6s. 6d.; 260 tons, and under 280, 7s.; 280 tons, and under 300, 7s. 6d.; 300 tons, and under 320, 8s.; 320 tons, and under 340, 8s. 6d.; 340 tons, and under 360, 9s.; 360 tons, and under 380, 9s. 6d.; 380 tons, and under 400, 10s.; 400 tons, and under 450, 11s. 3d.; 450 tons, and under 500, 12s. 6d.; and 1s. 3d. for every additional 50 tons.

RATES OF SLIPPAGE AT THE CORPORATION SLIPS.—All decked vessels, same rates as for wharfage; wood-boats, three half-pence for every ton burthen, and allowed to remain six days each trip, for the purpose of discharging; if they remain longer, to pay one penny per ton, additional, each day; no boat to remain longer than twenty days.

PORT-WARDENS' FEES.—For every survey, 7s. 6d. to each Warden attending; attendance upon every public sale, 10s. per day to each Warden; for every certificate, (except for branch pilot,) 7s. 6d. to each Warden; for examining candidate for a branch pilot, and signing certificate, 5s. to each Warden;—to be paid by person requiring service to be performed.

FEES FOR MEASURING COALS AND SALT.—For every chaldron of Coal, 5d.; for every twenty bushels of Salt, 2d.

INSPECTION OF FLOUR AND MEAL.—For every barrel, 1½d.; for every half-barrel or bag, 1d.

INSPECTION OF PICKLED FISH.—For inspecting, culling and branding each barrel, when the quantity inspected for one individual does not exceed one hundred barrels, the sum of 6d.; when the quantity inspected exceeds that, 5d. per barrel; tierces and half tierces in like proportion.

CULLING DRIED FISH.—For every quintal culled, 2d.

GAUGING AND SEARCHING OIL.—For a cask of 150 gallons and upwards, 1s. 6d.; do. do. 100 gallons and under 150, 1s. 3d.; for all casks under 100 gallons, and barrels, 1s. each.

GAUGING WINE, &c.—For gauging and marking a pipe or puncheon, 6d.; for a hogshead or other cask of smaller dimensions, 4d.

INSPECTING LIME.—For every hogshead, half hogshead, or barrel, 3d.

RATES OF WEIGHING AT THE PUBLIC WEIGHING MACHINES IN ST. JOHN.—For every load not exceeding 1000 lbs. weight, one shilling; and one penny for every additional cwt.—payable half by the seller, and half by the buyer.

RATES OF CARTAGE IN SAINT JOHN.

OUTLINE OF THE ELEMENTARY PRINCIPLES OF AGRICULTURAL CHEMISTRY.

Agriculture is the art of cultivating the soil, so as to raise the largest crop at the smallest cost, and with the least injury to the land; every farmer, therefore, ought especially to be acquainted with the nature or composition of crops, soils, manures, &c. *Chemistry* professes to ascertain and declare the *elementary composition* of all things, and *Agricultural chemistry* is the special application of Chemistry to the pursuits of the Farmer. We propose, in the course of the following article, to give the Agriculturist an idea of the way in which Chemistry has been applied to the advancement of his art, how it has explained the reasons for his most successful practice, and how a knowledge of its truths will always best direct to safe and economical results.

I. OF THE NATURE OF CROPS.—Crops and all vegetable substances consist of two parts,—one which burns away in the fire, called the *Organic part*, and one which does not burn away, called the *Inorganic part*, or ash. Of these, the organic or combustible portion forms from 90 to 99 out of every 100 parts of their weight.

The organic part is composed of four elementary substances which have been termed *Carbon*, *Hydrogen*, *Oxygen* and *Nitrogen*, with minute quantities of *Sulphur* and *Phosphorus*. Of these, carbon, (which is the most abundant) sulphur and phosphorus are solids, while the other three are colourless and invisible gases. Most plants will yield the above six substances when properly treated, though several of their bulky constituents, such as starch, gum, sugar, fibre of wood and oily matters contain only carbon, hydrogen and oxygen.

The ash, or inorganic part of plants, when analyzed, is found to contain eight or ten different substances, namely, *Polash*, *Solu*, *Lime*, *Magnesia*, *Oxide of Iron*, *Oxide of Margunese*, *Silica*, *Chlorine*, *Sulphuric acid*, or *Oil of Vitriol*, and *Phosphoric acid*: of these, phosphoric and sulphuric acid are liquids, chlorine is a yellow, corrosive gas, and all the others are solids. These are all to be found in the ash of our usually cultivated plants, though the amount of ash differs in different plants, and the quantity of any one of these exists in different proportions in the ashes of the different parts of the same plant: thus, 100 pounds of hay leave nine or ten pounds of ash, while 100 pounds of wheat leave less than two pounds. The ash of wheat, again, contains more phosphoric acid than that of hay, while the ash of hay contains more lime than that of wheat.

These various constituent elements of plants have been derived partly from the air and partly from the soil. Plants, like animals, require constant supplies of food in order that they may live and grow. This food is, accordingly, absorbed from the soil by the rootlets, and from the air by the leaves, of the plant.

The constituents of the ash, or inorganic part, are derived by the roots from the soil, while the organic food is derived partly from the air and partly from the soil.—The charcoal, or carbonaceous portion of the plant, is derived chiefly from the air, where it exists in small quantities as *Carbonic acid*, a gas which would be poisonous if not very much diluted by common air. Common air consists of oxygen and nitrogen gases, mixed in the proportion of one to four parts, by weight; but besides these gases and watery vapour, there is always a little carbonic acid: in five thousand gallons of air there is, in fact, seldom more than two gallons of carbonic acid gas. In order, therefore, to absorb this useful substance in sufficient quantities from the atmosphere, the leaves have been contrived; and these, by means of their great extent of surface, pierced with innumerable pores or openings, are enabled to suck in as much as is required for the sustenance of the plant. Every twenty-two pounds of carbonic acid contain six pounds of carbon and sixteen of oxygen, and living plants, under the influence of the sun's light, have the power of decomposing this gas—retaining the carbon and giving off the oxygen again into the air by the leaves. Besides carbonic acid, the leaves of plants also drink in *watery vapor*, which, being a chemical compound of oxygen and hydrogen gases, in the proportion of 8 of the former to 1 of the latter, may serve to supply these essential constituents. acid and some other compounds of carbon exist likewise in the soil, and enter the plant freely by its numerous roots.

The nitrogen of plants enters chiefly under the forms of *Ammonia* and *Nitric acid*, both of which are found in small quantities in the soil and are brought to the roots as liquids, ready for absorption. These, which are called the *ultimate elements of plants*, are curiously combined and grouped together under certain more familiar forms of which the most notable are *Woody fibre*, *Starch* and *Gluten*. *Woody fibre* forms the chief part of the woody and of the tough and fibrous part of all plants. *Starch*, again, is a white powdery substance which abounds in many roots, fruits and seeds, and is readily removed from them by washing;—the greater part of a potato consists of starch, and about half the weight of meal and flour consumed for food.—*Gluten* is a tough adhesive substance which, though in smaller quantity, occurs along with starch in almost all seeds. If a piece of dough be washed with water, the white starch will go off with the water, while the viscid gluten remains behind. *Gum* and *Sugar*, in certain proportions, are also present, more or less, in the sap of all plants, and, strange to say, all the above-mentioned substances, which are so different in their form and qualities, are found, on analysis, to consist of carbon and the elements of water (oxygen and hydrogen) only.

| Carbon. | Water. | |
|---------|-------------|------------------------------------------------------|
| 36 lbs. | and 36 lbs. | form 72 lbs. of <i>Woody fibre</i> . |
| 36 " | " 45 " | " 81 " of <i>Dry Starch</i> or <i>Gum</i> . |
| 36 " | " 49½ " | " 85½ " of <i>Loaf Sugar</i> or <i>Sugar Candy</i> . |
| 36 " | " 64 " | " 100 " of <i>Raisin</i> and <i>Honey Sugar</i> . |
| 36 " | " 27 " | " 63 " of <i>Humic acid</i> . |

Thus we see why the leaves drink in carbonic acid and water, which, together, yield all the elements of the above substances, and why the oxygen of the carbonic acid, which only served to render the carbon gaseous, is given off again as being of no use to the plant. In order to supply the loss of carbonic acid sustained by the atmosphere, in which it serves other important purposes, it is restored to it by animals whose breath contains it, by the decay of plants and animals, and by the burning of wood and coal,—the carbon of which, after uniting with the oxygen of the air, becomes again the very carbonic acid which is required. Thus, animals produce carbonic acid, upon which *plants* live, and from carbonic acid and water together, plants produce starch, &c. upon which *animals* live.

Gluten consists of the above-mentioned elements, together with Nitrogen and a little sulphur, and phosphorus; these three last are derived almost solely from the soil, and hence the importance of adding to the soil manures which shall contain them.

II. OF THE NATURE OF THE SOIL.—The soil, like the plant, consists of an organic or combustible, and of an inorganic or incombustible portion: this may be readily seen by heating a little of it on the end of a knife. The blackening thus produced depends upon the carbonaceous matter, which gradually burns out and leaves the proper mineral portion of the soil by itself.

The *organic* part of the soil, as is well known, is derived from the roots and stems of decayed plants, and from the dung and remains of small animals. A good soil contains from one-tenth to one-twentieth of its weight of organic matter, while barren peaty soils may contain three-fourths or more of it. By frequent ploughing and cropping, with insufficient manure, the organic matter diminishes, while it increases again by leaving the land to pasture, by freely supplying it with barn-yard manure or peat compost, by ploughing in green crops, by growing clover and other long-rooted plants, which are left in the soil. Much of this organic matter enters the roots of plants as food, and is necessary to their healthy growth.

The *mineral* part of the soil is derived from the crumbling down of solid rocks. It consists principally of *sand*, *clay* and *lime*, and most rocks may be regarded as more or less hardened sandstones, limestones and clays (slates and shales). Hence, soils are classed according to the preponderance of one or other ingredient into sandy or light soils, stiff clay soils and calcareous soils. Mixtures of these, in various pro-

portions, are called Loams or loamy soils. The light soils are most easily and cheaply cultivated, and are best adapted for barley, turnips, rye, buckwheat and corn, and green crops. Heavy clay lands, again, generally require to be drained first, or they are laid down to permanent pasture. In draining such land the drains ought always to be as deep as possible, say, at least, from thirty to thirty-six inches, and not further than fifteen to twenty feet apart. In this country stone drains are preferred, though tile drains, of one or two inches bore, are conceived to be the best in England. Most cultivated plants send their roots down two or three feet, and the deeper the dry soil is made, the deeper the roots can go in search of food. Deep drainage, while it allows more freedom in ploughing and digging the fields, lets in the air to the subsoil, and allows rain water to sink down and wash out of it anything that may be hurtful to the roots of plants: of these, iron-ochres is the most common, and by its cementing qualities converts a layer of earth or gravel into a retentive pan.

By draining, by subsoil ploughing (which brings up the subsoil), and by the addition of lime or marl, heavy clay lands may be rendered lighter, or more cheap to work; they will then also yield far heavier crops, and grow green crops in addition.

The inorganic or earthy part of the soil serves both to fix the plant and to supply it with its food. It consists chiefly of *silica* (or sand), *alumina* (or the earth of clays) and lime, &c., but it also contains small quantities of *potash*, *soda*, *magnesia*, *oxide of iron*, *oxide of manganese*, *sulphuric acid*, *phosphoric acid*, and *chlorine*; all of these, it will be observed, are *precisely the same* substances which the chemist has detected in the ash of plants. In the soil, however, they exist in very different proportions; thus, *alumina* is always present in the soil, and seldom, if ever, in plants: it serves chiefly to give *stiffness* to the soil in which the plants grow, and to enable it to hold their watery food. Neither is *silica* present in so large proportional quantity in the ash of plants: it is of use chiefly to give *lightness* to the soil, and to obviate the bad effects of too much water. By a due proportion of these two substances (*sand and clay*), which are possessed of such opposite qualities, the proper *texture* of the soil is maintained. None of the above substances exist in the air, and therefore, the plant must have absorbed them while dissolved in the water of the soil in which its roots are spread out.

A soil, to be fertile, must contain *all* these substances, for plants require them all, though in different proportions, for their healthy growth. This will be further illustrated by the subjoined table.

I. QUANTITY AND COMPOSITION OF THE ASH LEFT BY A TON (2240 lbs.) OF HAY OF DIFFERENT KINDS.

| | Italian Rye-grass Hay. | CLOVER HAY. | | Lucerne Hay. |
|------------------|------------------------------|-------------|--------|-----------------|
| | | Red. | White. | |
| Potash, | 17 | 26 | 24½ | 30 |
| Soda, | 7 | 3½ | 10½ | 13½ |
| Lime, | 13¾ | 55½ | 45½ | 107½ |
| Magnesia, | 3 | 17½ | 14 | 7¾ |
| Oxide of Iron, | 1 | 1½ | 3½ | ¾ |
| Sulphuric acid, | 4 | 6½ | 12½ | 9 |
| Phosphoric acid, | 8¾ | 10 | 20 | 29 |
| Chlorine, | 2 | 4 | 5 | 6¾ |
| Silica, | 81½ | 5 | 6 | 7½ |
| | 138 | 129½ | 141¾ | 211½ |

Should one only of the above substances be absent from the soil, it might still grow very well those crops which require only a small part of that one substance; but those which require a large part of it would be stunted and unhealthy: thus, if the land contained little lime, it might grow a good crop of rye grass, and yet might not be able to grow a good crop of clover.

If several of these constituents were absent, the soil would be naturally barren; and, as is well known, large tracts of country may be either naturally fertile or naturally barren—their character depending essentially upon the presence or absence of some of the above eight or ten substances. This may be illustrated by reference to the subjoined Table.

Barrenness sometimes arises from the soil containing too much of some of these elements: oxide of iron or common salt are thus often injurious to the soil. This case is best met by thorough draining, subsoil ploughing, and liming where necessary. But besides these natural causes of barrenness, any soil may be rendered barren by being treated, year after year, with the same crop. The reason of this is, that these crops draw certain substances from the soil in great abundance, and after a number of years the soil can no longer furnish these substances in sufficient quantity for their healthy or abundant growth; thus, grain crops especially exhaust the soil of phosphoric acid, potash and magnesia.—But this will be better understood by referring to the subjoined Table, which exhibits the composition in 100 pounds of the ash of several kinds of grain.

III. COMPOSITION OF ONE HUNDRED POUNDS OF THE ASH OF VARIOUS CULTIVATED GRAINS AND ROOTS.

t might still grow
stance; but those
us, if the land
yet might not be

instance, be removed, we must return it again under the form of bone dust, or guano, or phosphate of lime.

A fertile soil, it will also be observed, may be rendered unproductive by any kind of cropping,—that is, if the crops are carried off the land, and no return made to it,—for every crop takes away from the soil a certain quantity of those substances which all plants require. Hence, the fertility of the soil can only be permanently sustained by putting in *the proper substances, in the proper quantities, and at the proper times.*

To keep up the fertility of the land, a farmer must put in at least as much as he takes out; to make his land better, he must put in more than he takes out. All this time, be it observed, he takes off the land what he can sell for much money (*crops*), and he puts in what he can buy for comparatively little money (*manure*). The nature of the soil and the plant is such that the latter can, by proper management, be made to convert manure, the worthless refuse of our horses and cattle, into valuable food.

III. OF THE NATURE AND APPLICATION OF MANURES.—Any thing that furnishes food to growing plants may be called a manure. Some contain the fertilizing elements under a small bulk, and are called Portable manures: these include guano, bone dust, rape dust, pigeon dung, phosphate of lime, gypsum, nitrate of soda, &c. They may, all of them, be carried to great distances, and yet be applied with profit by the farmer.

1. *Vegetable Manures* are those parts of plants which are usually buried in the soil for the purpose of making it more productive. The most important are *grass, clover, straw, hay, potato tops, rape dust, &c.*

The soil is manured with green grass, when grass land is ploughed up. In the same way, clover, buckwheat, rye, and even young turnips, are ploughed in green to enrich the soil. These all produce the best effects when ploughed into light sandy soils.

Sea-weed likewise, either spread on land or ploughed in, or allowed to rot and sink in, or, best of all, composted with earth and with shell sand or marl, forms a very valuable manure, especially for potato crops.

Potato tops may be ploughed in with advantage to the next year's grain crop. By pulling off the blossoms these tops are kept in a green state till the potatoes are dug up.

Turnip tops are also highly prized as a green manure. Near Edinburgh, the turnip tops are reckoned equal to eight tons of farm-yard manure.

Hay is usually applied to land in the shape of the dung of horses and cattle.

Straw is partly used as dung and partly trodden among the litter of the stalls or barn-yard. If light land is to be manured for a green crop, the straw ought to be well fermented or rotted, but for heavy clay land, during the naked fallow before a crop of wheat, the straw ought to be more loose and unfermented, as it thus serves to keep the land open.

Rape cake and rape dust (the refuse that remains after the rape seed has been pressed for its oil) may be applied with profit (16 to 20 cwt. to an acre) for turnips or potatoes, in place of the whole or part of the common farm-yard dung,—or to the extent of three to five hundred weight per acre, as a top-dressing to young wheat in spring.

2. *Animal Manures* include *blood, flesh, bones, hair, wool, and the dung and urine of animals, and the refuse of fish.*

Blood is a very powerful manure. It is generally applied as mixed with other refuse of slaughter-houses, but in some places it is dried and applied as a top-dressing, or is drilled in with the seed.

The flesh of dead animals buried in soil or saw-dust, with a little marl, makes a most enriching compost.

Bones are crushed in mills, and then sifted into the various sizes of inch-bones, half-inch bones and bone dust. The bone dust acts most quickly, but its effects are

less permanent. Bones are best for light or dry lands, instead of the whole or of a part of the farm-yard manure. They are often mixed with wood ashes and drilled in with turnip seed. It is advisable, after raising one crop of turnips with bones alone, to raise the next crop on the same field with farm-yard manure alone. On soils rich in phosphates, bones produce little benefit; but from soils poor in phosphates, excellent crops, both of wheat and turnips, may be raised by the use of bones. Bones, as usually applied to land, consist of about equal parts of *Phosphate of Lime (Bone earth)* and *Gelatine* or glue. Glue is a good manure of itself, and all plants require phosphoric acid and lime for their healthy growth. Every one hundred pounds of burnt bones will yield forty to forty-five lbs. of phosphoric acid.

Bones are likewise usefully applied to pasture lands; they supply the phosphates of which the land had been robbed by the cows fed upon it. Every ten gallons of milk contain about half a pound of bone earth, and for every half pound thus carried away, one pound of common bone dust should be returned. If it be not returned, only those grasses can grow which require little bone earth; where it is returned to the soil, new grasses spring up, which enable the cow to produce milk in greater abundance, and richer in cheese than before.

When bone dust is stirred in with an equal weight of oil of vitriol, diluted with rather more than its own weight of water, it is dissolved, and in the minute state of division to which it has now been reduced, may be more advantageously applied to the land. The solution may be either weakened by the addition of thirty times its bulk of water, and applied with a water-cart, or it may be dried up with peat, saw-dust or soil, and drilled in as bones usually are.

Hair and woollen rags, when mixed with earth, make an excellent compost, but they are hardly accessible in this country as yet.

Animal dung is largely used as manure. Of the various kinds, *night soil*, and *birds' dung* are the most valuable; next to these is *horse dung*, after that, *pigs' dung*, and lastly, *cows' dung*.

The superior value of *night soil* results from the mixed nature of the food, which is both of animal and vegetable nature.

Horse dung is richer than *cow's dung*, because the horse voids so little urine as compared with the cow. A stall-fed cow voids about 2000 or 3000 gallons of urine in a year, and this carries off a large proportion of that which would otherwise be favorable to fermentation.

Pigs' dung is best used as compost, or mixed with that of other animals.

The mixed dung of animals differs from their food principally in containing less carbon and more nitrogen and saline matter. The carbon of the food is consumed during breathing, having been united with the oxygen of the air which enters the lungs, and again thrown off as carbonic acid gas. In this way, a man gives off about half a pound of carbon in a day, and a cow or a horse throws off eight or ten times as much. This larger proportion of nitrogen and saline matter is one of the principal causes of the greater activity of the dung of animals. During the fermentation of manures, hydrogen and nitrogen (3:14) combine together to form a stroog smelling gas, technically termed *ammonia* or *hartshorn*, and the presence of this gas is the cause of the pungent smell perceived in hot stables. If the smell be not sufficient to distinguish it, its presence over dung-heaps or in the stable may be readily indicated by a feather dipped in *vinegar* or *spirit of salt*, which will become surrounded by white fumes. This pungent gas is readily dissolved by water, and is sucked in by the roots of plants. Within the plant it is again decomposed, and helps to form gluten and other substances. Now, as ammonia is produced in largest quantity in the liquid part, especially of cows' dung, it is of the greatest importance to prevent this liquid from running to waste. One thousand gallons of cow's urine have been found to be equal upon grass to two cwt. of guano, and upon turnips superior to twenty cart-loads of good farm-yard dung. Every farm-yard, therefore, ought to possess a tank or cistern for the purpose of receiving this useful liquid, which, after fermentation and dilution with water, may be applied on grass land or any young crops with a water cart. It may also be occasionally pumped upon dung or compost heaps so as to

promote their fermentation. It is worth while to remark that the fermented urine of cows, horses and sheep, contain potash, soda and ammonia, but no *phosphates*; while the drainings of dung-heaps, the urine of man and that of the pig does contain them.

There is another liquid called the *ammoniacal liquor* of the gas works, which might be employed as a liquid manure. It ought to be diluted with four or five times its own weight of water, and employed in the same way as the liquid manure of the farm-yard.

Pigeon's dung and *guano* (which is the dung of sea-fowl) may be profitably applied as a top-dressing (2 cwt. per acre) to young crops, or they may be used very advantageously when mixed with half of the usual farm-yard dung for the turnip or potato crop (2 or 3 cwt. per acre); in the latter case, it is better to cover it or to mix it with a quantity of earth, to prevent the seed from touching it. Guano ought never to be mixed with quicklime, because the latter will set free its ammonia, and cause it to escape into the air.

Fish refuse, when it can be had, forms an excellent manure, and is best used when made into a compost with earth and marl. This compost ought to be turned over once or twice before using.

3. *Saline, or Mineral manures.* Of these the most important are *Bone Earth, Soda Nitre, Epsom Salts, Common Salt, Gypsum, Kelp, Soot, Wood Ashes*, and *Lime*.

Phosphate of Lime, or Bone earth, occurs as a mineral in some places, and is contained to a variable extent in all limestones. When this mineral phosphate is applied in the state of powder, or dissolved in oil of vitriol, it is very advantageously used as a manure, both to the grain and root crops.

Soda-Nitre (a natural compound of *Nitric acid* and *Soda*), which is imported from Peru at a low rate, may be advantageously applied as a top-dressing to grass land and to young corn. Its beneficial action depends upon its supplying *nitrogen* and *soda* to the growing crops.

Glauber Salts are composed of *sulphuric acid* (oil of vitriol) and *soda*. When it can be had at a cheap rate, it may be advantageously applied as a top-dressing to grass lands, to turnips, beans, and young potato plants. It yields both sulphuric acid and soda, which are required by the young plants.

Epsom salts, a compound of *sulphuric acid* and *magnesia*, has been used as a top-dressing for wheat and for the potato: both of its constituents are required by crops.

Common Salt is a compound of *chlorine* and *sodium*, both of which are required by plants. As the sea-breezes generally convey a little salt water for many miles inland, common salt will be most useful in places remote from the sea-shore. It may either be applied as a top-dressing, or it may be mixed with other manure, or with the water used in slaking quick-lime.

Native gypsum or plaster consists of *sulphuric acid, lime* and *water*. When heated to redness, it loses twenty-one per cent. of water, and is then called *burned gypsum*. In the state of powder, it forms an excellent top-dressing for clover, peas and beans, and is recommended for strewing on fermenting dung-heaps, or on the moist floor of stables, so as to fix the ammonia, or to bring it into such a state that it will escape less readily into the air:—as these saline manures contain but few ingredients, it is generally better to use mixtures of them. They ought also to be applied in calm weather, and soon after or before rain, so that they may be dissolved in the soil.

Kelp, or the ash of burned sea-weed, may be employed as a top-dressing to grass and grain crops. For root crops it may be used either alone, at the rate of four to six cwt. an acre, or with half farm-yard manure.

Wood ashes, when applied to grass lands, destroy moss and improve the herbage. They may be also employed on most other crops with advantage, mixed with bones, rape dust, guano, &c.

Coal Soot contains *charcoal, lime, sulphuric acid* and *ammonia*, and is applied

as a top-dressing to land, as a manure for potatoes, and as an admixture with other manures.

Limestone consists of *lime* in union with *carbonic acid*; by chemists it is termed *carbonate of lime*. One hundred tons of pure limestone contain fifty-six tons of lime and forty-four tons of carbonic acid.

Marl is *carbonate of lime* in a state of fine powder, and more or less mixed with earthy matter. Both limestones and marls may contain from one to four per cent. of *phosphate of lime*.

Shells and *Shell sand* are also nearly the same thing as common limestone. Marls and shell sand may be applied with advantage as a top-dressing to sour, coarse and mossy grass lands. They may also be ploughed or harrowed into arable land, and may be applied with especial advantage, and in large quantity, to peaty soils. They may likewise be used in making composts with earth and vegetables, or animal matter.

The presence of the carbonate of lime in a soil, or in a marl or stone, may be readily detected by pouring a little vinegar or weak spirit of salt upon a little of it placed in a glass. If any bubbling up or effervescence ensues it must be due to the presence of carbonic acid, which thus escapes through the liquid which has been added.

When limestone is burned in the kiln, the carbonic acid is driven off by the heat, and lime alone remains. In this state it is called *quick* or *hot lime*, and one ton of pure limestone yields about 11½ cwts. of quick lime.

When water is poured on quick lime, the water is absorbed by the lime and disappears. Much heat is likewise given off, the lime falls to pieces, and takes the name of *slaked* or *slacked lime*. In this one ton of pure lime becomes 26½ cwts. of slaked lime.

But if water had not been poured on, the quick lime would have gradually absorbed watery vapour from the air and fallen to pieces, in which state it is said to have been *air-slaked*. But besides drinking in watery vapour, it also absorbs carbonic acid from the atmosphere, and returns at length to the state of carbonate or *mild lime*. When it has thus returned to the state of carbonate it forms a very fine powder, and can be thoroughly mixed with the soil. Quick lime acts much in the same way upon land as mild lime, but more quickly. Their beneficial effect depends upon their supplying the lime which all plants require as part of their food—by combining with acids in the soil so as to remove the sourness of land, and by converting the vegetable matter of the soil into the food of plants.

Lime is best applied on the surface of land, as it naturally tends to sink. Quick lime is the best for peaty soils, for heavy clay soils, for arable lands which are sour, and for such as contain a great deal of vegetable matter. Wet air-slacked lime, again, is said to be best for hill pastures.

In England, quick lime is usually added to land at the rate of 8 or 10 bushels a year to an imperial acre. It is generally put in, however, at the beginning of every rotation, or every second rotation. It is observed to produce a greater effect upon dry than upon wet land, but in all cases it requires to be repeated at certain intervals, as some of it must be removed in the crops, some is removed by rains, and some sinks into the subsoil. The use of lime alone can never prevent the exhaustion of land. Manure is required as well as lime for the healthy and luxuriant growth of crops; and, as is well understood,

“The use of marl without manure
Will always make the farmer poor.”

IV. OF THE ADAPTATION OF THE CROPS FOR FOOD.—The different kinds of grain which the farmer reaps, consist chiefly of *starch*, *gluten*, and *oil* or *fat*, in different proportions; thus, 100 pounds of

Root crops consist chiefly of *water* and *starch*; thus, potatoes contain about 75 per cent. of water; mangold-wurtzel, 85; and turnips, 88 per cent. The proportion of their different ingredients is found to differ in different varieties of the same grain or root, and in different climates and soils.

Both seeds and roots leave a small ash when burned, as may be seen by referring to the Table at p. 101. In every case, however, it is *phosphoric acid* in combination with *potash*, *sola*, *magnesia* and *lime*, which are its most important ingredients.

Vegetables to be suitable for the food of animals, must contain substances similar in composition to those which exist in the bodies of the latter, and these are the gluten, oil and mineral matter, which collectively make up the bulk of all the plants which are cultivated by the farmer. *Starch*, *sugar* and *gum*, which consists of carbon and water, supply the carbon which animals throw off from their lungs during respiration. A man who throws off from his lungs, under form of carbonic acid gas, six or eight ounces of carbon in a day, must consume nearly a pound of starch in the same time in order to replace it. The carbon of the food, in becoming carbonic acid, gives off the heat required to maintain the warmth of the animal body. The gas itself, when given off with the breath and diffused through the atmosphere, is again absorbed by plants and transformed into starch: so that there is here a mutual dependence and harmony established between the animal and vegetable kingdom.

The *gluten* of the food is required for the purpose of repairing the daily waste of the muscular or fleshy parts of the body. There is reason to believe that the flesh and all the parts of the body are removed in the course of a few years, having formed, in the last stage, the dung and urine of the animal. Now, the *gluten of plants* has almost exactly the same composition as the *flesh of animals*, and, accordingly, is well fitted to repair the waste which takes place.

The *oil* or *fat* of the food serves to supply the natural waste of fatty matter in the animal body. When more than that is taken, fat accumulates in the animal. Linseed oil-cake and the like, which contain much oil, will, therefore, generally fatten most quickly.

The *phosphate of lime* and *other mineral matters* of the food serve to supply the daily waste of the bones, of the salts of the blood, &c.

A growing animal will obviously require a larger supply of gluten and saline matter than a full-grown animal, which has only to supply the daily waste of the body.

In order to convert a ton of oats or turnips into the largest quantity of beef or mutton, the cattle or sheep ought to be kept in a warm and sheltered place, where they might have wholesome air, and but little light, and where they would be as little disturbed as possible. In order to fatten a full-grown beast, it should be kept warm and quiet, and fed with fat or oily food, such as oil-cake, oats, corn, boiled linseed jelly, &c., with a good supply of turnips; but if the object be to get the richest manure only, the stock ought to be kept in a cool and sheltered place, and to be allowed to take a good deal of exercise. Fattening cows and bullocks do best with fresh and sweet food, while pigs thrive best on food that has been slightly soured.

All animals, even pigs, thrive best when their skins are kept clean, and their food supplied to them at regular intervals, say, at least three times a day.

OF MILK AND DAIRY PRODUCE.—Milk consists of *water*, *curd*, *butter*, and a peculiar kind of sugar, called *milk sugar*. 100 lbs. of milk contain about $4\frac{1}{2}$ lbs. of curd, 3 of butter, and $4\frac{1}{2}$ of milk sugar: nearly all the rest is water.

When new milk is set aside, the fat rises in the form of cream, and can be skimmed off; a little vinegar or rennet separates the curd, and the sugar is obtained by evaporating the whey.

Common butter consists of *fat*, *water*, and a little *curd*. 100 lbs. of fresh butter contain 10 or 12 lbs. of water, and about one of curd: the rest is fat.

Cheese consists of *pure curd*, *butter* or *fat*, and *water*. 100 lbs. of cheese contain from 30 to 45 lbs. of water. Skim-milk cheese contains from six to ten per cent. of butter; full-milk cheese from twenty to thirty per cent. of butter, and about as much curd.

In order to make a cow give the largest possible quantity of milk, she should be fed with rich juicy grass, turnips with their tops, green rye, brewers' grains, warm mash or other watery food, and drink as often as she will take it; but again, if it is desired to get milk of the best possible quality, a cow should have drier food—oats, beans, bran, oil-cake, and clover hay, along with her turnips or boiled food. In order to make her give much butter, she should have the same food as a fattening animal—oil-cake, oats, barley, corn-meal, and some turnips. To get much cheese from the milk, the cow ought to get beans, peas, vetches and clover, with oil-cake, all of which make the milk richer in curd, that is, they contain a very large proportion of a substance which has nearly the same composition and properties as the curd of milk.

Milk itself contains all the elements of a nutritious food. The batter of milk supplies the fat of the body; the curd supports the muscles; the milk sugar supplies the carbon for respiration; and the phosphates, and the earthy matter of the bones. Like blood, it is the most complex fluid in nature; and, like blood, it is of itself, qualified to sustain and nourish the life of animals.

CRIMINAL LAW.

(12 VICTORIA, CAP. 29—MARCH 14, 1849.)

AN ACT TO CONSOLIDATE and AMEND the several Acts of Assembly relating to the CRIMINAL LAW of this PROVINCE, so far as relates to the definition of certain indictable offences, and the punishment thereof.

NOTE:—For the sake of conciseness, the arrangement has been made according to the degree of punishment attached to the several offences.

OFFENCES PUNISHABLE BY DEATH.

Murder.

Setting fire, or in any way destroying any ship or vessel, with intent to murder, or whereby human life is endangered.

Carnal knowledge of any woman against her will, by force, or while insensible.

Carnal knowledge of any girl under the age of ten years.

Unnatural offence with mankind or brute animal.

Breaking and entering into any dwelling-house, or any inner part thereof, between nine in the evening and six in the morning, and assaulting, with intent to murder, any person therein, or causing bodily harm or doing any personal violence to such person.

Setting fire maliciously to any dwelling-house, any person being therein.

Robbing any person, and at the time or immediately before or after, causing any grievous bodily harm to any person.

Exhibiting any false light or signal with intent to bring any ship or vessel into danger, or maliciously doing anything tending to the immediate loss or destruction of any ship or vessel in distress.

OFFENCES PUNISHABLE BY IMPRISONMENT NOT EXCEEDING FOURTEEN YEARS.

Riotously assembling to disturbance of public peace, and with force demolishing, pulling down and destroying, or beginning to demolish pull down and destroy, any building.

Manslaughter.

Maliciously preventing or impeding any person—being on board of, or having quit- ted any ship or vessel which shall be in distress, or wrecked, stranded, or cast on shore—in his endeavour to save his life—(not less than three years).

Attempt to procure miscarriage in any woman being with child, whether made by herself or any other person.

Burglary, *i. e.*, the breaking and entering into the dwelling-house of another, between the hours of nine in the evening and six in the morning, with intent to com- mit any felony.

Entering the dwelling-house of another with intent to commit any felony, or being in such dwelling-house committing any felony: and in either case, breaking out of such house between the hours of nine in the evening and six in the morning.

Maliciously destroying, throwing down or damaging, by the explosion of gunpowder or other explosive substance, the whole or any part of any dwelling-house, any person being therein—(not less than three years).

Robbery, *i. e.*, the felonious taking of money or goods from the person of another, or in his presence against his will, by violence or putting him in fear—(not less than three years).

Being armed with any offensive weapon or instrument, and robbing, or assaulting with intent to rob, or together with one or more persons, robbing or assaulting with intent to rob, and at the time, or immediately before or after such robbery, causing bodily harm or doing any violence to the person of another.

Plundering or stealing any part of any ship or vessel, wrecked, stranded, or cast on shore, or any goods, merchandize or articles of any kind, belonging to such ship or vessel—(not less than three years).

Accusing or threatening to accuse any person of an abominable crime, or with any assault with intent to commit the same, with a view to extort gain, and extorting thereby gain from such person.

Maliciously setting fire to any church, chapel, meeting-house, house, stable, coach-house, outhouse, warehouse, office, shop, mill, malthouse, barn or granary, or to any building or erection used in carrying on any trade or manufacture, whether in possession of the offender or any other person.

Maliciously setting fire to, casting away, or in anywise destroying, any ship or vessel, whether complete or unfinished, with intent to prejudice the owner of such ship or of any goods on board the same, or any insurer of such ship or goods.

OFFENCES PUNISHABLE BY IMPRISONMENT NOT EXCEEDING SEVEN YEARS.

Maliciously shooting, attempting to discharge any kind of loaded arms, stabbing, cutting or wounding with intent to prevent the lawful apprehension of the offender or his accomplices.

Corruptly taking any money, or receiving directly or indirectly, under pretence of helping any person to any chattel, money, valuable security or moveable thing, stolen, taken, detained or converted, (unless the person so taking or agreeing to take such money or reward shall cause the offender to be brought to trial for the same.)

Causing bodily harm with intent to kill, by administering poison or other destructive thing, or by any means manifesting a design to kill.

Attempting to kill, by any means manifesting a design to kill other than the actually administering poison or any other destructive thing, although no bodily harm be caused.

Committing any theft, where the means by which the thing stolen is obtained are by accusing or threatening to accuse, by words or letter, any person of any treason or felony, or of any assault with intent to commit any rape or unnatural crime.

By the same means attempting to commit theft, or demanding by threatening letter anything being the subject of theft.

Larceny, *i. e.*, the wrongful taking and carrying away of the personal goods of another from any place, with a felonious intent to convert them to the taker's own use, without the consent of the owner.

Stealing any valuable security—(not less than one year.)

Stealing cattle, or wilfully killing cattle with intent to steal the carcass or skin, or any part of the cattle killed.

Stealing by a clerk or servant, anything belonging to or in possession or under the power of his master.

Embezzlement by clerk or servant, or person employed as such, of anything the property of his employer, received or taken into possession by him by virtue of such employment.

OFFEN

Incest,
Keeping

Receiving or having in possession anything stolen, obtained by false pretences or embezzled, knowing the same to have been so stolen, obtained or embezzled, in case such stealing, obtaining or embezzling shall amount to felony.

Forging, or altering or uttering, knowing the same to be forged or altered, any writing, with intent to defraud any person.

Forging, with intent to defraud any person, any muniment of title or testamentary instrument.

Maliciously destroying any part of any ship or vessel in distress, wrecked, stranded or cast onshore, or any goods or articles belonging to the same.

Maliciously damaging, otherwise than by fire, any ship or vessel, whether complete or unfinished, with intent to destroy or render useless the same.

Maliciously setting fire to any mine of coal or cannel coal.

Maliciously setting fire to any stack of grain, hay, straw, coals, charcoal, or pile of cordwood.

Maliciously breaking or cutting down any sea-bank or sea-wall, dyke or aboidoau, whereby any lands shall be or likely to be overflowed or damaged, destroying any mill-dam or public bridge, or doing any injury to such bridge, so as to render it dangerous or impassable.

OFFENCES PUNISHABLE BY IMPRISONMENT NOT EXCEEDING FOUR YEARS.

Unlawfully, riotously and tumultuously remaining together of twelve persons or more for the space of one hour, after the following proclamation made by the Sheriff, or under Sheriff or any Justice of the Peace for the County, or by the Mayor or other head officer for the time being, or any Justice of the Peace of any City or Town Corporation where such assembly shall be.

PROCLAMATION.

"Our Sovereign Lady the Queen charges and commands all persons being here assembled, immediately to disperse themselves and peaceably to depart to their habitations or to their lawful business, or they will incur the penalty of the law against unlawful assemblies. GOD SAVE THE QUEEN."

Accessory after the fact to murder—(Fine at the discretion of the Court in addition).

Maliciously attempting to cause grievous bodily harm, by any means manifesting such design, whether any bodily harm be caused or not.

Conviction for any felony not punishable with death, after a previous conviction for felony.

OFFENCES PUNISHABLE BY IMPRISONMENT NOT EXCEEDING THREE YEARS.

Certifying as true, knowing the same to be false, by any clerk or other officer having custody of the records of any Court of Justice, or the Deputy Clerk or officer, any false copy or certificate of any indictment or conviction, or uttering the same with a false signature, knowing the same to be false.

Wrongfully breaking into and entering any dwelling-house or building, between six in the morning and nine in the evening, with intent to commit felony—(Fine in addition, at the discretion of the Court.)

Assaulting any person with intent to rob.

Demanding with menaces or by force any property, with intent to steal the same.

Maliciously placing or throwing in or near any building or vessel any gunpowder or other explosive substance, with intent to destroy or damage, whether or not any explosion takes place, or damage be caused.

Maliciously setting fire to any crop of corn, grain or hay, whether standing or cut down.

OFFENCES PUNISHABLE BY IMPRISONMENT NOT EXCEEDING TWO YEARS.

Incest, adultery, or fornication.

Keeping gaming or disorderly houses.

Bigamy—(Fine in addition at discretion of the Court).

Hurting or obstructing any person lawfully making proclamation for dispersing an unlawful assembly.

The assembling together, or continuing assembled, of three or more persons, with intent, without lawful authority, to execute any common purpose with force and violence, or in so violent and tumultuous a manner, and under such circumstances as are calculated to create terror and alarm amongst Her Majesty's subjects.

The fighting together of two or more persons in a public place, under circumstances calculated to create public alarm.

Assaulting any peace officer, constable, marshal or revenue officer in the due execution of his duty, or any person acting in aid of such officer—(Fine in addition at discretion of the Court).

Assaulting any person with intent to resist the lawful apprehension or detainer of the party so assaulting, or any other person liable to be apprehended or detained.—(Fine in addition at discretion of the Court.)

Perjury or subornation of perjury.

Rescue or breach of prison.

Stealing, or for any fraudulent purpose taking from its place of deposit, or from any person having the lawful custody thereof, or maliciously obliterating, injuring or destroying any written instrument of justice.

Endavouring to conceal the birth of a child by the mother, by any secret disposition of the dead body, whether such child died before, at, or after birth.

Assaulting with intent to commit felony.—(Fine in addition at discretion of the Court.)

Obtaining anything which is the subject of theft by any false representation of some state of things past or present, or by cheating at games with intent to defraud any person.

Receiving or having in possession anything stolen, obtained by false pretence, or embezzled, knowing the same to have been so stolen, obtained or embezzled,—where such stealing, obtaining or embezzling does not amount to felony.

False making or counterfeiting any coin, or uttering such, knowing it to be counterfeited.

Maliciously causing water to be conveyed into any mine or subterranean passage communicating therewith, with intent to damage or hinder the working of such mine, and the obstructing any air-way, water-way, drain-pit, level or shaft of any mine.

Accessories after the fact, to any Felony punishable by this Act, except receivers of stolen property.

OFFENCES PUNISHABLE BY IMPRISONMENT NOT EXCEEDING
TWELVE MONTHS.

Solemnizing or assisting to solemnize marriage, without being duly authorized.—(In addition, fine not less than £50, or more than £100.)

Openly carrying dangerous and unusual weapons by two or more persons, in any public place, in a manner calculated to create public alarm.

Maliciously destroying or damaging any tree, shrub or plant, growing in any park, pleasure ground, garden, orchard, field, pasture, square, avenue or street.—(In addition, fine not exceeding £10.)

Maliciously destroying or damaging any glass or wood work, or any lead, copper, iron, brass, or other metal, or any utensil or fixture made of metal or other material, fixed in any square, street or other place, dedicated to public use or ornament.—(Or, a fine not exceeding £10.)

OFFENCES PUNISHABLE BY FINE OR IMPRISONMENT FOR PERIODS LESS
THAN A YEAR.

Soliciting or procuring signatures, or other consent of persons, above the number of twenty, to any petition or address to either branch of the Legislature, for alteration of matters established by Law, unless previously consented to by three or more of the Justices of the County or the majority of the Grand Jury of the County where

the matter shall arise, at the Assizes or Quarter Sessions;—or, repairing to either branch of the Legislature on pretence of presenting any petition or address, with excessive number of people, or at any other time with more than ten persons.—(Fine not exceeding £100. Imprisonment for three months.)

[This does not intend to prevent persons not more than twenty presenting any public or private grievance or complaint to any member or members of the Legislature, Assembly while sitting, or to the Administrator of the Government, for remedy—nor to any address to the Administrator of the Government by all or any members of the General Assembly during its Session.]

Procuring or persuading any Soldier to desert, or assisting any deserter, knowing him to be such, in deserting or concealing himself.—(Fine £20, or in default of payment, Imprisonment not exceeding six months.)

Buying, exchanging, detaining or otherwise receiving from any Soldier or Deserter, any arms, clothing, caps, or regimental necessaries—or receiving from any Soldier any provisions, unless by consent of the Commanding Officer.—(Fine £5, or Imprisonment not exceeding six months.)

Disturbing any meeting of persons for religious worship, or molesting any person officiating at such meeting or any persons there assembled.—(Conviction before any Justice of the County where the offence is committed. Fine not less than ten nor more than forty shillings, and, in default of payment, Imprisonment in County Gaol for any term not less than twenty-four hours nor more than ten days.)

Shooting, gaming, sporting, playing, hunting, drinking, or frequenting tippling houses, servile labour (works of necessity and mercy excepted) on Sunday.—(Conviction before Justice of the Peace. Fine not less than five nor more than forty shillings, and, in default of payment, Imprisonment not less than twelve hours nor more than four days.)

Drunkenness.—(Conviction before any Justice of the Peace. Fine not less than five nor more than twenty shillings, and, in default of payment, Imprisonment not less than twelve hours nor more than four days.)

Unlawfully cutting and taking away any growing Corn or Grain, robbing any Orchard, Garden, or Plantation of any Fruit, Vegetables, or other things growing therein—willfully breaking or removing any part of any Hedge, Fence or Enclosure, or removing from the premises or injuring any Vehicle, Sleigh, or Article belonging to any person, and on his premises.—(Fine not exceeding £5, or Imprisonment not exceeding six months.)

Maliciously killing any Cattle, or causing any harm to the same with intent to kill or render the same useless to the owner, either permanently or for a time.—(Fine not exceeding £10, or Imprisonment not exceeding six months.)

Malicious damaging any thing kept for purposes of art, science, or literature, or as an object of curiosity in any repository open for the admission of the public gratis or by payment of money.—(Fine not exceeding £100, or Imprisonment not exceeding six months.)

Celebrating marriage, by persons duly authorized, without banns or licence.—(Fine £20.)

OFFENCES PUNISHABLE BY FINE AND IMPRISONMENT AT THE DISCRETION OF THE COURT.

Publishing the setting up of any Lottery with intent to have the same drawn, or inducing persons to purchase tickets for the same, or playing or drawing at such Lottery, or purchasing any lot or ticket for the same.

[This does not extend to the allotment of Fishing Lots in the City of Saint John under direction of the Corporation.]

Carnal knowledge of any Girl above the age of ten and under the age of twelve years.

Unlawful abduction, whether with or without her consent, of any unmarried girl under the age of sixteen years, out of the possession or against the will of her parents or lawful guardian.

Stealing, or for any fraudulent purpose destroying, or concealing any testamentary instrument.

Stealing any muniment of title.

Wantonly and cruelly beating, abusing, or ill-treating any Cattle.

The Acts of Assembly, 12th Vict. ch. 30, "An Act to consolidate and improve the Laws relative to the Administration of Criminal Justice," and 12th Vict. ch. 31, "An Act to facilitate the performance of the duties of Justices of the Peace out of Sessions within this Province with respect to summary convictions and orders," are strongly recommended to the careful attention of all Magistrates. Their duties are very fully and plainly laid down in these Acts. The limits of this publication prevent the insertion of any abstract of these Acts which would be of any practical use.

CANADA, (East and West.)—Specie par of Exchange, 9 per cent. In Lower Canada, when the navigation is open, the Bank rate of Exchange is generally 1-2 to 2 per cent. above the New-York rate. In Upper Canada, 2 and 3 per cent. ditto. When the navigation is closed, the difference between the rate of Exchange in New-York and Canada is seldom less than 3 and 3-1-2 per cent.

NEW-BRUNSWICK.—Specie par of Exchange, 8 per cent. When the steamers are running between the States and New-Brunswick, the Bank rate of Exchange is generally 1 per cent. above the New-York rate; during the winter months about 2 and 3 per cent.; but in consequence of British Silver being legal tender to any amount at 8 per cent. premium, and being a very inconvenient remittance to the United States, the rate of Exchange in New-Brunswick is less governed by the rate in New-York, than would otherwise be the case.

NOVA-SCOTIA.—Specie par of Exchange, 12-1-2 per cent. The rate of Exchange in Halifax is seldom under 12-1-2 per cent., and is frequently 14 and 14-1-2 per cent.

NEWFOUNDLAND.—Specie par of Exchange, 8 per cent.; and under which rate the Bank seldom draws. Generally in July and August the rate is 8-1-2 and 9 per cent., unless Exchange is under par in New-York. In April, May, October and November, the rate for private Bills is generally very low: 4 to 6 per cent.—The quotation for Exchange in Newfoundland is not the same as in the other Colonies. If £100 sterling realize £120 currency (8 per cent.), the Newfoundland quotation would be 20 per cent. premi.

UNITED STATES.—Specie par of Exchange is within a fraction of 9-1-4 per cent. When Exchange is above 10-1-2 per cent. and the rate of interest in England 5 per cent., specie can be remitted at profit of about 1-2 per cent. When the rate of Exchange is 6 per cent. and the rate of interest in England is 5 per cent. specie can be imported at a profit of 1-2 per cent.—In New-York, the rate of Exchange is generally lowest in the months of January, February and March, when the cotton bills are in the market for large amounts.

| | 700 | 0 2762 | 11 648 | 17 643 | 17 643 | 725 2 | 72 52 | 139 043 | 207 053 | 246 063 | 285 073 | 324 083 | 363 093 | 402 103 |
| | 800 | 0 3157 | 13 033 | 19 028 | 19 028 | 828 8 | 82 88 | 158 903 | 236 913 | 275 923 | 314 933 | 353 943 | 392 953 | 431 963 |
| | 900 | 0 3552 | 14 418 | 20 413 | 20 413 | 932 4 | 93 28 | 178 763 | 264 773 | 303 783 | 342 793 | 381 803 | 420 813 | 459 823 |

By means of the foregoing Table the interest of any sum from one shilling to £2000, for the terms therein mentioned, may be readily obtained. Thus, to find the interest of £1742 8s. for 90 days at six per cent. per annum, we have:—

| | | | |
|-------------------|---------|-------------|----------------|
| Interest of £1000 | 0 0 | for 90 days | = £14 15 10.68 |
| " | 700 0 0 | " | = 10 7 1.48 |
| " | 40 0 0 | " | = 0 11 10.03 |
| " | 2 0 0 | " | = 0 0 7.10 |
| " | 0 8 0 | " | = 0 0 1.42 |

Therefore the Interest of £1742 8 0 for 90 days = £25 15 6.71

It will also be obvious that the table may be used for computing the interest of any sum for any specified number of years and days.

N.B.—These calculations allow for the *detour* made by the British Steamers in touching at Halifax.

APPENDIX.

ANNUAL REPORT OF THE SAINT JOHN AGRICULTURAL SOCIETY.

The Directors of the Saint John County Agricultural Society beg to submit the following Report to the annual meeting. During the past year, monthly meetings have been regularly held, and have been well attended; the consequence of which has been, that much discussion has taken place, and considerable efforts have been made to advance the interests of agriculture. Most of the remarks which will close this Report are the fruit of such discussions. The action taken by the Directors will be narrated in detail.

Impressed with the importance of obtaining and diffusing sound knowledge on the subject which they have in hand, the following publications have been received and circulated,—“Johnston’s Lectures on Agriculture,” “Stephen’s Book of the Farm,” “The Journals of the Royal Agricultural Societies of England and Scotland,” “The London Gardeners’ Chronicle,” “The North British Agriculturist,” and “The Albany Cultivator.”

Having learned, early in the year, that Professor Johnston, of the University of Durham, and Lecturer to the Agricultural Society of Scotland, had been invited to visit the United States, the Directors brought the matter under the notice of the Government, and petitioned His Excellency to invite the Professor to visit this Province on his route, and give his opinion on its agricultural capabilities. This request was complied with. The Professor is now with us, and is making himself acquainted with the soil and produce of each section of the Province. It is to be hoped that his report will be carefully studied, and his directions followed by every farmer. As to his ability to teach, it need only be said, that his opinions are valued wherever scientific agriculture is known; and that the best farmers of Britain and the United States have been glad to come before him in the attitude of learners.

For the purpose of inducing the farmers of this County to test the utility of *thorough-draining*, the Directors offered premiums to such as would undertake the experiment, and report on the results. A copy of the conditions and directions will be found in the appendix. As the Directors have reason to hope, that the Commissioners of the Provincial Penitentiary will import a tile machine to manufacture draining pipes during the next season, they will allow another year to intending competitors. For their information, it may be remarked, that in England tile draining is done at less than half the cost of stone draining, even when stone is on the land, and is more effective. The former costs, in England, from £3 to £6 per acre, with drains 3 to 5 feet deep, and 20 to 40 feet apart: the latter from £10 to £30. The bottom of the drain is cut exactly to the width of a two or three inch pipe. After the pipes are securely fitted, the clay is packed closely back upon them, without any stone, brush, or other material; and however singular it may seem, experience has proved, that by this simple and cheap drainage, not only are springs and wet lands dried, but that even the surface water finds its way to the conduits, rendering the land more permeable, easier worked, and earlier ready for the seed than before, and the crops healthier, more abundant, and fully three weeks sooner ready for the sickle.

The Directors caused a large quantity of turnip, carrot, beet, and parsnip seed to be imported last season, together with wheat, barley, and oats, all of which were readily sold, without loss. They would recommend that a still larger quantity be imported, as many this season were unable to obtain a supply, and the necessity for an increased cultivation of root crops is becoming better understood.

The Directors offered premiums for the best fields of turnips, carrots, mangold wurtzel and parsnips, "quantity, quality, and cultivation considered," also for the largest quantities of wheat, barley, oats, buckwheat and potatoes raised. The judges awarded these premiums as follow:—First premium for turnips, to Thomas Davidson, second to Dr. Peters, third to F. J. Ayers; first premium for carrots, to Dr. Peters, second to Thomas Davidson; first premium for oats and buckwheat, to Thomas Dewar; second premium for buckwheat, to Robert Bowes; third premium for potatoes, to Thomas Dewar; first premium for essay on making manure, to Robert Bowes.

The reports of the competitors will be found in the appendix. The annual fair and cattle show was held on 27th September. The list of successful competitors has been already published.

The fair, from the day being wet, was not well attended. His Excellency the Lieutenant-Governor was pleased to honor the Show with his presence, and minutely examined the cattle and articles exhibited. Four samples of wheat were shown; one weighed 64 lbs. and two over 60. The oats weighed 46, 44 and 42 lbs. per bushel. The turnips, carrots, mangold wurtzel, and potatoes, were very superior, and pronounced by the judges as good as could be raised in any country. There is but little butter and no cheese made in this county. In the appendix will be found directions for making both in the most approved methods.

For the purpose of encouraging the production of these articles in the county, the Directors would recommend that large premiums be offered for the largest quantities of good quality made in any one dairy.

The Directors have to report in relation to the crops in the county for the past season, that hay, except on the marshes, was very light, probably not half an average, very little wheat was grown, but, where tried, yielded abundantly without rust or weevil. Barley has not been successfully cultivated, probably because the land has not been put in a proper condition for it, that crop requiring a very fine tilth. Oats have been a good crop. Buckwheat has been extensively grown, and yielded abundantly. Potatoes kept quite free from the disease until fully grown and nearly ripe, and, in general, were not affected at all. In some sections, however, especially in the vicinity of this city, the disease made its appearance with all its former virulence. After blackening the tops, it struck down to the roots, and in different fields from a quarter to a half were lost. It appears, therefore, that the disease has not yet taken its departure, and that the potato ought not to be depended on as the only root crop.

Carrots and turnips have been extensively cultivated, and notwithstanding the extreme drought, are generally a good crop. Mangold Wurtzel and parsnips, although better adapted for cows and pigs, and quite as easily raised as the others, have not been much tried. The English horse bean or Heligoland bean has been grown for several years on one or two farms, and when planted early have ripened and yielded well. The white bean and field pea have scarcely been tried, which is to be regretted, as they are a sure and profitable crop, and excellent alike for the table and as food for cattle.

The Directors appointed Committees to organise branch Societies in the different parishes of the county; one only has been formed at Loch Lomond, which has been conducted with much spirit; a report of its transactions is appended.

An oat mill, grist mill, and carding mill, has been established at Golden Grove, to which the Directors have awarded a premium of £25, as advertised.

An application was made to this Society, by persons interested in the coloured population at Loch Lomond, to assist in stimulating these people to help themselves. Seeds were distributed amongst them, from funds furnished by a gentleman in England, through Mr. Duval of the Normal School here, and premiums offered, with a good result. Almost every family have grown more or less vegetables where none were grown before, to the extent of from 10 to 50 bushels to each, and have found out that they can do something. Their crops were surprising, considering that their only implement is a short hoe, and that they use little or no manure. The Di-

rectors would recommend that a small sum be expended in clearing up and ploughing a field near the school house, where the children may be trained to habits of industry, and be shewn the effects of proper cultivation. The present teacher, if properly supported, is likely to effect much improvement amongst them. Their land being very fertile, and their wants few, they require only to be taught industry and self-dependence to prevent them from continuing a burthen on the community.

The Directors have as yet been unsuccessful in their endeavours to introduce a bone mill into the county. This is to be regretted, as, besides those wasted, large quantities of bones are annually shipped off to be returned to us in the shape of cabbages and flour. Perhaps the Legislature may be induced to import one, and have it worked in the Provincial Penitentiary.

The Directors have had under their notice the way in which grain and vegetables are measured in this Province, and have concluded that the present mode is objectionable, and causes much loss and inconvenience, and would recommend that a petition be presented to the Legislature, praying that a law be passed to cause all grain and vegetables to be sold by weight. Other societies are requested to examine into the matter, and, if they concur in the opinion, to co-operate with this Society in bringing the subject before the Legislature.

The Directors have pleasure in acknowledging the honour conferred on their report of last year, by Messrs. H. Chubb & Co., and the Members of the Fredericton Athenæum, by its publication in the New Brunswick Almanac, by which it was introduced into localities rarely visited by book or newspaper, and they trust that these gentlemen will be repaid by the increasing interest which is being manifested throughout the Province in Agricultural improvement.

In accordance with the Report of last year, the Directors petitioned the Legislature to appoint a Central Board or Provincial Society, and to introduce agricultural education, but nothing was done. This arose chiefly from the opposition of the farmers in the Legislature, they being decidedly opposed to any additional expenditure for the improvement of agriculture. Three-fourths of them actually voted against the invitation to Professor Johnston.

The Directors recommend that renewed efforts be made to induce Government to furnish means of education suitable to young men designed for farmers, by the formation of one or more large schools, with model farms attached, and by the science of agriculture being taught in all the common schools. Seminaries are maintained at the public expense for the education of those intended for other professions; and as farming is second to none in importance, it is neither fair to the farmers nor for the general good that this occupation should be deprived of those benefits which science and knowledge can afford.

The Treasurer's account is herewith submitted, shewing a balance on hand of £40 18s. 2d. The year's subscriptions and the annual grant from Government added thereto, will make the amount available, for next year's operations, about one hundred and seventy-five pounds.

The following general remarks are, as before mentioned, the results of, or suggested by, the discussions at the monthly meetings of the Society.

The state of agriculture and those depending on it in this Province, are admitted by all to be in great need of improvement. There is little or no farming capital: an exhausting mode of cultivation prevails by which that little is becoming less. There is no surplus produce on which to feed those who would manufacture for us; nay, farmers do not raise even enough for themselves; and it is the reply to those who would wish to introduce draining, deep ploughing, a proper rotation of crops, and plentiful manuring, whereby the crops would be more than doubled: Oh, but there are no markets!—we have no capital!—we cannot afford to pay for labour!—we cannot sell at a remunerating price what we at present produce!—and why urge us on to what would be our ruin?

Were we seeking popularity, or desirous of gaining the favour of those to whom we address ourselves, we should probably, like the other quacks of the day, say to them that their present state is caused by an unpropitious climate, or a sterile soil,

by errors of omission or commission on the part of Government, by a want of capital or a want of markets, and would urge them to seek for protection or free trade, or a responsible government, reciprocity, independence or annexation, as a cure for all their evils.

But we have other ends in view, we wish to raise the agriculturists of our country to the condition which belongs to them, to that of intelligent, prosperous, high-principled men, who know their rights and their duties, and will fearlessly assert the one and faithfully perform the other, and must, therefore, say, that from all that we have seen or can judge, we are sincerely of opinion, that general prosperity can alone be obtained by a general increase of individual intelligence, energy, enterprise, industry, and public and private economy, and in no other way, and by no other means whatever, and each one who desires to bring this about must begin at home, must do the duties which lie nearest to him, must seek out and endeavour to fulfil the purposes for which God has placed him in this world, and resolve, that the blame of being one of a spiritless, indolent, extravagant, and poverty-stricken people, shall not lie at his door. Let such a spirit but be diffused amongst us, and with our fertile soil, healthy climate, and vast natural resources, we are prepared to run a race with the best nation on the face of the earth.

But increased production will create markets: and in this way—as soon as a surplus of provisions is afforded, the farmer, who was before his own blacksmith, shoemaker, weaver, tailor, doctor and minister, finding out the advantages of a division of labour, exchanges his for the labour of others. Centres of those thus employed, or towns and villages are gradually formed as supply and demand increase. Machinery is called in to aid, and then come the large manufacturing towns.

We are at about the end of the first, and beginning of the second, period. Villages are becoming visible in every direction—at Hampton, the Bend, Dorchester, Saekville, Sheffield, Woodstock, &c.

Some think, and perhaps they are right, that by a certain course of legislation, called “protection to home industry,” the progress towards prosperity can be much hastened; others, that trade should be left to seek out and follow its natural channels, and that Government cannot interfere with the industry of one class, but at the expense and to the injury of others. As an agricultural society, we discard politics, and cannot, therefore, properly express our opinion on either side; whatever way, however, is taken, a speedy progress to prosperity can only follow an increase of enterprise and intelligent industry.

In inquiring into the causes of the backward state of agriculture, the small amount of accumulated capital, in proportion to the business done, and the want of energy and enterprise in the people, it is obvious that, like rich men’s sons, we have had so many advantages bestowed upon us, that our energies have been cramped. Our forests have been to us like the gold mines to Spain—they brought money so easily, that not knowing the value of it, we let it go as it came.

The gambling nature of the trade in timber operated also to seduce people from the more slow but sure modes of making a living. The profits of farming—nay, in too many cases, the farms themselves have been sacrificed to the insatiable craving for an easy and quick way of making money which this trade seemed to offer.

From the ease with which the timber growing upon every farm could be converted into money, the population have also acquired a taste for certain descriptions of food, not in themselves more nutritious or agreeable to the taste than the grains and other produce of the country, but which habit has rendered so essential that their use is persisted in, now even when the timber is gone, so that the farmer, from whom we ought to expect not only all our provisions and clothing, but articles of export to pay for the few foreign luxuries we require, and cannot produce, are themselves the chief consumers of imports, without furnishing a single export in return.

It may be profitable to us to compare notes with our friends across the lines—they have no advantage over us in soil or climate, and we are all of the same blood. In former times, like us, they attended to lumbering, to the neglect of their farms.

Some thirty years ago they were very much in our circumstances: the lands worn out, no markets, and unable to compete with the produce of the new and fertile western country. The western fever seized them, and an almost general desertion of the farming population took place. We have read accounts of the Northern States at that period, which might be applied word for word to our own country at this day. In process of time, numbers of the emigrants returned, in impaired health, having found out that a fertile soil and mild climate (competition and cost of transport rendering money-making out of the question) were dearly bought at the price of health. A new stimulus was given to agricultural pursuits, better modes of culture were adopted, improved stock imported, a sound education made accessible to all, and they are now a prosperous and happy people.

Let us compare their present state with ours—perhaps we may profit by taking a leaf out of their book. While they are furnishing a surplus of butter, cheese, beef and pork, as an export to the English market, we, with equal facilities, do not produce enough for ourselves. While we are grumbling over our long winter, wasting our time in junketing, lounging about taverns or law courts, or what is as bad, cutting logs which will require the best part of the summer to get to market, and in the end run us in debt; their young men and maidens, taking the advantage of every waterpower, and daily inventing new machinery, are making pulm-leaf hats, pails, brooms, rakes, and axes, which they hand over to us in exchange for our dollars. While we are pampering ourselves on Genesee flour and yankee pork, the very people who furnish us with these articles pride themselves in living on corn, rye, and buckwheat. While they willingly tax themselves to support a school system which surpasses all that the world has ever seen, and by which every child may obtain the education of a gentleman, we dole out such miserable pittances that no teacher who has strength to be a labourer will stay with us. While they give all honour and respect to the intelligent workers of all classes—while their farmers take pride in their occupation, and keep their scorn for the loafers who seek to live on the labour of others—we despise the horny hand and homespun coat, and those only who are fit for nothing else become farmers. While they love their country and the wise institutions which their own manly exertions have founded, and stir up their national pride by bragging about themselves and all that belongs to them, we, with natural advantages quite equal to theirs, with institutions such as we are pleased to make them, and which are inferior to theirs only through our own lethargy and stupidity, are contented to grovel on year after year, in servile submission to those evils which are the effects of our own spiritless and short-sighted selfishness, without the power to make that vigorous and united effort which alone is required to place us in a position quite equal to theirs, in the meantime, grumbling at and disparaging a country, a climate, and a soil, which are but too good for such thankless ingrates.

To conclude, while they, having exercised a rigid and wise economy in their domestic affairs, turn as one man to take the same care of their public matters, to see that no extravagant salaries are paid, and that their public, like their private, servants, give a fair day's work for a fair day's wages, we—but we must stop, as we are verging on politics.

In our Report of last year, we gave it as our opinion that the low price of beef in our markets might be attributed chiefly to undue competition amongst the producers of that article caused by the want of green crops, for winter feeding. We were agreeably surprised to find that Mr. Macaulay, in his recently published History of England, after describing the state of agriculture in the time of Charles the Second, in words that might be applied almost literally to this Province at this day, adduces a similar reason for like circumstances then existing, and further corroborates other of our opinions by stating, that the agricultural prosperity of England, at a more recent period, might be mainly attributed to the introduction of green cropping on an extensive scale.

But we may be required to show where the capital is to come from that is necessary for carrying out this improved mode of farming, and although the subject is a difficult one, we do not shrink from the task.

The Divine truth, "Whosoever hath, to him shall be given, and he shall have more abundance, but whosoever hath not, from him shall be taken away even that he hath," is as applicable to temporal as to spiritual things. Conducting the inquiry on this principle, we may ask—Do our farmers make a good use of the capital they have?—Do they take advantage of the light shed by science and increased knowledge on their pursuits?—Do they seek to profit by the experience of others?—Do they add the profits derived from farming to the capital, and invest them in further improvements?—Or do they, on the contrary, regularly loan their profits on mortgage, invest them in more land, build saw-mills, or expend them in fitting out their sons as lawyers or store-keepers?—Or to leave generalities and go into particulars—would not the difference in produce arising from a proper rotation of crops, and the present exhausting system, soon increase capital?—Could not each farmer in the country, by the mere exercise of his common sense applied to the matter, at least double the quantity and quality of his manure?—Would not the difference between raising cows of the value of £5 and £10, between a dairy of cows yielding 4lbs. and 8lbs. of butter each per week, between beef selling at 1½d. and 5d. per lb., cheese at 8d. and 6d., butter at 8d. and 1s., oats at 1s. 6d. and 8s.—all such differences, being the result of different management merely, soon leave a surplus of profits which would change the country from a poor into a rich one?

Another mode of obtaining capital, however, is open to us, by means of Banks. Banking capital in this country has hitherto been available only to those engaged in commercial pursuits. Farmers have been rigidly excluded from it, and this chiefly because our Banks were originated for the express purpose of accommodating the mercantile and lumbering interests.

The plan on which they are formed, being a combination of the business of the exchange-broker and money-lender, forces them to have their main dealings with those who can furnish them with Bills of Exchange drawn against exports, and causes the accommodation which they can afford to the general interests to be to a limited extent in amount, and temporary and uncertain in duration.

Were our farmers to furnish an export, which they *will* do sooner or later, say of beef, pork, butter, cheese, wool, hemp, or vegetables, the Banks, as now constituted, would, no doubt, be as ready to deal with them as with other producers. We may mention, as an instance of what may be done in this way, that the farmers' wives in the State of Maine export a greater value of poultry and eggs than we do in timber.

But Banks are wanted with a constitution so founded as to enable them to advance capital to farmers without, at least, the immediate necessity of such a return; and what is called the Scotch Banking system precisely meets our case.

This system was founded for the encouragement of agriculture, and has not hitherto extended beyond that kingdom. On this system, productive land, instead of gold and silver deposited, is the value pledged on which the Banks are allowed to issue notes, and money is principally loaned on what are called cash credits—the borrower being allowed to draw to a certain extent, and paying daily interest on the amount at his debit.

But before farmers can obtain loans on this or any other system, they must first generally deserve and obtain the character of being prudent, industrious, frugal, upright, honourable men, willing and prompt to fulfil all engagements at whatever sacrifice; and second, shew that they can make a profitable use of capital loaned to them.

That there are many farmers who come up to the first condition we are happy to be able to bear testimony; still, from the demoralising nature of the timber trade, in which so many have been engaged, we are not prepared to say, that the above can as yet be held as the general character of our people. With regard to the second, any one who travels through the country and sees the mere *playing* at farming which generally prevails; the main part of the farms lying in weedy and worn-out hay-fields, and stunted pastures, with little pocket-handkerchief patches of green crop; the scratching of the earth, which serves as an excuse for ploughing; the

starved mongrel race of cattle, unfit either to yield milk or take on beef; the manure heaps exhaling their gases to heaven, and the precious liquid draining into the nearest brook—and all this with a listless desponding people, afraid to take bold work for fear it will not pay, so much accustomed to the high wages and profits of a protected timber trade, that they despise the slow returns and prospective benefits resulting from the cultivation of the soil, worshipping money as the one thing needful, as the only thing to be desired, and ignorant of, and, therefore, incapable of appreciating, the glorious privilege of being independent, of having enough, and to spare of those things which are ever the reward of frugality and patient industry, and of which money is only the representative.

Any one witnessing such a state of things can have little hesitation in saying, that until an entire change can be brought about, there is already quite enough of capital employed in farming for all the good that is done with it.

That these circumstances are not the effects of any inability in the soil to reward the intelligent cultivator, or any other insurmountable barrier to prosperity, is rendered evident by the fact, that the almost universal answer from every part of the Province, to an enquiry which has been recently made, is, "That farmers who have devoted themselves exclusively to their business have invariably accumulated property, and, with ordinary prudence and industry, have generally become rich."

Our former remarks regarding improved stock perhaps require further explanation. They have been understood as if we wished to introduce foreign stock to take the place of native, from, it may have been supposed, our foolish preference for things from abroad, many alleging, that native cows give as much milk as foreign, thrive better, and are more suited to the country.

Now, be it observed, that we pronounced no opinion as to one breed of cows being better than another; and the reason why we prefer others to the cows of this country is, that there is no distinct breed here, they are all mongrels, or derived from crosses between cows brought into the country with the first settlers, and others since introduced from all parts of the world.

As such, although there may occasionally be good milkers amongst them, the progeny cannot be calculated upon, and the more especially on account of the carelessness that prevails regarding what bulls are kept—anything in the shape of a bull being reckoned quite good enough. Those making a business of it, and depending on the produce of the dairy for the means of paying a heavy rent, could not afford this *playing at farming*. With them it would be a matter of life or death. Every cow would have to do its duty, and produce so much, or the rent could not be paid.

There are common cows in Britain as well as in this country. Particular breeds are thus made. A farmer may have in his dairy of twenty cows, say five, that with the same feed will yield more milk and butter than the others. He is aware that it would pay him better if all his cows were equal to those, and to effect this, he breeds his future stock from them only, taking care that the bull is also from a good milker, it being a rule that "like begets like," and killing off any that may not come up to the mark. By careful breeding in this way, for many generations, have breeds been formed, possessing distinctive qualities, colour, and shape—the produce of which retain the characteristics.

None of these breeds are ever crossed for breeding purposes, nor are they allowed to be mixed with common stock. Some breeds also have been made up on account of their size and fattening propensities.

There are in England three celebrated breeds—the Durham, Devon, and Hereford. In Scotland, but one—the Ayrshire. The Galloway, Angus, and West Highland are not used for the dairy.

Now, if our farmers choose to take the trouble, and are willing to leave the benefit as a legacy to their children, they may make a breed of their own too; the same care and time would produce the same results. But common sense suggests that it will be cheaper to take the benefit of the labour and care of others. He must be a poor farmer, however, who is contented year after year to go on with an inferior race of cows without selection or an attempt at improvement.

One cause of the prejudice against the imported breed in this country is from bulls only being introduced into particular districts. The produce of a cross cannot be calculated on, it may take after either parent, or be worthless.

No correct judgment can be formed of the value of any breed unless it is kept pure: a little care and attention in the beginning is all that is required to effect this; and those only who have seen herds of well-bred and well-fed cattle can understand why such prices should be paid for them.

In Britain and the United States, cattle of the improved breeds are valued at more than double the price of the common kinds, and bulls are often sold at from £20 to £100. Does any one suppose that the rent-paying farmer of Britain can afford to do this to gratify a fancy?

At all the cattle shows in Britain premiums are given only for the above breeds. We observe also that at the last New-York State Show, at Syracuse, no other breeding cattle were admitted to compete than pure-bred Durham, Devon, Hereford, and Ayrshire. Native cattle and grade or crosses were excluded. Our Agricultural Societies may take a hint from this. Some of them this year excluded all but native cattle from competing!! Our neighbors of the United States have no want of national pride; and they rather surpass us in a knowledge of what will pay. We may presume, therefore, that in this they are right and we are wrong.

These breeds, however, will be no better than our own, unless they are better treated; they will not even do so well with the same care, never having been accustomed, like our hardy race, to stand cold and hunger.

If dairying is meant to pay, cows should be warmly housed from November to May, and only out to drink, fed with turnips and straw or hay in winter. In summer they should have for pasture the best hayfield on the farm, which can be afforded to them if turnips and straw are fed, and the manure saved from the cows being kept in, will raise all the turnips.

With such treatment the improved breeds will show their superiority.

We trust we will be excused for our want of method in putting together these hurried remarks. We are too much engaged in the active business of life to find time to round periods and construct learned sentences; and, unfortunately, many, who ought to take the lead, who have most interest in the improvement of the country, and most spare time at their disposal, stand coldly aloof, and afford us neither their time, money, nor countenance.

We offer no apology for speaking of Provincial agriculture generally, we being only a local society.—In pressing danger, no one can be blamed for calling "fire!" And if ever a country needed the utmost exertions of every one who can aid in rousing her from a state of almost hopeless asphyxia, this is the one.

With our timber nearly exhausted—without another article of export, and following a mode of agriculture that is fast destroying the ability of the soil to produce food—what but poverty and ruin can overtake us!

But we think we can discern symptoms of better things to come. The public mind is becoming alive to the necessity for giving that attention and encouragement to agriculture to which its importance entitles it.

The idea is gaining ground, that probably this may be a farming country after all!

Such being the case, we have full faith in the result, and trust we shall live to see prosperity and happiness, as the reward of intelligent industry, taking the place of our present poverty and despondency.

By order of the Board.

R. JARDINE, *President.*

DOUGLAS B. STEVENS, *Secretary.*

Saint John, October 25, 1849.

APPENDIX TO THE REPORT.

THE ST. JOHN AGRICULTURAL SOCIETY OFFERS THE FOLLOWING SPECIAL PREMIUMS :

For the best Report on Draining, founded on experiments made in this County, in conformity with the annexed conditions, *Ten Pounds.*

For the Second best, *Five Pounds.*

For the Third best, *Two Pounds Ten Shillings.*

CONDITIONS.—A portion of upland, not less than half an acre, to be drained early next summer; the drains to be from three to five feet deep, and from twenty to forty feet apart, running parallel and emptying into a main drain, sunk at a lower level and six inches deeper than the others. The land to be afterwards ploughed to the depth of twelve inches, and after a light manuring, to be sown with turnips, barley, oats or buckwheat, and ploughed again in the fall, or summer fallow. The next season to receive a dressing of *well-rotted* manure, and after sufficient ploughing and harrowing to bring the soil to a fine tilth, to be sown with turnips, carrots, beets and cabbages, or either of them, in drills. When the crop is out, after a dressing of sixty bushels of quick lime to the acre, to be ploughed. The third season, to be sown in April with wheat or barley and grass seed.—The Report to give in detail the mode and cost of these operations, and the amount and value of produce; also, for the purpose of showing the profit or loss arising from this mode of farming; a similar account of the crops from an equal portion of the same field, to be cultivated in the ordinary manner.—The Report to be furnished in October, 1852.

DIRECTIONS.—The drains may be opened to the depth of twelve to eighteen inches with the plough, then sloped down to six inches wide at the bottom. As there are no draining tools here, a shovel should be ground to a point of five inches for the last shovelling. After the drain is thoroughly level and clean, in the absence of tiles, broken stones should be laid carefully in by hand, to the depth of fourteen inches, an inverted sod laid on the top, and the clay or soil closely packed down. The filling in and levelling should be done with the plough. The main drain should be twelve inches wide at the bottom, and have a pipe formed, with eighteen inches of broken stones on top. Cedar or fir branches may be laid on top of the stones in the main drain.—The cost of opening and closing drains in Britain is about 7d. per rod; in this County, drains have been opened at 6d. per rod.—The first ploughing may be done with a common and subsoil plough, with two common ploughs following one another, or the ground may be trenched.

OBSERVATIONS.—As a knowledge of the effects intended to be produced by these operations will enable the farmer to work understandingly and intelligently, it may be observed, that land in its ordinary state is saturated with water coming from the bottom upwards, and is therefore not only impervious to the air, but cannot even be penetrated by the rain, which flows over the surface, and instead of adding to, carries off, the nutritive particles from the soil. Manure and lime are, comparatively, ineoperative on land in this situation, and from the coldness and sourness of the subsoil, crops are weakly, subject to disease and the attack of insects, and liable to injury or even destruction from vicissitudes of the season; from all which diseases and accidents a state of vigour and high health is the only preservative.—After thorough draining, the till in immediate contact with the drain first parts with its moisture, the place of which is supplied by air, and becoming porous, it forms a conduit for the moisture of the next adjoining portions, and so the process goes on until the whole land becomes dry to the surface. Being thus porous, every shower adds fertility and heat by percolating slowly through the soil until it reaches the drains, leaving in its progress the rich stores of carbon and ammonia which it had derived from the atmosphere. The earth also becomes more capable of decomposing the vegetable remains and manure deposited in it: in other words, it is enabled to digest the food supplied, and furnish the plants with the life-blood necessary for their vigorous growth.—It may also be noticed that, by the old mode of draining, (the drains being either shallow or stoned up nearly to the top) the surface water found its way in and eventually filled up the drains with sand and gravel. By this new mode (a small quantity of stones or a tile being sunk to a considerable depth and the earth packed closely upon them) no rain or surface water is allowed to come in directly from above, all the water enters at the bottom, and the rain goes through the soil so slowly that the drains do not begin to run for some hours after a shower; and so may last for centuries.

D. B. STEVENS, *Recording Secretary.*

R. JARDINE, *President.*

St. John, 4th January, 1849.

THOMAS DAVIDSON'S STATEMENT OF TURNIP CROP.

LITTLE RIVER, OCTOBER 16, 1849.

To the President of the Agricultural Society.

SIR,—The way in which I cultivated my field of turnips was thus:—The extent is nine acres; it is a hillside, and the soil is gravelly loam, naturally poor, and had never been in crop. The year before last, I ploughed it in the fall, after pulling the bushes out. In the following spring, I sowed oats and had a fair crop. After the oats were out I drained it with stone drains three feet deep, I then ploughed it

ir crop. After the
then ploughed it

deep. This spring I ploughed it twice, and put on 45 single horse loads to the acre of well rotted manure in drills 30 inches apart. I sowed on the top of the manure 3 cwt. of guano to the acre, then closed the drills and sowed turnip seed, about 5lb. to the acre, from 5th to 30th June. The fleas were numerous, but left enough for a crop. I thinned or singled them to about 10 inches apart, by hand, removing the earth from each plant so that it fell over. During the next month I passed through them with the hoe, levelling the drills and destroying all weeds; I ran through them twice afterwards with the drill harrow, and to finish, ran a light furrow with the drill plough to carry off the water. The produce of a square rod in different parts of the field, measured in a flour barrel, estimated at 2½ bushels, was 8 bushels, which shows a produce of 1280 bushels per acre. I have sold about 2000 bushels at 1s. 3d. per bushel—and what I cannot sell I intend to feed with straw to my dairy cows, and boiled with chaff to my horses and pigs. I think a bushel of turnips boiled with chaff will go as far as a bushel of bran, and at that rate would be worth from 9d. to 1s. per bushel.

I cannot well estimate the value, however, for feeding, but consider them indispensable. I consider that an acre of turnips would keep five cows through the winter, as well as an acre of hay would keep one.

The cost of cultivation I consider to be—

—Or, in other words, they stand me in about 2d. per bushel. My field of Carrots was cultivated in the same manner. It contained two acres—was sown about the 1st of May with seed prepared as recommended by Mr. Ingledew, and thinned to about four inches. The produce is five and a quarter bushels to the rod, or 840 bushels to the acre. I can sell a considerable quantity at 2s. 6d. per bushel, the rest I will feed to my horses and pigs.

I am your obedient servant,

THOMAS DAVIDSON.

DR. PETERS' STATEMENT.

LANCASTER, October 22d, 1849.

SIR,—My mode of cultivating carrots and turnips is to spread the manure upon the ground at the rate of thirty tons to the acre, and plough it in, then harrow well, and run the drills with a double mould-board plough. My man, with a pair of horses, will plough, harrow, drill and sow an acre in two days with ease, which, at 12s. 6d. per day, is 25s. I weed chiefly with a drill plough and cultivator. My turnips averaged eight bushels to the square rod. My carrots were all housed before I got your note, so that I cannot say how many bushels I had in a square rod, but the circumference of most of them was from eight to ten inches, and the Belgian were from eighteen inches to two feet long. I always sow Carrots upon potato land, and Turnips upon oat stubble. I sell carrots at 2s. 6d. and 3s. per bushel, and turnips at 1s. 3d. to 1s. 4d. I think the White Belgian Carrot the most profitable crop that can be put in the ground.

I remain your obedient servant,

G. P. PETERS.

STATEMENT OF MR. FREDERICK J. AYERS.

COLDBROOK, October 22d, 1849.

To the President of the Agricultural Society :

SIR,—I send you a certificate of the quantity of turnips to the square rod, which is eight bushels, or at the rate of 1280 bushels to the acre.

I cultivated this season about an acre of turnips. The season being dry and my land lying high, it had a very unpromising appearance until 1st September.—Since then the growth has been most rapid. I adopted Mr. Ingledew's mode of culture, as far as thinning and taking the earth from the plant, leaving nothing but the tap root in the ground, except in a very few instances, to test the principle, as laid down by some writers, but in no instance did it succeed, the turnip being much better when the earth was taken from the plant. The land is a dark loam with a little marl on a gravelly subsoil, which, two years ago, was broken up from very rough pasture and planted with potatoes. I ploughed it last fall, and four times this spring, harrowing well in a day or two after each ploughing, until it was very fine. After the third ploughing, I spread on eighteen double loads of manure, a mixture of horse, cow, and pig dung, and ploughed it in. After harrowing, I run drills twenty-four inches apart, raking them down and sowing the seed as fast as the drills were made. Part sown on 20th June, and the rest on 1st July—the last sowing stood the fly best; and some portion sown on 20th July are as good as any of the field, and have a fine flavour. The past season, on account of the drought, has been a very unfavourable one for the cultivation of the turnip, and I take much pleasure in presenting for competition such a crop,—but as good as the yield is, I think it would have been increased materially had I not committed the very common error of leaving the plants too thick, and having the drills too near each other; but as I am only a novice in agriculture, I will not trouble you with more remarks, further than to state that the cultivation of an acre of turnips in this vicinity may be stated at from £12 to £15, and when the crop is properly cultivated, one thousand bushels to the acre is nothing more than an average crop; and if we put them down at 1s. per bushel—and they are seldom sold at so low a price—it would leave the profit on an acre at Thirty-five Pounds.

I am your obt. servant,

FREDERICK J. AYERS.

[The above were accompanied by proper certificates.]

Mr. Thomas Dewar, Gardner's Creek, furnishes certificates that he has raised from fifteen acres, 607 bushels of oats. Six acres of buckwheat yielding 143½ bushels, and 4½ acres of potatoes yielding 746 bushels.

Mr. Robert Bowes furnishes a certificate that he has raised 114 bushels of buckwheat.

The following is Mr. Robert Bowes' statement of his plan of saving manure, to which the premium was awarded:—

To the President of the Saint John Agricultural Society.

Sir,—As your Society has offered a Premium to the Farmer who has displayed the most intelligence and economy in saving and making manure, and as I am convinced that upon this depends in a great measure the successful prosecution of Agriculture in this County, I am induced to lay before you my experience in this matter. The exhausting process of farming hitherto carried on in this Province, cannot be improved, save by the production of a larger quantity of manure than heretofore. Convinced of this, I, in the month of July, three years since, hauled out of a bog eighty cart loads of bog earth to the end of the land where I intended to apply it, mixed it with eight hogsheds of quick lime, and let it remain until the following Spring, when I spread it, broad cast, on about two and a half acres of land, which had been ploughed about the time I hauled out the bog earth. I sowed it with Oats, Timothy, and Red Clover, and harrowed it properly. I had a good crop of Oats that year, and an excellent crop of Hay the next year. I did not, however, like the look of the heap; when I turned it over, the lime seemed dead and the bog wet and cloggy. There was about thirteen or fourteen loads of the bog earth left, with which I had not sufficient lime to mix, and it laid over winter. I determined to try how barn manure would do to mix with it. I accordingly put six cart loads of the barn manure to the bog and let it stand for four or five days, when I found it in a complete state of fermentation. I applied it to a piece of

ground alongside the other, and I found the crops to be superior on the latter. The next year, I hauled one hundred and seventy loads of peat to the field where I intended to apply it, and to every seventh load I added one of earth. I turned the heap over twice in the summer, which I found improved it very much. As soon as the frost left in the spring, I had the barn manure admixed, one load to two of the peat, with the latter finely pulverised, and thrown loosely in a compost heap, ten feet in width and five feet in height, shaped thus Δ . I then left the heap to do for itself. I then harrowed the ground, picked off the stones, and struck out drills two feet apart, and left the ground prepared for the reception of the manure. In four days I found the compost in a proper state of fermentation. (It is necessary to have a few loads of earth convenient, lest the heap would overheat, to throw on the top two or three inches, to prevent the escape of the ammonia or gas.) In a few days the compost pucked down eight or ten inches, into a solid mass of fertilizing matter. I let it stand for four days, then hauled it out on the land, thirty-four single horse-loads to the acre, and covered it up with the plough in the drills. I put in carrot seed; the day following, I found the manure had warmed the ground, and, notwithstanding the dry weather, the seed germinated, and in four days they appeared above the ground. I planted in the same acre of ground, potatoes, carrots, turnips, beets, cabbage, and corn, all of which grew abundantly, which will appear more fully in the accompanying certificate. So, sir, like the Irish bog, there is something very extraordinary in the peat if properly manufactured, and I would strongly recommend that in all cases the peat should go through a thorough course of fermentation, and, if possible, be applied to the ground when warm. It may be asked, why not add more earth to the heap? I answer, it would prevent fermentation. The manure that I mixed with the muck was that of six cows and two horses, which was evenly mixed through the winter in the barn-yard. But, sir, our farmers will think very hard to quit their old method, which was to haul out their manure and apply it to the ground cold, wet, and unmix'd, which, if it never was to be put with a compost, it would improve it very much to turn it over, and let it stand for a few days to warm a little before being put in the ground. In our cold spring weather, care should be taken not to put any lime in the same compost with barn manure, as they never agree; the one is sure to eat up the other. It may be asked also, would not quick lime do to mix with peat; and I think it would, by preparing the peat the same as above described, and in the spring, break the lime into small pieces and put it through the peat till it slacks; then turn it over and let it stand four or five days—say, put one load of lime to six loads of muck,—this, I think, when put on the ground warm, would be a very good manure. But this is not the method followed by the farmers of this locality; they commonly mix the lime with the wet sour muck, without turning it over in the summer, or soaking it, or waiting for the required power of the atmosphere to manufacture it; in the spring the lime is dead, and, I think, can be very little service to the land. Charcoal would be another excellent ingredient to make manure, especially to the farmers in the interior parts of the country, who cut so much wood-land down annually and burn it on the ground. If the farmers would make charcoal of part of the wood they burn up, they would find it very much to their benefit. I think that sea-weed would be a very good ingredient to mix with peat for compost; but this article is only to be obtained along the sea board of this Province, and could not apply to the interest or benefit of the farmers generally, but only to those farmers who reside along the sea coast. Neither can lime be had except in particular places in this Province, and then it must be purchased at a very dear rate, placing it entirely out of the reach of small farmers, or of those living in the back settlements and interior parts of the Province. I think the simple method of making manure that I found out by experiment, would tend to the general good as well in the most remote parts of the Province as in these localities, as the article can be got almost on every farm, with no other cost than that of manufacturing it, and it is within the reach of the poor farmer as well as the rich; and although simple as this mode of making manure may appear, any farmer who will add to his manure heap twice the quantity he makes at his barn yard, and follows it up annu-

a being dry and

wily, together with rotation cropping, may rest assured his farm would soon have a different appearance to that which it has this day. I have one hundred and seventy single horse lands of bog earth now prepared as above, for the coming spring. I find this description of manure more nutritious to plants than any other I have yet used. Another good tendency fermentation has on manure is to destroy the foul seeds, such as dog-nettle, sorrel, and other seeds, which remain safe and sound through the winter about the barn yard. The rough buck-wheat is a grain that is sown very much these last three or four years all over the country, the seed of which is almost imperishable, and gives the farmer a great deal of trouble in weeding out from amongst his crops; it might be destroyed by putting the manure-heap through a thorough course of fermentation in the spring, before applying it to the ground. This description of grain the farmers heretofore hesitated in sowing, in consequence of the great difficulty they met with in clearing it out of the land;—this difficulty can easily be removed by the following method:—As soon as the grain is removed off the land where it has been grown, put on the harrow and harrow in all the fallen grain smoothly.—In a few days a young braird will come up, which should not be interfered with. Now have it eaten down with cattle in order that the seed may be well exhausted before the frost sets in, which will kill the green braird, and the farmer may rest assured it will give him no more trouble.

Sir, I hope you will excuse me for trespassing so long on your valuable time.
I remain your obedient servant,
ROBERT BOWES.

Golden Grove, September 20th, 1849.

The following letter from Mr. Layton, of Richibucto, to the Society, on the same subject, is deemed worthy of publication:—

RICHIBUCTO, 23d MARCH, 1849.

To ROBERT JARDINE, Esquire, President, Saint John Agricultural Society.

Sir—At your last monthly meeting, it was intimated by a resolution affixed to the end of your Report, that your Society would be obliged by any information from either the practical or theoretical farmer. As one of the former class, I beg to submit the following observations upon the saving and increasing of manure. Your Society, I know, will acknowledge the importance of the subject; and although I shall fail in treating of it with that learned knowledge which becomes the professor or the lecturer, nevertheless I trust I shall be able to guide the farmer upon principles sufficiently philosophical in the preserving and gathering his manure with success.

Putrefaction proceeds in all cases by the elementary principles being set at liberty, either in a volatile or fluid state. If a quantity of stable dung be piled in a heap, whether exposed or not, it very soon heats, and a constant stream of vapour is emitted, which is as constantly reducing its weight and volume, and, at the end of six months not more than a fourth of its original bulk will remain for the farmer, and this will be a blackish earth if exposed to the weather, and a dry powder if covered, mostly of carbonaceous matter, all the other ingredients (being the best part of the heap) will be partly sunk in the earth, and partly blended with the atmosphere, to be carried with the winds, and combined anew with some living vegetable, or to enter into some other compound, but totally lost to the farmer; they may be fixed and entangled in the luxuriance of the forest, but they can never enrich his harvest; the nutritive juices may have passed downward, and enrich the spot that it covered, but the real substance is gone as completely as if consumed by fire.

Putrescent manures act upon vegetation by being subjected to the putrefactive process; this process goes on in part by the elementary principles being set at liberty, as before stated; and passing off in gases or steams, but it must not be supposed that their escape is necessary to decomposition, for nature has given us means by which they may be applied to use. These are chiefly two—water and earth. Water is the universal solvent, and exerts a wonderful influence on the

economy of the vegetable world; it is susceptible of holding in solution the gases or stenms, and thus hindering their escape. One hundred grains of fluid will actually fix and retain one hundred and ninety cubic inches of the gas. Earth, too, is another absorber of all the gases which arise from a putrefying dung heap, which our farmers can prove by putting a layer of common soil, from twelve to eighteen inches thick, on a heap of dung while in a state of fermentation, and afterwards separate it carefully, and it will be found to contain the most fertilising qualities; the compost heaps which attract so much attention at Miramechi are made valuable chiefly by this absorbing power of earth.

A good agriculturist would no more allow fermentation to be going on in his dung heap unmixed with earth, sea weed, or something else which has the power of fixing and retaining the gases, than the distiller would allow his still to beset to work without the worm to cool and condense the spirit which rises in vapour or steam.

Earth also absorbs the putrid gases from water. Take that black, rich liquid which has run through a dung heap, and contains so much of its essence, being saturated with the gases (of which too much may always be found about our barns after rain), and pass the same through a heap of earth of sufficient bulk, and it will run a stream of clear water.

The above observations, I think, conduct to the following conclusions, viz.: that during the putrefaction of a vegetable mass, or a common dung heap, the gases naturally fly upward and blow away with the atmosphere unless arrested—that water will absorb them and hold them in solution—that the water undergoes a change in colour and smell—that earth has also the power of arresting the gases in their ascent, and of separating the soluble parts from water (which holds them suspended) by means of filtration. These deductions have been my guide in arriving at the following plan for saving and increasing manure:—

Let your barn and out-houses, if possible, be built in a square (if that cannot be done, fence in a yard at the south side of your barn, which will always be useful), leaving an area in the middle, and out of which never let your cattle go during the winter; dig out the area to the depth of three feet in the middle, rising gradually to the surface as you come to the buildings or fence. Into this square haul in the fall, or better in the summer, a quantity of earth, peat, seaweed, sawdust, or any other matter which has the power of absorption, spreading it from twelve to eighteen inches thick. Into this convey as much drainage from your barns as possible, as well as the soapuds and other drainage from your house; wheel in the dung, beginning at the middle, mixing the different kinds, and leaving it flat at the top to encourage the cattle to walk about in it, which, by compression, will check fermentation but not decomposition, thus preventing the waste of ammonia. The snow and rain falling on this heap will do much good, because, as I have stated, water has the power of fixing the gases, and although it may run through the heap, it must come in contact with the earth or peat underneath, which, as I have shewn, will absorb the putrid gases from the water by filtration. In the spring, when the weather gets warm, it will, of course, ferment, when the judicious farmer will have ready a pile of earth or peat to throw on the top, about twelve or eighteen inches thick, to fix and retain the gases as they rise.

The attention which is paid to this part of farming indicates, almost with certainty, the state of ignorance or intelligence of the farmer; for whenever we observe a want of exertion to accumulate, by artificial means, the aggregate heap beyond the bare supply from the cattle, no further proof is required of the state of debasement in which agriculture rests.

I remain, Sir, your very obedient servant,

J. G. LAYTON.

The following is a statement of the proceedings of the Loch Lomond Branch Society:

LOCH LOMOND, 22d October, 1849.

Robert Jardine, Esq., President of the Agricultural }
Society for Saint John County, &c. &c. }

Sir,—As some of the principal premiums recently offered by our infant Society remain yet to be awarded, I regret that it is not in my power to forward you, for the information of the Parent

Society, a full report of our disbursements. At the same time I feel much pleasure in acquainting you of the unanimity that prevails in this Branch, and the zeal manifested by the members, individually and collectively, to promote the cause of Agriculture generally. Two valuable members enrolled their names the evening after the Exhibition, adding liberal donations to the funds, and others expressed their determination to become members of the Society immediately.

A great deal could not be expected at the first Annual Show here, at this time, owing to the disadvantageous circumstances under which the country has had to labor (in part occasioned by the failure of the crops for several years previously), but, certainly, the specimens of potatoes, turnips, carrots, and other vegetables exhibited, as well as grains of various kinds, would do credit to countries far more renowned for agriculture.—The Cattle Show was only ordinary, but as stock is in the way of improvement, by the Ayrshire and other good breeds being introduced into this quarter, there cannot be a doubt that, ere long, a very Improved breed of cattle will be the result.—Sheep and swine were of a very fair quality; and I am happy to add that quite a reaction in favor of agriculture has taken place.

I am, sir, your most obedient servant,

JOHN JORDAN,

President of the Loch Lomond and Golden Grove Agricultural Society.

The Directors, thinking it might be of service to obtain the opinion of Mr. Robert Gray, a practical Farmer, recently from Scotland, on various points of husbandry, the following is his reply to their application :

OAK PARK, FREDERICTON, Oct. 24, 1849.

To the President of the St. John Agricultural Society :

Sir,—In answer to your request to furnish you with my mode of cultivating turnips, my opinion of what kind of cows are best adapted for dairy purposes, what rotation of crops I think would be most suitable in this country, and the way in which "Dunlop" cheese is made, I beg to submit the following.

THE CULTIVATION OF TURNIPS.

Land intended for turnips should be ploughed in the fall, especially if it has any portion of clay in its composition. It has thus the benefit of the winter's frost, which renders it friable and easier worked in the Spring. The number of spring ploughings and harrowings will depend on the nature of the soil, which must be thoroughly pulverised and cleaned, every clod broken, and every weed gathered off.—It is then drilled up into ridges of from 26 to 30 inches, according as the land is level and clear of stones or otherwise. Well prepared manure is then put into the drills, and seed sown (at the rate of 3 lbs. per acre) as soon after as possible.

It is of great importance that the operations of drilling, manuring, covering the manure, and sowing, should be carried on in as rapid succession as possible. Seed sown on the evening of the day that the manure is applied and covered, will vegetate under the most unfavourable circumstances, whilst, if it is delayed for only twelve hours it will either not vegetate at all or so partially and feebly as to render it useless as a crop. So soon as the young plants show their rows distinctly, the grubber or cultivator should be passed between the rows, and the stripe of surface left between its operation and the line of plants should be taken off by the hand hoe. This gives an effectual check to the first growth of weeds, and renders the subsequent weeding comparatively easy. When the plants have got to some size, and begin to crowd each other, they should be singled out to a distance of from ten to fourteen inches, according as the crop is likely to be, a bulky one or otherwise. Moist weather is the best for this operation, but it should not be delayed more than eight days beyond the proper stage, even though the weather should be unfavourable. While the thinning is going on, the earth should be removed from the roots of the plants left, so that only the tap root shall have a hold of the soil. At least one hand hoeing will be necessary after this, and as much cultivation between the rows as there is leisure for up to the time that the plants begin to meet their leaves across the drill, when the drill plough may be passed lightly between the rows so as to form a channel for the surface water to run off, but without putting any earth up to the bulbs.

MANGOLD WURTZEL.

The culture of mangold wurtzel is much the same as for turnips, only the seed requires to be sown by the hand, and slightly covered with a rake or shovel. It is

chiefly valuable as food for milch cows, as it does not, like turnips, taste the milk. In other respects I think it inferior to turnips, and being easily damaged by frost, should not, in my opinion, be grown to any great extent in this Province.

CARROTS.

Land intended for carrots should have the manure ploughed in in the fall, and by as deep a furrow as possible. The seed should be thoroughly separated, mixed up with moist earth or sand, and placed in a rather warm situation, such as a kitchen, and turned over repeatedly for say forty-eight hours before sowing. This will cause the seed to germinate and insure an early braird. The rest of the treatment is similar to that for turnips, only in thinning out the distance between the plants should be from four to six inches.

BREEDS OF CATTLE.

From my experience in the matter, I give a decided preference to Ayrshire cows for the dairy.

I believe they will yield a greater quantity of milk in proportion to the food they consume than any other breed. Besides this, they are docile and hardy, and will thrive on pasture and with a description of keep when such breeds as the Short Horns would starve. They also possess more than average feeding qualities of their own, and when crossed with the Short Horn or Durham Bull, the produce is an animal remarkable for early maturity and a disposition to fatten. If proof were wanting of the excellence of the breed, it would be found in the circumstance that they are carried to almost every quarter of the globe. Large droves are every year taken to England, and during the last ten years, considerable numbers have been shipped to the Cape, the Isle of France, to Sweden, Denmark, Belgium, and the United States.

ROTATION OF CROPS.

The same rotation will not answer equally well on all soils and under all circumstances. The one I consider most generally applicable, and which I have myself adopted, is the following.

First year (and when the ground has been broken up from grass) oats or buckwheat; Second year, drilled green crop, properly cleaned and manured; Third year, wheat, barley or other grain, with grass seeds; and fourth, fifth, sixth, and perhaps seventh year, grass made into hay or pastured.

METHOD OF MAKING DUNLOP CHEESE.

When more than the produce of one milking is used, the old milk must be heated to the same temperature as that newly drawn from the cows, or a little above it.—This is best done by putting the milk, after taking off the cream, into a tin pan, and that again into boiling water. When the milk is properly heated, it is (together with the cream previously drawn off,) and the new milk, put into a tub and well stirred together, and the steep applied. When the milk has coagulated, which will be in about twenty minutes, the whole should be stirred up and thoroughly broken by the hand. In ten minutes afterwards the whey should be taken off, and the curd pressed against the bottom of the tub, till it is firm enough to be lifted into a drainer, or vessel with a porous bottom, when it is cut with a knife, once in every ten minutes for an hour. It is then put into a cloth, and a pressure applied to expel the whey more thoroughly. When this is done and the curd gets dry and firm, it is put into a tub and carefully minced with the curd knife, and salt and a little nitre applied. The curd, with a cloth round it, is then put into a chesset, set before the fire for three hours, and turned from time to time to preserve a uniform heat. It is then put in the press and a light pressure applied. At the end of an hour the cheese is turned upside down in the chesset, and a cloth drawn from boiling water applied. At the end of another hour the cloth is again changed, and the cheese is left in the press till the following morning, when it is taken out, slightly heated before the fire, and again returned to the chesset and the press. When the wet cloths have been changed a time or two, a dry cloth is substituted and a greater pressure applied
