## Quebec Lunatic Asylum.

TO

THE HONORABLE PROVINCIAL SECRETARY

*of the Province of Quebec.*

SIR,

We have the honor to submit the medical report on the Quebec Lunatic Asylum for the year 1883-84.

Relying on your kindness, we hope that we will be allowed, as in the past, a sufficient number of copies to enable us to exchange with foreign institutions which do us the honor of corresponding with us.

We have the honor to be,

Your obedient servants,

F. E. ROY, M. D.

G. A. LARUE, M. D.

Quebec, 1st July 1884.

Since its foundation, that is to say, during the 39 years of its existence, our establishment has received within its walls 4,681 insane persons; of this number 1,857 have been discharged, and 1,918 have died. At the present time 906 patients are under our care.

We now give some statistics, which include all the patients who have been in our establishment since the commencement.

*Percentage of discharges and deaths (1) sorties.*

Admitted, 4,681. Discharged and died (*sorties*), 3775. Percentage, 80.62

*Percentage of discharges alone.*

Admitted, 4,681. Discharged, 1,857. Percentage, 39.67

*Percentage of deaths.*

Admitted, 4,681. Died, 1,918. Percentage, 40.97

*Percentage of the known results.*

Admitted, 4,681.  
Remaining, 906.

Ascertained results, 3,775 { Discharged, 1,857. Percentage 49.18  
Died 1,918. " 50.80

(1) The French words *sorties* here includes both *discharged and died*.

AVERAGE DURATION OF THE DISEASE PREVIOUS TO ADMISSION.

Males ..... 46 Duration : 2 years, 1 months, 23 days.  
Females ..... 30      "      2      8      7      "  
Both sexes ..... 76      "      2      4      10      "

The chances of cure depend on the time of the commencement of the disease. It is therefore of importance to all, who interest themselves in the practical success of our establishment, that they should understand the origin and nature of the diseases of those who are entrusted to our care. This table thus becomes, from this point of view, one of the most important in our medical report, inasmuch as it tends to show the more or less favorable prospect of cure in the patients admitted during the 12 months.

One of the most judicious and proper means of preventing the crowding of asylums, and, at the same time, of promoting the welfare of all insane persons, is to work *practically* against the disease in such lunatics by their immediate confinement in an asylum.

If this confinement be prompt, the disease will be easy to combat, the cure rapid, the stay in the asylum short, and the cost consequently smaller to the country.

As far as the medical treatment is concerned, the urgent necessity of submitting the patient to immediate treatment will be readily understood, that is to say, at the commencement of the initial attack; for a disease, whose origin is to be looked for in the remote past, yields with more difficulty to the beneficial influence of medical treatment than one of recent date, and especially so in the case of nervous disorders and mental alienation.

Statistics, on this subject, come to the aid of physicians on lunacy.

We find, on consulting the tables given by Tucke, as well as those of Esquirol, Iinel and their successors, that the average time in which there is a chance of cure, is a little less than one year, and that after the third year, the probability of cure is only about at the rate of one eight p. c.

By returns in *Great Britain*, 9 out of 10 insane patients are cured when subject to medical treatment during the three months following the breaking out of the disease, (opinion expressed by Lord Ashley in the House of Commons on a motion of the 6th June, 1845.)

The *United States* show similar results.

Statistics in *France* give the following average of cures :

76 per cent in the 1st month of the disease.

53 " " " 2nd " " "

41 " after " 6th " " "

30 " if the disease lasts more than one year.

English authors have treated this question at length, and upon it they are all agreed.

" In dealing with insanity, says Dr. Mandsley it is above all things necessary that treatment should begin early, before the habit of the definite morbid action has been fixed in the mental organization. There is reason to believe that if the first obscure threatenings were duly recognized and appreciated, and the proper remedial means at once adopted many cases of insanity might be arrested at the outset. But the mischief is that a case of insanity hardly ever comes under the care of those specially qualified by their experience to treat it, until the disease has been firmly established, and the hope of recovery, save from gradual and protracted means, is gone in some cases, and all hope gone in others. When the disease is well established, our treatment must not be rashly vigorous and energetic, with the aim of effecting any sudden revolution, but rather patient and systematic, in the hope of a gradual change for the better—while, in other diseases, time is reckoned by weeks and months."

Dr. Duncan, of Dublin, adds :

" It is not at all difficult to understand why the efficacy of treatment should depend upon the promptness and energy with which the proper remedies are applied. All morbid action in every organ of the body must at its commencement, be a merely functional affection, that is to say, it must be entirely independent of any structural alteration in the organization of the part; afterwards, when it has lasted for a certain period, secretions are effused which clog the vessels, and embarrass still further their natural action. If the treatment be commenced before any change in the minute structures has taken place, it is quite obvious that the difficulty of restoring the parts to their healthy condition must be considerably less, and must occupy a shorter time than if it be delayed to a later period. And when organic alterations have once actually occurred, the hope we have of being able to remove them completely depends upon the

degree of consolidation that has been allowed to take place, and this again depends, for the most part, upon the interval that has elapsed from the commencement of the disease action."

Winslow expresses the same opinion in his work on the Brain and Mind, page 28.

"A vast and frightful amount of chronic and incurable insanity exists at this moment in our private and county asylums, which can be clearly traced to the criminal neglect of the disease in its first or latent stage."

"It is sincerely hoped," adds Sir William Ellis, "that the knowledge of these circumstances will induce an early application to be made for the admission of patients; as, even if the neglect does not prove fatal, it is contrary to every principle of justice and humanity that a fellow-creature, deranged, perhaps, only on one point, should, from the want of the early attention of those whose duty it is to watch over him, linger out his existence separated from all who are dear to him, and be condemned, without any crime, to be a prisoner for life."

We find also the following, at page 379, of the *Journal of Insanity*, 1870 :

"The universal testimony, based upon their own experience, of physicians having charge of institutions for the insane, both in this country and abroad, is to the effect that when patients are subjected to early and judicious treatment, in the early stage of this disease, from eighty to ninety per cent will recover. It is the neglect of this early treatment," remarks the late Dr. Brigham, of the Utica Asylum, "that fills the alms-houses and the asylums of the country with incurable insane."

Dr. Grissom, superintendent of the North Carolina Lunatic Asylum, in his report for 1871, page 19, also enunciates the same opinion, which has become general, that the success of medical treatment in matters of mental alienation depends to a great degree on the promptitude with which the necessary remedies are used in the disease, and in the quickness with which the patient is removed from the domestic hearth, and that, to hope for cure, it is absolutely requisite, to place the victim of this terrible disease, from the very beginning of the attack, under treatment

in a lunatic asylum. Any delay under such circumstances is very often a cause of failure.

"The experience of the profession on this special subject," he adds, "shows that in cases of recent madness, which are taken in time and treated with discernment, 70 to 80, per cent are cured," whilst on the contrary among those which are neglected, very few patients recover."

"We cannot have stronger evidence in support of these arguments than the statement of Dr. Jarvis, whose authority is unquestionable, and who thus expresses himself on this subject:—"In a perfect state of things where the best appliances, with the science and skill of the age have provided for healing, are brought to bear upon these lunatics, in as early a stage of their malady as they are to those who are attacked with fever or dysentery, probably eighty and possibly ninety per cent, would be restored, and only twenty, or perhaps ten per cent, would be left among the constant insane population."—Other authorities state that when a case is immediately placed under proper medical treatment only 5 per cent of the cases thus treated become incurable. The superintending physician of the *Southern Ohio Lunatic Asylum, Report for 1869*, in an analysis made on the result of the treatment in that Institution, on 1,781 cases of insanity, shows by the following figures that the chances of cure diminish in exact proportion to the duration of the disease:

Placed under treatment	After the attack	Cured.
530 patients.....	1 month.....	363 or 68.49 p. c.
219    "     ....	2    "     ....	141    "     63.01    "

163 years     ....	2 years     ....	47    "     28.83    "
191 over     ....	2    "     ....	33    "     17.32    "

What has just been said fully justifies our observations. This question does not admit of a doubt, and any man, no matter how unexperienced can judge for himself of their pertinence.

The duty of the State, and of society as well as of the family, cannot be clearer, more precise and at the same time more imperative. All

understand it ; but alas ! how few are concerned about it or give it attention. Yet we speak here not only of opinions ; we wish for facts, we do not ask for theory only, we must have practice. It is our duty as physicians to combat acknowledge errors, to throw light upon them, to point out the evil and the remedy calculated to remove it ; but what can our efforts accomplish if families will persist in their indifference as regards their members attacked by mental alienation ? The necessary stimulus must come from above ; the Administration must give the example by placing itself at the head of the movement ; it is its duty and its interest so to do.

The want of suitable attention to the insane is carried to a lamentable extent in this country. Far from viewing the precarious state of these unfortunates, in a serious light and immediately placing them under proper medical treatment, they are left a vegetate, so to speak, in the bosoms of their families, where their future is daily darkened by a sojourn prejudicial to their special state. Moreover, this indifference is carried so far that patients are only sent to the Asylum after they have become incurably insane through neglect, for which we are nevertheless held responsible. This state of things brings to our recollection a few lines, from the writings of Dr. Berthier, which we may without exaggeration apply to our own country :

" What is our course of conduct with regard to the insane," says he, " that is with regard to our diseased ? We leave them to themselves. We abandon them to empirics, or they are only confided to us, when having become dangerous either to society or to their relatives ; it is deemed necessary to *get rid* of them, that is to say, when a thousand remedies have failed, after having had a deleterious effect on their organism ; in fine, when they are in the most favorable position to become incurable. Thus our institutions are filled with unfortunate patients of 3, 4, 5, 10, 20 and 30 years standing, who become endless sources of expense to their families and the public. On the part of parents it is a wrong calculation ; on the part of the authorities, such conduct spirit of the law and to nullify its humanitarian object.

The medico-psychological annals (1st series, vol. XII, page 83), reproduce the following words of the celebrated Dr. Follet, on this question :

"How is it, that the insane are sent to us only after several years' duration of the disease, whether coming from their families or the hospitals, where they have been retained for a long time, or from central houses or the different prisons whence they have been discharged by order of *non-lieu* ?

"It is thus that lunatics are allowed abroad without notice, to be tolerated here and there, as long as it is possible, and are isolated only when they cause disturbance in the family or neighborhood ; when they have made progress in chronicity which will condemn them to a life of utter oblivion." He adds to these pertinent remarks a form of circular which the authorities should address to mayors : "Observation shows that medical treatment is to often delayed, and if insanity could only be treated from its commencement, we would have more numerous cases of cure, and less liable to relapse. It happens that under the pressure of certain conditions which are easily understood, the majority of patients enter an establishment only after an attack of insanity of long duration ..... If for an ordinary fever, or the slightest wound we hasten to a physician, is it prudent to allow a mental disease to run its own course without being exposed to see it grow worse and finally become dangerous to order and the safety of the public ? Are we to wait until the mental state has already given rise to disturbance, before we think it necessary to take any notice of it ?

Thus we have quotations, authorities and proofs.

The Inspectors understood the importance of the unanimous opinions of physicians on this subject, and the following extract, from their Report of 1667-68, page 13, unquestionably leaves no doubt as to their views in regard to it.

"By the prompt admission of patients, a much larger number would probably be relieved from their unfortunate affliction. The more that are cured, the more useful members will society possess, and the more will the number of the useless be diminished..... We hope that the Government will at least take measures to suppress the deplorable habit of immuring in our prisons that class of prisoners (lunatics) which is and always has been the terror of sheriffs and jailors.

"In all countries, this almost barbarous custom of shutting up

lunatics in prison, as if they were criminals, is now condemned. In England, not only is it condemned, but it is prohibited by a law, which comes into force this very year. We should imitate the mother country in this respect, as we do in many others.

"It is especially in prisons that lunatics rapidly become incurable. In them, they are nearly always shut or chained up. They receive little or none of the particular cares demanded by their disease, as neither place nor circumstances admit of it. It is fortunate when they do not commit suicide, either by hanging themselves or fracturing their skulls against the iron doors of their cells, as recently happened in the Joliette gaol.

"The formalities required by law for the admission of patients are also to be complicated and necessitate too much delay. While the authorities are deliberating, or the parties corresponding, the unfortunate patient has to wait it is true, but the disease does not wait. If often makes rapid progress, so that when admission is obtained, all chance of cure is gone. Madness has its crisis. That crisis rarely or ever returns. If the turning point be not taken advantage of by the physician, it is a misfortune difficult, if not impossible, to remedy.

"The application should be made directly to the Warden of the Asylum, and upon returning an immediate answer that the case is admissible, the patient might be at once entered, leaving to the Warden the duty of informing the Government of the fact."

In the bold, outspoken character of these remarks, a love of truth and a sincere desire to promote the efficiency of any efforts that the Government may make in favor of the insane will be easily recognized.

All these quotations are in no way inappropriate when applied to our own country. We have elsewhere spoken of patients coming from gaols, and the figures of the table we have given at the commencement of these remarks on the previous duration of the disease are more than sufficient to attract attention and prove the great importance of this question.

Economists have endeavored to reduce the annual expenditure for the insane and think that they have found out and easy means of doing by retarding as much as possible the incarceration of lunatics in asylums

This is an error on their part. It suffices to seriously contemplate the subject to see how false such a step is, and here again, we appeal to the experience of persons of enlightenment, whose testimony will leave no doubt, and who prove that this factitious appearance of economy, ill-advised at the best, in place of diminishing the annual expense to the State, entails the outlay of *enormous sums*.

One quotation will suffice. We find it in the *Journal of Insanity*, January, 1870, page 379, under the following title : *How money is saved by hospitals for the insane.*"

Dr. Macdonald, a former superintendent of the Bloomingdale Asylum, estimated the recoveries in recent cases subjected to treatment at 76 per cent, while in chronic cases but 7 per cent were restored. In 1865, Dr. Willard, of Albany, reported to the Legislature that there were 1,345 insane persons in the poor-houses and county receptacles of the State. On the basis of Dr. Macdonald's calculation, 7 per cent, or 92 of these might recover without treatment, and 1,253 would remain in the county-houses, a public charge, during the 18 years which the life tables of Le Cappalain and of the English Lunacy Commissioners show to be the average duration of life in the incurably insane. Estimating the weekly cost, in the poor-houses, of these 1,253 persons at \$1.50 each, the expense of maintenance would be as follows : For one week \$1,879.50, for one year \$97,734 ; and for the 18 years of average lunacy life, the enormous sum of \$1,759,212. Had these 1,345 received the benefits of early asylum treatment, by the above calculation, 1,022 would have been restored to health ; their average period under treatment in hospital would have been ten months, at a monthly cost of sixteen dollars each, the aggregate expense of their care and cure would have amounted to \$163,000, and the tax-payers would have been relieved of an extra payment of \$1,271,888 for their support.

These results prove, once more, how necessary it is that lunatics still at large should be confined, while they offer a solution as well assured as charitable to the persistent researches of the economists in question.

It is therefore very desirable that the knowledge of these facts should lead to the immediate confinement of lunatics still at large and favor above all their more prompt admission especially at the commencement of the disease.

By practically adopting this new system, the Government would secure greater economy, reduce its responsibility and render its efforts more conformable to the principles of justice and humanity.

## THIRD PART

### DISCHARGES.

The tables contained in this part of the report show the number of patients discharged and their mental condition at their departure.

We have taken special pains to establish the percentage of discharges, as it shows the results obtained during the year.

The division of the tables is as follows :

TABLE I.

Patients discharged during the year.

TABLE II.

Nature of the disease of discharged patients.

TABLE III.

Duration of the disease before admission.

TABLE IV.

Principal causes of insanity.

TABLE V.

Duration of treatment.

TABLE VI.

Total duration of the disease from its manifestation

TABLE VIII.

Age at time of discharge.

TABLE I

## FOURTH PART.

### DEATHS.

We beg specially to draw the reader's attention to the exceptionally favorable percentage of deaths this year.

This satisfactory result contributes greatly towards proving the excellence of the hygienic system of our establishment.

The tables of deaths are given as follows :

TABLE I.

Deaths.

TABLE II.

Deaths classified according of the form of mental  
disease.

TABLE III.

Duration of treatment.

TABLE IV.

Age at death.

TABLE V.

Causes of death.

TABLE I  
THAI THUOT  
DEATHS.

## FIFTH PART.

### SUMMARY.

This last part of the report shows the number of patients remaining under treatment at the end of the year.

The following tables indicate their mental condition, and give a more or less correct idea of their chances of cure, etc.

TABLE I.

Movement of the population.

TABLE II.

Duration of residence.

TABLE III

Age.

TABLE IV.

Diseases of patients remaining.

TABLE V.

Probable chances of cure.
